Seasonal Habitat	Allowable Use of Key Species
Nesting/Breeding <sup>1</sup>	Residual perennial grass height: Grazing post nesting/breeding season: 4 in. <sup>15,16</sup> Grazing during nesting/breeding season <sup>a</sup> : 7 in. <sup>10,15,16</sup>
	<sup>a</sup> Average, assuming current vegetation composition has the capability.
	≤35% shrub species
Brood-Rearing /Summer	≤40% herbaceous species <sup>17</sup>
	≤35% woody species
	Average stubble height 4 inches (depending on site capability and potential) for herbaceous riparian vegetation <sup>17</sup>
Winter	≤35% shrub species

**1-Grass heights only apply in nesting habitats with sufficient sagebrush cover (15-25%) to support nesting.**

**Comment [PM18]:** This is FS language that will be required. Need to discuss BLM's use of these.

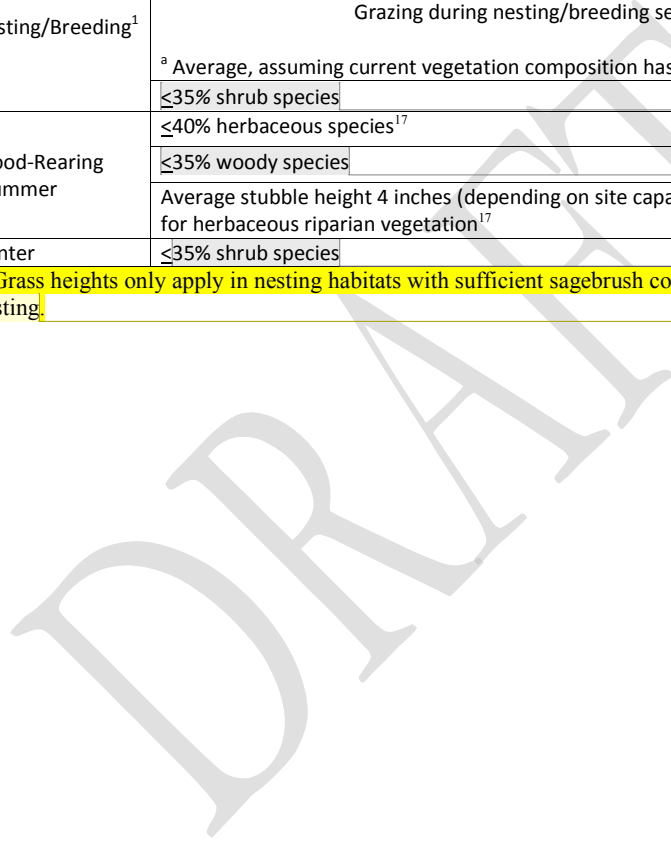

**Comment [LD19]:** Allowable Use is fine for BLM too

**Comment [PM20]:** This is from FS Draft. Assumes we will be monitoring shrub utilization in spring. Need to discuss.

**Comment [PM21]:** This is from FS Draft. Assumes we will be monitoring shrub utilization in summer. Need to discuss.

**Comment [PM22]:** This is from FS Draft. Assumes we will be monitoring shrub utilization in winter. Need to discuss.

**Comment [LD23]:** In the grazing section, we have language about considering ESDs and current site potential as well, so that unrealistic objectives aren't put in place for areas that can't produce 7" every year. May need to spell out how this works if POSE doesn't count towards cover requirements, but it is the main perennial grass out there...

3. General Direction (GD)

- 3.1. GD-1: Comply with state and federal laws, regulations, policies, and standards, including FLPMA multiple use mandates and NFMA regulations.
- 3.2. GD-2: Implement actions (day-to-day management, monitoring, and administrative functions) that stem directly from regulations, policy, and law, which are considered in conformance with the LUPA that are not specifically addressed in the plan amendment.
- 3.3. GD-3: Preserve and recognize valid existing rights, which include any leases, claims, or other use authorizations established before a new or modified authorization, change in land designation, or new or modified regulation is approved. Activities on existing mineral leases are managed through terms, conditions and stipulations on the leases, and through specific operating conditions included in operating plan approvals for the duration of the lease.
- 3.4. GD-4: Allowable uses and management actions from the existing LUPs that remain valid and do not require amending are carried forward.
- 3.5. GD-5: Sustain habitat in sufficient quantities and quality for resilient plant and wildlife populations.
- 3.6. GD-6: Provide for human safety and property protection from wildfire.
- 3.7. GD-7: Ensure that existing utility corridors would remain unchanged.
- 3.8. GD-8: Limit all Forest Service-administered lands to designated routes.
- 3.9. GD-9: Existing requirements regarding site-specific environmental analysis, public involvement, consultation with tribes and other agencies, or compliance with applicable laws without waiver are maintained.
- 3.10. GD-10: Appropriate, site-specific analysis as described in NEPA and any requisite site specific decision making (i.e., 43 CFR Subpart 4160, or 36 CFR Part 251) would be conducted prior to approving proposed management actions.
- 3.11. GD-11: Impacts analysis on other sagebrush steppe species and impacts on state endowment trust lands managed by the Idaho Department of Lands would be analyzed during site-specific project NEPA review.
- 3.12. GD-12: Activities not specifically addressed by the plan amendment would still be subject to the allowances and restrictions of the applicable land use plans.
- 3.13. GD-13: Information in the Management Plan and Conservation Strategies for Sage-Grouse in Montana would be considered when designing projects that may affect sensitive species or federally listed species in Montana.
- 3.14. GD-14: Any oil and gas leasing decisions would be consistent with the BLM and Forest Service requirements for leasing decisions as found in 43 CFR Part 3101 and 36 CFR 228.102, respectively.
- 3.15. GD-15: In conjunction with plan evaluation, re-evaluate management zones, required design features and other protective stipulations as new science, information and data regarding the habitats and behavior of the species is obtained. Incorporate these findings as part of plan maintenance.
- 3.16. GD-16: Incorporate required design features (RDFs) as described in Appendix A in the development of project or proposal implementation, reauthorizations or new authorizations and suppression activities.
- 3.17. GD-17: Incorporate best management practices as described in Appendix A, as applicable and appropriate in the design and development of implementation activities and projects.
- 3.18. GD-18: Conduct implementation and project activities consistent with seasonal habitat restrictions described in Appendix B.

Comment [CY24]: Designate utility corridors or designated and de facto corridors or authorized ROWs?

Comment [CY25]: Why single out IDL?

Comment [d26]: Not BLM's jurisdiction

Comment [CY27]: How will public be involved?

Comment [CY28]: Need to further review Appendices, but maintenance activity could be impacted. For example-seasonal restrictions, but power company needs to respond to outage...

Comment [d29]: May need an exception for emergency repairs.

Comment [BER30]: Paul is compiling.

- 3.19. GD-19: Incorporate appropriate buffers into implementation and project design to avoid and minimize impacts to GRSG described in Appendix C.

**Comment [CV31]:** Need to review how this is defined in Appendix.

DRAFT

**4. Coordination**

- 4.1. CC-1: Collaborate, coordinate and utilize cooperative planning efforts to implement and monitor activities to achieve desired conditions and to maximize the utilization of available funding opportunities. Coordination efforts could include: adjacent landowners, federal and state agencies, local governments, tribes, communities, other agencies, resource advisory groups and non-governmental organizations.
- 4.2. CC-2: Develop a cooperative MOU between the BLM, Forest Service and State of Idaho to establish the State of Idaho as a cooperating agency during implementation of the final decision. The MOU would identify responsibilities, role and interaction of the BLM, FS and Task Team. Montana BLM will participate as appropriate on Montana's Sage-grouse Oversight Team to facilitate coordinated and implementation of BLM's final decision and Montana's forthcoming sage-grouse conservation strategy.
- 4.3. CC-3: The BLM and Forest Service would consider any recommendations from the Governor of Idaho as a result of evaluation completed by the Sage-Grouse Implementation Task Force.
- 4.4. CC-4: The BLM and Forest Service would coordinate with the State of Idaho and Montana and the Idaho Sage-Grouse Implementation Task Force and Montana Sage-grouse Oversight Team regarding proposed management changes, the implementation of conservation measures, mitigation, and site-specific monitoring, related to adaptive management and livestock grazing (Appendix O).
- 4.5. CC-5: At the state level, BLM and Forest Service would consider recommendations from the Governor in the decision process recognizing that the BLM and Forest Service have the final decision making authority and responsibility on federal lands under their appropriate jurisdiction.
- 4.6. CC-6: At the state level, BLM and Forest Service would coordinate with IDFG, MFWP, USFWS, and other conservation partners in collaborative efforts with adjacent states (Oregon, Nevada, Utah, Montana, Wyoming) in GRSG MZs IV and II to evaluate GRSG habitat and population status and trends within the broader USFWS PACs and make appropriate recommendations for GRSG conservation at broader scales.
- 4.7. CC-7: At the state level, BLM and Forest Service would coordinate with appropriate WAFWA Sage-grouse Technical Committee to develop consistent population and habitat monitoring approaches that facilitate GRSG conservation at the MZ scale.
- 4.8. CC-8: All prescribed burning would be coordinated with state and local air quality agencies to ensure that local air quality is not significantly impacted by BLM and Forest Service activities.

**Comment [d32]:** Permitted users of federal lands need to be included in coordination.

## 5. Greater Sage-Grouse Management Areas

- 5.1. Management Area (MA)-1: Designate five GRSG Conservation Areas within the sub-region to form the geographic basis for achieving population objectives; evaluating the disturbance density and adaptive regulatory triggers; and tailor adaptive management responses. These conservation areas are depicted in Map 1. These areas are referred to as Mountain Valleys, Desert, West Owyhee, Southern and Southwestern Montana Conservation Areas.

### Conservation Area Description:

Mountain Valleys Conservation Area – generally located north of the Snake River Plain, and includes habitat in west-central population area. It extends west from Rexburg, north and west of Highway 33 to Howe, north and west of Highway 33/22 to Arco, north and west of Highway 26/20/93 to Carey, north and west of Highway 20 west to Hill City, north and west of Highway 20 to the Dylan Karaus Road, west to Canyon Creek. Canyon Creek to the confluence with the Snake River form the western boundary.

Desert Conservation Area – located north of the Snake River and south of the Mountain Valleys Conservation Area. It extends from the confluence of Canyon Creek and the Snake River, eastward to Idaho Falls. The Snake River and Henry’s Fork form the eastern boundary.

West Owyhee Conservation Area – located south of the Snake River and west of the Bruneau River.

Southern Conservation Area – located south of the Snake River and east of the Bruneau River, including East Idaho uplands and Bear Lake Plateau, and the Utah portion of the Sawtooth National Forest in Box Elder County.

Southwestern Montana – located in southwestern Montana - encompassing the Dillon and Butte BLM Field Office boundaries.

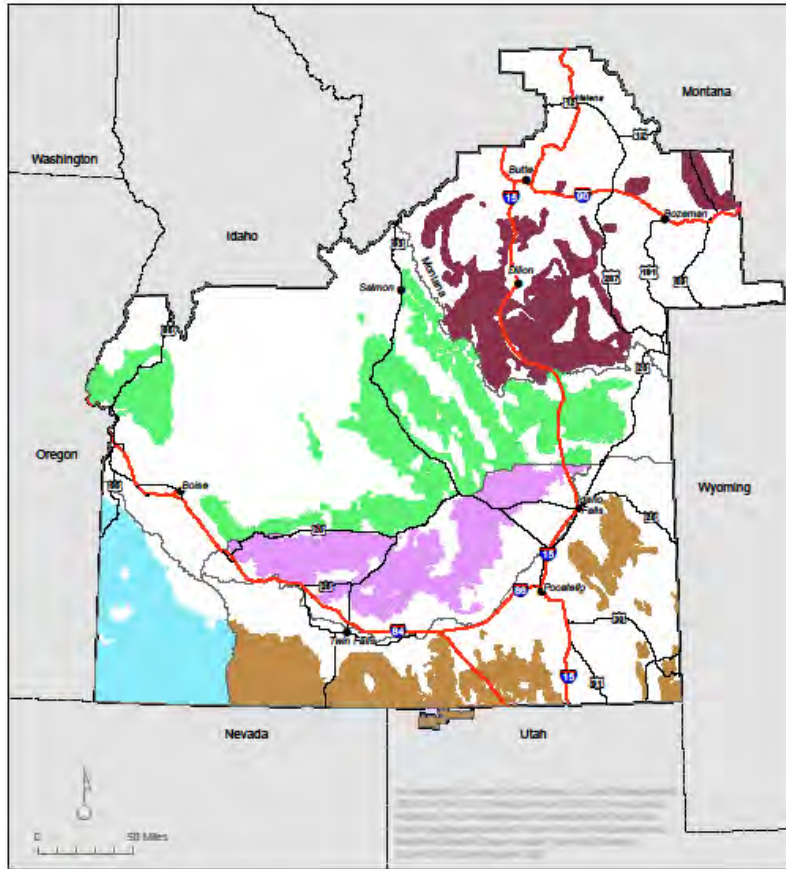

Additionally, sage-grouse habitats in the Desert and West Owyhee CAs are relatively contiguous, while those in the Mountain Valleys and Southern CAs tend to be more fragmented due to topography, elevational and land use differences.

- 5.2. MA-2: Within each Conservation Area (CA) designate GRSG Management Zones: Core, Important and General Management Zones (Map 2). **Core Management Zones (CMZs)** focus on conserving the two key meta-populations in the sub-region. These meta-populations consist of a large aggregation of interconnected breeding subpopulations of GRSG that have the highest likelihood of long-term persistence. The CMZ encompasses areas with the highest conservation value to GRSG, based on the presence of larger leks, habitat extent, important movement and connectivity corridors and winter habitat. Core Management Zones include adequate area to accommodate continuation of existing land uses and landowner activities. **Important Management Zones (IMZs)** contain additional high value habitat and populations that provide a management buffer for the CMZ, connect patches of CMZ. The IMZ encompasses areas of generally moderate to high conservation value habitat and/or populations and in some CAs includes areas beyond those identified by USFWS as necessary to maintain redundant, representative and resilient populations

(Priority Areas for Conservation (PACs)). The IMZs are typically adjacent to CMZs but generally reflect somewhat lower GRSG population status and/or reduced habitat value due to disturbance, habitat fragmentation or other factors. There are no IMZs designated within the Southwestern Montana CA. **General Management Zones (GMZs)** encompass habitat that is outside of CMZs or IMZs. It is generally characterized by more marginal habitat and few, if any, occupied leks or other important seasonal use areas.

- 5.3. MA-3: Annually prioritize Conservation Areas at the state scale considering results of the annual adaptive regulatory trigger evaluations relative to implementation of restoration and mitigation activities.
- 5.4. MA-4: Prioritize activities to protect, enhance and restore GRSG habitats (i.e. suppression activities, fuels management activities, vegetation treatments, invasive species treatments, etc.) first by Conservation Area, if appropriate (CA under adaptive management or at risk of engaging adaptive management), followed by Core Management Zones, then Important Management Zones then General Management Zones within the Conservation Areas. Local priority areas within these zones will be further refined as a result of completing the GRSG Wildfire and Invasive Species Habitat Assessments as described in Appendix D. This could include projects outside GRSG habitat when those projects would provide a benefit to GRSG habitat.
- 5.5. MA-5: The management zone map would be re-evaluated in conjunction with plan evaluation processes (i.e. approximately every 5 years). This re-evaluation could indicate the need to adjust Core, Important or General Management Zones. These adjustments could occur upon completion of the appropriate analysis (plan amendment) to review the allocation decisions based on the map.
- 5.6. MA-6: The appropriateness of specific project proposals or management activities within the management zone designations (Core, Important, General) would be assessed individually during project-level NEPA analysis. This evaluation is necessary since designations of Core, Important and General Management Zones were derived at a broad scale with additional refinements relative to boundaries and management consideration; locally GRSG habitat suitability and vegetation characteristics vary.

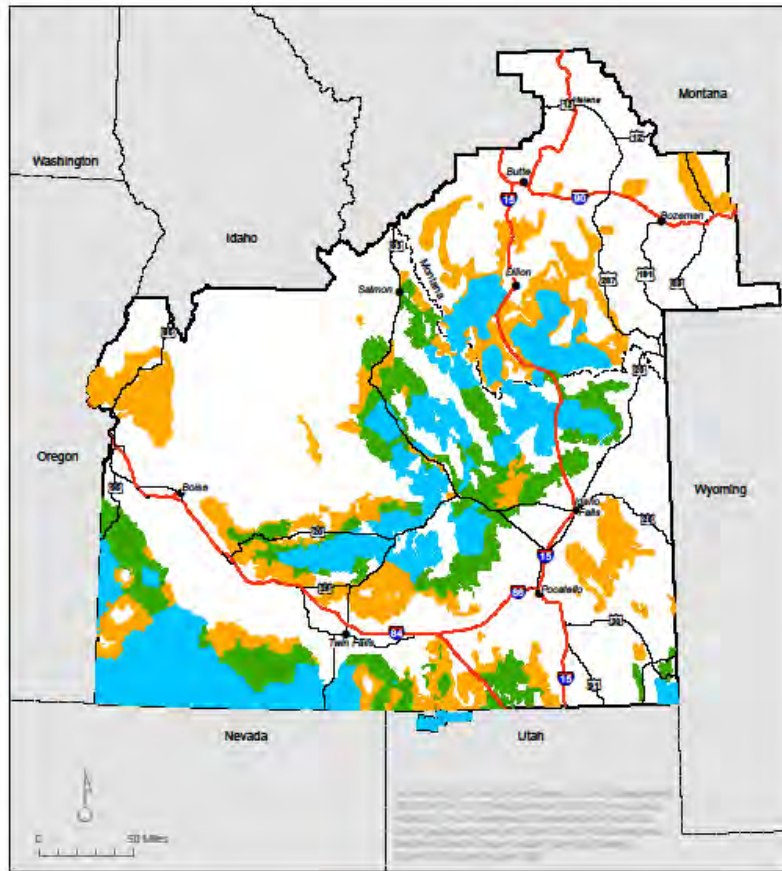

Map 1. Conservation Areas within Idaho and Southwestern Montana Subregion

- |   |                            |
|---|----------------------------|
| <b>Conservation Area with Management Zone</b> | Conservation Area Boundary |
| Idaho Desert Conservation Area                | Analysis Boundary          |
| Idaho Mountain Valleys Conservation Area      |                            |
| Idaho Southern Conservation Area              |                            |
| Idaho West Owyhee Conservation Area           |                            |
| SW Montana Conservation Area                  |                            |

  - General
  - Analysis Boundary

## 6. Adaptive Management

- 6.1. Adaptive Management (AM)-1: Idaho: Use hard and soft population and habitat triggers, evaluated within a Conservation Area, to determine an appropriate management response.
- 6.2. AM-2: Utilize monitoring information collected through the Monitoring Framework Plan (Appendix E) to determine when adaptive regulatory triggers have been met.
- 6.3. AM-3: Idaho: BLM and Forest Service would maintain GRSG habitat information, through use of the Key Habitat map or latest sagebrush/vegetation map, which would be used to track and identify habitat changes to assess the habitat trigger in the adaptive management approach. Key habitat map updates are made each winter by BLM in coordination with the FS and Idaho Department of Fish and Game (IDFG), using the process described in Appendix F.
- 6.4. AM-4: BLM and Forest Service would utilize population information collected and maintained by the Idaho Department of Fish and Game to track and identify population changes to assess the population trigger in the adaptive management approach...
- 6.5. AM-5: Twice each year the applicable monitoring information would be reviewed to determine if any adaptive management criteria have been met.
- 6.6. AM-6: Adaptive regulatory triggers would be individually calculated across all ownerships within the biologically significant units (BSU). The BSU is defined as the nesting and wintering habitat within Core and Important Management Zones within a Conservation Area.
- 6.7. AM-7: Adaptive Regulatory Criteria for Hard Habitat Triggers are defined as:
  - A 20 percent combined loss of nesting and/or wintering habitat within CMZ within a CA compared to the 2011 baseline; or
  - A 20 percent combined loss of nesting and/or wintering habitat within IMZ within a CA compared to the 2011 baseline.
- 6.8. AM-8: Adaptive Regulatory Criteria for Soft Habitat Triggers are defined as:
  - A 10 percent combined loss of nesting and/or wintering habitat within CMZ within a CA compared to the 2011 baseline; or
  - A 10 percent combined loss of nesting and/or wintering habitat within IMZ within a CA compared to the 2011 baseline.
- 6.9. AM-9: Adaptive Regulatory Criteria for Hard Population Triggers are defined as:
  - A 20 percent decline in maximum number of males counted and a finite rate of change significantly below 1.0 within CMZ within a CA over a period of 3 consecutive years compared to the 2009-2011 baseline; or
  - A 20 percent decline in maximum number of males counted and a finite rate of change significantly below 1.0 within IMZ within a CA over a period of 3 consecutive years compared to the 2009-2011 baseline.
- 6.10. AM-10: Adaptive Regulatory Criteria for Soft Population Triggers are defined as:
  - A 10 percent decline in maximum number of males counted and a finite rate of change below 1.0 within CMZ within a CA over a period of 3 years when compared to the average finite rate of change from 2009-2011; or
  - A 10 percent decline in maximum number of males counted and a finite rate of change below 1.0 within IMZ within a CA over a period of 3 years when compared to the average finite rate of change from 2009-2011.
- 6.11. AM-11: When any of the Adaptive Regulatory Criteria for Soft Triggers have been met then the Implementation Team would engage to identify implementation level actions that may be appropriate to consider.

Comment [BER33]: Describe Project Level Adjustments.

Comment [BER34]: From Paul - Confirm if this should read "average maximum" (avg max no. per lek) or is it the total max number of birds. Important distinction.

- 6.12. AM-12: When any of the Adaptive Regulatory Criteria for Soft Triggers have been met the Implementation Team would evaluate causal factors and recommend additional potential implementation level activities Appendix G.
- 6.13. AM-13: When any of the Adaptive Regulatory Criteria for Hard Triggers have been met due to loss of habitat then CMZ management actions would be applied to the IMZ within that CA.
- 6.14. AM-14: If an adaptive regulatory trigger is tripped and livestock grazing is identified as a probable limiting factor then adjustments would follow the Adaptive Grazing Management Response described in Appendix G.
- 6.15. AM-15: Remove any adaptive management response when the habitat or population information shows a return to or an exceedance of baseline values within the associated CA.
- 6.16. Montana Adaptive Management:

**Comment [BER35]:** John Carlson to provide template of language.

DRAFT

## 7. Anthropogenic Disturbance

- 7.1. Anthropogenic Disturbance (AD)-1: Limit anthropogenic disturbance to 3 percent as calculated within the biologically significant unit (BSU). The BSU is defined as the nesting and wintering habitat within Core and Important Management Zones within a Conservation Area, inclusive of all ownerships. This excludes habitat disturbance from wildfire and includes activities described in Appendix H. For Idaho this disturbance is measured by direct footprint or by ROW width for linear features. For Montana this disturbance is measured utilizing the Disturbance Density Calculation Tool process described in Appendix I.
- 7.2. AD-2: New anthropogenic disturbances within winter and nesting habitat within Core or Important management zones within a CA where the disturbance threshold is already exceeded from any source or where the proposed development would result in the threshold being exceeded would not be allowed until enough habitat has been restored to maintain the area under this threshold (subject to valid existing rights).
- 7.3. AD-3: Core Management Zone: Anthropogenic Disturbance Exception Criteria – in addition to the Core and Important Management Zone Anthropogenic Disturbance Development Criteria (AD-4), the following criteria must all be met in the screening and assessment process:
- The population trend for the GRSG within the associated Conservation Area is stable or increasing over a three-year period and the population levels are not currently engaging the adaptive management triggers;
  - The development with associated mitigation would not result in a net loss of GRSG habitat and would provide a net conservation benefit of the respective Core Management Zone;
  - The project would not likely result in a net loss of GRSG habitat or habitat fragmentation or other impacts causing a decline in the population of the species within the relevant CA;
  - The project is developed pursuant to a valid existing authorization;
  - The project is an incremental upgrade/capacity increase of existing development;
  - Cannot be reasonably accomplished outside of the Core Management Zone;
  - Can be co-located within the footprint of existing infrastructure (proposed actions would not increase the existing authorized footprint and associated impacts more than fifty percent (50%), depending on industry practice.
  - Development would follow the required design features (RDF) and best management practices (BMPs) as described in Appendix A;
  - The project would not exceed the disturbance threshold (AD-1).
  - The project has been reviewed by the State Implementation Team and recommended for consideration by the Idaho Governor.
- 7.4. AD-4: Core and Important Management Zone: Anthropogenic Disturbance Development Criteria – the following criteria must be met in the screening and assessment process:
- The project cannot reasonably be achieved, technically or economically, outside of this management zone; and
  - The project is co-located within the footprint for existing infrastructure, to the extent practicable. In the event co-location is not practicable, the siting should best reduce cumulative impacts and/or impacts on other high value natural, cultural, or societal resources; and

**Comment [CY36]:** Right, but EIS only applies to federal land.

**Comment [d37]:** Ask BLM if this is just roads and pipelines which would mean the ROW width is basically the same as the direct footprint. Or does this include powerlines where the ROW width includes area that is not disturbed.

**Comment [CY38]:** This needs to be clarified for the State.

**Comment [CY39]:** Need to make sure this will be compatible with e and g when we play out different project scenarios. Is there an implied "and" after each criteria, or is it an "or"?

- c. The project does not result in a net loss of GRSG habitat or habitat fragmentation or other impacts causing a decline in the population of the species within the relevant CA; and
  - d. The project design mitigates unavoidable impacts through appropriate compensatory mitigation; and
  - e. The project complies with the applicable RDFs as described in Appendix A.
  - f. The project would not exceed the disturbance threshold (AD-1).
- 7.5. AD-5: Construction activities and other short-term anthropogenic disturbances would be carried out subject to seasonal and timing restrictions Appendix B.

DRAFT

**8. Mitigation**

- 8.1. Mitigation (MIT)-1: BLM and USFS would establish an inter-agency GRSG Conservation Board at the state level (both Idaho and Montana) to oversee GRSG Conservation.
- 8.2. MIT-2: The BLM and USFS, in coordination with the GRSG Conservation Board would develop a State Mitigation Strategy. In Idaho this strategy would be consistent with the Idaho Mitigation Framework (Appendix J).
- 8.3. MIT-3: Mitigate impacts from anthropogenic developments (Appendix H) to GRSG habitats by first avoidance of impacts, minimizing impacts and then compensating for impacts.
- 8.4. MIT-4: Mitigate anthropogenic development (Appendix H) impacts to CMZs to a no net loss standard (Appendix K) through application of appropriate mitigation in accordance with the Mitigation Framework (Appendix L), referred to as no unmitigated loss.
- 8.5. MIT-5: Mitigate anthropogenic development (Appendix H) impacts to GRSG habitat through application of appropriate mitigation in accordance with the Mitigation Framework (Appendix L).

DRAFT

**9. Wildfire Preparedness/Prevention**

- 9.1. Wildfire Preparedness (WFP)-1: Support development and implementation of Rangeland Fire Protection Associations (RFPAs) in coordination with the State of Idaho.
- 9.2. WFP-2: Develop a consistent approach to fire restrictions within GRSG habitat through the existing coordinated inter-agency approach to fire restrictions based upon National Fire Danger Rating System thresholds (fuel conditions, drought conditions, and predicted weather patterns).
- 9.3. WFP-3: Annually incorporate into existing fire management plans results and updates from the Wildfire and Invasive Species Habitat Assessments described in Appendix D, to communicate/explain the resource value of GRSG habitat, including fire prevention messages and actions to reduce human-caused ignitions.
- 9.4. WFP-4: Continue to participate with the Wildland Fire Leadership Council, a cooperative, interagency organization dedicated to achieving consistent implementation of the goals, actions, and policies in the National Fire Plan and the Federal Wildland Fire Management Policy.
- 9.5. WFP-5: Continue annual coordination meetings held between cooperating agencies that have fire suppression responsibilities. Incorporate Rangeland Fire Protection Associations and other stakeholders into this coordination. Discuss priority suppression areas and distribute maps showing priority suppression areas at both the Conservation Area and the local office levels as based on the adaptive management strategy and Wildfire and Invasive Species Assessments.
- 9.6. WFP-6: Ensure firefighter personnel receive annual orientation regarding GRSG habitat and sagebrush management issues as related to wildfire suppression.
- 9.7. WFP-7: As part of the Wildfire and Invasive Species Assessments, identify roads, trails, and recreational use areas with high frequency of human caused fires within or adjacent to the Core or Important Management Zones. Consider these areas during annual fire restriction evaluations, and as appropriate, through site specific management.
- 9.8. WFP-8: Coordinate with Federal, State and local jurisdictions on fire and litter prevention programs to reduce human caused ignitions.
- 9.9. WFP-9: Implement activities identified within the Wildfire and Invasive Species Assessments.

## 10. Wildfire Suppression

- 10.1. WFS-1: Complete Wildland Fire and Invasive Species Assessments as described within Appendix D within 1 year of the Record of Decision and incorporate results into appropriate Fire Management Plans as they are completed. Wildfire and Invasive Species Habitat Assessments are interdisciplinary evaluations of the threats posed by wildfire and invasive species, as well as identification of priority areas/treatment opportunities for fuels management, fire management, and restoration. These assessments identify priority areas and describe strategies for fuels management, suppression and restoration activities.
- 10.2. WFS-2: As part of the Wildfire and Invasive Species Assessments incorporate a wildfire response time analysis focusing on response time to identified priority areas within Core and Important Management Zones or on those fires that have the potential to impact Core and Important Management Zones. Incorporate findings into Unit Initial Attack program
- 10.3. WFS-3: As part of the Wildfire and Invasive Species Assessment incorporate a water capacity analysis for suppression purposes, including potential private water sources. Provide water availability to respond to fire in or threatening CMZ and IMZ during initial attack.
- 10.4. WFS-4: During high fire danger conditions, stage initial attack and secure additional resources closer to priority areas identified in the Wildfire and Invasive Species Assessments, based on anticipated fires and weather conditions, with particular consideration of the West Owyhee, Southern and Desert Conservation Areas to ensure quicker response times in or near GRSG habitat.
- 10.5. WFS-5: Utilize a full range of fire management strategies and tactics through strategic wildfire suppression planning consistent with appropriate management response and within acceptable risk levels, to achieve resource objectives for GRSG habitat consistent with land use plan direction. Utilizing both direct and indirect attack as appropriate to limit the overall amount of GRSG habitat burned. This could include suppressing fires in intact sagebrush habitats; limiting fire growth in General Management Zones when suppression resources are available or managing wildfire for resource benefit in areas of conifer (juniper) encroachment.
- 10.6. WFS-6: Suppression priorities: Firefighter and public safety followed by property are the highest priority for protection during suppression activities. Maintaining GRSG habitat will be prioritized immediately after human life and property, commensurate with threatened and endangered species habitat or other critical habitats to be protected.
- 10.7. WFS-7: Ensure close coordination with federal and state firefighters including the Rangeland Fire Protection Associations during suppression activities.

## **11. Fuels Management**

- 11.1.** FM-1: Design and implement fuels treatments that would reduce the potential start and spread of unwanted wildfires and provide anchor points or control lines for the containment of wildfires during suppression activities with an emphasis on maintaining, protecting, and expanding sagebrush ecosystems and successfully rehabilitated areas and strategically and effectively reduce wildfire threats in the greatest area.
- 11.2.** FM-2: Enhance (or maintain/retain) sagebrush canopy cover and community structure to match expected potential for the ecological site and consistent with GRSG habitat objectives unless fuels management objectives requires additional reduction in sagebrush cover to meet strategic protection of GRSG habitat. Closely evaluate the benefits of the fuel management treatments against the additional loss of sagebrush cover on the local landscape in the NEPA process.
- 11.3.** FM-3: Apply appropriate seasonal restrictions for implementing fuels management treatments according to the type of seasonal habitats present. Allow no treatments in known winter range unless the treatments are designed to strategically reduce wildfire risk around and/or in the winter range and would protect, maintain, increase, or enhance winter range habitat quality. Ensure chemical applications are utilized where they would assist in success of fuels treatments. Strategically place treatments on a landscape scale to prevent fire from spreading into Core Management Zones or WUI.
- 11.4.** FM-4: Develop a fuels continuity and management strategy to expand, enhance, maintain and protect GRSG habitat informed by the Wildfire and Invasive Species Assessments completed as described in Appendix D.
- 11.5.** FM-5: When developing the fuels management strategy as part of the Wildfire and Invasive Species Assessment described in Appendix D consider up-to-date fuels profiles; land use plan direction; current and potential habitat fragmentation; sagebrush and GRSG ecological factors; active vegetation management steps to provide critical breaks in fuel continuity where appropriate; incorporate a comparative risk analysis with regard to the risk of increased habitat fragmentation from a proposed action versus the risk of large scale fragmentation posed by wildfires if the action is not taken.
- 11.6.** FM-6: Fuel treatments will be designed through an interdisciplinary process to expand, enhance, maintain, and protect GRSG habitat which considers a full range of fuel reduction techniques, including: grazing, targeted grazing, prescribed fire, chemical, biological and mechanical treatments.
- 11.7.** FM-7: Existing and proposed linear ROWs could be considered for use and maintenance as vegetated fuel breaks in appropriate areas.
- 11.8.** FM-8: Fuel breaks would incorporate existing vegetation treatments (seedings) or be located adjacent to existing linear disturbance areas where appropriate. Fuel breaks should be placed in areas with the greatest likelihood of compartmentalizing a fire and/or to foster suppression options to protect existing intact habitat.
- 11.9.** FM-9: Strategically pre-treat areas to reduce fine fuels.
- 11.10.** FM-10: Protect seeding efforts from subsequent fire events.
- 11.11.** FM-11: Targeted grazing as a fuels treatment to adjust the vegetation conditions to reduce the potential start and spread of unwanted wildfires may be implemented within existing grazing authorizations if feasible such as through temporary non-renewable authorizations, or through contracts, agreements or other appropriate means separate from existing grazing authorizations and permits.

**Comment [CY40]:** Text should clarify that ROW holder is not responsible for fuel break creation or maintenance (unless get mitigation credit).

- 11.12. FM-12: Targeted grazing to achieve fuels management objectives should conform to the following criteria:
- Targeted grazing should be implemented strategically on the landscape, and directly involve the minimum footprint and grazing intensity required to meet fuels management objectives.
  - Allow conformance to the applicable Standards for Rangeland Health and Guidelines for Livestock Grazing Management (Idaho or Montana) at the assessment scale.
  - Where feasible and applicable coordinate with the grazing permittee to strategically reduce fuels through livestock management within the Mandatory Terms and Conditions of the applicable grazing authorizations
- 11.13. FM-13: Prioritize the use of native seeds for fuels management treatment based on availability, adaptation (site potential), and probability of success. Where probability of success or native seed availability is low or non-economical, nonnative seeds may be used to meet GRSG habitat objectives to trend toward restoring the fire regime. When reseeding, use fire resistant native and nonnative species, as appropriate, to provide for fuel breaks.
- 11.14. FM-14: Maintain effectiveness of fuels projects to ensure long-term success, including persistence of seeded species and/or other treatment components while maintaining the integrity of adjacent vegetation.

**Comment [d41]:** And fuel breaks. Must ensure that a strategy is implemented to maintain effective fuel breaks.

**12. Wildfire Restoration/Rehabilitation – Emergency Stabilization and Rehabilitation**

- 12.1. ESR-1: Utilize the findings and Restoration/Rehabilitation Strategy developed as part of the Wildfire and Invasive Species Assessment process described in Appendix D to determine if rehabilitation actions are needed, based on ecological potential, and direct emergency stabilization and rehabilitation (ESR) (BLM) or Burned Area Emergency Restoration (BAER) (FS) actions after fire.
- 12.2. ESR-2: Incorporate GRSG Habitat Management Objectives into ESR/BAER plans based on site potential and in accordance with the Restoration/Rehabilitation Strategy developed as a result of the Wildfire and Invasive Species Assessments.
- 12.3. ESR-3: Adjust management activities, as appropriate to ensure successful establishment of vegetation from ESR and rehabilitation informed through the evaluation of measurable groundcover and vegetation objectives such as plant vigor, seed production and growing season conditions.
- 12.4. ESR-4: Adjust, as appropriate, livestock management on adjacent unburned areas to mitigate the effect of the burn on local GRSG populations.

DRAFT

### 13. Habitat Restoration and Vegetation Management

- 13.1. VEG-1: Implement habitat rehabilitation or restoration projects in areas that have potential to improve GRSG habitat using a full array of treatment activities as appropriate, including chemical, mechanical and seeding treatments.
- 13.2. VEG-2: Implement vegetation rehabilitation or manipulation projects to enhance sagebrush cover or to promote diverse and healthy grass and forb understory to achieve the greatest improvement in GRSG habitat based on Wildfire and Invasive Species Assessments, HAF assessments, other vegetative assessment data and local, site specific factors that indicate sagebrush canopy cover or herbaceous conditions do not meet habitat management objectives (i.e. is minimal or exceeds optimal characteristics). This may necessitate the use of prescribed fire as a site preparation technique to remove annual grass residual growth prior to the use of herbicides in the restoration of certain lower elevation sites (e.g., Wyoming big sagebrush) but such efforts will be carefully planned and coordinated to minimize impacts to sage-grouse seasonal habitats.
- 13.3. VEG-3: Require use of native seeds for restoration based on availability, adaptation (ecological site potential), and probability of success (Richards et al. 1998). Non-native seeds may be used as long as they support GRSG habitat objectives (Pyke 2011) to increase probability of success, when adapted seed availability is low or to compete with invasive species especially on harsher sites.
- 13.4. VEG-4: Implement management changes in restoration and rehabilitation areas, as necessary, to maintain suitable GRSG habitat, improve unsuitable GRSG habitat and to ensure long-term persistence of improved GRSG habitat (Eiswerth and Shonkwiler 2006). Management changes could be considered during livestock grazing permit renewals, travel management planning, and renewal or reauthorization of rights-of-way.
- 13.5. VEG-5: Consider establishing seed harvest areas that are managed for seed production (Armstrong 2007) to provide a reliable source of locally adapted seed to use during rehabilitation and restoration activities.
- 13.6. VEG-6: Allocate use of native seed to GRSG or ESA listed species habitat in years when preferred native seed is in short supply. This may require reallocation of native seed from ESR (BLM) and/or BAER (Forest Service) projects outside of Core or Important Management Zones to those inside it. Where probability of success or native seed availability is low, nonnative seeds may be used as long as they meet GRSG habitat conservation objectives (Pyke 2011). Re-establishment of appropriate sagebrush species/subspecies and important understory plants, relative to site potential, shall be the highest priority for rehabilitation efforts.
- 13.7. VEG-7: During land health assessments evaluate the compatibility of existing nonnative seedings for GRSG habitat to keep as a component of a grazing system, development of a forage reserve, or to be used as a fuelbreak (Davies et al. 2011) or during restoration development. If nonnative seedings do not contribute to a grazing system, are not suitable for a forage reserve, and are not suitable fuelbreaks, evaluate the nonnative seedings in and adjacent to CMZ to determine if they should be diversified with or converted to native grasses, forbs, and shrubs, including sagebrush.
- 13.8. VEG-8: Utilize conifer (juniper) removal treatments to reduce the extent of conifer encroachment areas. Refrain from using prescribed fire and conducting removal

projects in old-growth juniper stands. Old-growth juniper trees are characterized by rounded tops and spreading canopies, often containing dead limbs and/or spike tops, large branches near the base of the tree, as well as furrowed, fibrous bark, and are typically host to arboreal lichens. Leader growth in the upper quarter of the tree is usually less than one inch. These trees are generally distributed on rock outcrop or rubble land soils, or other soils with coarse fragments in the soil-surface and/or slopes over 12-25%, where juniper vegetation type is the climax plant community (IDFG 2000; Miller et al 2005; USDI and USGS 2007).

DRAFT

#### 14. Invasive Species

- 14.1. Invasive Species (INV)-1: Incorporate results of the Wildfire and Invasive Species Assessments into projects and activities addressing invasive species.
- 14.2. INV-2: Implement noxious weed and invasive species control using integrated weed management actions per national guidance and local weed management plans for Cooperative Weed Management Areas in cooperation with State and Federal agencies, affected counties, and adjoining private lands owners.
- 14.3. INV-3: Conduct integrated weed management actions for noxious and invasive weed populations that are impacting or threatening GRSG habitat quality using a variety of eradication and control techniques including chemical, mechanical and other appropriate means.
- 14.4. INV-4: Require project proponent to ensure that treatments of noxious weeds and invasive species on disturbed project construction areas are completed for at least 3 years.

**Comment [CY42]:** This should be treatment of weeds that are caused by or contributed to the project proponent. The project proponent should not be responsible for weeds that were present prior to their project – unless they get mitigation credit.

DRAFT

**15. Lands and Realty / Infrastructure**

- 15.1. Lands and Realty (LR)-1: Core: Designate and manage Core Management Zones as ROW avoidance areas subject to RDFs, BMPs, buffers and seasonal timing restrictions (Appendix A, B & C). Important: Designate and manage Important Management Zones as ROW avoidance areas subject to RDFs, BMPs, buffers and seasonal timing restrictions. General: Designate and manage General Management Zones as open with proposals subject to RDFs, BMPs, buffers and seasonal timing restrictions.
- 15.2. LR-2: Core: Designate and manage Core Management Zones as exclusion areas for Wind and Solar testing and development, nuclear and hydropower energy development. Important: Designate and manage Important Management Zones as avoidance areas for Wind and Solar testing and development, nuclear and hydropower development. General: Designate and manage General Management Zones as open for Wind and Solar testing and development and nuclear and hydropower development subject to RDFs, BMPs, buffers and seasonal timing restrictions.
- 15.3. LR-3: Core: Development of commercial service airports and facilities (as defined by FAA 2014 – publically owned airports that have at least 2,500 passenger boardings each calendar year and receive scheduled passenger service) would not be allowed within Core Management Zones. Important and General Management Zones are Avoidance and Open respectively for these types of ROW applications as described in LR-1.
- 15.4. LR-4: Core: Development of new landfills would not be allowed within Core Management Zones. Important and General Management Zones are Avoidance and Open respectively for these types of ROW applications as described in LR-1.
- 15.5. LR-5: Core Management Zones: Rights-of-way for development of new or amended ROWs and land use authorizations, not excluded, would not be allowed except according to the Anthropogenic Disturbance Exception Criteria (AD-3). Important: Rights-of-way for development of new or amended ROWs and land use authorizations, not excluded, could be considered consistent with the Important Management Zones Anthropogenic Disturbance Development Criteria. (AD-4). General: New ROW and land use authorizations could be considered.
- 15.6. LR-6: If the project is an incremental upgrade/capacity increase of existing development - the existing transmission line must be removed within a specified amount of time after the new line is installed and energized.
- 15.7. LR-7: Existing designated corridors, including Section 368 Corridors, will remain Open (subject to the ongoing settlement agreement).
- 15.8. LR-8: Process unauthorized use. If the use is subsequently authorized, it would be authorized consistent with direction for the Management Zones within which it is located and the RDFs, BMPs, buffers and seasonal timing restrictions. If the use is not subsequently authorized the site would be reclaimed by removing these features and restoring the habitat.
- 15.9. LR-9: Land use authorizations that are temporary in nature would be subject to seasonal or timing restrictions and mitigation requirements regarding habitat loss as needed.
- 15.10. LR-10: New ROW applications for water facilities (ditches, canals, pipelines), or amendments to existing water facilities which include additional structures to improve fish passage or benefits to fisheries (new diversions, fish screens) would be

Comment [CY43]: This paragraph could be stated clearer I think.

Comment [CY44]: CHZ only? Or All 3 zones?

- allowed on a case-by-case bases subject to RDFs and BMPs to reduce impacts to GRSG habitat and mitigation requirements regarding GRSG habitat loss as needed.
- 15.11. LR-11: When a ROW grant expires and is not requested to be renewed, is relinquished, or terminated, the lease holder would be required to reclaim the site by removing overhead lines and other infrastructure and to eliminate avian predator nesting opportunities provided by anthropogenic development on public lands associated with the now void ROW grant (e.g., remove powerline and communication facilities no longer in service).
- 15.12. LR-12: Work with ROW holders to retrofit existing towers with perch deterrents or other anti-perching devices, where appropriate, to limit GRSG predation.
- 15.13. LR-13: Land tenure adjustments would be subject to the following disposal, exchange, and acquisition criteria, which include retaining lands with GRSG habitat. Retention of areas with GRSG would reduce the likelihood of habitat conversion to agriculture, urbanization, or other uses that would remove sagebrush habitat and potentially impact sensitive plants. Criteria:
- a. Lands within Core and Important Management Zones would not be available for disposal (Appendix M).
  - b. Acquire habitat within Core and Important Management Zones, when possible (i.e. willing landowner), and retain ownership of habitat within all Zones, except if a land exchange would allow for additional or more contiguous federal ownership patterns.
  - c. Lands within Core and Important Management Zones would be retained unless exchange of those lands would increase the extent or provide for connectivity of Core or Important Management Zones.
  - d. Evaluate potential land exchanges containing historically low-quality GRSG habitat that may be too costly to restore in exchange for lands of higher quality habitat, lands that connect seasonal GRSG habitats or lands providing for threatened and endangered species. These potential exchanges should lead to an increase in the extent or continuity of or provide for improved connectivity of Core Management Zones. Higher priority will be given to exchanges for those in-tact areas of sagebrush that will contribute to the expansion of sagebrush areas within Core Management Zones currently in public ownership. Lower priority would be given to other lands that would promote enhancement in the Core and Important Management Zones.
  - e. Identify lands for acquisition that increase the extent of or provide for connectivity of Core Management Zones.

**Comment [CY45]:** We should focus on reducing raven nesting opportunities as implied in LR-12. Request this be removed.

## 16. Minerals

### 16.1. Fluid Minerals

- 16.1.1.** Fluid Minerals (FLM)-1: Idaho: Areas within Core Management Zones with no or low potential for fluid mineral development (oil and gas or geothermal) would be closed. Areas within Core Management Zones with moderate to high potential for development and Important Management Zones would be open to mineral leasing and development subject to no surface occupancy, in accordance with the Anthropogenic Disturbance Exceptions (Core – AD-3) and the Anthropogenic Disturbance Development Criteria (Important – AD-4) subject to RDFs, BMPs, buffers, timing restrictions and standard stipulations. General Management Zones would be open to mineral leasing and development subject to CSU which includes RDFs, BMPs, buffers, seasonal timing restrictions and standard stipulations. Montana: Areas within Core Management Zones would be open to leasing subject to no surface occupancy. No waivers, exceptions or modifications would be allowed unless approved by the State Director. General Management Zones would be open to leasing subject to CSU which includes RDFs, BMPs, buffers, seasonal timing restrictions and standard stipulations.
- 16.1.2.** FLM-2: Core Management Zones: Waivers, exemptions or modifications to the NSO stipulation could be considered upon recommendation from the Governor through the Implementation Task Force during the federal site-specific NEPA analysis based on Core Management Zone Anthropogenic Disturbance Exception Criteria (AD-3). Important Management Zones: Waivers, exceptions or modifications to the NSO stipulation could be considered upon recommendation from the Governor through the Implementation Task Force during the federal site-specific NEPA analysis based on the Important Management Zone Anthropogenic Disturbance Development Criteria (AD-4). In the event a waiver, exception or modification were allowed development would still be subject to CSU which includes RDFs, BMPs, buffers, seasonal timing restrictions and standard stipulations.
- Waivers, Exceptions and Modifications (WEMs)** (Source IM-2008-032)

A waiver is a permanent exemption from a lease stipulation, the stipulation would no longer apply anywhere within the lease. Waivers require a 30-day public review and are approved and signed by the State Director.

An exception is a one-time exemption for a particular site within the lease; exceptions are determined on a case-by-case basis; the stipulation continues to apply to all other sites within the lease. An exception is a limited type of waiver.

A modification is a change to the provisions of a lease stipulation, either temporarily or for the term of the lease. Depending on the specific modification, the stipulation may or may not apply to all sites within the lease to which the restrictive criteria are applied.

- 16.1.3.** FLM-3: Incorporate required design features, best management practices appropriate to the management area, buffers and seasonal timing restrictions as conditions of approval into any post-lease activities.
- 16.1.4.** FLM-4: Complete a Master Development Plan on leases where a producing field is proposed to be developed.
- 16.1.5.** FLM-5: Encourage unitization when deemed necessary for proper development and operation of an area (with strong oversight and monitoring). The unitization must be

**Comment [CY46]:** I can't remember if this is something we all agreed to or if this paragraph all comes from BLM planning language.

designed in a manner to minimize adverse impacts on GRSG according to the Federal Lease Form, 3100-11, Sections 4 and 6.

- 16.1.6. FLM-6: Require a full reclamation bond specific to the site when surface disturbing activities are proposed. Ensure reclamation bonds are sufficient to cover costs that would result in full rehabilitation to restore lost GRSG habitat. Base the reclamation costs on the assumption that contractors for the BLM will perform the work.

**16.2. Unleased Fluid Minerals**

- 16.2.1. FLM-7: Allow temporary geophysical exploration, subject to site-specific RDFs, BMPs, buffers, seasonal restrictions, and daily timing restrictions.
- 16.2.2. FLM-8: Parcels nominated for lease in Core or Important Management Zones would be evaluated to determine whether they meet the Anthropogenic Disturbance Exception (AD-3 for CMZ) or Anthropogenic Disturbance Development Criteria (AD-4) for IMZ), prior to lease offering. Parcels which do not meet the criteria would not be offered for lease.

**16.3. Locatable Minerals**

- 16.3.1. Locatable Minerals (LOC)-1: Lands would remain open to locatable mineral entry in all management zones.
- 16.3.2. LOC-2: Apply reasonable and appropriate Conditions of Approval to prevent unnecessary or undue degradation of GRSG habitat when a Plan of Operations is submitted for BLM or FS approval, in accordance with 43 CFR 3809.411(d)(2) (or 36 CFR 228.5(a)(3) on National Forest System lands).

**16.4. Salable Minerals**

- 16.4.1. Salable Minerals (SAL)-1: Core: No new site authorizations would be approved. Important: New site authorizations could be considered consistent with the Anthropogenic Disturbance Development Criteria (AD-4) subject to RDFs, BMPs, buffers and seasonal timing restrictions. Sales from existing community pits within CMZ and IMZ would be subject to seasonal timing restrictions. General: Open to new site authorizations subject to RDFs, buffers and seasonal timing restrictions. Existing sites Open to new sales subject to seasonal timing restrictions.
- 16.4.2. SAL-2: Restore salable mineral pits no longer in use to meet GRSG habitat management objectives.
- 16.4.3. SAL-3: Require reclamation bonding that would require restoration of GRSG habitat on new site authorizations for mineral material pits in IMZ (this would not apply to free use permits issued to a government entity such as a county road district, but would apply to non-profit entities).

**16.5. Non-Energy Solid Mineral Leasable Minerals**

- 16.5.1. Non Energy Leasables (NEL)-1: Core and Important Management Zones: Areas within Know Phosphate Leasing Areas (KPLAs) will remain open to leasing. CMZ areas outside KPLAs are closed to leasing and prospecting. IMZ areas outside of KPLAs are open to leasing in accordance to the Anthropogenic Disturbance Development Criteria (AD-4) subject to the anthropogenic disturbance cap (AD-1), RDFs, BMPs, buffers and seasonal timing restrictions. Exceptions may be made for lease modifications and fringe leases where valid existing rights may be affected. General Management Zones: Lands are available for leasing, exploration activities and initial mine development subject to RDFs, BMPs, buffers, timing restrictions (seasonal and daily) and standard stipulations.

**Comment [BER47]:** From Paul - But what if we can show minimal issue such as far from leks, can moderate disturbance in lek/nest season etc. with seasonal or timing restrictions? See buffer table ideas.

**Comment [BER48]:** From Paul - Verify use of "administratively unavailable" for Important, per Buffer table and discussion with Karen Porter in May.

- 16.5.2. NEL-2: Require seasonal and daily timing restrictions in undeveloped non-energy mineral leases when exploration activities or initial mine development is proposed, as appropriate.
- 16.5.3. NEL-3: Include RDFs as conditions of approval to mine plans in undeveloped non-energy mineral leases.

**16.6. Mineral Split Estate**

- 16.6.1. Mineral Split Estate (MSE)-1: In coordination with surface land owner, apply stipulations, conservation measures, and design features consistent with those applied to BLM- and Forest Service-administered lands in the management zone where the federal government owns the mineral estate and the surface is non-federal ownership.
- 16.6.2. MSE-2: Recommend to the state regulatory entity to apply a timing restriction stipulation, COAs, and buffer restricts around occupied leks, when concurring to the approval of authorizations for mineral-related surface disturbance on lands in GRSG habitat where the federal government owns the surface and the mineral estate is in non-federal ownership.

DRAFT

## 17. Range Management/Livestock Grazing

- 17.1. Range Management (RM)-1: Continue to make GRSG habitat available for livestock grazing. Active AUMs for livestock grazing would remain the same, though the number of AUMs available on an allotment may be adjusted based on site-specific conditions to meet management objectives during term permit renewals, AMP development, or other appropriate implementation planning. Additionally, temporary adjustments can be made annually to livestock numbers, the number of AUMs, season of use in accordance with applicable regulations.
- 17.2. RM-2: Prioritize BLM land health assessments and processing of BLM grazing permits consistent with management zone prioritization (MA-4), unless other higher priority considerations exist such as threatened, endangered and proposed species habitat that livestock grazing could affect. Where possible, conduct land health assessments at the watershed, or other meaningful landscape-scale.
- 17.3. RM-3: Where opportunities exist, coordinate with other land managers to encourage livestock operations that utilize mixed federal, private and/or state land to be managed at the landscape scale to benefit GRSG and their habitat across land ownerships.
- 17.4. RM-4: CMZ & IMZ: During the land health assessment process, identify the type(s) of seasonal habitat the assessed areas are capable of supporting. Utilize the habitat assessment framework, (Stiver et al. 2014 as amended/replaced) or other BLM or Forest Service approved methodology, in accordance with current policy and guidance to determine whether vegetation structure, condition and composition are meeting GRSG habitat objectives including riparian and lentic areas (HM-OBJ-2; Table 2). Use appropriate Ecological Site Descriptions, reference sheets and state and transition models to inform desired habitat conditions and expected responses to management changes for the land unit being assessed.
- 17.5. RM-5: When modifying grazing management, analyze indirect effects to habitat, including changes in fuel loading and wildfire behavior.
- 17.6. RM-6: When livestock management practices are determined to not be compatible with meeting or making progress towards achievable habitat objectives following consultation, cooperating and coordination with permittees and interested publics, implement changes in grazing management through grazing authorization modifications, or allotment management plan implementation. Potential modifications include, but are not limited to, changes in:
- 1) Season or timing of use;
  - 2) Numbers of livestock;
  - 3) Distribution of livestock use;
  - 4) Duration and/or level of use;
  - 5) Kind of livestock (e.g., cattle, sheep, horses, or goats) (Briske et al. 2011);
  - 6) Voluntary measures such as temporary non-use; and
  - 7) Grazing schedules (including rest or deferment).
- 17.7. RM-7: Where opportunities exist, establish forage reserves to facilitate restoration and rehabilitation efforts in sage-grouse habitat areas.
- 17.8. RM-8: CMZ & IMZ - When an allotment becomes vacant or grazing preference is relinquished, consider voluntary retirement of the allotment or grazing preference in whole or in part, or converting the area to a forage reserve/buffer when doing so would maintain or enhance sage-grouse habitat. GMZ - When an allotment

- becomes vacant or grazing preference is relinquished, consider converting it to a forage reserve/buffer to use during fire rehabilitation or restoration efforts elsewhere, when such actions would result in a net benefit to GRSG habitat and other priority resources.
- 17.9. RM-9: CMZ & IMZ - Where practical, design pasture rotations to utilize exotic perennial grass seedings and/or annual grasslands, during GRSG nesting season annually or periodically.
- 17.10. RM-10: Evaluate the locations where salt/supplements are placed. In coordination with the permittee, have salt/supplements placed in areas which would reduce impacts to GRSG habitat (e.g., existing disturbed areas).
- 17.11. RM-11: Incorporate RDFs into Terms and Conditions for crossing permits to limit disturbance of occupied leks when trailing livestock across BLM- and Forest Service-administered lands in the spring. Work with permittees in locating over-nighting, watering and bedding locations to minimize impacts to seasonal habitats.
- 17.12. RM-12: Design any new structural range improvements, following cooperation, consultation and coordination with permittees, to minimize and/or mitigate effects to GRSG habitat. Any new structural range improvements are subject to RDFs (Appendix A). Structural range improvement in this context, include, but are not limited to: fences, exclosures, corrals or other livestock handling structures; pipelines, troughs, storage tanks (including moveable tanks used in livestock water hauling), windmills, ponds/reservoirs, solar panels and spring developments.
- 17.13. RM-13: During the land health assessment and grazing permit renewal process, evaluate existing livestock management range improvements with respect to their effect on GRSG habitat. Consider removal of projects that are not needed for effective livestock management, are no longer in working condition, and/or negatively affect GRSG habitat, with the exception of functional projects needed for management of habitat for other threatened, endangered or proposed species or other sensitive resources.
- 17.14. RM-14: Prioritize removal, modification or marking of fences or other structures in areas of high collision risk following cooperation, consultation and coordination with permittees to reduce the incidence of GRSG mortality due to fence strikes (Stevens et al. 2012).

**Comment [d49]:** My concerns with retirement of an allotment and relinquishment of AUMS is related to fuel load build up and fire. Long term rest causes an accumulation of fine fuels that increase wildfire risk, increases fire severity and subsequently the cost of fire suppression efforts and increases the likelihood of conversion to exotic annual grasslands (Davies et al. 2014). Additionally, areas with long-term protection from livestock grazing followed by fire resulted in substantial increases in cheatgrass and annual forbs, resulting in a shift from perennial vegetation dominance to annual vegetation dominance (Davies et al. 2009).

**Comment [BER50]:** From Paul – See revised buffer table.

**18. Wild Horses and Burros**

- 18.1. Wild Horse and Burro (WHB)-1: Develop or amend BLM Herd Management Area Plans and Forest Service Wild Horse Territory Plans to incorporate GRSG habitat objectives and management considerations for all BLM HMAs) and Forest Service Wild Horse Territories.
- 18.2. WHB-2: When evaluating AML on HMAs within CMZ, evaluate indicators that address structure/condition/composition of vegetation and measurements specific to achieving GRSG habitat objectives.
- 18.3. WHB-3: Utilize interdisciplinary land health assessments in HMAs containing GRSG habitat to determine whether vegetation characteristics are meeting appropriate seasonal habitat objectives.
- 18.4. WHB-4: CMZ: Do not expand HMAs. IMZ: Analysis of proposed additions to existing HMA boundaries should consider the direct, indirect and cumulative impacts on GRSG habitat, including the need for additional infrastructure such as boundary fencing, and consider alternative areas outside of CMZ and IMZ.

DRAFT

**19. Travel Management**

- 19.1. Travel Management (TM) -1: Limit motorized travel within Idaho BLM Field Offices to existing roads, primitive roads, and trails. This excludes areas previously designated as open through an affirmative land use plan decision or currently under review for designation as open, currently being analyzed in ongoing RMP revision efforts in the Four Rivers, Jarbidge and Upper Snake Field Offices. The initial designation would be “limited to existing roads, primitive roads and trails”; this designation would change to “limited to designated roads, primitive roads and trails”, in areas where travel management plans are completed.
- 19.2. TM-2: Close areas adversely affected by off-highway vehicles immediately to the type(s) of vehicle causing the adverse effect until the adverse effects are eliminated and measures implemented to prevent recurrence when the authorized officer determines that off-road vehicles are causing or will cause considerable adverse effects upon soil, vegetation, wildlife, wildlife habitat, cultural resources, historical resources, threatened or endangered species, wilderness suitability, other authorized uses, or other resources. This may include closure or specific routes or areas. (43 CFR 8341.2)
- 19.3. TM-3: Develop Travel Management Plans for each Field Office as described in the BLM Travel Management Handbook 8342.1 and according to the travel management planning guidelines (Appendix N).
- 19.4. TM-4: During subsequent travel management planning design and designate a travel system to minimize adverse effects on GRSG. Locate areas and trails to minimize harassment of wildlife or significant disruption of wildlife habitats. Give special attention to protect endangered or threatened species and their habitats. Allow for route upgrade, closure of existing routes, and creation of new routes to help protect habitat and meet user group needs, thereby reducing the potential for pioneering unauthorized routes. The emphasis of the comprehensive travel and transportation planning within Core Management Zones would be placed on having a neutral or positive effect on GRSG habitat.
- 19.5. TM-5: Conduct road maintenance activities to avoid disturbance during specific times at different seasons – see seasonal and timing restrictions section.

**Comment [CY51]:** Both of these should have provision for authorized use even if closed to others.

**20. Recreation**

- 20.1. REC-1: Manage existing recreation uses and sites to minimize adverse effects on GRSG or their habitat through incorporation of RDFs, BMPs, buffers and seasonal restrictions.
- 20.2. REC-2: Do not construct new recreation facilities (e.g., campgrounds, trails, trailheads, staging areas) within CMZs and IMZs unless the development would have a neutral effect or be beneficial to GRSG habitat (such as concentrating recreation, diverting use away from critical areas, etc.); or the new construction replaces existing facilities and reduces impacts from the existing facilities as in TM-4, or unless the development is required for visitor safety or resource protection.

DRAFT

**21. Monitoring**

- 21.1. Monitoring (MON)-1: Annually complete a review of Wildfire and Invasive Species assessment implementation efforts within GRSG habitat with appropriate USFWS and state agency personnel.
- 21.2. MON-2: Annually monitor the effectiveness of fuels treatment projects.
- 21.3. MON-3: Monitor invasive vegetation post vegetation management treatment
- 21.4. MON-4: Monitor project construction areas for noxious weed and invasive species for at least 3 years, unless control is achieved earlier.
- 21.5. MON-5: Use lek, nesting and winter habitat maps and key habitat map (updates) to annually assess GRSG population and habitat status in the context of the adaptive management triggers.
- 21.6. MON-6: Continue to support updates to the Key Habitat map to track vegetation changes in relation to GRSG habitat on a yearly basis, until such a time this process is replaced. The process used to update the Key Habitat Map is described in Appendix F.
- 21.7. MON-7: Monitor GRSG habitat as described in the monitoring framework plan (Appendix E) in coordination with IDFG and MT FWP.

DRAFT

## Appendices

Appendix A – Required Design Features and Best Management Practices

Appendix B – Seasonal Timing Restrictions

Appendix C – Application of Buffers

Appendix D – Wildfire and Invasive Species Assessments/FIAT Team

Appendix E – Monitoring Framework Plan

Appendix F – Idaho Key Habitat Map Update Process

Appendix G – Adaptive Management

Baseline Map and Description

Adaptive Management – Soft Trigger Implementation Actions

Adaptive Livestock Grazing Management Response

Appendix H – Idaho Anthropogenic Disturbance Process

Appendix I – Montana Anthropogenic Disturbance Process

Appendix J – Mitigation

Regional Mitigation Framework

Idaho Mitigation Framework

Unmitigated Loss

Appendix K – Lands No Longer Available for Disposal

Appendix L – Travel Management Planning Guidelines

Appendix O – Functioning of Boards

**Comment [BER52]:** Include description of how these are defined and mapped in supplemental information. Paul and Don K. have language. The baseline map needs to be developed – it is a map of the GRSG habitat (key habitat as described on the Key Habitat map) within nesting and wintering habitat (delineated by IDFG) within core and important areas.

**Comment [BER53]:** Need to develop appendix of lands no longer identified for disposal

**Comment [BER54]:** Develop description of how this board interfaces with State Implementation Team.  
Work to develop a clear description of how the Task Team would function in relation to the Mitigation Board, etc. Brent, Dustin, Rob, Cally, Jason and Don K. will work to develop this description. Need flow charts to diagram how interactions work. Describe the scope of the Implementation Team. Liaison on implementation team? Describe and develop MOU after the ROD

RE: Sage Grouse Administrative Draft Proposed Plan

Dear Brent:

This letter will constitute the comments of Power and Cassia County, Cooperating Agencies in this process.

This specific comment is directed to page eighteen (18) of the Draft Proposed Plan, section 7.4.

Under the Draft Land Use Plan Amendment and Environmental Impact Statement, for alternative E which was largely adopted in this Draft Proposed Plan, there was a distinction between Core and Important areas for lands and realty infrastructure. Specifically in Important areas, the Draft EIS stated “new infrastructure can be authorized if specific criteria are met.” Draft EIS. 2-33. shows criteria are described as similar to the best management practices. The Cooperating Agencies submit that those best management practices are far more practical than the increased criteria contained in the current 7.4.

Alternative E specifically stated “infrastructure is generally permissible, but requires analysis of whether it can be reasonably accomplished outside IHZ.” Draft, 2-164.

Specifically, 7.4.AD-4:c. Changes the language from the Draft EIS which stated “the project does not result in unnecessary and undue habitat fragmentation or other impacts causing a decline in the population of the species within the relevancy CA.”

The new language requires a project to not result in a “net loss of GRSG habitat.” As GRSG habitat is finite, and already established, this change in language is very confusing. The prior language just talked about unnecessary and undue habitat fragmentation. By adding the criteria of no net loss of habitat, the language could be interpreted by agencies as preventing a project completely. For example, a transmission tower has, basically, a fifty foot by fifty foot base. If the transmission tower is built in an Important Management Zone, there will be twenty five hundred square feet less habitat. That does not mean that the tower base will have any impact at all on Sage Grouse, as the literature seems clear that it would not. Certainly the requirement for mitigation would resolve that issue. However, we are concerned that this language will confuse the decision makers.

Power and Cassia County request that Criteria c be returned to that proposed from Alternative E in the Draft EIS.

The mitigation language in the next sentence should be sufficient to achieve the desired result.

The introduction and explanation in the Draft EIS was specifically **to authorize** new infrastructure development. That authorization language is also lacking in the 7.4 proposed plan.

We request it be reinstated, so that the agency understands that infrastructure is to be allowed, within certain criteria.

It must be understood that the BLM cannot simply follow a process that will require infrastructure to be built, but only to not allow it to built on public land. The concept of Adaptive Management, and the exact studying of impacts, does not support impossible criteria.

Very Truly Yours,

DOUGLAS J. BALFOUR

**Signed By:** robert.shirley.2@us.af.mil

Brent,

Below are DoD comments on the draft Proposed Plan for ID & SW MT GRSG RMP/EIS.

Comments:

1. The Minimization Measures Seasonal/Timing Restrictions & Buffers listed In Appendix B, Page 12 of 15 "Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary Table" lists restrictions to anthropogenic activities within 2 miles. Recommend reducing restriction on activities to within ~1 mile of active leks. Justification: based upon the rationale provided "statistical evidence that oil/well pad influence extended as far as 1.6 km (~ 1 mile) from grouse leks." Additionally, the intro to Appendix B has a lateral restriction of "within 1 km (0.62 mile): "Seasonal Timing Restriction During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations and March 25- May 15 in higher elevations), project activities will be avoided to the extent possible within 1 km (0.62 mile) of occupied leks between 6:00 p.m. and 9:00 a.m. to avoid disturbance to lekking and roosting sage-grouse."
2. Page 12 of 15, "Causes" Change "anthropogenic activities..." to "Ground based anthropogenic activities...." Justification: Clarifies RDF/BMP applies to ground based anthropogenic activities. Overflight by any aircraft (civilian, commercial, or military) could potentially generate a "repeated behavioral disturbance" and not result in "sustained avoidance of the lek during a particular lekking season." The rationale provided is focused on consistent noise/activity from ground based activities however the qualifier "anthropogenic activity" could be argued to include all anthropogenic activity to include any aircraft overflight. Previous scientific studies document the effects of overflight and sonic booms on wildlife were of short duration and rarely result in injury or negative population effects, and studies on similar upland game birds, including the wild turkey and bobwhite quail, found no decreased success rate in either breeding or hatching success from low-flying aircraft.

**Subject:** Re: Sage Grouse EIS consultation

I greatly appreciate the response, Scott. Based on the movement of the CA (our understanding is that we are pretty close to finalizing it and having it out for signature) and the enhanced coordination via the weekly phone calls for the sage grouse EIS/consultation, I believe we have made some meaningful progress in the last couple of weeks; we look forward to continuing on this trajectory. The unique relationship of these parallel efforts, their significance at the local/regional/national levels, and the linked project-level step-downs, required the collective "we" to step up, and I'm pleased to see that we are all working together to meet the needs of our respective agencies on this broader effort. Thanks again.

Hi Mark,

We have discussed each of the items internally that came out of the initial Sage-grouse EIS consultation call on July 10th which you provided to us in the below email, and have the following input by issue:

1. We agree that coordination between BLM/FS/FWS definitely needs to ramp up over the next few months in order to meet the tight timelines, particularly, given the added complexity associated with LEPA. We feel that the weekly calls and additional communication as needed is heading us in the right direction.
2. We are committed to providing the staff-level LEPA expertise necessary to facilitate good communication regarding LEPA. Anne Halford returns from vacation on August 4th, so we will be identifying the individual next week who will be providing that expertise.
3. We also agree that the LEPA CA and the Sage-grouse EIS need to be consistent and we are taking steps to ensure consistency.
4. The proposed action will be final in the near future.

We are committed to ongoing coordination through weekly calls and additional conversations or meetings as necessary. We appreciate your willingness to fully engage with us in this consultation process.

Thanks, Scott

Jeff/Kurt/Scott/Brent,

The IFWO had our first coordination call regarding the Sage Grouse EIS consultation with Chris Colt of the FS (overseeing the development of all EIS BAs). Unfortunately, Scott could not make the call last week, but as a group, we have committed to weekly calls each Thursday to ensure timely exchanges of information. Please review the following based on this initial call, which provided some insight on agency roles and responsibilities, timelines, and potential issues.

Issues/Needs to Consider:

1. With LEPA being a likely focal point for BA development (potential adverse affects and the need to develop a BO), it is clear that BLM/FS/FWS coordination needs to ramp up over the next few months to meet current projected timelines (coordination efforts have only just been initiated at the ID/MT EIS level for BA development).
2. Since the FS is essentially acting as contractors for BA development, and do not necessarily have the species expertise for all species being addressed in the BAs (notably for LEPA), it is recommended that BLM ensure staff-level LEPA expertise (perhaps Anne Halford or a District-level staff member) is available to facilitate good communication between BLM/FS/FWS regarding LEPA and the potential overlap to sage grouse RMP guidance/direction. Scott's ESA experience will continue to be invaluable.
3. The concurrent efforts of updating the LEPA CA between FWS and BLM, and amending the RMPs to include sage grouse guidance/direction, need to be compatible, notably as it relates to fire and range management guidance/direction (e.g., fuel breaks, rehabilitation, etc.); completion of 1 prior to the other without considering their relationship could result in conflicting approaches to species conservation.
4. We should acknowledge the added complexity of the ID/MT situation in that there is still no "official" proposal/action on which the BA will be based, and the ongoing nature of discussions at the national/regional/state levels relative to EIS direction (and hence the action described in the BA) creates a "moving target" for the associated consultation.

Given the above, I am seeking your support in prioritizing these standing coordination calls with appropriate personnel, ensuring that all communications at all levels are exchanged in a timely fashion (whether stemming from the BA development side or the EIS side, as they are intimately tied), and ensuring equal consideration be given to the concurrent CA update and EIS amendment efforts. If additional coordination beyond the BA development calls needs to occur, the FWS will be happy to engage. Please let me know your thoughts.

LAND USE PLAN AMENDMENTS AND ENVIRONMENTAL IMPACT STATEMENT**

**Comments on Preliminary Proposed Land Use Plan Amendment/Final EIS for Cooperating Agency Review  
April 29, 2015**

<b>Cmt #</b>	<b>Chapter and Page #</b>	<b>Row # or Line #</b>	<b>Reviewer Name</b>	<b>Reviewer Affiliation</b>	<b>Comment</b>
1.	Chapter 1 page 1-1  and page 1-4	16-44 of page 1-1  24-46 of page 1-4	Scott Lyons	Box Elder County Planner	<p>Here the Department of Interior presumes that USFWS effectively "found" and "determined" a significant enough threat to the GRSG exists to materially amend the LUPs through the Preliminary Proposed Land Use Plan Amendment (PPLUPA), even though the USFWS found a threat for only two of five of the Section 4(a)(1) listing factors even though the USFWS issued a "precluded" conclusion.</p> <p>Indulging the Department's notion that the USFWS determination is the substantial equivalent of an ESA Sec. 4 listing for purposes justifying the PPLUPA, <u>it would appear the Department's resulting PPLUPA contradicts the Congressional GRSG spending Moratorium.</u> The Department's treating the PPLUPA as a response to an ESA Sec. 4 finding makes the PPLUPA an effective written rule to address the Sec. 4 finding, thus contradicting the spending moratorium of Sec. 122 of Title I, Division F, 2015 spending law, PUBLIC LAW 113–235—DEC. 16, 2014 128 STAT. 2131, prohibiting the Department's use of Congressional funds to write or issue a proposed rule pursuant to section 4 of the ESA for greater sage grouse. The PPLUPA is in every material respect such a proposed set of rules for the GRSG, admittedly done as a result of and to redress the USFWS' ESA Sec. 4 "threatened but precluded" determination, which the Department is currently fictionalizing as an outright "threatened" determination. Fictionalizing has its consequences; here it's the running afoul of the Congressional GRSG spending Moratorium.</p>

<b>Cmt #</b>	<b>Chapter and Page #</b>	<b>Row # or Line #</b>	<b>Reviewer Name</b>	<b>Reviewer Affiliation</b>	<b>Comment</b>
2.	# 1 continued		Scott Lyons	Box Elder County Planner	<p>The Department's maneuvers to get around the precise wording of the Moratorium notwithstanding, either the USFWS determination constitutes an effective Section 4 "threatened" listing, in which case the PPLUPA response clearly violates the letter and spirit of the Congressional moratorium as a set of rules issued in response to the Section 4 determination, or the USFWS finding does not constitute a Section 4 "threatened" listing, in which case the PPLUPA is an arbitrary, needless effort to accommodate a species that is not in trouble. The Department needs to pick its poison.</p> <p>Certainly the spirit of the Moratorium has been subverted, which is, "Department stop using our funds to treat and manage this bird as if it were under a Section 4 ESA listing." The Department is plainly using Congressional funds to treat the bird in all material respects like it has a "threatened" listing.</p> <p>A credible argument can be made that the letter of the Moratorium is violated as well, because the PPLUPA at the page and lines referenced catches the Department acting as if a Sec. 4 "threatened" listing has occurred, and catches the Department acting like the PPLUPA is designed to respond to and comply with ESA Sec. 4.</p>
3.	Chapter 1 page 1-19	17-26	Scott Lyons	Box Elder County Planner	<p>The PPLUPA at the referenced page and lines professes participation and coordination with cooperating agencies. This is belied by the fact that only about two weeks were given the State and Counties to review and comment on the PPLUPA. This is not reasonable and meaningful participation and coordination with cooperating agencies under any stretch. The County has not had any meaningful opportunity to review and comment on the PPLUPA, <u>and that equates to no or scant cooperating agency opportunity for participation and coordination. The Department should start over and give 60-90 days to the cooperating agencies to review and comment on the PPLUPA, unless they'll swear an affidavit that they only took two weeks to issue it.</u></p>

4.	Chapter 1 page 1-19	34-45	Scott Lyons	Box Elder County Planner	<p>The PPLUPA at the referenced page and lines professes compliance with 43 CFR Part 1600. 43 CFR 1610.3-1 obligates the Department to meaningfully coordinate with the County in the promulgation of the PPLUPA. Section 1610.3-1(c) in particular obligates the BLM State Directors and Field Managers to provide opportunity for review, advice, and suggestion. <u>This obligation is violated given the extremely short time frame in which the County has been given to review and comment on the PPLUPA.</u></p> <p>The PPLUPA at the referenced page and lines professes compliance with 40 CFR Parts 1500 - 1508. Under 40 CFR 1506.2(d), the lead agency must ensure that the NEPA statement will discuss any inconsistencies between the proposed action and any approved State or local plan and laws (whether or not federally sanctioned), and where inconsistencies exist, the NEPA statement must describe the extent to which the lead agency will reconcile its proposed action with the State or local plan or law. <u>This has not happened. The PPLUPA falls far short of this standard. The time allowed to review and comment on the PPLUPA is so short, that the County as a cooperating agency is unable to meaningfully advise the Department regarding inconsistencies between the proposed action and the approved State Sage Grouse management plan, particularly as it applies to the County.</u> The short time frame for review and response effectively violates 40 CFR 1506.2(d) for failure to give the County an opp. to point out such inconsistencies. This short review and comment time frame also violates the Department's obligations discussed in the Council on Environmental Quality's Answers to the 40 Most Asked Questions, Number 14(b) (The lead agency, though it has the ultimate responsibility for the content of the NEPA statement, must use any environmental analyses and recommendations of a county cooperating agency to the maximum extent possible; consistent with the lead agency's responsibility, and consistent with this authority, the lead agency must recognize that if it leaves out a</p>

<b>Cmt #</b>	<b>Chapter and Page #</b>	<b>Row # or Line #</b>	<b>Reviewer Name</b>	<b>Reviewer Affiliation</b>	<b>Comment</b>
6.	Chapter 1 page 1-20	Lines 12-14	Scott Lyons	Box Elder County Planner	<p>The PPLUPA at the referenced page and lines pegs its planning criteria in part to the objectives and measures included in the USFWS 2013 final Conservation Objective Team (COT) report. The COT report was issued with no opportunity for public review and comment. It lacks the scientific quality, integrity, objectivity and utility required by the Data Quality Act *DQA). It's description of "science" makes no mention of hypothesis testing or potential falsification, so it runs counter to the DOI Manual on Scientific Integrity as well as the DQA and its Guidelines.</p> <p>The PPLUPA lacks the scientific quality, integrity, objectivity and utility required by the DQA, the Guidelines and the additional authority. The COT Report's description of "science" makes no mention of hypothesis testing or potential falsification, so it violates the DOI Manual on Scientific Integrity and the DQA and its Guidelines. The DQA, Section 515 requires Federal agencies to ensure and maximize the quality, objectivity, utility, and integrity of information, including statistical information, disseminated by Federal agencies on or after October 1, 2002. Yet the COT Report acknowledges uncertainty nearly 100 times. It admits a shortage of established research, credible conservation results and a lack of clear patterns with regard to GRSG. Population numbers, habitat, range, threats and viability are all acknowledged uncertainties. The COT report ignores studies that do not support its theses and jumps to scientifically unsupported conclusions. The COT report is not transparent, because it does not disclose data and methods of analysis. The COT report was guided by a relative handful of scientists with pre-established relationships with advocacy groups with single viewpoints, and failed to undergo adequate peer review.</p>
7.	# 6 continued		Scott Lyons	Box Elder County Planner	<p>Moreover peer review was not transparent and did not under go public comment.</p> <p>The COT report was not based on best available science; it had no original data or quantitative analyses. It omits many scientific papers and reports on other mitigation measures, raven predation, and how GRSG frequent roads, ag. areas and oil and gas development. The COT Report fails to acknowledge the significant effort of the State of Utah to conserve GRSG. The COT Report unfairly conflicts with the BLM and Forest Service multiple-use mandate, by calling for GSRG centric management in derogation of all other uses and values.</p>

April 29, 2015**

<b>Cmt #</b>	<b>Chapter and Page #</b>	<b>Row # or Line #</b>	<b>Reviewer Name</b>	<b>Reviewer Affiliation</b>	<b>Comment</b>
8.	Page 1-3 and Page 1-19	Lines 29-41 and Lines 32-33	Scott Lyons	Box Elder County Planner	<p>The County calls out the misleading omission of the National Technical Team Report (2011) (NTT Report) in the list of planning criteria under Section 1.7.1 on page 1-19. Lines 32-33 identify the BLM's National GRSG Conservation Strategy as one of the planning criteria, but omit express reference to the NTT Report. This is misleading, because the National GRSG strategy and accompanying BLM Instruction Memorandum (IM) 2012-044, by its very terms, relies on and follows the NTT Report. So to not candidly reference the NTT Report as part of the list of criteria under Section 1.7.1, cloaks the widely panned NTT Report, as it is part and parcel of the National GRSG Conservation Strategy.</p> <p>Reference is made to the NTT Report on page 1-3 at lines 29-41. The County's comments on the NTT Report itself are as follows:</p> <p>The BLM IM 2012-044 is another example of administrative creation of so-called "conservation" policy that runs counter to the FLPMA statute and regulations that put forth a multiple-use mandate. Lines 29-41 of page 1-3 are written as if everyone is supposed to run for cover and abandon the FLPMA multiple-use mandate and associated multiple planning and management regulations, because a federal bureau decreed a conservation ethic contrary the multiple-use mandate in the enabling legislation that created the bureau, all for a species for which the USFWS said a listing was not warranted. Then a self-styled "Technical Team" issues a report that further arrogates entrenchment of an anti-multiple-use ethic in contravention of the FLPMA statutory multiple-use mandate. So the County's first observation is that the IM's decree that everyone should honor the NTT report is invalid to the extent they both violate the FLPMA multiple-use mandate. The County holds to FLPMA and its multiple-use mandate and regulations in the face of an IM that improperly decrees monopolistic reign of the NTT Report despite other available and superior GRSG science.</p>

12.	#8 continued		Scott Lyons	Box Elder County Planner	<p>impose a huge burden on stakeholders with no scientific justification.</p> <p>Many DOI employees are on record in internal emails and the like recognizing the many scientific flaws of the NTT Report, and questioning the legality of conservation measures dogmatically recommended in the NTT Report.</p> <p>All the NTT Report flaws translate into flawed, poor quality Land Use Plan Amendments.</p> <p>BLM has failed to disclose all the sources of the NTT report and the supporting data and models for the public to assess the report's objectivity. Independent peer review and regulation are therefore impossible. Data gathering has varied from state to state, with standards changing over time. No central repository properly curates and maintains the data. Metadata are missing to document how the core data were collected, recorded and summarized. For example, GRSG lek count information comes from across several states, and no controls exist on the uniform means for counting such populations to predict potential trends and migration. DOI biologists have cherry picked lek count data from the several states to form the basis of reports used by the BLM.</p> <p>NTT members wrote to other NTT members internal emails to churn up and support scientific conclusions deemed to be weak.</p> <p>The NTT report contains selective citations.</p> <p>Worst of all, the NTT report goes beyond the job of providing science to imposing harsh restrictions. This is contrary to the DQA. The disturbance caps in the NTT report are unsupported. Same with the buffer zone around the lek. This is just policy dogma, usurping the role of policy makers.</p>

**BLM – UTAH SUB-REGION  
LAND USE PLAN AMENDMENTS AND ENVIRONMENTAL IMPACT STATEMENT**

**Comments on Preliminary Proposed Land Use Plan Amendment/Final EIS for Cooperating Agency Review  
April 29, 2015**

<b>Cmt #</b>	<b>Chapter and Page #</b>	<b>Row # or Line #</b>	<b>Reviewer Name</b>	<b>Reviewer Affiliation</b>	<b>Comment</b>
13.	#8 continued		Scott Lyons	Box Elder County Planner	<p>On the one hand, the NTT Report is fraught with sagebrush canopy threshold discrepancies to the point of being embarrassing. On the other hand, the NTT Report demands one-size-fits all recommendations regarding habitat that will only lead to contrary results across the diverse range. Somehow the National Technical Team did not get the memo: that sagebrush cover requirements vary between seasons and across populations.</p> <p>Noise restrictions in the NTT Report are not supported and are unreasonable.</p> <p>The NTT Report is full of misrepresentations regarding: population trends and persistence, natural GRSG population fluctuations, mortality due to predation and predator control, effects of hunting, effects of oil and gas operations, livestock grazing.</p> <p>The NTT Report fails to recognize the multi-million dollar efforts undertaken by Utah so conserve GRSG.</p>
14.	Chapter 2 in general		Scott Lyons	Box Elder County Planner	<p>The County incorporates the January 29, 2014 comments to Chapter 2 of the Utah Association of Counties (UAC) to the Draft LUPA/EIS at that time. <u><a href="#">A PDF copy of those comments and its appendix are submitted herewith.</a></u></p> <p>The window of time to review and comment on the present PPLUPA was so short (2 weeks) there was no reasonable opportunity to provide a page-by-page, line-by-line point-by-point application of UAC's January 2014 comments to Chapter 2 of the present PPLUPA. Under these circumstances, BLM cannot be heard to complain that this comment is inadequate because it does not identify specific pages and line numbers, etc. Such was impossible under the unreasonably short time frame. Give the County more time, and we will make that specific application of the prior comments. Otherwise, make do with the attached PDF comments, because they still apply to the carried forward defects of the present PPLUPA.</p>

# Comments on Bureau of Land Management/ US Forest Service's Utah Greater Sage Grouse Draft LUPA/EIS

Submitted by Utah Association of Counties

Date: January 29, 2014

---

Utah Association of Counties (UAC) appreciates this opportunity to comment as follows on the following sections of Chapter 2 of the Greater Sage Grouse Draft LUPA/EIS:

## Sections 2.1.4 and 2.1.5

### 1. General Comment

Many portions of Alternative D, the agency preferred alternative, are either consistent with the State of Utah greater sage grouse sage grouse plan, consistent with UAC's view, or both.

UAC advises the following practical modifications to Alternative D (hereafter "the Modified D Alternative") to harmonize and reconcile it with what UAC sees as helpful portions of the State's plan (Alternative E) needed to best bring about sustained recovery and growth of species population numbers and habitat improvement statewide while preserving and protecting critical public land uses so important to rural counties.<sup>1</sup>

For discussion purposes, UAC refers to the recommended changes herein as the ***Modified D Alternative***.

---

<sup>1</sup> BLM reportedly advised cooperator counties it would mix and match the best of various developed alternatives to ultimately achieve the proposed plan. Indeed the Draft LUPA/EIS at Section 2.9 (pb. 2-163) states:

Though Alternative D has been identified as the preferred alternative, aspects of Alternative E, which is based on the State of Utah and Wyoming's GRSG conservation plans, may also meet the purpose and need of this effort and fulfill the BLM and Forest Service's "statutory mission and responsibilities, giving consideration to economic, environmental, technical and other factors" (NEPAs 40 Most Asked Questions 4a). As such the proposed plan could include aspects of Alternative D, Alternative E, or other alternatives.

It is in this spirit that UAC offers these comments and urges consideration of the **Modified D Alternative**.

***The following comments about constructing a Modified D Alternative rest on the assumption that the final ROD adopts Maps 2.4 and 2.6 and references to the SGMAs mapped therein. Departure from the mapped SGMAs in Maps 2.4 and 2.6 and adoption of Map 2.3 and the PPMA areas therein, render meaningless and nonsensical the following proposed specific comments about construction of a Modified D Alternative. Again, an indispensable piece of the following proposed Modified D Alternative consists of a good faith adoption and application of Maps 2.4 and 2.6 in the final chosen alternative and ROD.***

2. Adopt Maps 2.4 and 2.6 and All References to SGMAs;  
Drop Map 2.3 and All References to PPMAs and PGMAs

The beginning and most critical building block of the proposed Modified D Alternative is adoption of Maps 2.4 and 2.6 and the Sage Grouse Management Areas (SGMAs) described and illustrated therein and the Greater Sage Grouse Habitat within those SGMAs.<sup>2</sup>

UAC strenuously opposes adoption of Map 2.3 and all references to and use of the PPMAs and PGMAs described and illustrated in Map 2.3. Pulling in from the PPMAs and PGMAs and narrowing the current plan to the SGMAs, where the latest and best science documents the true GRSG habitat exists, and where the real work can thus be done to improve the species, is logically in the species' overall best interest. Moreover, the areas mapped in Map 2.3 were done so arbitrarily without input and consideration of state and local sage grouse working groups and ignore on the ground science identifying the true location of nesting, breeding and brood rearing populations. Map 2.3 completely ignores this state and local input.

Again the most reasonable, workable approach is achieved through adoption of Maps 2.4 and 2.6 and adhering to the SGMAs as mapped therein.

3. Adopt the Rule that Fire and Vegetation Treatments Would Not Count  
Toward the 5% Disturbance Threshold in SGMAs

The Modified D Alternative urged by UAC embraces the following principles:

(a) Habitat loss due to fire should not be categorized as a human caused disturbance to an SGMA toward calculation of the disturbance threshold. Disturbance and the 5% cap on new permanent disturbance will reflect human-caused habitat loss other than fires (and other than agricultural improvements per comment below);

---

<sup>2</sup> Adequate protection of the species outside the SGMAs already exists in current RMPs and LUPs sufficient and commensurate to already scientifically documented marginal nature of the habitat found outside those SGMAs.

- (b) Habitat burned within an SGMA will be rehabilitated;
- (c) Rehab efforts should consist of reseeding with sagebrush;
- (d) Multiple attempts may be required at lower elevation sites until successful;
- (e) If more than 30% of habitat in an SGMA is burned in any 3-year period, the SGMA will be evaluated for viability to see if additional management actions are needed;
- (f) Remove reference to natural events from the discussion of disturbance in Section 8.0 to eliminate any confusion; and
- (g) Remove natural events from the definition of disturbance in Section 10.3 to eliminate any confusion.

## Table 2.1 of Chapter 2

4. Steer Away From Efforts to Impose Sage Grouse Related Restrictions Outside Mapped Habitat. (Table 2.1 pp-2-18)

The Modified D Alternative urged by UAC, instead imposing an unwieldy open-ended burden of requiring possible additional surveys and curbing off-habitat authorized uses within 4 miles of an occupied lek - whether in or out of a PPMA/PGMA, would follow the more practical State-based approach of concentrating on the habitat with real potential with 3-miles, around which all SGMA boundaries have been hardwired, thus providing certainty for other stakeholders, manageability for agency personnel, and focus for everyone's recovery efforts on the quality habitat worth preserving and enhancing.

5. For Purposes of the 5% Disturbance Cap Calculation, Exclude Developed Agricultural Land, and All Other Baseline Existing Anthro Disturbances

The Modified D Alternative urged by UAC, instead of labeling all anthropogenic disturbance within an SGMA as counting toward the disturbance cap, would exclude

(a) any agricultural development, existing or new, and

(b) any existing, already in place, anthropogenic disturbances of a nature other than developed agriculture. This policy is vital to counties' interest in protecting the property tax base of private lands within an SGMA. Counties do not want to see GRSG management policy steer and funnel county residents into a cruel, zero-sum trade-off game that threatens to erode county tax base. This policy is only consistent with the already enshrined principle that BLM and Forest Service do not have any regulatory authority to influence the amount of disturbance occurring on private taxable ground, when calculating the disturbance cap.

6. Instead of Obsessing Over Penalizing Counties For Every Known Type of Anthro Disturbance, Focus Plan on Vast Opportunities to Rehab Disturbance Enhance Habitat Where Feasible

The Modified D Alternative urged by UAC, instead of punishing counties for every acre of existing paved highway, gravel road, transmission line, substation, wind turbine, oil and gas well, geothermal well and associated facilities, excludes all such *already existing facilities* from the disturbance calculation, and measures instead any such new disturbance from the date of the plan forward.

But more importantly and far more helpful to the GRSG species, the Modified D Alternative urged by UAC focuses restoration on past, present and new disturbance to approximate the original land form in the following ways:

(a) Self-sustaining, vigorous, diverse, native (or otherwise approved) plant community - no invasive plants;

(b) Erosion features are equal to or less than surrounding area and erosion control, so that water naturally infiltrates into the soil;

(c) Free the area from state or county listed noxious weeds, anthropogenic debris or contaminated soil;

(d) Condition permitted activities on approved reclamation plans, with interdisciplinary review of available monitoring data and reports.

In other words, the Modified D Alternative focuses on incentivizing efforts to truly beautify SGMAs and enrich their GRS habitat potential, rather than needlessly penalize and demoralize Counties for disturbances already done and in place, which cannot be helped.

7. Protect County Vested Road Rights and Established Water Uses and Developments.

***Counties have valid existing vested rights in their B and D roads in SGMAs and elsewhere. County citizens with certificated State water rights have vested rights in existing water improvements. The Modified D Alternative would respect these facts and avoid policies and practices that pressure Counties into compromising those vested interests which protect the basic transportation and water needs and rights of county citizens and other Americans who value and use the public lands. Accordingly, under the Modified D Alternative:***

(a) Existing inventoried and numbered county roads and all present and future uses thereon within the established scope thereof do not count as disturbance toward any disturbance calculation cap.

(b) The same holds true for existing water improvements and necessary repairs and upgrades and future points of diversion necessary to realize and enjoy the currently certificated beneficial rights to such water.

***The following comments are to be read in conjunction with Exhibit A attached hereto, which is a marked up copy Table 2.1 of the Draft GRSG LUPA/EIS.***

Comment regarding Page 2-10, row entitled “Goal:”

The highlighted language should be combined for the Modified D Alternative.

Comment regarding Page 2-11, 1<sup>st</sup> row under heading “Objectives:”

The highlighted language should be modified to replace all references to PPMAs and PGMAs with references to the SGMAs shown in Maps 2.4 and 2.6, for the Modified D Alternative.

Comment regarding the row beginning at the bottom of 2-11, 2<sup>nd</sup> and continuing over to Page 2-12:

The highlighted language should be adopted to read as is for the Modified D Alternative.

Comment regarding the first full row on page 2-13:

The highlighted language should be adopted to read as is for the Modified D Alternative.

Comment on 1<sup>st</sup> row on page 2-14:

The highlighted language should be adopted to read as is for the Modified D Alternative.

Comment regarding the 2<sup>nd</sup> row on page 2-14:

The highlighted language should be combined and modified to replace all references to PPMAs and PGMAs with references to the SGMAs shown in Maps 2.4 and 2.6, and to make express reference to working with counties, for the Modified D Alternative.

Comment regarding the row beginning at page 2-15 and continuing over to the top portion of page 2-16:

The highlighted language should be adopted to the extent the figures are consistent with the State Plan for the Modified D Alternative:

Comment regarding the row beginning at the bottom portion of page 2-16 and continuing through pages 2-17, 2-18 and the top portion of 2-19; and the row beginning at the bottom portion of page 2-19 and continuing through page 2-20 and over to the top portion of 2-21:

The Modified D Alternative for these rows should be rewritten to replace all references to PPMAs and PGMAs with references to the SGMAs shown in Maps 2.4 and 2.6, and to reflect and incorporate comments 1-7 on pages 1-5 of these present comments.

Comment regarding the row beginning at the bottom portion of page 2-21 and continuing through pages 2-22, 2-23, 2-24, 2-25, 2-26, 2-27 and the top portion of page 2-28:

The highlighted language should be combined and modified to replace all references to PPMAs and PGMAs with references to the SGMAs shown in Maps 2.4 and 2.6, to bear in mind the notes shown on such pages, and to reflect and incorporate comments 1-7 on pages 1-5 of these present comments, for the Modified D Alternative.

Comment regarding the row beginning at the bottom portion of page 2-28 and continuing through pages 2-29, 2-30, 2-31, 2-32, 2-33 and the top portion of page 2-34:

The highlighted language should be combined and modified to replace all references to PPMAs and PGMAs with references to the SGMAs shown in Maps 2.4 and 2.6, to bear in mind the notes shown on such pages, and to reflect and incorporate comments 1-7 on pages 1-5 of these present comments, for the Modified D Alternative.

Comment regarding the 2<sup>nd</sup> row of page 2-34:

The highlighted language should be modified to replace all references to PPMAs and PGMAs with references to the SGMAs shown in Maps 2.4 and 2.6, and to bear in mind the note shown, for the Modified D Alternative.

Comment regarding the row beginning at the bottom portion of page 2-34 and continuing through pages 2-35, 2-36 and the upper portion of page 2-37:

The highlighted language should be modified to bear in mind the notes shown, for the Modified D Alternative.

Comment regarding the row beginning at the bottom portion of page 2-37 and continuing through pages 2-38, 2-39, 2-40, 2-41, 2-42 and 2-43:

The highlighted language should be adopted for the Modified D Alternative.

Comment regarding the row beginning at page 2-44 and continuing through 2-45 and the top portion of 2-46:

The highlighted language should be combined and modified to replace all references to PPMAs and SGMAs with references to the SGMAs shown in Maps 2.4 and 2.6, for the Modified D Alternative.

Comment regarding the row beginning at the bottom portion of page 2-46 and continuing over to the top portion of page 2-47:

The highlighted language should be modified to replace all references to PPMAs and PGMAs with references to the SGMAs shown in Maps 2.4 and 2.6, for the Modified D Alternative.

Comment regarding the 2<sup>nd</sup> row at page 2-47:

The highlighted language should be modified to bear in mind the note shown and to replace all references to PPMAs and PGMAs with references to the SGMAs shown in Maps 2.4 and 2.6, for the Modified D Alternative.

Comment regarding the row beginning at the bottom portion of page 2-47 and continuing over to the top portion of page 2-48:

The highlighted language should be applied bearing in mind the note shown, for the Modified D Alternative.

Comment regarding the 2<sup>nd</sup> row at page 2-48:

The highlighted language should be modified to bear in mind the note shown, and to replace all references to PPMAs and PGMAs with references to the SGMAs shown in Maps 2.4 and 2.6, for the Modified D Alternative.

Comment regarding the row beginning at the bottom portion of page 2-48 and continuing over to the top portion of page 2-49:

The highlighted language should be modified to replace all references to PPMAs and PGMAs with references to the SGMAs shown in Maps 2.4 and 2.6, for the Modified D Alternative.

Comment regarding the 2<sup>nd</sup> row at page 2-49:

The highlighted language should be modified to bear in mind the note shown, and to replace all references to PPMAs and PGMAs with references to the SGMAs shown in Maps 2.4 and 2.6.

Comment regarding the row beginning at the bottom portion of page 2-50 and continuing over to the top portion of page 2-50:

The highlighted language should be adopted for the Modified D Alternative.

Comment regarding the 2<sup>nd</sup> row at page 2-50:

The highlighted language should be applied bearing in mind the note shown, for the Modified D Alternative.

Comment regarding the row beginning at the bottom portion of page 2-50 and continuing over to the top portion of page 2-51:

The highlighted language should be applied for the Modified D Alternative.

Comment regarding the 2<sup>nd</sup> row at page 2-51:

The highlighted language should be applied for the Modified D Alternative.

Comment regarding the bottom row at page 2-51 and continuing over to the top portion of page 2-52:

The highlighted language should be modified to bear in mind the note shown, for Modified D Alternative.

Comment regarding the 2<sup>nd</sup> row at page 2-52:

The highlighted language should be adopted for the Modified D Alternative.

Comment regarding the 3<sup>rd</sup> row at page 2-52:

The highlighted language should be applied for the Modified D Alternative.

Comment regarding the bottom row of page 2-52:

The highlighted language should be applied for the Modified D Alternative.

Comment regarding the top row at page 2-53:

The highlighted language should be applied for the Modified D Alternative.

Comment regarding the 2<sup>nd</sup> row at page 2-53:

The highlighted language should be modified to bear in mind the note shown, for the Modified D Alternative.

Comment regarding the 3<sup>rd</sup> row at page 2-53:

The highlighted language should be applied for the Modified D Alternative.

Comment regarding the bottom row at page 2-53:

The highlighted language should be applied for the Modified D Alternative.

Comment regarding the top row at page 2-54:

The highlighted language should be applied for the Modified D Alternative.

Comment regarding the row beginning at the bottom portion of page 2-54 and continuing to the top portion of page 2-55:

The highlighted language should be combined for the Modified D Alternative.

Comment regarding the 2<sup>nd</sup> row at page 2-55:

The highlighted language should be combined for the Modified D Alternative.

Comment regarding the 3<sup>rd</sup> row at page 2-55:

The highlighted language should be combined for the Modified D Alternative.

Comment regarding the 4<sup>th</sup> row at page 2-55:

The highlighted language should be combined for the Modified D Alternative.

Comment regarding the bottom row at page 2-55:

The highlighted language should be applied for the Modified D Alternative.

Comment regarding the top row at page 2-56:

The highlighted language should be applied for the Modified D Alternative.

Comment regarding the bottom row beginning at the bottom portion of page 2-56 and continuing through page 2-57:

The highlighted language should be modified to bear in mind the note shown, for the Modified D Alternative.

Comment regarding the top row of page 2-58:

The highlighted language should be modified to bear in mind the note shown, for the Modified D Alternative.

Comment regarding the row beginning at the bottom portion of page 2-58 continuing through page 2-59 and page 2-60, and continuing over to the top portion of page 2-61:

The highlighted language should be modified to replace all references to PPMAs and PGMAs with references to the SGMAs shown in Maps 2.4 and 2.6, for the Modified D Alternative.

Comment regarding the row beginning at the bottom portion of page 2-61 and continuing over to the top portion of page 2-62:

The highlighted language should be adopted for the Modified D Alternative.

Comment regarding the row beginning at the bottom portion of page 2-62 and continuing over to the top portion of page 2-63:

The highlighted language should be adopted to read as is.

Comment regarding the 2<sup>nd</sup> row of page 2-63:

The highlighted language should be modified to bear in mind the note shown, for the Modified D Alternative.

Comment regarding the row beginning at the bottom portion of page 2-63 and continuing over to the top portion of page 2-64:

The highlighted language should be modified to bear in mind the note shown, and to replace all references to PPMAs and PGMAs with references to the SGMAs shown in Maps 2.4 and 2.6, for the Modified D Alternative

Comment regarding the row beginning at the bottom portion of page 2-64 and continuing over to the top portion of page 2-65.

The highlighted language should be modified to replace all references to PPMAs and PGMAs with references to the SGMAs shown in Maps 2.4 and 2.6, for the Modified D Alternative.

Comment regarding the row beginning at the bottom portion of page 2-65, continuing through page 2-66, and continuing over to the top portion of page 2-67:

The highlighted language should be adopted for the Modified D Alternative.

The highlighted language should be modified to replace all references to PPMAs and PGMAAs with references to the SGMAs shown in Maps 2.4 and 2.6, for the Modified D Alternative.

Comment regarding the 2<sup>nd</sup> row of page 2-105:

The highlighted language should be modified to bear in mind the note shown for the Modified D Alternative.

Comment regarding the row beginning at the bottom portion of page 2-105, continuing through pages 2-106 and 2-107, and continuing over to the top portion of page 2-108:

The highlighted language should be modified to replace all references to PPMAs and PGMAs with references to the SGMAs shown in Maps 2.4 and 2.6, for the Modified D Alternative.

Comment regarding the 2<sup>nd</sup> row at page 2-108:

The highlighted language should be modified to bear in mind the note shown, for the Modified D Alternative.

Comment regarding the row beginning at the bottom portion of page 2-108 and continuing over to the top portion of page 2-109:

The highlighted language should be adopted for the Modified D Alternative.

Comment regarding the 2<sup>nd</sup> row at page 2-109:

The highlighted language should be adopted for the Modified D Alternative.

Comment regarding the row beginning at the bottom portion of page 2-109, continuing through pages 2-110 and 2-111, and continuing over to the top portion of page 2-112:

The highlighted language should be modified to bear in mind the note shown, for Modified D Alternative.

Comment regarding the row beginning at the bottom portion of page 2-112 and continuing over to the top portion of page 2-113:

The highlighted language should be modified to bear in mind the note shown for Modified D Alternative.

Comment regarding the row beginning at the bottom portion of page 2-113 and continuing over to the top portion of page 2-114:

The highlighted language should be modified to bear in mind the note shown, and to replace all references to PPMAs and PGMAs with references to the SGMAs shown in Maps 2.4 and 2.6, for Modified D Alternative.

Comment regarding the row beginning at the bottom portion of page 2-114 and continuing over to the top portion of page 2-115:

The highlighted language should be modified to bear in mind the note shown, and to replace all references to PPMAs and PGMAs with references to the SGMAs shown in Maps 2.4 and 2.6, for the Modified D Alternative.

Comment regarding the row beginning at the bottom portion of page 2-115, continuing through page 2-116, and continuing over to the top portion of page 2-117:

The highlighted language should be modified to bear in mind the note shown, for Modified D Alternative.

Comment regarding the row beginning at the bottom portion of page 2-117, continuing through pages 2-118 and 2-119, and continuing over to the top portion of page 2-120:

The highlighted language should be modified to bear in mind the note shown, for the Modified D Alternative.

Comment regarding the row beginning at the bottom portion of page 2-120 and continuing over to the top portion of page 2-121:

The highlighted language should be adopted for the Modified D Alternative.

Comment regarding the row beginning at the bottom portion of page 2-121:

The highlighted language should be adopted for the Modified D Alternative.

Comment regarding the row at page 2-122:

The highlighted language should be modified to bear in mind the note shown, for the Modified D Alternative.

Comment regarding the row at the top portion of page 2-123:

The highlighted language should be adopted for the Modified D Alternative.

Comment regarding the row beginning at the bottom portion of page 2-123, continuing through pages 2-124, 2-125, 2-126, 2-127 and continuing over to the top of page of page 2-128:

The highlighted language should be modified to replace all references to PPMAs and PGMAs with references to the SGMAs shown in Maps 2.4 and 2.6, for the Modified D Alternative.

Comment regarding the 2<sup>nd</sup> row at page 2-128:

The highlighted language should be adopted for the Modified D Alternative.

Comment regarding the row beginning at the bottom portion of page 2-128 and continuing over to the top of page 2-129:

The highlighted language should be adopted for the Modified D Alternative.

Comment regarding the row beginning at the bottom portion of page 2-129, continuing through page 2-130 and continuing over to the top portion of page 2-130:

The highlighted language should be modified to bear in mind the notes shown, and to replace all references to PPMAs and PGMAs with references to the SGMAs shown in Maps 2.4 and 2.6, for the Modified D Alternative.

Comment regarding the row beginning at the bottom of page 2-131 and continuing over to the top of page 2-132:

The highlighted language should be modified to bear in mind the note shown, for the Modified D Alternative.

Comment regarding the row beginning at the bottom portion of page 2-132, continuing over to the top of page 2-133:

The highlighted language should be modified to bear in mind the note shown, for the Modified D Alternative.

Comment regarding the row beginning at the bottom portion of page 2-133, continuing through pages 2-134, 2-135 and continuing over to the top portion of page 2-136:

The highlighted language should be modified to bear in mind the note shown, for the Modified D Alternative.

Comment regarding the row beginning at the bottom portion of page 2-136, continuing through pages 2-137, 2-138 and continuing over to the top portion of page 2-139:

The highlighted language should be adopted for the Modified D Alternative.

Comment regarding the row beginning at the bottom portion of page 2-139 and continuing through page 2-140:

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E1	Alternative E2	
<b>SPECIAL STATUS SPECIES – GREATER SAGE-GROUSE (GRSG)</b>						
<b>GOAL:</b>						
With exception of the Uinta LRMP, goals have not been developed specifically for GRSG. However, all LUPs include a goal to work with partners to protect, maintain, and enhance habitat for special status species.	Maintain and/or increase GRSG abundance and distribution by conserving, enhancing or restoring the sagebrush ecosystem upon which populations depend in collaboration with other conservation partners.	Maintain and increase current GRSG abundance and distribution by conserving, enhancing or restoring the sagebrush ecosystem.	Maintain and/or increase abundance and distribution of GRSG by conserving, enhancing or restoring the sagebrush ecosystem upon which populations depend, in collaboration with other conservation partners.	Protect, maintain, improve and enhance GRSG populations and habitats within the State of Utah established SGMAs.	Conserve, recover, and enhance GRSG habitat on a landscape scale consistent with local, state, and federal management plans and policies, as practical, while providing for multiple use of BLM-administered and National Forest System lands.  Maintain and/or increase GRSG abundance and distribution by conserving, enhancing or restoring the sagebrush ecosystem upon which populations depend in cooperation with other state,	Goal GRSG-1

**Table 2.1  
Description of Alternatives A, B, C1, C2, D, E1, and E2**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E1	Alternative E2	
					local, industry, permittee and conservation partners.	
<b>Objectives:</b>						
In general, older plans do not include objectives specific to GRSG. More recent plans (those completed after 2000) may include an objective to advance conservation of the GRSG and GRSG habitat, although a mechanism for achieving GRSG specific objectives is infrequently identified.	<p>Designate PPMAs for each WAFWA MZ across the current geographic range of GRSG that are large enough to stabilize populations in the short term and enhance populations over the long term.</p> <p>GRSG habitat in Utah overlaps 4 WAFWA MZs:</p> <ul style="list-style-type: none"> <li>• MZ II – Wyoming Basins</li> <li>• MZ III – Southern Great Basin</li> <li>• MZ IV – Snake River Plain</li> <li>• MZ VII – Colorado Plateau</li> </ul> <p>Protect PPMAs from anthropogenic disturbances that will reduce distribution or abundance of GRSG.</p>	Establish a system of sagebrush reserves to anchor recovery efforts by protecting the highest quality habitats.	Identify and protect PPMAs from anthropogenic and natural disturbances that will reduce distribution or abundance of GRSG.	<p>Protect habitat which provides for the year-round life-cycle needs of the GRSG. Sustain the best-of-the-best existing GRSG populations.</p> <p>Perpetuate conditions necessary to ensure recruitment of a continuing population within the aggregate state population.</p> <p>Enhance or improve GRSG habitat that has been impaired or altered through restoration or rehabilitation activities.</p> <p>Eliminate the threats facing the GRSG while balancing the economic and social needs of the residents of Utah.</p> <p>Sustain the best-of-the-best existing GRSG populations and increase populations through habitat restoration and rehabilitation.</p>	Identify and prioritize opportunities for habitat enhancement and conservation within core areas based on threats and the ability to manage GRSG habitat.	Objective GRSG-1
Recently completed BLM plans include a management action to implement the most recent <i>UDWR Strategic Management Plan for Sage-Grouse</i> (UDWR 2002), the	To maintain or increase current populations of GRSG, manage or restore PPMAs so that at least 70 percent of the land cover provides adequate sagebrush habitat to meet	Restore and maintain sagebrush steppe to its ecological potential in GRSG habitat.	Manage or restore PPMAs so that at least 50 percent of the landscape (mapped occupied habitat within a population area) provides sagebrush cover to meet GRSG needs.	<p>Enhance an average of 25,000 acres of GRSG habitat in SGMA's annually.</p> <p>Increase the total amount of GRSG habitat acreage within</p>	Restore native (or desirable) plants and create landscape patterns which most benefit GRSG. Write specific LUP objectives for vegetation that connects habitats and creates	Objective GRSG-2

**Table 2.1**  
**Description of Alternatives A, B, C1, C2, D, E1, and E2**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E1	Alternative E2
<p><i>BLM National Sage Grouse Habitat Conservation Strategy</i>, and recommendations from local GRSG working groups, to protect, maintain, enhance, and restore GRSG populations and habitat.</p> <p>A few plans including more detailed habitat objectives that include land cover.</p>	<p>GRSG needs.</p>		<p>Within PPMAs where sagebrush is the current or potential dominant vegetation type or is a primary species within the various states of the ecological site description (ESD) – or comparable Forest Service methods, maintain or restore vegetation to provide habitat for lekking, nesting, brood rearing, winter, and transition areas. Desired cover percentages and heights for sagebrush, grasses, and forbs in seasonal habitats will be managed to meet habitat guidelines from scientific literature (e.g., Connelly et al. 2000 and Hagen et al. 2007), where such standards can be met. Adjustments from the guidelines may be made, but must be based on documented regional variation of habitat characteristics (e.g., sagebrush type, ecological site potential), quantitative data from population and habitat monitoring, and evaluation of local research.</p>	<p>and adjacent to SGMA by an average of 50,000 acres per year, through management actions targeting Opportunity Areas.</p>	<p>patterns that benefit GRSG. Write specific vegetation management objectives relative to invasive annual grass spread and woody plant removal where these are of concern in GRSG habitat. Consider management objectives in buffers around intact core areas that detect and rapidly respond to invasions in the buffer zones.</p> <p>Establish measurable objectives related to GRSG habitat from baseline monitoring data, ESDs (or comparable Forest Service methods), or land health assessments/evaluations.</p> <p>Incorporate available site information collected using the GRSG Habitat Assessment Framework or similar methods to evaluate existing resource conditions and to develop any necessary resource solutions.</p> <p>Incorporate management practices that will provide for maintenance and/or enhancement of GRSG habitats, including specific attention to maintenance of desired understories of sagebrush plant communities.</p>

**Table 2.1  
Description of Alternatives A, B, C1, C2, D, E1, and E2**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E1	Alternative E2
					When developing objectives for residual cover and species diversity, identify the ecological site types within the planning area and refer to the appropriate ESDs) (Forest Service may use other methods).
No similar action.	No similar action.	Increase GRSG populations to a level where they are viable and secure from local extirpation events, and eventually to a level that allows for an annual harvestable surplus.	No similar action.	<p>Sustain an average male lek count of 4,100 males (based on a 10-year rolling average on a minimum of 200 monitored leks) in the SGMAs, and increase the population of males to an average of 5,000 (based on the same 10-year rolling average on a minimum of 200 monitored leks) within the SGMAs.</p> <p>Maintain viable populations within each SGMA. Ensure a path for birds to migrate within SGMAs on a seasonal basis, and ensure a long-term genetic connection between populations as needed. Should the population trends within a population area temporarily or permanently suffer from the effects of factors such as wildfire, management controls in the other SGMAs will be adjusted to achieve the other objectives listed above.</p>	<p>Enhance quality/suitable habitat to support the expansion of GRSG populations on federally-administered lands within the planning areas.</p> <p>Manage GRSG seasonal habitats and maintain habitat connectivity to support population objectives set by the WGFD.</p> <p>Objective GRSG-3</p>

**Table 2.1  
Description of Alternatives A, B, C1, C2, D, E1, and E2**

<b>Alternative A</b>	<b>Alternative B</b>	<b>Alternative C</b>	<b>Alternative D</b>	<b>Alternative E1</b>	<b>Alternative E2</b>	
Under current management, there are no designated PGMA.	Quantify and delineate PGMA for capability to provide connectivity among and between PPMA.	No similar action because all mapped occupied habitat would be PPMA	Delineate and manage mapped occupied GRSG habitat outside PPMA as PGMA.	GRSG habitat outside SGMA would not be managed for the conservation of the species. No specific management actions are provided for this habitat.	No similar action.	Objective GRSG-4
All LUPs include a general commitment to coordinate management actions with state and local governments and non-governmental organizations.	No similar action.	No similar action.	Participate in local GRSG conservation efforts (e.g., UDWR, NRCS, local working groups) to implement landscape-scale habitat conservation, to implement consistent management to benefit GRSG, and to gather and use local research and monitoring to promote the conservation of GRSG. <div style="border: 1px solid red; padding: 2px; display: inline-block; color: red;">add counties</div>	The State of Utah will coordinate the efforts of BLM, Forest Service, USFWS, state agencies, local government, and others to accomplish the purposes of this Plan. The State will convene a Working Group with membership including the Dept. of Natural Resources, Dept. of Agriculture and Food, State Institutional Trust Lands Administration, BLM, Forest Service, NRCS, USFWS, and others as needed. The Working Group will meet as often as needed to coordinate the implementation of the State Sage-Grouse Plan (included in this alternative). The Working Group will initiate and coordinate the efforts of necessary technical teams to assure scientific and monitoring information is shared by all management agencies, and that efforts to achieve the necessary conservation goals are progressing.	In cooperation with local GRSG working groups, partners and stakeholders, develop site-specific conservation strategies to maintain or enhance GRSG habitats and habitat connectivity.  Continue to support the development of statewide GRSG seasonal habitat models for the State of Wyoming.  Utilize Local Working Group plans, analyses, and other sources of information to guide development of conservation objectives for local management of GRSG habitats.	Objective GRSG-5

				<p>Manage areas identified as SGMAs to avoid surface disturbance to the greatest degree possible. Coordinate with the UDWR when land use which may result in a disturbance is contemplated.</p> <p>All existing uses are explicitly recognized by this alternative and shall not be affected by the implementation of this alternative. The GRSG conservation measures identified in the associated NEPA documents for each of these projects would continue to be implemented to protect GRSG and its habitat. Provisions of this plan would not be added to the measures identified each specific project.</p>	<p>Lands and Realty, Range Management, Wild Horse and Burro, Solid Minerals-Coal, Locatable Minerals, West Nile, mineral materials, nonenergy solid leasables, Vegetation Management, Fire and Fuels Management, and Noise.</p> <p>Use the GRSG Habitat Assessment Framework or best available assessment tool (approved by the Responsible Official) when assessing or evaluating GRSG habitats at multiple scales.</p> <p>Ranger District staff will work with project proponents (including those within Forest Service) to site their projects in locations that meet the purpose and need for their project, but have been determined to contain the least sensitive habitats whether inside or outside of core areas.</p> <p>Forest Service district offices, in coordination with WGFD and other partners, will establish monitoring protocols for GRSG populations and habitat that will be incorporated into individual project approvals as</p>

**Table 2.1  
Description of Alternatives A, B, C1, C2, D, E1, and E2**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E1	Alternative E2	
No similar action.	<p>Manage PPMAs so that discrete anthropogenic disturbances cover less than 3 percent of the total GRSG habitat regardless of ownership. Anthropogenic features include but are not limited to paved highways, graded gravel roads, transmission lines, substations, wind turbines, oil and gas wells, geothermal wells and associated facilities, pipelines, landfills, homes, and mines.</p> <ul style="list-style-type: none"> <li>In PPMAs where the 3 percent disturbance threshold is already exceeded from any source, no further anthropogenic disturbances will be permitted by the BLM or the Forest Service until enough <b>only new disturbance, not existing disturbance; only take the fire related provisions here</b> and reclaim/restore anthropogenic disturbances</li> </ul>	<p>Limit discrete surface disturbance in PGMA to one instance per section of GRSG habitat regardless of ownership, with no more than 3 percent surface disturbance (or, where stipulated, implement the disturbance cap prescribed in the applicable state conservation plan, whichever is more protective). The 3 percent cap includes existing and all new initial disturbance to the landscape, interim mitigation and restoration efforts notwithstanding. Discrete disturbances include but are not limited to highways, roads, transmission lines, substations, wind turbines, oil and gas wells, heavily grazed areas, range developments, severely burned areas, pipelines, landfills, mines, and vegetation treatment that reduces sagebrush cover. As additional research on the 3 percent cap becomes available, revise this prescription, as necessary, to conserve GRSG.</p>	<p>Protect PPMAs from fragmentation by anthropogenic disturbances that will reduce distribution or abundance of GRSG by managing PPMAs so that discrete anthropogenic disturbances cover less than 5 percent of the area within the PPMA used by a population of GRSG, regardless of ownership. While the BLM and Forest Service do not have any regulatory authority to influence the amount of disturbance that will occur on state or private land, when determining whether development is appropriate on Federal lands, disturbances on private and state lands will count towards the 5 percent disturbance cap.</p> <p>When considering implementation-level actions, the 5 percent disturbance calculation would include all discrete anthropogenic disturbances within a biologically based disturbance calculation area, which must be</p>	<p>The provisions of this alternative include, under certain circumstances, a general limit on new permanent disturbance of 5 percent of habitat on state or federally managed lands within any particular SGMA. The fundamental purpose of this provision is to limit the effects of a large amount of disturbance to the existing habitat or activities of the GRSG. The cumulative calculation of permanent disturbance in any population area, and specific habitats within a population area, is the aggregate of the various project, land use, or natural event disturbances, as modified by the effects of rehabilitation, restoration or other mitigation actions.</p> <p>Many of the SGMAs extend into two or more counties. In such cases, the 5 percent limitation shall be apportioned to each county in proportion</p>	<p>appropriate and necessary. Small or in-house projects within core areas will also have a monitoring plan for GRSG incorporated in the approval document.</p> <p>Inside core areas the density and disturbance goals include:</p> <ul style="list-style-type: none"> <li>The Forest Service will consider and evaluate measures that limit or reduce the density of oil and gas or mining activities to no more than an average of 1 location per 640 acres across the Density Disturbance Calculation Tool; and to limit all surface disturbance (any program area) to no more than 5 percent of the core area landscape using the Density Disturbance Calculation Tool.</li> </ul>	MA-GRSG-4

**Table 2.1**  
**Description of Alternatives A, B, C1, C2, D, E1, and E2**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E1	Alternative E2
	<p>so that 3 percent or less of the total PPMA area is disturbed within 10 years.</p>	<p>For an area to no longer be considered disturbed under the 3 percent cap, disturbances need to be restored/reclaimed, where technically and legally feasible (e.g., valid existing rights, split estate lands). The objective of long-term restoration/reclamation is to make areas with disturbance useable by GRSG. For long-term restoration of PPMAs with discrete surface disturbances to be considered successful, GRSG must be documented to have used the area.</p>	<p>contained within the PPMA of a GRSG population area. The disturbance calculation area would be identified during the site-specific project planning/NEPA phase, but the following would be taken into account when determining what would be included/excluded:</p> <ul style="list-style-type: none"> <li>Existing developed agriculture lands should generally be excluded.</li> <li>Areas in PPMAs that have burned but have not recovered to the extent of being able to provide habitat for GRSG should generally be excluded from the baseline disturbance calculation area for which the 5 percent is calculated (though the burned areas are still part of the PPMA), unless the proposed disturbance is within the burned area. (For example, a potential disturbance calculation area is 2,000 acres and does not have any existing disturbance, thereby allowing up to 100 acres of total disturbance. If 1,000 acres of the area burns, the calculation area should be adjusted to exclude the 1,000 burned acres, reducing potential disturbance in the</li> </ul>	<p>to the total amount of habitat within the larger area.</p> <p>Because of the highly discontinuous nature of GRSG habitat in Utah, each of the SGMAs is a composite of habitat, non-habitat and opportunity areas. In many cases, it may be difficult to discern whether an existing dispersed use is part of habitat or non-habitat, and thereby make an accurate calculation of the base for the limitation calculation difficult to determine. As part of the implementation of this alternative, such issues should be brought to the interagency review effort coordinated by the Public Lands Policy Coordination Office to insure consistency in interpretation throughout the state. In addition, if it should become sufficiently apparent that an accurate determination of the base for the limitation calculation is not feasible, then the interagency coordination effort may propose and seek approval for an alternative measurement of, or technique to measure, the cumulative effects of disturbance.</p>	

**Table 2.1**  
**Description of Alternatives A, B, C1, C2, D, E1, and E2**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E1	Alternative E2
			<p>remaining area to 50 acres. If the proposed disturbance is within the burned area, the calculation area should include the entire 2,000 acres, but the disturbance would still be limited to 50 acres.) However, just because the burned area could be excluded from the disturbance calculation area, any existing disturbances within the burned areas would still be counted against the disturbance cap of the revised disturbance calculation area.</p> <ul style="list-style-type: none"> <li>Developed private lands that are no longer used by GRSG (e.g., towns, airports, reservoirs) would be excluded. However, other dispersed disturbances would be considered disturbance (e.g., cabins, access roads, community pits, etc.).</li> </ul> <p>Discrete disturbances should be consolidated and localized as much as possible, though total areas with discrete disturbances cannot exceed 5 percent in the identified disturbance calculation area. This could result in small areas where existing and proposed disturbances exceed 5</p>	<p>The area of permanent disturbance is the area within a spatial polygon defined by the outside limits of the actual disturbed area, plus the area outside of this polygon where effects of the project, based on the type of project, could be expected to cause a disturbance to GRSG.</p> <p>Allowances must be made to include the temporal effects of any temporary disturbance, if any such effects are expected. The calculation of the spatial extent of each proposed project or land use, or the area of a natural event, such as wildfire, to be employed in this calculation, is defined as part of the definition of disturbance. The base upon which this calculation is made may be increased through successful rehabilitation or restoration of habitat, or other mitigation actions as appropriate.</p>	

**Table 2.1**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E1	Alternative E2	
No similar action.	No similar action.	No similar action.	<p>The use restrictions, stipulations, seasonal constraints, etc. included for GRSG habitat are intended to be the initial and not the entirety of the protections. Project proponents and BLM/Forest Service offices should develop additional mitigation measures at the project level to address the site-specific issues and impacts associated with local effects of specific projects. The mitigation actions developed at the project level must be based on current scientific recommendations. Mitigation actions could include some or all of the following:</p> <ul style="list-style-type: none"> <li>• avoiding the impact altogether by not taking a certain action or parts of an action,</li> <li>• minimizing impacts by limiting the degree of magnitude of the action and its implementation,</li> <li>• repairing, rehabilitation, or restoring the affected area,</li> <li>• reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action, or</li> <li>• compensating for the impact by replacing or providing</li> </ul>	<p>Mitigation actions are designed to create new habitat or ameliorate disturbances by the creation of or protection of other habitat. Mitigation for a disturbance must be shown to be effective in the time-frame of the activity, not at some future date. Effective mitigation does not require that birds are immediately present using the land, only that the habitat is capable of supporting birds as part of their yearly life-cycle. However mitigation should be performed in areas which have the highest likelihood of occupation by the species. The amount of mitigation, if required, should be calculated based on the effects generated within SGMA.</p> <p>Prioritize areas for habitat improvement to make best use of mitigation funds.</p> <p>Mitigation for a disturbance should not necessarily be tied to reclamation efforts at the actual site of the disturbance. Mitigation may occur locally, elsewhere in the same population area, or in another population area, based on the</p>	<p>Within core areas, when mitigation is required, the agencies in coordination with WGFD and partners would use the following mitigation hierarchy: in-kind and onsite mitigation as first priority or in-kind mitigation offsite mitigation as second priority.</p> <p>When additional offsite mitigation is necessary, conduct it within the same population area where the impact occurs if possible or, if that is not possible, within the same MZ per 2006 WAFWA Strategy as the impact.</p>	MA-GRSG-9

**Table 2.1

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E1	Alternative E2
			<p>substitute resources or environments.</p> <p>Money for research or monitoring within PPMA will not be counted as mitigation.</p> <p>Mitigation includes actions that are designed to create new habitat or ameliorate disturbances by the creation of or protection of other habitat, either within the same population or in other areas of the State. The preference is that mitigation for impacts within PPMA will occur within the same population area of the impact. For off-site mitigation associated with mitigation of actions within PGMA, project proponents will work closely with the BLM and the State of Utah to identify PPMA where off-site mitigation could occur. The ratio for mitigation, either onsite or off-site, will be set at the project level and will depend on the type and quality of the habitat being affected and the nature of the action affecting the habitat. While mitigative exchange values will not be set in this planning process, they need to follow the guiding principles of not trading</p>	<p>location, which offers greater potential for enhancing GRSG populations, so long as the location of the mitigation does not result in the loss of resiliency, representation or redundancy of the species in Utah. The Public Lands Policy Coordination Office, with assistance from the UDWR, BLM, Forest Service, NRCS, Department of Natural Resources, Department of Agriculture and Food, and other entities, shall coordinate and oversee the creation and operation of a Greater Sage-Grouse Mitigation Bank in Utah. The operation of this Mitigation Bank will seek to rehabilitate or restore lands as habitat prior to need, as well as coordinate the mitigation for development or other effects upon the habitat of the GRSG. Once operational, contributions to the Bank will be welcome.</p> <p>Mitigation may be required in nesting and brood-rearing areas, winter habitat, and other habitat. Examples of successful mitigation for various GRSG habitat types include the following:</p>	

**Table 2.1**  
**Description of Alternatives A, B, C1, C2, D, E1, and E2**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E1	Alternative E2
			<p>short-term gains for long-term losses.</p> <p>For compensatory mitigation (either onsite or off-site), actions should consider the type and quality of habitat being impacted by a project and the proportional impact a project will have the population. In turn, proposed mitigation actions should address the same type and quality of habitat that may be impacted (e.g., breeding, nesting, brood-rearing, wintering, transitional habitats). The value of the habitat may increase if the birds use the area for more than one time of the year, if it is relatively higher in quality, or if the type of habitat is a limiting factor for the local population. Similarly, mitigation should account for the proportional impact a project will have to a specific population (if a given project impacts 1 percent of wintering habitat versus 30 percent of the wintering habitat).</p> <p>Mitigation that trades impacts to areas that are meeting habitat objectives with creation of areas that do not meet habitat objectives, even in high</p>	<p><u>Leks</u></p> <ul style="list-style-type: none"> <li>• Removal of trees on or adjacent to the lek.</li> <li>• Removal or marking of fences on or adjacent to the lek.</li> <li>• Employment of off-site mitigation (e.g., use of the concept of a mitigation bank, if appropriate).</li> </ul> <p><u>Nesting and Brood-Rearing Areas</u></p> <ul style="list-style-type: none"> <li>• Removal of trees to no more than 5 percent cover (the closer to 0 percent the better) and maintenance of at least 10 percent sagebrush cover.</li> <li>• Maintain forb cover greater than 10 percent and greater than 10 percent grass cover during nesting and brood-rearing season.</li> <li>• Maintain or improve wet meadows, when present.</li> <li>• Installation of green-strips or firebreaks to protect existing nesting habitat.</li> <li>• Employment of off-site mitigation (e.g., use of the concept of a mitigation bank, if appropriate).</li> <li>• Mitigation should be calculated at a minimum of a</li> </ul>

were provided as BMPs as part of BLM IM 2013-128 and the US Forest Service's July 3, 2013 Sage Grouse Conservation Methods 2013 letter. As such, they would be applied as BMPs to fuels and fire management action as a matter of compliance to BLM policy.	Appendix H, Required Design Features for Fire and Fuels)		outlined in Appendix H, Required Design Features for Fire and Fuels.	to provide additional habitat for GRSG where possible.	grasslands first to sites which are adjacent to or surrounded by core areas. Annual grasslands are second priority for restoration when the sites not adjacent to core areas, but within 2 miles of core areas. The third priority for annual grasslands habitat restoration projects are sites beyond 2 miles of core areas. The intent is to focus restoration outward from existing, intact habitat.
Most LUPs contain objectives for maintaining improving, or restoring sagebrush plant communities. The level of detail varies depending on the age of the LUP.  All LUPs address vegetation treatments for improvement of wildlife habitat overall or to provide increased forage for wildlife, livestock, and wild horses and burros.  Recent LUPs may include management actions that purposely restore or enhance GRSG habitat.	Make re-establishment of sagebrush cover and desirable understory plants (relative to ecological site potential) the highest priority for restoration efforts.	Composition, function, and structure of native vegetation communities will meet ESD (or the Forest Service equivalent) and will provide for healthy, resilient, and recovering GRSG habitat components.	Desired cover percentages and heights for sagebrush, grasses, and forbs in seasonal habitats will be managed to meet habitat guidelines from scientific literature (e.g., Connelly et al. 2000, Hager such standard Adjustments may be made based on do variation of characteristic type, ecological quantitative population a monitoring, local research	No similar action.	Make reestablishment of sagebrush cover and desirable understory plants the highest priority for restoration efforts
No similar action.	In fire prone areas where sagebrush seed is required for GRSG habitat restoration, consider establishing seed harvest areas that are managed	Same as Alternative B.	No similar a	imilar action.	Same as Alternative B.

UTAH CAN'T MEET THESE CONNELLY STANDARDS - THEY WERE DEVELOPED SPECIFICALLY TO SHRUP STEPPE HABITAT IN NORTHERN PART OF GSRG RANGE - THEY ARE BEING REWRITTEN. EFFORTS ARE UNDERWAY TO IDENTIFY UTAH SPECIFIC GUIDELINES.

	for seed production and are a priority for protection from outside disturbances.					
No similar action.	No similar action.	Avoid sagebrush Use whatever works or grows. Native where possible, but allow non-native if that's what works. state it in the positive - use what give best chance of good rehab.	No similar action.	No similar action.	No similar action.	MA-VEG-11
Recently completed LUPs promote use of native species when conducting restoration activities.	Prioritize native seed allocation for use in GRSG habitat in years when preferred native seed is in short supply. This may require reallocation of native seed from Emergency Stabilization and Rehabilitation (BLM) and/or Burn Area Emergency Rehabilitation (Forest Service) projects outside of PPMAs to those inside it. Use of native plant seeds for Emergency Stabilization and Rehabilitation or Burn Area Emergency Rehabilitation seedings is required based on availability, adaptation (site potential), and probability of success (Richards et al. 1998). Where probability of success or native seed availability is low, non-native seeds may be used as long as they meet GRSG habitat conservation objectives (Pyke 2011). Re-establishment of		the use of native seeds in PPMA based on availability, adaptation (ecological site potential), and probability of success. Where probability of success or adapted seed availability is low, desirable non-native seeds may be used to meet GRSG habitat objectives to trend toward restoring the fire regime. Re-establishment of appropriate sagebrush species/subspecies and important understory plants, relative to site potential, shall be the principle objective for rehabilitation efforts.	Allow use of fire-retardant vegetation that will buffer areas of high quality GRSG habitat from catastrophic fire.	Where probability of success or native seed availability is low or where there is a specific identified purpose that cannot be met with natives, (desirable non-native seeds may be used as long as they meet GRSG habitat conservation objectives),	MA-VEG-12

don't like non-native seeds; in this respect A is best because present LUPs promote native species

**Table 2.1**

<b>LIVESTOCK GRAZING/RANGE MANAGEMENT</b>							
Continue to make GRSG habitat available for livestock grazing. Active AUMs for livestock grazing would be 329,521 on BLM lands and 265,373 on National Forest System lands, though the number of AUMs on a permit may be adjusted during site-specific evaluations conducted during term permit renewals, allotment management plan development, or other appropriate implementation activity. Additionally, temporary adjustments can be made annually to livestock numbers, the number of AUMs, season of use, and other aspects of grazing within the terms and conditions of the permit based on the permittees livestock operation and/or an evaluation of a variety of forage and resource site-specific conditions.	Active AUMs for livestock grazing would be 329,521 on BLM lands and 265,373 on National Forest System lands. Permit and annual adjustments to those AUMs would be made consistent with regulation and the direction identified below.	<u>Alt C1:</u> Make mapped occupied GRSG habitat unavailable to livestock grazing for the life of the plan. This would result in a reduction of up to 329,521 permitted AUMs on BLM lands and 265,373 permitted AUMs on National Forest System lands (if all allotments with any overlap with GRSG habitat were closed in their entirety;	<u>Alt C2:</u> Within allotments that overlap mapped occupied GRSG habitat, reduce permitted AUMs by 131,808 permitted AUMs on BLM lands and 106,149 permitted AUMs on National Forest System lands. Reductions by allotment will occur by Field Office based on a review of the site-specific information (e.g., range condition, utilization levels, type and condition of GRSG habitat). Based on the Field Office review, the reductions in	Continue to make GRSG PPMAs and PGMAs available for livestock grazing. Active AUMs for livestock grazing would be 329,521 on BLM lands and 265,373 on National Forest System lands, though the number of AUMs on a permit may be adjusted during site-specific evaluations conducted during term permit renewals, allotment management plan development, or other appropriate implementation activity. Additionally, temporary adjustments can be made annually to livestock numbers, the number of AUMs, season of use, and other aspects of grazing within the terms and conditions of the permit based on the permittees livestock operation and/or an evaluation of a variety of forage and resource site-specific conditions.	Continue to make GRSG habitat within and outside of SGMAAs available for livestock grazing. Active AUMs for livestock grazing would be 329,521 on BLM lands and 265,373 on National Forest System lands. Existing grazing operations would utilize recognized rangeland BMPs to increase the necessary vegetation, and thereby increase the potential for nesting success and population recruitment.  Should site-specific concerns be raised about the effect of grazing upon GRSG habitat, and such effects are documented over a sufficiently long time-frame, corrective management actions should be addressed through the application of BMPs, including consideration of those identified by the Department of Agriculture and Food's Grazing Improvement Program.	For those portions of the planning area in Wyoming, continue to make core and non-core areas available for livestock grazing. Active AUMs for livestock grazing would be included with the 265,373 AUMs on National Forest System lands noted for Alternative A, though the number of AUMs (head-months) on a permit may be adjusted during site-specific evaluations conducted during term permit renewals, allotment management plan development (or the Forest Service equivalent), or other appropriate implementation activity. Additionally, temporary adjustments can be made annually to livestock numbers, the number of AUMs, season of use, and other aspects of grazing within the terms and conditions of the permit based on the permittees livestock operation and/or an evaluation of a variety of forage and resource site-specific conditions.  In determining appropriate management actions that will	MA-GRA-1

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E1	Alternative E2		
		livestock (e.g., cattle, sheep, horses, llamas, alpacas and goats).		other areas. In areas where GRSG nesting is common, managing for moderate use of plant growth across the landscape would be appropriate. Well-managed ranches with comprehensive grazing strategies that include short-term or duration grazing, higher levels of use may be acceptable, provided these higher levels of use include rested vegetation in nearby areas.	appropriate actions to address non-achievement and non-conformance.		
Livestock grazing program/policy direction allows the BLM/Forest Service to make changes to livestock grazing in response to drought conditions. Changes may include adjusting livestock numbers based on available forage or shortening the season of use.	During drought periods, prioritize evaluating effects of the drought in PPMAs relative to their needs for food and cover. Since there is a lag in vegetation recovery following drought, ensure that post-drought management allows for vegetation recovery that meets GRSG needs in PPMAs.	Alt C1: No similar action.	Alt C2: During drought periods, prioritize evaluating effects of drought in GRSG habitat areas relative to their biological needs, as well as drought effects on ungrazed reference areas. Since there is a lag in vegetation recovery following drought (Thurow and Taylor 1999; Cagney et al.	During drought periods, prioritize evaluating effects of the drought in PPMAs relative to their needs for food and cover.  Initiate emergency management measures (e.g. delaying turnout, adjusting the amount and/or duration of livestock grazing, implement other terms of the permit) during times of drought to protect GRSG habitat, in accordance with the Resource Management During Drought Handbook (BLM Handbook 1730-1).  Implement post-drought management to allow for vegetation recovery that meets GRSG needs in PPMAs.	No similar action.  so therefore stick with A	In addition to Alternative A, if periods of drought occur, where appropriate, the Authorized Officer will evaluate the season of use and stocking rate and adjust through coordination with grazing permittee/lessee and annual billings processes.	MA-GRA-9

**Table 2.1  
Description of Alternatives A, B, C1, C2, D, E1, and E2**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E1	Alternative E2		
		2010), ensure that post-drought management allows for vegetation recovery that meets GRSG needs in GRSG habitat areas based on GRSG habitat objectives.					
Manage, maintain, protect, and restore riparian and wetland areas to the proper functioning condition.	Manage riparian areas and wet meadows for proper functioning condition (Forest Service: or other similar methodology) within PPMAs.	<u>Alt C1:</u> No similar action.	<u>Alt C2:</u> Same as Alternative B.	Same as Alternative B.	Design water developments to enhance mesic habitat for use by GRSG and maintain adequate vegetation in wet meadows. Within SGMA, GRSG stipulations should take precedence over stipulations for other species if conflicts occur, if otherwise allowable by law.	Same as Alternative A.	MA-GRA-10
Manage, maintain, protect, and restore riparian and wetland areas to the proper functioning condition (or Forest Service equivalent method).	Within PPMAs and PGMA, manage wet meadows to maintain a component of perennial forbs with diverse species richness relative to site potential (e.g., reference state) to facilitate brood rearing. Also conserve or enhance these wet meadow complexes to maintain or increase amount of edge and cover within that edge to minimize elevated mortality during the late brood	<u>Alt C1:</u> No similar action.	<u>Alt C2:</u> Within GRSG habitats, manage wet meadows to maintain a component of perennial forbs with diverse species richness and productivity relative to site potential (e.g., reference state)	Same as Alternative B.	Design water developments to enhance mesic habitat for use by GRSG and maintain adequate vegetation in wet meadows. Within SGMA, GRSG stipulations should take precedence over stipulations for other species if conflicts occur, if otherwise allowable by law.	Same as Alternative A.	MA-GRA-11

**Table 2.1

	rearing period.		to facilitate brood rearing. Also conserve or enhance these wet meadow complexes to maintain or increase the amount of edge and cover within that edge to minimize elevated mortality during the late brood-rearing period.				
No similar action.	Where riparian areas and wet meadows meet proper functioning condition (Forest Service – or meet standards using other similar methodology), strive to attain reference state vegetation relative to the ESD.	<u>Alt C1:</u> No similar action.	<u>Alt C2:</u> Same as Alternative B.	No similar action.	Design water developments to enhance mesic habitat for use by GRSG and maintain adequate vegetation in wet meadows. Within SGMAs, GRSG stipulations should take precedence over stipulations for other species if conflicts occur, if otherwise allowable by law.	Consider the use of range improvement projects to maintain or enhance wet meadows.	MA-GRA-12
Manage rangeland resources to maintain healthy, sustainable, rangeland ecosystems and to restore degraded rangelands in accordance with Utah's Standards for Rangeland Health or standards or guidelines established in	Within PPMAs, reduce hot season grazing on riparian and meadow complexes to promote recovery or maintenance of appropriate vegetation and water quality. Utilize fencing/herding techniques or seasonal use or livestock distribution changes	<u>Alt C1:</u> No similar action.	<u>Alt C2:</u> No similar action.	Within PPMAs, assess livestock grazing in riparian and meadow complexes and ensure recovery or maintenance of appropriate vegetation and water quality. Where recovery or maintenance is not occurring and the causal factor is livestock grazing, reduce pressure on	Continue livestock grazing strategies that have proven effective in maintaining and enhancing GRSG habitat, unless compelling and credible cause-and-effect evidence indicates a disturbance exists.  Address incompatible grazing	Same as Alternative A. If the causal factor of not meeting a standard is due to livestock grazing then follow Executive Order 2013-03.	MA-GRA-13

**Table 2.1  
Description of Alternatives A, B, C1, C2, D, E1, and E2**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E1	Alternative E2		
individual Forest Service LRMPs. Rangeland health standards require that riparian areas be managed for proper functioning condition.	to reduce pressure on riparian or wet meadow vegetation used by GRSG in the hot season (summer).		riparian or wet meadow vegetation used by GRSG in the summer by adjusting grazing management practices (e.g., use fencing/herding techniques, or changes in seasonal use or livestock distribution).	strategies through established rangeland management practices consistent with the maintenance or enhancement of habitat.  Design water developments to enhance mesic habitat for use by GRSG and maintain adequate vegetation in wet meadows. Within SGMA, GRSG stipulations should take precedence over stipulations for other species if conflicts occur, if otherwise allowable by law.			
Consider authorization of new water developments on a case-by-case basis taking into consideration impacts to other resources and resource values.	Authorize new water development for diversion from spring or seep source only when GRSG habitat within PPMAs would benefit from the development. This includes developing new water sources for livestock as part of an allotment management plan/conservation plan to improve GRSG habitat.	<u>Alt C1:</u> No similar action.	<u>Alt C2:</u> Authorize no new water developments for diversion from spring or seep sources within-GRSG habitat.	Limit authorization of new water developments within PPMAs to projects that would have a neutral effect or be beneficial to GRSG habitat (such as by shifting livestock use away from critical areas). New developments that divert surface water must be designed to maintain continuity of predevelopment riparian or wet meadow vegetation and hydrology.	Design water developments to enhance mesic habitat for use by GRSG and maintain adequate vegetation in wet meadows. Within SGMA, GRSG stipulations should take precedence over stipulations for other species if conflicts occur, if otherwise allowable by law.	Continue to authorize water developments in core areas; evaluate all positives and negatives for both upland and riparian habitat.  Plan and authorize range improvement projects on BLM and National Forest System lands in a way that maintains and/or improves GRSG and its habitat within core areas. Analyze through a reasonable range of alternatives any direct, indirect, and cumulative effects of grazing on GRSG and its habitats through the NEPA process.	MA-GRA-14

here let's specifically call out C2, and emphasize that water developments actually help sage grouse

**Table 2.1  
Description of Alternatives A, B, C1, C2, D, E1, and E2**

Alternative A	Alternative B	Alternative C		Alternative D	Alternative E1	Alternative E2	
Consider modifications to existing water developments on a case-by-case basis taking into consideration impacts to other resources.	Analyze springs, seeps and associated pipelines to determine if modifications are necessary to maintain the continuity of the predevelopment riparian area within PPMAs. Make modifications where necessary, considering impacts to other water uses when such considerations are neutral or beneficial to GRSG.	<u>Alt C1:</u> No similar action.	<u>Alt C2:</u> Analyze springs, seeps and associated water developments to determine if modifications are necessary to maintain the continuity of the predevelopment riparian area within GRSG habitats. Make modifications where necessary, including dismantling water.	Within PPMAs evaluate existing water developments (springs, seeps, etc., and their associated pipelines) to determine if modifications are necessary to maintain or improve riparian areas and GRSG habitat. Make modifications where necessary, considering impacts to other water uses when such considerations are neutral or beneficial to GRSG.	No similar action.  <div style="border: 1px solid red; padding: 5px; color: red;">Could live with D, as long as existing water developments are held harmless, or the water yield capacity of those developments are held harmless</div>	Evaluate existing water developments associated with springs and seeps and modify associated pipelines/structures to those developments having an impact on core areas.	MA-GRA-15
Allow treatments that provide benefits for multiple resources. Additional forage will be appropriate to livestock, wild horses and burros (where applicable), and wildlife.	In PPMAs, only allow treatments that conserve, enhance or restore GRSG habitat (this includes treatments that benefit livestock as part of an allotment management plan/ conservation plan to improve GRSG habitat).	<u>Alt C1:</u> No similar action.	<u>Alt C2:</u> Ensure that vegetation creates landscape patterns which most benefit GRSG. Only allow treatments that are demonstrated to benefit GRSG and retain sagebrush height	In PPMAs, ensure that vegetation and rangeland treatments conserve, enhance or restore GRSG habitat (this includes treatments that benefit livestock).	No similar action.	For vegetation treatments in sagebrush within core areas, refer to WGFD <i>Protocols for Treating Sagebrush to Benefit Sage-Grouse</i> (WGFD 2011a, as updated) and IM 2013-128 ( <i>Sage-grouse Conservation Related to Wildland Fire and Fuels Management</i> ).  These recommended protocols will be used in determining whether proposed treatment constitutes a “disturbance” that will	MA-GRA-16

**Table 2.1  
Description of Alternatives A, B, C1, C2, D, E1, and E2**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E1	Alternative E2	
			and cover consistent with GRSG habitat objectives (this includes treatments that benefit livestock as part of an allotment management plan/ conservation plan to improve GRSG habitat).			contribute toward the 5 percent threshold for habitat maintenance or not. Additionally, these protocols will be used to determine whether the proposed treatment configuration would be expected to have neutral or beneficial impacts for core populations or if they represent additional habitat loss or fragmentation. Treatments to enhance sagebrush/grasslands habitat for GRSG will be evaluated based upon habitat quality and the functionality/use of treated habitats post-treatment.  Work collaboratively with partners at the State and local level to maintain and enhance GRSG habitats in a manner consistent with the core population area strategy for conservation.
Most LUPs do not include specific management actions related to seedings.  Plans do include generic decisions that allow maintenance of existing range improvements, which includes maintenance of historical seedings.	Evaluate the role of existing seedings that are currently composed of primarily introduced perennial grasses in and adjacent to PPMAs to determine if they should be restored to sagebrush or habitat of higher quality for GRSG. If these seedings are part of an allotment	<u>Alt C1:</u> No similar action.	<u>Alt C2:</u> Evaluate the role of existing seedings that are currently composed of primarily introduced perennial grasses in and	Evaluate the role of existing seedings that are currently composed of primarily introduced perennial grasses in and adjacent to PPMAs to determine if they should be restored to sagebrush or habitat of higher quality for GRSG. If these provide value in conserving or enhancing GRSG	No similar action.  <div style="border: 1px solid red; padding: 5px; color: red;">could live with D, but omit the language about "adjacent" to SGMAs</div>	No similar action.  MA-GRA-17

The Forest Service does not use similar OHV management categories to the BLM’s. OHV use on National Forest System Lands within the planning area is limited to roads, trails, and areas that have been designated through a transportation planning process. As such, all acres of the planning area within Wyoming are included in the Alternative E1 bullet that addresses the Forest Service.</p>	MA-TTM-1

**Table 2.1  
Description of Alternatives A, B, C1, C2, D, E1, and E2**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E1	Alternative E2	
OHV use on National Forest Lands within the planning area is limited to roads, trails, and areas that have been designated through a transportation planning process.)	OHV use on National Forest Lands within the planning area is limited to roads, trails, and areas that have been designated through a transportation planning process.)	Lands within the planning area is limited to roads, trails, and areas that have been designated through a transportation planning process.)	the planning area is limited to roads, trails, and areas that have been designated through a transportation planning process.)	OHV use on National Forest Lands within the planning area is limited to roads, trails, and areas that have been designated through a transportation planning process.)		
Under current management, there are no PPMAs.  OHV use will be managed as identified in the area-designations above.	In PPMAs, limit motorized travel to existing roads, primitive roads, and trails at a minimum, until such time as travel management planning is complete and routes are either designated or closed.	Same as Alternative B.  <div style="border: 1px solid red; padding: 5px; color: red; width: fit-content; margin: 10px auto;">as always our agreement with D is contingent on using the proper maps</div>	PPMAs and PGMAs that do not have designated routes in a Travel Management Plan would be managed at least as limited to existing routes (i.e., could maintain existing OHV closures) until a Travel Management Plan designates routes.  PPMAs that have undergone Travel Management Planning with route designation would be managed at least as limited to designated routes (i.e., would maintain existing OHV closures). In these areas, existing route designations would be reviewed and adjusted through future travel management planning efforts where impacts to GRSG from route presence or use may exist.	SGMAs with nesting and winter habitat that do not have designated routes in a Travel Management Plan would be managed at least as limited to existing routes (i.e., could maintain existing OHV closures) until a Travel Management Plan designates routes.  SGMAs with nesting and winter habitat that have undergone Travel Management Planning with route designation would be managed at least as limited to designated routes (i.e., could maintain existing OHV closures). In these areas, existing route designations would be reviewed and adjusted where impacts to GRSG from route presence or use may exist.	All acres of the planning area in Wyoming are National Forest System lands. The Forest Service does not use similar OHV management categories to the BLM's. OHV use on National Forest System Lands within the planning area is limited to roads, trails, and areas that have been designated through a transportation planning process.	MA-TTM-2
Under current management there are no designated PPMAs.	In PPMAs, travel management should evaluate the need for permanent or seasonal road closures.	Close approximately 555,700 acres of mapped occupied habitat to OHV use. In addition, during	During implementation-level travel planning, threats to GRSG and their habitat would be considered when evaluating	No similar action.  <div style="border: 1px solid red; padding: 5px; color: red; width: fit-content; margin: 10px auto;">essentially saying stick with No Action</div>	No similar action.	MA-TTM-3

**Table 2.1  
Description of Alternatives A, B, C1, C2, D, E1, and E2**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E1	Alternative E2	
No similar action. Under current policy, the need for permanent or seasonal road closures is evaluated during travel management planning.		implementation-level travel planning, consider additional route closures.	route designations and/or closures.			
Consider route and trail modifications (new or existing) on a case-by-case basis.  Identify travel management areas and prioritize travel management planning in areas where it would provide the most resource benefit.	Complete activity level plans within 5 years of the ROD. During activity level planning, where appropriate, designate routes in PPMAs with current administrative/agency purpose or need to administrative access only.	Same as Alternative B.	Complete transportation plans in accordance with National BLM Travel Management guidance, requiring the BLM to maintain a current action plan and planning schedule to most effectively target available resources. The following GRSG population areas are Utah's top priority areas to designate comprehensive travel plans: <ul style="list-style-type: none"> <li>• Sheeprocks</li> <li>• Bald Hills</li> <li>• Box Elder</li> <li>• Rich</li> <li>• Ibapah</li> <li>• Hamlin Valley</li> </ul>	<del>Counties should adopt and enforce travel management plans that include consideration for GRSG.</del>  rewrite this to support the principle that counties' travel management plans do NOT yield to greater sage grouse restrictions.	All acres of the planning area in Wyoming are National Forest System lands. The Forest Service does not use similar OHV management categories to the BLM's. OHV use on National Forest System lands within the planning area is limited to roads, trails, and areas that have been designated through a transportation planning process.	MA-TTM-4
Under current management there are no designated PPMAs.  Consider route and trail modifications (new or existing) on a case-by-case basis using the designation criteria.	In PPMAs, limit route construction to realignments of existing designated routes if that realignment has a minimal impact on GRSG habitat, eliminates the need to construct a new road, or is necessary for motorist safety.	Limit route construction to realignments of existing designated routes if that realignment has a minimal impact on GRSG habitat, eliminates the need to construct a new road, or is necessary for motorist safety. Mitigate any impacts to offset the loss of GRSG habitat.	Travel systems would be managed with an emphasis on improving the sustainability of the travel network in a comprehensive manner to minimize impacts to GRSG, maintain motorist safety, and prevent unauthorized cross country travel while meeting access needs. To do so, it may be necessary to improve portions of existing routes, close existing routes or create	No similar action.	Construct roads to minimum design standards needed for production activities within core areas.	MA-TTM-5

**Table 2.1  
Description of Alternatives A, B, C1, C2, D, E1, and E2**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E1	Alternative E2	
			new routes that meet user group needs, thereby reducing the potential for pioneering unauthorized routes. The emphasis of the comprehensive travel and transportation planning within PPMAs would be placed on having a neutral or positive effect on GRSG habitat.			
No similar action. Allow upgrades to existing roads on a case-by-case basis subject to site-specific environmental review.	In PPMAs, allow no upgrading of existing routes that would change route category (road, primitive road, or trail) or capacity unless the upgrading would have minimal impact on GRSG habitat, is necessary for motorist safety, or eliminates the need to construct a new road.	Allow no upgrading of existing routes that would change route category (road, primitive road, or trail) or capacity unless it is necessary for motorist safety, or eliminates the need to construct a new road. Any impacts shall be mitigated with methods that have been demonstrated to be effective to offset the loss of GRSG habitat.	In PPMAs, when considering upgrade of existing routes that would change route category (BLM route category: road, primitive road, or trail; Forest Service route category: level 1, level 2, or level 3) or capacity, consider the larger transportation network while providing for protection of GRSG habitat.	No similar action.	Within core areas, allow no upgrading of existing routes that would change route category (BLM route category: road, primitive road, or trail; Forest Service route category: level 1, level 2, or level 3) or capacity unless the upgrading would have minimal impact on GRSG in core areas, is necessary for motorist safety, or eliminates the need to construct a new road.	MA-TTM-6
All LUPs include management actions that encourage the administrating agency to follow BMPs that reduce or minimize the impacts of development, including use of existing roads where possible.	In PPMAs, use existing roads, or realignments as described above to access valid existing rights that are not yet developed. If valid existing rights cannot be accessed via existing roads, then build any new road constructed to the absolute minimum standard necessary, and add the surface disturbance to the total disturbance in the PPMAs. If that disturbance exceeds 3 percent for that area, then	Prohibit new road construction in mapped occupied GRSG habitat within 4 miles of occupied GRSG leks, and avoid new road construction in mapped occupied GRSG habitat.  In mapped occupied habitat, use existing roads, or realignments as described above to access valid existing rights that are not yet developed. If valid existing	In PPMAs, use existing roads, or realignments as described above to access valid existing rights that are not yet developed. If valid existing rights cannot be accessed via existing roads, then build any new road constructed to the absolute minimum standard necessary, and add the surface disturbance to the total disturbance in the PPMAs. Apply additional effective mitigation necessary to offset the resulting loss of GRSG habitat. Plan for	No similar action.	In core areas, limit route construction to realignments of existing designated routes if that realignment has a minimal impact on GRSG habitat, eliminates the need to construct a new road, or is necessary for motorist safety.  New primary and secondary roads would avoid areas within 1.9 miles of the perimeter of occupied GRSG leks within core areas.	MA-TTM-7

<b>Alternative A</b>	<b>Alternative B</b>	<b>Alternative C</b>	<b>Alternative D</b>	<b>Alternative E1</b>	<b>Alternative E2</b>	
	make additional, effective mitigation necessary to offset the resulting loss of GRSG habitat.	rights cannot be accessed via existing roads, then, following the 4-mile prohibition from leks, build any new road constructed to the absolute minimum standard necessary, and add the surface disturbance to the total disturbance in the PPMAs. If that disturbance exceeds 3 percent for that area, then make additional, mitigation necessary to offset the resulting loss of GRSG habitat.	new routes in consideration of the larger transportation network objectives and needs while providing for protection of GRSG habitat.		Other new roads would avoid areas within 0.6-mile of the perimeter of occupied GRSG leks within core areas.	
No similar action. The need for restoration of linear disturbances (unauthorized routes) is identified during the implementation-level travel management process or on a case-by-case basis.	In PPMAs, conduct restoration of roads, primitive roads and trails not designated in travel management plans. This also includes primitive route/roads that were not designated in Wilderness Study Areas and within lands with wilderness characteristics that have been selected for protection.	Same as Alternative B.	In PPMAs, conduct restoration of roads, primitive roads and trails not designated for motorized or non-motorized travel in travel management plans.	No similar action.	Within core areas, allow natural deterioration of roads or conduct restoration of roads, primitive roads and trails not designated in travel management plans. This also includes primitive route/roads that were not designated in Wilderness Study Areas and within lands with wilderness characteristics that have been selected to be managed to retain those characteristics for protection.	MA-TTM-8
When reseeding roads, primitive roads and trails use appropriate seed mixes and consider the use of transplanted sagebrush.	When reseeding roads, primitive roads and trails in PPMAs, use appropriate seed mixes and consider the use of transplanted sagebrush.	When reseeding closed roads, primitive roads and trails, use appropriate native seed mixes and require the use of transplanted sagebrush.	Same as Alternative B.	No similar action.	Within GRSG habitats, when reseeding, use appropriate seed mixtures and consider the use of transplanted sagebrush.	MA-TTM-9
No similar action.	No similar action.	No similar action.	No similar action.	Develop an educational process to advise OHV users of the potential for conflict with GRSG.	No similar action.	MA-TTM-10

			mitigation coordinated with BLM/Forest Service and the State of Utah is successfully completed in PPMAs.			
<b>Leased Federal Fluid Mineral Estate</b>						
No similar action.	In PPMAs, apply the following conservation measures through RMP implementation decisions (e.g., approval of an Application for Permit to Drill (APD), Sundry Notice, Master Development Plans, Surface Use Plan of Operations {Forest Service}, etc.) and upon completion of the environmental record of review (43 CFR 3162.5), including appropriate documentation of compliance with NEPA. In this process evaluate, among other things: 1. Whether the conservation measure is “reasonable” (43 CFR 3101.1-2) with the valid existing rights; and 2. Whether the action is in conformance with the approved LUP.	Apply the following conservation measures as COAs at the project and well permitting stages, and through RMP implementation decisions and upon completion of the environmental record of review (43 CFR § 3162.5), including appropriate documentation of compliance with NEPA. In this process evaluate, among other things: 1. Whether the conservation measure is “reasonable” (43 CFR § 3101.1-2) with the valid existing rights; and 2. Whether the action is in conformance with the approved LUP.	In PPMAs, apply the following conservation measures through implementation decisions (e.g., approval of an APD, Sundry Notice, Master Development Plans, Surface Use Plan of Operations {Forest Service}, etc.) and upon completion of the environmental record of review (43 CFR 3162.5), including appropriate documentation of compliance with NEPA. In this process evaluate, among other things: 1. Whether the conservation measure is “reasonable” (43 CFR 3101.1-2) with the valid existing rights; and 2. Whether the action is in conformance with the approved LUP.	All existing uses are explicitly recognized by this alternative and shall not be affected by the implementation of this alternative. The GRSG conservation measures identified in the associated NEPA documents for each of these projects would continue to be implemented to protect GRSG and its habitat. Provisions of this plan would not be added to the measures identified each specific project.	Overall consideration shall be given to minimizing the impact to GRSG through a project design that avoids, minimizes, reduces, rectifies, and/or adequately compensates for direct and indirect impacts to GRSG habitat or use and includes applicable and technical COAs. Selection and application of these measures shall be based on current science and research on the effects to important breeding, nesting, brood-rearing, and wintering areas. For proposed operations in core areas, the Surface Use Plan of Operations (see 43CFR 3162.3-1(f)) shall address, at a minimum, the anticipated noise, density and amount of disturbance, mechanical movement (e.g., pump jacks), permanent and temporary facilities, traffic, phases of development over time, offsite mitigation, and expected periods of use associated with the proposed project. Seasonal habitats or project features	MA-MIN-21

&lt;mark.a.mahoney.civ@mail.mil&gt;

Mr. Beck,

Attached are DoD comments on the BLM Administrative Draft for the Greater Sage-Grouse Proposed Plan Amendment/Final Environmental Impact Statement (FEIS) for the Idaho and Southwest Montana Sub-Region submitted in accordance with the Memorandum of Understanding between DoD and BLM establishing DoD as a Cooperating Agency.

The comments include a request to add language similar to text included in the Nevada and NE California Greater Sage-Grouse Proposed LUPA/Final EIS stating the BLM does not have the authority to regulate aircraft activities that are under the jurisdiction of the Federal Aviation Administration and the Department of Defense, and requests for exemption for projects which have military and national security requirements.

Due to the size of the document and abbreviated document review time line it is possible that additional DoD comments may be received which will be immediately forwarded for BLM consideration.

Thank you very much for the opportunity to review and comment on the document. If you have any questions, please let me know.

//SIGNED//

Robert M. Shirley, DAF

DoD Regional Environmental Coordinator, Region 10

AF Western Regional Environmental Office, San Francisco

***Preliminary Proposed LUPA/Final EIS for Cooperating Agency Review***

**To Cooperating Agencies:**

The **Preliminary Proposed LUPA/Final EIS** is intended for internal review by the Cooperating Agencies from April 29 – May 13, 2015. Please do not distribute.

- Email your comments on the Preliminary Proposed RMPA/FEIS for by close of business Wednesday, **May 13, 2015**
- Contact Jonathan Beck, with questions: 208-373-4070, or [jmbeck@blm.gov](mailto:jmbeck@blm.gov)

***How to Provide Valuable Feedback***

**Commenting:**

Compared to the Draft EIS, there have been very few changes to Chapter 2, Detailed Description of Draft Alternatives (FEIS Section 2.10) and Chapter 3, as well as Appendices G, I, J, Q, S, and V.

Please focus your review on those areas of special expertise associated with your role and responsibility that were recognized in the Memorandum of Understanding between the BLM and your agency.

If providing input on consistency with plans of other Federal agencies, state and local governments, and Indian tribes, please be consistent with the regulations regarding such at 43 CFR 1610.3

For each comment, please fill in the page number, line number, or table number on which you are commenting under the appropriate column heading in the matrix. **The page and line numbers in the PDF file MUST be used.**

To be most helpful, your comments **must be specific**. Please be unambiguous, clear, and directive, with exact wording changes stated. Ambiguous comments, such as “What?,” “Poor,” or “Is this right?,” are not helpful and will not be considered.

If you have the same comment more than once, do not refer back to a previous comment number. Instead, please copy and paste your comment to a new row in the matrix and provide the specific page number, etc.

If you need additional space for comments, click in the table cell where you would like to comment, select the *Table* menu, *Insert*, and either *Rows Above* or *Rows Below*.

LAND USE PLAN AMENDMENTS AND ENVIRONMENTAL IMPACT STATEMENT**

**Comments on Preliminary Proposed Land Use Plan Amendment/Final EIS for Cooperating Agency Review  
April 29, 2015**

<b>Cmt #</b>	<b>Chapter and Page #</b>	<b>Row # or Line #</b>	<b>Reviewer Name</b>	<b>Reviewer Affiliation</b>	<b>Comment</b>
10.	Chapter 2, Page 38	2	Carl Ruden	Mountain Home AFB, USAF	LR-1 could restrict MHAFB and MHRC ability to acquire and construct new emitter and no-drop sites and their associated roads Request exemption for projects which have military and national security requirements.
11.	Chapter 2, Page 183	7	Carl Ruden	Mountain Home AFB, USAF	Closing access to off-road driving may affect military operations, training and scientific studies & monitoring. Limiting OHV use to existing roads and trails is reasonable. Seasonally closing roads might impact MHAFB and MHRC activities. Request exemption for projects which have military and national security requirements.
12.	Chapter 5, Page 18	24	Carl Ruden	Mountain Home AFB, USAF	MHAFB has mitigation measures in place to prevent fires caused by AF activities. Mitigation measures taken during fire season include: restrictions on flare use, ordnance dropping restrictions, overland travel restrictions, restrictions in the use of smoke (CERE), firefighters and equipment onsite during training activities, mowing grasses in roads, maintaining/installing firebreaks.
13.	Chapter 5, Page 20		Carl Ruden	Mountain Home AFB, USAF	MHAFB has an active weed suppression program for our BLM Right-of-Ways, included noxious weed control along 81 miles of BLM roads annually.
14.	Chapter 5, Page 23		Carl Ruden	Mountain Home AFB, USAF	MHAFB has an active weed suppression program for our BLM Right-of-Ways, included noxious weed control along 81 miles of BLM roads annually.
15.	Chapter 5, Page 107	Table 5-26	Carl Ruden	Mountain Home AFB, USAF	Military Training-Location should identify Bruneau, Owyhee, and Jarbidge Field Offices or Boise District Office. Road and Emitter use occur in the Bruneau and Jarbidge Field Offices. Bombing ranges occur in the Jarbidge field office. Acres/miles can be calculated if required.
16.	2.7.3, 2-66	32-34	Sharon Geil	USAF	Include DoD within the list of Federal agencies, mention of DoD and DoD mission requirements seems lacking except within land ownership and similar all-inclusive tables.
17.	Chapter 2, Page 22	19	Elin Pierce Julie Jeter	Malmstrom AFB	AD-5 could restrict our ability to erect new power lines or communications site along access roads to missile sites or MAFs. Request exemption for projects which have military and national security requirements.
18.	Chapter 2, Page 30	27	Elin Pierce Julie Jeter	Malmstrom AFB	Measures outlined in the section Fuels Management (FM 1-7) can impact AF negatively by potentially increasing the occurrence of invasive species, enhancing access into remote sagebrush steppe, and (with respect to roads) potentially result in more wildfires – which endangered AF personnel and equipment.

To: "jmbeck@blm.gov" <jmbeck@blm.gov>

Wed, May 13, 2015 at 1:43 PM

Jim,

As you may know, The Department of Energy (DOE) already has a candidate conservation agreement (CCA) for sage-grouse on the INL Site. The actions within the proposed plan would be implemented on the INL Site for those actions BLM has management responsibility for under our MOU with the Upper Snake Field Office for BLM. It is a unique situation and little complicated (not unlike your proposed plan) but DOE would probably roll the final applicable requirements for the applicable actions into our existing CCA and BLM would continue to manage those resources under their authority. If you would like to have a discussion about this please let me know. The "conservations measures" in the proposed plan appear to provide adequate mitigation to address the threats and it is probably going to be tough implementing those measures. Anyway, I have no comments and if you would like a copy of our CCA, please let me know.

Cheers,

Jack Depperschmidt

**Custer County Idaho Comments on Idaho and Southwestern Montana Greater Sage-Grouse Administrative Draft of Proposed Land Use Plan Amendment and Final Environmental Impact Statement**

On behalf of the Custer County Idaho Board of Commissioners, please incorporate the following comments into the above referenced documents. All prior Custer County comments to this NEPA process are herein incorporated by reference.

**1. FEIS Chapter 1, Page 2:** *“While historical Euro-American settlement of these lands has been slower and sparser than in other regions of the country, habitat conversion to suit human purposes has contributed to widespread loss and decline of sagebrush habitat availability or quality and associated wildlife populations. These human purposes include agriculture and urban development, energy and mineral resource development, and a long history of dispersed (but sometimes intensive) uses such as domestic grazing.”*

Comment:

The Land Use Plan Amendment (LUPA) and Final Environmental Impact Statement (FEIS) for Idaho and southwestern Montana are based on a series of false assumptions including the statement quoted above. As testimonials from Custer County Commissioners and residents show, before enactment of the ESA, sage-grouse were abundant. Sage-grouse populations thrived in the era of agriculture in Idaho and southwest Montana. This fact is understated in the FEIS in favor of hypothetical pre-European settlement “make-believe” maps that are not

based on science. The artificial stories and maps created by federal biologists leave out the fact that when ranchers, farmers and miners settled in Idaho and Montana in the 1800s and 1900s they cleared trees, leveled land, planted crops, created year round water sources and increased the abundance of sage-grouse and the diversity of habitat the sage-grouse needed for optimum year round survival.

The false assumptions throughout the FEIS result in a proposed action that would harm the Greater Sage-Grouse as well as the economy of Custer County and other counties in Idaho and southwestern Montana. The proposed action would also harm the economic well being of our nation as a whole by destroying the very industries that have helped sage-grouse habitat diversification over time. The proposed action would also harm our military defense system by adding restrictions that are unnecessary and expensive. Every hour and every dollar the military spend on this false crisis is time and money that is urgently needed to strengthen our national defenses.

The false assumptions and incorrect political rationalizations in the name of the Endangered Species Act (ESA) are disingenuous and need to be corrected. For the reasons listed below and those itemized in past comments, the Custer County Board of Commissions recommends the No Action Alternative as the preferred alternative.

**2. FEIS Page 1 -9. “Within the Idaho and southwestern Montana sub-region, the PACs consist of a total 11,232,800 acres.”**

Comment:

Custer County is opposed to restrictions within over 11.2 million acres of Priority Areas for Conservation (PACs) including each and every proposed land withdrawal, restriction on land disposal, leasing closure, leasing constraint, non-energy leasing closure, saleable mineral material leasing closure, travel management restriction, ban from surface occupancy, anthropomorphic surface disturbance limitation and other action that prohibits economic opportunities, scientific vegetative management, and predator control options outlined clearly and succinctly in the Custer County Land Use Plan.

**3. FEIS Figure 1-1**

Comment:

This figure demonstrates that the Greater sage-grouse habitat is widespread and abundant. The proposed action is based on the premise that sage-grouse are declining due to man induced factors related to livestock grazing, oil and gas development, roads, and mining.

Instead, the science shows the sage-grouse populations fluctuate in relation to climate and predators and that sage-grouse are not threatened with extinction. Genetic work by Dr. Zink, discussed in previous comments submitted by Custer County, clearly demonstrates the genetic health of the Greater sage-grouse population across the eleven states where listing is proposed but not warranted.

The very work federal land management agencies should be taking to enhance sage-grouse habitat would be severely restricted by the proposed alternative. The proposed plan of action would limit options to manage sagebrush and riparian communities as well as predators, thus harming sage-grouse populations in Idaho and southwestern Montana.

**4. FEIS Table 1-3 Lists Predators as a threat to sage-grouse in all three documents cited:**

<b>USFWS 2010 Finding</b>	<b>2006 Idaho GRSG Conservation Plan</b>	<b>2005 Montana GRSG Management Plan</b>
---------------------------	--	--

Comment

FEIS Table 1-3 clearly demonstrates that USFWS, Idaho and Montana all consider predators a significant threat to sage-grouse. This fact contradicts Appendix R, Page R 15 which states:

*“The [Catron] county plan identifies predation as the primary threat in the county (p. 14). This threat is not shown as a primary threat on other threat descriptions (BLM, State, USFWS, Local Working Group). **Predator control is not under the jurisdiction or authority of the BLM or FS** (emphasis added) and a specific alternative to address predator control has been eliminated from detailed analysis”*

The FEIS and Appendix R need to be corrected so they don't contradict each other.

Please answer the question of why BLM and FS personnel think they can manage game bird populations (sage-grouse) and their habitat and why they think they can't manage predator populations (foxes, badgers, ravens, etc) and their habitat.

Also, if *“**Predator control is not under the jurisdiction or authority of the BLM or FS**”* (emphasis added) why are the two agencies involved in interdisciplinary teams to manage wolves? Wolves are predators. Wolves prey on sage-grouse.

Stating that BLM and FS can manage sage-grouse and wolves, but not “predators” is illogical and contradicts ongoing actions by both agencies. The statement that predator control is not under the jurisdiction or authority of BLM or FS is false and needs to be corrected. Both agencies know that they currently, through agreements with state and other federal agencies, jointly perform predator management control activities. The statement was merely placed in

Appendix R to discard the Custer County recommendation for predator control actions as a mechanism to increase sage-grouse numbers. The statement is political and it is false.

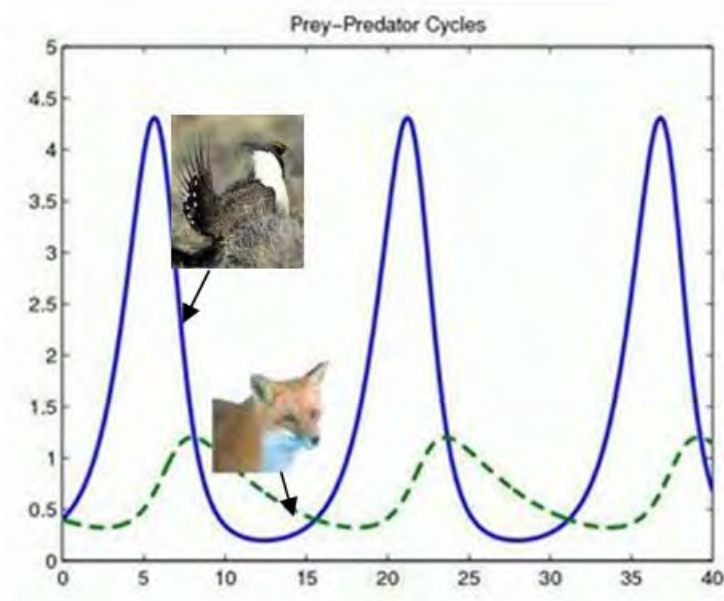

Please rewrite Appendix R as it relates to the Custer County Land Use Plan predator control recommendations and what BLM and FS can and cannot do through interagency agreements to control predators and to fund predator control programs when they so desire.

Why is it that BLM and Forest Service seem to think they can create rules and restrictions for sage-grouse and wolf habitat, hire biologists to count sage-grouse and wolves, radio track sage-grouse and wolves, map sage-grouse and wolf movements, etc. yet the same federal agencies say they can't count badgers, radio track badgers, map badger movements, or otherwise "manage" predators such as badgers?

What federal laws create the distinction between when the BLM and Forest Service can manage a particular species? BLM and Forest Service biologists are involved in programs to track deer and elk, yet these species are not listed as sensitive, threatened or endangered.

The FEIS needs to analyze predators as well a prey. The two are directly related and inseparable.

Anyone with basic wildlife management training knows that there is a predator – prey cycle:

Prior to enacting the ESA, predator control was a key factor in keeping sage-grouse numbers high. This is a well documented fact that recent agency biologists choose to ignore.

The presence or absence of predators is a key population factor in the survival and population viability of sage-grouse and cannot be categorically ignored. By ignoring the predator prey cycle in the FEIS, the agencies have missed a key factor in sage-grouse management that is critical to their decision. The lack of a detailed predator prey analysis negates the ability of the agencies to make an informed decision. The lack of a predator prey analysis makes the current FEIS proposed decision arbitrary and/or capricious.

## **5. FEIS Figure 3-3**

Comment:

This figure demonstrates that catastrophic fires are significant in Idaho and southwestern Montana. Science proves sage-grouse habitat is dynamic and vulnerable to catastrophic fires if left unmanaged (Davies et al 2011). The catastrophic fires that would be perpetuated by the proposed action will destroy soil microbes necessary to restore vegetation.

Livestock grazing prevents blazing, yet livestock grazing is severely restricted under the proposed action. The result of implementing the proposed action would be massive fuel loads that build up and burn hot, requiring federal, state and local resources to fight fires instead of producing food and economic prosperity.

## **6. FEIS Appendix D**

Comment:

Though the federal agencies assess fire strategies, they fail to include the private land and the value of partnerships with private landowners to create an ecosystem approach to fire management. Their analysis also fails to consider the large amount of revenue generated from mining, oil and gas, and livestock grazing that would be available to implement the fire management strategies if these resource uses were allowed to persist and thrive under Congressionally mandated multiple use guidelines.

The combination of natural resource use and mitigation provided when industry is involved in natural resource management, while at the same time creating wealth from food and energy producers, was not analyzed. Money matters. The Big Green organizations are not spending enough of their money on land management. Instead they spend it on litigation and lobbying. The litigation takes money away from federal land management agencies that would be better spent on managing wildlife habitat.

Natural resource users will spend money to manage the land so they can continue to use it wisely. Federal agencies should ally with livestock producers, mining companies, oil and gas companies, hunters and other natural resource users to find ways to work towards the goal of bringing both healthy natural resources and healthy economic metrics into balance. Government would be better served to work with producers instead of against them. The current plan of action works against industry.

The current plan of action did not take into account the comments provided by Custer County to date in regard to this NEPA decision. The proposed action is inconsistent with the Custer County Land Use Plan and the economic needs and willingness of the County and its constituents to work to assure the health of sage-grouse populations and their habitat.

## **7. FEIS Appendix R**

Comment:

Though Appendix R of the FEIS purports to take into account relevant County Land Use Plans, it does nothing to create consistency between federal and local plans. The Custer County Board of Commissioners adopted their Land Use Plan in hopes that it would be relevant to the decisions of federal land managers within the County. Instead, the Custer County Land Use Plan was largely ignored because it did not fit with the easier and less expensive government GIS models that lock up the land instead of managing land as evidenced by the millions of acres that would be withdrawn or restricted from multiple use under the proposed alternative.

## **8. Appendix AA**

Comment

The IMPLAN addressed in Appendix AA is deceiving in respect to tables that show no decrease in AUMs under the proposed action. The problem is that the price of the AUMs increases to the point that livestock producers will not be able to afford the AUMs (Appendix AA).

This real and significant economic impact was not analyzed in the FEIS, in direct violation of NEPA, CEQ regulations, the Regulatory Flexibility Act and a variety of other laws, policies and Executive Orders detailed in previous Custer County comments. Based on a lack of a proper economic analysis, any decision from the FEIS is by nature arbitrary and/or capricious.

The IMPLAN is akin to stating that the number of federal employees in BLM and Forest Service will stay the same, though in a different part of the analysis, their salaries will be cut 90%. Logic tells you the federal employees will leave if their salaries are significantly cut. Why wasn't the same logic used to state that AUMs will be significantly reduced under the proposed action alternative due to the significant increase in the cost of each AUM?

## **9. Appendix R**

Comment:

The LUPA/FEIS continue to ignore the Custer County Land Use Plan as evidenced in Appendix R of the FEIS. Custer County Commissioners have watched as ESA actions to bring back species such as the spotted owl, gray wolf and grizzly bear have restricted perceived threats such as livestock grazing, timber harvest, oil and gas development, mining and other natural resource uses. The result is unhealthy and unbalanced. Custer County Commissioners reacted by writing their own land use plan that should become part of any federal plans within the County. Instead, the proposed action is inconsistent with the County Land Use Plan and the federal government is negligent in its actions to dismiss the County Plan as irrelevant.

The proposed action further restricts land uses and land management tools that constituents of Custer County need to utilize in order to keep sagebrush from becoming decadent. Old growth climax sagebrush is not used by sage-grouse, yet that is what the proposed action will create, to the detriment of the very species the federal agencies purport to want to protect.

How did federal agencies get off track? The answer is simple. Politics, emotions and egos are overtaking science and facts. Many federal biologists have put their careers on the line to get promoted, make friends in Washington DC and become Hollywood – type stars in the eyes of people who trust them to save a species that would be best left to local management.

Pro-sage-grouse organizations are making billions of dollars off this false crisis. Politicians are getting reelected based on the lobbying efforts of these Big Green organizations that know the real issue is not sage-grouse. The real issue is power and wealth, big government control and a wildlands network where rural populations are exterminated for the perceived greater good of the country.

The crime is in the fact that rural Americans that feed the world are the heart and soul of our country. They should not be destroyed in favor of zealots that believe humans are a parasite on this earth. By writing Appendix R in a way that dismissed the Custer County Land Use Plan, the federal agencies are buying into a false premise that will actually put the security of

our nation at risk as we become dependent on other nations for food, energy, minerals, and other necessities of life.

The ESA action to place Canadian timber wolves in Idaho and southwest Montana has created a significant increase in predators which in turn threatens sage-grouse. As documented in earlier Custer County comments, raven numbers have increased thousands of fold in certain areas of Idaho due to the carcasses left by wolves. Ravens and other predators eat sage-grouse eggs and sage-grouse chicks. Why is the fact that ravens and other predators are causing a decline in sage-grouse ignored? The answer has to be political because it certainly isn't scientific. Many members of the Custer County Commission have seen the benefits of predator control. Many of the people who live in Custer County grew up in the County. They know the history, customs and culture of their ancestors. They know wildlife management. They know more about sage-grouse and sage-grouse habitat than federal biologists. Custer County Commissioners know that the proposed action is bad for sage-grouse and bad for their County.

## **10. FEIS Appendix BB**

Comment:

The federal agencies do not see the hypocrisy of their thinking. In Appendix BB they discuss nonmarket values including *“value from using these non-market resources, such as photographing ranch houses, old barns ... driving backcountry roads.”* They don't stop to think that the proposed action will destroy the very values they weigh. The proposed action will cause ranch houses and old barns to crumble and high density subdivisions to be built (Davies et al. 2011). Backcountry roads will either disappear or become paved roads with more traffic. The nonmarket analysis is fatally flawed because it places values on so many resources that will disappear if the proposed action is implemented. The nonmarket analysis must be re-written to take into account this factor.

## **SUMMARY**

In summary, the only acceptable alternative is the No Action Alternative. Idaho and Montana fish and wildlife management agencies need to work with local governments and multiple use groups to keep a wide diversity of habitat, with vegetation in various seral stages, to recreate an ecosystem where sage-grouse and other wild animals thrive. Predator control must be part of the solution.

The western eleven states where Greater sage-grouse are found should not become part of a conservation system that creates protection akin to national parks or wilderness. Sage-grouse

thrive on agriculture and a diversity of land uses and seral stages of vegetation. Sage-grouse do not thrive in climax communities of old growth sagebrush with unpalatable vegetation. The proposed action will exacerbate a situation where a spark of lightening is enough to start a catastrophic fire that burns millions of acres of sage-grouse habitat where fuel loads are so high that the habitat is lost for decades to come.

The FEIS needs to be rewritten to analyze the impacts the proposed action will have as fires increase and add more carbon to the environment than what was analyzed in the FEIS. (See <http://www.lanl.gov/discover/news-release-archive/2013/July/07.09-wildfires-may-contribute-to-global-warming.php>).

Please choose the No Action Alternative and work with local and state governments to manage sage-grouse and their habitat in balance with all wildlife and human activities. To do otherwise will rapidly result in the demise of sage-grouse and their habitat.

Respectfully Submitted on Behalf of Custer County by  
Darling Geomatics Sage-Grouse Biologist

Ref: DO 132-15

May 13, 2015

Dear BLM Project Managers:

Montana Fish, Wildlife and Parks, a Cooperating Agency with the BLM, has received electronic copies of the Administrative Draft Greater Sage-grouse Proposed Resource Management Plan Amendment/Final Environmental Impact Statement (FEIS) or Administrative Draft Proposed Resource Management Plan/Final Environmental Impact Statement (FEIS) for each of the field offices within the range of sage-grouse in Montana. This letter pertains to management decisions related to Greater Sage-grouse. FWP Regional Offices may provide additional comments on other aspects of Resource Management Plan revisions separately.

We have limited our review to the first section of Chapter 2 that details the changes between the Draft and Final EIS because of the limited time provided for review. The BLM's landscape-scale approach that prioritizes conservation action in the most important landscapes (e.g., Core Areas) yet honors valid and existing rights is consistent with Montana's Sage-grouse Habitat Conservation Program – Executive Order 10-2014. The BLM objectives of minimizing new or additional surface disturbance and improving habitat conditions directly align with Montana's program. We are supportive of the BLM's intent to maintain a surface disturbance limit of 3% in the absence of a Montana state program, but to adjust that limit to 5% to be consistent with the state program when the state program becomes fully functional. This consistency among regulatory processes will be easier to communicate with the public and will ultimately provide greater benefits to sage-grouse.

Thank you for the opportunity to review the Administrative Draft. Montana Fish, Wildlife and Parks looks forward to continuing to work with the BLM on implementation of the Resource Management Plans and Greater Sage-grouse conservation efforts.

Sincerely,

A handwritten signature in blue ink that reads "Paul C. Sihler". The signature is written in a cursive, flowing style.

Paul Sihler

## Idaho Greater Sage-Grouse LUPA/EIS

May 13, 2015

### *Preliminary Proposed LUPA/Final EIS for Cooperating Agency Review*

#### To Cooperating Agencies:

The **Preliminary Proposed LUPA/Final EIS** is intended for internal review by the Cooperating Agencies from April 29 – May 13, 2015. Please do not distribute.

- Email your comments on the Preliminary Proposed RMPA/FEIS for by close of business Wednesday, **May 13, 2015**
- Contact Jonathan Beck, with questions: 208-373-4070, or [jmbeck@blm.gov](mailto:jmbeck@blm.gov)

### *How to Provide Valuable Feedback*

#### Commenting:

Compared to the Draft EIS, there have been very few changes to Chapter 2, Detailed Description of Draft Alternatives (FEIS Section 2.10) and Chapter 3, as well as Appendices G, I, J, Q, S, and V.

Please focus your review on those areas of special expertise associated with your role and responsibility that were recognized in the Memorandum of Understanding between the BLM and your agency.

If providing input on consistency with plans of other Federal agencies, state and local governments, and Indian tribes, please be consistent with the regulations regarding such at 43 CFR 1610.3

For each comment, please fill in the page number, line number, or table number on which you are commenting under the appropriate column heading in the matrix. **The page and line numbers in the PDF file MUST be used.**

To be most helpful, your comments **must be specific**. Please be unambiguous, clear, and directive, with exact wording changes stated. Ambiguous comments, such as “What?,” “Poor,” or “Is this right?,” are not helpful and will not be considered.

If you have the same comment more than once, do not refer back to a previous comment number. Instead, please copy and paste your comment to a new row in the matrix and provide the specific page number, etc.

If you need additional space for comments, click in the table cell where you would like to comment, select the *Table* menu, *Insert*, and either *Rows Above* or *Rows Below*.

Chairman Lindsey Manning  
Shoshone-Paiute Tribes  
PO Box 210  
Owyhee, NV 89832

Dear Chairman Manning:

In accordance with our unique government to government relationship, enclosed for your review is an electronic version (CD) of the Idaho Southwest Montana Sub-Region Administrative Draft for the Greater Sage-Grouse Proposed Plan Amendment/Final Environmental Impact Statement (FEIS). It is important to note that this review by your staff will be limited to two weeks, as it is for the Governor's office, and any information that you would like to share with us will need to be mailed or e-mailed back to Jonathan Beck (jmbeck@blm.gov) at the Idaho State Office by May 13, 2015.

Under the Federal Land Policy and Management Act (FLPMA), land use plans of the Secretary of the Interior shall be consistent with State, tribal and local plans to the maximum extent consistent with the purposes, policies, and programs of Federal laws and regulations applicable to public lands.

The administrative draft of this FEIS is not a public document and is being provided for your review prior to its public release and based on your unique government to government relationship with the Bureau of Land Management (BLM). We ask that you maintain the confidentiality of these documents throughout your review and until such time as the BLM (and the U.S. Forest Service) release this information to the public.

If you have any questions, please contact Jonathan Beck, the BLM Project Manager for the Greater Sage-Grouse LUP Amendments, Idaho Southwest Montana Sub-Region, at 208-373-4070, or e-mail at jmbeck@blm.gov. Thank you for your assistance in our efforts for the conservation of the Greater Sage-grouse. I look forward to receiving your input.

Sincerely,

Jeffery L. Foss  
Acting State Director

**Idaho and Southwestern Montana Greater Sage-Grouse  
Proposed Land Use Plan Amendment and  
Final Environmental Impact Statement**

**Responsible Agencies:** United States Department of the Interior  
Bureau of Land Management (Lead Agency)

United States Department of Agriculture  
Forest Service

**Type of Action:** Administrative (X) Legislative ( )

**Document Status:** Draft ( ) Final (X)

**Abstract:** This Proposed Land Use Plan Amendment (LUPA) and Final Environmental Impact Statement (EIS) has been prepared by the United States Department of the Interior, Bureau of Land Management (BLM) and United States Department of Agriculture, Forest Service (Forest Service) with input from 26 cooperating agencies. This document is considering amendments to 26 BLM and 8 Forest Service land use plans to address management of Greater Sage-Grouse habitat in Idaho and portions of Montana and Utah. The Proposed LUPA and Final EIS describe and analyzes alternatives for managing Greater Sage-Grouse habitat on approximately 9.2 million acres of BLM-administered lands and 1.9 million acres of National Forest System lands. Major planning issues addressed include energy and minerals, lands and realty (including rights-of-way), wildfire, vegetation management (including invasive species and conifer encroachment), livestock grazing, recreation and travel management, and socioeconomics. To assist the agencies decision makers and the public in focusing on appropriate solutions to the planning issues, the Final EIS considers 7 alternative LUPAs. **Alternative A** is a continuation of current management (No Action Alternative); use of public lands and resources would continue to be managed under the current BLM and Forest Service land use plans, as amended. **Alternative B** is based on management actions from the Sage-Grouse National Technical Team's *A Report on National Greater Sage-Grouse Conservation Measures*. **Alternative C** is based on management actions submitted by various groups during public scoping. **Alternative D** was developed by the agencies' interdisciplinary team to address local ecological site variability and address conservation of Greater Sage-Grouse in context with other competing human interests. **Alternative E** is based on the State of Idaho's Governor's Alternative, developed from recommendations by the State of Idaho's Greater Sage-Grouse Task Force. Similar to Alternative C, **Alternative F** was derived from individual and conservation group scoping comments. The **Proposed Plan** is a mix of management actions selected from the range of alternatives in the Draft LUPA/EIS and is based on best science, public scoping comments, public comments on the Draft LUPA/EIS and internal agency discussion. **Alternatives D and E** were the agencies' co-preferred alternatives in the Draft EIS.

**Protest Period:** Protests must be postmarked or received no later than 30 days after publication of the US Environmental Protection Agency Notice of Availability in the *Federal Register*. Refer to the instructions in the letter preceding this abstract for additional information on how to protest. The close of the protest period will be announced in news releases and on the Idaho website: [http://www.blm.gov/id/st/en/sage-grouse\\_rmp\\_revision.html](http://www.blm.gov/id/st/en/sage-grouse_rmp_revision.html).

May, 2015

Dear Reader:

Enclosed is the Idaho and Southwestern Montana Greater Sage-Grouse Sub-regional Greater Sage-Grouse (GRSG) Proposed Resource Management Plan Amendment (PRMPA) and Final Environmental Impact Statement (FEIS), one of fifteen sub-regional efforts being conducted as part of the Bureau of Land Management (BLM) National Greater-Sage Planning Strategy. The BLM prepared the PRMPA/FEIS in consultation with cooperating agencies, taking into account public comments received during this planning effort. The purpose of the PRMPA is to amend: 1) the following Idaho BLM plans: Birds of Prey NCA RMP (2008); Bruneau RMP revision (and existing 1983 Bruneau RMP); Challis RMP (1999); Craters of the Moon NM RMP (2006); Four Rivers RMP revision (and existing 1988 Cascade and 1983 Kuna RMPs); Jarbidge RMP revision; Lemhi RMP (1987); Owyhee RMP (1999); Pocatello RMP revision; Shoshone-Burley RMP revision (and existing 1980 Bennett Hills/Timmerman Hills, 1985 Cassia, 1975 Magic, 1985 Monument, 1981 Sun Valley, and 1982 Twin Falls MFPs/RMPs); Upper Snake RMP revision (and existing 1983 Big Lost, 1985 Medicine Lodge, 1981 Big Desert, and 1981 Little Lost-Birch Creek MFPs/RMPs); 2) the following Idaho Forest Service Plans: Curlew National Grassland Management Plan (2002) (FS); Caribou National Forest Revised Forest Plan (2003) (FS); Sawtooth National Forest Revised Forest Plan (2003) (FS) and 3) The following Montana BLM plans: Butte RMP (2009) and Dillon RMP (2006) RMPs to identify and incorporate appropriate conservation measures to conserve, enhance and/or restore GRSG habitat by reducing, eliminating, or minimizing threats to that habitat. The need for action is in response to the US Fish and Wildlife Service's (USFWS) March 2010 "warranted, but precluded" Endangered Species Act listing petition. The USFWS found that the inadequacy of regulatory mechanisms was identified as a significant threat to GRSG in their finding on the petition to list the GRSG. RMP conservation measures were identified as the BLM's principal regulatory mechanism.

This PRMPA and FEIS have been developed in accordance with the National Environmental Policy Act of 1969, as amended, and the Federal Land Policy and Management Act of 1976, as amended. The PRMPA is largely based on Alternatives D and E, the co-preferred alternatives in the Draft Resource Management Plan Amendment/Environmental Impact Statement (DRMPA/DEIS), which was released on November 1, 2013. The PRMPA/FEIS contains the Proposed Plan, a summary of changes made between the DRMPA/DEIS and PRMPA/FEIS, impacts of the Proposed Plan, a summary of the written and verbal comments received during the public review period for the DRMPA/DEIS, and responses to the comments.

IDMT\_0074969

Pursuant to BLM's planning regulations at 43 CFR 1610.5-2, any person who participated in the planning process for this PRMP and has an interest which is or may be adversely affected by the planning decisions may protest approval of the planning decisions within 30 days from date the Environmental Protection Agency (EPA) publishes the Notice of Availability of the FEIS in the Federal Register. For further information on filing a protest, please see the accompanying protest regulations in the pages that follow (labeled as Attachment # 1). The regulations specify the required elements of your protest. Take care to document all relevant facts. As much as possible, reference or cite the planning documents or available planning records (e.g. meeting minutes or summaries, correspondence, etc.).

Emailed protests will not be accepted as valid protests unless the protesting party also provides the original letter by either regular mail or overnight delivery postmarked by the close of the protest period. Under these conditions, the BLM will consider the emailed protest as an advance copy and will afford it full consideration. If you wish to provide the BLM with such advance notification, please direct emailed protests to: [protest@blm.gov](mailto:protest@blm.gov).

All protests must be in writing and mailed to one of the following addresses:

Regular Mail:

Director (210)  
Attn: Protest Coordinator  
P.O. Box 71383  
Washington, D.C. 20024-1383

Overnight Delivery:

Director (210)  
Attn: Protest Coordinator  
20 M Street SE, Room 2134LM  
Washington, D.C. 20003

Before including your address, phone number, email address, or other personal identifying information in your protest, be advised that your entire protest – including your personal identifying information – may be made publicly available at any time. While you can ask us in your protest to withhold from public review your personal identifying information, we cannot guarantee that we will be able to do so.

The BLM Director will make every attempt to promptly render a decision on each protest. The decision will be in writing and will be sent to the protesting party by certified mail, return receipt requested. The decision of the BLM Director shall be the final decision of the Department of the Interior on each protest. Responses to protest issues will be compiled and formalized in a Director's Protest Resolution Report made available following issuance of the decisions.

Upon resolution of all land use plan protests, the BLM will issue an Approved RMPA and Record of Decision (ROD). The Approved RMPA and ROD will be mailed or made available electronically to all who participated in the planning process and will be available on the BLM website at [http://www.blm.gov/id/st/en/prog/nepa\\_register/sage-grouse\\_rmp\\_revision.html](http://www.blm.gov/id/st/en/prog/nepa_register/sage-grouse_rmp_revision.html).

Unlike land use planning decisions, implementation decisions included in this PRMPA/FEIS are not subject to protest under the BLM planning regulations, but are subject to an administrative review process, through appeals to the Office of Hearings and Appeals (OHA), Interior Board of Land Appeals (IBLA) pursuant to 43 CFR, Part 4 Subpart E. Implementation decisions generally constitute the BLM's final approval allowing on-the-ground actions to proceed. Where implementation decisions are made as part of the land use planning process, they are still subject to the appeals process or other administrative review as prescribed by specific resource program

regulations once the BLM resolves the protests to land use planning decisions and issues an Approved RMP and ROD. The Approved RMP and ROD will therefore identify the implementation decisions made in the plan that may be appealed to the Office of Hearing and Appeals.

Sincerely,

Timothy M. Murphy  
State Director, Idaho

Administrative Draft  
Cooperating Agency Review

## Protest Regulations

[CITE: 43CFR1610.5-2]

TITLE 43--PUBLIC LANDS: INTERIOR  
CHAPTER II--BUREAU OF LAND MANAGEMENT, DEPARTMENT OF THE INTERIOR  
PART 1600--PLANNING, PROGRAMMING, BUDGETING--Table of Contents  
Subpart 1610--Resource Management Planning  
Sec. 1610.5-2 Protest procedures.

- (a) Any person who participated in the planning process and has an interest which is or may be adversely affected by the approval or amendment of a resource management plan may protest such approval or amendment. A protest may raise only those issues which were submitted for the record during the planning process.
- (1) The protest shall be in writing and shall be filed with the Director. The protest shall be filed within 30 days of the date the Environmental Protection Agency published the notice of receipt of the final environmental impact statement containing the plan or amendment in the Federal Register. For an amendment not requiring the preparation of an environmental impact statement, the protest shall be filed within 30 days of the publication of the notice of its effective date.
- (2) The protest shall contain:
- (i) The name, mailing address, telephone number and interest of the person filing the protest;
  - (ii) A statement of the issue or issues being protested;
  - (iii) A statement of the part or parts of the plan or amendment being protested;
  - (iv) A copy of all documents addressing the issue or issues that were submitted during the planning process by the protesting party or an indication of the date the issue or issues were discussed for the record; and
  - (v) A concise statement explaining why the State Director's decision is believed to be wrong.
- (3) The Director shall promptly render a decision on the protest.
- (b) The decision shall be in writing and shall set forth the reasons for the decision. The decision shall be sent to the protesting party by certified mail, return receipt requested. The decision of the Director shall be the final decision of the Department of the Interior.

## Background

In 2010, the U.S. Fish and Wildlife Service (“Service”) found the Greater Sage- Grouse (“sage-grouse”) warranted for listing under the Endangered Species Act (“ESA”), but precluded due to higher listing priorities.<sup>1</sup> The Service ranks candidate species on a scale of 1 to 12, with 1 as the highest priority for listing. Sage-grouse received a rank of 8 (“moderate”). The Service based this determination primarily on Factors A and D, “present or threatened destruction, modification, or curtailment of habitat or range” and the “inadequacy of regulatory mechanisms,” provided in Section 4(a)(1) of the Endangered Species Act (“ESA”).<sup>2</sup> The primary causes of Factor A were infrastructure development, wildfires, and invasive plants.<sup>3</sup> Existing regulatory mechanisms were inadequate to adequately address these primary threats due to lack of sage- grouse specific directives and certainty of implementation, particularly for wildfire prevention and suppression.

The Center for Biological Diversity and other environmental groups sued the Obama Administration to act on species with “warranted but precluded” status. In 2012, The Obama Administration agreed to settle the lawsuit with the environmental organizations and act under the ESA on some 750 species, including 251 previously listed as “warranted but precluded.”<sup>4</sup> This settlement included sage-grouse and the deadline for determination was set for September 2015. In a 2012, the Western Watersheds Project challenged the Service’s “but precluded” portion of the 2010 decision in Idaho District Court. As part of Judge Winmill’s decision, he judicially ratified this September 2015 date for a new sage-grouse listing determination.

In response, the Bureau of Land Management (“BLM”) announced it would undertake an unprecedented land use planning effort to include sage-grouse specific measures for 88 Resource Management Plans (“RMP”). This effort also includes some Forest Service LUPs. To aid in this effort, the BLM released the National Technical Team Report (“NTT Report”) and Instructional Memorandum (“IM”) 2012-43 in December 2011. That same month, Secretary of the Interior Ken Salazar invited western states to develop their own state plans, similar to the effort already undertaken by Wyoming that could be included in the BLM’s Land Use Plan Amendment Environmental Impact Statement “LUPA” and “EIS”. And Secretary Salazar committed that if these state plans or portions thereof were approved by the Service, the state plans could replace

the National IM 2012-043 until the BLM completed the EIS process. Governor Otter accepted the Secretary's invitation.

Governor Otter, through Executive Order 2012-02, created a Sage- Grouse Task Force consisting of a variety of stakeholders to develop recommendations for an Idaho specific alternative.<sup>5</sup> The Task Force held 12 public meetings across Idaho and received advice from the Service, BLM and the Idaho Department of Fish and Game guided the process. The Task Force also opened up a comment period before submitting to BLM.

In August, Governor Otter sent a letter to Brian Kelly, State Director for the Service requesting feedback on the Alternative.<sup>6</sup> Brian's response gave a strong indication that the Alternative's map would be sufficient.<sup>7</sup> His response also encouraged Governor Otter to better define the adaptive triggers, enhance measure to address the primary threat of wildfire, and better integrate the secondary threat of improper grazing into the overall strategy. In September 2012, Governor Otter adopted recommendations of the Task Force and submitted the first draft to BLM. (Alternative E). In March 2013, Governor Otter, consistent with IM 2012-043, submitted a "Concurrence Request" (D-93) to the Service.

The Service favorably responded, "concurring" that the four foundational elements – namely, the State's map with habitat zones and conservation areas, adaptive regulatory triggers, and population objectives -- were consistent with the Conservation Objectives Team Report ("COT Report"). The Service also conditionally concurred with the livestock grazing management and infrastructure components subject to more detail regarding the Implementation Team (D-123). In May 2013, and based on the Service's concurrence letter, the BLM requested further clarification and refinement of the Alternative E so the Alternative was accurately captured and analyzed in the EIS (D-131). On July 1, 2013, the State submitted his response, further clarifying the adaptive triggers, infrastructure, mitigation, and wildfire measures (D-145). The rationale and justification of Alternative E's triggers, along with the studies and data relied on is on page D-178 of the DEIS. The September 2012 draft of the Alternative, the March 2013 Concurrence Request, and the July 2013 Clarification and Refinement Letter collectively constitute Alternative E.

The State of Idaho strongly believes Alternative E best meets the purpose and need of this analysis as it provides the greatest opportunity to preclude an ESA listing. Alternative E represents the best available science for the Greater Sage-Grouse in Idaho because it is the product of a diverse group of stakeholders relying on Fish and Game's decades of on-the-ground information. Governor Otter modeled this approach based on Idaho's successful roadless rule that passed judicial muster in Idaho and at the Ninth Circuit Court of Appeals. Alternative E focuses on addressing the primary threats identified by the Service, while also providing

---

<sup>5</sup> See Idaho Executive Order 2012-02, available at: [http://gov.idaho.gov/mediacenter/execorders/eo12/eo\\_12\\_02.pdf](http://gov.idaho.gov/mediacenter/execorders/eo12/eo_12_02.pdf)

<sup>6</sup> Appendix B

<sup>7</sup> Appendix C

management flexibility consistent with the BLM's multiple-use mandate. And as detailed in the Service's letters, including the agency's comments on the Administrative DEIS, Alternative E also comports most closely with the COT Report, which will guide the Service 2015 listing analysis. In short, as detailed in Governor Otter's June 16 memo to Secretary Jewell, the State believes the Service's concurrence letter provides the best roadmap for successfully resolving this issue.<sup>8</sup> To be sure, the State is aware that further refinement is needed, especially with the implementation plan; we look forward to working with the BLM and other stakeholders to complete that process.

And Alternative E is more attuned to local concerns than the other alternatives. Many of the areas impacted by this planning analysis form the identity for rural Idaho communities and are still a significant part of the State's identity. Local communities are sensitive to the economic consequences of federal land management decisions; whether for recreation or other multiple-use purposes. Further, Alternative E accounts and acknowledges the State's 2006 plan which was largely the effort of Local Working Groups. By contrast, Alternatives B, C, and F are not sensitive to these concerns and represent a one-species management regime wholly divorced from BLM's multiple-use mandate. Alternative D better recognizes these local issues, but is still overvalues the needs of the species to the detriment of multiple-use management and local concerns. Idaho strongly encourages the BLM to select a final alternative that balances local, state and national interests, BLM's multiple-use mandate, and the needs of the species. Not only is this possible, but Alternative E provides the roadmap for doing so. Collaborating and cooperating with the State regarding the long-term strategy for these lands and the species is critical. The BLM should give weight to the unique perspectives and knowledge provided by the State through the scientific expertise of the Idaho Department of the Fish and Game, Dr. Jack Connelly, Dr. Karen Launchbaugh from the University of Idaho, and Dr. Steve Knick and the recommendations from the Task Force.

### State Conservation Plans

Alternative E follows a long line of successful state-based conservation strategies. The Service has a history of concurring with State plans before making a final ESA determination. The Service concurred with Idaho management plans for wolves and the Yellowstone Grizzly Bear population. As mentioned above, the Idaho Roadless Rule, while not a species-driven effort, was the result of State and federal collaboration and passed judicial muster. This process has been no different with the State consistently seeking the iterative feedback from the relevant federal agencies, notably the Service, to ensure Idaho's plan is best positioned to preclude the need to list and maintain predictable levels of land use.

---

<sup>8</sup> Appendix D

The staying power of the roadless rule is due to the Forest Service’s recognition that resolving these complex environmental issues requires the involvement of the State and other stakeholders. And the roadless rule considered the unique characteristics of each individual inventoried roadless area, rather than mandating a one-size-fits-all management approach.

## STATE OF IDAHO COMMENTS

### I. Alternative E Best Addresses the Issues in the 2010 Finding

Governor Otter applauds the BLM for recognizing the importance of State and local perspectives by choosing Alternative E as “co-preferred” alternative. The Service’s 2010 warranted but precluded determination found that BLM did not provide enough information to analyze their regulatory mechanisms or RMPs.<sup>9</sup> Further; the BLM’s only mechanisms for wildfire management were Instructional Memorandum (IM) documents that had expiration dates. BLM had no long-term measures and an inadequate track record of implementing and monitoring their internal Manual 6840. The Service also noted that the information received was vague and:

...did not specify what requirements, direction, measures, or guidance has been included in the newly revised RMPs to address threats to sage-grouse and sagebrush habitat.

Therefore, we cannot assess their value or rely on them as regulatory mechanisms for the conservation of the greater sage-grouse.<sup>10</sup>

The Service needed predictability in BLM’s regulatory mechanisms to push the extinction risk curve past the foreseeable future. But the Service did not appear to suggest a complete overhaul of BLM’s existing RMPs. This is the approach of Alternatives B, C, and F; and moreover, targeting activities that have not demonstrated a meaningful impact to the species at the expense of grappling with wildfire and invasive species is not a wise approach.

Alternative E, by contrast, provides long term, measurable objectives for the most important threats—fire and infrastructure. Governor Otter applauds the BLM for recognizing the importance of State and local perspectives by choosing Alternative E as “co-preferred” alternative. It also addresses the most relevant secondary threats in the appropriate context.

The Task Force sent its recommendations to the Governor in June 2012. These recommendations were the result of eight public meetings, held across the state over the course of three months. These recommendations were guided by of technical expertise of the Idaho Department of Fish and Game, the U.S. Fish and Wildlife Service, and other relevant state and federal agencies.

---

<sup>9</sup> *Supra*, note 1.

<sup>10</sup> *Id.*

The State's management approach was designed to be clear and measurable over varying spatial and temporal scales. This approach consists of management objectives attempting to address key decision points outlined in the Service's 2010 determination. The Idaho Sage-Grouse management approach includes implementation of regulatory mechanisms to support the overall management, conservation objectives of the species and stabilization of habitats and populations, including a systematic review of habitat and population status, and development of adaptive regulatory triggers to address sudden and unanticipated changes.

One of the most important recommendations from the Task Force was to adopt the Sage-Grouse Management Area (SGMA) with three distinct management zones: Core Habitat (CHZ), Important Habitat (IHZ) and General Habitat (GHZ). These management zones outline a suite of basic management activities that may or may not occur in a given area. These management zones represent a management continuum with a more restrictive approach at one end providing a high level of protection to the species within CHZ and a more flexible approach for GHZ, allowing for more multiple use activities. IHZ acts as a "buffer zone" for CHZ, providing more restrictions than GHZ, but more flexibility than CHZ, and has the potential to operate as CHZ if necessary. These three management zones provide an array of permitted and prohibited activities.

The State developed a suite of regulatory measures to address the primary threats to sage-grouse as well as some of the activities identified by the Service as secondary threats. These measures were the result of analyzing the best available information on the primary and secondary threats. The measures for each threat will be discussed in more detail below and through comments of relevant state agencies.

The State also anticipated the potential for unexpected and catastrophic events as the result of wildfire and West Nile Virus. Thus, the State developed an adaptive regulatory trigger to ensure the populations and habitats within CHZ and IHZ are maintained and enhanced. These regulatory triggers were intended to provide a regulatory backstop for navigating unanticipated and deleterious impacts to the species. If these measures prove necessary, the State would still be well positioned to conserve the species and its habitat, while maintaining predictable levels of land use.

To aid in the assessment of this management approach, the State divided the SGMA into four individual Conservation Areas. Each conservation area is divided into CHZ, IHZ, and GHZ based upon modeling of sage-grouse breeding bird density, habitat connectivity and persistence, scientific knowledge based on surveys and radio telemetry studies, and the recommendations of the task force.

The Governor's Alternative developed two management objectives to ensure that the requirements outlined in the 2010 finding are met. The first objective is to implement regulatory mechanisms. This objective responds to the Service's determination that BLM did not have adequate regulatory mechanisms to manage the primary threats to sage-grouse. The Governor's objective is to implement regulatory mechanisms to maintain and enhance sage-grouse habitats, populations and connectivity in areas within CHZ, buffered by strategic areas within IHZ, dominated by sage-brush. This will allow the state to conserve at least 65% of current known leks within the state and 95% of the male population of sage-grouse.

The second management objective is to ensure the effectiveness of the first objective. This is done through monitoring the stability of habitat and population trends over time. The State recognizes the need to regularly analyze the effectiveness of the regulatory measures as well as to discern whether active conservation and restoration efforts, including conifer control, wildfire suppression, and more passive habitat protection techniques such as fuel breaks are effective strategies. The adaptive triggers of Alternative E were the result of developing this objective.

The result of these two objectives is that the state is able to respond to threats in virtually real time, instead of implementing top down restrictions or trying to make management decisions based on predictions and assumptions of future habitat and population growth or decline.

The adaptive triggers are intended to improve sage-grouse population trends, protect the overall baseline population, preserve a buffer population, and conserve habitat. The triggers have both population and habitat components. Population components consider population growth and change in lek size. The habitat component considers loss of breeding and/or winter habitat. The population trigger is measured in this way because numerous studies show that lek size is related to population change.<sup>11</sup> Additionally, several researchers have shown that loss of winter or breeding habitats resulted in decreased sage-grouse populations.<sup>12</sup> Both population and habitat triggers are tripped at 20% loss within a conservation area.

The population trigger is measured by calculating a finite rate of change between successive years for sage-grouse population. The ratio of males counted in a pair of successive years estimates the finite rate of change at each lek site in that one year interval. These ratios can be combined across leks within a population for each year to estimate that finite rate of change for the entire population of a habitat zone within a conservation area.

The population is measured across successive years because small game populations typically fluctuate among years due to weather and other environmental variables. A finite rate

---

<sup>11</sup> Connelly and Braun 1997; Connelly et al. 2004, Baumgaurt 2011, Garton et al. 2011

<sup>12</sup> Swensen et al. 198, Connelly et al 2000a, Miller et al. 2011

of change for any given year is not very meaningful. However, a series of years where the finite rate of change remains at or above 1.0 indicates a stable to increasing population.

Lek attendance by males has been used as an indicator of a population trend in some areas since the early 1950s. However, male lek attendance can be influenced by severity of the previous winter, weather, timing of counts during the spring, and other factors.<sup>13</sup> Lek data provide a powerful data set for assessing population trends over time, but counts for a single year may not reflect trends accurately.

Since these populations vary from year to year, it was important to determine at what point a drop in lek attendance meant a population decline. Published information suggests that a change in maximum number of males counted on leks of 10-15% cannot confidently be considered a reflection of population status. However, a 20% decline would likely not be related to lek attendance patterns but would instead reflect a population decline. This is why Alternative E sets its hard population trigger at 20%.

Sage-grouse populations are affected by habitat loss, which is why the primary threat to sage-grouse is wildfire. Several studies have shown that sage-grouse are particularly sensitive to loss of nesting and wintering habitat. A 30% loss of breeding/winter habitat is thus far the lowest amount of habitat loss for which a population response could be detected. Additionally, landscapes with less than 30% area in sagebrush within 6.4 km of lek center have the lowest probability of lek persistence. In response to these data, Alternative E takes a conservative approach to allow for quicker reaction time. A soft trigger is set at a 10% loss of breeding or wintering habitat in CHZ or IHZ within a Conservation Area. A hard trigger is set at a 20% loss of breeding or winter habitat in CHZ within a Conservation Area.

Originally, the habitat and population triggers were tied together. The habitat trigger can trip causing change in management before a population trigger for the same area may trip. This is because a large wildfire will cause a level of loss that we know will result in a significant population decline. However, the population decline may not manifest itself until 2-4 years after the habitat loss because sage-grouse are long-lived birds. This improved adaptive trigger program allows BLM to be proactive to prevent further habitat loss during the time it takes for the population declines to occur. The rationale and justification of Alternative E's triggers, along with the studies and data relied on is on page D-178 of the DEIS.

#### A. Alternatives B, C, and F Do Not Meet the Purpose and Need

The purpose and need of a proposed action delineates the range of alternatives in an EIS. As such, the purpose and need cannot be so narrowly defined that it precludes other reasonable

---

<sup>13</sup> Emmons and Braun 1984, Hupp 1987, Baumgart 2011

alternatives.<sup>14</sup> “If the agency constricts the definition of the project's purpose and thereby excludes what truly are reasonable alternatives, the EIS cannot fulfill its role. Nor can the agency satisfy the Act.<sup>15</sup> The evaluation of alternatives required under NEPA provides alternative means to accomplish the *general goal* of a major federal action. "The [EIS] shall briefly specify the underlying purpose and need".<sup>16</sup> The protection of sage-grouse and sage-grouse habitat is the general goal of the LUPA revisions. Noticeable absent from the purpose and need statement is mention of the 2010 decision or any commitment to precluding a “threatened” listing determination. The inclusion of alternatives in an EIS must achieve the stated Purpose of the EIS *within the framework of the planning criteria*. This EIS's broad purpose and need is

...to identify and incorporate appropriate conservation measures into LUPs [Land Use Plans] to conserve, enhance, and restore GRSG [Greater Sage-Grouse] habitat by reducing, eliminating, or minimizing threats to that habitat.

The other alternatives are either a laundry list of best management practices (BMPs), sometimes overly draconian, without a cogent strategy, or target a specific use that fails to address the primary threats identified by the Service. Accordingly, Alternatives B, C, and F should be rejected for not meeting the purpose and need.

Alternative A and E are the only proposals that meet the purpose and need statement because they are the only ones that adequately respond to the 2010 Warranted but Precluded determination and meet BLM’s multiple-use mandate. Alternative D gets closer to the purpose and need, but still locks up too much land without justification and lacks certainty. Despite adopting a similar adaptive management construct, Alternative D still relies on the overly restrictive BMPs from Alternative B, which are inconsistent with BLM’s multiple use mandate.

The State would like to a more complete analysis of Alternative A. Following the 2010 decision, threat levels for sage-grouse were moderate. The Service’s concern was long-term implementation. It’s possible that BLM could have satisfied the Service’s determination if it developed a better implementation structure for existing regulations. BLM’s response to Governor Otter’s Consistency Review indicated Wyoming’s plan was satisfactory for threats in that region, which accounts for roughly 50% of the sage-grouse population.<sup>17</sup> Yet, this analysis seems wholly lacking in this present document. Instead, BLM arbitrarily re-calibrated the environmental baseline for the species through NTT. The EIS does not justify this. As the State has been on record before, and will provide more detail below, the NTT Report is a complete non-starter for Idaho. The BLM must remember that the U.S. Supreme Court held that

---

<sup>14</sup> *Simmons v. U.S. Army Corps of Engineers*, 120 F. 3d at 664, 27 (7<sup>th</sup> Cir.)

<sup>15</sup> 42 U.S.C. § 4332(2)(E)”).

<sup>16</sup> 40 C.F.R. § 1502.13

<sup>17</sup> Appendix E

implementation of the ESA must not result in “needless economic dislocation,” or be based on “speculation or surmise.”<sup>18</sup>

## B. Reasonable Range of Alternatives

NEPA requires agencies to provide a reasonable range of alternatives for Environmental Impact Statements.<sup>19</sup> However, this requires more than merely providing several alternatives. The “heart of the environmental impact statement” is considering alternatives.<sup>20</sup> The NEPA process requires an agency to rigorously explore and objectively evaluate all reasonable alternatives so decision-makers and the public are fully informed. NEPA documents are intended to be used as a tool during the planning and decision-making process.<sup>21</sup> The “rule of reason” guides both the choice of alternatives as well as the extent to which the Environmental Impact Statement must discuss each alternative.<sup>22</sup> The Environmental Impact Statement need not consider an infinite range of alternatives, only reasonable or feasible ones.<sup>23</sup> Substantial case law exists regarding the range of alternatives that need to be included in an Environmental Impact Statement (EIS), and “[t]he existence of a viable but unexamined alternative renders an environmental impact statement inadequate”.<sup>24</sup> Section 6.6.3 of BLM’s NEPA Manual (Handbook H-790-1) provides clear guidance on when BLM should eliminate an alternative from detailed analysis:

You may eliminate an action alternative from detailed analysis if:

It is ineffective (it would not respond to the purpose and need)(e.g. Alternatives B, C, and F).

It is inconsistent with the basic policy objectives for the management of the area.

Project alternatives derive from an EIS’s “Purpose and Need” section, which briefly defines “the underlying purpose and need to which the agency is responding in proposing the alternatives including the proposed action.”<sup>25</sup> The stated goal of a project necessarily dictates the range of “reasonable” alternatives and an agency cannot define its objectives in unreasonably narrow terms.<sup>26</sup> This EIS has six alternatives. However, two of the alternatives are based on the NTT Report. One of these should be removed. Instead of putting together an alternative that addressed the specific needs of Idaho public lands, and based on the primary threats to the

<sup>25</sup> 40 C.F.R. § 1502.13

<sup>26</sup> See *Citizens Against Burlington*, *supra* note 22.

species, BLM used their NTT Report as the foundation of their sub-regional planning efforts. In some cases, such as infrastructure development, especially in BLM's priority habitat, the other co-preferred appears to be more restrictive than the NTT Report. This does not meaningfully solve the problems identified in the 2010 decision; rather these alternatives employ an unnecessary top-down, one-size-fits-all approach of the NTT Report. And it likely does not meet the COT as evidenced by Service's letter on DEIS. Instead, it creates redundancy, as analysis of both alternative B and D reaches nearly identical conclusions throughout the entire document, despite significant revisions to Alternative D to make it look more like Alternative E from the Administrative draft phase to the published draft phase. Alternatives C and F are no different. Environmental interest groups developed both of those incomplete alternatives which do not address the primary threats to sage-grouse, opting instead to use the NTT report to fill in the gaps. Alternative C's exclusive focus is to eliminate grazing on public land. Eliminating grazing is not only inconsistent with BLM's multiple use mandate, it also would likely exacerbate the primary threat of wildfire by increasing fuels across the range. These alternatives are inappropriate for several reasons, including the most important, that it does not address the primary threats. And these alternatives are outside the scope of Secretary Salazar's December 2011 statement that BLM needed to preclude the need to list while maintaining predictable levels of land use. Alternative F falls short too, which means BLM is spending time and resources analyzing two incomplete alternatives from environmental interest groups.

These alternatives do not adequately disclose the impact to the human environment as required by NEPA. This is either because BLM did not sufficiently take a "hard look" at this impact as required by NEPA, or they failed to disclose this impact with the public. Without disclosing these impacts or analyzing whether these measures will indeed meet the purpose and need, BLM failed to take the requisite hard look.

### C. BLM Did Not Take the Requisite "Hard Look"

NEPA has twin aims. First, the agency is obligated to consider every significant aspect of the environmental impact of a proposed action. However, that does not necessarily mandate a particular result. Instead, it just prescribes the process. If the adverse environmental effects of the proposed action are adequately identified and evaluated, the agency is not constrained by NEPA from deciding that other values outweigh the environmental costs.<sup>27</sup>

Second, it ensures the agency will inform the public that it considered environmental concerns-including human environmental concerns-in its decision making process.<sup>28</sup> Under NEPA, environmental impact statements must precede "major Federal actions" and agencies

---

<sup>27</sup> See *Strycker's Bay Neighborhood Council, Inc. v Karlen*, 444 U.S. 223, 227-228 (1980).

<sup>28</sup> *Baltimore Gas & Elec. Co. v. Natural Res. Def. Council*, 462 U.S. 87, 97 (1983).

must take “a ‘hard look’ at “environmental consequences” of their actions,<sup>29</sup> “sharply defining the issues and providing a clear basis for choice among options by the decision maker and the public.”<sup>30</sup>

To take the required “hard look” at a proposed project’s effects, an agency may not rely on incorrect assumptions or data in an EIS.<sup>31</sup> The agency is required to insure the professional integrity, including scientific integrity, of the discussions and analyses in environmental impact statements.<sup>32</sup> An agency’s EIS violates NEPA where it corrupts its environmental analysis with irrational assumptions or methodologies.<sup>33</sup> BLM violated NEPA by developing two alternatives (B and D) based on a document severely lacking in scientific integrity and comprised of irrational assumptions and methodologies. Alternatives C and F also incorporate elements of Alternative B, so those components must be set aside as well. Further, BLM’s economic analysis is inadequate and fails to provide meaningful public evaluation.

#### D. Multiple- Use

Under the Federal Land Policy and Management Act (“FLPMA”) BLM is required to manage the public lands on the basis of multiple use and sustained yield.<sup>34</sup>

Multiple use management’ is a deceptively simply term that describes the enormously complicated task of striking a balance among the many competing uses on public lands, ‘including, but not limited to, recreation, range, timber, minerals, watershed, wildlife and fish, and [uses serving] natural scenic, scientific and historical values.’<sup>35</sup>

We recognize the difficult task the BLM faces in managing public lands; however, three of the alternatives do not fit within BLM’s mission as a land manager. Alternative B is overly restrictive for infrastructure development and oil and gas activities. Alternative C would eliminate livestock grazing entirely and the addition of ACECs through Alternative F would restrict a variety of uses. Restricting uses or unnecessarily reducing agency discretion may seem to be the prudent course of action, but the result is BLM will lose the flexibility needed to anticipate future uses and needs of the country. Without a more complete analysis of how

infrastructure projects in the past decade have impacted the population of the species, such an overreaching proposal is unnecessary.

## II. The NTT REPORT IS NOT THE BEST AVAILABLE SCIENCE

The NTT Report is part of the BLM’s National Sage-Grouse Conservation Strategy. This strategy is highly bureaucratic, relying on the development of 15 or more teams. It is led by a sage-grouse coordinator that appears to have no real experience with either sage-grouse or sagebrush. This approach is heavily dependent on the National Technical Team. The goal of the National Technical Team was to ensure BLM management actions were effective and based on the “best available science.” Should not the test isn’t best available science it’s the data that matters and that data comes from the species manager – the State. To achieve that end, logically, the team would be comprised of highly qualified and knowledgeable scientists that would largely be independent of BLM. Instead, 78% of this 23 member team were federal employees; with 61% coming directly from BLM. Of the 23 members, none have more than 15 years of experience with sage-grouse or sagebrush or a substantial publication record. This is not for lack of highly knowledgeable, independent scientists to call on for such a study. In fact, at least two state and two university biologists, one of which Idaho heavily relied on, with a combined total of more than 100 years of experience dealing with sage-grouse were not involved. Out of twenty senior authors of chapters in the SAB volume on sage-grouse, only two were on the Technical Team. Neither of those two team members has more than 15 years working on sage-grouse. There were four authors of sage-grouse management guidelines, which were used in Alternative E, but none of these authors were on the Technical Team. This seems to violate the decision in *Western Watersheds* where the court found that while the Service consulted experts, the agency excluded them from the listing decision, thus violating the statutory requirement that “best science” be applied.<sup>36</sup> This creates “opacity when transparency is required.”<sup>37</sup>

In the Craters of the Moon litigation in 2012, Winmill declared in his decision that testimony established the NTT Report as the best available science on sage-grouse. However, this claim is disingenuous. What actually happened makes a less compelling case for the NTT Report. Judge Winmill made an assumption that the NTT Report was the best available science during a discussion of an objection between the BLM attorney and himself during questioning of *Western Watersheds* Project witness, Clait Braun. In fact, the only person in that trial to discuss the merits of the NTT Report was Clait Braun, a witness for the party *opposing* the BLM. No

---

<sup>37</sup> *Id.*

BLM or objective outside scientist testified about the NTT Report. Nor did the briefings or declarations discuss the scientific merit of the Report.<sup>38</sup>

In December 2012, Secretary Salazar responded to a series of inquiries from House Natural Resources Committee Chairman Doc Hastings regarding the ongoing RMP process with particular emphasis on the NTT Report.<sup>39</sup> Interior also attached an outside scientific review of the NTT Report that was highly critical of the 2011 draft report. For example, one outside scientist said the document was “an odd mix of scientific citations and policy decisions with no real tie between the two.”<sup>40</sup> Another said it “seem[ed] a strange blend of policy loosely backed by citations with no analysis of the science.”<sup>41</sup> The outside science review uncovered numerous flaws in the document and prompted the Governor’s Office of Species Conservation (“OSC”) to file a Freedom of Information Act Request with the Department of Interior, seeking all documents related to the development of the NTT Report. Interior only released documents under repeated threats of legal action and then, only in pieces, over a period of several months. OSC submitted the request in January 2013, but Interior did not respond in full until late summer 2013.

In June 2013, concerned over Interior’s inadequate response and uncertainty about the EIS process, Governor Otter wrote a letter to Secretary of the Interior Sally Jewell.<sup>42</sup> This letter served as an opportunity to inform Secretary Jewell of the importance of this present EIS process and also to share the information he learned from the FOIA response. Governor Otter pointed out that the NTT Report was legally flawed, scientifically flawed, incompatible with the COT Report, and procedurally deficient under Federal Advisory Committee Act requirements.

The FOIA documents reveal this group’s work significantly departed from the 2010 finding without disclosing any rationale. In fact, this report arbitrarily re-calibrated the environmental baseline for sage-grouse, established through the 2010 Warranted but Precluded decision. The State believes the BLM lost some perspective after that decision. In 2010, the Service determined that while sage-grouse *could* have been listed as “threatened,” its priority was low because threats were not as immediate as other “warranted” species. In fact, the only reason for the abbreviated timeline under which BLM and the Service are operating under is due to a court order that set arbitrary deadlines for the Service to make decisions on 250 candidate species. The Service’s 2015 deadline was not chosen due to any increased risk of extinction to the species, as evidenced by the number 8, instead, a settlement between the federal government and environmental activist groups.

<sup>42</sup> Appendix D

#### A. The NTT Report May Include Illegal Management Actions

Shortly before the release of the document, senior BLM staff expressed concern that the measures included in the NTT Report were inconsistent with the BLM's statutory duty under the Federal Land Policy and Management Act (FLPMA).<sup>43</sup> In fact, in a document titled, "How the NTT Report Changes the way BLM Operates," it clearly states that for the fluid minerals program: "The BLM would *preclude* fluid mineral development within designated priority sage-grouse habitat. Where the BLM cannot preclude development due to valid existing rights, the BLM *would attach* moderate to major restrictions to the development...."<sup>44</sup> Such a policy, reminiscent of the failed "Wildlands Policy", would result in approximately 40 million acres treated as *de facto* Wilderness.

A December 21, 2011 email exchange between Dwight Fielder (BLM Washington Office, Chief of Fish and Wildlife Conservation) and Pat Deibert (Service; National Sage-Grouse Coordinator) recognizes that some of the measures in the report were legally flawed, as described in a December 20, 2011 email from Jim Perry (BLM Washington Office, Senior Natural Resource Specialist). The BLM attempted to paper over this issue by adding a caveat that the document had not undergone policy or legal review.

In response to the caveat suggestion, Deibert states:

**"I would only consider adding this to a cover memo. This report is a science document period."**

Fielder to Deibert: "But, does the NTT really want to recommend something that is blatantly illegal?"

Deibert reinforces to Fielder: "**The NTT is providing the science. That does not change with the laws that BLM works under.**"

Fielder to NTT Team Leader Raul Morales: "I don't know how to respond to this and am thinking that I shouldn't."<sup>45</sup>

Granted, this type of exchange is common within the federal family; however, the troubling aspect is that the Department and senior-level BLM would knowingly release a flawed report. Equally troubling is the Service's insistence on measures more stringent than the science underlying their 2010 decision would require. The Service describes the threat level as

---

<sup>43</sup> Appendix I

<sup>44</sup> *Id.*

<sup>45</sup> *Id.*

“moderate” in the 2010 finding – a 40 million acre withdrawal is certainly unnecessary to preclude the listing of this species.

B. The NTT Report does not meet the Data Quality Act

The Data Quality Act requires that agencies “ensure public confidence and trust,” and uphold the “highest level of integrity....”<sup>46</sup> But the development of the NTT alternatives falls short of the high degree of transparency required by the Data Quality Act. Idaho is not the only State to raise these concerns. Other Western states such as Wyoming, Colorado, and Utah share these concerns.<sup>47</sup>

The released documents raised even more concerns for the State. The BLM deliberately kept the NTT Report close to the vest throughout its development. The team leader asked members not to share drafts of the document, even though some of those members represented States, and the team appears to have violated the requirements of the Federal Advisory Committee Act (FACA). Raul Morales, BLM Team Leader, actually commended the Team for maintaining a tight grip on the report:

I have been very impressed by the excellent job everyone on the NTT has done in keeping a very close hold on our report... You also let them know that since I understand that the API has been in to visit with Bob Abbey and Mike Pool over BLM’s National Interim policy make [sic] you wonder how they got word of our Interim Policy since the review for this policy was ‘restricted’ to our Federal and State family members. I can only imagine what will happen once the NTT Report is released.<sup>48</sup>

To qualify for an exemption from FACA, the State representatives to the NTT Team must have a letter from their respective governor.<sup>49</sup> These letters were sent only after the NTT Team met, developed a draft, and the issue was identified by the Office of the Solicitor on or around September 22, 2011. The Team leader, Raul Morales wrote

Regarding the NTT Report, I have been asked by our Washington Office (WO) to hold on to it for a bit longer. The solicitors have been talking and have decided, to be safe, that

<sup>46</sup> *Memorandum on Scientific Integrity from the Administration of Barack H. Obama for the Heads of Executive Departments and Agencies*, Fed. Reg. 10671 (Mar. 11, 2009), available at: <http://www.gpo.gov/fdsys/pkg/FR-2009-03-11/pdf/E9-5443.pdf>. (“Obama Memorandum on Scientific Integrity”)

<sup>47</sup> Appendices K, L, and M

<sup>48</sup> Included in Appendix I

<sup>49</sup> 2 U.S.C.A. § 1534(b). *See also* Idaho Wool Growers Assoc. v. Shafer, 637 F.Supp.2d 868, 875-876 (Idaho 2009).

they are going to want letter from the Governor's [sic] office from OR, UT, NV, CO to go along with Governor Otter's letter...<sup>50</sup>

This action is disconcerting to the State as Governor Otter only appointed a representative to provide "technical advice" and not to make management recommendations. Failure to obtain the FACA letter in a timely manner coupled with such an implicit restriction on the Team's ability to share the draft, provided governors no opportunity to evaluate whether appointees were actually adhering to the instructions of their sponsor states.

And, alarmingly, the NTT appears to tailor the recommendations to be consistent with legal settlements with environmental litigants, rather than an unbiased assessment of conservation alternatives. In an email dated December 17, 2011, Raul Morales states:

The solicitors were struggling with having a Policy recommendations piece in the NTT report due to ongoing negotiations with current litigants over a lawsuit affecting 16 BLM LUP's. So we removed the Policy recommendation piece from this draft report...the wording describing some conservation measures is different, again to address solicitors [sic] concerns...<sup>51</sup>

This seems very pre-decisional. The State has serious concerns with the integrity of the peer review process and the NTT Report itself as a result of these discoveries and numerous others that will be discussed in greater detail in the following pages.

### C. The NTT Report is Not the Best Available Science

The NTT Report's sweeping measures were an effort to preclude development across 40 million acres; often supported by nothing more than "best professional judgment" instead of credible scientific information. At some point, the "science" crossed into advocacy.

The primary objective of the NTT is "to protect sage-grouse habitats from anthropogenic disturbances that will reduce distribution or abundance of sage-grouse" (NTT at 7). To achieve the primary objective the NTT sets forth sub-objectives. Two of the four sub-objectives assert that 70% of the range within priority habitat needs to provide "adequate" sagebrush habitat to meet sage-grouse needs, and that discrete anthropogenic disturbances in priority habitat be limited to less than 3% of the total sage-grouse habitat regardless of ownership (NTT at 7). But the report does not address the issue of scale very clearly, so the accuracy of this data is questionable. Nor do these recommendations account for State specific differences as noted in

---

<sup>50</sup> Appendix I

<sup>51</sup> *Id.*

Gov. Mead's letter.<sup>52</sup> For example, habitat loss and accompanying population decline due to infrastructure development in Idaho does not resemble the on-the-ground reality.

The outside science reviewers' concerns related to the lack of discussion on limiting habitat does not appear to have been adequately addressed, and is a significant omission because it fails to provide a mechanism for prioritizing management efforts and assumes the same risks are representative across the entire range.<sup>53</sup> The NTT and "Appendix A" of the DEIS fail to provide reason or support for consolidating all sage-grouse seasonal habitat range-wide, regardless of relative importance or quality to sage-grouse populations.

### 1. Internal BLM Staff Questioned the Credibility of Science

Some NTT Team members even questioned the hastiness of the process. On September 16, 2011, Robin Sell (CO) stated,

I don't feel like we really got into (or had time to discuss) the current science out there on SG...so I would propose that the researchers and biologists on the NTT --maybe a few other bios if appropriate – meet again in the next months (maybe Nov/Dec) for about 3 days to have a frank discussion on various studies/papers out there...the good, bad & ugly so to speak. *It would not hold up the current document...* The reality, the science folks were not going to have this kind of discussion with program leads in the group, and our timeline did not allow this *review and scrutiny*. But I think this kind of full disclosure will really benefit the Bureau, FWS, and SG down the road.<sup>54</sup>

On November 7, 2011, and acutely aware of these shortcomings, Team Lead Morales recounted the NTT's response to the group.

A small team of us completed changes to the report that reflected *some* of the review made by outside scientists commissioned by NDOW Director, Ken Mayer. The outside scientists *only reviewed the Conservation measures section of the report* and not the Policy recommendations. Our team only addressed the quick comments made by the science team. Some of the "longer" term comments (as depicted in the text box to the right) made by the science team *were not addressed* and can be discussed by the National Policy Team at some point to determine the need for our conservation measures to address some of the science "short falls" brought up by the science team.<sup>55</sup>

If this is indeed was a "science" document comprised of "scientists" –the science underlying these "game-changing" measures should have been completely validated before

---

<sup>52</sup>

<sup>53</sup> Appendix B.

<sup>54</sup> Appendix I.

<sup>55</sup> *Id.*

releasing the document. Notwithstanding the fact that BLM had almost three more years until the RMP revisions were due, the agency nonetheless felt it mission critical to release a flawed document.

On December 13, 2011, Morales updated the group regarding feedback he received from the National Policy Team.

...[W]hat the NPT charged me to do was to convene a small team of NTT members (mainly scientist folks) and with the help of a WAFWA appointed scientist (former Colorado Division of Wildlife Director, Tom Remington) they asked that we further strengthen the science underpinnings to our conservation measures... This small team met last week in Phoenix for 2½ days and we are currently in the process of formatting and updating the NTT Report to reflect the efforts of the science team last week... Due to concerns by solicitors in DC the NTT report will look different. However *the content is generally the same* and due to the science review we did make changes to the Goals and Objectives section, some conservation measure[s] in fluid minerals have been updated (i.e. 2.5% has been changed to 3% with rationale)... the solicitor concerns with the Policy recommendation piece stems from *ongoing litigation discussions* they [are] currently having with litigants over BLM's recently completed LUPs.<sup>56</sup>

In sum, while it seems like the NTT Report did change between the initial November draft based on solicitor and outside science review, the record reflects a fatally flawed draft document that was “generally the same” as the content in the final report.

## 2. The NTT Report Does Not Provide Adequate Support for its Conclusions

The NTT Report has been used to support anthropogenic disturbance caps of less than five percent and total disturbance caps of less than 30 percent without any scientific data that they are: (1) scientifically defensible; (2) achievable; (3) would result in stable GSG populations; (4) would not result in irreparable harm to other species; and (5) would not unnecessarily have a negative effect on local economies.

The NTT report recommended numerous one-size-fits-all regulatory prescriptions, and made no allowance for recommendations for including local sage grouse conservation plans (i.e. county-level, working group, or private land) that have tailored conservation measures to local conditions, including unique habitat and threats, and socio-economic factors.

The new best management practices (BMP) proposed by the NTT are unnecessarily restrictive, are not supported by scientific information, and do not address specific cause and effect mechanisms that are known to be deleterious to sage grouse. The imposition of new

---

<sup>56</sup> Appendix I

BMPs was made without any tracking and testing of the effectiveness of currently required BMPs.

#### D. The NTT Report Does Not Account for Developments in this Issue

The NTT Report was published in December 2011; over two years ago. Since then, the Serviced published its final version of the COT Report and the State submitted Alternative E to BLM. These documents should all be used together when determining what is the “best available science” for sage-grouse management. Western Association of Wildlife Agencies (“WAFWA”), agreed, stating in a letter that the NTT alone is not the best available science for sage-grouse.<sup>57</sup>

According to WAFWA, the NTT report provides valuable information, but it does not reflect all of the current science, especially that found in the Studies in Avian Biology volume “Greater Sage-Grouse: Ecology and Conservation of a Landscape Species and Its Habitats” and other recent peer-reviewed publications.<sup>58</sup> Idaho did not adopt or endorse any one publication to the exclusion of the others in developing Alternative E. Instead, Idaho believes that a number of peer-reviewed publications collectively constitute the best available science for sage-grouse and should be used in our effort to conserve the species and preclude the need for listing under the Endangered Species Act (ESA).

For example, management and regulatory mechanisms should be based upon the best available science, reflected in multiple peer-reviewed publications and which embrace empirically derived knowledge and local variation in environmental conditions. This approach provides the best strategy for near and long-term management of sage-grouse and provides the best opportunity for precluding the need to list the species under ESA.

In addition, the “one-size-fits-all” approach in the NTT Report is at odds with the sage-grouse guidelines paper cited favorably elsewhere in the January 15 letter. The authors of this paper argued that “Because of gaps in our knowledge and regional variation ... the judgment of local biologists and quantitative data from population and habitat monitoring are necessary to implement the guidelines correctly.”<sup>59</sup> The guidelines paper concludes “Local differences in conditions that affect sage-grouse populations may occur and should be considered in conservation plans.” This is the approach we have taken in Idaho and have recommended the BLM and U.S. Forest Service use to revise land use plans. BLM needs to disclose these issues and be consistent with WAFWA’s interpretation.

<sup>58</sup> *Id.*

<sup>59</sup> Appendix J

### III. COMPARISON OF THE CO-PREFERRED ALTERNATIVES

The Service believes States should be especially important partners in managing public land and natural resources. States in the West own and manage large tracts of land with tremendous social and biological value. State governments also frequently pioneer innovative land management programs and policies and exert considerable influence over statewide economic development and private land use, both of which significantly affect natural resource management. Accordingly, following the Service's example, the BLM must not discount the insight of state conservation agencies as the wildlife manager of this particular species.

The Service identified habitat destruction as the result of infrastructure development as the primary threat to sage-grouse. Wyoming's Core Strategy focuses on this threat because 50 % of the sage-grouse population lives within Wyoming's boundaries. Wyoming focused on this threat because of the oil and gas production occurring in its state. Idaho has not seen the effects of oil and gas production nor is development occurring at an unsustainable rate across sage-grouse habitat. In fact, infrastructure development of the magnitude raised by the Service is not significant. Thus, for the Great Basin states, the other primary threats of wildfire and invasive weeds may be more relevant.

Accordingly, the best alternative for this Sub-Basin region should have a strong strategy for mitigating the effects of wildfire both in the short- and long-term. While better than Alternative B, C, and F, Alternative D still unnecessarily restricts large-scale infrastructure development across 8.3 million acres within Idaho, appears to lack a coherent strategy to address wildfire, and incorporates many of the same BMPs from the flawed NTT Report. In fact, the primary distinction is Alternative D utilizes an adaptive management construct. The rest of the measures are nearly the same, or in some cases more restrictive. Thus, if the NTT Alternative, (Alternative B) does not meet the purpose and need, Alternative D similarly cannot meet the purpose and need either. Alternative E is the only alternative that proposes a strategy that meaningfully helps the sage-grouse and preserves predictable uses of land, which is an integral part of BLM's mission to maintain multiple uses on public lands.

#### A. Management Zones and Conservation Areas

In Brian Kelly's April 2013 letter to the Governor, he identified Alternative E's four Foundational elements as consistent with the General Conservation Objectives and Specific Conservation Objectives related to Priority Areas for Conservation (PACs) in the COT report. These foundational elements include the designation of a Core Habitat Zone, which is home to 73% of the male sage-grouse population in Idaho. The designation of CHZ also addresses the

primary threat of infrastructure development by prohibiting it, but providing a process for limited exceptions. The Service commended the State for ensuring that any exception must still meet the standards for development in the IHZ.

The second foundational element was the designation of the IHZ. This zone includes 22% of the male sage-grouse in Idaho. This zone captures the intent of the COT report by stopping population decline in that while infrastructure is permitted, it is permitted in a way that must demonstrate it will not affect the population trend for the relevant Conservation Area. It also serves an important role as a buffer for habitat loss due to fire.

Alternative E's Conservation Areas and management zones include the total habitat identified as PACs. This is reflective of focusing on responding to what the Service has identified as the most serious threats, and the most crucial habitats for sage-grouse. Alternative E prioritizes focusing resources on the most important regions for sage-grouse. Alternative E's map meets the COT's objective of retaining sage-grouse habitats within PACs. .

Four conservation areas in which adaptive triggers are individually applied ensures a high level of sensitivity to change, that will translate to more timely changes in management if necessary, which creates an enhanced ability to ensure the population objective for Alternative E is met state-wide.

In contrast, Alternative D has 10 Population Areas, that with individually applied adaptive triggers. While some of these Population Areas align well with Alternative E's Conservation Areas, several go beyond Alternative E's designated habitat and are relatively small areas. For example, Alternative D's Sawtooth population is roughly 27,000 acres. Tripping a trigger in this area is likely to occur often, due to its small size. Further, a trigger in this small of an area is likely not going to impact sage-grouse in the same way as a trigger would in a larger Population Area, like the Mountain Valleys population, which is over 4 million acres. This disparity makes it difficult for BLM to prioritize resources and land management decisions.

Further, if BLM adopts Alternative D's Population Areas as its method of delineating sage-grouse habitat, it may unwittingly give itself an unfunded mandate. Currently, little to no monitoring occurs in the East Central Idaho, Weiser, and the Sawtooth populations. This is for a variety of reasons, only one of which is funding. The primary reason for the lack of monitoring is that these populations are small and relatively unimportant to the overall sage-grouse population in Idaho. Thus, even if funding was available to monitor these areas, it would be very hard to justify diverting resources to these areas. Yet, Alternative D delineates all three of its zones in each of these populations, thus *requiring* monitoring to determine if triggers have been tripped. This is unnecessary and an unwise use of BLM resources. In contrast, Idaho Fish and Game currently monitors all of the lek routes in Alternative E's CHZ and IHZ, and has requested additional funding from the State to improve this monitoring. This means that Alternative E's

trigger program can be implemented immediately, with no additional funding from the State or from BLM, because IDFG is already collecting the data required to do so.

Alternative D's Population Areas are an unrealistic method of categorizing sage-grouse habitat. In fact, Alternative D includes protections for an additional 700,000 acres. Alternative D's Priority zone contains 7 million acres and the medial zone has 1.3. This is in contrast to Alternative E's more balanced approach of 4.9 million acres in CHZ and 2.7 million acres in IHZ. As Alternative D is written, its trigger program is rendered largely ineffective because tripping a trigger only extends protection to an additional 1.3 million acres. Alternative E is able to protect twice that, so triggers will actually have an impact. Alternative E includes 95% of the sage-grouse population in Idaho within CHZ and IHZ's 7.6 million acres. Thus, BLM's inclusion of an additional 700,000 acres equates to saving at best, a few more percentage points, without affecting a listing determination. BLM would be required to spend time and effort monitoring areas that the Service has not identified as significant for sage-grouse.

BLM argues that these areas are important for "connectivity" for sage-grouse, as the bird cannot appreciate the boundaries the government has created for it. However, the Service still has determined that these areas are relatively unimportant to the entire population and has excluded these areas from its PACs. It is unclear why BLM continues to insist on expending limited resources on these additional acres, when both the Service and the State identified other areas as higher priorities. This is unnecessary and an unwise use of BLM resources. Alternative E's CHZ contains 73% of the male sage-grouse population, whereas GHZ contains 5%. Alternative D would require BLM to expend time and resources areas outside of PACs because it has designated these areas as higher priority. Alternative E's Conservation areas enable resources to be allocated to the most important areas for sage-grouse, ensuring that the Idaho population remains viable.

#### B. Adaptive Triggers allow BLM to Manage the Primary Threats

The Service recognized the importance of Alternative E's measurable population objective, and how the Alternative utilizes monitoring to ensure the objective is met. It also sets metrics that trigger changes in practices or review of current practices to ensure the Strategy's conservation objective is met long-term. Alternative E's monitoring program and triggers meet's the COT's objective of implementing appropriate restoration efforts if PACs are lost to catastrophic events. It also meets the objective of restoring and rehabilitating degraded sage-grouse habitat within PACs.

Alternative E's adaptive triggers also meet the COT's objective to re-evaluate the status of PACs and adjacent sage-grouse habitat at least once every 5 years or when important new information becomes available. Alternative E accounts for this through the annual habitat monitoring and corresponding adaptive triggers. The Implementation Team will meet annually to discuss loss of habitat and/or population and make appropriate recommendations as needed.

For both Alternative D and E, the triggers are individualized per conservation or population area. That means in Alternative D, a hard trigger, requiring immediate management change would become operative in any of the ten areas. This makes Alternative D's trigger mechanism extremely sensitive. The Governor is not sure that this type of sensitive trigger is actually implementable by BLM. Further, BLM has not provided any scientific justification for this sensitive of a trigger. In contrast, Alternative E's triggers are spread over much larger areas, providing a more manageable, practical mechanism for changing management when necessary. Even Alternative E's trigger mechanism is conservative, and more sensitive than necessary. However, the Governor believed it was important to be proactive in addressing and minimizing threats across sage-grouse's range. Alternative D goes too far and will ultimately be too sensitive to allow for efficient allocation of time and resources.

### C. The Implementation Commission

Both alternatives include a team that is designed to oversee the trigger strategy of each plan. However, Alternative D's Technical Advisory Team (TAT) cuts out the long term role of the state to help on triggers that apply across all jurisdictions. The other missing component of Alternative D is the ability for stakeholders to review infrastructure projects and recommend appropriate compensatory mitigation before a project proponent submits their permit application to the BLM.

Alternative E's Implementation Commission makes recommendations on future on-the-ground management actions following the record of decision. This group will be similar to Idaho's Roadless Commission.<sup>60</sup> Should the BLM select Alternative E, the State anticipates through a Memorandum of Understanding with BLM and the US Forest Service, the State through the Office of the Governor will become a cooperating agency. Governor Otter by Executive Order will establish the Implementation Commission, similar in composition to the original Task Force, to serve in an advisory capacity. The Commission will submit management recommendations to the Governor, who will then make management recommendations to BLM and the Forest Service. The group will be comprised of agency officials from The Governor's Office of Species Conservation, the Idaho Department of Fish and Game, the BLM, the US Forest Service, and the US Fish and Wildlife Service. The relevant federal agency would still retain discretion over the ultimate decision.

Bi-annually, the Commission will hear presentations from a technical team from the Idaho Department of Fish and Game and BLM on the population and habitat data collected. If the data shows that a soft trigger has tripped, the Commission may decide whether any action should be taken, and make recommendations to the Governor. The Governor will use that

---

<sup>60</sup> See Idaho Executive Order 2011-09, *available at*: <http://adminrules.idaho.gov/rules/2012/EXOOrders/2011-09-exo.pdf>

information to make a recommendation to the BLM or Forest Service regarding any potential management changes.

If the data shows that a hard trigger is tripped, as defined above, the Commission must recommend making management changes based on an analysis of the threats causing the decline. For example, the management provisions of the CHZ would also apply to the IHZ. However, the Commission may decide additional management changes are necessary to respond to that particular hard trigger.

Another part of the Implementation Commission will focus on infrastructure projects. This group, will be established in the same way, but will be comprised similarly to the Sage-Grouse Task Force. This group will review potential infrastructure projects and mitigation packages and will make recommendations in the manner described above. This group will meet as needed to review potential infrastructure projects. And this group will review whether projects fall into a category that would potentially allow them to develop in CHZ. However, this group's role is to allow the permit applicant the opportunity to explain the benefits and burdens of such a project. They will also assess a project's mitigation proposal and will determine the appropriate cost for both direct and indirect effects. They will also decide what mitigation projects will be implemented for each development. This group will then work with the trigger group of the Commission to utilize mitigation for priority restoration areas.

#### D. Primary Threats

##### 1. Infrastructure

Alternative E's plan for Infrastructure development again allows BLM to focus its resources on the most important habitat, which allows greater flexibility for economic development and growth in less important areas. While very little development has occurred within CHZ in the last ten years, or that BLM has disclosed in the document, there does not appear to be any new infrastructure projects on the horizon. Based on the actual impacts of this threat, Alternative E provides a more properly tailored approach specific to Idaho than Alternative D. In CHZ, infrastructure is generally prohibited, unless a project proponent can meet several stringent criteria including compensatory mitigation. These criteria are likely to ensure infrastructure projects do not adversely impact the species in CHZ. In contrast, Alternative B does not provide an exemption process and as suggested above by emails discussing the NTT Report, may restrict beyond BLM's authority.

Infrastructure development in IHZ is slightly more flexible because of this zone's dual role as a short-term hedge against losing birds and/or habitat in the CHZ and a meaningful opportunity to develop projects. These projects are generally permitted if they meet certain requirements, particularly, whether the project demonstrates a high value benefit to the State. Additionally, the project proponent must also show that the project cannot be reasonably

achieved outside of IHZ, and to the extent practicable, it must co-locate the project with existing infrastructure. The project should not result in undue habitat fragmentation or other impacts that cause a decline in the population of the species within that Conservation Area. The project proponent must also mitigate unavoidable impacts with an appropriate compensatory mitigation plan. Alternative D's "medial" habitat intends to create a similar buffer zone, but it is too small to have a substantial impact when a trigger is tripped. It is also very restrictive, which means fewer developments and less opportunity for mitigation.

Alternative D is unnecessarily restrictive for an additional 2.1 million acres in their Priority designated areas, and 700,000 additional acres in total. In CHZ, infrastructure is generally precluded except for valid existing rights, rights and/or incremental upgrade and/or capacity increase of existing subject to some limitations (2-82). Essentially, CHZ is as restrictive as is legally allowed. The CHZ protects 73% of the male lek population. Infrastructure is generally permitted subject to certain criteria in IHZ. This is a practical approach, reflective of what sage-grouse actually need, in contrast to blanket restrictive policies across a large landscape. The CHZ and IHZ were the result of Dr. Jack Connelly's extensive study of sage-grouse and his determination of how resources could be prioritized to ensure maximum viability and long-term preservation. This is also a realistic approach to future economic development in Idaho, being flexible to accommodate the needs of Idaho as its population grows.

Alternative E also applies many of the conservation measures identified in the COT's energy development objective to design energy development to insure that it will not impinge upon stable or increasing sage-grouse population trends. The COT conservation measures stress avoiding energy development in PACS. However, the COT also recognizes that due to valid existing rights, avoidance is not always possible. If development must occur, it should only be in non-habitat areas, including all appurtenant structures, with an adequate buffer that is insufficient to preclude impacts to sage-grouse habitat from noise, and other human activities. If development must occur in sage-grouse habitats due to existing rights and lack of reasonable alternative avoidance measures, the development should occur in the least suitable habitat for sage-grouse and be designed to ensure at a minimum that there are no detectable declines in sage-grouse population trends. Alternative E addresses these issues in its infrastructure measures by restricting development in CHZ, with an exemption process for valid existing rights, and by allowing more flexibility for development in IHZ and GHZ. This is coupled with adequate monitoring and adaptive management.

The final alternative should provide the discretion for BLM to be a good neighbor by achieving a shared responsibility for siting of infrastructure on federal, state and private lands. Alternative D will not permit BLM to be a good neighbor by requiring the private lands to accept most of the burden. However, Alternative E would give the BLM the tools to be a good neighbor while protecting the habitat necessary for sustaining a viable population of the species.

i. Mitigation

Alternative D's mitigation strategy is "no net unmitigated loss" which means at best, a 1:1 ratio of acres. However, Alternative D essentially excludes infrastructure in its most restrictive management zone, so there would be no real opportunity for mitigation. Further, "no net unmitigated loss" is vague. BLM needs to clarify concerns such as issues of habitat quality within a particular category. For example, Alternative E's CHZ includes restoration habitat that is either grassland or invaded by juniper. Restoration of these areas to meet sage-grouse habitat needs doesn't change the number of acres in CHZ and so would not meet the "net" definition. This description does not specify whether mitigation or restoration of lower quality habitat could allow it to become higher quality habitat, thus meeting "net" criteria. Further clarification of how project proponents' mitigation strategies meet these criteria is necessary. Protection mitigation should also be clarified. This type of mitigation can protect thousands of acres from burning, but could potentially not meet the "net" criteria. This definition does not define how maturation of seeded restoration projects is calculated. And this is only appropriate for large-scale infrastructure, not other activities. Overall, this idea needs to be fleshed out to determine whether it is an effective strategy for infrastructure development and mitigation. The Governor does not support mitigation in advance of a project. This method increases the likelihood of litigation, especially if this process moves forward without a role for the State of Idaho. Governor Otter does not believe that disturbance caps are appropriate for Idaho; however, the concept of "no net unmitigated loss" needs further clarification and refinement before the state can support it.

2. Wildfire

Wildfire is a difficult threat to prevent and control. However, the adaptive construct of Governor's Alternative provides a mechanism to prevent sage-grouse from any likelihood of becoming endangered in the foreseeable future. The short-term use of triggers and zones will provide the time to develop more proactive measures that demonstrate long-term success on the landscape.

The employment of specific, more aggressive wildlife and invasive species management practices to prevent further encroachment into the CHZ and IHZ should be driven by local planning efforts at the field office and ranger district level. As referenced above, the creation of RFPAs throughout the Sage-Grouse Management Area (SGMA) is a regulatory mechanism that will ensure better and faster initial attack on wildfires threatening the CHZ and IHZ through the employment of additional trained firefighters and resources in rural parts of the SGMA. From a regulatory mechanism standpoint, Idaho Code Chapter 1, Title 38 was recently amended to allow for the creation of Rural Fire Protections Associations (RFPAs). Additionally, this spring the Idaho Legislature authorized funding to help cover start-up costs for 4 RFPAs in southwest Idaho.

The emphasis for fuel break prioritization should be in areas within the Wildland-Urban Interface (WUI) where human life and safety are at risk. For instance, the Boise District BLM is currently in the planning phase of a fuel-break project within the Interstate-84 corridor between Boise and Mountain Home, Idaho referred to as the “Paradigm Project”. The idea behind the project is to strategically place and improve upon fuel breaks within this corridor, therefore keeping wildfires to more manageable sizes thus requiring fewer firefighting resources. The State of Idaho supports this project, as well as other similar fuel-break projects designed to secure the WUI and free up firefighting resources to be focused on providing initial attack on wildfires in areas that have the potential to impact greater sage-grouse habitat within the CHZ and IHZ. After securing the WUI, prioritization of fuels breaks should go to areas of high human ignition based upon ignition data and maps produced by BLM districts and field offices.

As will be discussed in greater detail by comments provided by the Idaho Department of Lands, Alternative E is the only alternative that provides certainty of implementation for its measures. The amended July 1 fire table, on page D-157 of Appendix D, is divided into three categories-prevention, suppression, and restoration. This table identifies specific actions, where they will be implemented, how they will be implemented, how much of a specific action is necessary, when it will be implemented, and what mechanism will be used to implement the action. Strategies to develop these specific actions will be completed at the most local level of management. This gives local fire managers a framework under which to operate while still providing flexibility for them to make appropriate decisions for their area.

Alternative E’s prevention measures include fuel breaks, fuels reduction, and fire restrictions and closures. Alternative E requires that strategy and associated NEPA for these prevention efforts should be completed within two years of signing the Record of Decision for this current EIS. Fire suppression measures include creating additional Rural Fire Protection Associations (RFPAs), response time analysis, suppression capacity analysis, water capacity analysis and implementation, and firefighter education on the importance of protection CHZ and IHZ. These measures should be implemented within one year of the Record of Decision for this EIS.

Restoration efforts include reseeding, sagebrush seedlings, invasive annual grass expansion prevention, reseeding on State owned lands by federal contractors, and conifer removal on state owned lands by federal contractors. A reseeding strategy must be completed within one year of signing the Record of Decision and implementation of restoration to offset wildfire losses in CHZ and IHZ since 2011 must be completed within 2 years of signing the Record of Decision. Offset models of wildfire losses in CHZ and IHZ should be completed 3 years after signing the Record of Decision. A sagebrush seedlings strategy should be completed within one year of the Record of Decision. Planting should be completed in CHZ within two years of signing the Record of Decision and within 3 years for IHZ. For invasive annual grass prevention, modeling and strategy should be completed within 1 year of signing the Record of

Decision. Techniques to prevent further spread in CHZ and IHZ should be implemented within 2 years of signing the record of decision. Offset of annual grass spread in CHZ and IHZ should occur within 3 years of signing the Record of Decision. A Memorandum of Understanding (MOU) for reseeding on state-owned lands should be signed within 1 year of the Record of Decision. State lands should be reseeded within one year of a wildfire. An MOU for conifer removal should be signed within 1 year of the Record of Decision. Conifer removal on state lands should occur within the timeframe of federal projects.

Alternative E addresses the COT's conservation objective to retain and restore healthy native sagebrush communities within sage-grouse range. Alternative E applies the COT's conservation measure to design and implement restoration of burned sagebrush habitats to allow for natural succession to healthy native sagebrush plant communities. This is also addressed through Alternative E's habitat monitoring program and adaptive triggers.

The COT also stresses the importance to immediately suppress fire in all sagebrush habitats. Alternative E addresses this in both CHZ and IHZ and also through its monitoring and adaptive management.

Alternative E addresses the COT objective to maintain and restore healthy native sagebrush communities. Alternative E shares the conservation measure to reduce or eliminate disturbances that promote the spread of invasive species. Alternative E further supports this measure through monitoring and adaptive triggers. Alternative E also requires best management practices for construction projects in and adjacent to sagebrush habitats to prevent invasion.

#### E. Alternative E Addresses Secondary Threats in the Appropriate Context

##### 1. Improper Grazing

Alternative E best addresses the secondary threat of improper grazing. Alternative E provides a mechanism for renewing grazing permits in the most important sage-grouse habitats first and provides an objective way of measuring whether permit holders are meeting the rangeland health standards most important to protecting and conserving sage-grouse habitat.

There are two pathways where this management framework is applicable: (1) in conjunction with scheduled term grazing permit renewals; and (2) where the adaptive regulatory trigger has been tripped (as described in section 3) and livestock grazing is identified as a potential causal factor. See Concurrence Request at 6.

Under the first path, the Governor's Alternative provides a framework for BLM to assess Standard 8 and Standards 2 and 4 based on the Conservation Objectives Team Report (COT Report) with respect to sage-grouse. As described in more detail below, if no trigger has been tripped across a Conservation Area, the Standard 8 analysis for sage-grouse should be a straightforward process.

Standard 8 of the IRHS establishes that the habitat important to threatened and endangered plants and animals meet a “maintain a viable population” threshold with respect to livestock grazing.<sup>61</sup> Consistent with the overall approach of the Governor’s Alternative, utilizing an outcome-based conservation strategy within an adaptive construct, the State of Idaho has identified an overall population target buttressed by regulatory mechanisms and adaptive regulatory triggers. Where these population and habitat triggers are being maintained within a Conservation Area, there is a rebuttable presumption that current grazing systems are adequate to maintain viable sage-grouse populations; and therefore, absent compelling information, no further changes to the grazing systems will be required pursuant to the Standard 8 analysis with respect to sage-grouse.

There are several similarities and consistencies between Alternative D and Alternative E for grazing. However, the most important distinction between the two alternatives is that Alternative D does not provide certainty of implementation. Instead, Alternative D and the measures pulled from Alternative B merely provide best management practice suggestions, with no mechanism to ensure that they will be implemented. Further discussion of these similarities and differences can be found in comments submitted by the Idaho Department of Agriculture.

The COT’s objective for grazing management focuses on consistency with local ecological conditions that maintain and restore healthy sagebrush shrub and native perennial grass and forb communities and conserve the essential habitat components for sage-grouse. Areas which do not currently meet this standard should be managed to restore these components. Adequate monitoring of grazing strategies and their result, with necessary changes in strategies, is essential to ensuring that desired ecological conditions and sage-grouse response are achieved. Livestock number must be managed at levels that allow native sagebrush vegetative communities to minimally achieve Rangeland Health Standards. Alternative E addresses this objective by prioritizing the assessment process on sage-grouse population change. Alternative E would also implement desired habitat conditions and initiate measures to maintain essential habitat components. Monitoring and associated triggers are also integral to this objective.

Alternative E is consistent with the COT’s determination that range management structure should be designed and placed to be neutral or beneficial to sage-grouse. Alternative E addresses this through its identified Best Management Practices. Idaho provided the definitive science on fences and sage-grouse and is now engaged in long term work to better understand the relationship between livestock grazing and sage-grouse. Through this and other efforts like it, Idaho is leading the charge on sage-grouse conservation.

Alternative E is also consistent with the COT’s objective to protect sage-grouse from negative influences of grazing by free roaming equids. This means managing free roaming equids at levels that allow native sagebrush vegetative communities to minimally achieve PFC or

---

<sup>61</sup> 43 C.F.R. Subpart 4160

Rangeland Health Standards. Alternative E maintains rangeland health standards, but also provides BLM with an objective way to measure these standards

## 2. Recreation

Idaho believes the conservation measures identified in both Alternative D and E are relatively compatible for Recreation management. However, this is discussed in greater detail in the comments provided by the Idaho Department of Parks and Recreation.

## 3. West Nile

The State does not find any conflicts between the conservation measures in Alternative D and E for the prevention and management of the West Nile Virus

## F. Alternative A Is Incomplete

BLM does not include existing conservation efforts, such as the Rangeland Fire Protection Associations when discussing the current status of sage-grouse conservation. These associations operated for the entire 2013 fire season; putting out fires before BLM could even arrive. Yet, this was not included in the Alternative A's discussion. BLM did not include any discussion of this effort, despite it being a collaborative process between the agency and landowners across Idaho. BLM's analysis should have included the impacts these associations already had on the ground.

# IV. CHAPTER 4 ANALYSIS

## A. The Impact Analysis is Insufficient

The Chapter 4 impact analysis is insufficient. This was an issue that the State attempted to address throughout the Administrative Draft phrase of the document, but still has not been satisfactorily improved. This is primarily because this chapter ignores the beneficial impacts of monitoring, adaptive management and how the specific conservation measures for each threat would be implemented.

### 1. Adaptive Management

The adaptive management strategy is an integral component of Alternative E. Without this mechanism, Alternative E is just a list of conservation measures, no more implementable than anything BLM was doing before the 2010 determination. However, the addition of this component provides certainty of implementation and measurable reduction of the impacts of current threats on sage-grouse. This concept, as discussed above, allows BLM and the State to respond to present challenges and to react appropriately when new issues arise. The adaptive

management mechanism is also a crucial part of how conservation measures for each threat are implemented. To discuss them separately leads to an incorrect analysis and a misleading conclusion about the impacts of Alternative E. In fact, these alternatives are quite distinguishable in their effects on sage-grouse conservation.

Further, the BLM cannot just make conclusory statements as, “Impacts are similar to those under Alternative B” or “Same as Alternative A” with no statements to support the claim.

Alternative E impacts are unique from Alternative B in that Alternative E includes a mechanism that provides certainty of implementation for conservation measures for all threats. The adaptive triggers allow the State and BLM to keep a close eye on what happens in sage-grouse habitat and to respond accordingly.

## 2. Implementation Team

As discussed in greater detail above, the Implementation Team operates the adaptive management strategy by receiving the data collected by Idaho Fish and Game and the BLM and makes recommendations to the Governor who then advises BLM and the Forest Service on any necessary management changes. This happens annually. This group’s existence ensures that when management changes are necessary, they are reasonably certain to occur. However, the impact analysis does not accommodate for this fact and thus, the analysis is incorrect as to the effectiveness of Alternative E.

## 3. Specific Measures

When measured in isolation any of the conservation measures outlined in Alternative E very likely produce similar results as those identified in Alternative B and D. However, these measures cannot be assessed in a vacuum, as BLM did here. Instead, these measures should be analyzed in relationship to the triggers that make them operational. A conservation measure is just an idea, unless a management plan states how it will be implemented and then actually implements it.

### i. Wildfire

The July 1 Clarification and Refinement letter sent to BLM by the Governor outlines a wildfire strategy that focuses on prevention, suppression, and restoration. These measures also require BLM to take certain actions within one year of signing the Record of Decision. This strategy provides certainty that the measures will be implemented and that action will be taken.

Additionally, in 2012, Idaho, in collaboration with BLM established Rural Fire Protection Associations. These Associations, discussed in further detail in the attached comments from the Idaho Department of Lands, have already been established, and funded by the Idaho State Legislature and assisted BLM in the 2013 fire season. Additional Associations continue to be added and IDL recently established a full time position in their office to manage them.

In contrast, under Alternative B and D, “impacts on sage-grouse from fire suppression activities would largely be the same as Alternative A.” This determination is shocking, considering inadequate regulatory mechanisms for wildfire control was the primary purpose for the “warranted but precluded” determination. However, Alternative B does not alter the status quo. BLM reaches the same conclusions for Alternative D, saying on page 4-55, “overall, Alternative D would reduce impacts to wildfire similar to Alternative B.” If the measures from this alternative are selected for the final, it is likely the Service will be forced to list sage-grouse as threatened, because regulatory mechanisms are still inadequate for dealing with the primary threats. This goes against BLM’s original objective for this EIS, handed down to them from Secretary Salazar- “preclude the need to list while maintaining predictable levels of land use.”

It may be possible that this conclusion, despite proper analysis, is correct, as BLM is currently able to put out 97% of wildfires during fire season. So, new measures may not increase this number substantially. However, the distinction between Alternative E and its co-preferred partner Alternative D is that Alternative E is the only one that responds to the Service’s concern that existing fire mechanisms were only implemented through temporary IMs that expired every two years. The table provided in Appendix D for Alternative E and also noted as Table 2-13 in this EIS provides timelines for both BLM and the Forest Service to implement long term fire management measures. This ensures that measures are not only effective in reducing the impact of fires, but also that fires can continue to be managed consistently at the local level. No other Alternative in the DEIS addresses fire in this way. In fact, Alternatives C and F merely defer to Alternative B for the primary threat facing sage-grouse. Thus, while the impacts of the measures themselves may not differ substantially from Alternative A or B, Alternative E’s impacts are much bigger as they are paired with a mechanism to ensure they are actually implemented.

The DEIS also includes language that the Governor specifically requested be removed from the Administrative EIS as it was vague, conclusory, and inaccurate. On page 4-105 in Volume II B, BLM states that Alternative E “*does not provide much guidance regarding other fuel treatments and ESR, which could limit the success of fire suppression and regrowth of desired vegetation after a fire.*” This causes the reader to wonder what BLM’s measure for “much guidance” on fuel treatments is and whether any alternatives meet this rigid, yet mysterious standard. This type of statement is inappropriate for an EIS. Further, it is inaccurate. In fact, Alternative E provides extensive guidance on fuel treatments and ESR. This statement was actually in the Administrative EIS before BLM reviewed the July 1 letter. BLM promised to remove this statement upon review of the new information and agreed that these types of subjective statements would be removed before the DEIS was published. The Governor expects this error to be corrected before the Final EIS is published.

## ii. Infrastructure

BLM failed to state why further restrictions on infrastructure are necessary in the Great Basin region. Under existing RMPs, no large scale infrastructure has been built in CHZ. In fact,

the only potential project, known as the China Mountain Wind Energy project's EIS was put on hold, despite creating a sage-grouse conservation plan, an off-site mitigation plan with 1:3 and 1:5 ratios of acres lost and acres restored. This project is currently on hold. Another more recent example is the Gateway West Transmission project. The current proposal recommends building on private land to avoid what Alternative E maps as primarily IHZ, but is identified as PPH for BLM. This shows that existing regulations for site specific NEPA analysis works for restricting infrastructure development in the most important sage-grouse habitat in Idaho, and may already be overly restrictive. Yet, BLM does not address what existing infrastructure impacts on sage-grouse are and what, specifically, its regulations in Idaho are lacking.

BLM provides an analysis for three separate types of infrastructure development and the impacts for each under Alternative E. Surprisingly, different conclusions are reached for each type, despite the fact that Alternative E makes no such distinction itself. In fact, Alternative E defines infrastructure quite broadly. This definition of "infrastructure" includes

discrete, large-scale anthropogenic features, including but not limited to highways, high voltage transmission lines, commercial wind projects, energy development (e.g. oil and gas development, geothermal wells), airports, mines, cell phone towers, landfills, residential and commercial subdivisions. (page 30, Governor's Alternative.)

Thus, while the state recognizes the potential need to discuss the effects of each type of development separately, the state is perplexed as to why the conclusions are different, if any conclusions are made at all.

BLM states that Alternative E does not provide assurance that oil and gas development would only occur in IHZ if it would not cause a decline in sage-grouse populations. However, this assurance is provided through the Implementation Commission, as discussed in detail above. The Implementation Commission will review development projects and make recommendations to the Governor, who in turn will make recommendations to BLM, as to whether certain projects would activate a hard or soft trigger. This is possible with development in IHZ. Based on this recommendation, BLM can choose not to grant a development permit for projects. The Implementation Commission is empowered to make a strong recommendation due to the information it receives annually from the Idaho Department of Fish and Game. With this data, the Implementation Team would be able to determine with confidence the likelihood that a development project would result in a population decline.

BLM does not provide a conclusion as to the impacts from Land Uses and Realty Management with respect to wind energy for Alternative E. Again, the Implementation Commission would make a recommendation for any potential wind energy project, relying on the data provided by the Idaho Department of Fish and Game. Infrastructure development also has the potential to activate a trigger. If a necessary development activates a hard trigger, IHZ is managed as CHZ for the purposes of future infrastructure development. Thus, BLM should have

concluded that impacts from wind energy would be reduced, relative to Alternative A. Further, BLM should have concluded that because of Alternative E's adaptive trigger strategy, that impacts would be reduced as compared to any other alternative included in the DEIS.

Further, without providing any evidence to support it, BLM concludes that Impacts with respect to geo-thermal energy are the same as Alternative A. Again, impacts here would be the same as other types of energy development. It is unclear why BLM reached this determination and why, if Alternative E treats all types of development the same, why geothermal impacts would be the same as Alternative A, while oil and gas development impacts would be reduced relative to Alternative A. What distinction has BLM found in the state's treatment of these types of infrastructure development? There should be none and thus, BLM's conclusion that impacts from geothermal energy would be the same as Alternative A, with no supporting analysis is incorrect.

#### B. Cumulative Effects

NEPA requires that where several actions have a cumulative ... environmental effect, this consequence must be considered in an EIS.<sup>62</sup> Cumulative impacts on the environment:

Result from the incremental impact an action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time.<sup>63</sup>

A cumulative impact analysis "must be more than perfunctory; it must provide 'a useful analysis of the cumulative impacts of past, present, and future projects.'"<sup>64</sup> To be useful to decision makers and the public, the cumulative impact analysis must include "some quantified or detailed information; ... general statements about possible effects and some risk do not constitute a hard look absent a justification regarding why more definitive information could not be provided."<sup>65</sup>

---

<sup>62</sup> *Te-Moak Tribe of W. Shoshone of Nev. v. U.S. Dep't of Interior*, 608 F.3d 592, 602 (9th Cir.2010) (citation and internal quotation marks omitted).

<sup>63</sup> 40 C.F.R. § 1508.7

<sup>64</sup> *Kern v. U.S. Bureau of Land Mgmt.*, 284 F.3d 1062, 1075 (9th Cir.2002) (quoting *Muckleshoot Indian Tribe v. U.S. Forest Serv.*, 177 F.3d 800, 810 (9th Cir.1999)).

<sup>65</sup> *Ocean Advocates v. U.S. Army Corps of Eng'rs*, 402 F.3d 846, 868 (9th Cir.2005) (quoting *Neighbors of Cuddy Mountain v. U.S. Forest Serv.*, 137 F.3d 1372, 1379–80 (9th Cir.1998)). Federal agencies may "aggregate [ ] cumulative effects analysis" for NEPA purposes. *League of Wilderness Defenders–Blue Mountains Biodiversity Project v. U.S. Forest Serv.*, 549 F.3d 1211, 1217 (9th Cir.2008)

("[A]gencies are not required to list or analyze the effects of individual past actions unless such information is necessary to describe the cumulative effects of all past actions combined."<sup>66</sup>

Prior to this EIS process, Idaho attempted to address sage-grouse issues on state and private land, including a Candidate Conservation Agreement with Assurances ("CCAA") in the Weiser area. BLM makes no mention of this process but it is illustrative of the larger issue. There is little doubt that BLM's final alternative will drive land management decisions in southern Idaho for many years. This even applies, in some instances, to State Endowment Land because of the checkerboard nature of the land ownership. So if BLM effectively withdraws all development in priority habitat it makes it very difficult to develop on adjoining state and private land. But the State has not completely left the field with regard to State/Private lands. RFPAs deal with highest threat across all landscapes and the Idaho Department of Fish and Game monitors bird populations across the state which informs the triggers. And if the BLM adopts Alternative E, Idaho is willing to examine other BMPs if necessary and appropriate.

The present DEIS is comprised of general statements about possible effects and do not constitute a "hard look." For example, on page 4-296, the DEIS is quick to dismiss Alternative E's extensive fire management approach because it "overall has fewer management actions to protect [sage-grouse] from fire than other action alternatives." In contrast, the DEIS praises Alternative B, while providing vague descriptions of how that alternative can affect the impacts of fire. Again, BLM fails to understand that the Service wanted a coherent strategy to address this threat, rather than a laundry list of conservation measures. This effects analysis does not address the fact that only Alternative E provides certainty of implementation for fire management, and every other threat. BLM does recognize, however, that management under Alternatives B, C, or F would most likely push Right of Way development on private lands, resulting in more loss of sage-grouse habitat long term. Idaho is already seeing the effects of this with the Gateway West project. Alternative E can site infrastructure in a way that minimizes loss and fragmentation of habitat, predation risk, and other threats while keeping right of way development on public land.

BLM's analysis of cumulative effects is lacking for vegetation. BLM assumes because Alternative E's CHZ is smaller than BLM's PPMA that cumulative effects would be greater than other alternatives. However, even though Alternative E's CHZ is smaller than BLM's PPMA, it doesn't mean the rest of the zones are any less protected. 73% of the male population resides in CHZ and 22% are in IHZ. Alternative E allows BLM to prioritize its resources. In spite of the PPMA designation, BLM may not be able to commit adequate resources to respond to threats within all of PPMA.

---

<sup>66</sup> (quoting Council on Environmental Quality Memorandum, "Guidance on Consideration of Past Actions in Cumulative Effects Analysis" (June 24, 2005)).

The DEIS does recognize the strength of Alternative E's flexible grazing management strategy. This strategy allows any potential management changes to occur at the site-specific level.

Overall, BLM's Chapter 4 analysis is inadequate, vague, and often inaccurate. Many conclusions are without support. Even when the conclusion is correct, it is difficult to determine why. Alternatives are lumped together in groups for various stages in the analysis, where BLM determines they all have similar effects. This is unhelpful because this type of analysis does not allow the reader to distinguish between the effects of each individual alternative. It is also unlikely that 6 unique alternatives could all, at times, produce the exact same effects.

### CONCLUSION

The final alternative must take a balanced approach recognizing both local and national interests, and BLM's multiple-use mandate for the management of these lands. While the State believes that Alternative E is the only alternative that meets the objective of this planning effort, there may be some details of Alternative D that can be folded into the Governor's Alternative.

#### Memorandum

To: Steve Ellis, Idaho State Director, Bureau of Land Management, Boise, Idaho

From: Brian T. Kelly, State Supervisor, U.S. Fish and Wildlife Service, Idaho Fish and Wildlife Office, Boise, Idaho

Subject: Comments on the Administrative Draft: Idaho and Southwestern Montana Sub-regional Greater Sage-grouse Resource Management Plan and Environmental Impact Statement

Thank you for the opportunity to provide comments relative to the subject June 24, 2013, Administrative Draft Resource Management Plan (RMP) and Environmental Impact Statement (EIS). The EIS describes and analyzes six alternatives (A through F) for managing public lands and resources in the planning area. The planning area consists of Bureau of Land Management (BLM) and U.S. Forest Service (FS)-administered lands and minerals in Idaho, excluding the panhandle, and Southwestern Montana. The specific BLM field offices (FO) and national forests (NF) included in the planning area are: Bruneau FO, Burley FO, Challis FO, Four Rivers FO, Jarbidge FO, Owyhee FO, Pocatello FO, Salmon FO, Shoshone FO, Upper Snake FO, Boise NF, Caribou-Targhee NF, Curlew National Grassland, Salmon-Challis NF, and Sawtooth NF in Idaho.

As a cooperating agency, our comments are provided pursuant to the National Environmental Policy Act (NEPA), 40 Code of Federal Regulations Part 1500-1508, and as requested per the March 2012 Memorandum of Understanding between the BLM, the U.S. Fish and Wildlife Service (Service), and the FS. Our comments are authorized under the Endangered Species Act, of 1973, as amended (16 U.S.C. 703 *et seq.*), and the Fish and Wildlife Coordination Act (16 U.S.C. 661 *et seq.*).

You have stated that the Administrative Draft is still undergoing further refinement and the Sub Regional Interdisciplinary Team's intent is for specific components to be finalized in the next version scheduled to be completed by early August. Therefore, due to the incomplete nature of the current draft and the short time line provided to us for review and comment, our comments are as a result limited at this time. We have primarily focused our review of the EIS on the sections regarding Greater sage-grouse issues and conservation actions that may address the threats detailed in the Service's 2010 Warranted but Precluded Finding. To do this, we have reviewed the EIS alternatives for their consistency with the conservation objectives identified in the Service's Conservation Objective Team (COT) report.

IDMT\_0075009

Throughout Table 2.x (Chapter 2, Management Actions by Alternative) of the EIS, there is lack of specificity regarding where, when, and how management actions will be implemented. Increased specificity of these management actions will increase our certainty of effectiveness and implementation.

There are substantial differences between the FS's Standards and Guidelines as well as between BLM's Management Actions and Best Management Practices. Many of the actions currently contained in Table 2.x may be interpreted as FS Guidelines or BLM Best Management Practices rather than FS Standards or BLM Management Actions. Understanding how these will be incorporated into Land Use Planning (LUP) documents directly affects our ability to determine whether they will provide sufficient regulatory mechanisms. We suggest providing increased clarity regarding how these will be incorporated into future LUP documents.

Long-term conservation of sage-grouse will depend on a continued commitment to adequately manage threats to the species and its habitat and to ensure a robust monitoring and adaptive management strategy. The State of Idaho developed alternative (Alternative E), is currently the only alternative that substantively addresses these topics. Although we fully realize that Alternative E will require further effort to bring it to full development, currently, it most closely meets the goals and objectives of the COT.

As noted above, the ability to implement any one alternative or a combination of alternatives is an important consideration in the Service's listing evaluation. We look forward to further coordination with you in developing the EIS so that we can provide more substantive comments to assist you in ensuring that the final version meets with the objectives for long-term conservation of Greater sage-grouse and is implementable under BLM policies and regulations. Thank you again for the opportunity to review and provide comment on the RMP and EIS. Please do not hesitate to contact me at 208-378-5243 or Jason Pyron of my staff at 208-685-6958.

Here you go. I put it in a Word Document so I could save it for future reference. I don't actually have a copy of the recent FEIS, so I couldn't figure out how to reference the Cooperating Agencies section, "Section 5XX." I have a copy of the proposed plan, but couldn't find a section on CAs in it. I hope I'm not being stupid. Sorry if I am!

Let me know if you want me to work on this more, or of course, if you need anything else. Grazie!

Jessica,

Can you fill in the blanks for this response and send it back to me.

Thanks!

Cooperating agency relationships are described in the Final EIS in Section 5.XX, Cooperating Agencies. In December 2011, the BLM sent letters to XX tribal governments inviting them to be cooperating agencies. The BLM also sent letters to XX local, state, and federal agencies inviting them to participate as cooperating agencies for the LUPA/EIS. [NOTE TO BLM: use this if applies to ID subregion or delete: Subsequently, the State of Wyoming and 4 local government agencies in Wyoming requested and were granted cooperating agency status for the Idaho Sub-regional LUPA/EIS effort, given the portions of two National Forests that overlap into Wyoming and their proximity to the Idaho planning area.] To date, XX agencies agreed to participate on the EIS as designated cooperating agencies, XX of which have signed Memoranda of Understanding with the BLM's Idaho State Office (Table 5.XX, Cooperating Agencies).

Cooperating agency relationships are described in the Final EIS in Section 5.XX, Cooperating Agencies. In December 2011, the BLM sent letters to ~~xx~~five tribal governments within the Idaho and Southwestern Montana Sub-region inviting them to be cooperating agencies. The BLM also sent letters to ~~xx~~over 60 local, state, and federal agencies inviting them to participate as cooperating agencies for the LUPA/EIS. [NOTE TO BLM: use this if applies to ID sub-region or delete: Subsequently, the State of Wyoming and 4 local government agencies in Wyoming requested and were granted cooperating agency status for the Idaho Sub-regional LUPA/EIS effort, given the portions of two National Forests that overlap into Wyoming and their proximity to the Idaho planning area.] To date, ~~xx~~29 agencies agreed to participate on the EIS as designated cooperating agencies, ~~xx~~of which and have signed Memoranda of Understanding with the BLM's Idaho State Office (Table 5.XX, Cooperating Agencies).

**Commented [GJD1]:** I counted 62 to be exact, so if you want to use that number, you can. I just figured that, by averaging, we are covered in case my numbers are off by 1 or 2, but I counted three times and kept coming up with 62.

**Commented [GJD2]:** All 29 have signed the MOU, so it seems like this is the same number and we don't have to differentiate, right?

**Idaho and Southwestern Montana Greater Sage-Grouse Plan Amendment  
Response and Consistency with COT Recommendation Comments on Draft EIS Preferred Alternatives**

Topic	FWS Comments on DEIS	BLM Proposed Plan Resolution
<b>Adaptive Management</b>	1. We recommend that the FEIS include both a hard and a soft [adaptive management] trigger... We believe that inclusion of a soft trigger (10%) in the FEIS would provide increased responsiveness to stochastic threats and additional flexibility for proactive management; both important elements that increase stakeholder participation and early implementation of incentive-based conservation actions.	The PP includes both hard and soft adaptive management triggers. (AM-7, AM-8, AM-9 & AM-10)
<b>Adaptive Management</b>	2. We recommend that an Implementation Team/Commission process be included in the FEIS. The process should also include specificity regarding team composition and how science will inform the process and ultimate decision regarding remediation actions.	The PP includes direction to coordinate with the State of Idaho and Montana on both adaptive management and mitigation to support implementation and consideration of both adaptive management responses and mitigation requirements. (CC-2, CC-4, AM-11, AM-12, MIT-1 & MIT-2)
<b>Adaptive Management</b>	3. An explanation should be provided for why the identified baseline year was selected for the adaptive management triggers.	The PP includes an appendix that describes the delineation and rationale supporting the data sets used to develop the baseline maps. (Appendix I & Appendix H)
<b>Conifer Encroachment</b>	4. We recommend the selected alternative identify a rate at which treatments should be implemented to meet the COT objective. Additionally, removal of pinyon-juniper trees encroaching within 1000 meters of a lek should be the highest priority.	The PP includes conservation measures with sufficient specificity to ensure certainty of implementation and effectiveness needed to meet this measure. Conservation measures include a treatment objective supporting a "no net gain" of conifer. (Table 1 - Treatment Objectives)
<b>Disturbance</b>	5. The DEIS does not provide adequate specificity regarding how the "no net habitat loss" standard would be implemented to determine its consistency with the COT report or whether it would be a suitable replacement for a disturbance cap. Please provide further clarification of how this approach would be consistent with the COT report.	The PP includes both a disturbance cap (3%) and a requirement for no net unmitigated loss resulting from development activities. (AD-1, MIT-3, MIT-4 & Appendix K)
<b>Disturbance</b>	6. Alternative E prescribes a 3 percent anthropogenic disturbance cap in the Core Habitat Zone (CHZ) and a	The PP includes a disturbance cap (3%) that applies to

Topic	FWS Comments on DEIS	BLM Proposed Plan Resolution
	<p>5 percent anthropogenic disturbance cap in the Important Habitat Zone (IHZ). Both of these caps would only apply to fluid mineral development (pg. 2-100). We recommend that a 3 percent disturbance cap be applied to the CHZ and the IHZ and that the cap include other anthropogenic disturbances (for example, Infrastructure as defined by Alternative E, pg. D-33).</p>	<p>large scale anthropogenic disturbance. (AD-1 &amp; Appendix H)</p>
<b>Disturbance</b>	<p>7. The available scientific literature discusses several different spatial scales and evaluates different land use activities than those assessed in the DEIS. Therefore, we recommend that you provide a clear analysis and rationale in the DEIS of the methods you will use to calculate disturbance to sage-grouse habitat.</p>	<p>The PP defines an appropriate analysis scale which is consistent with the broad scale monitoring framework and supports a step-down or roll-up consistent with that direction to appropriately apply to the local scale and consistently relate to the broader scale. (AD-1 &amp; Map 3)</p>
<b>Disturbance</b>	<p>8. The DEIS does not provide adequate specificity regarding how the "no net habitat loss" standard would be implemented to determine its consistency with the COT objective. If it is the intent of Alternative D to implement a 3 percent disturbance cap as well as the above mentioned NSOs and noise stipulations, it would be consistent with the COT objective. Although Alternative E is largely consistent with the COT, we would recommend that the 3 percent disturbance cap be consistently applied across the P ACs (CHZ and the IHZ) and that it include other anthropogenic disturbances (as discussed above).</p>	<p>The PP includes conservation measures with sufficient specificity to ensure certainty of implementation and effectiveness needed to meet this measure. "No net unmitigated habitat loss" and 3% disturbance cap have both been included and further described. (AD-1, AD-2, MIT-4 and Appendix K)</p>
<b>Effects Analysis</b>	<p>9. We recommend that the impact analysis be improved through the following ways:                      a. We need more clarity as to the extent to which proposed actions within each alternative would ameliorate the threats to GRSG within the identified analysis areas. This is not to suggest that the current conservation measures within the range of alternatives are inadequate, but rather to emphasize the need for a more comprehensive impact analysis. Currently, the analysis demonstrates the extent to which an impact is</p>	<p>While the effects analysis is not complete and is undergoing revision and development, USFWS staff is involved in this process and are helping to identify and work with the effects analysis teams to ensure these components are sufficiently addressed in the Final EIS.</p>

Topic	FWS Comments on DEIS	BLM Proposed Plan Resolution
	<p>reduced within a Population Area. However, it should also incorporate the best available science to show how that reduction could ameliorate the associated threat and consequently impact GRSG individuals and populations. The impacts to individuals and associated populations should then be compared across alternatives.</p> <p>b. The analysis should consider the beneficial impacts of best management practices and required specific design features where appropriate.</p> <p>c. The analysis should address the extent to which conservation measures within the alternatives meet the objectives of the COT. For example, we recommend inclusion of the COT matrix with an associated narrative.</p>	
<b>Fire and Invasives</b>	<p>10. We also recommend incorporating literature by the Fire and Invasive Species Team (FIST), which is currently developing landscape prioritization for fire and invasive species, as well as step down assessments.</p>	<p>The PP includes conservation measures that address the step down assessments and wildfire prevention, suppression and post-fire restoration and the commitment to implement findings from these assessments. (WFS-1, WFS-2, WFS-3, WFS-4, WFS-7, FM-4, FM-5 &amp; FM-6)</p>
<b>General</b>	<p>11. We encourage the BLM and FS to resolve any inconsistencies across planning boundaries where these differences do not have a clear basis. Where differences in management are warranted, the rationale for divergent management approaches should be fully explained as they pertain to meeting the COT objectives.</p>	<p>The Proposed Plan (PP) conforms to the NPT guidance on land allocation decisions that are consistent with adjacent planning areas. There are several minor divergences that are more protective of GRSG and their habitat than described in the NPT guidance (fluid minerals, ROWs). (MA-2)<sup>1</sup></p>
<b>General</b>	<p>12. We hope that through our comments, the BLM and FS will expand the detail of several key components to a level where we can fully evaluate the FEIS pursuant to the COT. Some key components include:</p> <p>a. Details on how habitat and disturbance will be monitored;</p> <p>b. Methods of landscape-scale prioritization and implementation of step-down assessments for addressing</p>	<p>The PP includes a description of the monitoring efforts that will be completed to support implementation and evaluation of the PP. (MON-1, MON-2, MON-3, MON-4, MON-5, MON-6, MON-7, Appendix E &amp; Appendix F)</p> <p>The PP includes conservation measures that address the</p>

Conservation measures are included to assess and adjust activities post fire in fire, rehabilitation and adjacent areas to both ensure successful post-fire recovery and to mitigate the effect of the burn on GRSG populations. (ESR-3 &amp; ESR-4)</li> <li>c. Conservation measures identified that provide certainty of implementation and effectiveness needed to meet this measure. (WFS-1, WFS-2, WFS-3, WFS-4, WFS-7, FM-4, FM-5 &amp; FM-6) Includes adequate monitoring and AM. Increased specificity and integration of conservation measures for prevention, suppression, and restoration.</li> <li>d. Conservation measures identified with sufficient specificity to ensure certainty of implementation and effectiveness needed to meet this measure. "No net unmitigated habitat loss" and 3%</li> </ul>

Topic	FWS Comments on DEIS	BLM Proposed Plan Resolution
		<p>disturbance cap have both been included and further described. (AD-1, AD-2, MIT-4 and Appendix K)</p> <p>e. Conservation measures identified with sufficient specificity to ensure certainty of implementation and effectiveness needed to meet this measure. Conservation measures include a treatment objective supporting a "no net gain" of conifer. (Table 1 - Treatment Objectives)</p> <p>f. Conservation measures are identified clarifying the exemption process and associated mitigation. (AD-3 &amp; AD-4)</p>
<b>Invasives</b>	<p>14. We need additional clarity for both Alternative D and E as to site-specific actions to meet the COT objective. Both preferred alternatives have appropriately identified the need to work more extensively at a local scale to coordinate and implement actions that will result in improved wildfire and invasive species management strategies. As discussed above for fire, inclusion of commitments to implement conservation projects identified in the step-down assessments will be needed to increase our certainty that actions, necessary for GRSG conservation, will occur.</p>	<p>The PP includes conservation measures that address the step down assessments and invasive species and the commitment to implement findings from these assessments. (WFS-1, ESR-1 &amp; INV-1)</p>
<b>Management Areas</b>	<p>15. We recommend that the habitat categories included in the FEIS be biologically meaningful and pragmatically effective.</p>	<p>BLM and FS have worked in coordination with FWS and the State of Idaho to adjust management zones to more accurately delineate biologically relevant and meaningful areas that are appropriate in coordination with the adaptive management strategy and disturbance threshold. (MA-2)</p>
<b>Mining</b>	<p>16. The COT objective is to maintain stable to increasing GRSG populations and no net loss of GRSG habitats in areas affected by mining. Both Alternative D and Alternative E propose to implement conservation</p>	<p>The PP includes a more detailed description of the mitigation program and also identifies specific implementation actions to develop a detailed mitigation plan in coordination with the states utilizing their</p>

Topic	FWS Comments on DEIS	BLM Proposed Plan Resolution
	measures that meet the COT objective; however, we will need further specificity on mitigation requirements (see general comment on mitigation).	frameworks as a foundation. The state framework identifies metrics and conservation measures to be considered as well as identification of service area considerations. (MIT-1, MIT-2 & Appendix J)
<b>Mitigation</b>	17. To meet several conservation objectives within the COT, a "meaningful mitigation" program must be implemented. Both Alternatives D and E contain some essential elements for a comprehensive mitigation strategy, but we need additional details. We also encourage the inclusion of the concept of "additionality" and a "net conservation benefit" standard. We encourage close coordination with the State on this mitigation element in order to maintain their important collaborative conservation process.	The PP includes a more detailed description of the mitigation program and also identifies specific implementation actions to develop a detailed mitigation plan in coordination with the states utilizing their frameworks as a foundation. (MIT-1, MIT-2 & Appendix J)
<b>Mitigation</b>	18. We need additional detail for both Alternatives D and E regarding how mitigation will be accomplished in future decision making processes. Further clarity is needed in the following areas: a. Methodologies or metrics that will be used to determine expected impacts of actions and conservation measures used to offset them. b. Identification of "service areas," or areas where offsets would be focused. c. Inclusion of a transparent and accountable monitoring program that includes performance standards that are used to ensure conservation measures meet predetermined goals and objectives. d. The role of the land management agency(s) if the Alternative E mitigation program were implemented.	The PP includes a more detailed description of the mitigation program and also identifies specific implementation actions to develop a detailed mitigation plan in coordination with the states utilizing their frameworks as a foundation. The state framework identifies metrics and conservation measures to be considered as well as identification of service area considerations. (MIT-1, MIT-2 & Appendix J)
<b>Monitoring</b>	19. Both Alternatives D and E currently lack a clear explanation of how implementation monitoring would be executed (including intervals and standards). Such an explanation is needed for us to fully evaluate the efficacy of the monitoring being proposed.	The PP includes a description of the monitoring efforts that will be completed to support implementation and evaluation of the PP. (MON-1, MON-2, MON-3, MON-4, MON-5, MON-6, MON-7, Appendix E & Appendix F)

Topic	FWS Comments on DEIS	BLM Proposed Plan Resolution
<b>Monitoring</b>	20. With regard to habitat monitoring, it is currently unclear how habitat change will be monitored within either Alternative D or Alternative E. For example, habitat monitoring discussed in Alternative D (Chapter 2) is significantly different than the Monitoring Framework Plan discussed in Appendix E. While we support the habitat characteristics identified in Alternative E, a more robust description of the habitat monitoring program should be provided.	The PP includes a more detailed description of habitat monitoring efforts. (MON-3, MON-4, MON-5, MON-6, MON-7, Appendix E & Appendix F)
<b>Noise</b>	21. Noise and seasonal stipulations should be considerations during the construction and long-term implementation of land use activities. Your proposed implementation of noise and seasonal stipulations across all alternatives appears to be applied only to initial construction activities.	The PP includes required design features which apply to noise levels associated with leks, these RDFs would be applied to project proposals and developments where and when these concerns exist as either stipulations or conditions of approval. They would apply to both construction and operation (when taken in combination with seasonal restrictions also included as RDFs). (GD-16, GD-17, GD-18, GD-19, Appendix A & Appendix B)
<b>Prescribed Fire</b>	22. We recommend that the FEIS include provisions to eliminate prescribed burning in sage-grouse wintering and breeding [i.e., lekking, nesting and early brood rearing (Connelly et al. 2004, Connelly et al. 2011)] habitats unless biologically justified; If prescribed fire is allowed in GRSG habitats, then we recommend that the FEIS commit to using the risk analysis tool currently in development by WAFWA.	The PP includes conservation measures to address treatments, including prescribed fire. (FM-3)
<b>Wildfire</b>	23. We need additional clarity for...wildfire and invasive species management strategies. The step-down assessments, as identified in Alternative D (Appendix K), provide a sound framework upon which to complete these actions. Inclusion of commitments to implement conservation projects identified in these step-down assessments will be needed to increase our certainty that actions, necessary for GRSG conservation, will occur.	The PP includes conservation measures that address the step down assessments and wildfire prevention, suppression and post-fire restoration and the commitment to implement findings from these assessments. (WFS-1, WFS-2, WFS-3, WFS-4, WFS-7, FM-4, FM-5 & FM-6)

**Subject:** Section 7 Coordination for BLM/USFS LUP Amdnements

Hi, Chris. My name is Barb Schmidt, and I am a section 7 biologist with the Idaho Fish and Wildlife Office (IFWO) in Boise. I understand that you are the lead biologist writing the biological assessment for the BLM and USFS Land Use Plan Amendments in Idaho and SW Montana to include conservation measures for greater sage-grouse. The IFWO will be the lead FWS office working with you to complete this consultation. Would it be possible for the IFWO to review your preliminary biological assessment or to let us know what your effects determinations will be for the species being addressed in your document? This will help IFWO to ensure that the final biological assessment contains adequate information to complete our section 7 consultation/conference for BLM/FS in order to meet the timelines for signing of the ROD. Many thanks, Chris, for any information that you can provide. Barb

GRSG LUP Amendment EIS Biological Assessment  
Planning Meeting Minutes 6/9/2014

1. Introductions

- Bruce Davidson – Botany: (559-920-6349)
- Kat Carsey – Botany: (559-793-8145)
- Janet Moser – Wildlife: (559-341-6812)
- Steve Kozlowski – Wildlife: (307-745-2343)
- Katherine Malengo - Wildlife: (831-674-0685)
- Chris Colt – EIS Wildlife Lead: (208-236-7506w. 208-881-1975c.)

2. What are we up to? (explanation)

- a. First, our team is tasked with writing six Biological Assessments (NWCO, UT, ID/SW MT, NV/CA, OR, Dakota Prairies) for the greater sage-grouse Land Use Plan Amendment EISs covering both FS and BLM planning units. (Note: the WY9 plan EIS BA has been contracted to a private contractor and we are not responsible for writing this document.)
- b. Second, we are tasked with revising the five FS Biological Evaluations from the DEIS for the FEIS (NWCO, UT, ID/SW MT, NV/CA, WY9). This includes the sage-grouse viability analysis within each BE. Also, we are tasked with writing the BE for the Dakota Prairies. (Note: there are no FS lands within the Oregon EIS, therefore there is no FS BE required.)

3. Timeline

- a. For each EIS there will be two Records of Decision, one for the BLM and one for the FS. The Records of Decision are scheduled to be signed by the end of December 2014.
- b. Each of the FEISs are scheduled to be released to the public October 15<sup>th</sup>, 2014.
- c. The responses from the FWS, either Biological Opinion or letter of concurrence are needed prior to the signing of the RODs. The FWS requires a 135-day review period, therefore, we need to have the BAs to them by July 15<sup>th</sup>, 2014

4. O: drive file structure: O:\NFS\Collaboration\SageGrouseConservation\05 Resources\02 BA\_BE

- a. Everyone should have read/write access to this folder on the O: drive. Please verify this.
- b. Structure: 02 BA\_BE → EIS → DEIS (for older materials used in the DEIS)  
**FEIS** (use this folder).

Subfolders:

Example BA\_BOs (BAs and BOs from most of the BLM and FS units)

Literature (pdf documents of any literature cited in the analysis)

Proposed Plan (proposed plan/proposed action/selected alternative for BLM and FS)

Species List (finalized species list for the analysis, verified by the FWS)

Working DocumentsBA: (working draft of the BA, use subfolders as necessary when several people are working on the BA)

Botany

WildlifeFish

5. How to dissect an elephant/plan of attack:

- First, get TEAMS folks up to speed on the project by reviewing the *FS Draft BE* to get a sense for the type of analysis we will be conducting, then review the *proposed plan* to understand the actions, finally review the *BA template*.
- We will start on the NW Colorado BA. Bruce and Kat will break up the workload on the botany section and Katherine will work with Janet and Steve on the wildlife/Fish section.
- Once we have completed a working draft of the NWCO BA, we will divide up the remaining BAs between the specialists as appropriate based on workload and personnel.
- We will hold a weekly call on Mondays at 10:00 MDT for the next month to keep the project on track. (888-844-9904; 7251216#)

6. Tasks: (for this week)

- Meeting minutes – **Chris**
- Send out Proposed Plan & BA Template – **Chris**
- Organize O: drive directory (insure there is a finalized species list for each EIS) – **Katherine**
- Clean up FWS comments on BA Template – **Katherine**
  - Contact FWS (Terry Ireland) on hanging issues - **Chris**
- **Bruce & Kat** – review NWCO plant list and available time and divide workload
- Gather critical habitat spatial data – **Chris**
- GIS overlay of critical habitat and GRSG habitat – BLM NOC
- .
- .
- .

List of EISs and BLM/FS planning units:

## **Rocky Mountain Region**

### **NW Colorado Sub-region EIS:**

BLM: Grand Junction, White River, Kremmling, Colorado River Valley, and Little Snake  
Forest Service: Routt NF

### **WY 9 plan Sub-region EIS:**

BLM: Pinedale, Kemmerer, Rock Springs, Rawlins, Casper, and Newcastle  
Forest Service: Bridger-Teton NF, Medicine Bow NF, Thunder Basin National Grassland

### **Dakota Prairies National Grassland EIS:**

Dakota Prairie NG (ND/SD) - (note: No BLM)

## **Great Basin Region:**

### **Utah Sub-region EIS:**

BLM: Kanab, Grand Staircase Escalante National Monument, Richfield, Price, Vernal, Pinyon, Cedar-Beaver-Garfield-Antimony, House Range, Warm Springs, Box Elder, Pony Express, Randolph, and Park City.

Forest Service: Ashley NF (UT/WY), Dixie NF, Fishlake NF, Manti-LaSal NF, Uinta NF, Wasatch-Cache NF (UT/ID).

### **Idaho/SW Montana Sub-region EIS:**

BLM (Idaho): Birds of Prey National Conservation Area, Bruneau, Challis, Craters of the Moon National Monument, Cascade, Kuna, Jarbidge, Lemhi, Owyhee, Pocatello, Bennett Hills/Timmerman Hills, Cassia, Magic, Monument, Sun Valley, Twin Falls, Big Lost, Medicine Lodge, Big Desert, and Little Lost-Birch Creek

BLM (Montana): Dillon

Forest Service: Beaverhead-Deerlodge NF (MT), Caribou NF, Challis NF, Curlew NG, Salmon NF, Sawtooth NF (ID/UT), Targhee NF

### **Nevada/California Sub-region EIS:**

BLM California: Alturas, Eagle Lake, and Surprise

BLM Nevada: Black Rock, Desert-High Rock Canyon National Conservation Area, Carson City, Elko, Ely, Paradise-Denio, Shoshone-Eureka, Tonopah, Sonoma Gerlach (MFP), and Wells.

Forest Service: Humboldt NF, Toiyabe NF (NV/CA)

### **Oregon Sub-region EIS:**

BLM: Upper Deschutes, Brothers-La Pine, Three Rivers, Steens Mountain Cooperative Management and Protection Area, Andrews Management Area, Southeast Oregon, Baker, and Lakeview.

(Note: No Forest Service)

Hi All –

Chris has forwarded the Section 7 Consultation Agreement for final review and preparation for signature. You have until June 27<sup>th</sup> to give me any proposed changes to this. I will consolidate all proposed changes for the Great Basin and forward back to Chris. Please forward to your T&E Specialists and ask for their comments or concerns as well. Be aware that this has been thru a lot of review and scrutiny already....so unless it's a big red flag hanging out there....(you know the answer!)

Thanks,

Lauren

Attached is the section 7 Consultation Agreement for the greater sage-grouse land use plan amendment effort. It is ready for final review in preparation for signature. Please route through the appropriate folks for their briefing and review of this document by Friday, June 27<sup>th</sup>, 2014. Earlier drafts of this document have been routed through the sub-regional, regional, and WO levels over the past couple of months, so I believe folks should be familiar with the agreement and its purpose. Thank you for this final review and push for signature.

Sincerely,

Chris Colt

CONSULTATION AGREEMENT

BETWEEN

BUREAU OF LAND MANAGEMENT,

U.S. FOREST SERVICE

AND

U.S. FISH AND WILDLIFE SERVICE

For

Amendments to BLM Resource Management Plans and  
National Forest Land and Resource Management Plans  
for Greater Sage-Grouse Conservation

**A. Purpose:**

This Consultation Agreement (Agreement) establishes the cooperative process, products, schedules, and expectations for conducting Section 7 consultation and voluntary conferencing under the Endangered Species Act of 1973, as amended (ESA), on amendments to Bureau of Land Management (BLM) Resource Management Plans or Management Framework Plans (RMPs) and U.S. Forest Service (FS) Land and Resource Management Plans (LRMPs) (collectively referred to as land use plans or land use plan amendments). The purpose of these land use plan amendments is to identify and incorporate appropriate conservation measures to conserve, enhance, and restore Greater Sage-grouse (sage-grouse) habitat by reducing, eliminating, or minimizing threats to that habitat.

This Agreement addresses consultation/ conferencing on all species listed under the ESA as threatened or endangered, or proposed for listing, and all designated or proposed critical habitat on BLM-administered and NFS lands that may be affected by implementation of BLM and FS land use plan amendments for sage-grouse conservation. The BLM, FS, and FWS will identify staff from the BLM State Offices and FS Regional Offices to ensure that consultation products are developed on schedule as identified herein. In addition, the BLM, FS, and FWS will identify an Issue Resolution Group (IRG), which will be convened to resolve issues during consultation/conferencing.

**B. Scope of the Agreement:**

The BLM will complete sub-regional planning efforts to amend the following RMPs:

**Nevada and Northeastern California Sub-Regional Greater Sage-Grouse RMP Amendment/EIS:**

- **BLM California RMP Amendments:** Alturas, Eagle Lake, and Surprise;
- **BLM Nevada RMP Amendments:** Black Rock, Desert-High Rock Canyon National Conservation Area, Carson City, Elko, Ely, Paradise-Denio, Shoshone-Eureka, Tonopah, Sonoma Gerlach (MFP), and Wells.

**Idaho and Southwestern Montana Sub-Regional Greater Sage-Grouse RMP Amendment/EIS:**

- **BLM Idaho RMP Amendments:** Birds of Prey National Conservation Area, Bruneau, Challis, Craters of the Moon National Monument, Cascade, Kuna, Jarbidge, Lemhi, Owyhee, Pocatello, Bennett Hills/Timmerman Hills, Cassia, Magic, Monument, Sun Valley, Twin Falls, Big Lost, Medicine Lodge, Big Desert, and Little Lost-Birch Creek.
- **BLM Montana RMP Amendments:** Dillon.

**Utah Sub-Regional Greater Sage-Grouse RMP Amendment/EIS:**

- **BLM Utah RMP Amendments:** Kanab, Grand Staircase Escalante National Monument, Richfield, Price, Vernal, Pinyon, Cedar-Beaver-Garfield-Antimony, House Range, Warm Springs, Box Elder, Pony Express, Randolph, and Park City.

**Oregon Sub-Regional Greater Sage-Grouse RMP Amendment/EIS:**

- **BLM Oregon RMP Amendments:** Upper Deschutes, Brothers-La Pine, Three Rivers, Steens Mountain Cooperative Management and Protection Area, Andrews Management Area, Southeast Oregon, Baker, and Lakeview.

**Northwest Colorado Greater Sage-Grouse RMP Amendment/EIS:**

- **BLM Colorado RMP Amendments:** Grand Junction, White River, Kremmling, Colorado River Valley, and Little Snake.

**Lewiston Greater Sage-Grouse RMP Amendment/EIS:**

- **BLM Montana/Dakotas RMP Amendments:** Headwaters and Judith.

**North Dakota Greater Sage-Grouse RMP Amendments/EIS:**

- **BLM Montana/Dakotas:** North Dakota.

**Wyoming Nine-Plan Greater Sage-Grouse RMP Amendment/EIS:**

- **BLM Wyoming RMP Amendments:** Pinedale, Kemmerer, Rock Springs, Rawlins, Casper, and Newcastle.

The FS will complete sub-regional planning efforts to amend the following LRMPs:

**Northern Region 1:** National Forests: Beaverhead-Deerlodge (MT)

National Grasslands: Dakota Prairie (ND/SD)

**Rocky Mountain Region 2:** National Forests: Medicine Bow (WY), Routt (CO),

National Grasslands: Thunder Basin (WY)

**Intermountain Region 4:** National Forests: Ashley (UT/WY), Boise (ID), Bridger-Teton (WY), Caribou (ID), Challis (ID), Dixie (UT), Fishlake (UT), Humboldt (NV), Manti-LaSal (UT), Salmon (ID), Sawtooth (ID/UT), Targhee (ID), Toiyabe (NV/CA), Uinta (UT), Wasatch-Cache (UT/ID).

National Grasslands: Curlew

**C. Background:**

In March 2010, the FWS determined that the listing of the Greater Sage-grouse for protection under the Endangered Species Act (ESA) was “warranted but precluded” (75 FR 13910). By September 30, 2015, the FWS must either propose the sage-grouse for listing under the ESA or determine that listing is no longer warranted.

Based on the FWS’s timeline for making a listing decision on the sage-grouse, the BLM and the FS intend to complete their land use plan amendments by the end of 2014. As the steward of more than half of all remaining sagebrush habitat in the United States, the BLM has the lead role in this land use planning effort. The FS is the steward of an estimated 8% of greater sage-grouse habitat nationwide and is a Cooperating Agency in this land use planning effort.

**D. Authority:**

This Agreement is developed and implemented under the authority of:

1. The Federal Land Policy and Management Act of 1976 (43 USC 1712);
2. The National Forest Management Act of 1976 (16 USC 1600);
3. The Endangered Species Act of 1973, as amended (16 USC 1531-1544); and
4. The MOA on Endangered Species Act section 7 programmatic consultations and coordination among the BLM, National Marine Fisheries Service, Fish and Wildlife Service, and Forest Service, dated August 30, 2000.

**E. Consultation Action:**

The BLM and FS will consult/confer with the FWS on the land use plan amendments associated with each of the sub-regional planning efforts identified in Section B of this Agreement. Each of the land use plan amendment decisions will reflect the unique factors within each agency’s administrative area and land use planning process. The focus of the section 7 consultation/conference will be to examine the expected effects of the amendments to the existing land use plans on listed and proposed species, and designated and proposed critical

habitat to ensure that the actions will not jeopardize the continued existence of those species or destroy or adversely modify critical habitat.

**F. Roles and Responsibilities:**

**The BLM and FS agree to:**

1. In coordination with the FWS, develop one Biological Assessment for each sub-regional EIS.
2. Coordinate with the FWS to identify the required information and analysis presented in the Biological Assessments. The Biological Assessments will provide at a minimum:
  - a. A description of the proposed action.
  - b. Any required design features (RDF) and additional conservation measures for species/habitat protection.
  - c. Maps and a description of the areas that may be affected by the action.
  - d. A summary of the status and conditions for Threatened, Endangered and Proposed (TEP) species and proposed or designated Critical Habitat in the action area.
  - e. Analysis of the direct, indirect, and cumulative effects of the proposed action on TEP species and proposed or designated Critical Habitat.
  - f. A determination of effects and rationale for each TEP species and any proposed or designated Critical Habitat.
3. Identify a lead contact for each agency and for each sub-regional EIS project to facilitate coordination and communication among affected administrative units.
4. Informally consult/ confer with the FWS pursuant to section 7 of the ESA during the development and refinement of the proposed land use plan amendments.
5. Submit one Biological Assessment for each sub-regional EIS in conjunction with a request to the FWS for formal consultation.
6. In coordination with FWS, develop conservation measures to reduce adverse effects to listed species (or critical habitat) and include them in the proposed action. If incidental take is anticipated and quantified any reasonable and prudent measures and terms and conditions that the FWS proposes to minimize the impact of any anticipated take shall be discussed by the interagency consultation team for each of the EIS efforts prior to issuance of a final Biological Opinion.

**The FWS agrees to:**

1. Identify a lead Regional Office that will coordinate the FWS consultation/ conferencing efforts.
2. Prepare a Biological Opinion (or appropriate consultation/conference document) for each proposed action for which a Biological Opinion is necessary, and provide the BLM and the FS an opportunity to review and comment on any such Biological Opinion at the draft stage.

3. Identify a lead office and staff point of contact for each of the sub-regional EIS efforts to facilitate communication and coordination among the appropriate agency offices.
4. Provide a draft of the consultation response to the BLM and the FS for review no later than two weeks before the end of the consultation period. In coordination with the FS and BLM, develop conservation measures to reduce adverse effects to listed species (or critical habitat) and include them in the proposed action. If incidental take is anticipated and quantified as necessary, any reasonable and prudent measures and terms and conditions that the FWS proposes to minimize the impact of any anticipated take shall be discussed by the interagency consultation team for each of the EIS sub-regional efforts prior to issuance of a final Biological Opinion.

**The BLM, FS, and FWS mutually agree to:**

1. Work cooperatively to complete conferencing/ consultation in an effective and efficient manner within the appropriate timeframes established by policy and regulation or an agreed upon timeframe.
2. Designate representatives for the IRG:
  - BLM: Steve Small, Chief, Division of Fish and Wildlife; and
  - FS: Christopher Worth, Assistant Director, Wildlife, Planning, TES, Air and Soil.
  - FWS: Nicole Alt, Deputy Assistant Regional Director, Lakewood, CO Region 6.
3. Provide early notification to the IRG if any problems arise that would affect the content of consultation-related documents or agreed upon timeframes and deadlines for completing the consultations/conferences under this Agreement.
4. The IRG will meet within 10 days of the identification of an issue on an as needed basis to resolve any issues that arise during the consultation/conference process.
5. Meet or otherwise communicate on a bi-weekly basis during the FWS’ review of the Biological Assessments and the development of any Biological Opinion (or final consultation /conference document)(s), to resolve any material issues that may arise during the consultation/conference process covered by this Agreement.
6. Meet the time commitments indicated in the table below.

**G. Estimated Time Frame for Consultation Process (recognizing the multiple planning efforts will follow slightly different timelines):**

<b>Task</b>	<b>Estimated Date for Completion</b>
<ul style="list-style-type: none"> <li>• BLM/FS: Initiate informal consultation/conference with FWS during preparation of the Draft EIS for the proposed amendment of one or more RMPs or LRMPs.</li> </ul>	July 2013 (Completed)
<ul style="list-style-type: none"> <li>• BLM/FS: Release of the individual Draft EISs for the proposed action amendment(s)</li> </ul>	December 2013 (Completed)

for public review.	
• BLM/FS: Identify selected alternative	Estimated Date: June 16, 2014
• BLM/FS: Submit Biological Assessments of the proposed action to the FWS	Estimated Date: July 15, 2014
• FWS: Complete consultation/conference process on the proposed action. <sup>1</sup>	Estimated Date: December 1, 2014

<sup>1</sup>Submission of the BA initiates the statutory/policy timelines for FWS. If concurrence, within 30 days of receipt of BA. If BO, within 135 days of receipt of BA and acknowledgement of adequacy of information. If BO, FWS will seek to provide an expedited review and draft copy for review to BLM and FS prior to finalization.

#### **H. General Provisions:**

1. This Agreement and the above timelines can be amended by mutual agreement of the parties.
2. This Agreement is only intended to improve the internal management of consultation on amended plans by the BLM, FS, and the FWS. It is not intended to, nor does it, create any right or benefit, substantive or procedural, enforceable at law or equity by a party against the United States, its agencies or instrumentalities, its officers or employees, or any other person. Nothing in this Agreement will be construed as obligating the BLM, FS, and the FWS to the expenditure of funds.
3. Each agency will maintain a copy of this Agreement.

**I. This Agreement is entered into by:**

GRSG LUP Amendment EIS Biological Assessment  
Planning Meeting Minutes 6/16/2014

1. Billing stuff: Contact Katherine Malengo for the correct project cost codes. Additionally, please send the number of hours charged against the project to Katherine bi-weekly when you submit your time.
2. NV/CA BA Project Assignments:
  - a. Steve – Wolf
  - b. Katherine M. – Cuckoo
  - c. Janet – Skipper, Fairy shrimp
  - d. Bruce/Kat – Plants
3. Idaho/MT BA Project Assignments:
  - a. Steve – Slickspot Peppergrass – Contact ID FWS Barbara Schmidt
  - b. Katherine – complete table 1 and modify NWCO BA for ID/MT
4. Issue: Mitigation measures – If your analysis suggests that there is the potential for an impact, but that impact can be minimized or eliminated through the requirement of a mitigation measure, we will do the following. Be as specific as possible so we can track the necessary mitigation measure to see if it is already in the existing RMP or in the EIS. If not and we believe that we need this in the ROD, we will need to work closely with the sub-regional EIS project lead to include the necessary mitigation in the EIS/ROD. In the EIS it will be any number of items: FS Standard, BLM Management Action, Required Design Feature, etc. In the BA we will call them mitigation measures.
5. Issue: Lynx – Because sagebrush is listed as a secondary habitat for lynx it must be considered in the analysis. Need to work with Missy Dressen (Routt NF) and FWS closely on this issue.
6. Issue: ID FWS Response – Idaho Field Office of the FWS did not respond to the initiation letter species list. Therefore, we will work on the assumption that the list we sent to them is acceptable. We will use this list.
7. Issue: Species we are consulting on. We are only consulting on listed species and conferencing on proposed species. We are not conferencing on any candidate species.
8. Tasks:
  - Verify WO buy off on BLM proposed plan for NWCO EIS – **Chris** (waiting to hear back from Bridget Clayton – NWCO project lead).
  - ✓ Send out Proposed Plan & BA Template – **Chris**
  - ✓ Organize O: drive directory (insure there is a finalized species list for each EIS) – **Katherine**
  - ✓ Clean up FWS comments on BA Template – **Katherine**
  - ✓ Contact FWS (Terry Ireland) on hanging issues - **Chris**
  - ✓ **Bruce & Kat** – review NWCO plant list and available time and divide workload
  - ✓ Gather critical habitat spatial data – **Chris** Obtained from FWS – data available online.
  - ✓ GIS overlay of critical habitat and GRSG habitat – BLM NOC
  - ✓ Meet with with Routt NF (Missy) and FWS on Lynx issue
  - Complete analysis for necessary species on NWCO BA

9. Team Members

- Bruce Davidson – Botany:  
(559-920-6349)
- Kat Carsey – Botany:  
(559-793-8145)
- Janet Moser – Wildlife:  
(559-341-6812)
- Steve Kozlowski – Wildlife:  
(307-745-2343)
- Katherine Malengo - Wildlife:  
(831-674-0685)
- Chris Colt – ID Team Wildlife  
Lead: (208-881-1975c.)

10. Next Call: Monday 23 June 2014 @ 2:00 pm MDT/1:00 PDT

- (888-844-9904; 7251216#)

**Subject:** FW: BA development for ID sage grouse EIS

Brent,

I wanted to get a better idea of what your expectations are for the actual informal consultation with the FWS.

Below is an email request from ID FWS to hold a weekly consultation meeting for the ID effort. I think this would be an important step in coordination. However, I am concerned about myself and my team being the ones conducting this meeting. My main concern is that, as the "contractor" writing the BA we really need the local folks, primarily the BLM, to conduct the consultation and we can participate and then write the analysis as directed. Additionally, I am concerned about time, as our team (4 of us) have 5 different EIS BA's to write by July 15<sup>th</sup> as per the FEIS/ROD timeline, so we are a bit crunched for time.

**Subject:** BA development for sage grouse EIS

Chris/Bruce,

I oversee a lot of the S7 work out of the Idaho Fish and Wildlife Office of the FWS, and while I know there have been some initial discussions between you guys and Barb Schmidt, I am concerned that as time keeps ticking by, we might not be on the same page at the same time relative to BA content, determinations, and expectations. I'm sure we're all aware that surprises down the line are not going to be looked at favorably on this monumental and high level effort, thus I suggest we establish regular check-ins (weekly conference calls?) to trade the latest and greatest information on what you guys know, where we are in the process, and if things still look like they are on track to meet everybody's expectations. I'd like to keep my managers informed to avoid surprises, and it seems a regular conference call might be the easiest way to engage. I know things are in perpetual motion on this broader effort, but any information exchange between us will put the IFWO in a better

place to react to changes that need to be captured through the consultation, starting with the development of the BA.

Please let me know your thoughts, and pass this idea along to others that might also need to be engaged.

Thanks

I have attached the GRSG Amendment EIS Biological Assessment team meeting notes from Monday (6/23/14). Some of the key issues covered were the NWCO process, logic for the lynx analysis as well as plants. We also laid out some of the assignment for the NV/CA and ID/MT projects, which we are moving to next.

GRSG LUP Amendment EIS  
Biological Assessment Team  
Planning Meeting Minutes  
6/23/2014

1. NWCO BA Project Discussion:

- a. BA Document steps/status – Table 1 updated; first step was to determine “no effect” vs. “further analysis” based on set of listed criteria; second step, determine next set of species that are “no effect” based on additional, yet brief analysis (one or two paragraphs) and is provided in appendix 1. Final step is to do an in depth analysis for those species that require in depth look based on potential for impact. Currently working on finalizing this for vertebrates and plants.
- b. Lynx – Steve K:
  - i. Based on information from Routt National Forest and FWS Biologists, sagebrush habitat is a secondary habitat type for Canada lynx. For section 7 consultation analysis purposes on the Lynx, secondary habitat is analyzed the same as primary habitat. Therefore, a full analysis is being conducted.
  - ii. The first step in the analysis is to overlay Lynx Analysis Units (LAU) and linkage areas on sage-grouse habitat (ADH = PPH + PGH (ADH = All Designated Habitat)) and examine the locations and number of acres of overlap. From this overlay analysis, ADH did not overlap any linkage areas and there was only one area (California Park, 1,700 acres) that overlapped an LAU. (An important issue with this mapping exercise is that the LAUs have been designated for the Routt NF, but not on the BLM.)
  - iii. Next, we reviewed the proposed actions and how that would impact the habitat for the lynx on 1,700 acres on Routt National Forest. Based on this review/analysis we are considering a no effect determination. Some of the considerations in this analysis include the following:
    - The programmatic nature of this analysis and the future site-specific NEPA and Section 7 consultation at the project level.
    - The decisions in this proposed action generally limit anthropogenic disturbances and will not impact the lynx.
    - The small amount of habitat in the analysis (1,700 acres) is secondary habitat for the lynx. These areas are not critical for lynx and are incidental use and are generally limited to occasional movements of lynx traveling to more desirable habitat.
  - iv. Steve is following up on this logic with FS (Missy Dressen, et al), FWS (Terry Ireland) and BLM (Lisa Belmonte) and developing a thorough write-up for both BLM and FS lands.

- c. Plants – Bruce: Most listed plant species are no effect as they are not in sagebrush habitat types. Two listed plant species that are within sagebrush habitat types are the CO Hookless Catus and Osterhout’s Milkvetch, therefore we are fully analyzing them. The initial examination is that these species will be a “no effect” determination based on the fact that these are fairly site-specific species and as long as there is a plan requirement to do do site-specific surveys and avoid at the project level, or a required design feature which requires or insures site-specific protection.
2. NV/CA BA Project Assignments:
  - a. Steve – Wolf
  - b. Katherine M. – Cuckoo
  - c. Janet – Skipper, Fairy shrimp
  - d. Bruce/Kat – Plants
3. Idaho/MT BA Project Assignments:
  - a. Bruce – Slickspot Peppergrass – To contact ID FWS Barbara Schmidt
  - b. Katherine – modify NWCO BA for ID/MT
  - c. Katherine – update table 1
  - d. Katherine – verify species for analysis; assign out as appropriate
4. Issue: Mitigation measures discussion - If the analysis suggests that there is the potential for an impact, but that impact can be minimized or eliminated through the requirement of a mitigation measure, we will do the following. Be as specific as possible so we can track the necessary mitigation measure to see if it is already in the existing RMP or in the EIS. If not and we believe that we need this in the ROD, we will need to work closely with the sub-regional EIS project lead to include the necessary mitigation in the EIS/ROD. In the EIS it will be any number of items: FS Standard, BLM Management Action, Required Design Feature, etc. For now, in the BA we will call them mitigation measures.
5. Tasks:
  - NV/CA – coordinate BLM RMP names with the list we currently have – **Katherine** to work with Arlene Kasic (CA BLM), Could also contact Sandra Brewer, Joe Tague or Randy Sharp (NV BLM).
  - Each specialist to continue/complete analysis on their species for the NWCO BA and get text into document on O: drive.
  - Start work on assigned species on NV/CA BA.
6. Next Call: Monday 30 June at 2:00 pm MDT (Note that we decided to shift the time later in the day.)

Thanks for the note Jeff. I am driving to NC today but need to talk to Tim or you. It is still unclear to us how Important Areas within PACs will have the necessary protective requirements for GRSG habitat. I'm also unclear whether "no net unmitigated loss" will be applied to Core, Important and General habitat as recommended by the NPT. As I mentioned on our call we recommend that Important Areas within PACs be managed consistent with Core Zones and the "no net unmitigated loss" be for both Core and Important Areas. This accepts your distinction of these Areas from General Habitat. Let me know when would be a good time to talk. Ed

Tim  
Regarding the draft memo back to Ed on the sage grouse administrative draft proposed decision, I called Steve Small this AM and learned that the WO has some questions regarding level of protection within important habitat (will areas identified as important habitat within PACs receive the highest level of protection? I explained how the adaptive mgmt strategy will move protections to from important to core when triggers are tripped ).

Steve said that Ed is going to set up a call with you this week to discuss these questions. I mentioned to Steve that Jim Lyons will be here on Friday for a visit and it would be most helpful to have this issue resolved by this Thursday.

**Subject:** Idaho and Southwestern Montana GRS G Follow-Up

Ed,

We appreciate your time to talk through the remaining questions this afternoon. As a follow-up we wanted to provide you the exact language out of the administrative draft proposed plan regarding avoidance/development criteria and mitigation requirements.

As a preamble the Idaho and southwestern Montana plan that has been worked on collaboratively with FWS, Forest Service and the State of Idaho incorporates conservation principles around project consideration, design and placement to avoid the areas of highest value for sage-grouse with a significant emphasis on avoiding and minimizing any impacts to habitat and sage-grouse populations first. The plan direction is to exclude many activities in Core Management Zones and avoid any anthropogenic development in Important Management Zones. If proposals for development are received, those proposals must be vetted through the disturbance criteria and placed in locations that would minimize or not impact birds or their habitats. Any residual impacts would require mitigation.

Important Management Zones are designated as ROW Avoidance areas as described in the allocation table previously provided. What wasn't captured is the stringent project consideration criteria that must be met for development to occur in these areas. It is the application of these criteria that forward the conservation principle of avoiding and minimizing impacts to sage-grouse habitat and reflect protective management more similar to Core Management Zones than General Management Zones.

*Important Management Zone: Anthropogenic Disturbance Development Criteria – the following criteria must be met in the screening and assessment process:*

- a. The project cannot reasonably be achieved, technically or economically, outside of this management zone; and*
- b. The project is co-located within the footprint for existing infrastructure, to the extent practicable. In the event co-location is not practicable, the siting should best reduce cumulative impacts and/or impacts on other high value natural, cultural, or societal resources; and*
- c. The project does not result in a net loss of GRS G habitat or habitat fragmentation or other impacts causing a decline in the population of the species within the relevant Conservation Area; and*
- d. The project design mitigates unavoidable impacts through appropriate compensatory mitigation; and*
- e. The project complies with the applicable RDFs.*
- f. The project would not exceed the 3% disturbance threshold.*

The plan also calls for mitigation in all management zones:

*Mitigate impacts from anthropogenic developments to GRS G habitats (this includes Core, Important and General Management Zones) by first avoidance of impacts, minimizing impacts and then compensating for impacts.*

Mitigation would still occur for any impacts in General Management Zones as well; however, requiring a no net loss standard for General Management Zones specifically raised some concerns over placement – in that we would not want the plan to construe a no net loss of habitat within General Management Zones where location

of mitigation efforts may be driven to areas of low value for sage-grouse. Instead by still requiring mitigation of habitat in General Management Zones, without invoking a no net loss for those areas, then the mitigation efforts could be more appropriately placed in areas of high value to sage-grouse.

*Mitigate anthropogenic development impacts to Core Management Zones to a no net loss standard through application of appropriate mitigation in accordance with the Mitigation Framework, referred to as no unmitigated loss.*

This no net loss standard is included in Important Management Zones as part of the criteria described (c & d) with the emphasis on first no loss of habitat then mitigating any residual effects. This is different in concept from an approach that looks at incorporating a higher degree of mitigation in order to provide for more loss initially.

If you have need of any further description or clarification just let me know.

Hi Brent,

Attached are two tables – one tracks the internal BLM comments on the DEIS. The other tracks changes to the FEIS needed based on public comments. I tried to identify where the change needs to be made and by whom. I did not see public comment responses (and changes to the FEIS) on the following topics:

- NEPA, etc
- ACECs
- Climate change
- Soils
- Water
- Fire/fuels
- Recreation
- Travel management
- Tribal interest
- Vegetation
- Wild horse and burro
- Lands with wilderness characteristics
- Livestock grazing

**IDMT GREATER SAGE-GROUSE  
RESOURCE MANAGEMENT PLAN AMENDMENT AND ENVIRONMENTAL IMPACT STATEMENT  
Changes to Public Draft RMPA/EIS**

<b>Cmt #</b>	<b>Page #</b>	<b>Cmt #</b>	<b>Reviewer Name/ Program</b>	<b>Change to document</b>	<b>Remarks / How Resolved</b>
1.			Jackovac – 14.1	Response: LR-19 and LR-21 do not specifically state whether or not lands identified for disposal in the LUPs would still be available for disposal. BLM needs to clarify this in the document.	BLM: Chapter 2
2.		IDMTSG-14-0131-8	Porter-minerals-range of alts	A more complete analysis of the effects of imposing restrictions on phosphate activities will be included in the FEIS. Clarify in FEIS the BMPs/RDFs that would apply to existing phosphate leases in sg habitat. Also clarify compensatory mitigation requirements. See notes for IDMTSG-14-0131-20 (row 22, below)	EMPSi/BLM Chapter 4  Chapter 2/Appendix
3.		IDMTSG-14-0049-10	Porter-minerals-range of alts	While Alt. D of the DEIS did propose closing all PPMA and PMMA habitat in areas with no to low potential for the occurrence of a fluid mineral to future leasing, that management action has been changed in the FEIS to leave all lands open to future leasing, subject to a No Surface Occupancy stipulation in PPMA and PMMA.	BLM: May need to change this response based on proposed plan.
4.		IDMTSG-14-0049-10	Porter-minerals-range of alts	add definition of VER to glossary. Note- this is not an easily definable term! I couldn't find a definition in Black's Law Dictionary, but did find a Solicitor's Opinion that provides context: M-36910 (Supp.) 88 I.D. 909, 912 (1981). Here are some excerpts: VER are those rights short of vested rights that are immune from denial or extinguishment by the exercise of Secretarial discretion. They may arise from two situations: a statute may prescribe a series of requirements which, if satisfied, create rights in the claimant by the claimant's actions under the statute without an intervening discretionary act; or, a VER may be created as a result of the exercise of Secretarial discretion. VERs are not absolute- the nature and extent of the rights are defined either by the statute creating the rights or by the manner in which the Secretary chose to exercise his discretion. VERs that include the right to develop may not be regulated to the point where the regulation unreasonably interferes with enjoyment of the benefit of the right.	EMPSi to do

Changes to Public Draft RMPA/EIS**

<b>Cmt #</b>	<b>Page #</b>	<b>Cmt #</b>	<b>Reviewer Name/ Program</b>	<b>Change to document</b>	<b>Remarks / How Resolved</b>
5.		IDMTSG-14-0049-27	Porter-minerals-range of alts	While Alt. D of the DEIS would have applied seasonal restrictions to lands with moderate to high potential for the occurrence of a fluid mineral, BLM's preferred management action has been changed in the FEIS to applying a year-round No Surface Occupancy stipulation in PPMA and PMMA. Seasonal restrictions would be applied in PGMA.	BLM: May need to change this response based on proposed plan.
6.		IDMTSG-14-0049-9	Porter-minerals-range of alts	BLM's preferred management action for future oil and gas leasing has been changed in the FEIS to applying a year-round NSO stipulation in PMMA and PPMA. This will exclude all development on leases in these areas.	BLM: May need to change this response based on proposed plan.
7.		IDMTSG-14-0153-28	Porter-minerals-range of alts	BLM's preferred alternative for future leases has been changed in the FEIS to impose an NSO in all PPMA and PMMA habitat, and to impose a lek buffer in PGMA. What is the lek buffer for PGMA in FEIS?	BLM: May need to change this response based on proposed plan.
8.		IDMTSG-14-0212-11	Porter-minerals-range of alts	There may be mineral leases in the ACECs proposed in Alts. C and F- that information will be included in the FEIS, as well as a discussion of mineral potential in the proposed ACECs Determine whether there are mineral leases in the ACECs proposed by Alts C and F. Determine mineral potential in ACECs proposed by Alts. C and F.	BLM: GIS analysis
9.		IDMTSG-14-0182-6	Porter-minerals-baseline data	BLM's preferred management action has been changed in the FEIS to applying a year-round No Surface Occupancy stipulation in PPMA and PMMA. Seasonal restrictions would be applied in PGMA. Lands outside of sage grouse habitat would not be subject to stipulations developed in this EIS.	BLM: May need to change this response based on proposed plan.
10.		IDMTSG-14-0180-43	Porter-minerals-impact analysis	The section describing the impacts from leasable minerals management for Alt E is not correct and needs major revision. See my comments on pg 4-61-63.	BLM/EMPSi

RESOURCE MANAGEMENT PLAN AMENDMENT AND ENVIRONMENTAL IMPACT STATEMENT  
Changes to Public Draft RMPA/EIS**

<b>Cmt #</b>	<b>Page #</b>	<b>Cmt #</b>	<b>Reviewer Name/ Program</b>	<b>Change to document</b>	<b>Remarks / How Resolved</b>
11.		IDMTSG-14-0212-30	Porter-minerals-impact analysis	The impacts of Alts F and B will be analyzed in more detail in the FEIS, specifically with respect to disturbance caps. Distinguish between Impacts from Alts F and B. Note: This is a disturbance cap question.	BLM/EMPSi
12.		IDMTSG-14-0212-29	Porter-minerals-impact analysis	Include a discussion of the effects of phosphate management actions to socio-economics in Ch 4. Also, references to section 4.11.2 should be corrected and should refer to section 4.12.2.	ICF EMPSi
13.		IDMTSG-14-0131-13	Porter-minerals-cumulative analysis	Cumulative effects across state lines will be considered in the FEIS.	EMPSi response: It will be for GRSG, but I don't think so for minerals?
14.		IDMTSG-14-0131-20	Porter-minerals-cumulative analysis	Analysis of impacts in the DEIS doesn't make sense. Table 4-64 (and subsequent tables in the section) is full of errors. None of Idaho's Phosphate leases are subject to NSO, CSU, or TL stips. Also I question the figures identified as unleased KPLAs closed to leasing (3720 acres) and subject to NSO (620 acres). I recommend doing away with the following columns in Table 4-64: Closed, NSO, CSU and TL. Here are actual numbers from LR2000: There are a total of 80,168 acres designated as KPLA. Currently, there are 31,670 acres of KPLA leased (48,498 acres of unleased KPLA). There are 12,904 acres of leased land outside of KPLAs. None of the leases are covered by NSO, CSU, or TL stips.	BLM/EMPSi work with GIS
15.		IDMTSG-14-0131-30	Porter-minerals-cumulative analysis	Socio-economic impacts resulting from the loss of availability of phosphate resources in each of the alternatives will be discussed in greater depth in the FEIS. Add impacts from loss of phosphate resources to socio-economic section	ICF

**IDMT GREATER SAGE-GROUSE  
RESOURCE MANAGEMENT PLAN AMENDMENT AND ENVIRONMENTAL IMPACT STATEMENT  
Changes to Public Draft RMPA/EIS**

<b>Cmt #</b>	<b>Page #</b>	<b>Cmt #</b>	<b>Reviewer Name/ Program</b>	<b>Change to document</b>	<b>Remarks / How Resolved</b>
16.		IDMTSG-14-0212-31	Porter-minerals-cumulative analysis	Additional analysis is required. Reasonably foreseeable actions, and the impacts of proposed conservation measures, will be discussed in the FEIS. Additional analysis required. Discuss reasonably foreseeable actions and impacts of proposed conservation measures in FEIS.	EMPSi – look at comment Additional cumulative for minerals?
17.		IDMTSG-14-0212-5	Porter-minerals-cumulative analysis	Add discussion of economic and social impacts of restricting phosphate mining and imposing conservation measures.	ICF
18.		IDMTSG-14-0166-7	Porter-minerals-mitigation measures	The RDFs were adopted from BMPs in Appendix D of the NTT report. In that appendix, it states that "BMPs are continuously improving as new science and technology become available and therefore are subject to change. Include from the following BMPs those that are appropriate to mitigate effects from the approved action." Add wording to the FEIS from the NTT report in discussion of RDFs.	Ask Brent if he concurs
19.		IDMTSG-14-0149-15	Makela- 7.3	Clarify in FEIS the validity of NTT, COT, BER relative to "establish standards of scientific integrity under the ESA, the Data Quality Act, and the Presidential and DOI memoranda and orders."	Ask Brent
20.		IDMTSG-14-0151-29	Makela- 7.3	Ensure FEIS clarifies how PACs were delineated (IDFG delineated based on Core and Important zones, and provided to FWS).	BLM: Chapter 2
21.		IDMTSG-14-0151-39	Makela- 7.3	Clarify in FEIS: Sage-grouse MZs were an attempt by WAFWA to delineate GRSG habitat range wide into more discrete areas for broad scale planning. Population monitoring is still done at finer scales such as State, local working group, Conservation Area or similar.	Chapter 2 or 3?
22.		IDMTSG-14-0049-32	Makela- 7.5	Ensure Proposed Plan has appropriate provisions/ clarity for actions in General management areas. Needs additional discussion.	BLM: Chapter 2

RESOURCE MANAGEMENT PLAN AMENDMENT AND ENVIRONMENTAL IMPACT STATEMENT  
Changes to Public Draft RMPA/EIS**

<b>Cmt #</b>	<b>Page #</b>	<b>Cmt #</b>	<b>Reviewer Name/ Program</b>	<b>Change to document</b>	<b>Remarks / How Resolved</b>
23.		IDMTSG-14-0056-17	Makela- 7.5	<b>Commenter states:</b> There is no published research that supports restricting or closing grazing, in areas adjacent to burns, in order to compensate for loss of habitat attributable to wildfire. (DESR- 5, page 2-134). <b>Response:</b> Clarify this measure further in FEIS. The MA says to consider such action. The need for it, therefore, would depend on the site specific situation such as if a burn were adjacent to remaining limited/fragmented habitat or other circumstances	BLM: Chapter 2
24.		IDMTSG-14-0056-9	Makela- 7.5	<b>Commenter (0056-9 and similar comment for 0105-13) states:</b> Alternative E includes the requirement for any assessment to determine whether or not a given area has the ability to provide sage grouse habitat (See Appendix D, page D-36). This is critical because as the maps are difficult to decipher on the large scale and personal knowledge of the area reflects that some areas identified as within PPGH or Core habitat do not have the ability to provide for sage grouse needs. <b>Response:</b> Build a mechanism into the Proposed Plan that allows for evaluation of circumstances on case by case basis at the site specific scale. Maybe add wording that such would be addressed via subsequent project level NEPA analysis?	BLM: Chapter 2
25.		IDMTSG-14-0105-13	Makela- 7.5	<b>Comment:</b> how would population triggers be applied if there is no definition for “population areas”? <b>Response:</b> Clarify discussion of habitat and population triggers for any relevant alternatives (D, E, Proposed Plan...).	BLM: Chapter 2
26.		IDMTSG-14-0153-26	Makela- 7.5	Project leads should discuss how to consistently address impacts from military flights and firm up discussion at 4-15. Consider adding additional detail from Mt. Home AFB Integrated Resource Mgt. Plan.	BLM: Chapter 2 BLM/EMPSi: Chapter 4

**IDMT GREATER SAGE-GROUSE  
RESOURCE MANAGEMENT PLAN AMENDMENT AND ENVIRONMENTAL IMPACT STATEMENT  
Changes to Public Draft RMPA/EIS**

<b>Cmt #</b>	<b>Page #</b>	<b>Cmt #</b>	<b>Reviewer Name/ Program</b>	<b>Change to document</b>	<b>Remarks / How Resolved</b>
27.		IDMTSG-14-0166-8	Makela- 7.5	Confirm that Alt F incorporates recommendations as noted (Sage-Grouse Recovery Alternative did not faithfully follow the original proposed alt)...BLM/FS believe that the Proposed Plan accommodates GRSG conservation without the need for additional broad land designations.	BLM: Chapter 2
28.		IDMTSG-14-0178-6	Makela- 7.5	Firm up discussion of existing policy/mechanisms in Alt A.	EMPSi – Check comment; Chapter 2?
29.		IDMTSG-14-0180-48	Makela- 7.5	Need to confirm where, in Alt D, we refer to 80% relative to brood habitat	BLM: Chapter 2
30.		IDMTSG-14-0206-1	Makela- 7.5	Commenter states: We worry that this language could be read to suggest that the State’s objective is to protect just the CHZ with 65% of the leks in Idaho and that a population decline in the IHZ would be consistent with this objective. This could lead state and federal agencies to “manage down” to a lower population level... Response: Clarify the 65 % rationale for Alt E.	BLM: Chapter 2
31.		IDMTSG-14-0212-1	Makela- 7.1 (moved to leasable minerals?)	Suggest looking more closely at this issue to ensure it has been adequately analyzed and address (economic issues vs. GRSG population impacts, etc). According to the commenter the core of this issue is that nearly 11 million acres of public land will be closed to phosphate development with this decision and that this is more restrictive than would be done under ESA if the species were listed. Under ESA, each individual project could be evaluated on a site-specific basis and mitigation strategies could be included.	ICF
32.		IDMTSG-14-0212-27	Makela- 7.1 (moved to leasable minerals)	Is there an adequate baseline description for leasable minerals?	Chapter 3

**IDMT GREATER SAGE-GROUSE

75.		IDMTSG-14-0212-17	Makela- 7.9	Comment: To incentivize immediate conservation efforts while ensuring realistic opportunities for development, the Agencies' Final LUP Amendment provisions should provide a clearer, more robust, mitigation credit program. The elements of the mitigation program should include, at a minimum, the ability of federal project proponents to pursue, and receive mitigation credits for, mitigation projects on private or state lands to offset future federal project impacts. Mitigation credit opportunities also should not be limited to traditional habitat improvement and protection activities. The Agencies should work with project proponents to develop alternative mitigation actions that could be used to offset project impacts.... Response: Discuss/consider this w/respect to mining which has little option for "NSO" type of buffers, especially for locatables under 3809.	BLM: Chapter 2
76.			ICF- socio	See document from ICF titled "IDMT_Report_Section 22_ICF Expected revisions_042514.docx". This document contains revisions that ICF expects to make to the FEIS in response to public comments on the DEIS.	EMPSi see document
77.			Ralston- edits	You indicated in Appendix H-4 that if an area met the relevance criteria and were in PPH, they were determined to have importance because of being a national priority for BLM. Table 3-45 has 67 Existing ACECs. Why the difference in numbers? Response: Change made	Change made
78.			Ralston- edits	Volume II A, Table I-5, page I-39: County Land Use and Sage-Grouse Management Plans lists Growth Policy dated June 20, 2005 as the reference for Beaverhead County, Montana. Our perspective would have indicated information on county land use policy for Beaverhead County, Montana would be found in the "Beaverhead County Public Lands Resource Use Policy and Plan" Response: Change made	Change made

87.			Ralston- edits	<p>As noted in the introductory comments, Y -3 II straddles the Idaho and Nevada border and operates a single ranching entity to coordinate grazing on BLM allotments in both states. BLM, however, states in the Nevada DEIS that planning for the land use plans covering this part of both Idaho and Nevada will occur through the Nevada FEIS and Record of Decision but will be implemented and administered through the Jarbidge and Burley FEIS and Record of Decision. See Nevada DEIS Section ES.2. Additionally, the decisions and analyses for that portion of Y-3 II's allotments in Nevada will occur through the Nevada DEIS and will end at the Nevada state line apparently leaving decisions and analysis for Y-3 II's ranch operations north of the Nevada border to the Idaho DEIS. Id. This is confusing because just a few sentences earlier it is stated that planning for both Idaho and Nevada land use plans will occur through the Nevada DEIS. Id. Thus, within a few short sentences it is unclear how the lands utilized by Y-3 II in Nevada and Idaho are being analyzed, decided, implemented, and administered. If read correctly, it appears that actual management decisions are being made in each state's DEIS, but that Idaho will administer both Idaho's management decisions and Nevada's management decisions as they relate to Y -3 II. Consequently, Y -3 II must analyze and comment on both the Nevada and Idaho DEISs. Y -3 II also notes that this bifurcation of planning and management processes, while at least addressed by the Nevada DEIS, is not addressed in the Idaho DEIS as it should be.</p> <p>Response: Brent to convene a bi-state group to discuss this specific issue with Jarbidge, Burley, Bruneau and Elko Field Offices</p>	BLM work with NV

88.			Ralston- edits	<p>The DEIS is also internally inconsistent, as to what BLM is proposing. In one place it states that it relates only to Forest Service decision making (implying BLM is not proposing any specific plan amendments) (DEIS at 5), and in another stating that “the BLM is proposing to amend the Battle Mountain/Tonopah Resource Management Plan (RMP) and the Carson City Field Office Consolidated RMP by adding to or changing some of the regulatory mechanisms to reduce, eliminate, or minimize threats to the Bi-state sage-grouse habitat on Federal lands administered under those plans” (DEIS at 1). This fundamental inconsistency also renders the DEIS inadequate as an informational document.</p> <p>Response: In the preparation of the Final EIS any internal inconsistencies that have been identified are being corrected. This particular inconsistency does not apply to the Idaho and Southwestern Montana Draft EIS.</p>	In the preparation of the Final EIS any internal inconsistencies that have been identified are being corrected. 89.			Ralston- edits Appendix A	<p>A-IS "The County Plan encourages the federal agencies (BLM and Forest Service) to coordinate and maintain communication with the county and the counties' Natural Resource Advisory Committee. As part of this coordination the county requests documentation and research be available to support management decisions."</p> <p>This statement should be corrected. The County Plan "requires" the federal agencies to coordinate its plans and policies as directed under the appropriate federal statutes. The Plan requires coordination with the Board of Commissioners. The Natural Resource Advisory Committee's purpose is to advise the Commissioners. All official communication should be with the Commissioners. The County Plan does more than request documentation and research, but requires that all policies of the federal and state agencies be coordinated with the County for the purpose of ensuring a comprehensive approach to greater sage-grouse management Response: This has been changed in Appendix A.</p>	This has been changed in Appendix A.
90.			Ralston- edits	<p>2-18 "These plans were based largely on the existing LWG GRSG Plans (Custer county 2006, Owyhee County 2013), which were considered during the initial development of the range of alternatives considered in detail." This statement is false as it relates to the Custer County Sage Grouse Comprehensive Plan, which is the Counties primary planning device for Sage-Grouse in Custer County, and should be clarified. The Custer County plan was developed and approved in 2013, and while the Local Working Group plan was consulted during the development of the County's Sage Grouse Plan, it was only one of several grouse plans consulted. Response: Change made in FEIS.</p>	Change made

<b>Cmt #</b>	<b>Page #</b>	<b>Cmt #</b>	<b>Reviewer Name/ Program</b>	<b>Change to document</b>	<b>Remarks / How Resolved</b>
91.			Ralston- NEPA range of alts	<p>Alternative A is excluded from the discussion of "Elements Common to Alternatives B, C, D, E, and F," which implies that these elements are not present in the no action alternative. This misleads the public. For instance, one of the elements common to all but Alternative A is "adaptive management." This element is clearly part of the current management framework as is noted in Appendix A, page 21. In answering whether the Challis RMP Complies with the Custer County Sage-Grouse Management principle that includes the use of adaptive management, the document affirms that the Challis RMP is compliant with a clear "Yes." However, in this same discussion, under "inclusion in Amendment EIS" the document only refers to Alternatives B-F as having an adaptive management component. Either Alternative A does use the adaptive management principle and it should state this, or it does not and compliance with Custer County Plan should be noted as a "NO."</p> <p>Response: Further description of adaptive management principles and strategies as described in each alternative has been included.</p>	Further description of adaptive management principles and strategies as described in each alternative has been included.
92.			Ralston- FLPMA consistency with other plans	<p>NEPA requires a discussion of "Possible conflicts between the proposed action and the objectives of Federal, regional, State and local land use plans, polices and controls for the area concerned." (40 CFR I 502.1 6(c)) It is the clear policy as stated in numerous County plans that the lands within the political boundaries of the county be maintained to ensure a vibrant local economy that is built on the historic use of and right to the productive use of these lands.</p> <p>Restricting and in some alternatives, eliminating these uses conflicts with the Counties policies. These conflicts have not been identified, analyzed or resolved in the DEIS.</p> <p>Response: As a result of the Preliminary Proposed Plan review any inconsistencies with local plans will be noted by those entities and will be addressed accordingly.</p>	As a result of the Preliminary Proposed Plan review any inconsistencies with local plans will be noted by those entities and will be addressed accordingly.

Comment Form – All Internal BLM Comments**

Page #	Section Title or #	Commenter	Comment	Response
ES-13	Table ES-4	k.bocking	None of the acres in the table are accurate or add up for any of the alternatives. No PGMA acres for DFO under alt D.	
Ch 2	D-FM-6 E-FM-6	Upper Snake Field Office	<p>Comment 2) Consider melding D and E for FM-6, or just using E.</p> <p>Regarding the second bullet in D-FM-6, for the entire allotment the bullet may work but what about fuel breaks? The desired condition of the actual fuel break area might not meet standards but might be appropriate.</p> <p>The third bullet does not seem useful. People always have to follow terms and conditions anyway so if you are doing something within the terms and conditions you do not need to put it in the land use plan. If you are doing something for fuels management outside of the permitted use it should be considered a fuels project and it would have nothing to do with the permitted use.</p>	
Ch 2	D-LG/RM-4	Upper Snake Field Office	Comment 3) The phrase “the highest priority” in D-LG/RM-4 is a little troubling. I understand the need to focus on sage grouse, but let’s say in the future there is a listed species in a field office and its habitat has shrunk down to one little area, in theory we could have 100 allotments with sage grouse ahead of this species and the allotment would not get assessed. In some offices PPMA is almost the whole field office and this would reduce flexibility to protect other listed species. Is this language bumping sage grouse ahead of threatened and even endangered species? I realize at the end of the action it says with consideration for threatened and endangered species but I am not sure what that means.	
Ch 2	D-LG/RM-5	Upper Snake Field	Comment 4) Regarding D-LG/RM 5: While overall HAF is good, there are some things such as randomness of site selection that do not	

January 2014

Page #	Section Title or #	Commenter	Comment	Response
		Office	match up well with standards and guides. Also some of the HAF objectives are not obtainable in dry habitats. Can we provide more on-site flexibility in this action to account for the S&G process' direction to "performed on representative sites" and address dry sites that don't meet HAF standards even without livestock grazing?	
Ch 2	D-LG/RM-11 E-LG/RM-10 D-LG/RM-44	Upper Snake Field Office	Comment 5) Consider using E-LG/RM-10 over D-LG/RM-11 in the Proposed RMP/Final EIS. E-LG/RM-10 would still give the authorized officer the ability to adjust livestock use at a trough if there is a conflict with livestock and sage grouse. The term "when possible" might not be the best phrase to use here. This phrase could be used to force the turning off of troughs even when there is no known conflict. It is difficult to counter an argument that it is "possible" to turn off a trough. Also D-LG/RM 44 could also be used to properly manage livestock use around a trough. Proposal would be to keep E-LG/RM-10 and D-LG/RM-44 and remove D-LG/RM-11.	
2-16	3 <sup>rd</sup> paragraph	P. Makela	The brief descriptions of PPMA and PMMA could be improved on. See suggested wording based on descriptions of PPMA and PMMA provided to EMPSi via email on 8/1/2013.	PPMAs contain the areas of highest conservation value to GRSG. Key characteristics include areas of higher lek attendance and lek connectivity, lower habitat fragmentation, important movement corridors and winter habitat.  PMMA's contain areas of moderate to high conservation

Page #	Section Title or #	Commenter	Comment	Response
				value to GRSG that are generally adjacent to PPMAs but reflect reduced GRSG population and/or habitat characteristics.
2-16	3 <sup>rd</sup> paragraph	P. Makela	Second to last sentence says “Under Alternative D, the BLM and Forest Service would require no net unmitigated loss of PPMAs instead of a disturbance cap.” This is also referenced on page 2-65 describing alt D further. This statement is inconsistent with wording for Alt D for Unleased Federal Fluid Minerals Estate on page 2-177, Management Action D-MLS-12 that says we will not exceed a disturbance density of 1/640 acres or max 3% disturbance per section.	Discuss with ID Team. It appears that the reference to 1/640 and 3% should be deleted and reference no net unmitigated loss.
2-25	Table 2-2	Porter	Fluid mineral leasing acreages wrong (Alt D=270 acres of BLM open to leasing?). Also should split into geothermal vs. O&G, as acreages will be different. Alt. D- where did TL’s, CSU’s, NSO’s come from?	
2-35	Table 2-3	P. Makela	For leased fluid minerals, Alt D, it says to use RDFs as Conditions of Approval. However, I do not see any RDFs for Alt D in Appendix C. It only shows BMPs for Alt D and RDFs for Alt B and F.	Verify if Alt D RDFs need to be added to appendix C or if table 2-3 should reference BMPs instead.
2-36	Table 2-3	P. Makela	Alt D references the disturbance density metrics of 1/640 acres and 3%. As noted above, if we are using “no net unmitigated loss” as per pages 2-16 and 2-65, these should be removed.	Discuss/confirm with ID team.
2-45	Volume 1	k.bockting	What alternative is this map? The DFO did not identify core/PPMA as ACEC’s for Alt D.	
2-50	VOL IIA Pp 3 and 4	k.bockting	Last sentence of these two pp say “Figures at the end of this chapter illustrate...” What figures? Need to identify.	

January 2014

Page #	Section Title or #	Commenter	Comment	Response
2-65	2.6.4 Alt. D	Porter	Second paragraph- Second sentence “New authorizations would not be allowed in PPMAs” includes minerals, O&G, and geothermal development. This conflicts with the minerals management actions for Alt. D.	
2-69	Table 2-5	P. Makela	Footnote references Stiver et al 2000 but this should be 2010. (i.e., the GRSG Habitat Assessment Framework). Also this is straight from the 2010 HAF, which does not reference Connelly for this information, so delete reference to Connelly 2013 here as I think that is a typo.	Change Stiver et al. 2000 to 2010.
2-70	Table 2-6	P. Makela	Footnote cites Connelly et al. 2000. Delete and change citation to Stiver et al. 2010 as this is verbatim from Page II-12 of that document.	Cite Stiver et al. 2010 instead.
2-71	Table 2-7	P. Makela	To footnote of Connelly et al. 2000 <u>add</u> Stiver et al. 2010.	Add Stiver et al. 2010 to the Connelly citation.
2-71	Table 2-9	P. Makela	To footnote of Connelly et al. 2000 <u>add</u> Stiver et al. 2010.	Add Stiver et al. 2010 to the Connelly citation.
2-72	Table 2-10	P. Makela	To footnote of Connelly et al. 2000 <u>add</u> Stiver et al. 2010.	Add Stiver et al. 2010 to the Connelly citation.
2-77	Last paragraph	P. Makela	Mentions that CHZ avoids development in PACS “with a process for limited exceptions”.	Clarify what those exceptions would be and the suggested process, to reduce ambiguity.
2-78	Para 1	P. Makela	Says the IHZ is defined by the 75 percent BBD areas etc. Actually, the 75 % BBD includes the BBD zones below it (i.e., 1 to 75%). But definition of CHZ says it includes the 25-50 BBD. I think what they want to say is that IHZ includes the 75% BBD areas that are not already accounted for by the CHZ’s 25-50%	Discuss with ID Team and state to ensure definition/process is captured

January 2014

Page #	Section Title or #	Commenter	Comment	Response
			BBD, since BBD is cumulative.	accurately.
2-80	Hard trigger bullet 2	P. Makela	Says 20% loss in CHZ nesting and/or wintering habitat within the “CHZ and IHZ”. I believe this should say “...within the “Conservation Area” but need to confirm.	Confirm with State.
2-81	Bullet 5	P. Makela	For exemptions, what does it mean for a project that “benefits the State of Idaho?”	Clarify with the State, the criteria that would be applied or process that would be used to make this determination, as it is ambiguous as written.
2-82	Bullet 2	P. Makela	Mentions a “limited process for exemptions”.	Clarify with State what this process is.
2-82	Last bullet	P. Makela	Says to “...prioritizes the need to examine allotments within CHZ with declining populations” This implies we have population trend info for GRSG at the allotment level, however we do not. Does it mean to read “...prioritizes the need to examine allotments within CHZ of Conservation Areas with declining populations”?	Clarify with State as to intent with this wording.
2-91	Lands and Realty	P. Makela	Alt F. Says “Similar to Alternative B, a five percent disturbance cap...”. However on page 2-62 it says Alt. B has a 3% cap and Table 2-18, on page 2-162 says F has a 3% cap.	Confirm if B/F should have a 3 or 5% cap and do consistency check in document.
2-122	Vol IIA Table 2-18	k.bockting	Need to Identify a % threshold of habitat that can be treated or to be maintained within the PPMA.	
2-177	Vol IIA Table 2-18	k.bockting	What are the TL strips referred to in the table under alt D for unleased fluid minerals? Also how do we measure the 3% disturbance/section?	
2-192	Table 2-19	Porter	Non-energy leasable writeup should include exception for lease	

Page #	Section Title or #	Commenter	Comment	Response
			mod/fringe lease.	
2-193	Table 2-19	Porter	Alt A acres withdrawn (1.2 million) is not consistent with pg 4-33 (621,400). Text after the acreage figure should be moved to Alts B and C. Alt. D description is incorrect, as no additional acres are proposed for withdrawal. You could replace the text after the acreage figure and say that this acreage would “remain withdrawn from mineral entry”, or simply say that no additional acreage is proposed. Text after the acreage pertains to the first sentence of the cell, concerning 3809.	
2-201	Table 2-20	Porter	Summary of “Energy Development- Non-renewable” is not accurate. Alt D also closes areas to leasing, and in fact closes more acreage to leasing than Alt B, as it includes medial habitat, which Alt. B doesn’t. Alt D precludes undue or unnecessary degradation by limiting O&G leasing to only those areas (in PPH and PMH) with moderate or higher occurrence potential.	
2-201	Table 2-20	Porter	Alt. D should not say “Same as Alt A”. It should say “No new withdrawals for locatable minerals. New 3809 Plans and Notices would be subject to appropriate BMPs as Conditions of Approval.” For non-energy, add “An exception may be considered for lease modifications and fringe acreage leases.” In the summary, Second sentence of first paragraph (closures) should include salable mineral authorizations within 3 km of a lek, and non-energy leasable minerals in PPMA and PMMA. The second paragraph under the Summary should read “Under Alt. D, appropriate surface use restrictions would be placed on mineral exploration and development where allowable, to protect . . .	
2-201	Table 2-20	Porter	In the heading for “Renewable Energy Sources”, Geothermal should be included and the management actions described. Or better, on the previous page, change the heading for “Energy Development (Non-renewable)” to “Energy Development (Fluid Minerals).” Either way, geothermal is not addressed in the current table.	
	Figure 2-37	Porter	Alt A map should have NSO’s, TL’s, etc. from existing plans. ALSO- ALL minerals maps should show the entire SNRA as WD or closed, even the private lands.	
	Figure 2-40	Porter	What is the source for NSO, TLs, CSUs?	

January 2014

Page #	Section Title or #	Commenter	Comment	Response
3-121	Vol IIA Figure 3-14	k.bocking	Map displays the Continental Divide <b>National Scenic</b> trail on the MT ID border. This is not a NHT trail.	
3-135	Vol IIA Table 3-49	k.bocking	Oregon trail does not occur in MT - Replace Oregon NHT with <b>Nez Perce Trail</b> in Dillon Field Office.	
4-32	Tables 4-9	Porter	Numbers are doubtful. For instance, where is 22% of East-Central pop. Area closed? How is it that that large a closure doesn't affect any leks? Also compare the numbers to the locatable WD table on the next page. Only 5% of the same habitat is WD, however that area affects 8.3 leks?? <b>None of the analysis in this section makes sense.</b>	
4-174	Table 4-56	Porter	Table shows that 3.188 million acres are currently closed to leasing. Wrong/inconsistent with other acreage figures. Also the table shows leasing in areas that are closed to leasing. Acres do not match table 2-2 (pg 2-25). Totals are not correct. Need to verify all other tables in this section.	
4-174	Last sentence	Porter	Insert "continue to be" between "would" and "available"	
4-175	Second paragraph	Porter	Sentence should read, "Under this alternative, <u>it is reasonably foreseeable to anticipate that</u> 25 new wells would ... Make this change to all alternatives	
4-178	Sentence bfr table	Porter	Should be occurrence potential vs. development potential.	
4-179		Porter	Alt D second paragraph, first sentence- occurrence vs. development. Fourth line should say would remain open subject to ...	
4-179	Last sentence	Porter	It is an erroneous assumption that low potential areas would be less likely to be explored or developed. What is missing is a statement supporting the alternative by saying that closing areas with low potential in PPH and PMH prevents undue and unnecessary degradation of the lands, which is a mandate of FLPMA. We have over 90k acres nominated for leasing in the Jarbidge FO, a PPH area with low potential. Keeping medium potential areas open, with stipulations to mitigate, is consistent with FLPMA and BLM's multi-use mandate.	
4-180	Table 4-59	Porter	Acreage figures for medium potential/closed to leasing should be the same as Alt. A, as no additional medium potential areas are being proposed for closure under Alt D. Text should also change to reflect this.	

January 2014

Page #	Section Title or #	Commenter	Comment	Response
	E-VG-26	Upper Snake Field Office	Comment 1) Consider using E-VG-26 over D-VG-26 (which is blank). This would give the authorized officer more flexibility to manage mountain sagebrush range sites that can quickly exceed canopy cover requirements.	
6-20	Vol IIB References	k.bockting	Not sure what the reference from MFWP 2009 is from? I am not aware of a "GRSG Habitat Conservation Strategy" from January 31, 2009, nor is Catherine Wightman or the local FWP biologists.	
B-2	Table B-1	k.bockting	No RFDS for the B-D National Forest in MT	
C-4	Table C-1 GOA # 292	k.bockting	"Limit noise levels at sunrise at the perimeter of leks"? From sunrise until when? for 10 minutes? 30 minutes? 3hours? This needs to be clarified. What constitutes the lek perimeter? Recommend limiting noise levels w/in 1 mile of leks between 6PM - 9AM. (Patricelli, et al., Revised noise recommendations, 2012)	
C-6	Table C-1	k.bockting	Fuels/Fire BMP/RDF's are very similar from the NTT and IM 2013-128. Should combine them and list them once to remove confusion.	
O -1	Appendix O	k.bockting	List is incomplete, Why is there a list for MT but not ID? Recommend removing this list for MT, it has no bearing on the overall DEIS.

Brent,

I while back I sent you a list of items that will need to be fixed in the FEIS. Should I be concerned that these are not in the document with BLM internal comments that you just sent out?

Since they are not there, should I keep these in mind and look for them in the FEIS?

E-LG/RM-10 would still give the authorized officer the ability to adjust livestock use at a trough if there is a conflict with livestock and sage grouse. The term "when possible" might not be the best phrase to use here. This phrase could be used to force the turning off of troughs even when there is no known conflict. It is difficult to counter an argument that it is "possible" to turn off a trough. Also D-LG/RM 44 could also be used to properly manage livestock use around a trough. Proposal would be to keep E-LG/RM-10 and D-LG/RM-44 and remove D-LG/RM-11.	
2-16	3 <sup>rd</sup> paragraph	P. Makela	The brief descriptions of PPMA and PMMA could be improved on. See suggested wording based on descriptions of PPMA and PMMA provided to EMPSi via email on 8/1/2013.	PPMAs contain the areas of highest conservation value to GRSG. Key characteristics include areas of higher lek attendance and lek connectivity, lower habitat fragmentation, important movement corridors and winter habitat.  PMMA's contain areas of moderate to high conservation

Page #	Section Title or #	Commenter	Comment	Response
				value to GRSG that are generally adjacent to PPMAs but reflect reduced GRSG population and/or habitat characteristics.
2-16	3 <sup>rd</sup> paragraph	P. Makela	Second to last sentence says “Under Alternative D, the BLM and Forest Service would require no net unmitigated loss of PPMAs instead of a disturbance cap.” This is also referenced on page 2-65 describing alt D further. This statement is inconsistent with wording for Alt D for Unleased Federal Fluid Minerals Estate on page 2-177, Management Action D-MLS-12 that says we will not exceed a disturbance density of 1/640 acres or max 3% disturbance per section.	Discuss with ID Team. It appears that the reference to 1/640 and 3% should be deleted and reference no net unmitigated loss.
2-25	Table 2-2	Porter	Fluid mineral leasing acreages wrong (Alt D=270 acres of BLM open to leasing?). Also should split into geothermal vs. O&G, as acreages will be different. Alt. D- where did TL’s, CSU’s, NSO’s come from?	
2-35	Table 2-3	P. Makela	For leased fluid minerals, Alt D, it says to use RDFs as Conditions of Approval. However, I do not see any RDFs for Alt D in Appendix C. It only shows BMPs for Alt D and RDFs for Alt B and F.	Verify if Alt D RDFs need to be added to appendix C or if table 2-3 should reference BMPs instead.
2-36	Table 2-3	P. Makela	Alt D references the disturbance density metrics of 1/640 acres and 3%. As noted above, if we are using “no net unmitigated loss” as per pages 2-16 and 2-65, these should be removed.	Discuss/confirm with ID team.
2-45	Volume 1	k.bockting	What alternative is this map? The DFO did not identify core/PPMA as ACEC’s for Alt D.	
2-50	VOL IIA Pp 3 and 4	k.bockting	Last sentence of these two pp say “Figures at the end of this chapter illustrate...” What figures? Need to identify.	

January 2014

Page #	Section Title or #	Commenter	Comment	Response
2-65	2.6.4 Alt. D	Porter	Second paragraph- Second sentence “New authorizations would not be allowed in PPMAs” includes minerals, O&G, and geothermal development. This conflicts with the minerals management actions for Alt. D.	
2-69	Table 2-5	P. Makela	Footnote references Stiver et al 2000 but this should be 2010. (i.e., the GRSG Habitat Assessment Framework). Also this is straight from the 2010 HAF, which does not reference Connelly for this information, so delete reference to Connelly 2013 here as I think that is a typo.	Change Stiver et al. 2000 to 2010.
2-70	Table 2-6	P. Makela	Footnote cites Connelly et al. 2000. Delete and change citation to Stiver et al. 2010 as this is verbatim from Page II-12 of that document.	Cite Stiver et al. 2010 instead.
2-71	Table 2-7	P. Makela	To footnote of Connelly et al. 2000 <u>add</u> Stiver et al. 2010.	Add Stiver et al. 2010 to the Connelly citation.
2-71	Table 2-9	P. Makela	To footnote of Connelly et al. 2000 <u>add</u> Stiver et al. 2010.	Add Stiver et al. 2010 to the Connelly citation.
2-72	Table 2-10	P. Makela	To footnote of Connelly et al. 2000 <u>add</u> Stiver et al. 2010.	Add Stiver et al. 2010 to the Connelly citation.
2-77	Last paragraph	P. Makela	Mentions that CHZ avoids development in PACS “with a process for limited exceptions”.	Clarify what those exceptions would be and the suggested process, to reduce ambiguity.
2-78	Para 1	P. Makela	Says the IHZ is defined by the 75 percent BBD areas etc. Actually, the 75 % BBD includes the BBD zones below it (i.e., 1 to 75%). But definition of CHZ says it includes the 25-50 BBD. I think what they want to say is that IHZ includes the 75% BBD areas that are not already accounted for by the CHZ’s 25-50%	Discuss with ID Team and state to ensure definition/process is captured

January 2014

Page #	Section Title or #	Commenter	Comment	Response
			BBD, since BBD is cumulative.	accurately.
2-80	Hard trigger bullet 2	P. Makela	Says 20% loss in CHZ nesting and/or wintering habitat within the “CHZ and IHZ”. I believe this should say “...within the “Conservation Area” but need to confirm.	Confirm with State.
2-81	Bullet 5	P. Makela	For exemptions, what does it mean for a project that “benefits the State of Idaho?”	Clarify with the State, the criteria that would be applied or process that would be used to make this determination, as it is ambiguous as written.
2-82	Bullet 2	P. Makela	Mentions a “limited process for exemptions”.	Clarify with State what this process is.
2-82	Last bullet	P. Makela	Says to “...prioritizes the need to examine allotments within CHZ with declining populations” This implies we have population trend info for GRSG at the allotment level, however we do not. Does it mean to read “...prioritizes the need to examine allotments within CHZ of Conservation Areas with declining populations”?	Clarify with State as to intent with this wording.
2-91	Lands and Realty	P. Makela	Alt F. Says “Similar to Alternative B, a five percent disturbance cap...”. However on page 2-62 it says Alt. B has a 3% cap and Table 2-18, on page 2-162 says F has a 3% cap.	Confirm if B/F should have a 3 or 5% cap and do consistency check in document.
2-122	Vol IIA Table 2-18	k.bockting	Need to Identify a % threshold of habitat that can be treated or to be maintained within the PPMA.	
2-177	Vol IIA Table 2-18	k.bockting	What are the TL strips referred to in the table under alt D for unleased fluid minerals? Also how do we measure the 3% disturbance/section?	
2-192	Table 2-19	Porter	Non-energy leasable writeup should include exception for lease	

Page #	Section Title or #	Commenter	Comment	Response
			mod/fringe lease.	
2-193	Table 2-19	Porter	Alt A acres withdrawn (1.2 million) is not consistent with pg 4-33 (621,400). Text after the acreage figure should be moved to Alts B and C. Alt. D description is incorrect, as no additional acres are proposed for withdrawal. You could replace the text after the acreage figure and say that this acreage would “remain withdrawn from mineral entry”, or simply say that no additional acreage is proposed. Text after the acreage pertains to the first sentence of the cell, concerning 3809.	
2-201	Table 2-20	Porter	Summary of “Energy Development- Non-renewable” is not accurate. Alt D also closes areas to leasing, and in fact closes more acreage to leasing than Alt B, as it includes medial habitat, which Alt. B doesn’t. Alt D precludes undue or unnecessary degradation by limiting O&G leasing to only those areas (in PPH and PMH) with moderate or higher occurrence potential.	
2-201	Table 2-20	Porter	Alt. D should not say “Same as Alt A”. It should say “No new withdrawals for locatable minerals. New 3809 Plans and Notices would be subject to appropriate BMPs as Conditions of Approval.” For non-energy, add “An exception may be considered for lease modifications and fringe acreage leases.” In the summary, Second sentence of first paragraph (closures) should include salable mineral authorizations within 3 km of a lek, and non-energy leasable minerals in PPMA and PMMA. The second paragraph under the Summary should read “Under Alt. D, appropriate surface use restrictions would be placed on mineral exploration and development where allowable, to protect . . .	
2-201	Table 2-20	Porter	In the heading for “Renewable Energy Sources”, Geothermal should be included and the management actions described. Or better, on the previous page, change the heading for “Energy Development (Non-renewable)” to “Energy Development (Fluid Minerals).” Either way, geothermal is not addressed in the current table.	
	Figure 2-37	Porter	Alt A map should have NSO’s, TL’s, etc. from existing plans. ALSO- ALL minerals maps should show the entire SNRA as WD or closed, even the private lands.	
	Figure 2-40	Porter	What is the source for NSO, TLs, CSUs?	

January 2014

Page #	Section Title or #	Commenter	Comment	Response
3-121	Vol IIA Figure 3-14	k.bocking	Map displays the Continental Divide <b>National Scenic</b> trail on the MT ID border. This is not a NHT trail.	
3-135	Vol IIA Table 3-49	k.bocking	Oregon trail does not occur in MT - Replace Oregon NHT with <b>Nez Perce Trail</b> in Dillon Field Office.	
4-32	Tables 4-9	Porter	Numbers are doubtful. For instance, where is 22% of East-Central pop. Area closed? How is it that that large a closure doesn't affect any leks? Also compare the numbers to the locatable WD table on the next page. Only 5% of the same habitat is WD, however that area affects 8.3 leks?? <b>None of the analysis in this section makes sense.</b>	
4-174	Table 4-56	Porter	Table shows that 3.188 million acres are currently closed to leasing. Wrong/inconsistent with other acreage figures. Also the table shows leasing in areas that are closed to leasing. Acres do not match table 2-2 (pg 2-25). Totals are not correct. Need to verify all other tables in this section.	
4-174	Last sentence	Porter	Insert "continue to be" between "would" and "available"	
4-175	Second paragraph	Porter	Sentence should read, "Under this alternative, <u>it is reasonably foreseeable to anticipate that</u> 25 new wells would ... Make this change to all alternatives	
4-178	Sentence bfr table	Porter	Should be occurrence potential vs. development potential.	
4-179		Porter	Alt D second paragraph, first sentence- occurrence vs. development. Fourth line should say would remain open subject to ...	
4-179	Last sentence	Porter	It is an erroneous assumption that low potential areas would be less likely to be explored or developed. What is missing is a statement supporting the alternative by saying that closing areas with low potential in PPH and PMH prevents undue and unnecessary degradation of the lands, which is a mandate of FLPMA. We have over 90k acres nominated for leasing in the Jarbidge FO, a PPH area with low potential. Keeping medium potential areas open, with stipulations to mitigate, is consistent with FLPMA and BLM's multi-use mandate.	
4-180	Table 4-59	Porter	Acreage figures for medium potential/closed to leasing should be the same as Alt. A, as no additional medium potential areas are being proposed for closure under Alt D. Text should also change to reflect this.	

January 2014

Page #	Section Title or #	Commenter	Comment	Response
	E-VG-26	Upper Snake Field Office	Comment 1) Consider using E-VG-26 over D-VG-26 (which is blank). This would give the authorized officer more flexibility to manage mountain sagebrush range sites that can quickly exceed canopy cover requirements.	
6-20	Vol IIB References	k.bockting	Not sure what the reference from MFWP 2009 is from? I am not aware of a "GRSG Habitat Conservation Strategy" from January 31, 2009, nor is Catherine Wightman or the local FWP biologists.	
B-2	Table B-1	k.bockting	No RFDS for the B-D National Forest in MT	
C-4	Table C-1 GOA # 292	k.bockting	"Limit noise levels at sunrise at the perimeter of leks"? From sunrise until when? for 10 minutes? 30 minutes? 3hours? This needs to be clarified. What constitutes the lek perimeter? Recommend limiting noise levels w/in 1 mile of leks between 6PM - 9AM. (Patricelli, et al., Revised noise recommendations, 2012)	
C-6	Table C-1	k.bockting	Fuels/Fire BMP/RDF's are very similar from the NTT and IM 2013-128. Should combine them and list them once to remove confusion.	
O -1	Appendix O	k.bockting	List is incomplete, Why is there a list for MT but not ID? Recommend removing this list for MT, it has no bearing on the overall DEIS.	

## **Lands and Realty Follow-Up for FEIS**

Per Comment Number 26-9, we will need to make sure it is clear that lands currently identified for “disposal”, will be changed to “retain.”

Per Comment Number 49-24, the question about buried powerlines vs. overhead lines causing impact to sage grouse needs to be answered (by biology), so that Lands and Realty management actions can lay out the recommendations.

Per Comment Number 49-7, we may need to explain that complete exclusion is unrealistic.

Per Comment Number 183-16 and 183-17, co-location is not always practicable or feasible; we may need to add flexibility into our Alt G lands and realty actions.

Per Comment Number 206-9, the suggestion that excluded activities in Alt D should go through the State’s proposed exemption process, may be one to add in Alt G.

Per Comment Number 210-7, we may want to reference APLIC standards.

Per Comment Number 212-6, need to ask Karen Porter about lease development and what is authorized. Do they contain a valid existing right to roads...?

Per Comment Number 242-20, may need to reference the COT in developing Alt G.

Per Comment Number 49-25, maybe some of the buffer’s bio’s are drafting will fit this comment?

Per Comment Number 183-37 and 49-31, biologists need to answer to the conflicting requests for perch divereters and then we need to make a recommendation for powerline in Alt. G.

Per Comment Number 210-4, with conflicting opinions, biologists may need to decide/recommend overhead vs. buried for Alt G and explain why.

Per Comment Number 180-42, we need to provide a conclusion on impacts of wind energy in Alt E.

Per Comment Number 183-29, we need to clarify what the acreages mean according to the BER report.

Per Comment Number 183-38, need to look at WECC and NERC standards to see if co-locating can have some flexibility; otherwise co-locations could cause reliability issues and outages.

Change D-LR-19. "Acquire habitat when possible and retain ownership of habitat, except if a ~~land exchange~~ would allow..." "land exchange" needs to be changed to "disposal" (a more correct terminology)

**In 2.6.4 Alternative D**, "Required" needs to be changed to "allowed" in the following sentence:  
The following are examples of ROWs that could be required in PPMA"

This statement does not seem accurate... I think it should be "decreasing" instead of "increasing:"  
"Alternatives A, B, C, and F would force wind energy ROWs outside GRS habitat, thereby increasing the potential for indirect effects in the planning areas, such as requests for new transmission line ROWs and access roads.

The following needs to be clarified in the FEIS: "Impacts from lands and realty to wind energy were discussed in Chapter 4, page 4-331. BLM groups Alternative A and Alternative E together in regards to impacts on wind energy. Under Alternative E, the BLM and the Forest Service would limit impacts from wind and solar energy development through the use of triggers in addition to the general stipulations identified in the GRS section, as well as best management practices that would also apply to Alternative A.

**Subject:** Comment Response Review for Idaho/Montana Sage-Grouse EIS

Hi Vonnie,

Ken Visser recommended that I request your review of one of our comment responses for the Idaho/MT Sage-Grouse EIS. We received several comments to the effect that BLM does not have authority to close grazing allotments, or that a new "chiefly valuable" determination would need to be made. The following is our response. Could you please review it by August 7th and let me know if any changes are needed?

Thank You,  
Nika

FLPMA grants the Interior Secretary the authority to make land use planning decisions, taking into consideration multiple use and sustained yield, areas of critical environmental concern, present and potential uses of the land, relative scarcity of values, and long-term and short-term benefits, among other resource values (43USC 1711 Sec 201 (a)). 43 CFR § 4100.0-8 provides that the BLM shall manage livestock grazing on public lands in accordance with applicable land use plans. Further, the BLM may designate lands as "available" or "unavailable" for livestock grazing through the land use planning process (H-1601, Land Use Planning Handbook, Appendix C). A decision to cease livestock grazing is not permanent. It is subject to reconsideration, modification and reversal in subsequent land use plan decisions.

The Taylor Grazing Act requires that the Secretary "make such rules and regulations ... [and] do any and all things necessary ... to insure the objects of ... grazing districts, namely, to regulate their occupancy and use, to preserve the land and its resources from destruction or unnecessary injury [and] to provide for the orderly use, improvement and development of the range." (43 USC § 315a).

FLPMA grants the Interior Secretary the authority to make land use planning decisions, taking into consideration multiple use and sustained yield, areas of critical environmental concern, present and potential uses of the land, relative scarcity of values, and long-term and short-term benefits, among other resource values (43USC 1711 Sec 201 (a)). 43 CFR § 4100.0-8 provides that the BLM shall manage livestock grazing on public lands in accordance with applicable land use plans. Actions taken under land use plans may include making some, or all of the land within grazing districts, unavailable for grazing during the life of the plan as well as imposing grazing use restrictions, limitations or other grazing management related actions intended to achieve such goals and objectives (H-1601, Land Use Planning Handbook, Appendix C).

A "chiefly-valuable-for-grazing" determination is required only when the Secretary is

considering creating or changing grazing district boundaries. Such a determination is neither required nor appropriate when establishing grazing levels within a district. (See USDI Solicitor Memorandum Clarification of M-37008 (May 13, 2003)). This RMP is not considering creating or changing grazing district boundaries. Although lands have been identified as "chiefly-valuable-for-grazing" per the Taylor Grazing Act for purposes of establishing grazing districts within the public domain (see, 43 U.S.C. § 315) this does not negate the BLM's authority or responsibility to manage those lands to achieve resource condition goals and objectives under the principals of multiple use and sustained yield as required by FLPMA and its implementing regulations.

Well I shared the report but I didn't really communicate the assignment that goes along with it. So here goes...

Everyone needs to take a look at this again, particularly noting any highlighted areas, and make sure these responses are good to go. If there are some edits or adjustments to the response please make that in track changes and send back to me by August 8<sup>th</sup>. If there is additional insight you can provide in resolving any of the highlighted areas also include that in track changes.

I've reattached the report again in case you misplaced it!!

Hi Brent,

Attached is the latest comment report. It is pretty similar to the report I gave you earlier in the month, but the planning related (NEPA, FLPMA, other laws) and minerals issues and responses have been updated. Let me know if you'd like anything else.

Meredith

## Section 3 - Edits Total

Number of Submissions: 27

Total Number of Comments: 62

---

## Section 4 – NEPA

Total Number of Submissions: 2

Total Number of Comments: 2

---

### Summary

The FEIS needs to identify an Environmentally Preferred Alternative, evaluate the plan according to the USFWS's Evaluation Criteria for Conservation Plans, and provide a summary comparison of the population effects under each alternative.

---

### Response

1. Section 1505.2(b) requires that, in cases where an EIS has been prepared, the Record of Decision (ROD) must identify all alternatives that were considered, ". . . specifying the alternative or alternatives which were considered to be environmentally preferable." This alternative(s) will be identified in the ROD.
2. The Policy for the Evaluation of Conservation Efforts (PECE) is the USFWS responsibility and will be used by USFWS during their evaluation of BLM/FS land use plans as appropriate.
3. The FEIS includes discussion of population effects. For instance, [refer to chapter 4 section] incorporates consideration of Greater Sage-grouse populations in the cumulative effects analysis, which is organized by WAFWA MZ.

## Section 4.1 - Public Notification

Total Number of Submissions: 1

Total Number of Comments: 1

---

### Summary

BLM needs to publish the statistics for people that provided comment letters on the Draft EIS, as well as the comments, their responses, and changes made to the document in the FEIS.

---

### Response

All substantive comments received on the Draft EIS were considered and reviewed for information that would result in changes to the document. Comments simply stating a preference for or against a specific alternative or opinions without reasonable basis were considered non-substantive since they do not meet the substantive comment requirement of BLM Handbook H-1790-1, Section 6.9.2.1. The substantive comments, along with the commenter and associated issue statements and responses, are presented in the Proposed LUPA/Final EIS in Chapter XX [or Appendix XX], along with a complete explanation of the procedures followed for analyzing comments. See Section XXX for

additional details on the comment analysis process.

[NOTE TO BLM: Section/Appendix numbers will be updated by EMPSi once this section has been added to the FEIS.]

Form letters, or identical letters submitted by different commenters, were identified as part of the DLUPA/DEIS comment response effort. Since these submissions are identical in nature, it is adequate for only one “master” form letter to be included as part of the comment response effort and reviewed for substantive comments. All form letters will be entered into the project decision file and all commenters will be entered into the project decision file as having submitted a comment during the DLUPA/DEIS comment period.

Index of parties, comments, and responses are provided in the FEIS. Changes made to the EIS are noted as... [NOTE TO BLM: Waiting on direction from national team on how will changes be noted between the DEIS and FEIS. EMPSi will include language on this topic in this response.]

## Section 4.2 - Cooperating Agency Relationships

Total Number of Submissions: 5

Total Number of Comments: 5

---

### Summary

The BLM did not coordinate with state and local agencies that would be affected by the actions considered in the EIS, as required by NEPA and FLPMA. Several agencies requested cooperator status for review and revisions to the Final EIS.

[NOTE to BLM: inserted UT issue statement and response for use in ID report. Meredith to talk to ID PM to make sure this accurately reflects the comments. If not, rewrite to make it accurate.]

---

### Response

Both the CEQ and BLM Planning regulations define cooperating agency status, including what it is, who is eligible to become a cooperating agency, and how the lead agency should invite participation as a cooperating agency (40 CFR 1501 and 1508; 43 CFR 1601.0-5). Cooperating relationships are limited to government entities, state agencies, local governments, tribal governments, and other Federal agencies that have jurisdiction by law or special expertise. Additionally, per the regulations and BLM policy, there is no coordinating agency status (BLM Desk Guide to Cooperating Agency Relationships and Coordination with Intergovernmental Partners, pages 21 and 31, respectively). To be a cooperating agency, the local agency must meet the eligibility criteria set out in the regulations and policies. The specific role of each cooperating agency is based on jurisdiction by law or special expertise, which is determined on an agency-by-agency basis and identified in the Memorandum of Understanding.

Cooperating agency relationships are described in the Final EIS in Section 5.XX, Cooperating Agencies. In December 2011, the BLM sent letters to XX tribal governments inviting them to be cooperating agencies. The BLM also sent letters to XX local state, and federal agencies inviting them to participate as cooperating agencies for the LUPA/EIS. [NOTE TO BLM: use this if applies to ID subregion or delete: Subsequently, the State of Wyoming and 4 local government agencies in Wyoming requested and were granted cooperating agency status for the Idaho Sub-regional LUPA/EIS effort, given the portions of two National Forests that overlap into Wyoming and their proximity to the Idaho planning area.] To date, XX agencies agreed to participate on the EIS as designated cooperating agencies, XX of which have signed Memoranda of Understanding with the BLM’s Idaho State Office (Table 5.XX, Cooperating Agencies).

In addition to the BLM’s invitations to a wide variety of agencies to participate as Cooperating Agencies, DOI regulations (43 CFR 46.225(c)) require the BLM, as lead agency, to consider any request by a government entity to participate as a Cooperating Agency (BLM Desk Guide to Cooperating Agency Relationships and Coordination with Intergovernmental

Partners, pages 8-9). From the time that the Notice of Intent was published and throughout the development of the EIS, an agency could notify the BLM requesting Cooperating Agency status. Section 202 of FLPMA requires the BLM and Forest Service, to the extent consistent with the laws governing the administration of the public lands, coordinate the land use inventory, planning, and management activities of or for such lands with the land use planning and management programs of other Federal departments and agencies and of the States and local governments within which the lands are located.

All agencies participating as cooperating agencies have been given opportunities to participate during various steps of the planning process, including regular briefings, requests for input on draft alternatives and the administrative draft EIS, and identification of issues and data during scoping and the DEIS comment periods, as required by 40 CFR 1503.2 and 40 CFR 1506.10. Further, coordination will continue with cooperating agencies in order to identify consistency issues and to be compliant with the relevant laws and regulations. While the laws and regulations associated with cooperating agencies and coordination with other federal agencies and state, local, and tribal governments state that coordination must occur, they do not prescribe the methods necessary to meet the legal or regulatory requirements. Based on the coordination efforts describe above, the BLM and Forest Service have met the legal and regulatory requirements for coordination to date, as described in **Section 5.XX**.

### Section 4.3 - Range of Alternatives

Total Number of Submissions: 29

Total Number of Comments: 80

---

#### Summary

1. The alternatives fail to meet NEPA adequacy because:

- a. they (individually or collectively) do not meet the purpose and need for the action
- b. alternatives were all largely the same, and that the BLM needed to provide more distinction (range) between them
- c. BLM needs to consider the alternatives presented by Cooperating Agencies and Environmental Organizations, including the County alternatives, the Conservation Groups' alternative, and alternatives for the listing of the species or not listing the species.
- d. specifically that Alternative D needed to include the Ecological Site Descriptions to provide adequate understanding of the current management
- e. and the BLM and Forest Service failed to adequately define the No Action Alternative.

2. Commenters also suggested that BLM and Forest Service did not provide adequate rationale for the need of the project.

---

#### Response

I. a. In accordance with NEPA, the BLM and FS have discretion to establish the purpose and need for action (40 CFR 1502.13). CEQ regulations direct that an EIS "...shall briefly specify the underlying purpose and need to which the agency is responding in proposing the alternatives including the proposed action" (40 CFR 1502.13). Also, under the CEQ regulations, the BLM and the Forest Service are required to "study, develop, and describe appropriate alternatives to recommended courses of action in any proposal which involves unresolved conflicts concerning alternative uses of available resources as provided by section 102(2)(E) of the Act [NEPA]." (40 CFR 1501.2(c)). The breadth or narrowness of the purpose and need statement has a substantial influence on the scope of the subsequent analysis. The purpose and need statement provides a framework for issue identification and will inform the rationale for alternative selection. The range of alternatives developed are intended to meet the purpose and need and address the issue; thereby, providing a basis for eventual selection of an alternative in a decision (BLM NEPA handbook and Forest Service Handbook 1909.15 – National Environmental Policy Act Handbook Chapter 10 – Environmental Analysis).

As stated in the DLUPA/EIS, the BLM and the Forest Service prepared the Idaho LUP amendment with an associated EIS to be applied to lands with greater sage-grouse habitat. This effort responds to the FWS's March 2010

b. The BLM and the Forest Service considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM and the Forest Service consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and greater sage-grouse in the planning area, the BLM and the Forest Service fully considered the management opportunities presented in the Analysis of the Management Situation (AMS) and the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As a result, four alternatives were analyzed in detail in the DLUPA/EIS that best addressed the issues and concerns identified by the affected public. The range of alternatives in the DLUPA/EIS represented a full spectrum of options including a no action alternative (current management, Alternative A).

Additionally, the resulting action alternatives offer a range of possible management approaches for responding to planning issues and concerns identified through public scoping, and to maintain or increase GRSG abundance and distribution in the planning area. While the goal is the same across alternatives, each alternative contains a discrete set of objectives and management actions and constitutes a separate RMPA with the potential for different long-range outcomes and conditions.

The relative emphasis given to particular resources and resource uses differs as well, including allowable uses, restoration measures, and specific direction pertaining to individual resource programs. When resources or resource uses are mandated by law or are not tied to planning issues, there are typically few or no distinctions between alternatives. Meaningful differences among the four alternatives are described in Table 2-2, Comparative Summary of Alternatives, in Section 2.8, Summary Comparison of Alternatives, of the Draft EIS.

c. Based on this alternative development process, the BLM considered input from cooperating agencies, environmental organizations, and the public. As described in 2.4.2. Alternative B, the BLM used the GRSG conservation measures in A Report on National Greater Sage-Grouse Conservation Measures (NTT 2011) were used to form BLM management direction under Alternative B, which is consistent with the direction provided in BLM Washington Office Instruction Memorandum 2012-044 (the BLM must consider all applicable conservation measures developed by the NTT in at least one alternative in the land use planning process).

During scoping for the Idaho GRSG RMPA/EIS, individuals and conservation groups submitted management direction recommendations for protection and conservation of GRSG and their habitat, including the Sage-grouse Recovery Alternative and proposed disturbance cap. The recommendations, in conjunction with resource allocation opportunities and internal sub-regional BLM input, were reviewed in order to develop BLM management direction for GRSG under Alternative C.

Alternative D incorporates adjustments to the NTT report (NTT 2011) to provide a balanced level of protection, restoration, enhancement, and use of resources and services to meet ongoing programs and land uses, and was developed in full cooperation with the Cooperating Agencies taking note of the agencies' concerns with socioeconomic issues.

The BLM and Forest Service considered the State of Idaho's Sage-Grouse Conservation Plan in its cumulative effects analysis (Draft EIS Chapter 5, Cumulative Effects, [Section 5.4](#), Special Status Species).

Whether the Greater Sage-grouse is determined for listing by the USFWS is outside the jurisdiction of the BLM and beyond the scope of this EIS. As noted in the Purpose and Need, the BLM was to consider regulatory mechanisms that would protect the species and its habitat. As such, the BLM did not develop alternatives should the USFWS choose to list or not list the Greater Sage-grouse.

e. Ecological Site Descriptions are provided for in Chapter 3, Affected Environment as part of the baseline studies; additionally, current management is described in Alternative A.

f. As clarified by the CEQ, the “no action alternative” for a land use plan amendment or revision means “no change” from current management or level of management intensity (CEQ 40 Questions, Question 3). The no action alternative may be thought of in terms of continuing with the present course of action. The No Action Alternative is described in Alternative A, and includes the current management for the programs within the scope of the analysis. However, the FWS determined that the current regulatory mechanisms were not "adequate" in their 2010 warranted but precluded for listing decision. Therefore, the No Action Alternative provides a baseline for comparison of the four action alternatives to the existing planning decisions.

2. The purpose and need is provided in chapter 1. Under FLPMA, the Secretary of the Interior, acting through the BLM has the discretion to engage in land use planning whenever appropriate for management of the public lands.

## Section 4.4 - Best Available Info Baseline Data

Total Number of Submissions: 4

Total Number of Comments: 5

---

### Summary

The EIS fails to meet NEPA adequacy for baseline data because the scale of baseline data used is too broad, the EIS failed to include the State and Transition models as part of the baseline information, and the No Action management actions, as presented, do not explain the regulatory mechanisms that are currently available to preserve sage grouse habitat.

---

### Response

The CEQ regulations require an environmental impact statement to "succinctly describe the environment of the area(s) to be affected or created by the alternatives under consideration. The description shall be no longer than is necessary to understand the effects of the alternatives. Data and analyses in a statement shall be commensurate with the importance of the impact, with less important material summarized, consolidated, or simply referenced. Agencies shall avoid useless bulk in statements and shall concentrate effort and attention on important issues" (40 CFR 1502.15). Additionally, the [name of particular amendment] is a programmatic NEPA effort to conserve greater sage-grouse and its habitat across a broad geographic area. As such, the BLM and the Forest Service described the current conditions and trends in the affected environment broadly, across a range of conditions, appropriate to program-level land use planning actions.

The BLM and the Forest Service complied with these regulations in describing the affected environment. The requisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The affected environment provided in [Chapter XX] and various appendices including [cite appendix(es)] in the [name of particular amendment] is sufficient to support, at the general land use planning-level of analysis, the environmental impact analysis resulting from management actions presented in the DLUPA/EIS. For example, [use relevant example for the particular issue...here's one provided: listing every water quality-impaired stream within the planning area by name would not provide useful information at this broad-scale analysis, particularly where the proposed plan alternatives did not vary the level of riparian protections to provide reduced levels for non-impaired streams. The riparian protections within each alternative were applied to all streams, whether or not they were water quality-impaired. However, understanding the miles of impaired BLM streams, as presented in the DLUPA/EIS at Section 3.5.7, is useful in establishing a baseline by which the BLM may analyze the relative effects of each alternative's broad-based approach.]

As specific actions come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. Site-specific concerns and more detailed environmental descriptions will be addressed when project-level reviews are tiered to the analysis in this EIS (40 CFR 1502.20, 40 CFR 1508.28). In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for any site-specific actions.

## Section 4.5 - GIS Data and Analysis

Total Number of Submissions: 8

Total Number of Comments: 13

---

### Summary

Commenters noted several issues with the GIS data and analysis conducted in the Draft EIS:

- The maps and data layers do not provide enough detail to address "local ecological site variability". The data are too coarse and do not provide assurances to more localized decision making; some habitat type areas are inaccurately identified in the maps.
- BLM used old data layers to develop maps; BLM should use the newer data layers.
- the BLM needs to be consistent in their edge-mapping across state boundaries when there are different data sets used.

**NOTE TO BLM:** some comments relate to specific changes for the maps presented in the DEIS, and for the data layers to be made available for download from the BLM website.

---

### Response

Before beginning the Idaho Sage grouse EIS and throughout the planning effort, the BLM and the Forest Service considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The data needed to support broad-scale analysis of the planning area are substantially different than the data needed to support site-specific analysis of projects. The LUPA/EIS data and information is presented in map and table form and is sufficient to support the broad scale analyses required for land use planning.

Additionally, the BLM and the Forest Service consulted with, collected, and incorporated data from other agencies and sources, including but not limited to the U.S. Fish and Wildlife Service and state agencies, including the state wildlife agency. Considerations included but were not limited to [list the types of data or GIS layers that were gathered/used. A few examples: threatened and endangered species and their habitats, water quality- limited (303d) streams, deer and elk herd management areas, invasive plants, and uses on State lands]. The Draft EIS notes that the BLM and FS would incorporate any refinements or updates if or when the data were made available.

As a result of these actions, the data gathered by the BLM and the Forest Service is of the appropriate scale and provided an adequate analysis that led to an adequate disclosure of the potential environmental consequences of the alternatives.

A land use planning-level decision is broad in scope and, therefore, does not require an exhaustive gathering and monitoring of baseline data. The baseline data provides the necessary basis to make informed land use plan-level decisions. Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The BLM and the Forest Service will conduct subsequent project-specific NEPA analyses for projects proposed for implementation under the land use plan, which may include but

are not limited to fuels treatment, habitat restoration, [etc.; list others as applicable]. The subsequent NEPA analyses for project-specific actions will tier to the land-use planning analysis and evaluate project impacts at the appropriate site-specific level (40 CFR 1502.20, 40 CFR 1508.28). As required by NEPA, the public will have the opportunity to participate in the NEPA process for site-specific actions.

**NOTE TO BLM:** Need to respond to the last comment related to consistency across state boundaries for our mapping efforts. There is no national response for this issue.

## Section 4.6 - Indirect Impacts

Total Number of Submissions: 4

Total Number of Comments: 5

---

### Summary

BLM's overall impact analysis is deficient in the following areas:

1. lack of discussion for where, when, and how BLM will have sufficient funding to implement the actions;
2. the analysis does not distinguish between the effects of each alternative;
3. did not fully analyze the No Action alternative by not acknowledging the existing laws and actions already in place that would manage the habitat;

---

### Response

1. As a landscape level planning effort, none of the alternatives authorize site specific activities on public lands. The agencies' selection of an alternative does not authorize funding to any specific project or activity nor does it directly tie into the agencies' budgets as appropriated annually through the Federal budget process. As a consequence, agencies' costs and differences in program costs across alternatives have not been quantified. Information has been presented in several resource impact sections on the types of costs that might be associated with various sage-grouse conservation measures.

2. Direct the reader to the Effects Summary table in ch 2. Determine whether revisions to the table would be necessary to distinguish more between the effects.

3. All alternatives are subject to existing laws, even the no action (cite chapter 1 where those laws are listed). The no action was fully analyzed; however, the Purpose and Need for this effort responds to the FWS's 2010 finding that existing regulatory mechanisms in existing land use plans are inadequate to protect the species, therefore, the no action is not sufficient to meet this Purpose and Need.

## Section 4.7 - Cumulative Impacts

Total Number of Submissions: 6

Total Number of Comments: 7

---

### Summary

The EIS cumulative impacts analysis is inadequate because it does not adequately identify the reasonably foreseeable future actions, present a comprehensive listing of the effects across ALL subregions, nor analyze how the alternatives' actions would affect actions and decisions in neighboring states/jurisdictions.

---

## Response

The BLM and the Forest Service thoroughly explained its consideration and analysis of cumulative effects in the Draft and Final LUPA/EIS in Section 4.24. The Draft and Final LUPA/EISs considered the present effects of past actions, to the extent that they are relevant, and present and reasonably foreseeable (not highly speculative) Federal and non-Federal actions, taking into account the relationship between the proposed alternatives and these reasonably foreseeable actions. This discussion summarizes CEQ guidance from June 24, 2005, stating that "[g]enerally, agencies can conduct an adequate cumulative effects analysis by focusing on the current aggregate effects of past actions without delving into the historical details of individual past actions." This is because a description of the current state of the environment inherently includes the effects of past actions. Information on the current conditions is more comprehensive and more accurate for establishing a useful starting point for cumulative effects analysis. The BLM and the Forest Service explicitly described their assumptions regarding proposed projects and other reasonably foreseeable future actions. On Forest Service-administered lands, reasonably foreseeable actions are those that would occur under their current land use plans from a broad-scale perspective.

The BLM and the Forest Service have complied fully with the requirements of 40 CFR 1508.7 and prepared a cumulative impact analysis to the extent possible based on the broad nature and scope of the proposed management options under consideration at the land use planning level.

The DLUPA/EISs contains a qualitative discussion of cumulative effects at the WAFWA Management Zone scale to set the stage for a more quantitative analysis to be contained in the Proposed Land Use Plan Amendment/FEIS. Additional quantitative cumulative analysis was added to the Final EIS in **Section 4.XX**, Cumulative Impacts.

## Section 4.8 – Disturbance Cap

*No comments are associated with this issue.*

---

## Summary

Commenters felt there was no methodology or scientific backing for establishing the disturbance cap in the alternatives, and that the BLM/FS needed to demonstrate more range in the disturbance cap amounts presented in the alternatives.

---

## Response

In determining the disturbance cap level for each alternative, the BLM utilized the recommendations and input specific to each alternative. For example, for Alternative B, the BLM utilized the cap levels recommended in the NTT Report. Conservation measures included in Alternative B focus primarily on GRSG PPH and include a 3-percent disturbance cap in PPH. PPH areas have the highest conservation value to maintaining or increasing GRSG populations.

For Alternative C, conservation measures were mostly focused on ADH (PPH, PGH, and linkage/connectivity habitat). These areas have been identified by CPW in coordination with respective BLM offices, and include a 3-percent cap on disturbance in ADH. This disturbance cap number for Alternatives B and C were incorporated as-is from the NTT Report and conservation group alternatives; the BLM did not modify the caps in the alternatives.

For Alternative D, the BLM intended to protect those areas that were most important for sage-grouse within PPH; in other words, the alternative would protect the best of the best habitat. The BLM utilized information from the Wyoming Core Strategy to support consideration of the five-percent disturbance cap, with the goal to represent the reasonable edge of the range of alternatives with a higher percentage.

While the caps would set a particular level of disturbance, the implementation of the disturbance caps would occur after the RMPA is approved in the Record of Decision. The BLM inventoried the habitat with the best available info at the

time of the DEIS, but would also do additional in-depth analysis & inventory within management zones at the implementation stage.

---

## Section 4.9 - Mitigation Measures

Total Number of Submissions: 13

Total Number of Comments: 18

---

### Summary

1. The BLM needs to include a monitoring, mitigation, and adaptive management plan/framework in the FEIS that will include specific criteria for determining sage grouse conservation success and how the disturbance percentages will be calculated.

2. BLM needs to clarify the relationship between the disturbance thresholds and the monitoring framework.

3. The BLM needs to release the mitigation strategy for public review.

---

### Response

Mitigation and monitoring frameworks were introduced in the DE IS in Chapter 2 and in **Appendices X and X**. An Adaptive Management strategy was also introduced in Chapter 2 of the DEIS. A more detailed mitigation framework, monitoring framework, and adaptive management strategy has been incorporated into chapter 2 of the FEIS, **section X** and **Appendices X, X, and X**.

Mitigation will be applied to all implementation actions/decisions that take place on Federal lands within greater sage-grouse habitat during the life of this plan. Mitigation has been further defined as Regional Mitigation and the Framework is in **Appendix X**. The Regional Mitigation Framework was developed to follow the BLM's Regional Mitigation Manual MS-1794, Forest Service Handbook FSH 1909.15, and CEQ 40 CFR 1508.20.

The Mitigation Framework, through the mitigation hierarchy, guides the BLM and Forest Service. The hierarchy direction is to first, avoid impacts entirely by not taking a certain action or parts of an action, second, if unable to avoid, minimize impacts by limiting the degree or magnitude of an action or parts of an action, and lastly, if avoidance or minimizing is not possible, compensate impacts associated with future implementation actions. If residual impacts to greater sage-grouse from implementation-level actions remain after applying avoidance or minimization measures, then compensatory mitigation projects will be used to offset the residual impacts in an effort to achieve the land use plan goals and objectives. As articulated in **Appendix X**, compensatory mitigation will occur on sites that have the potential to yield the greatest conservation benefit to the greater sage-grouse, regardless of land ownership. These sites should be sufficiently "durable." According to BLM Manual Section 1794, durability is defined as "the administrative, legal, and financial assurances that secure and protect the conservation status of a compensatory mitigation site, and the ecological benefits of a compensatory mitigation project, for at least as long as the associated impacts persist.

Specific mitigation strategies, based on the Framework, will be developed by regional teams (at the WAFWA Management Zone level) within one year of the issuance of the Record of Decision. These strategies will guide the application of the mitigation hierarchy to address greater sage-grouse impacts within that WAFWA Management Zone. The WAFWA Management Zone Regional Mitigation Strategy will be applicable to BLM and Forest Service lands within the zone's boundaries. Subsequently, the BLM/FS's NEPA analyses for implementation-level decisions that might impact greater sage-grouse will include analysis of mitigation recommendations from the relevant WAFWA Management Zone Regional Mitigation Strategy(ies).

The Monitoring Framework in **Appendix X** outlines the methods that the BLM and Forest Service will use to monitor

and evaluate the implementation and effectiveness of the planning strategy and the land use plans to conserve the species and its habitat. The regulations for the BLM (43 CFR 1610.4-9) and the Forest Service (36 CFR 219.12) require that land use plans establish intervals and standards, as appropriate, for monitoring and evaluations, based on the sensitivity of the resource to the decisions involved.

Implementation monitoring results will provide information to allow the BLM and FS to evaluate the extent that the decisions from the BLM resource management plans (RMPs) and Forest Service land and resource management plans (LRMPs) to conserve greater sage-grouse and their habitat have been implemented. Effectiveness monitoring will provide the information to evaluate whether BLM and Forest Service actions achieve the objective of the planning strategy (BLM IM 2012-044) and the conservation measures contained in the land use plans to conserve greater sage-grouse populations and their habitats.

Monitoring efforts will include data for measurable quantitative indicators of sagebrush availability, anthropogenic disturbance levels, and sagebrush conditions. This information will assist the BLM and the Forest Service with identifying whether or not they are achieving their land use plan goals and objectives, reaching an adaptive management soft or hard trigger, as well as providing information relative to the disturbance cap. Specifically, habitat degradation (percent of human activity in a biologically significant unit), habitat availability (percent of sagebrush in a biologically significant unit), and habitat degradation intensity (density of energy facilities and mining locations) will be gathered to inform the disturbance cap objective (insert PRMP/FEIS management action for disturbance cap here).

Adaptive management is a systematic approach for improving resource management by learning from management outcomes. An adaptive approach involves exploring alternative ways to meet management objectives, anticipating the likely outcomes of alternatives based on the current state of knowledge, implementing one or more of these alternatives, monitoring to learn about the impacts of management actions, and then using the results to update knowledge and adjust management actions accordingly.

Incorporating adaptive management into the [insert name of plan] will ensure a degree of certainty that the decisions in the plan will effectively contribute to the elimination or adequate reduction of one or more threats to the greater sage-grouse and its habitat. The adaptive management approach incorporates a set of triggers in the plan, a soft and hard trigger. These triggers were developed to inform the BLM/FS as to when the Federal agency needs to respond (take action) to address a declining trend in sage-grouse or sage-grouse habitat figures.

Soft triggers represent an intermediate threshold indicating that management changes are needed at the project/implementation level to address habitat and population losses. Hard triggers represent a threshold indicating that immediate action is necessary to stop a severe deviation from greater sage grouse conservation goals and objectives as set forth in the BLM/FS plans. The adaptive management soft and hard triggers and land use planning responses to these triggers are described and analyzed fully in this EIS [insert management action where the triggers and responses are referenced].

The agencies will use the data collected from monitoring (Appendix X) to identify any changes in habitat conditions related to the goals and objectives of the plan. The BLM/FS will use the information collected through monitoring to determine when adaptive management triggers are met."

## Section 5 – FLPMA

Total Number of Comments: 12

---

### Summary

The DLUPA/EIS has failed to comply with the multiple-use mandates found in the BLM's FLPMA and the Forest Service's

Multiple Use Sustained Yield Act because it has put protecting greater sage-grouse and sage-grouse habitat above legal requirements for balanced management.

---

## Response

FLPMA (Section 103(c)) defines "multiple use" as the management of the public lands and their various resource values so that they are utilized in the combination that will best meet the present and future needs of the American people. Accordingly, the BLM is responsible for the complicated task of striking a balance among the many competing uses to which public lands can be put. The BLM's multiple-use mandate does not require that all uses be allowed on all areas of the public lands. The purpose of the mandate is to require the BLM to evaluate and choose an appropriate balance of resource uses which involves tradeoffs between competing uses. The FLPMA also directs the United States (US) Department of the Interior, Bureau of Land Management (BLM) to develop and periodically revise or amend its Resource Management Plans (RMPs), which guide management of BLM-administered lands, and provides an arena for making decisions regarding how public lands would be managed and used.

Consistent with the Multiple-Use Sustained-Yield Act of 1960 (16 U.S.C. 528–531) (MUSYA), the Forest Service manages National Forest System land to sustain the multiple use of its renewable resources in perpetuity while maintaining the long-term health and productivity of the land. Resources are managed through a combination of approaches and concepts for the benefit of human communities and natural resources. Land management plans guide sustainable, integrated resource management of the resources within the plan area in the context of the broader landscape, giving due consideration to the relative values of the various resources in particular areas. The Forest Service is required by statute to have a national planning rule: the Forest and Rangeland Renewable Resources Planning Act of 1974, as amended by the National Forest Management Act of 1976, requires the Secretary of Agriculture to issue regulations under the principles of the Multiple-Use Sustained-Yield Act of 1960 for the development and revision of land management plans.

The [name of particular amendment] is a targeted amendment specifically addressing goals, objectives, and conservation measures to conserve greater sage-grouse and to respond to the potential of its being listed (see Section I.XX, Purpose and Need). Both, the Forest Service's and BLM's planning processes allow for analysis and consideration of a range of alternatives in the DLUPA/EIS that identified and incorporated conservation measures to conserve, enhance, and restore greater sage-grouse habitat and to eliminate, reduce, or minimize threats to this habitat to ensure that a balanced management approach was recommended. The DLUPA/EIS includes alternatives that provide a greater and lesser degree of restrictions in various use programs, but would not eliminate or invalidate any valid existing development rights. For example, [insert one or more examples of the range of actions considered, include references to sections/table where they can be found].

Additionally, the BLM and the Forest Service developed the [name LUPA/EIS] with involvement from cooperating agencies, including [name various agencies, including the state wildlife agency, state's governor's office, other fed agencies, any local agencies/governments] to ensure that a balanced multiple-use management strategy to address the protection of greater sage-grouse while allowing for utilization of renewable and nonrenewable resources on the public lands.

## Section 5.1 - Inventories

*No comments are associated with this issue.*

---

## Section 5.2 - Consistency with other state, county, or local plans

Total Number of Submissions: 8

Total Number of Comments: 14

---

## Summary

The BLM's actions considered in the alternatives conflict with local and state agency plans and policies; furthermore, the BLM did not review all of the county and state plans to ensure that conservation measures are as consistent as possible with other planning jurisdictions.

---

## Response

To the extent possible under existing law, the BLM's land use plans must be consistent with officially approved or adopted resource-related plans of Indian tribes, other Federal agencies, and State and local governments (see 43 CFR 1610). The BLM has worked closely with State and local governments during preparation of the Draft LUPA/EIS. The Draft LUPA/EIS lists the cooperating agencies actively involved in the planning process in Section 5.3. As described in Section 5.4, Coordination and Consistency, the BLM requested the state, county, and tribal government cooperating agencies assist in the consistency reviews by reviewing the range of alternatives associated with the draft LUPA/EIS and identify potential inconsistencies between the alternatives and each agency's applicable plans. This allows the state, local, and tribal cooperating agencies to use their special expertise regarding the familiarity with their own state, local, or tribal plans. On the local level, it is a county's responsibility to accurately identify and communicate any inconsistencies between that county's plan and the proposed alternative.

The BLM works to find a balance among uses and needs as reflected in these local government plans and has done so in the preparation of the LUPA/EIS; a list of these plans can be found in Section 1.8, Relationship to Other Policies, Plans, and Programs. The BLM is aware that there are specific State or local laws relevant to aspects of public land management that are discrete from, and independent of, Federal law. However, BLM is bound by Federal law. As a consequence, there may be inconsistencies that cannot be reconciled. The FLPMA requires that BLM's land use plans be consistent with State and local plans "to the extent practical". In a situation where State and local plans conflict with Federal law, there will be an inconsistency that cannot be resolved. Thus, while State County and Federal planning processes, under FLPMA, are required to be as integrated and consistent as practical, the Federal agency planning process is not bound by or subject to County plans, planning processes, or planning stipulations. While the BLM is not obligated to seek consistency, the agency is required to describe the inconsistencies between the proposed action and the other plans, policies, and/or controls within the EIS, so that the State and local governments have a complete understanding of the impacts of the PRMP on State and local management options. This information has been updated in the FEIS in Section 1.8.

The BLM coordinates with cooperating agencies commensurate with each agency's recognized jurisdiction or expertise. In areas where the States of Idaho and Montana has clear jurisdiction, such as wildlife populations, the BLM has worked closely with that State agency. In cases where a county or agency has expertise, such as local county socioeconomic information, the BLM has worked closely with the group to incorporate the information into the EIS.

[NOTE TO BLM from WO: plans, policies that commenters felt needed to be reviewed for consistency:

Gooding conservation district sage grouse conservation plan

National Academy of Sciences 2013 recommendations for the WHB program

State of MT sage-grouse management strategy

Custer County plans

Owyhee County plans]

## Section 5.4 - Planning Regs 43 CFR 1600

Total Number of Submissions: 2

Total Number of Comments: 2

## Summary

The BLM did not provide an explanation for how and why they defined the planning area as they did.

---

## Response

[NOTE TO BLM: This is from a national response.]

The framework for the scope of analysis for the project is based upon the BLM and the Forest Service Planning and NEPA manual and handbooks definitions of the planning, decision, and analysis areas. Specifically, Forest Service Manual 1900-Planning Chapter, Zero Code defines the Area of Analysis as “The geographic area within which ecosystems, their components, or their processes are evaluated during analysis and development of one or more plans, plan amendments, or plan revisions. This area may vary in size depending on the relevant planning issue. For a plan, an area of analysis may be larger than a plan area. For development of a plan amendment, an area of analysis may be smaller than the plan area and include multiple ownerships.”

For this environmental impact statement, decision areas are those public lands and mineral estates within the planning area that are encompassed by all designated habitat (ADH) (which includes preliminary priority habitat [PPH], preliminary general habitat [PGH], and linkage/connectivity habitat).

The definition of a Planning Area is the geographic area within which the BLM will make decisions during a planning effort. A planning area boundary includes all lands regardless of jurisdiction; however the BLM will only make decisions on lands that fall under the BLM’s jurisdiction (including subsurface minerals). Unless the State Director determines otherwise, the planning area for a RMP is the geographic area associated with a particular field office (43 CFR 1610.1(b)). State Directors may also establish regional planning areas that encompass several field offices and/or states, as necessary.

[SOL comments: Seems that this response needs to include more about the relationship between the Great Basin planning area boundaries (esp. the ID/SW MT boundary) and GRSG habitat. In other words, was there a biological + practical reason that the plans have been separated in this way? Relationship to WAFWA zone? Needs more explanation. Also, I see that this refers to PPH and PGH, and linkage/connectivity habitat...but what about Idaho's other types of habitat-core, medial/important? Should they be explained here in the context of the planning area question? NOTE: Plan areas. National Forest System lands covered by land use plans. (36 CFR 219.16). If not included in DEIS already, make a notation that the FEIS will be updated to note definitions of planning, decision, and analysis areas to clarify these terms.]

## Section 6 - Other Laws

Total Number of Submissions: 11

Total Number of Comments: 15

---

## Summary

The BLM has failed to document how the EIS and/or actions considered in the EIS comply with other laws, including all Onshore Orders regulating oil and gas development, the Energy Policy Act of 2005 and Energy Policy and Conservation Act of 2000, the Taylor Grazing Act, the Mining and Minerals Policy Act, the Information Quality Act, the Wild Horse and Burro Act, other multiple use mandates (e.g., Multiple-Use Sustained Yield Act of 1960, Forest and Rangeland Renewable Resources Planning Act of 1974, National Forest Management Act of 1976), and compliance with other federal agency regulations (e.g., XXX).

---

## Response

The Draft and Final EIS Section 2.5, Management Common to All Alternatives, state that all alternatives would comply with state and federal laws, regulations, policies, and standards, and implement actions originating from laws, regulations, and policies. Additionally, in **Section XX.XX**, Planning Criteria, the BLM has a criterion stating that all BLM alternatives would comply with existing laws, regulations, and policies. The BLM and FS have reviewed all actions in the Proposed LUPA and found them to be consistent and within the bounds of all required laws, regulations, and policies.

## Section 7 - Sage Grouse

*No comments are associated with this issue.*

---

### Section 7.1 - NTT report/findings

Total Number of Submissions: 11

Total Number of Comments: 32

---

#### Summary

Commenters contended that the NTT report is not based on the best available science, contains technical and methodological errors, is not based on local conditions, and has not undergone adequate peer review. Commenters questioned why the NTT report was used when the IM requiring its use has expired.

---

#### Response

A National Technical Team (NTT) was formed as an independent, science-based team to ensure that the best information about how to manage the greater sage-grouse is reviewed, evaluated, and provided to the BLM and the Forest Service in the planning process. The group produced a report in December 2011 that identified science-based management considerations to promote sustainable greater sage-grouse populations. The NTT report (NTT 2011) used the best current scientific knowledge to guide the BLM planning efforts through management considerations to ameliorate threats, focused primarily on priority greater sage-grouse habitats on public lands. The NTT report cited 122 references including published papers from the formal scientific literature such as Journal of Wildlife Management, Conservation Biology, Biological Conservation, Wildlife Biology, BioScience and others, as well as graduate theses and dissertations, conservation strategies, FWS 2010 finding, and others representing the best available science. The NTT report was intended to be used at a programmatic scale and may not reflect local conditions.

The BLM used the NTT report per BLM IM 2012-044 to construct an alternative that would meet the purpose and need. This report was not the only source of information for developing a range of alternatives (see Section 7.5, Range of Alternatives).

**[NOTE TO BLM- Clarify in FEIS the policy requirements for Administrative Procedure Act (APA), NEPA relative to IM, and NTT and clarify the NTT process and FACA in the FEIS.]**

BLM is implementing IM 2012-044 through the Greater Sage-grouse planning effort. When an IM expires without being superseded, it can still be applicable and provide guidance to the BLM. The fact that IM 2012-044 expired does not mean the BLM has no authority to continue to analyze the conservation measures identified in the NTT Report. The BLM is appropriately considering and evaluating the measures in the NTT Report, in addition to any other relevant science, through the Greater Sage-grouse planning process.

{Note: Suggest asking for National justification of why the NTT was an appropriate source}

## Section 7.2 – BER

Total Number of Submissions: 1

Total Number of Comments: 2

---

### Summary

The BER contains outdated baseline literature and should be updated with suggested literature.

---

### Response

[NOTE TO BLM: The BLM is reviewing suggested literature and will include where necessary.]

A baseline environmental report, titled Summary of Science, Activities, Programs, and Policies That Influence the Rangeland Conservation of Greater Sage-grouse (*Centrocercus urophasianus*) (referred to as the BER), was released on June 3, 2013, by the U.S. Geological Survey. The peer-reviewed report summarizes the current scientific understanding about the various impacts to greater sage-grouse populations and habitats and addresses the location, magnitude, and extent of each threat. The data for this report were gathered from BLM, Forest Service, and other sources and were the best available at the range-wide scale at the time collected. The report provides a framework for considering potential implications and management options, and demonstrates a regional context and perspective needed for local planning and decision-making.

The BLM reviewed the literature sources provided by commenters to determine if there were new or updated sources that should be considered in the EIS. BLM's findings of this review were... [insert the results from the literature review. While it doesn't directly address the BER report being updated, it's addressing the point that BLM did make the effort to consider new or updated info in the EIS in addition to the BER report.]

While there was consistent direction provided in alternative develop, such as BLM WO IM 2012-044, variation across sub-regionals was needed to accommodate the local issues and specific state and Forest Service requirements. Alternative D was developed by the BLM in coordination with the Forest Service and local FWS. This alternative includes modifications to the conservation measures identified in the NTT report and is designed to address local ecological site variability. This alternative also emphasizes balancing resources and resource use among competing human interests, land uses, and the conservation of greater sage-grouse habitat. Alternative E was developed from recommendations by the State of Idaho's greater sage-grouse task force and would apply to all BLM-administered and National Forest System lands located in the state. See Section 2.1.2 regarding alternative development and explanation of components of each alternative. {Note: Suggest including more justification of the BER in response}

## Section 7.3 – COT

Total Number of Submissions: 9

Total Number of Comments: 17

---

## Summary

Commenters had two distinct views regarding the COT report. One group considered the report overly biased and not representative of the best available information. The other group suggested the DEIS was not fully consistent with the COT report habitat mapping and therefore requires revision to address those deficiencies.

---

## Response

In March 2012, the FWS initiated a collaborative approach to develop range-wide conservation objectives for the greater sage-grouse to inform the 2015 decision about the need to list the species and to inform the collective conservation efforts of the many partners working to conserve the species. In March 2013, this team released the Conservation Objectives Team (COT) report based upon the best scientific and commercial data available at the time that identifies key areas for greater sage-grouse conservation, key threats in those areas, and the extent to which they need to be reduced for the species to be conserved. The report serves as guidance to Federal land management agencies, State greater sage-grouse teams, and others in focusing efforts to achieve effective conservation for this species.

Table 2-20 demonstrates how the BLM and Forest Service management actions under each alternative address the threats to the populations in the Idaho and southwestern Montana sub-region. In Idaho, Core and Important Habitat Zones under Alternative E were used to derive the PACs in the COT. The BLM and Forest Service have continued to work with the USFWS and State agencies to develop a proposed plan.

[NOTE TO BLM: Clarify in the FEIS the validity of NTT, COT, and BER as relative to the established standards of scientific integrity under the ESA, the Data Quality Act, and the Presidential and DOI memoranda and orders. Ensure the FEIS clarifies how PACs were delineated (IDFG delineated based on Core and Important zones, and provided to FWS). Clarify MZs and population monitoring efforts in the FEIS.]

## Section 7.4 - Policy Guidance

Total Number of Submissions: 1

Total Number of Comments: 1

---

## Summary

The BLM and Forest Service should include additional information to improve consistency with USFWS's Policy for Evaluation of Conservation Efforts.

---

## Response

The BLM and Forest Service are working closely with the USFWS to ensure certainty of implementation and effectiveness to the extent possible. However, certain management actions, such as restoration activities, are contingent on funding availability and thus some uncertainty remains.

## Section 7.5 - Range of Alternatives

Total Number of Submissions: 28

Total Number of Comments: 90

---

## Summary

Commenters proposed revisions or requested additional details and clarifications to the alternatives related to GRSG.

Topics of concern included:

- The size of lek buffers
- Level of predator control
- Need for and size of disturbance cap
- Restrictions on wind energy development
- Noise restrictions
- Livestock grazing management changes
- Inadequate description of adaptive management and monitoring
- Need for an improved definition of no net unmitigated loss
- Leasable mineral restrictions
- Juniper removal
- Existing and new fencing as they relate to sage-grouse strikes and mortality
- Lack of active habitat restoration
- Habitat monitoring

Commenters were concerned about greater sage-grouse habitat mapping, including suggesting clarifications or revisions to the habitat map and concerns about using the map for site-scale projects.

Commenters were also concerned that Manual 6840 was not used as the baseline policy governing present GRSG conservation in the No Action alternative.

---

## Response

As noted above in the response in Section 4.3, Range of Alternatives, Section 2.1 of the Draft EIS describes how the Idaho and southwestern Montana GRSG LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA and worked closely with the State with assistance from the USFWS.

Meaningful differences among the six alternatives are described in Table 2-2, Comparative Summary of Alternatives by Acres Allotted, and in Section 2.6, Detailed Description of Alternatives, of the Draft EIS. [Specify where changes have been made to the FEIS regarding each of the bullets below]. Refer to tab 32 regarding predator control. All of these issues have been addressed in new management actions prepared for the proposed plan and analyzed in Chapter 4 (and reference relevant appendices regarding AM and monitoring, etc.).

Regarding the following issues:

The size of lek buffers -lek buffers will be revised in final plan/FEIS reflecting additional review of best science.

- Level of predator control
- Need for and size of disturbance cap- Additional specificity regarding the disturbance cap has been further explained in the FEIS.
- Restrictions on wind energy development
- Noise restrictions. Noise and seasonal stipulations for both construction and long-term implementation of land use activities has been included in the final EIS. [NOTE TO BLM (from Makela)- Project leads should discuss how to consistently address impacts from military flights and firm up discussion at 4-15. Consider adding additional detail from Mt. Home AFB Integrated Resource Mgt. Plan.]
- Livestock grazing management changes
- Inadequate description of adaptive management and monitoring. The BLM and FS believe the management actions described in the Proposed Plan will adequately address sage-grouse conservation needs without the need for additional large scale designations.
- Need for an improved definition of no net unmitigated loss- Additional specificity regarding the no net habitat loss objectives has been further explained in the FEIS.

- Leasable mineral restrictions
- Juniper removal
- Existing and new fencing as they relate to sage-grouse strikes and mortality. The BLM and FS used the latest science in developing management actions relative to fences that adequately address collision risk. No change has been made to the document regarding this issue in the FEIS.
- Lack of active habitat restoration- Site specific projects are not identified in the broad scale plan, but there are a number of restoration actions described in Table 2-18 Vegetation/Restoration section in the DEIS and in the Proposed Plan.
- Habitat monitoring- The BLM and FS, in coordination with the state, have clarified monitoring and mapping expectations in the FEIS.

A description of the habitat mapping process for each alternative is presented in Section 2.6, Detailed Description of Alternatives. The Proposed Plan will contain a mechanism that allows for evaluation of circumstances on case by case basis at the site specific scale that would be addressed via subsequent project level NEPA analysis.

Manual 6840 is referenced in Chapter 1, Section 1.x, Planning Criteria, and provides general guidance for special status species, but it does not provide language relative to specific conservation actions for specific species. [BLM- ensure Manual 6840 is discussed in Alternative A and also relevant FS policy].

[NOTE TO BLM: Ensure Proposed Plan has appropriate provisions/clarity for actions in General management areas. Needs additional discussion.]

## Section 7.6 - Best Available Info Baseline Data

Total Number of Submissions: 38

Total Number of Comments: 97

---

### Summary

Commenters suggested new or additional literature for the BLM and Forest Service to consider in the DLUPA/EIS related to:

- Determination of GRSG population size and trends – inaccuracy of past counts; insufficient data to determine trend.
- Effects of livestock grazing, predation, drought, noise, and anthropogenic development
- Appropriate lek buffers and disturbance cap to incorporate
- Mitigation
- Hunting– outside scope but managed via the Idaho and Montana state plans
- GRSG habitat requirements
- Accuracy of the habitat mapping
- Infrastructure
- West Nile virus

---

### Response

As described in Section 4.4 of this comment report, The BLM and the Forest Service used the most recent and best information available that was relevant to a land-use planning-level analysis including the Baseline Environmental Report (BER; Manier et al. 2013), NTT report (NTT 2011), and COT report (USFWS 2013). Additionally, the BLM and the Forest Service consulted with, collected, and incorporated data from other agencies and sources, including but not limited to the U.S. Fish and Wildlife Service, Idaho Department of Fish and Game, scientific literature, field and district office data. Considerations included but were not limited to [list the types of data or GIS layers that were gathered/used].

Of the suggested studies and references put forth by the commenters, the BLM and Forest Service reviewed them to determine if they presented new information that would need to be incorporated into the FEIS, were references already included in the draft EIS, or if the references provided the same information as already used or described in the Draft EIS. The BLM determined that several of these references contained new or relevant information regarding xxx

resources and the analysis was clarified and references cited in Sections XXX of the FEIS. In some cases, the additional literature was essentially the same as existing sources and was not incorporated.

A description of the habitat mapping process for each alternative is presented in Section 2.6, Detailed Description of Alternatives.

## Section 7.7 - Impact Analysis

Total Number of Submissions: 22

Total Number of Comments: 70

---

### Summary

The BLM and Forest Service should conduct additional, more comprehensive analysis of the impacts on greater sage-grouse to provide more substantiated conclusions.

Commenters provided suggestions on how to improve or modify the impact analysis for greater sage-grouse in several topic areas including:

- Hunting
- Predation
- Anthropogenic disturbance, disturbance caps, and lek buffers
- Expanding on beneficial effects on GRSG from range improvements
- Greater sage-grouse population size and trend
- Livestock grazing, fences, and trailing
- Noise as related to low-level military overflights
- Success of habitat improvement projects
- Prescribed fire
- Herbicides
- West Nile virus
- More detailed analysis of Alternative A
- Climate change
- Need to identify areas for restoration
- Coal suitability

The EIS fails to provide justification as to why “withdrawal from mineral entry” is necessary to protect GRSG and its habitat when the same objective can be achieved through avoidance, minimization of impacts, and mitigation of impacts within the designated areas.

---

### Response

The LUPA/FEIS provides an updated and expanded discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As described in Chapter 2.3.2, coal was not an issue for analysis. As required by 40 CFR 1502.16, the LUPA/FEIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man’s environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources should the proposal be implemented. The LUPA/FEIS provided sufficiently detailed information to aid in determining whether to proceed with the proposed plan in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service

Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. Therefore, effects on GRSG population levels are not required to be quantified as part of the impact analysis. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

[BLM: Eventually need to fill this in:] Impacts from XX on greater sage-grouse were considered in Section 4.x of the Draft EIS. Include discussion of what changes were made and where. If no change made, describe why the impact analysis is adequate for that topic. Some template text:

While a land use planning-level action is broad in scope and, therefore, does not require site specific impact analysis, a thorough review of the EIS's impact analysis relevant to [speak to the specific topic or theme of the issue statement, e.g., anticipated fluid mineral development of the planning area] was found to need additional information and support for the conclusions/findings. The BLM and the Forest Service have updated this information in the Proposed Land Use Plan Amendment/FEIS to provide the necessary information to make informed land use plan-level decisions. Specifically, [insert a summary of the information that was updated and include a citation for where the reader could find it in the FEIS.]

The facts that sagebrush takes decades to re-establish and that disturbance from light and noise affect GRSG mean that avoidance, minimization of impacts and mitigation of impacts are not sufficient methods of protecting GRSG and sage brush habitat. Additionally, this concept was considered within the range of alternatives- Alternative D does not withdraw lands from mineral entry. No change to the EIS has resulted from this comment. [NOTE TO BLM: Consider whether inserting text to this effect into the EIS is appropriate.]

## Section 7.8 - Cumulative Impact Analysis

Total Number of Submissions: 3

Total Number of Comments: 3

---

### Summary

The BLM and Forest Service need to provide additional analysis regarding the cumulative effects of livestock grazing and land treatments. In addition, the agencies should predict greater sage-grouse population changes based on expected cumulative actions.

---

### Response

As described in Section 4.7 of this comment report, the BLM and Forest Service analyzed cumulative effects to GRSG in the DLUPA/EIS in Section 4.16 of the EIS. The BLM and Forest Service expanded and quantified cumulative impacts for the proposed LUPA/FEIS. Section 7.7 of this comment report describes how land treatments and domestic livestock were addressed in the Environmental Consequences section of the DEIS. The DLUPA/EIS considered the present effects of past actions, to the extent that they are relevant, and present and reasonably foreseeable (not highly speculative) Federal and non-Federal actions, taking into account the relationship between the proposed alternatives and these reasonably foreseeable actions. This discussion summarizes CEQ guidance from June 24, 2005, stating that "[g]enerally, agencies can conduct an adequate cumulative effects analysis by focusing on the current aggregate effects of past actions without delving into the historical details of individual past actions." This is because a description of the current state of the environment inherently includes the effects of past actions. Information on the current conditions is more comprehensive and more accurate for establishing a useful starting point for cumulative effects analysis. The CEQ interpretation was accepted by the Ninth in *NW Env'tl. Advoc. v. Nat'l Marine Fisheries Serv.*, 460 F.3d 1125, 1141 (9th

Cir. 2006). The BLM and the Forest Service explicitly described their assumptions regarding proposed projects and other reasonably foreseeable future actions. On Forest Service-administered lands, reasonably foreseeable actions are those that would occur under their current land use plans from a broad-scale perspective.

The BLM and Forest Service have complied with the requirements of 40 CFR 1508.7 and prepared a cumulative impact analysis to the extent possible based on the broad nature and scope of the proposed management options under consideration at the land use planning level. Therefore, effects on GRSG population levels are not required to be quantified as part of the cumulative impact analysis.

The BLM and Forest Service added quantitative analysis to Section 4.16 related to **XXX topics**. [Note to BLM/FS: insert description of any revisions made]

## Section 7.9 - Mitigation Measures

Total Number of Submissions: 12

Total Number of Comments: 34

---

### Summary

The BLM and Forest Service mitigation strategy is inadequate or needs clarifications. Topics of concern include:

- Certainty that mitigation will be implemented
- Lack of scientific evidence that mitigation and habitat restoration results in greater sage-grouse population increases
- Adequacy of the monitoring program
- Effectiveness of compensatory mitigation
- How mitigation proposals will be evaluated
- Siting of mitigation actions
- Durability of mitigation investments
- Consideration of using mitigation banks
- Creation of a mitigation program
- Framework behind exceptions and associated mitigation, e.g., science behind allowing exceptions; offsetting losses and prove mitigation is successful
- Need for mitigation given the restrictive management in the alternatives
- Link between compensatory mitigation and adaptive management

---

### Response

The Mitigation, Monitoring, and Adaptive Management strategies are described more fully in **Section XX** of this comment report and included in Chapter 2 and **Appendices X, X, and X** of the DEIS. Refer to BLM Mitigation Manual.

## Section 8 – ACECs

*No comments are associated with this issue.*

---

### Section 8.1 - Range of Alternatives

Total Number of Submissions: 9

Total Number of Comments: 10

---

## Summary

Issue 1: In the Draft EIS/LUPA, the BLM/FS did not accurately or consistently represent the number of ACECs being proposed under each alternative, particularly Alternative C.

Issue 2: Alternatives in the Draft EIS/LUPA do not provide an adequate range of management actions for ACECs by only considering new ACECs under two of the action alternatives (C and F).

Issue 3: Whether ACECs or another administrative designation, the BLM/FS should ensure any administrative designation established for the protection of sage-grouse habitat will provide adequate non-discretionary protections.

---

## Response

Response 1: The FEIS has been revised to ensure consistent representation of proposed ACECs under Alternatives C and F.

[NOTE TO BLM: Review EIS/LUPA for consistent representation of proposed ACECs under Alternatives C and F.]

Responses 2 and 3: As noted in section 4.3, NEPA Range of Alternatives, of this report, the alternatives, including the management actions for the fire ACEC program, meet the purpose and need for the EIS. Alternatives within the EIS have established that not all protective management for the Greater Sage Grouse is limited to ACEC designation. Only Alternatives C and F proposed to establish ACECs for the protection and management of the Greater Sage Grouse. While the other alternatives do not propose such designations, they still contain similarly specific management prescriptions to manage and protect the Greater Sage Grouse and its habitat that would be equivalent to protections afforded via an ACEC or other designations.

## Section 10 - Climate Change

### Section 10.4 - Cumulative Impact Analysis

Total Number of Submissions: 2

Total Number of Comments: 5

---

## Summary

The EIS does not adequately address the cumulative effects of climate change on sage-grouse or sage-grouse habitat, including the cumulative effects of livestock grazing on vegetation communities and the likelihood of a changing climate to result in an increase in invasive weeds.

---

## Response

Assessing the impacts of grazing on climate change is outside the scope of this document, except as it pertains to reducing impacts on GRSG and GRSG habitat within the planning area and in consideration of valid existing rights and the BLM's multiple use mandate under the Federal Land Policy and Management Act. The PRMP/FEIS does disclose the potential effects associated with global climate change on the Greater Sage-grouse in Section XX. However, pursuant to 40 CFR 1500.1(b), information must be "of high quality" in order to be considered in the analysis. As explained in Section xx of the EIS, it is speculative to attempt to predict the specific nature or magnitude of such changes.

NOTE TO BLM: Based on the NEPA and CEQ guidance for cumulative impacts analysis, determine if the DEIS analysis is adequate or not. If not, make necessary corrections and note what was modified here. Include direction to reader where to find revised analysis (e.g., "See Section 5.XXX for additional information."). The BLM will review. Follow up needed with Bryce.

## Section 12 - Fire and Fuels

### Section 12.1 - Range of Alternatives

Total Number of Submissions: 11

Total Number of Comments: 15

---

#### Summary

The BLM and the Forest Service should examine the location and size of proposed fuel breaks in further detail as fuel breaks in large areas of intact sagebrush limit fire and related habitat destruction. Specifically, one commenter requests use of green-strips, including non-native species, for fuel breaks. Use of prescriptive fire as a management tool should be further examined.

Timelines for long-term fire management measures should be established in the FEIS. One commenter recommends that measures be implemented one year after the ROD. Implementation details of fire control measures should be specified. The BLM/Forest Service should acknowledge the importance of flexibility in fire management plans in the FEIS and allow for on-the ground decision making for effective fire-management. Alternative language should be revised for clarity.

---

#### Response

Fuel breaks are site-specific - see Oregon response. Use of prescribed fire varies by alternative. [needs more subregional input].

### Section 12.2 - Best available information baseline data

Total Number of Submissions: 4

Total Number of Comments: 5

---

#### Summary

The FEIS should include citations indicating that implementation of fuel breaks in sagebrush systems reduces the rate of spread of fire. In addition, citations should be provided to support the use of prescribed fire to improve GRSG habitat. The BLM and Forest Service should recognize livestock grazing as an effective fire management tool due to its role in controlling invasive plants and decreasing fuel loads.

---

#### Response

The EIS affected environment section provides the appropriate information for the scope and scale of the project (see section 4.4, NEPA Baseline Information of this report). However, upon BLM and Forest Service reviews and public comment suggestions, some sections in Chapter 3 have been updated and revised to include clarifications or new information. Section 3.XX, [insert section name], in the FEIS has been revised to update information regarding fuel

breaks and **Section 3.XX, [insert section name]**, has been updated to clarify the relationship between livestock grazing and fire.

## Section 12.3 - Impact Analysis

Total Number of Submissions: 6

Total Number of Comments: 7

---

### Summary

The DEIS does not contain sufficient analysis of indirect impacts of reduced grazing on fuel loads and related wildfire risk. Additionally, the analysis of impacts of fire suppression activities should be reexamined. It is particularly important that this analysis is clarified as lack of sufficient regulatory mechanisms for wildland fire was cited as a primary threat to GRSG in the FWS listing decision.

---

### Response

The impact analysis provides the appropriate information for the scope and scale of the project (see section 4.6, NEPA Impact Analysis, of this report). Upon BLM and Forest Service reviews and public comment suggestions, some sections in Chapter 4 have been updated and revised to include clarifications to the text. **Section 4.XX, [insert section name]**, in the FEIS has been revised to clarify the impacts of reduced grazing on fuel loads. **[BLM/Forest Service- need to add review impacts in Ch 4 for consistency with this language added to chapter 3 for relation between grazing and fire. Review impacts analysis to make sure that impacts analysis has sufficient info on impacts of reduced grazing on fuel loads]**

In addition, impacts analysis discussion has been modified to clarify the impacts of different suppression measures proposed by Alternative. **[BLM/Forest Service- need to review and modify discussion of impacts of fire suppression measures (i.e. specific conservation measures under B vs. approach under E)]**

## Section 13 - Fish and Wildlife

### Section 13.1 - ESA Consultation

Total Number of Submissions: 3

Total Number of Comments: 3

---

### Summary

The BLM fails to address avoiding the potential to list the GRSG under the Endangered Species Act (ESA) and that the bird does not meet the criteria to be listed under the ESA.

---

### Response

As stated in Chapter 1, Section 1.1, Background in the DRMP, this plan amendment effort is the result of the July 2011, BLM National Greater Sage-Grouse Planning Strategy (BLM 2011). The Strategy responds to the March 2010, US Fish and Wildlife Service (USFWS) 12-Month Finding for Petitions to List the Greater Sage-Grouse (*Centrocercus*

urophasianus) as Threatened or Endangered (75 Federal Register [FR] 13910, March 23, 2010) (2010 Finding). In the 2010 Finding, the USFWS concluded that GRSG was “warranted, but precluded” for listing as a threatened or endangered species.

## Section 14 - Lands and Realty

Total Number of Submissions: 1

Total Number of Comments: 1

---

### Summary

The BLM should prohibit the construction of new permanent infrastructure within lands specially designated for sage-grouse protection, because studies show GRSG avoid areas with development.

---

### Response

The alternatives consider a range of alternatives regarding ROW avoidance and exclusion. Table 2-3 identifies existing ROW avoidance and exclusion areas in the lands and realty section.

## Section 14.1 - Range of Alternatives

Total Number of Submissions: 11

Total Number of Comments: 20

---

### Summary

Commenters requested clarification regarding: types of exclusions, valid existing rights, aboveground fiber optic lines, and disposal under current land use plans.

Commenters also suggested additions to the range of alternatives considered and provided information on the feasibility of the alternatives (e.g., co-location, perch diverters, and burying lines).

Commenters noted that the document has contradicting management actions regarding geothermal development between lands and minerals sections.

Commenters noted that Alternative E did not adequately address the purpose and need.

Need to include:

Comment #14-0049-8: reclaim areas that have been developed for powerlines that are no longer in use.

Comment #14-0153-41: Comment stated that BLM did not evaluate the NTT recommendation that all electrical distribution lines be buried within Core Areas.

---

### Response

The BLM and the Forest Service considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM and the Forest

Service consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and greater sage-grouse in the planning area, the BLM and the Forest Service fully considered the management opportunities presented in the Analysis of the Management Situation (AMS) and the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As a result, six alternatives were analyzed in detail in the DLUPA/EIS that best addressed the issues and concerns identified by the affected public. The range of alternatives in the DLUPA/EIS represented a full spectrum of options including a no action alternative (Alternative A).

Proposed avoidance and exclusion area designations vary by alternative, as explained on page 2-33 in Table 2-3. Under Alternative D, all new ROWs, unless specifically excluded, would be avoided, whenever possible, see LR-3 (ex. wind facilities, etc). Required design features that would apply to specific types of facilities in greater sage-grouse habitat are located in Appendix C.

The EIS/LUP includes an alternative that allows for placement of fiber optic lines on existing infrastructure (Alternative D Action LR-6 and LR-7 in Table 2-18).

Under Alternative D Table 2-18, LR-9, new power lines outside of existing ROWs, would be buried, where feasible. Reclamation of lands, once facilities are removed, are part of standard BMPs, Appendix C. Amendments to existing facilities that are otherwise excluded may be allowed under Alternative D, LR-6. Under Alternative D, lands currently identified for retention within priority greater sage-grouse habitat would be retained unless disposal of those lands would increase the extent or provide for connectivity of priority habitat (LR -19 and LR-21), Alternatives A through F propose retention of all utility corridors (Table 2-18).

Lands and Minerals management actions did contradict on the topic of geothermal development (D-LR-3, page 2-162 and D-MLM-1, page 2-180) and the FEIS will correct this contradiction.

The first of the assumptions under Lands and Realty Assumptions, Page 4-158, is that BLM and the Forest Service will protect valid existing rights, as long as those ROWs comply with the terms and conditions of their ROW grant. The agencies will consider all safety concerns into all decisions to authorize a pipeline, including burying a transmission line.

## Section 14.2 - Best available information baseline data

Total Number of Submissions: 5

Total Number of Comments: 9

---

### Summary

Commenters raised concerns with the baseline assumption (as noted in Ellis 1984 and Connelly et al. 2000) that power lines and other vertical structures increase perching opportunities for raptors and increase the potential for GRSG to abandon leks).

Commenters suggested that the BLM and the FS should have considered several additional references in their analysis, related to the relationship between GRSG and transmission lines. For example, commenters noted the DEIS did not include studies that found underground powerlines have more environmental impacts than overhead powerline placement.

Commenters questioned the data in Table 3-36, which includes the acreage of transmission lines within greater sage-grouse habitat.

Need to include:

Comment #14-0049-25 requested the LUPA include a minimum four-mile buffer from active leks for new powerlines or

similar ROW developments.

Comment #14-0049-31 request to include that infrastructure would be co-located when possible.

---

## Response

Many reports have been prepared for the development of management recommendations, strategies, and regulatory guidelines. The National Technical Team report (NTT 2011), Conservations Objectives Team (COT; FWS 2013), and the Summary of Science, Activities, Programs and Policies that Influence the Rangewide Conservation of Greater Sage-Grouse (also referred to as the Baseline Environmental Report [BER]; Manier et al. 2013) are the most widely used reports that have been incorporated in BLM and Forest Service EISs that address the effects of implementing greater sage-grouse conservation measures on lands they manage. Additionally, the BLM and the Forest Service developed the Idaho Draft Environment Impact Statement/Land Use Plan Amendment with involvement from cooperating agencies, including Idaho Department of Fish and Game to ensure that a balanced multiple-use management strategy to address the protection of greater sage-grouse while allowing for utilization of renewable and nonrenewable resources on the public lands.

Management actions included in the Draft EIS/LUPA for the underground placement of powerlines are intended to reduce the potential for long-term impacts on GRSG habitat and species viability. Literature referenced in the FEIS demonstrates that overhead powerlines provide perching opportunities for ravens and other avian predators.

BLM and the Forest Service has reviewed scientific literature provided by commenters regarding the effects of powerlines on greater sage-grouse, buffers, perch diverters, and overhead versus burying lines, and the DEIS has been revised, as appropriate.

Transmission acreages came from the peer-reviewed Baseline Environmental Report (Manier et al. 2013).

## Section 14.3 - Impact Analysis

Total Number of Submissions: 2

Total Number of Comments: 5

---

## Summary

Commenters stated that the BLM/FS should have concluded that because of Alternative E's adaptive trigger strategy the impacts from wind energy would be reduced compared to Alternative A.

Commenters stated that the agencies should carefully evaluate the impacts of stipulating co-location of electrical powerlines.

Commenters requested information on the impact of transmission lines on a landscape level would be more appropriate to reference in relation to sage-grouse persistence in the landscape and that information from Walker et al. 2007 has been used selectively in regards to transmission infrastructure.

Include:

Comment #14-183-38: Request that BLM re-consider and evaluate the stipulation that electrical powerlines must be co-located

---

## Response

The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts,

of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

Impacts from lands and realty to wind energy were discussed in DEIS/LUPA Chapter 4, page 4-331. BLM groups Alternative A and Alternative E together in regards to impacts on wind energy. Under Alternative E, the BLM and the Forest Service would limit impacts from wind and solar energy development through the use of triggers in addition to the general stipulations identified in the GRSG section, as well as required design features. This is clarified in the FEIS (see section).

Management actions included in the Draft EIS/LUPA for the co-location of new infrastructure in existing ROWs are intended to reduce the amount of surface disturbance in GRSG habitat and concentrate new development in habitat areas already affected by anthropogenic activities. The BLM and FS recognize that co-location is not feasible in all circumstances, particularly for new powerlines. Under all alternatives, the BLM and FS would continue to review proposed infrastructure projects on a case-by-case basis. Such a review would include preparation of the appropriate NEPA documentation and coordination with the responsible federal, state, and local permitting agencies.

## Section 15 - Leasable Minerals

### Section 15.1 - Range of alternatives

Total Number of Submissions: 6

Total Number of Comments: 14

---

#### Summary

The DEIS needs a better explanation on how valid existing rights are defined and how they will be protected, including fringe or preference right leases. The alternatives need to follow the NTT report recommendations more closely, as well as reflect current USFWS policy recommendations.

The BLM needs to clarify the location of non-leased Known Phosphate Areas in relation to GRSG habitat. The plan is potentially more restrictive to phosphate leasing than a listing under the ESA and did not properly define the environmental baseline for leasable minerals. Without prohibiting new phosphate mining in GRSG habitat, the LUPA does not protect GRSG from the potential impacts of selenium being released to the environment and poisoning wildlife, including GRSG, through transport in air and water and subsequent bioaccumulation. The EIS fails to explain or discuss the authority that the BLM has to close public lands to leasable mineral prospecting and leasing under the LUPA process under Alternatives B, C and D.

The reliance upon vague RDFs under Alternative D is a failure of the BLM to adopt best science that calls for specific restrictions based on observed GRSG response to surface disturbances.

---

## Response

[NOTE TO BLM: The BLM should examine the existing discussion of valid existing rights that will survive the proposed LUPA and should expand that discussion if it seems insufficient.]

The BLM and the Forest Service considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM and the Forest Service consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and greater sage-grouse in the planning area, the BLM and the Forest Service fully considered the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As a result, six alternatives were analyzed in detail in the DLUPA/DEIS that best addressed the issues and concerns identified by the affected public. The DLUPA/DEIS includes alternatives that provide a greater and lesser degree of restrictions in various use programs, but would not eliminate or invalidate any valid existing development rights. BLM agrees that it cannot impose an NSO on an existing lease. A definition of valid and existing rights has been added to the Glossary in the FEIS.

[NOTE TO BLM: Multiple changes were recommended to the FEIS by Porter- see separate tracking sheet.]

[NOTE TO BLM: Have minerals program elaborate on where the phosphate leases are relative to the management designations for the various Alternatives. Makela- is there an adequate baseline description for leasable minerals? Also, BLM look into the issue of restrictions in proposed plan relative to restriction under an ESA listing for minerals development.]

[NOTE TO BLM: determine whether there are mineral leases in the ACECs proposed by Alts C and F. Determine mineral potential in ACECs proposed by Alts. C and F.]

[NOTE TO BLM: Add to GLOSSARY- Valid Existing Rights]

Selenium bioaccumulation is not identified by the US Fish and Wildlife Service or the NTT Report as a major threat to GRSG and is not part of the conservation strategy being applied by the BLM. No change to the EIS has resulted from this comment.

According to 43 CFR 3501.17 and H-1601-I, Land Use Planning, the BLM has the authority to close areas to non-energy leasable mineral prospecting and leasing. The regulations providing this authority do not need to be described in the EIS because they are outlined in the CFR and describing all governing regulations in the EIS would be impracticable.

[NOTE TO BLM: BLM to examine its jurisdiction to prioritize GRSG conservation over laws relating to KPLAs and to describe that result in the comment response, along with any appropriate changes to the EIS.]

[NOTE TO BLM: BLM's preferred alternative may be changed in the FEIS, to keep all lands in KPLAs open to future non-energy solid mineral leasing, but to close areas in PPMA and PMMA outside of KPLAs. An exception would be made when additional lands are needed to recover ore on the lease (fringe acreage leasing, lease modifications).]

The RDFs were adopted from BMPs in Appendix D of the NTT report. In that appendix, it states that "BMPs are continuously improving as new science and technology become available and therefore are subject to change. Include from the following BMPs those that are appropriate to mitigate effects from the approved action." Wording from NNT report has been added to the discussion of RDFs in the FEIS.

## Section 15.2 - Best available information baseline data

Total Number of Submissions: 1

Total Number of Comments: 1

---

## Summary

The oil and gas conditions in the Payette area are different than those studied in the NTT report and should not be used as baseline data. The impacts described by Johnson et al 2011 are overstated and should be replaced by information from Coates et al 2013.

---

## Response

The reasonably foreseeable development scenario for oil and gas assumes a conventional oil and gas field. The current development occurring in the Payette area of Idaho is not within sage grouse habitat. BLM's preferred management action has been changed in the FEIS to applying a year-round No Surface Occupancy stipulation in PPMA and PMMA. Seasonal restrictions would be applied in PGMA. Lands outside of GRSG habitat would not be subject to stipulations developed in this EIS.

*[NOTE TO BLM: Review section on 4-8 for best available science for basis of decisions. Have a biologist help determine.]*

## Section 15.3 - Impact Analysis

Total Number of Submissions: 3

Total Number of Comments: 5

---

## Summary

The impact analysis in the DEIS of management actions on leasable mineral development is insufficient.

---

## Response

The acres of unleased KPLA land unavailable for development by alternative has been corrected in the Ch. 4 tables in the FEIS. The section describing the impacts from leasable minerals management for Alt E has been revised. The impacts of non-energy leasable minerals management actions to socio-economics have been included in the FEIS and the impacts with respect to disturbance caps have been analyzed in more detail.

*[NOTE TO BLM: Tables of acres of unleased KPLA land unavailable for development by alternative in Ch. 4 need to be corrected.]*

*[NOTE TO BLM: Impacts from leasable minerals management in alt E needs to be revised.]*

*[NOTE TO BLM: Include a discussion of the effects of phosphate management actions to socio-economics in Ch 4. Also, references to section 4.11.2 should be corrected and should refer to section 4.12.2.]*

*[NOTE TO BLM: Distinguish between Impacts from Alts F and B. Note: This is a disturbance cap question.]*

## Section 15.4 - Cumulative impact analysis

Total Number of Submissions: 2

Total Number of Comments: 6

---

## Summary

The DEIS did not adequately analyze cumulative impacts of management actions on leasable mineral development, including impacts to the Western Phosphate Field, the American agriculture industry, and national food security.

---

## Response

The BLM and the Forest Service thoroughly explained their consideration and analysis of cumulative effects in the DLUPA/EIS in Section 4.24.20. The DLUPA/EIS considered the present effects of past actions, to the extent that they are relevant, and present and reasonably foreseeable (not highly speculative) Federal and non-Federal actions, taking into account the relationship between the proposed alternatives and these reasonably foreseeable actions. This discussion summarizes CEQ guidance from June 24, 2005, stating that "[g]enerally, agencies can conduct an adequate cumulative effects analysis by focusing on the current aggregate effects of past actions without delving into the historical details of individual past actions." This is because a description of the current state of the environment inherently includes the effects of past actions. Information on the current conditions is more comprehensive and more accurate for establishing a useful starting point for cumulative effects analysis. The CEQ interpretation was accepted by the Ninth in *NW Env'tl. Advoc. v. Nat'l Marine Fisheries Serv.*, 460 F.3d 1125, 1141 (9th Cir. 2006). The BLM and the Forest Service explicitly described their assumptions regarding proposed projects and other reasonably foreseeable future actions. On Forest Service-administered lands, reasonably foreseeable actions are those that would occur under their current land use plans from a broad-scale perspective.

Additional information on the cumulative impacts on the Western Phosphate Field, unleased KPLAs, socio-economic impacts from loss of phosphate resources, reasonably foreseeable actions, and proposed conservation measures have been added to Sections XXX and XXX (minerals and socio-economics cumulative impacts). [NOTE TO BLM: Review cumulative section and add necessary information.]

## Section 16 - Livestock Grazing

Total Number of Submissions: 2

Total Number of Comments: 3

---

## Summary

[NEED SUMMARY]

---

## Response

[NOTE TO BLM: May need to go up to solicitor's office for review.]

FLPMA grants the Interior Secretary the authority to make land use planning decisions, taking into consideration multiple use and sustained yield, areas of critical environmental concern, present and potential uses of the land, relative scarcity of values, and long-term and short-term benefits, among other resource values (43USC 1711 Sec 201 (a)). 43 CFR § 4100.0-8 provides that the BLM shall manage livestock grazing on public lands in accordance with applicable land use plans. Further, the BLM may designate lands as "available" or "unavailable" for livestock grazing through the land use planning process (H-1601, Land Use Planning Handbook, Appendix C). A decision to cease livestock grazing is not permanent. It is subject to reconsideration, modification and reversal in subsequent land use plan decisions.

The Taylor Grazing Act requires that the Secretary "make such rules and regulations ... [and] do any and all things

necessary ... to insure the objects of ... grazing districts, namely, to regulate their occupancy and use, to preserve the land and its resources from destruction or unnecessary injury [and] to provide for the orderly use, improvement and development of the range.” (43 USC § 315a).

FLPMA grants the Interior Secretary the authority to make land use planning decisions, taking into consideration multiple use and sustained yield, areas of critical environmental concern, present and potential uses of the land, relative scarcity of values, and long-term and short-term benefits, among other resource values (43USC 1711 Sec 201 (a)). 43 CFR § 4100.0-8 provides that the BLM shall manage livestock grazing on public lands in accordance with applicable land use plans. Actions taken under land use plans may include making some, or all of the land within grazing districts, unavailable for grazing during the life of the plan as well as imposing grazing use restrictions, limitations or other grazing management related actions intended to achieve such goals and objectives (H-1601, Land Use Planning Handbook, Appendix C).

A “chiefly-valuable-for-grazing” determination is required only when the Secretary is considering creating or changing grazing district boundaries. Such a determination is neither required nor appropriate when establishing grazing levels within a district. (See USDI Solicitor Memorandum Clarification of M-37008 (May 13, 2003)). This RMP is not considering creating or changing grazing district boundaries. Although lands have been identified as “chiefly-valuable-for-grazing” per the Taylor Grazing Act for purposes of establishing grazing districts within the public domain (see, 43 U.S.C. § 315) this does not negate the BLM’s authority or responsibility to manage those lands to achieve resource condition goals and objectives under the principals of multiple use and sustained yield as required by FLPMA and its implementing regulations.

## Section 16.1 - Range of alternatives

Total Number of Submissions: 24

Total Number of Comments: 64

---

### Summary

Multiple commenters requested that the alternatives require closure of voluntarily relinquished allotments. Commenters questioned why changes to grazing management are needed when livestock grazing is not listed as a primary threat to GRSG. More than one commenter noted that grazing should only be restricted where it can be shown that grazing is directly related to the failure to meet GRSG habitat objectives. Additionally, commenters stated that the DEIS failed to consider increased grazing and question the rationale behind this decision. Some commenters also requested additional consideration of reduced grazing levels and utilization levels, as well as temporary or permanent closure of all or some GRSG habitat to grazing.

Several commenters requested that the LUPA/EIS provide specifics regarding habitat assessments schedules and application of standards, and use of ecological site descriptions, require immediate application of certain terms and condition to permits, and impose grazing restrictions for priority or general habitat.

---

### Response

The ID/SWMT LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA. See response in section 4.3 NEPA Range of Alternatives of this report. The DEIS analyzed a range of alternatives including no grazing and a 25 percent reduction in grazing. Reduction in AUMs under Alternative F would be specified in site specific decisions at the permit renewal level. Language in the FEIS for Alternative F reduction has been clarified.

[BLM and Forest Service- need to review the language in Alt F mgmt. actions related to the 25% reduction and review related analysis. Determine if revision needed to table 4-5].

Livestock grazing is identified by USFWS as a threat to GRSG in the March 23, 2010 Federal Register Notice, and therefore it is addressed in this LUPA. Existing regulatory mechanisms, including the fundamentals for rangeland health, would continue to provide the basis for managing grazing in GRSG habitat. However, the preferred alternative would provide additional consistency in application of BLM rangeland health standards and guidelines relative to GRSG habitat, and would provide additional guidance for prioritizing land health assessments and review of grazing permits to ensure that grazing management is compatible with attainment of sage-grouse habitat objectives within the planning area. In addition, RDFs and best management practices would be adopted to reduce effects of range improvements and livestock trailing across public lands. Grazing use would be modified when it is identified as the cause for not meeting Sage Grouse objectives. The intent of the land use plan amendment is to change management under all resource programs, where necessary, to benefit Sage Grouse habitat. Standards and Guidelines assessments result in a determination of causal factors for non-achievement of any applicable standard, including standards for wildlife habitat. Where livestock management is determined to be a causal factor for non-achievement of a standard, management must be modified to conform with applicable guidelines.

The BLM is required to follow the grazing regulations, including the decision process at 43 CFR 4160, when modifying permit or leases. Therefore, modifications to terms and conditions of permits and leases would be applied as needed during the permit renewal process.

As stated in the preferred alternative [mgmt. action #] habitat objectives would be adjusted based on site potential. Site specific requirements would be specified in NEPA for permit renewal. Language in the preferred alt. has been modified to clarify (see section X.X.X).

## Section 16.2 - Best available information baseline data

Total Number of Submissions: 13

Total Number of Comments: 42

---

### Summary

Multiple commenters asserted and presented citations supporting their position that grazing has the potential to benefits GRSG by controlling cheatgrass and reducing wildfire risk. Other commenters presented citations supporting the position that grazing damages GRSG habitat and increases cheatgrass risk.

Several commenters requested more detailed information about current grazing management and habitat conditions in the planning area.

Other commenters noted the importance of ranching in the local economy, and also that ongoing collaboration between private ranchers and federal agencies has helped preserve GRSG habitat and should be acknowledged in the EIS.

---

### Response

Before beginning the LUPA/EIS and throughout the planning effort, the BLM and the Forest Service considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The BLM and the Forest Service also used the most recent and best information available that was relevant to a land-use planning-level analysis (refer to response in section 4.4, NEPA Baseline data- Best Available Science for additional information). [NOTE TO BLM- review text in section 4.4 response once complete to ensure consistency]

Section 3.X, livestock grazing discusses the current level of grazing in the planning area and management systems in place. Impacts of current and historic grazing on other resource and resource uses are discussed under the appropriate

resource and resource use headings (i.e. **Section 3.X**, Sage grouse Habitat). Section 4.2.2 in the DEIS provides an overview of the ecological impacts of livestock grazing. The DEIS analyzed the effects of no grazing and reduced grazing on components of sage-grouse habitat, including changes in wildfire risk and cheatgrass incursion. See changes to **Section 3.X**, fire management, for additional discussion of cheat grass-wildfire dynamics. **[NOTE TO BLM/EMPSi-Review the text in Ch 3 veg related to fire/livestock.]**

Discussion of socioeconomic impacts of current grazing operations in the planning area is discussed in **Section 3.X**, Socioeconomics.

Additional language has been added to the FEIS (**section X.X.X**) recognizing the role of Rural Fire Protection Districts and other collaboration efforts **[Note- need to add language to FEIS]**

## Section 16.3 - Impact Analysis

Total Number of Submissions: 6  
Total Number of Comments: 11

---

### Summary

Some comments detailed beneficial impacts of grazing, and the adverse impacts of grazing restrictions on to livestock operations, Rangeland Fire Protection Associations, and the local economy.

One commenter notes that limitations on water developments can have impacts on grazing management and need to be clarified and analyzed in greater detail.

---

### Response

Impacts to livestock grazing from current livestock grazing management are addressed in section 4.9.4 of the DEIS. Impacts to the socioeconomic aspect of livestock grazing are discussed in Section 4.19 of the DEIS.

While a land use planning-level action is broad in scope and, therefore, does not require site specific impact analysis, a thorough review of the EIS's impact analysis relevant to grazing and indirect socioeconomic impacts and was found to need additional information and support for the conclusions/findings. The BLM and the Forest Service have updated this information in the Proposed Land Use Plan Amendment/FEIS to provide the necessary information to make informed land use plan-level decisions (see changes in section 4.19). Impacts to Rangeland Fire Protection Associations are discussed in **section 4.X**, fire management. BMPs for livestock developments including water have been revised in the FEIS and related impacts on livestock grazing management have been clarified.

## Section 17 - Locatable Minerals

### Section 17.3 - Impact Analysis

*No comments are associated with this issue.*

---

## Summary

The EIS fails to provide justification as to why “withdrawal from mineral entry” is necessary to protect GRSG and its habitat when the same objective can be achieved through avoidance, minimization of impacts, and mitigation of impacts within the designated areas. The current approach in the EIS does not meet FLPMA requirements for finding ways to remain flexible in balancing conservation and resource uses.

---

## Response

This concept was considered within the range of alternatives, as explained under Section 4.3, NEPA Range of Alternatives in this section. No change to the EIS has resulted from this comment.

## Section 17.4 - Cumulative impact analysis

Total Number of Submissions: 1

Total Number of Comments: 1

---

## Summary

The DLUPA/DEIS fails to adequately analyze the cumulative impact of locatable mineral withdrawals across the GRSG range.

---

## Response

Additional information on the cumulative effect of withdrawals across GRSG range has been added to **Section XXX** (locatables cumulative effects section) of the EIS. **[NOTE TO BLM: Could include roll-up of withdrawals from plans for incorporation into EIS]**

## Section 20 - Recreation

### Section 20.1 - Range of alternatives

Total Number of Submissions: 2

Total Number of Comments: 3

---

## Summary

In the EIS/LUPA, the BLM/FS should incorporate additional management actions (e.g. SRP/SUP stipulations, OHV noise regulations, seasonal restrictions on OHV events near leks, and rerouting of OHV events away from leks, and hunting) to limit the potential for impacts on Sage-Grouse from recreation activities. Any management actions limiting recreation activities in sage-grouse habitat should be based on the best available science with proven habitat conservation results.

---

## Response

The EIS considers an adequate range of alternatives to protect GRSG, including varying levels of restriction on recreational activities and special recreation permits/special use permits (insert correct management actions and table number). During subsequent implementation-level travel management planning, new travel management plans would evaluate vehicle routes and determine the need for permanent or seasonal road closures, and mode of travel (e.g. motorcycle, ATV, and UTV) restrictions, including speed. New travel management plans would evaluate vehicle routes and determine the need for permanent or seasonal road closures, and mode of travel (e.g. motorcycle, ATV, and UTV) restrictions during subsequent implementation level travel management planning. 43 CFR 8340 requires all OHVs to comply with state laws including noise and spark arrester requirements.

Contemporary hunting seasons in the Idaho and Southwest Montana Sub-region are very conservative with respect to their length and bag limits. GRSG hunting and its effects are described in more detail in Sections XX and XX of the FEIS.

## Section 22 - Socioeconomics and Environmental Justice

### Section 22.3 - Impact Analysis

Total Number of Submissions: 22  
Total Number of Comments: 39

---

### Summary

The socioeconomic analysis in the DEIS is overly broad and does not provide sufficient analysis of impacts to individuals, local communities or counties. The DEIS should also expand analysis of the restrictive management actions on planning area operators, communities and services including but not limited to grazing operators and mining.

Finally, the analysis methodology is inadequate to provide a comprehensive analysis of direct, indirect, and cumulative analysis of the socioeconomic impacts on the planning area communities.

---

## Response

The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-I, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and

implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

[BLM provide input on why county level analysis was not completed]

Impacts were considered on numerous resources, resource uses, and socioeconomic conditions, which included [list noted issues]. See Section 4.22 of the Draft EIS.

The DLUPA/EIS describes the methodology and assumptions used for conducting the impact analysis (see Section 4.22.2 of the Draft EIS). The methodology and assumptions provide an adequate starting point for discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.24, the DLUPA/EIS identified methodologies used and made reference to the scientific and other sources relied upon for conclusions in the analysis. Based on these methodologies and assumptions, the DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

[Add language on budget issues as appropriate: As a landscape level planning effort, none of the alternatives prescribe project specific analysis on BLM or USFWS managed lands. Furthermore, the agencies' selection of an alternative does not authorize funding to any specific project or activity nor does it directly tie into the agencies budgets as appropriated annually through the federal budget process. As a consequence, agencies' costs and differences in differences in program costs across alternatives have not been quantified. Information has been presented in several resource impacts sections on the types of costs that might be associated with various sage-grouse conservation measures]

## Section 23 - Soil

### Section 23.2 - Best available information baseline data

Total Number of Submissions: 1

Total Number of Comments: 1

---

#### Summary

One commentor notes that the DEIS lacks references to support discussion of macrobiotic crusts.

---

#### Response

[BLM/Forest Service- review soils section to determine if references needed to support discussion]

## Section 24 - Travel Management

### Section 24.1 - Range of alternatives

Total Number of Submissions: 8

Total Number of Comments: 11

---

## Summary

The Draft EIS/LUPA failed to consider a full suite of travel management-related management actions that would protect sage grouse habitat while allowing for continued administrative access, particularly for existing livestock grazing permittees. Commenters proposed that management actions should be included in the proposed plan to prohibit and reclaim/restore roads in GRSG habitat, limit motorized events, close PPHP to OHV use, apply additional seasonal travel restrictions, and apply a maximum route density within proximity of leks in PPH and PGH. Commenters also requested that proposed management actions preserve motorized access on existing routes per the 3-State OHV and National Route Designation decisions and maintain administrative access in grazing allotments.

---

## Response

Section 1.4 of the Draft EIS describes how the Idaho Montana GRSG LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA. The BLM and Forest Service complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft LUPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions from the field office RMPs are acceptable and reasonable. In these instances, there was no need to develop alternative management prescriptions.

During subsequent implementation-level travel management planning new travel management plans would evaluate vehicle routes and determine the need for permanent or seasonal road closures, and mode of travel (e.g. motorcycle, ATV, and UTV) restrictions, including noise levels and speed. The route designation process will be completed as subsequent implementation level planning using current Travel Management policies and will include public and local agency involvement. Addressing these issues at the implementation level allows the BLM and Forest Service to take new information into account as it becomes available.

Needs for administrative access to valid existing rights, grandfathered uses, or permitted activities would taken into consideration during site-specific NEPA analysis. Restrictions applied to recreational OHV use may not apply to permitted administrative uses.

The BLM and Forest Service have not added a restriction that would limit road densities to less than 0.09 km per km squared (Wisdom et al. 2011) in GRSG habitat because the threshold established by Wisdom used coarse road data. When taking into consideration actual road density information, use of this threshold is not appropriate. The BLM and Forest Service have included surface disturbance thresholds, which would restrict the density of disturbance tied to new and existing roads in GRSG habitat.

## Section 24.2 - Best available information baseline data

Total Number of Submissions: 2  
Total Number of Comments: 2

---

## Summary

Chapter 3 of the Draft EIS/LUPA does not depict the number of acres designated as open to cross-country motorized travel.

---

## Response

[NOTE TO BLM: Add current CTTM area designation acres to Chapter 3.]

### Section 24.3 - Impact Analysis

Total Number of Submissions: 3

Total Number of Comments: 6

---

## Summary

For various reasons, commenters assert that the Draft EIS/LUPA does not adequately analyze the impacts of proposed management actions on travel management. For example, commenters contend that the analysis is not based on sound science or is narrowly focused and biasedly uses studies that only demonstrate the negative effects from OHV use; does not adequately describe the magnitude of OHV vs. “naturally occurring” impacts across alternatives; and does not distinguish between motorized and non-motorized impacts. Commenters further request the BLM/FS consider conducting site-specific studies to support proposed management and assert that there would be indirect effects (e.g. ban on new road construction) incurred by existing ROW authorization holders by deferring travel management planning.

---

## Response

As described in Section 4.6 of this comment report, the LUPA/FEIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. Further, as described in Section 4.4. of this comment report, the BLM used the most recent and best available information that was relevant to a land-use planning-level analysis.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-I, Chapter II, A-B at 11-13 and Chapter IV, B at 29). The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

The mechanism being used to determine landscape level travel area designations (open/limited/closed) is 43 CFR 8340 which regulates OHV travel on public lands. BLM does not have a similar regulation for non-motorized travel. Non-motorized travel can be regulated through supplementary rules. Supplemental rules and site specific route designations will be addressed at the implementation level in the future.

New construction related to power line access would be exempted under 43 CFR 8340.05 (3).

While multiple studies on OHV use have been cited, BLM is using the BLM Travel Management Manual and Handbook (M-1626 & H-83421) to address travel planning in the EIS and will continue to use the same policy for future implementation and planning.

## Section 24.5 - Mitigation measures

Total Number of Submissions: 1

Total Number of Comments: 1

---

### Summary

The LUPA/EIS should adopt additional travel-related mitigation measures to educate the public and prevent the spread of invasive species from travel-related sources through mitigation measures such as those described at playcleango.org.

---

### Response

Appendix C of the DEIS/LUPA includes required design features and best management practices, including those that are based on the best available science to prevent the spread and effects of non-native plant species. See RDF # 290.

NCT note: ID and NV should use the same response as it is the same issue statement.

1. BLM reviewed the measures provided by commenters on playcleango.org
2. they were found to be the same as (similar as?) those already provided in Appendix XX.
3. Review of the impact analysis confirmed that the outcomes from the suggested mitigation measures would be the same as those described in the EIS (see section XX).
4. Conclusion (e.g., no changes needed).

## Section 25 - Tribal Interest

### Section 25.1 - Consultation requirements

Total Number of Submissions: 1

Total Number of Comments: 1

---

### Summary

The BLM should consider additional areas for ACEC designation and should consult with the Shoshone-Bannock Tribes about these designations.

---

### Response

The BLM and Forest Service recognize their responsibility to ensure that meaningful consultation and coordination concerning GRSG planning is conducted with federally recognized tribes, including the Shoshone-Bannock Tribes, to consider tribal treaty rights and trust resources. [BLM-FS-include relevant legal citations. Note consultation efforts to date]

### Section 25.4 - Impact Analysis

Total Number of Submissions: 1

Total Number of Comments: 2

---

## Summary

The BLM must ensure tribes, in particular the Shoshone-Bannock Tribe, maintain opportunities to access the public domain, exercise off-reservation treaty rights, and continue their traditional customs and practices.

---

## Response

The BLM, Forest Service recognize their responsibility to consider potential impacts to Tribal resources.

Article 4 of the Fort Bridger Treaty, signed in 1868, retains the Eastern Band Shoshone and Bannock Tribes' rights to hunt, fish, gather natural resources, and provide other associative right necessary to effectuate these rights. Other treaties ensure similar rights for other tribes.

## Section 26 - Vegetation Sagebrush

### Section 26.1 - Range of alternatives

Total Number of Submissions: 6

Total Number of Comments: 12

---

## Summary

Commenters recommended that the preferred alternative include:

- Specific vegetation treatment acreage objectives
- Passive sagebrush restoration
- Limitations on vegetation treatments in sagebrush areas. To meet COT report objectives, include regulatory mechanisms to avoid sagebrush removal or manipulation in sage-grouse breeding or wintering habitats with minor exceptions.
- Establish Priorities for pinyon-juniper removal including reduced grazing in conjunction with pinyon-juniper treatment.
- Restore non-native seedings to increase GRSG habitat
- Apply additional restrictions for herbicide application in GRSG habitat
- Commit to a program to plan, fund, execute and monitor large scale integrated invasive species infestation and eradication projects in a measurable timeframe.
- Include specific objectives to measure success in invasive species eradication

---

## Response

As described in Section 4.3, the ID/SWMT LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA.

Some of the recommended components were addressed in the DEIS and additional info will be included in the FEIS as detailed below.

- Specific vegetation treatment acreage objectives [need National Policy team input- to decide how treatment objectives will be incorporated]
- Passive sagebrush restoration: In the DEIS Alternative C and management changes that allow progress towards standards and guidelines allow for passive sagebrush restoration. In some areas passive restoration may not be sufficient to improve GRSG habitat and active restoration may be necessary (Davies et al. 2011) (see pp 4-54 DEIS [check page]).

- Limiting vegetation treatments in sagebrush areas is covered under Alternative D ([provide pg reference]). To meet COT report objectives, include regulatory mechanisms to avoid sagebrush removal or manipulation in sage-grouse breeding or wintering habitats with minor exceptions. [include info from FEIS specific to meeting COT report objectives if appropriate]
- Establish Priorities for pinyon-juniper removal including reduced grazing in conjunction with pinyon-juniper treatment: Priorities for PJ removal are addressed in the DEIS ([check that preferred alt includes removal within 1000m of leks per COT report objectives, if not explain rationale])
- Restore non-native seedings when beneficial to GRS habitat: Alternative C in the DEIS supports restoration of native vegetation to areas that have been seeded with non-native species when beneficial to GRS ([cite mgmt. action]). The preferred alternative provides direction for restoring non-native seedings. [provide mgmt. action number and check language to refine if needed in mgmt. action]
- Apply additional restrictions for herbicide application in GRS habitat: Herbicide/Pesticide BMPs are covered under the Veg treatment PEIS (BLM 2007x). The IDMT GRS EIS tiers to the analysis in this document.
- Commit to a program to plan, fund, execute and monitor large scale integrated invasive species infestation and eradication projects in a measurable timeframe. Include specific objectives to measure success: This EIS is intended to provide treatment methods, priority and objectives and the conditions under which these treatment objectives would occur. Specifics regarding treatment effectiveness, funding and implementation would be covered in site specific management actions. BLM and Forest Service would follow agency specific monitoring requirements.

## Section 26.2 - Best available information baseline data

Total Number of Submissions: 13

Total Number of Comments: 24

---

### Summary

The DEIS fails to provide adequate baseline information related to sagebrush vegetation. Commenters questioned the source of BLM data and requested the FEIS utilize additional baseline data on cheatgrass extent and evaluate effectiveness of continuing programs against weeds and juniper encroachment. Commenters provided additional literature to consider. Commenters also advocated an adaptive approach to vegetation management based on site-specific habitats.

---

### Response

As described in Section 4.4, the BLM and FS considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land use plan-level. Adaptive management would be incorporated into vegetation treatment and restoration programs under Alternatives D and E. Adaptive management would allow BLM increased flexibility to adjust programs based on data collected during operation, to respond to changing conditions and improve effectiveness of vegetation management programs.

[BLM: provide direction if any change to analysis is necessary. Notes during cmt response mtg: Clarify use of 70% cover from NTT; update EIS with new rare plant list.]

Change to make: Footnote in Table 3-4 change source to – ID team input and EIS vegetation model. Cite the VDDT appendix.]

The BLM and Forest Service has clarified the vegetation modeling and data sources in Chapter 3. [Insert details regarding location and changes made]

## Section 26.3 - Impact Analysis

Total Number of Submissions: 2

Total Number of Comments: 3

---

### Summary

Commenters express concern about unintended or undesirable impacts of vegetation management programs to control weeds or restore sagebrush habitat. The DEIS inadequately analyzes impacts from vegetation restoration

---

### Response

As described in Section 4.6, the DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives.

Contiguous blocks: Site-specific calculations will be conducted at the implementation level.

PJ: Clarification will be provided in [Section XX](#).

---

## Section 26.4 - Cumulative impact analysis

Total Number of Submissions: 1

Total Number of Comments: 1

---

### Summary

BLM's cumulative impacts analysis for vegetation failed to consider the impacts of limited resources on sage-grouse protection.

---

### Response

Funding and availability of resources is outside the scope of this EIS.

---

## Section 26.5 - Mitigation measures

Total Number of Submissions: 3

Total Number of Comments: 7

---

### Summary

Commenters requested detailed plans of action and clarification on mitigation and monitoring, including timing of re-seeding and restoration after fire.

---

## Response

Mitigation has been further defined as a Regional Mitigation Framework and is detailed in Appendix X. The Framework is incorporated in the [insert Proposed Plan/Proposed Plan Amendment] and was developed to achieve a net conservation gain to the species by implementing conservation actions. Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can help achieve the greatest conservation benefit for greater sage-grouse and its habitats.

If impacts to greater sage-grouse or its habitat from authorized land uses remain after applying avoidance and minimization measures, then compensatory mitigation projects will be used to fully offset impacts to achieve conservation benefits. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation.

Specific mitigation strategies, based on the Framework, will be developed by regional teams within one year of the issuance of the Record of Decision and be consistent with the BLM's Regional Mitigation Manual MS-1794, Forest Service Handbook FSH 1909.15, and CEQ regulations at 40 CFR 1508.20.

Mitigation measures for specific projects are implementation level decisions and will be included in site-specific analysis which is outside the scope of this EIS.

## Section 27 - Vegetation Riparian

### Section 27.1 - Range of Alternatives

Total Number of Submissions: 2

Total Number of Comments: 3

---

#### Summary

Commenters suggested management approaches for riparian vegetation, including removal of invasive tamarisk, limitations on or removal of livestock grazing, and maintenance of sage-grouse habitat objectives.

---

#### Response

As described in Section 4.3, the Idaho and Southwestern Montana LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA.

[BLM: provide direction if any change to analysis is necessary.]

### Section 27.2 - Best Available Info Baseline Data

Total Number of Submissions: 2

Total Number of Comments: 2

---

#### Summary

Commenter requests baseline data related to Proper Functioning Condition of riparian areas in sage-grouse habitat. Commenter questions whether PFC protects stability of riparian habitat for sage-grouse.

Commenter notes that current PFC assessment methods should be modified to address sage-grouse needs. Commenter requests site-specific management of riparian habitat to balance competing uses.

---

## Response

Comprehensive PFC data is not available on a sub-regional level but is displayed when available. Proper Functioning Condition of riparian systems according to BLM Manual 1737 includes stabilization of streambanks, maintenance of ponding, reduction in erosion, and other features beneficial to sage-grouse. Modifications to PFC methods are outside the scope of this planning effort.

## Section 27.5 - Mitigation Measures

Total Number of Submissions: 2  
Total Number of Comments: 2

---

## Summary

Commenter notes that current PFC assessment methods should be modified to address sage-grouse needs. Commenter requests site-specific management of riparian habitat to balance competing uses.

---

## Response

Proper Functioning Condition of riparian systems according to BLM Manual 1737 includes stabilization of streambanks, maintenance of ponding, reduction in erosion, and other features beneficial to sage-grouse.

Under the proposed plan, adaptive management would be incorporated into vegetation treatment and restoration programs, including riparian management. Adaptive management would allow BLM increased flexibility to adjust programs based on data collected during operation, to respond to changing conditions and improve effectiveness of vegetation management programs.

*[BLM: provide direction if any change to analysis is necessary.]*

## Section 29 - Water

### Section 29.3 - Impact Analysis

Total Number of Submissions: 2  
Total Number of Comments: 2

---

## Summary

The EIS fails to address impacts on the soil and watershed conditions resulting from grazing-sourced manure, soil erosion and pathogen contamination under each alternative and to provide appropriate mitigation measures. Such an

analysis should include a list of impaired waters and the sources of contamination for those waters. The EIS also fails to address the negative impact on GRSG of restricting or removing water developments under Alternative D.

---

## Response

**NOTE TO BLM: BLM should review impact discussions under soil and water resources under each alternative and consider mentioning any appropriate beneficial impacts on soils and watersheds that would result from grazing restrictions.**

**NOTE TO BLM: BLM should review impacts on GRSG from grazing under Alternative D and consider whether it is appropriate to identify adverse impacts on GRSG through the restriction or removal of grazing-related water developments.**

**[NOTE TO BLM: Discuss with biologists the impacts of the removal of water development on Sage Grouse.]**  
**303d listed streams are discussed in Section 3.16.2.**

## Section 30 - Wild Horse and Burros

Total Number of Submissions: 4

Total Number of Comments: 6

---

## Summary

Commenters stated that livestock and wild horses were inappropriately grouped together in management actions. Some commenters were also concerned with the 25% proposed reduction of AML under Alternative F and the basis for reduction; they requested reevaluation of reduction based on the fact that wild horse habitat overlaps a minimal percentage of GRSG habitat.

Some commenters also stated that the proposed management should provide flexibility to increase AML/AUM and/or open HAs if data becomes available demonstrating that genetic viability of wild horses and burros is threatened. Commenters also stated that the preferred alternative would give the BLM too much discretion to reduce AMLs or zero out HMAs which would violate the BLM's legal mandate to protect WHB.

---

## Response

The BLM and the Forest Service considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. See Section 4.3, NEPA Range of Alternatives, in this report for an expanded explanation on what constitutes a reasonable range of alternatives. **[NOTE TO BLM-check final response in section 4.3 for consistency]**

The BLM protects, manages, and controls wild horses in accordance with the Wild Free-Roaming Horses and Burros Act of 1971 (Public Law 92-195, as amended), the purpose of which is to "manage wild horses and burros within herd management areas (HMAs) designated for their long-term maintenance, in a manner designed to achieve and maintain a thriving natural ecological balance (TNEB) and multiple use relationships." The FLPMA directs the BLM to manage wild horses and burros as one of numerous multiple uses including mining, recreation, domestic grazing, and fish and wildlife. It also required a current inventory of wild horses and burros. Additional guidance is found in 43 CFR 4700, Protection, Management, and Control of Wild Free-roaming Horses and Burros.

Adjusting AML does fall within the legal mandate of the BLM to protect WHB and other resources. Through the BLMs program of monitoring and analysis of data, AMLs have been established and will continue to be adjusted based on the analysis of data. AMLs can be adjusted based on the limitations and capability of the range, including the four habitat components (forage, water, cover, and space), while managing for healthy populations of WHBs in balance with other uses and resources (including sage grouse). An explanation of the relationship between AMLs and AUMs has been

included in the FEIS in **section X.X.X**.

Should the 25% reduction be carried forward in the preferred alternative, genetic viability would be considered in the adjustment of AMLs. Increasing AMLs and/or opening HAs is outside the purpose and need for this project.

## Section 30.1 - Best available information baseline data

Total Number of Submissions: 2

Total Number of Comments: 3

---

### Summary

Commenters requested documentation of critical genetic data on each of the wild horse and burro herds in the planning area. This will provide BLM basis for identifying which HMAs would not be feasible to place AML reductions on while maintaining genetically viable herds. Commentors also requested exact population data for all wild horse populations in HMAs and HAs and clearly defined maps of HMAs and HAs. Finally, commenters stated that any land policy changes resulting from the sage grouse plan must be in conformance with the National Academy of Sciences 2013 recommendations for reform of the federal wild horse management program.

---

### Response

The prerequisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The baseline data provided in Chapter 3 and various appendixes in the Draft LUPA/DEIS is sufficient to support, at the general land use planning-level of analysis, the environmental impact analysis resulting from management actions presented in the Draft LUPA/DEIS. A land use planning-level decision is broad in scope and, therefore, does not require an exhaustive gathering and monitoring of baseline data (see response to section 4.4 in this report for more details). **[NOTE TO BLM- check final language in section 4.4 response for consistency]** Much of the data in the DLUPA/DEIS is presented in qualitative and map form, and is sufficient to support the gross scale analyses required for land use planning. The DEIS includes maps of HMAs and HAs. Population data is included in **Table 3.X** of the DEIS. These maps and tables have been reviewed for accuracy prior to inclusion in the FEIS. Genetic documentation of WHB is an ongoing implementation level process used to monitor the genetic health of BLM's wild horse and burro populations (see IM 2009-061).

The NAS report has been considered in the development of the FEIS and actions appropriate the land management planning level included as appropriate. Findings of the NAS would also be considered under separate site-specific NEPA actions.

## Section 30.2 - Impact Analysis

Total Number of Submissions: 6

Total Number of Comments: 9

---

### Summary

Commenters stated that the analysis on GRSG from wild horses and burros are not distinguished from livestock which inaccurately increases the threat.

Commenters identified contradictions in the document such as where the document states that "Under all alternatives, no direct change would occur to areas allocated as HMAs/WHBTs for wild horses and burros", then the report proceeds to summarize how every single alternative would restrict wild horse and burro usage in their own federally designated habitats.

---

## Response

The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives for a land use planning effort (see detailed response in section 4.6, NEPA Impacts Analysis).  
*[NOTE TO BLM- check final response in section 4.6 to ensure consistency]*

The USFWS identified grazing as a threat in the NTT and COT report but did not specifically delineate between livestock and WHB grazing. However, within the DEIS, the BLM and Forest Service did analyze impacts on WHB and domestic livestock grazing separately and also analyzed the impacts on GRSG from WHB and domestic livestock grazing separately. Impacts on GRSG from WHB and domestic livestock grazing are identified in Section 4.X of the DLUPA/DEIS. Impacts on WHB from GRSG management strategies are identified in Section 4.X of the DLUPA/DEIS. BLM appropriately analyzed the impacts to WHB from actions not related to changes in AML.

Text in the WHB impact section has been reviewed and relationship between allocation and management actions clarified in the FEIS.

*[NOTE TO BLM- insert the recommended text below in the FEIS: Under all alternatives, with the exception of Alternative XX, management actions for wild horses and burros would not result in direct changes to HMA status, to AMLs within designated HMAs, or acreage designated as HMAs. Impacts under all alternatives, with the exception of Alternative XX, would be limited to any future changes that may result in AML and/or acreage adjustment as well as reconsideration of HMA status that are based on achievement of GRSG habitat objectives for improving habitat conditions, as described in further detail below.]*

*Under Alternative XX, in contrast, AMLs would be directly reduced by 25 percent for all HMAs within PPMAs. This would result in a reduction of the established AMLs for all HMAs that are located entirely or partially within mapped occupied GRSG habitat. As a result of AML reduction under Alternative XX, costs of wild horse and burro management would increase, due to a need for additional horse gathers for removal and/or population growth suppression (PGS) treatments.]*

## Section 31 – Lands with Wilderness Characteristics

### Section 31.1 - Range of Alternatives

Total Number of Submissions: 3

Total Number of Comments: 4

---

## Summary

All lands with wilderness characteristics that overlap with Greater Sage-Grouse habitat represent good opportunities for Greater Sage-Grouse conservation and should be analyzed to see how managing those lands to protect wilderness characteristics would coincide with Greater Sage-Grouse conservation. The BLM should consider lands with wilderness protection as an alternative to ACEC protection for some areas.

The BLM should complete Lands with Wilderness Characteristics inventories and the DEIS should consider potential

Lands with Wilderness Characteristics in the scope of this process.

---

## Response

Per BLM Manual 6320, Considering Lands with Wilderness Characteristics in the BLM Land Use Planning Process, “In some circumstances, consideration of management alternatives for lands with wilderness characteristics may be outside the scope of a particular planning process (as dictated by the statement of purpose and need for the planning effort). For example, a targeted amendment to address a specific project or proposal may not in all circumstances require consideration of an alternative that would protect wilderness characteristics. In these situations, the NEPA document associated with the plan amendment must still analyze effects of the alternatives on lands with wilderness characteristics.” Therefore, analysis in this planning document regarding lands with wilderness characteristics will not be completed.

As described in Section 8 of this comment report, Alternative C considers ACEC designation for Greater Sage Grouse habitat and species protection.

## Section 31.2 - Best Available Info Baseline Data

Total Number of Submissions: 4

Total Number of Comments: 4

---

## Summary

The BLM should work with Upper Snake staff to ensure lands with wilderness characteristics inventories and management are consistent between this EIS/LUPA and the Upper Snake RMP.

The BLM must provide a map of the lands with wilderness characteristics and where it overlaps with priority habitat. The FEIS should explain how the BLM will comply with the 2014 appropriations bill for the Department of the Interior, Environment and Related Agencies and with Secretary Salazar’s Secretarial Order No. 3310.

---

## Response

BLM Upper Snake Field Office continues to evaluate lands with wilderness characteristics within the planning area. Decisions related to lands with wilderness characteristics will be addressed in the Upper Snake EIS/LUP. Per BLM Manual 6320, Considering Lands with Wilderness Characteristics in the BLM Land Use Planning Process, “In some circumstances, consideration of management alternatives for lands with wilderness characteristics may be outside the scope of a particular planning process (as dictated by the statement of purpose and need for the planning effort). For example, a targeted amendment to address a specific project or proposal may not in all circumstances require consideration of an alternative that would protect wilderness characteristics. In these situations, the NEPA document associated with the plan amendment must still analyze effects of the alternatives on lands with wilderness characteristics.” Therefore, analysis in this planning document related to lands with wilderness characteristics will not be completed.

The BLM is not making decisions on lands with wilderness characteristics in this planning effort. Doing so is outside the purpose and need and scope of this EIS.

**[NOTE TO BLM: Consider including a map displaying the overlap of lands with wilderness characteristics and priority habitat should be included in the EIS.]**

NCT note: Consider using similar language to section 8 of this document. Language relevant to ACEC issues may be applicable to LWC and may help clarify why LWC is out of scope. It does not seem that the response fully addresses the issue statement. Answer to Secretary Salazar's Secretarial Order No. 3310? Possibly use some of the language developed by NVCA in section 31.0 of this document.

### Section 31.3 - Impact Analysis

Total Number of Submissions: 2

Total Number of Comments: 2

---

#### Summary

If the BLM does not complete lands with wilderness characteristics inventories, the BLM should use GIS to inventory roadless areas and consider those as potential lands with wilderness characteristics for planning purposes.

---

#### Response

No decisions related to the management of lands with wilderness characteristics will be made at this part of the planning effort. Decision related to the management of lands with wilderness characteristics are out of the scope of this plan amendment process.

NCT note: It seems like this response could be combined with section 31.2 of this document. Responses are nearly identical and basically already included in the summary.

### Section 32.1 - Predation

Total Number of Submissions: 5

Total Number of Comments: 6

---

#### Summary

Some commenters state that the BLM does not adequately address the threat of predation or fully analyze the direct, indirect, and cumulative impacts of predation on GRSG populations; Predation was identified as a threat by the state of Idaho. Others question the inclusion of analysis of impacts of anthropogenic structures on predators of GRSG, given that the USFWS did not identify predation as a primary threat to GRSG.

---

#### Response

As stated in Section 2.3.1 in the DRMPA/DEIS, predator removal is outside the scope of LUPA. The BLM and the Forest Service have updated the description of the threat of predation in Section 3.2.1 and addressed the potential effects of predation on GRSG populations in the **Section 4.x**.

The BLM and the Forest Service have authority to manage the habitat and have provided an updated analysis in **Section 4.x** of the FEIS to describe how the numerous management actions across the range of alternatives could affect the habitat and indirectly the effects of predation. Altering the sagebrush habitat of the greater sage-grouse can create an influx of predators into an area and lead to a population decline. Roads, fences, power lines, and other infrastructure as well as the development of trails and other disturbances may improve access for potential predators near GRSG habitat

and increase risks to the species.

## Section 32.2 – Noise

Total Number of Comments: 1

---

### Summary

Commentor states that noise studies cited in the DEIS are not public and therefore the results are not reproducible; alternative data should be utilized.

---

### Response

Bilckley et al.'s research on noise and GRSG has since been published:

Blickley J.L, D. Blackwood, and G.L. Patricelli. 2012. Experimental evidence for the effects of chronic anthropogenic noise on abundance of greater sage-grouse at leks. Conservation Biology Vol 26. No 3. 461-471

This literature has been added to the noise section in the FEIS.

[Change to FEIS- add citation and data from this study in noise section. Consider addition of other data to support claims]

## Section 32.3 - Weeds

Total Number of Submissions: 2

Total Number of Comments: 4

---

### Summary

Issue 1: Commenters request analysis of past vegetation treatment programs and recommend scientific literature on effects of vegetation treatments.

Issue 2: One commenter requests baseline data on cheatgrass in planning area.

Issue 3: Partnerships with private landowners to control cheatgrass should be considered in the FEIS.

---

### Response

Response 1: As described in Section 4.4, the BLM and FS considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land use plan-level.

As a result of these actions, the BLM and Forest Service gathered the necessary data essential to make a reasoned choice among the alternatives analyzed in detail in the DLUPA/DEIS. The BLM and Forest Service utilized the available data to provide an adequate analysis that led to an adequate disclosure of the potential environmental consequences of the alternatives. [Insert any changes that were made to the EIS as a result of comment received. If no changes necessary, reference the section in the EIS that contain the relevant information].

Analysis of proposed weed treatment methods tiers off of analysis in the Final Vegetation Treatments Using Herbicides

on Bureau of Land Management Lands in 17 Western States Programmatic Environmental Impact Statement (PEIS) [BLM 2007x]

Response 2: Potential occurrence of cheatgrass has been modeled (section 3.3.5). Acre of cheatgrass potential in GRSG habitat are shown in the DEIS based on Manier et al. 2013 (see Ttable 3-15, Acres of Cheatgrass Potential within GRSG) [Can incorporate concept of limited info regarding cheatgrass mapping] Information presented is appropriate for the planning level actions and analysis. Further analysis will occur on a site-specific basis at the implementation level.

Response 3: Cooperation with all landowners would be undertaken as feasible and is included in the range of alternatives.

**Organization1:**DreamCatcher Wild Horse and Burro Sanctuary  
**Commenter1:**Barbara Clarke

**Comment Excerpt Text:**

To meet its legal and ethical obligations, the final EIS must include the following:

1. Language that clearly distinguishes between federally protected wild horses and burros from livestock.

2. Language that acknowledges and numbers that reflect the BLM's legal mandate (requirement under the law which is not optional) to protect wild horses under federal law as well as sage grouse, vs. its discretion to authorize livestock grazing
3. A clear directive to all BLM districts to preserve wild horses and burros above a level that allows for adequate genetic diversity. Genetic diversity must be specifically defined in the final EIS.
4. Directives that prohibit the reductions of current Animal Unit Months (AUMS) of forage allocated for wild horses and burros. The EIS must outline a reduction, and if necessary elimination of livestock grazing, before any reduction of AUMs for wild horses and/or burros could occur. Discretionary livestock grazing occurs on a drastically larger scale in critical sage grouse habitats than wild horse and/or burro usage.
5. Provisions to allow for increases in wild horse and burro Appropriate Management Levels and for restoration of zeroed out (Herd Area) habitat where appropriate.
6. Requirement that any land use policy changes resulting from the sage grouse plan be in conformance with the National Academy of Sciences' 2013 recommendations for reform of federal wild horse management program. BLM commissioned this report and has thus far chosen to studiously ignore it since it confirms many of the advocates points regarding mismanagement and the inadvisability of continuing BLM's failed, outlandishly expensive "just round them up" strategy.
7. Recognition of the current scientific consensus that the wild horse is a native, reintroduced North American wildlife species that co-exists with sage grouse in the high desert sagebrush ecosystems in the North American West.
8. A truly competent EIS which meets its legal intent and requirement must include detailed and comprehensive information on the following:
  - a. Vitally important Maps which set forth distinctly all HMAs and which distinguish the HMAs from the Herd Areas (HAs), with accompanying data on:
    - i) number of horses estimated within each area along with the number of livestock within each area;
    - ii) AUM allocations for wild horses and/or burros COMPARED with livestock AUMs usage, i.e., set forth AUMs for each.
  - b. All information describing and documenting the differences between wild horse and burro and livestock range impacts;
  - c. All genetic reports and documentation of genetic viability status of all wild horse and burro herds within the planning area.

---

**Comment Number:** IDMTSG-14-0049-11

**Organization1:** Greater Yellowstone Coalition

**Commenter1:** Barb Cestero

**Comment Excerpt Text:**

The DEIS confirms that lands generally withdrawn from mineral entry for locatable minerals include ACECs and other specially designated areas. Because the staking of a mining claim may lead to operations that have the potential to significantly disrupt sage-grouse, including the use of excavators, dump trucks, front end

loaders, and blasting, we suggest that BLM and USFS withdraw from mineral entry all areas specially designated for sage-grouse. The National Technical Team Report supports this proposal. Because of the potential for disturbance, Alternatives B and C recommend withdrawing PPMAs from mineral entry. Alternative F does not recommend closing any sage-grouse habitat to mineral entry. In this instance, we feel that Alternative F does not go far enough and therefore we urge the agencies to adopt the more conservative approach encompassed in Alternatives B and C

---

**Comment Number:** IDMTSG-14-0049-12

**Organization1:** Greater Yellowstone Coalition

**Commenter1:** Barb Cestero

**Comment Excerpt Text:**

As the DEIS recognizes, the Pocatello Field Office has a large nonenergy solid leasable minerals program for phosphate. DEIS at 3-114. There are currently ten phosphate leases administered by BLM that are located in sage-grouse habitat. DEIS at 3-114. Unfortunately, one major shortcoming of the 2012 Pocatello RMP is the lack any stipulations or minerals guidance for nonenergy leasable minerals which specifically address sage-grouse.<sup>11</sup> DEIS at 3-114. Fortunately, none of the ten leases in sage-grouse habitat are active and no mining is planned on these leases in the next 5 to 10 years. DEIS at 3-114. However, there are a few leases that are active in sage-grouse habitat. For example, the Trial Creek and Caldwell Canyon leases are located in sage-grouse habitat east of Conda Mountain and are currently undergoing drilling. DEIS at 3-114. There is also a lease located in priority sage-grouse habitat northwest of Bear Lake near Paris, Idaho, which would likely be developed as an underground mine if developed. DEIS at 3-114.

<sup>11</sup> Failure to manage phosphate mining to minimize impacts to sage-grouse was a concern that GYC repeatedly raised in comments during the Pocatello RMP revision process. This concern, however, was never addressed. Phosphate companies should not now get a free card to mine without regard to impacts on sage-grouse and sagebrush habitat simply because BLM failed to address this important issue in its last plan revision - which notably was completed after the Fish and Wildlife Service found that listing for sage-grouse was warranted. This deficiency must be fully addressed and repaired in this DEIS.

---

**Comment Number:** IDMTSG-14-0049-13

**Organization1:** Greater Yellowstone Coalition

**Commenter1:** Barb Cestero

**Comment Excerpt Text:**

We propose that areas specially designated for sage-grouse protection are closed to phosphate leasing, and existing leases should be subject to a NSO stipulation. As recommended by the National Technical Team Report, this should include not allowing any new leases to expand existing mines.

---

**Comment Number:** IDMTSG-14-0049-26

**Organization1:** Greater Yellowstone Coalition

**Commenter1:** Barb Cestero

**Comment Excerpt Text:**

We would propose that in the first instance, a four mile NSO stipulation should be applied around active or existing known leks. This four-mile buffer is in line with the National Technical Team's recommendations for existing leases in priority habitat.<sup>26</sup> Similarly, Alternative B would limit surface disturbances to no more than one per section for future fluid mineral leases. DEIS at 2-188. This restriction should be

implemented for all existing and future leases in order to stay within the 3% disturbance cap described above.

---

**Comment Number:** IDMTSG-14-0049-28

**Organization1:** Greater Yellowstone Coalition

**Commenter1:** Barb Cestero

**Comment Excerpt Text:**

Although it may not be necessary to withdraw all general sage-grouse habitat from locatable mineral entry, the LUPA should suggest stipulations that may be imposed to minimize impacts to sage-grouse. This may include a buffer area around leks and seasonal closures or restrictions. The agencies should review the best available science to determine what other stipulations may be effective in reducing impacts to sage-grouse and sage-grouse habitat.

**Comment Number:** IDMTSG-14-0050-14

**Organization1:**

**Commenter1:** Kathleen Gregg

**Comment Excerpt Text:**

The final EIS must include the following:

1. Language to direct all BLM and USFS districts to preserve wild horses and burros above a level that allows for adequate genetic diversity. Genetic diversity must be specifically defined in the final EIS.
  2. Directives that prohibit the reductions of current Animal Unit Months (AUMS) of forage allocated for wild horses and burros. The EIS must outline a reduction, and if necessary elimination of domestic livestock grazing, before a reduction of AUMs for wild horses and/or burros as is outlined in the legislation that was passed that clearly states “devoted principally, but not necessarily exclusively to their [wild horse and wild burro] welfare” (WFRHBA, 1971)
  3. Discretionary domestic livestock grazing occurs on a drastically larger scale in critical sage grouse habitats than wild horse and/or burro usage.
  4. Provisions to allow for increases in wild horse and burro Appropriate Management Levels and for restoration of zeroed out (Herd Area) wild horse and burro legal habitat.
  5. Requirement that any land use policy changes resulting from the sage grouse plan are in conformance with the National Academy of Sciences’ 2013 recommendations for reform of federal wild horse management program.
  6. Detailed and comprehensive information on the following:
    - a) Clearly defined maps that delineate all HMAs and Herd Areas, accurate and substantiated data on number of horses estimated within each area, AUM allocations for wild horses and/or burros and other wildlife COMPARED with domestic livestock usage.
    - b. All information describing and documenting the differences between wild horse and burro and other wildlife compared to domestic livestock range impacts;
    - c. All genetic reports and documentation of genetic viability status of all wild horse and burro herds within the planning area.
    - d. All information, including aerial and ground survey reports and photos regarding accurate and substantiated current population census for all wild horses and burros within each Herd Management Area and Herd Area.
-

**Comment Number:** IDMTSG-14-0050-17

**Organization1:**

**Commenter1:**Kathleen Gregg

**Comment Excerpt Text:**

Maps must be provided that clearly discern the different locations of Herd Management Areas (HMAs) and Herd Areas (HAs) in order to include the possible re-introduction of wild horses and wild burros onto their legal Herd Area range. Any alternative provided must allow provisions for increasing habitat and resources, including re-populating legal wild horse and burro Herd Area range, and increasing AUMs and/or AML where a genetic risk is revealed to be increasing. Data such as the number of wild horses and/or wild burros estimated within each area and the AUM usage for wild horses and burros on the HMAs must be included and clear designation such as the chart provided below must be given to clearly show the range usage of domestic livestock compared to wildlife and compared to wild horses and burros.

**Organization1:**Guerry, Inc

**Commenter1:**Michael A. Guerry

**Comment Excerpt Text:**

The involved agencies should also give weight in their decision to, the efforts that have been made by the ranching community to benefit the Greater Sage Grouse and their habitat. Such projects as, fencing springs and water developments, installing pipelines and water troughs to help better distribute livestock and provide additional water sources for the sage grouse, many of these projects having been accomplished in conjunction with the local sage grouse working groups. Also, larger landscape size projects like the formation of the Rangeland Fire Protection Associations, and Sage Grouse Initiative projects, like the brush manipulation project we are working on in our operation in partnership with NRCS, the local sage grouse working group and the Idaho Fish & Game appear to be benefitting the sage grouse and their habitat as well.

Continued BLM recognition and support of Rangeland Fire Protection Associations should be included in the final document.

---

**Comment Number:** IDMTSG-14-0056-3

**Organization1:**Helmick Ranch

**Commenter1:**Neil Helmick

**Comment Excerpt Text:**

Continued livestock grazing is crucial to sage grouse conservation and any selected alternative should be written to promote the longevity of ranching operations and reward good stewardship. Ranchers are the stewards for the habitat of many species, including sage grouse on both private and public lands. As stewards, we manage forage for optimum production, which is also beneficial to sage grouse. We are often times the first responders to wildland fire, and are involved in Rangeland Fire Protection Associations. We treat noxious weeds on our private lands to prevent the spread to federal lands, and spend more time on our public lands than any federal land management agency. These things that we do relate directly to several of the identified threats to sage grouse habitat.

---

**Comment Number:** IDMTSG-14-0057-12

**Organization1:****Commenter1:**Eileen Hennessy**Comment Excerpt Text:**

Moreover, misguided strategies to protect sage grouse by eliminating natural predators, such as mountain lions, coyotes and even ravens, throws the ecosystem out of whack, even contributing to population growth of mustangs which provides BLM with incentive to call for the removal of so-called “excess” wild horses -- a problem that this agency itself creates by allowing the elimination of mountain lions through indiscriminate hunting, as contrary to BLM claims, wild horses DO, in fact, have natural predators (mountain lions) that help keep their populations in check. A policy must be established to promote the protection of predator species in an effort to restore natural population control mechanisms and restore the “thriving natural ecological balance” of these public lands areas. Predator eradication does not promote a healthy ecosystem.

---

**Comment Number:** IDMTSG-14-0057-4**Organization1:****Commenter1:**Eileen Hennessy**Comment Excerpt Text:**

Wild equines enhance riparian areas and the ecosystem - cattle simply destroy the land and pollute the water. A horse’s post-gastric digestive system reseeds the range and assists greatly in building nutrient-rich humus which leads to healthy soils. They also break frozen water, which in turn allows other wildlife to drink. While cattle ruminate near riparian areas where they defecate, mobile wild horses continue to move 5-10 miles a day aiding digestion. If the cattle are being allowed to stay, so should the wild horses for, unlike livestock, they are an asset. If the agency analyzed the obvious difference of impacts between wild horses and livestock on the range, it would become apparent that the Proposed Action would not support wild horse reductions or removals but would implicate destructive cattle for the damage of forage and riparian areas and would clearly demand their removal or, at the very least, that they be reduced so that their numbers are evenly balanced with those of the wild horses in their own federally designated areas to rectify the wildly unfair allocation of resources the BLM has seen fit to bestow upon them which violates the Federal Land Policy and Management Act (FLPMA) and the Wild Free-Roaming Horses and Burros Act. The final EIS must provide all rangeland health assessments and procedure for conducting such assessments of the impacts for wild horses as well as livestock and BLM must have extensive knowledge of the differences in impacts on the range of wild horses vs. cattle.

---

**Comment Number:** IDMTSG-14-0057-6**Organization1:****Commenter1:**Eileen Hennessy**Comment Excerpt Text:**

\* Proposed modifications in public land management policies on such a large scale require revisions in both Land Use Plans (LUP’s) and Resource Management Plans (RMP’s) which are the structure for public land management for years to come and must include all information necessary before enacting policy changes that could have negative repercussions for federally protected wild horses and burros, other wildlife and our public lands. Any land use policies that would result from the plan to protect sage grouse habitat must comply with NAS recommendations calling for a complete transformation of the ineffectual and unsustainable Wild Horse and Burro Program. If the BLM truly “welcomes” the findings in the June 2013 National Academy of Sciences (NAS) report calling for a humane and progressive change in the BLM’s failed policies for the Wild Horse and Burro Program, the agency must back up its claim be heeding the recommendations of the National Research Council and steer the agency in a new direction for the benefit of our wild equine herds and the American public/taxpayers. This would include ceasing roundups and removals of federally protected wild equines at the expense of the American taxpayer in favor of managing our wild horses and burros ON THE

RANGE in accordance with the Wild Free-Roaming Horse and Burro Act which states that “they are to be considered in the area where presently found, as an integral part of the natural system of the public lands“.

---

**Comment Number:** IDMTSG-14-0057-7

**Organization1:**

**Commenter1:**Eileen Hennessy

**Comment Excerpt Text:**

The EIS fails to seriously analyze the extreme difference of range impacts of overpopulated destructive livestock as compared to beneficial wild equines. Instead of constantly implicating wild horses/burros for rangeland degradation without scientific evidence to back up such a claim, BLM must provide a detailed breakdown of range data, including GENUINE data that TRUTHFULLY examines the obvious difference of impacts between destructive livestock vs. beneficial wild equines is needed, including data on usage of stream riparian areas.

---

**Comment Number:** IDMTSG-14-0057-9

**Organization1:**

**Commenter1:**Eileen Hennessy

**Comment Excerpt Text:**

Considering that an estimated population of 200,000 sage grouse warrants efforts to protect their habitat and call for their listing under the ESA, scant in comparison populations of wild horses and burros (BLM wildly exaggerated guesstimates: 33,780 mustangs/ 6,825 burros) which according to accurate independent surveys number 20,000-25,000 (perhaps only 15,000) wild horses remaining, it appears these federally protected animals are in more danger of extinction than sage grouse thereby necessitating vital protections for wild equines in their own federally designated areas as well as all overlapping areas, not actions that would put them at risk such as those suggested in the alternatives provided in the EIS.

**Comment Excerpt Text:**

Vol 2, Page 2-203 Summary

Alternatives B, C, D, & F would consider acquisition as a tool for conserving important habitat... Owyhee County cannot afford to lose more of our tax base. Those private lands already have restrictions by our county comprehensive plan.

---

**Comment Number:** IDMTSG-14-0105-6

**Organization1:**Owyhee County

**Commenter1:**Brook Russell

**Comment Excerpt Text:**

A management objective and associated management actions addressing a specific planning issue may seem perfectly reasonable within the context of the planning issue. However, achievement of the objective through application of specific management actions will often create a conflict with objectives and actions assigned to other planning issues. For example, grazing restrictions following wildfire may preclude opportunity to utilize livestock grazing to direct the burn recovery toward a more desirable outcome. Resting cheatgrass for two growing seasons following a wildfire may not be a proper response. Management actions related to travel management plans will inadvertently prohibit OHV use for administrative and other essential management activities until travel management planning is completed (which could take years).

**Comment Number:** IDMTSG-14-0108-12

**Organization1:**Western Range Service

**Commenter1:**Quinton J. Barr

**Comment Excerpt Text:**

The FWS Findings regarding greater sage-grouse population trends prior to the 1960s are riddled with deficiencies. Because the Draft LUPA EISs elect to focus on habitat factors and avoid analysis of either historical or current greater sage-grouse population levels, they are almost completely void of any information to remedy these deficiencies.

---

**Comment Number:** IDMTSG-14-0108-4

**Organization1:**Western Range Service

**Commenter1:**Quinton J. Barr

**Comment Excerpt Text:**

Like the NOI, the NV Draft LUPA/EIS Purpose and Need states that this “effort is needed to respond to the USFWS’s March 2010 “warranted, but precluded” ESA listing petition decision” (see NV Draft LUPA/EIS, page 1~7). The NV Draft LUPA/EIS further states “one of the purposes of this planning effort is to provide sufficient evidence for USFWS to consider preclusion of a potential listing for GRSG (greater sage-grouse) as a threatened or endangered species under the ESA” (see NV Draft LUPA/EIS, page 1~3). Thus, the overriding purpose of both the NOI and NV Draft LUPA/EIS specifically ties to the desire to avoid listing the greater sage-grouse under the ESA.

---

**Comment Number:** IDMTSG-14-0108-7

**Organization1:** Western Range Service

**Commenter1:** Quinton J. Barr

**Comment Excerpt Text:**

In order to fulfill the overriding purpose and need, the Final LUPA EISs must evaluate whether the greater sage-grouse meets the criteria of the ESA as an endangered species or as a threatened species under current land use plan management direction.

---

**Comment Number:** IDMTSG-14-0108-8

**Organization1:** Western Range Service

**Commenter1:** Quinton J. Barr

**Comment Excerpt Text:**

Neither of the Draft LUPA EISs analyzes whether the greater sage-grouse meets the ESA definitions for listing as endangered or threatened. Thus, both the Draft LUPA EISs fail to meet the overall purpose for the EISs identified by the NOI. To evaluate whether the greater sage-grouse presently meets the criteria to be listed as endangered or threatened under the ESA, one must answer the following questions:

1] How many greater sage-grouse are needed to safeguard the species against extinction?

2a] Do current population numbers and trends put the greater sage-grouse at risk for imminent extinction, thus qualifying it as an “endangered” species?

2b] Do current population numbers and trends put the greater sage-grouse at risk for eventual extinction in the foreseeable future, thus qualifying it as a “threatened” species?

The Draft LUPA/BLM consequences discussion (pages 4-12 through 4-13) is deficient in that: (1) the uncertainty regarding the effect of mineral mining development activities on GSG habitat and population is not adequately described; and (2) potential risks associated with mine development and the mitigation of those risks are not adequately discussed in sufficient detail.

The agencies wrongly assume that areas currently identified as having no or low potential for oil and natural gas may not eventually prove to contain moderate or high potential. Due to major advances in geophysical exploration, drilling and completions technology in recent years, operators have produced significant amounts of oil and natural gas in areas across the country that were once thought to contain little or no economically accessible quantities. By closing these areas to future leasing the agencies will be unnecessarily preventing the exploration and possible production of oil and natural gas resources and associated economic benefits to local communities, states, and the nation. We strongly recommend that the agencies refrain from closing these areas to future leasing and instead apply more appropriate controlled surface use (CSU) and Timing Limitation (TL) stipulations.

**Comment Excerpt Text:**

The NOI states that the purpose behind the Draft LUPA EISs is “to incorporate consistent objectives and conservation measures for the protection of greater sage-grouse (into land use plans)... in order to avoid a potential listing under the Endangered Species Act.” See NOI3, page 77009, underlined emphasis added. Similarly, the NV Draft LUPA/EIS states that this “effort is needed to respond to the USFWS’s March 2010

“warranted, but precluded” ESA listing petition decision” (see NV Draft LUPA/EIS1, page 1~7 [chapter #~page #]) and further states “one of the purposes of this planning effort is to provide sufficient evidence for... preclusion of a potential listing... as a threatened or endangered species under the ESA” (see NV Draft LUPA/EIS1, page 1~3). Thus, the overriding purpose of both the NOI and NV Draft LUPA/EIS specifically ties to the desire to avoid listing the greater sage-grouse under the ESA.

In order to fulfill such purpose, the Draft LUPA EISs are fundamentally obligated to evaluate whether the greater sage-grouse meets the criteria of the ESA as an endangered species or as a threatened species under current land use plan management direction. Under the ESA, a species is defined as “endangered” if it is in danger of extinction throughout all or a significant portion of its range, and is defined as “threatened” if it is likely to become endangered in the foreseeable future. See ESA4, definitions (6) and (20). Thus, the criteria to qualify as either endangered or threatened under the ESA hinges upon how soon a species facing extinction is likely to disappear, with “endangered” status facing imminent extinction (in the immediate future), and “threatened” status facing eventual extinction in the foreseeable future.

Neither of the Draft LUPA EISs analyzes whether the greater sage-grouse meets the ESA definitions for listing as endangered or threatened. Thus, both fail to meet the overriding purpose for the EISs. To evaluate whether the greater sage-grouse presently meets the criteria to be listed as endangered or threatened under the ESA, one must answer two questions:

- 1] How many greater sage-grouse are needed to safeguard the species against extinction; and,
- 2] Do current greater sage-grouse population numbers and trends put the greater sage-grouse at risk for imminent extinction or for eventual extinction in the foreseeable future?

**Comment Excerpt Text:**

The U.S. Fish and Wildlife Service (FWS) provided the information required to answer these questions in its 2010 FWS Findings. The FWS Findings identified greater sage-grouse populations below 50 breeding adults “as being at short-term risk of extinction” and identified populations below 500 breeding adults “as being at long-term risk for extinction.” See FWS Findings6, page 13959. The FWS Findings further qualified that the minimum effective population size needed to protect the species long-term may be as high as 5,000 individuals in order to “maintain an effective population size of 500 birds” (see, FWS Findings6, page 13985) and to maintain “minimal viable population(s)” (see, FWS Findings6, pages 13959 and 13985). Thus, a population that exceeds 50 breeding adult sage-grouse is needed to safeguard the species against the short-term risk of imminent extinction, and as many as 5,000 individual sage-grouse may be needed as a minimum effective population to safeguard the species against the long-term risk of extinction in the foreseeable future.

The FWS Findings estimated that the recent range-wide greater sage-grouse population totals over 535,000 birds, which is 107 times larger than the minimum effective population of 5,000 birds. See FWS Findings6, Table 4, page 13921. All eleven of the locations reported in Table 4 greatly exceed a population of 50 breeding adults. Likewise, given the estimated number of males by Management Zone reported in Table 6 of the FWS Findings (see FWS Findings6, page 13923) and the female skewed sex ratio for greater sage-grouse (reported to average about two females to one male, FWS Findings6, pages 13916 and 13992), it is evident that all seven Management Zones greatly exceed a population of 50 breeding adults. Thus, all seven Zones exceed the population size below which greater sage-grouse are considered to be at risk for short-term extinction, so there are at least seven areas that support sufficient populations to prevent the greater sage-grouse from being listed as endangered under the ESA.

6 FWS Findings: Fish and Wildlife Service, 50 CFR Part 17. Endangered and Threatened Wildlife and Plants; 12-Month Findings for Petitions to List the Greater Sage-Grouse (*Centrocercus urophasianus*) as Threatened or Endangered. Federal Register / Vol. 75, No. 55 / Tuesday, March 23, 2010 / Proposed Rules. See [www.gpo.gov/fdsys/pkg/FR-2010-03-23/pdf/2010-5132.pdf](http://www.gpo.gov/fdsys/pkg/FR-2010-03-23/pdf/2010-5132.pdf).

In fact, all seven of the Management Zones exceed a population of 500 breeding adults, and five of the Zones greatly exceed the minimum effective population of 5,000 individual birds below which greater sage-grouse are considered to be at risk for long-term extinction. Additionally, estimates for the rate of decline in greater sage-grouse populations from 1985 through 2007 have averaged about 1.4% per year. See FWS Findings6, page 13922. Assuming that current management practices endure and this rate of decline continues indefinitely, it would take more than 330 years for the existing greater sage-grouse population to dwindle below the minimum effective population. Speculating what might occur over three centuries from now reaches well beyond the foreseeable future. Thus, there are now numerous areas that will support populations that exceed the minimum effective population of 5,000 birds into the foreseeable future to preclude listing the greater sage-grouse as threatened under the ESA.

Given the number of males identified for four greater sage-grouse populations within the Idaho sub-region (with 9,114; 5,457; 304; and, 448 breeding males respectively, see ID Draft LUPA/EIS2, page 3-8) and the female skewed sex ratio for greater sage-grouse (reported to average about two females to one male, FWS Findings6, pages 13916 and 13992), it is evident that all four identified Idaho greater sage-grouse populations exceed a population of 500 breeding adults (with 27,342; 16,371; 912; and, 1,344 breeding adult birds respectively), and two of the Idaho populations greatly exceed the minimum effective population of 5,000 individual birds which precludes a population from the long-term risk of extinction. Thus, at least two Idaho populations support sufficient numbers to preclude the greater sage-grouse from being listed as threatened under the ESA.

**Energy/Military Footprint Concerns**

Why is there no analysis of the INEL site, existing footprint and any potential expansion and/or changes in type and /or magnitude of roading, building, powerline and other disturbance? The same applies to the Saylor Creek and Juniper Butte USAF Bombing ranges, and airspace activity – especially those areas subject to loud plane noise, low level military overflights, use of flares (which could potentially start fires), and significant ground-based disturbance including accessing remote emitter and No Drop sites? This is made even more critical due to politicians pushing use of the even louder F-35 plane. To what degree is the existing military footprint and noise footprint stressing sage- grouse in the highly fragmented Jarbidge? What about the Bruneau Owyhee Canyonlands and adjacent Oregon and portions of NV? This region is the heart of the remaining bulk of inter-connected less fragmented sage-grouse habitat in the northern Great Basin population. Many areas of the Nevada landscape to the south is considerably more fragmented by fires.

The BLM states that it will be implementing adaptive management and using monitoring data to inform management. Meaningful “adaptive management” requires clearly defined if/then statements with mandatory monitoring with defined statistical rigor. The EIS and proposed amendments failed to provide any of this. The BLM is planning to plan, developing the adaptive management plan at an unspecified later date. The BLM claims it will use hard and soft triggers for change, but the BLM does not conduct sufficiently robust/quantitative monitoring of livestock impacts to use in this fashion. Rangeland health evaluations are conducted an irregular intervals and are highly subjective, making them inappropriate for use as measurements for conservation objectives.

**Updated Population Analysis Is Not Outside The DEIS Scope**

DEIS at 1-18 shows BLM has ignored WWP scoping comments asking for a new and updated population analysis with the Range-wide GRSG effort, by claiming it is outside the scope. An updated analysis using 2003-2013 lek data is critical. The Garton (Knick and Connelly 2011 Studies in Avian Biology Chapter) estimates are now outdated. Significant and widespread new habitat loss and degradation have occurred since 2007 – which was the break-off for lek counts used in the Garton population analysis.

This process must re-do and revise the population estimates and trajectories in ID, NV, MT, WY, UT. This is necessary to understand the current status of populations that since 2007 have been subjected to fire loss of sagebrush (and often intensified and shifted grazing in unburned habitats surrounding burned lands, coupled with poor fire rehab recovery of sage-grouse habitat components and microbiotic crusts, as there has been minimal rest from grazing so recovery is limited. The flawed agency post-fire actions retard recovery and promote areas becoming weedlands through minimal rest, and this DEIS takes no concrete steps to change that – only vague promises.

**Appendix B RFFDS**

**Oil and Gas**

The RFFD for Four Rivers is greatly deficient. BLM claims a mere 6 to 10 exploration wells on BLM land north of the Payette River. There are also very foreseeable wells on state land. See [http://www.idl.idaho.gov/bureau/Minerals/min\\_leasing/2013-Revised-Auction-Notice.pdf](http://www.idl.idaho.gov/bureau/Minerals/min_leasing/2013-Revised-Auction-Notice.pdf)

Several local news articles have described the mini-oil boom. This number seems far too low given the news reports of large-scale leasing. How has BLM also factored in the 130,000 reported acres of private land leases, and where are they located in relation to the Weiser sage-grouse population?

**Commenter1:** Erik Molvar

**Comment Excerpt Text:**

The priority habitats designated should all be withdrawn from locatable minerals entry, and the federal agencies should propose this through the RMP amendment. We lack confidence in federal agencies’ abilities to restrict the level of activity and surface disturbance on mining claims filed under the 1872 mining law to accommodate sage grouse habitat needs. Therefore, the appropriate course of action is to avoid allowing claims to issue in these priority habitats. We are particularly concerned about the potential for uranium extraction, be it underground, strip mining, or through in situ drilling and extraction methods. The lack of uranium mining activity thus far in the planning area is not a reliable measure of future development potential

**Comment Number:** IDMTSG-14-0153-51

**Organization1:** Wild Earth Guardians

**Commenter1:** Erik Molvar

**Comment Excerpt Text:**

We are concerned that off-road vehicle use is a threat to the viability of greater sage-grouse populations, and that it should be carefully managed to prevent impacts to grouse populations. Off-road vehicles are noisy, and typically exceed the background noise levels by more than 10 dBA (Northwest Colorado RMP Amendment DEIS at 399), thereby creating disturbance for sage grouse. In addition dust can inhibit the growth of forbs, sagebrush, and other plants important to the sage grouse diet. For BLM should impose seasonal closures of these areas during the breeding and nesting season, and during winter for winter concentration areas. For Priority Habitat, BLM should also close these areas through the early- and late-brood-rearing seasons

---

For priority habitats: Limit OHV use to designated roads and trails; limit to existing roads and trails pending designation in the context of a 5-year travel planning effort (North Dakota RMP Amendment, Bighorn Basin RMP Revision).

For priority habitats: Conduct restoration of roads not designated under travel planning (NW Colorado RMP Amendment).

For priority habitats: Use existing roads, or realignments as described above to access valid existing rights that are not yet developed. If valid existing rights cannot be accessed via existing roads, then build any new road constructed to the absolute minimum standard necessary. Allow no upgrading of existing routes that would change route category (road, primitive road, or trail) or capacity unless the upgrading would have minimal impact on sage-grouse habitat, is necessary for motorist safety, or eliminates the need to construct a new road. (North Dakota RMP Amendment).

For priority habitats: Conduct restoration of roads not designated during travel planning. (Northwest Colorado RMP Amendment)

For priority habitats: New road construction would be limited to realignments of existing roads, if that realignment has a minimal impact on greater sage-grouse habitat, eliminates the need to construct a new road, or is necessary for public safety. Incorporate BMPs. Existing roads used to access valid existing rights; if unavailable, construct to minimum standard necessary. (HiLine RMP revision, North Dakota RMP Amendment).

For priority habitats: Prohibit or bury powerlines within 0.6 miles of leks unless no SG declines can be demonstrated. Prohibit overhead transmission except within 0.5 mile of existing lines, corridor a maximum of 1 mile wide. Bury lines where possible. (Buffalo RMP revision).

For priority habitats: High-profile structures exceeding 10 feet in height, would be eliminated, designed or sited in a manner which does not impact sage grouse. Permanent (longer than 2 months) structures which create movement must be designed or sited to minimize impacts to sage grouse. (North Dakota RMP Amendment).

Priority Habitat would be a priority in consideration of land acquisitions. Retain public ownership of PH. Consider exceptions where: There is mixed ownership, and land exchanges would allow for additional or more contiguous federal ownership patterns within the priority sage-grouse habitat area; Under priority sage-grouse habitat areas with minority federal ownership, include an additional, effective mitigation agreement for any disposal of federal land. As a final preservation measure consideration would be given to pursuing a permanent conservation easement. (North Dakota Plan Amendments).

For priority habitats: No Surface Occupancy stipulations required for any new fluid minerals leasing, with no option for exceptions or modifications. (California-Nevada RMP Amendment).

For priority habitats: Allow only heliportable geophysical exploration, with timing limitations applied. (North Dakota RMP Amendment, Bighorn Basin RMP Revision).

Apply Timing Limitation Stipulations to all Priority Habitat. (South Dakota RMP Amendment).

For priority habitats: Timing Limitations should apply to surface disturbing and disruptive activities. (Lander RMP revision).

Find Priority Habitats unsuitable for coal leasing. (North Dakota RMP Amendment, HiLine RMP Revision, Northwest Colorado RMP Amendment).

Close Priority Habitats to energy and non-energy leasable minerals leasing. (HiLine RMP revision, California-Nevada RMP Amendment).

Close Priority Habitats to salable minerals development. (North Dakota RMP Amendment, Nevada – Northeast California RMP Amendment)

Priority Habitats are exclusion areas for new renewable energy ROW permitting. (North Dakota, California-Nevada, and Idaho-Southwest Montana RMP Amendments; HiLine, Buffalo, and South Dakota RMP revisions).

For priority habitats: Maximum 25% forage utilization for livestock grazing in each grazing allotment. (North Dakota RMP Amendment).

For priority habitats: Employ herd management to minimize livestock impacts on sage grouse nesting habitat during spring. Hot season grazing does not occur on an annual basis. Adjust AUMs where sage grouse habitat objectives are not being met. Incorporate terms and conditions into grazing permits to meet sage grouse habitat objectives. (California-Nevada RMP Amendment).

For priority habitats: Incorporate sage grouse habitat objectives into permit renewals. Manage toward ecological site potential and toward reference state to achieve sage grouse objectives. (NW Colorado RMP Amendment).

For priority habitats: Avoid all new structural range developments and location of supplements (salt or protein blocks) unless independent peer-reviewed studies show that the range improvement structure or nutrient supplement placement benefits GRSG. Design any new structural range improvements and location of supplements to conserve, enhance, or restore SG habitat through an improved grazing management system relative to SG objectives. Evaluate existing range improvements and location of supplements during AMP renewal process to make sure they conserve, enhance or restore SG habitat. (North Dakota RMP Amendment).

For priority habitats: Authorize water developments only when no adverse effect to SG. Analyze springs, seeps, and pipelines to see if modifications are needed. (NW Colorado RMP Amendment).

For priority habitats: Grazing allotments not meeting rangeland health standards and not making progress toward this goal will be closed. (Miles City RMP revision).

For priority habitats: Employ herd management to minimize livestock impacts on SG nesting habitat during spring. Hot season grazing does not occur on an annual basis. Adjust AUMs where SG habitat objectives are not being met. Incorporate terms and conditions into grazing permits to meet SG habitat objectives. (Nevada –

NE California RMP Amendment).

For priority habitats: Develop specific objectives to conserve, enhance or restore PH based on ESDs and assessments. Implement management actions (grazing decisions, AMP/Conservation Plan development, or other plans or agreements) to modify grazing management to meet seasonal sage-grouse habitat requirements. (North Dakota RMP Amendment).

For priority habitats: Where riparian and wetland areas are already meeting standards they would be maintained in that condition or better. Where a site's capability is less than PFC, BLM would manage to achieve or move toward capability. Manage wet meadows to maintain a component of perennial forbs with diverse species richness relative to site potential (e.g., reference state) to facilitate brood rearing. Where riparian areas and wet meadows meet PFC, strive to move towards GRSG habitat objectives within capabilities of the reference state vegetation relative to the ESD. (North Dakota RMP Amendment).

For priority habitats: Do not allow vegetation treatments with a potential to adversely affect sage grouse. Retain a minimum of 70% of ecological sites capable of supporting 12% cover in Wyoming big sage or 15% cover in mountain big sage. Manage a total disturbance cap of less than 30% lands not meeting these criteria. (NW Colorado RMP Amendment).

For priority habitats: Evaluate role of existing seedings composed of introduced perennial grasses in and adjacent to Priority Habitat to determine if they should be restored to sagebrush or habitat of higher quality for sage grouse. If these seedings are part of an AMP/ Conservation Plan or if they provide value in conserving or enhancing the rest of the Priority Habitat, then no restoration would be necessary. (North Dakota RMP Amendment).

For priority habitats: Do not use fire in precipitation zones < 12", except as last resort and where conditions allow and cheatgrass is a very minor component. (NW Colorado RMP Amendment).

For priority habitats: Rest grazing allotments 3 full years following fire; utilize grazing exclosures for monitoring; grazing excluded until woody and herbaceous plants achieve SG objectives. (Bighorn Basin RMP Revision).

For priority habitats: Remove, modify, or mark fences to reduce sage grouse strikes. (Nevada – NE California RMP Amendment, NW Colorado RMP Amendment, Bighorn Basin RMP Revision, Utah RMP Amendment, North Dakota RMP Amendment).

For priority habitats: Permanent retirement of grazing allotments will be considered on a willing-permittee basis. (Bighorn Basin RMP revision, Miles City RMP revision).

### **General Sage Grouse Habitats**

For general habitats: Limit motorized use to existing roads and trails pending travel management planning. Complete planning within 5 years of ROD. (California-Nevada RMP Amendment, North Dakota RMP Amendment).

For general habitats: Conduct restoration of roads, primitive roads and trails not designated in travel management plans. (North Dakota RMP Amendment).

For general habitats: Site and/or minimize linear ROW to reduce disturbance to sagebrush habitats. Maximize placement of power lines and transportation routes in existing ROWs. Power lines would be buried, eliminated, designed or sited in a manner which does not impact SG. ROWs would be allowed with

appropriate mitigation and conservation measures identified within the terms of the authorization to minimize surface disturbing and disruptive activities. Co-locate new ROWs within existing ROWs where possible. (North Dakota RMP Amendment).

For general habitats: Exclusion area for renewable energy rights of way; allowable if co-located on industrial facilities for on-site generation. (California-Nevada RMP Amendment).

For general habitats: Allow new routes/realignments during site-specific travel planning if it improves GRSG habitat and resource conditions. Allow no upgrading of existing routes that would change route category (road, primitive road, or trail) or capacity unless the upgrading would have minimal impact on sage-grouse habitat, is necessary for motorist safety, or eliminates the need to construct a new road. (North Dakota RMP Amendment).

For general habitats: Only allow geophysical operations by heliportable drilling methods and in accordance with seasonal timing restrictions. (North Dakota RMP Amendment).

For general habitats: Find unsuitable for coal surface mining. (NW Colorado RMP Amendment).

For general habitats: High-profile structures exceeding 10 feet in height, would be eliminated, designed or sited in a manner which does not impact sage grouse. Permanent (longer than 2 months) structures which create movement must be designed or sited to minimize impacts to greater sage grouse (North Dakota RMP Amendment).

For general habitats: Noise limited to no more than 10 dBA above ambient, where technologically feasible (Buffalo RMP revision).

For general habitats: Employ herd management to minimize livestock impacts on sage grouse nesting habitat during spring. Hot season grazing does not occur on an annual basis. Adjust AUMs where sage grouse habitat objectives are not being met. Incorporate terms and conditions into grazing permits to meet SG habitat objectives. (California-Nevada RMP Amendment).

For general habitats: Bury new distribution lines within 1 mile of leks. (HiLine RMP revision).

For general habitats: Where riparian and wetland areas are already meeting standards they would be maintained in that condition or better. Where a site's capability is less than PFC, BLM would manage to achieve or move toward capability. Manage wet meadows to maintain a component of perennial forbs with diverse species richness relative to site potential (e.g., reference state) to facilitate brood rearing. (North Dakota RMP Amendment, Utah RMP Amendment).

For general habitats: Avoid all new structural range developments and location of supplements (salt or protein blocks) unless independent peer-reviewed studies show that the range improvement structure or nutrient supplement placement benefits sage grouse. (North Dakota RMP Amendment).

For general habitats: Do not use fire in precipitation zones < 12", except as last resort and where conditions allow and cheatgrass is a very minor component. (Northwest Colorado RMP Amendment).

The USGS Report also states:

[t]he magnitude of the impacts of mining activities on sage-grouse and sagebrush habitats is largely unknown, but mining of various Federal mineral resources (locatable and saleable) currently affects approximately 3.6 percent of potential sage-grouse habitat directly (across all MZs) with indirect effects potentially affecting large portions (5–32 percent) of some MZs”

USGS Report at 71 (internal citation omitted). While the impacts to GRSG from mining are uncertain, the habitat loss due to mining range-wide are minor and temporary because lands are reclaimed after mining, and therefore can be mitigated with appropriate conservation measures including off-site mitigation for such impacts. It should be noted that BLM reports that GRSG populations can adapt to some habitat fragmentation and that GRSG are able to bypass unsuitable habitats during migration from one seasonal habitat to another (USGS Report at 26); and that GRSG can adapt to some level of habitat fragmentation. For mining companies, a lease is a contract authorizing it to conduct mining operations on that tract, and granting the right to utilize adjacent lands by executing a lease modification, and these rights cannot be undermined by the LUPA process proposed here by the Federal land management agencies.

24. See, e.g., Conda Partnership v. Archer Investment Co., 12 F.3d 1105 (9th Cir.1993) (Unpublished Opinion).

The Ninth Circuit addressed whether an assignee had to pay royalties to the assignor on a tract that was added to the original lease by a lease modification after the assignment. The Circuit panel held that the rights to the tract added by the lease modification were created as a part of the original lease.

25. For example, when an entity enters into a mineral lease that company obtains a right to a noncompetitive lease of the lease modification area, see 43 C.F.R. § 3510.11 (2002). This right is only subject to the lessee’s compliance with the restrictions contained within 43 C.F.R. § 3510.15. If a lessee has complied fully with those restrictions, there is the right to modify the lease pursuant to its application.

**Comment Excerpt Text:**

A coalition of environmental organizations<sup>73</sup> developed and previously submitted a new alternative for consideration entitled, the Sage-Grouse Recovery Alternative.<sup>74</sup> Our recommendations build upon some of the proposed actions contained in the Sage-Grouse Recovery Alternative (Alternative “F” in the DEIS, although the DEIS did not faithfully follow all of the recommendations), and so they are not identical. For instance, our recommendations also incorporate very recent research results on the impacts of noise and ravens on sage grouse. In addition, our proposed system of sage grouse conservation areas system includes winter

distribution habitat and does not solely focus on mapping breeding and brood-rearing areas; within sage grouse conservation areas we generally buffer active leks with a 10 km buffer for surface occupancy and new roads, and 7.6 km for new trails, while Alternative F uses more conservative buffers.

#### A. The BLM Should Designate a System of Sage Grouse Conservation Areas (“SGCA”)

The Center requests that the agencies map and implement a conservation reserve system for the recovery of the sage grouse. Tools to implement and sustain such as system are limited however the agencies should take advantage of all existing land designations to do so, and pursue more durable and lasting designations through rule-making and Congressional actions.<sup>75</sup> Primary among existing designations are the Area of Critical Environmental Concern authorized in the BLM’s regulations, and the USFS may “adopt special designations through plan amendment or revision” to conserve natural resources (36 CFR § 219.27). The USFWS should administratively designate sage grouse conservation areas in the current planning process with similar purpose and management as BLM ACECs to conserve sage-grouse and other sagebrush dependent species on National Wildlife Refuges in the planning area.

A primary concern is that none of the administrative designations now in existence provide for long term assurances that the lands will be managed for the recovery and conservation of the grouse. As a parallel effort, the Center urges the agencies to pursue new authorities to enter into long term conservation for the grouse another species that provide for durable protections.

<sup>73</sup> Including the American Bird Conservancy, Defenders of Wildlife, the Sierra Club, and Wild Earth Guardians.

<sup>74</sup> Attached

<sup>75</sup> For fuller discussion, refer to the Sage-Grouse Recovery Alternative, pages 28-31.

At the heart of the effort to avoid the extirpation and extinction of the sage grouse, there must be a profound

and fundamental recognition that further habitat declines are very serious in nature. Early conservationist Aldo Leopold once said, “To keep every cog and wheel is the first precaution of intelligent tinkering.”<sup>76</sup> Due to the heavy impacts of man, fire and climate change on the landscape, we are facing a crisis of losing the “cogs” that form an intact and functional sage grouse ecosystem. Immediate steps are needed to stabilize the losses and lay the foundation for future recovery.<sup>77</sup>

Towards this end, the Center and others are proposing a system of habitat reserves to provide for the conservation and recovery of the grouse. Rationale and details for this proposed reserve system are now provided.

Greater sage grouse are a landscape species.<sup>78</sup> Migratory populations have large annual ranges that can encompass >2,700 km<sup>2</sup> / 667,184 ac.<sup>79</sup> Large-bodied birds like sage grouse are generally more strongly affected by habitat loss and fragmentation.<sup>80</sup> Although conclusive data on minimum patch size is unavailable, conserving large expanses of sagebrush steppe is the highest priority to conserve sage-grouse.<sup>81</sup> <sup>82</sup> One study identified ten lek complexes that were >5,000 km<sup>2</sup> / 1,235,526 ac) (range 5,395–100,288 km<sup>2</sup>) and 8 of them contained >100 leks (range 143–1,139).<sup>83</sup> Some sagebrush-dependent species use different habitat composition, structure or succession than sage grouse prefer. Protecting large blocks of habitat will also help preserve a mosaic of different habitats of varying successional stages used by sage-grouse and other sagebrush-dependent species.

Preserving large habitat islands in itself is not enough – these centers must be inner-connected for several reasons.

Connelly (eds). *Greater Sage-Grouse: ecology and conservation of a landscape species and its habitats*. Studies in Avian Biol. Series, vol. 38, Univ. Calif. Press. Berkeley, CA.

Knick et al. stated that, “Species that have multiple interconnected populations are more likely to persist because risk of extirpation caused by regional events...connectivity among populations ensures that recolonization can occur following local extirpation assuming that sufficient habitat remains.”<sup>84</sup>

In addition, some sage grouse populations (known as “migratory”) move long distances between seasonal

habitats, sometimes in two distinct movements.<sup>85</sup> Annual movements of 40-160 km by sage grouse along established routes have been reported.<sup>86</sup> Thus Beck et al. recommended conserving habitat corridors to facilitate easier movement for migratory sage grouse.<sup>87</sup>

Protecting smaller habitat patches can help connect larger areas. Successful conservation strategies for sage grouse would preserve networks of populations and/or habitat patches, including connecting smaller lek complexes within 18 km that could serve as intermediary islands of habitat for dispersing sage grouse.<sup>88</sup>

#### a. Reserve Components

Several habitat characteristics capable of being mapped are included as components in the reserve system—courtship, breeding and nesting areas, brood rearing areas, winter habitats and linkages.

##### i. Courtship, breeding and nesting areas

In the spring, during the breeding season, sage-grouse males seek out courtship areas, known as “leks” that are open areas of bare soil, short grass steppe, windswept ridges, or exposed knolls in which to gather and perform their ritualized mating displays and breed with females.<sup>89</sup> An important factor affecting lek location appears to be proximity to as well as configuration and abundance of nesting habitat.<sup>90</sup>

Leks are normally “traditional”, and occur in the same location each year. Some leks studied by early investigators have persisted for 28–67 years since first counted. The presence of broken bird-point arrowheads on some leks suggests that sage-grouse had used those sites for at least 85 years. Leks and the number of attending males are regularly used to monitor the long-term status of populations because of their traditional locations.<sup>91</sup>

91 Ibid.

Although the actual lek sites are typically open areas, they are usually located in the midst of denser shrub stands, which together provide the necessary combination of visibility, protection, food, and thermal regulation.<sup>92</sup>

In a recent study looking at greater sage grouse across six western states, it was reported that 90% of the active leks were surrounded by areas having greater than 40% sagebrush cover. Further, 99% of the active leks were in landscapes with less than 3 % of the area in human development.<sup>93</sup> Successful leks occurred in areas with low road densities – less than 1 km/km<sup>2</sup> of secondary roads, less than .05km/km<sup>2</sup> of highways, and less than .01 km/km<sup>2</sup> of interstate highways. Another pertinent finding was that habitat suitability was highest when power line densities were less than .06 km/km<sup>2</sup>; leks were absent where power line densities exceeded .2 km/km<sup>2</sup>. With respect to communication/cellular towers, leks were absent when

tower densities exceeded .08 km/km<sup>2</sup>.<sup>94</sup>

Wisdom et al. reported that areas extirpated of sage grouse had 27 times the human density, 3 times more area in agriculture, were 60% closer to highways, and had 25% higher density of roads than what was found in occupied habitat. Also, it was found that power lines and cellular towers had significant impacts on whether or not a habitat was occupied.<sup>95</sup>

Studies published by Braun in 1977 and Connelly in 2000 initially set the standard that leks should be buffered by a 3.2 km or 3.1 mile radius, both to provide security for the grouse and to acknowledge the fact that many, but by no means all, female grouse will nest in the immediate area of the lek.<sup>96</sup>

However, more recent studies have suggested that the 3.2 km is questionable as to whether or not it adequately provides for the conditions needed for successful breeding and nesting.

It was found in one study that a 3 km buffer encompassed only 45% of the nesting females associated with that lek, while a 5 km buffer accommodated 64% of the nests. It was also reported that nests located within 1 km of another nest tended to have lower nesting success likely due to enhanced prey detection by predators.<sup>97</sup> The same study further suggests that to protect and maintain sage grouse populations residing in relatively contiguous sagebrush habitats, managers should minimize or halt actions that reduce the suitability of nesting habitats within 5 km of a lek until detailed site specific monitoring suggested otherwise. It also noted that a substantial number of females nested distances greater than 5 km from a lek and that this additional increment of individual recruitment could be important for population viability.<sup>98</sup>

<sup>98</sup> Ibid.

For a related grouse, the U.S. Fish and Wildlife Service recommended "... avoiding placing wind turbines within 5 miles [8 km] of known leks (communal pair formation grounds) in known prairie grouse habitat".<sup>99</sup>

Johnsgard indicated that there was no obvious relationship between lek location and nest site. In 5 different studies involving more than 300 nests the average distance between lek and Sage-grouse nest where the females was first seen or captured was 3.5 mi (5.6 km).<sup>100</sup>

A majority (~90%) of nesting and brood-rearing habitat was within 10 km (6.2 miles) of active leks in Alberta (Aldridge and Boyce 2007); 97 percent of nests were found within 6.2 miles of leks where females were marked in the Powder River Basin in Montana and Wyoming.<sup>101</sup>

Walker et al. in another study found that the impacts from energy development on lek persistence and nesting were still apparent at a distance of 6.4 km from the disturbance.<sup>102</sup>

Connelly et al. reported in their assessment for the Western Governors' Association that road traffic within 7.6 km had adverse impacts on male grouse attendance at leks.<sup>103</sup>

## ii. Brood-raising areas

Brood rearing habitats are a very important component of sage-grouse habitats. A mosaic of upland sagebrush vegetation intermixed with mountain meadows and spring systems compose brood rearing habitat.

Placing a heavy focus on habitat protection around leks is not suitable for ensuring the viability of sage grouse populations. Studies have shown that both nest and brood rearing habitats are on average 6 km from leks, and it is not until 10 km from leks that one reaches the threshold where 90% of the habitat occurs.<sup>104</sup>

Brood occurrence is greater in more heterogeneous sagebrush stands, where patchy cover reduces predator efficiency but still affords necessary forb resources. Sage grouse are more abundant in patchy habitats containing a mix of mesic, forb-rich foraging areas interspersed within suitable sagebrush escape cover.<sup>105</sup>

Approach for Endangered Greater Sage-Grouse. *Ecological Applications* 17(2):508-526.

105 Manier et al. 2013. Page 21.

Broods are typically found in areas near nest sites for the first 2–3 weeks after hatching. Such habitat needs to provide adequate cover and areas with sufficient forbs and insects to ensure chick survival in this life stage.  
106

As the chicks get older, sage-grouse tend to move into more moist areas (streambeds or wet meadows) because as herbaceous vegetation dries out, wetter areas provide more forbs and insects for hens and their chicks.<sup>107</sup> Droughts resulting in reduced cover can make these habitats risky for sage grouse chicks, particularly if livestock grazing intensities have exacerbated the vegetative declines.<sup>108</sup>

iii. Wintering habitat

As previously mentioned, although leks are important focal points for breeding and subsequent nesting in the surrounding region, other seasonal use areas and habitat requirements may be equally limiting to sage-grouse populations.<sup>109</sup>

Suitable and diverse winter habitats are critical to the long-term persistence of grouse populations.<sup>110</sup> As summer ends, the diet of sage grouse shifts from a diet of insects, forbs and sagebrush to one comprised almost entirely of sagebrush.<sup>111</sup> In winter, the grouse depends heavily on sagebrush for cover, habitat selection being driven by snow depth, the availability of sagebrush above the snow, and topographic patterns that favorably mitigate the weather.<sup>112</sup>

Abundance of sagebrush at the landscape scale greatly influences the choice of wintering habitat. One study found that the grouse selected for landscapes where sagebrush dominates over 75% of the landscape with little tolerance for other cover types.<sup>113</sup> Because appropriate wintering habitat occurs on a limited basis and because yearly weather conditions influence its availability, impacts to wintering habitat can have large disproportional effects on regional populations. One study in Colorado found that 80% of the wintering use

occurred on only 7% of the area of sagebrush available.<sup>114</sup> Additionally, some degree of site fidelity to winter areas is suspected to exist, and wintering areas not utilized in typical years may become critical in severe winters.<sup>115</sup>

Lower elevation sagebrush winter habitat used by sage grouse may also constitute important winter areas for big game and early spring forage areas for domestic livestock. Due to differing vegetative condition requirements, land treatments on lower elevation sagebrush areas to increase big game or livestock forage at the expense of sagebrush cover and density could have long-term negative consequences for the grouse.<sup>116</sup>

Sage grouse in the Powder River Basin were 1.3 times less likely to use otherwise suitable winter habitats that have been developed for energy (12 wells/4 km<sup>2</sup>), and avoidance was most pronounced in high-quality winter habitat with abundant sagebrush.<sup>117</sup>

#### iv. Linkages

Because use and availability of these seasonal habitats are spread across a given landscape, sage- grouse require vast areas of contiguous sagebrush to meet their needs on an annual basis.<sup>118</sup> Although leks are important focal points for breeding and subsequent nesting in the surrounding region, other seasonal use areas and habitat requirements may be equally limiting to sage-grouse populations. Population size and isolation can have serious negative impacts on genetic variability and population persistence.<sup>119</sup>

Science informs us that populations of rare species in small, disjunct areas of occupied range have a high risk of extirpation, and that the probability for extinction increases for populations that become increasingly small and isolated.<sup>120</sup>

Naugle et al. recently observed, that the severity of impacts to sage grouse from human disturbances, in particular energy development dictate the need to shift from a local to a landscape view for basing conservation actions.<sup>121</sup>

Any conservation reserve system for sage grouse must ensure the connectivity between metapopulations are preserved. GIS modeling can identify sage-grouse habitat, at a larger scales. There are limitations to a GIS-designed reserve system –for instance, within areas identified by GIS modeling as nesting habitat, there is some local variability in which sites are actually suitable for nesting, nests may be clumped in one area and not another, or local topography makes a linear distance from a lek meaningless. Still, for purposes of identifying crucial habitat for the grouse it is a crucial first step. As inventory and telemetry work advance, the system can be fine-tuned. The important thing is that key habitats and linkages not be lost and the precautionary principle applied to sage grouse management. <sup>122</sup>

Greater Sage-Grouse: ecology and conservation of a landscape species and its habitats. Studies in Avian Biology (vol. 38). University of California Press. Berkeley, CA.

122 The precautionary principle states: “Precautionary Principle states that when an activity causes some threat or harm to the public or the environment, general precautionary measures should be taken. When a scientific investigation proves that there is a possible risk in doing some activity, then this principle should be applied. Internationally, one of the most important expression of the Precautionary principle is the Rio Declaration from the United Nations Conference on Environment and Development. Principle 15 of the Rio Declaration reads:

“In order to protect the environment, the precautionary approach shall be widely applied by States according to their capabilities. Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation.”

This principle is applied in the context of human activities on the environment and human health.

In U.S the precautionary principle is not expressly mentioned in any laws or policies. Despite U.S. acceptance of the precautionary principle in international treaties and other statements, little work has been done to implement this principle.” From: <http://definitions.uslegal.com/p/precautionary-principle/>

## A. Threats and Management Direction

The DEIS identified about a dozen issues and threats to be considered in the land use plan amendment process. What follows is the Centers brief reaction to theses and recommendations for addressing them. We separate our recommendations into two general categories – inside our proposed sage grouse conservation areas (“SGCAs”) and sage grouse habitat outside of them.

### a. Energy Development and Transmission

The Center strongly supports and advocates for energy policies that rapidly phase out fossil- based sources in favor of renewable sources, including ending fossil fuel extraction on public lands, and supports renewable sources of energy such as wind, solar and geothermal, with the goal in mind of halting the rapid rise of greenhouse gas concentrations in the atmosphere and slowing the tide of climate disruptions.

At the same time, the Center is highly concerned about the impacts from poorly sited renewable energy projects on rare species and their habitats. We advocate for locating renewable energy projects on private or previously disturbed lands near transmission lines, or through roof-top solar distributive-community systems.

The threats from energy developments are many pronged. In addition to the direct impacts of destruction of actual habitat by the footprint of the project, secondary and indirect impacts due to energy development include avoidance of previously used areas due to species psychology, increased predation, traffic-associated mortality, increased chance and spread of diseases such as the West Nile virus.

Transmission lines—a key component of renewable energy development—also negatively impact sage grouse populations. One study found that the mean distance to electric transmission lines was greater than 2 times further in occupied range than in extirpated range.<sup>123</sup>

123 Wisdom et al. 2011.

The Center brings to your attention recent research on the impacts of ravens on sage grouse and other species in sagebrush habitats, with emphasis on how it relates to raven use of transmission lines.

Common raven populations in the western United States have more than quadrupled over the last 40 years.<sup>124</sup> This increase is believed to be a result of human alterations of natural habitats that provide subsidies and benefits to the ravens. For instance, road-kills, trash dumps and landfills, and livestock operations provide readily available sources of food. Water developments for livestock, irrigation and sewage lagoons provide new water sources. But with respect specifically to energy development, tall structures (e.g., power poles and transmission towers) constructed by humans provide ravens with elevated perches and nesting substrate in areas where natural tall structures (e.g., trees) are rare or nonexistent. <sup>125</sup>

Howe et al. found that ravens selected nest locations that were (1) in close proximity to transmission lines; (2) in close proximity to land cover edges; and (3) within areas that contained abundant edge formed by adjoining land cover types. Selection for edge-dominated areas, specifically edges between sagebrush and grasslands and nonnative cover types, suggests that ravens are taking advantage of new habitat conditions caused by a combination of habitat fragmentation and conversion. <sup>126</sup>

In their research Howe and her co-authors, found that ravens preferred nest sites that were closer to transmission lines than expected based on availability. Transmission poles provided nesting substrates and perches taller than any other substrate present in their study area.<sup>127</sup>

Increased presence of ravens can be deleterious to other species within the geographical range of ravens, and raven abundance has been positively correlated with predation of eggs or nestlings of other birds breeding within raven range, including eggs and nestlings of sage grouse.<sup>128</sup> In another study nests in fragmented habitats were approximately 9 times more likely to be depredated than those in contiguous habitat.<sup>129</sup>

It is quite clear from observation and reported science that ravens are increasing and benefiting from fragmentation and human changes on the landscape. As this occurs, there will be continued negative consequences to sage grouse nesting success and recruitment into the breeding population.

<sup>124</sup> Sauer, J. R., J. E. Hines, J. E. Fallon, K. L. Pardieck, D. J. Ziolkowski Jr., and W. A. Link (2011). The North

American Breeding Bird Survey, Results and Analysis 1966–2009, Version 3.23.2011.

<sup>125</sup> Howe, Kristy B., Peter S. Coates and David J. Delehanty. 2014. Selection of anthropogenic features and vegetation characteristics by nesting Common Ravens in the sagebrush ecosystem. *The Condor, Ornithological Applications*, Vol. 116, 2014, pp. 35-49.

<sup>126</sup> Howe et al. 2014.

<sup>127</sup> Ibid.

<sup>128</sup> Coates, P.S. and D. J. Delehanty. 2010. Nest predation of Greater Sage-Grouse in relation to microhabitat factors and predators. *J. of Wildlife Management*, 74:240-248.

<sup>129</sup> Vander Haegen, W. M., M. A. Schroeder, and R. M. DeGraaf. 2002. Predation on real and artificial nests in shrubsteppe landscapes fragmented by agriculture. *The Condor* 104:496–506.

The infrastructure associated with energy development within sagebrush ecosystems threatens the contiguous habitats remaining in the western United States. The linear right-of-ways associated with wind and other energy developments likely provide anthropogenic nesting subsidies and fragmented landscapes, both of which increase nesting opportunities for ravens. Preventing fragmentation by transmission lines, roads, and

other human interventions is integral to stemming the increase and range expansion of raven populations.<sup>130</sup>

We recommend the following strengthened management approaches to minimize further degradation of sage grouse habitats from energy-related development.

#### Management Prescriptions:

##### i. Management Inside SGCAs in sage grouse habitat

- Exclude these areas from new energy leasing and rights-of-way.
- Whenever possible, bury existing transmission lines within 10 km from active leks.
- Institute seasonal restrictions on surface occupancy within 10 km from leks during courtship and early brood-rearing periods.
- No new road construction within 7.6 km of active leks.
- If existing disturbed area in the SGRA exceeds 3% of the surface area, institute measures to provide additional mitigation to offset the impacts on the grouse.

##### ii. Management outside SGCAs in sage grouse habitat

- Institute seasonal restrictions on surface occupancy within 5 km from leks during courtship and early brood-rearing periods.

##### b. Livestock Grazing and Wild Horses

Grazing by settlers during the latter part of the 19th and early 20th centuries was largely unregulated and seriously depleted native forbs and grasses needed by sage-grouse. Historic grazing practices also facilitated invasions by non-native plants, including cheatgrass. A conservation assessment of sage grouse and its habitats found that impacts attributable to historic overgrazing have not been remedied, because, “plant communities still are not given rest from grazing” and “distribution of livestock has changed because water developments have increased the area that could be grazed.” Consequently, the assessment stated, “We cannot conclude that the effect of grazing has been reduced because even reduced numbers of livestock may still exert a larger influence on those habitats.”<sup>131</sup>

<sup>130</sup> Howe. Et al. 2014.

<sup>131</sup> Connelly et al. 2004.

Livestock grazing remains the most widespread use of land in the sagebrush biome. Domestic livestock continue to alter the sagebrush steppe by consuming native grasses and forbs, trampling sagebrush, and spreading nonnative weeds like cheatgrass. The introduction of invasive plant species increases the risk and severity of wildfires, which can irreversibly alter the composition of the ecosystem. Livestock grazing also compacts the soil, destroying the microbiotic soil crusts that retain moisture and limit wildfire. In addition, grazing livestock degrade riparian areas when, during hot periods, they congregate around water sources and shady areas, damaging streams, springs, seeps, and wet meadows, which are also crucial for the grouse.<sup>132</sup>  
133

Standards and guidelines for management of public grazing lands are established by local resource advisory councils and must address habitats and conservation measures for endangered, threatened, proposed, candidate, or other at-risk or special status species. Under this set of criteria for rangeland health, 58% of lands that have been assessed (25% of all lands under management by the U.S. Bureau of Land Management) (including non-sagebrush habitats) met the standards or were making progress towards meeting those standards. Livestock were a factor in 36% of the assessed lands not meeting standards (15% of the all lands). Another 6% of the assessed lands were not meeting standards for causes other than livestock grazing.

Fifty-seven percent (>37 million ha) of the public lands managed by the U.S. Bureau of Land Management have not been assessed.<sup>134</sup>

For further documentation of the impacts of livestock and grazing on sage grouse and its habitats we refer you to the Sage-Grouse Recovery Alternative, and incorporate these comments as our own.<sup>135</sup>

The Center emphasizes our agreement with the Sage-Grouse Recovery Alternative regarding the treatment of livestock grazing as a diffuse disturbance on sage grouse habitat.<sup>136</sup> The readily and all too often observed sacrifice zone of utter destruction that occurs around watering, salting and gathering corrals is anything but diffuse. As Holechek and others observed, depending on topography, areas of severe degradation, or “sacrifice areas” around water sources, including water developments, can extend from one to several miles from water sources.<sup>137</sup>

137 Holechek, J. L., R. D. Pieper, C. H. Herbel. 2001. RANGE MANAGEMENT: PRINCIPLES AND PRACTICES. 4th ed. Prentice-Hall. Upper Saddle River, NJ.

Given the state of degradation and the pervasive nature of livestock grazing, we recommend establishing a utilization rate of 25-30% while meeting sage grouse habitat objectives. While definitions of light grazing use vary, numerous references have settled on a general 25 percent harvest coefficient for allocating forage for livestock.<sup>138</sup> Although this rate is more conservative than others prescribed for light grazing, it allows both forage species and livestock to maximize their productivity, allows for error in forage production estimates, accounts for the potential effects of drought, and supports multiple use values.<sup>139</sup> Holecheck et al. also noted that, because most ranchers have difficulty monitoring and measuring annual grazing utilization (and the BLM doesn't regularly monitor and collect utilization information), use of grazing coefficients higher than 25 percent “invariably leads to land degradation...when drought occurs because of rancher reluctance [to reduce livestock numbers].”<sup>140</sup> Limiting livestock grazing to 25 percent utilization would also support other sage-grouse habitat objectives, such as maintaining a minimum stubble height.<sup>141</sup> A case study of the Antelope Springs Allotment in southern Idaho demonstrates that ranching operations can be successful and improve sage-grouse habitat using a 20 percent utilization standard.<sup>142</sup>

We recommend the following strengthened management approaches to minimize further degradation of sage grouse habitats from livestock grazing and the impacts from feral wild horses.

#### Management Prescriptions:

##### i. Management inside SGCAs in sage grouse habitat

- Issue no new grazing permits.
- Identify existing grazing allotments where permanent retirement of the grazing privileges are feasible, and proceed with such retirements.
- Avoid all new structural range improvements, and prohibit water developments and salting within 10 km of active leks.
- Authorize no new water developments for diversion from spring or seep sources.
- Ensure new or rehabilitated water developments are designed to use best management practices to limit and mitigate potential impacts from the West Nile virus.

- Remove, modify or mark fences in areas of moderate or high risk to sage grouse collisions.143
- Institute 25-30% grazing utilization standard on existing allotments while meeting objectives for sage grouse habitat conditions.
- Prioritize completion of land health assessments and ensure grazing systems and practices under permit are designed and required to meet sage grouse habitat objectives. Institute timely monitoring to ensure objectives are being met.
- Manage riparian and wetland areas to meet properly functioning condition standards. Manage wet meadows to maintain perennial forbs and a rich species mix needed for sage grouse brood-rearing.
- Review free-roaming horse and burro herd management plans with sage grouse habitat objectives in mind. Aggressively manage herds to maintain them at or below herd management objectives.

## ii. Management outside SGCAs in sage grouse habitat

- Identify existing grazing allotments where permanent retirement of the grazing privileges are feasible, and proceed with such retirements.
- Avoid all new structural range improvements, and prohibit water developments and salting within 10 km of active lets.
- Authorize no new water developments for diversion from spring or seep sources.
- Ensure new or rehabilitated water developments are designed to use best management practices to limit and mitigate potential impacts from the West Nile virus.
- Remove, modify or mark fences in areas of moderate or high risk to sage grouse collisions.144
- Institute 25-30% grazing utilization standard on existing allotments while meeting objectives for sage grouse habitat conditions.
- Manage rangelands to meet properly functioning condition standards. Manage wet meadows to maintain perennial forbs and a rich species mix needed for sage grouse brood-rearing.
- Manage free-roaming horse and burro populations at levels demonstrated to achieve and maintain sage grouse habitat objectives.

## c. Landscape-scale changes and vegetation management

The Center addresses this issue by defining vegetation management as treatments to achieve and protect sage grouse life-cycle habitat needs and the control and prevention of noxious and invasive species.

The need for vegetation management to manage for specific resource objectives arises from changes to the natural ecosystems, either through natural changes in succession or state, or from large scale disturbances such as wildfires, spread of invasive and non-native species, climate disruption, or other human alterations to

ecosystems.

The DEIS does a credible job of documenting the ecosystem changes that have occurred over the past 100+ years.

144  
Ibid.

The Center believes it is important to state that human-induced landscape-scale changes to sage grouse ecosystems pose a dire threat to the long term continued existence of the species. We are not alone. Miller et al. noted that sagebrush habitats are severely stressed across much of the range, and their total area likely will decline in the relatively near future as a result of invasive species, fire, and climate change.<sup>145</sup>

At lower elevations and in the more arid portions of the sage grouse range, the catastrophic spread of cheatgrass, aided and abetted by the impacts from over-grazing and changes in fire frequency and intensity has led to a lasting, if not permanent changes in ecosystem states. Repeat fires that eliminate or reduce shrubs, native grasses, and forbs; disturb soils and biological crusts; and release nutrients have allowed cheatgrass and other introduced annuals to replace the native shrub and herb layers. The resultant landscape is largely composed of introduced annuals, and is more susceptible to annual weather patterns and varies greatly from year to year, depending on moisture availability. Long term changes in climate that facilitate or enhance invasion and establishment by invasive annual grasses further exacerbate the fire regime and accelerate loss of sagebrush habitats.<sup>146</sup>

At higher and cooler elevations, changes in fire frequency and intensity have come at the expense of sagebrush ecosystems in a different manner. Under pre-European settlement conditions, wildfires and indigenous planned fires kept pinyon pine and western junipers (“PJ”) confined to areas where fires would not typically reach – mainly rocky terrain where the fuels needed to carry the fire were patchy and disjunct. Once modern settlers arrived in the mid-1880s this pattern changed. Heavy livestock grazing initially greatly reduced the fine fuels needed to carry fires, and later active human intervention suppressed fires to prevent their spread. As a result, PJ species were able to establish seedlings in grass and shrubland areas where formerly fires would have eliminated them. This then was the beginning of the woodland expansion into sage grouse habitat that continues today.<sup>147</sup> <sup>148</sup> Prior to 1860 two-thirds of the landscape was treeless and occupied by sagebrush-steppe communities. Today, less than one-third of the landscape remains treeless and more than 90 percent of the trees have established since the 1860s. These data support the need for active management in tree removal. In the absence of disturbance, woodlands will continue to expand, mature, and close.<sup>149</sup>

#### Management Prescriptions:

##### i. Management inside of SGCAs in sage grouse habitat

Restoring sage grouse habitat that is degraded or fragmented might be useful tool for the benefitting the species. However, these programs are likely to be both difficult and expensive, and may take centuries to achieve a complete restoration of a functioning system of sagebrush habitats within a landscape mosaic.<sup>150</sup> The obvious and best way to provide for the species at least in the short to intermediate term is to protect the remaining existing habitat, which is the intent of the Center's proposed conservation reserve system.

- Where it will achieve sage grouse habitat objectives, passive restoration approaches should be favored over active methods.
- Any vegetation treatment plan must include pretreatment data on wildlife and habitat condition, establish non-grazing exclosures, and include long-term monitoring of treated areas.
- Ensure that vegetation treatments create landscape patterns which most benefit sage--grouse. Only allow treatments that are demonstrated to benefit sage-grouse and retain sagebrush height and cover consistent with sage-grouse habitat objectives (this includes treatments that benefit livestock as part of an AMP/Conservation Plan to improve sage--grouse habitat).
- Identify and prioritize sage-grouse habitat for restoration projects based on environmental variables that improve chances for project success.<sup>151</sup> Prioritize restoration in seasonal habitats that are thought to be limiting sage--grouse distribution and/or abundance and where factors causing degradation have already been addressed (e.g., changes in livestock management).
- Restrict activities in SGCAs that facilitate the spread of invasive species, including recreational and commercial use by off-road vehicles.
- Do not use prescribed fire as a tool in low elevation areas where the potential for cheatgrass invasion is above low.
- Retain sagebrush canopy cover at or above what is expected for that ecological site, consistent with sage-grouse habitat objectives unless a fuels management objective requires additional reduction in sagebrush cover to meet strategic protection of priority sage--grouse habitat and conserve habitat quality for the species.
- Aggressively monitor and control invasive vegetation in sagebrush steppe ecosystems. Rapidly restore burned or disturbed habitat to minimize or prevent the incursion of invasive plants.
- In areas of PJ, avoid treating the areas of persistent woodlands. Persistent woodlands are an ecological condition, irrespective current observed "fire condition class", where site conditions and disturbance regimes are inherently favorable for PJ, and where trees are a major component of the vegetation unless recently disturbed. These woodlands do not represent twentieth century conversion of formerly non-wooded vegetation types, but are places where trees have been an important stand component for several hundred years.<sup>152</sup>
- In areas where sagebrush is prevalent or where cheatgrass is a concern, utilize mechanical methods rather than prescribed fire.
- Apply appropriate seasonal restrictions for implementing management treatments consistent with the types of seasonal habitats present.

##### ii. Management outside SGCAs in sage grouse habitat

- Where it will achieve sage grouse habitat objectives, passive restoration approaches should be favored over active methods.
- Identify and prioritize sage-grouse habitat for restoration projects based on environmental variables that

improve chances for project success.153 Prioritize restoration in seasonal habitats that are thought to be limiting sage--grouse distribution and/or abundance and where factors causing degradation have already been addressed (e.g., changes in livestock management).

- Restrict activities in SGCAs that facilitate the spread of invasive species.
- Do not use prescribed fire as a tool in low elevation areas where the potential for cheatgrass invasion is above low.
- Retain sagebrush canopy cover at or above what is expected for that ecological site, consistent with sage-grouse habitat objectives unless a fuels management objective requires additional reduction in sagebrush cover to meet strategic protection of priority sage--grouse habitat and conserve habitat quality for the species.
- Aggressively monitor and control invasive vegetation in sagebrush steppe ecosystems. Rapidly restore burned or disturbed habitat to minimize or prevent the incursion of invasive plants.
- In areas of PJ, avoid treating the areas of persistent woodlands. Persistent woodlands are an ecological condition, irrespective current observed “fire condition class”, where site conditions and disturbance regimes are inherently favorable for PJ, and where trees are a major component of the vegetation unless recently disturbed. These woodlands do not represent twentieth century conversion of formerly non-wooded vegetation types, but are places where trees have been an important stand component for several hundred years.154
- In areas where sagebrush is prevalent or where cheatgrass is a concern, utilize mechanical methods rather than prescribed fire.
- Apply appropriate seasonal restrictions for implementing management treatments consistent with the types of seasonal habitats present.

153 Meinke et al.2009.

154 Romme et al. 2008.

#### d. Wildfire Operations

Wildfires present a huge threat to sage grouse ecosystems - between 2000 and 2012, over 2 million acres of GRSG habitat in the planning area were affected by wildland fire, and the threat of future wildfires are discussed in the DEIS.155

As discussed in Section 3 c of these comments, the best and most prudent approach is to protect and preserve existing sage grouse habitats as opposed to being in the position of restoring or replacing damaged or lost habitats.

Fire suppression activities should be aggressive and aimed at minimizing acres burned. Protecting sage grouse habitats should generally rank above protection of human property and always behind protection of human lives.

#### e. Recreation and Travel Management

Although specific work addressing effects of roads, trails, and OHV use on sagebrush habitats and sage-grouse has not been conducted, research suggests common effects including habitat loss and fragmentation, invasive plant spread, induced displacement or avoidance behavior, creation of movement barriers, noise, and direct encounters.<sup>156</sup> Reducing the extent and influence of roads and trails can be incorporated into near-term and long-term plans for consolidating, conserving, and improving priority habitat areas. The impacts of roads and other surface occupancy on grouse and their habitat needs are covered in Section 2 of these comments, and form the basis for our management recommendations.

Some non-inclusive examples of the motorized recreation threat to sage grouse could be useful and informative and are now provided.

In the late-2000s the U.S. Forest Service conducted travel management planning on its administrative units in Nevada. The Center and other concerned groups and individuals raised the issue of conflicts and adverse impacts on sage grouse from such a public land use. The result demonstrated a general lack of concern by the Forest Service. In its final decisions, the Forest Service<sup>157</sup> allowed the following:<sup>158</sup>

<sup>155</sup> DEIS, Chapter 3.7.

<sup>156</sup> Knick, S.T., Hanser, S.E., Miller, R.F., Pyke, D.A., Wisdom, M.J., Finn, S.P., Rinkes, E.T., and Henny, C.J.,

2011, Ecological influence and pathways of land use in sagebrush, in Knick, S.T., and Connelly, J.W., eds., Greater Sage-Grouse: ecology of a landscape species and its habitats: Berkeley, Calif., University of California Press, Cooper Ornithological Union, p. 203–252.

<sup>157</sup> In this case the Humboldt-Toiyabe National Forest

<sup>158</sup> See decision documents at:

<http://www.fs.usda.gov/wps/portal/fsinternet/projects/htnf/landmanagement/projects?sortby=1&archive=1>

- On the Ely Ranger District, 79 miles of open motorized routes were allowed within 2- miles of an active lek. There were minimal seasonal closures.
- On the Austin and Tonopah Ranger Districts, 240 miles of open routes were approved in nesting and brood-raising areas, including 24 miles within .5 km of active leks. There were minimal seasonal closures.
- The Bridgeport Ranger Districts (partly in California and all within Bi-state sage grouse areas) left open 719 miles of routes in nesting and brood-raising areas, including 388 miles that “pass through leks”. There were minimal seasonal closures.
- The Mountain City, Jarbridge and Ruby Mountain Ranger Districts left open 146 miles in nesting areas, including 24-miles that came within .5 miles of an active lek. These districts did identify 86 miles of open routes to be seasonally closed to benefit sage grouse.

Management Prescriptions:

#### i. Management inside SGCAs in sage grouse habitat

- All travel must be on designated open roads and trails, subject to seasonal restrictions.
- Seasonal restriction should include the periods of courtship, nesting and early brood raising, as well as times when the grouse are on wintering habitats.
- No new trail construction within 7.6 km of active leks.
- Close existing trails and roads to achieve an open road and trail density not greater than 1 km/km<sup>2</sup>.<sup>159</sup>
- During travel management planning evaluate the closure of secondary and primary roads in the SGRA.
- Seasonally prohibit camping within 7.6 km of active leks.
- Allow no commercial or special use permitted activities in SGRAs unless there is a demonstrated beneficial affect for the grouse.

## ii. Management outside SGCAs in sage grouse habitat

- All travel must be on designated open roads and trails, subject to seasonal restrictions.
- Seasonal restriction should include the periods of courtship and nesting, as well as times when the grouse are on wintering habitats.
- No new trail construction within 6.4 km of active leks.
- Seasonally prohibit camping within 6.4 km of active leks.

## f. Mineral Development

The impacts from the various minerals development activities – fluid, coal, locatable, leasable and sand and gravel have been amply documented in by Connelly, Naugle and others and have been cited elsewhere in our comments.<sup>160 161</sup> While the impacts are much akin to those of energy development, on-the-whole they involve much greater human presence and activity and noise, and hence have a much greater impact on the grouse.

159 Knick et al. 2013.

160 Connelly et al. 2011a

161 Naugle et al. 2011.

In addition, we wish to highlight a few of the examples.

Energy development can cause radical changes to sagebrush ecosystems. Analysis of oil and gas developments found cases where such lands contained twice as many roads and power lines and the density of development far exceeded the grouse's threshold of tolerance. <sup>162</sup>

Energy development and its related infrastructure impacts grouse in many ways, both direct and indirect, cumulatively and synergistically.

Males and females may abandon leks if repeatedly disturbed by raptors perching on power lines near leks, by vehicle traffic on nearby roads, or by noise and human activity associated with energy development. Collisions with power lines and vehicles and increased predation by raptors may increase mortality of birds at leks. Roads and power lines may also indirectly affect lek persistence by altering productivity of local populations or survival at other times of the year. Sage-grouse mortality associated with power lines and roads occurs year-round, and artificial ponds created by development that support breeding mosquitoes known to vector West Nile virus elevate risk of mortality from disease in late summer. Sage-grouse may also avoid otherwise suitable habitat as development. Impacts from well sites to leks were still evident out to 6.4 km from the well.<sup>163</sup>

Sage-grouse in the Powder River Basin were 1.3 times less likely to use otherwise suitable winter habitats that have been developed for energy (12 wells/4 km<sup>2</sup>), and avoidance was most pronounced in high-quality winter habitat with abundant sagebrush.<sup>164</sup>

Blickley found in a treatment-control paired study that there was an immediate and sustained decline in male grouse attendance on leks subjected to human noise associated with well sites (29% decline on drilling noise leks and 73% decline on traffic noise leks relative to paired non- noise leks) and evidence of similar declines in female attendance.<sup>165</sup>

As reported in the Sage-Grouse Recovery Alternative,

162 Ibid.

163 Ibid.

164 Doherty et al. 2008.

165 Blickley et al. 2012.

“A new study commissioned by the Bureau of Land Management has exposed major difficulties with the agency's current approach to sage-grouse conservation in the Powder River Basin, a region that is heavily developed for gas and oil. The study indicates that an increasing density of coalbed methane wells and conventional oil and gas wells coupled with an outbreak of West Nile virus could cause "functional extinction" of sage-grouse in the Powder River Basin. Under such a scenario, modeling predicts that 370 active leks known today in the Basin would be reduced to only six (Taylor et al. 2012). The authors estimate that 27 percent of the pre-development sage grouse population has already been lost as a result of heavy coalbed methane and conventional drilling in the Powder River Basin, and predicts that only 39 percent of the original population will remain when coalbed methane is fully developed (with up to eight wells per section) in the Basin, even in the absence of a West Nile virus outbreak (Taylor et al. 2012). The study also found that sage-grouse censused at large leks would be expected to decline by 70 percent from pre-development numbers as well spacing reaches 4 wells per square mile. Finally, effects of drilling on sage-grouse were noticeable out to 12.4 miles from leks, indicating that current core areas may not be large enough to conserve and recover the species (Taylor et al. 2012).”<sup>166</sup>

#### Management Prescriptions:

##### i. Management inside SGCAs in sage grouse habitat

- Close/find unsuitable/withdraw all unleased or available areas to fluid, solid, locatable or salable mineral leasing.<sup>167</sup>
- Upon expiration or termination of existing leases, do not re-lease the area.
- Only allow geophysical exploration activities by helicopter portable drilling methods in accordance with appropriate seasonal and timing restrictions.
- Ensure that with any new leasing do not contribute to a total human disturbance exceeding 3% per section of that area.
- In existing leased and permitted areas, apply a 10 km non-surface occupancy around active leks and limit permitted disturbance to 1 per section and no more than 3% surface disturbance per section.
- Apply best management practices to minimize surface disturbing activities.
- Implement courtship, nesting, early-brood rearing and winter seasonal and timing restrictions for all human activities.
- Avoid the surface disposal of produced water<sup>168</sup> unless it can be proven to be beneficial to sage grouse and includes measures to preclude the spread of West Nile virus.

##### ii. Management outside SGCAs in sage grouse habitat

- Apply a 10 km non-surface occupancy around active leks and limit permitted disturbance to 1 per section and no more than 3% surface disturbance per section.
- Apply best management practices to minimize surface disturbing activities.
- Implement courtship, nesting, early-brood rearing and winter seasonal and timing restrictions for all human activities, including exploration.
- Avoid the surface disposal of produced water unless it can be proven to be beneficial to sage grouse and includes measures to preclude the spread of West Nile virus.

**Comment Excerpt Text:**

The use of anecdotal information included in the “Sage-Grouse ESA Species Listing Form” is also non-compliant with U.S. DOI Information Quality Guidelines Section II:4 (a) and (b). The following statements under the “Population Estimates/Status” heading exemplify a reliance on anecdotal evidence, which is not “sound and objective scientific practices” or “standard and accepted methods” as required by U.S. DOI Information Quality Guidelines Section II: 4 (a) and (b).

“Estimates of greater sage-grouse abundance were mostly anecdotal prior to the implementation of systematic surveys in the 1950’s (Braun 1998, p. 139). Early reports suggested the birds were abundant throughout their range, with estimates of historical populations ranging from 1,600,000 to 16,000,000 birds (65 FR 51580). However, concerns about extinction were raised in early literature due to market hunting and habitat alteration (Hornaday 1916, pp. 181-185). Following a review of published literature and anecdotal reports, Connelly et al. (2004, ES-1-3) concluded that the abundance of sage-grouse has declined from pre-settlement (defined as 1800) numbers. Most of the historical population changes were the result of local extirpations, which have been inferred from a 44 percent reduction in sage-grouse distribution described by Schroeder et al. 2004 (Connelly et al. 2004, p. 6-7).

The previous passage is contradicted with the following under “Population Trends”:

“Although population numbers are difficult to estimate, the long-term data collected from counting males on leks provides insight to population trends. Periods of historical decline in sage-grouse abundance occurred from the late 1800s to the early 1900s (Hornaday 1916, pp. 179-221; Crawford 1982, pp. 3-6; Drut 1994, pp.2-5; Washington Department of Fish and Wildlife 1995; Braun 1998, p. 140; Schroeder et al. 1999, p. 1). Other noticeable declines in sage grouse populations occurred in the 1920s and 1930s, and then again in the 1960s and 1970s (Connelly and Braun 1997, p. 3-4; Braun 1998, p. 141). Declines in the 1920s and 1930s were attributed to hunting, and declines in the 1960s and 1970s were primarily a result of loss of habitat quality and quantity (Connelly and Braun 1997, p. 2).

Using estimates from the late 1800s-1950 are anecdotal and are therefore non-compliant with U.S. DOI Information Quality Guidelines Section II: 4 (a) and (b) because “Estimates of greater sage-grouse abundance were mostly anecdotal prior to the implementation of systematic surveys in the 1950’s.”

“Sage-Grouse ESA Species Listing Form” includes no data on one of the major “population(s) addressed by an estimate of applicable effects” which is the human population that will be affected by the data that would determine an ESA ruling for listing the greater sage- grouse for protection under the ESA. Data and information included in the form excludes an evaluation of the negative and positive condition of the human habitat that will be altered by decisions made using the “Sage-Grouse ESA Species Listing Form.” More comprehensive data is necessary to meet the U.S. DOI Information Quality Guideline’s requirements for

quality as

stated in Section II: 4: "With respect to influential scientific information disseminated by the Department, regarding analysis to human health, safety, and the environment, the Department will ensure to the extent practicable, the objectivity of this information by adapting the quality principles found in the Safe Drinking Water Act Amendments of 1996." These guidelines for quality data and information hold FWS and DOI accountable to regard "human health, safety and the environment" in influential scientific data. The current "Sage-Grouse ESA Species Listing Form" does not meet these criteria by excluding data that calculates the impact of the sage-grouse species on human health and safety. (e.g.: Bad land management decisions using this data could lead to fuel heavy forests which burn and release smoke into the air, which harms human health and safety. Removing grazing access to public lands will lead to a decrease in beef production, beef production profitability and will in turn lead to harms on human health and safety due to the lack of economic opportunity and so on...)

A comprehensive determination of the interconnected relationship that is mutually beneficial, between humans and sage-grouse must be included in the "Sage-Grouse ESA Species Listing Form" prior to listing decisions for sage-grouse under the ESA.

1-3

"USFWS determined that ...Factor D, "the inadequacy of existing regulatory mechanisms" posed "a significant threat to the Greater Sage-Grouse now and in the foreseeable future" (USFWS 2010) (emphasis added). The USFWS identified the conservation measures in LUPs as the principal regulatory mechanisms for the BLM and Forest Service."

Comment:

USFWS did not state that BLM lacked regulatory mechanism to protect sage-grouse habitat under existing RMPS. The USFWS stated the BLM failed to provide them with data to prove they can protect and monitor sage-grouse habitat. This difference is significant.

Under Alternative A (existing management), the agencies have complete authority to standardize monitoring and implement defensible monitoring. Monitoring is already specifically required BLM and US Forest Service rules and regulations.

BLM should concentrate on promoting and then protecting native predators to enable natural control of the wild-horse population on the range. A puma, bear, wolf, and coyote-protection program should be implemented. BLM should work with the Idaho Department of Fish and Game and the Montana Department of Fish, Wildlife and Parks to prohibit hunting of predators in the Sub-Region. Concerned livestock operators should be advised to use guardian-dogs to protect their animals. There are several specialty breeds that have been developed just for this purpose, and they are reportedly effective. It's just the cost of doing business on public lands, where the grazing is cheap.

Alternative E's plan for Infrastructure development again allows BLM to focus its resources on the most important habitat, which allows greater flexibility for economic development and growth in less important areas. While very little development has occurred within CHZ in the last ten years, or that BLM has disclosed in the document, there does not appear to be any new infrastructure projects on the horizon. Based on the actual impacts of this threat, Alternative E provides a more properly tailored approach specific to Idaho than Alternative D. In CHZ, infrastructure is generally prohibited, unless a project proponent can meet several stringent criteria including compensatory mitigation. These criteria are likely to ensure infrastructure projects do not adversely impact the species in CHZ. In contrast, Alternative B does not provide an exemption process and as suggested above by emails discussing the NTT Report, may restrict beyond BLM's authority.

**Comment Excerpt Text:**

Perch discouragers were originally designed to reduce raptor electrocutions by moving birds from an unsafe (electrocution risk) perching location to a safer alternative, either on the same structure or an alternate structure located nearby. Recent data has documented poor effectiveness in perch discouragers and greater effectiveness of covers for preventing electrocutions (see Suggested Practices for Avian Protection on Power Lines: The State of the Art in 2006 (APLIC 2006), pages 17 -18). Despite their declining use by electric utilities, perch discouragers have been installed in attempts to dissuade raptors and corvids from perching or nesting on power poles in areas with sage-grouse or other sensitive prey species. Perch discourager research has shown limited effectiveness in preventing perching, potential for increased nesting on discouragers, and increased electrocution risk associated with perch discouragers. In areas where raven predation on sage-grouse nests is a concern, perch discouragers may aid in the accumulation of nest material (APLIC 2006), and could potentially increase raven predation pressure due to nest construction on discouragers in sensitive areas. The negative impacts of perch discouragers must be weighed against the limited benefits they may provide, particularly if they are contributing to mortalities of protected birds and facilitating increases in predator nesting populations. The avian predators of sage-grouse should also be considered, as different species exhibit different hunting strategies, and employ different hunting techniques for different prey species. For example, golden eagle diet is largely mammalian (80-90%, Kochert et al. 2002). Golden eagle hunting behavior of sage-grouse is not accurately represented in the DEIS. Golden eagles prey on sage-grouse opportunistically, and typically hunt sage-grouse by stooping from a high soar or low, coursing ambush flight (Watson 1997, Kochert et al. 2002). Consequently, power poles may not play an important role in eagle predation of sage-grouse. Golden eagles are vulnerable to electrocution mortality (APLIC 2006) and perch discouragers have been correlated with increased eagle electrocution risk (PacifiCorp, in prep.). Common ravens are known predators of sage-grouse nests, yet ravens are able to overcome perch discouragers and may experience higher nesting rates on poles with perch discouragers.

Within priority sage-grouse habitats, the agencies should act immediately to bring all planning areas into compliance with rangeland health standards. The DEIS reveals that 61 allotments in this subregion are currently not meeting rangeland health standards, including over a million acres in priority habitat and several hundred thousand more acres in general habitat. DEIS at 3- 73.

---

**Comment Number:** IDMTSG-14-0053-1**Organization1:**Hagenbarth Livestock**Commenter1:**Jim Hagenbarth**Comment Excerpt Text:**

The Draft LUPA/EIS identifies different categories of habitat based on importance and this helps to develop management strategies that consider impacts by different land uses. The BLM and USFS do not have the authority to manage private and state lands, but impact these land management entities because much of the sagebrush landscape is used by public grazers whose economic sustainability is dependent on public grazing leases. Many of the grazing units are made up of intermingled ownerships that are manageable as a unit, but dysfunctional if managed separately. The sole entity that manages all the ownerships holistically is the public land grazer and he is the focus of the attempted listing to start with. The plaintiffs have no resource management plans that are workable, nor does the court, the Idaho Fish & Game or the USFWS. The huge pressures of developing infrastructure to satisfy the economic and social needs of the consumer makes it difficult to design collaborative plans that work. The LUP/EIS generally addresses fragmentation from a land use perspective, and not a land ownership point of view. There are many different kinds of fragmentation, but the most detrimental is the fragmentation of ownership which makes it very difficult for the managing entities to reach agreement on management strategies that enhance the resource. As regulations are developed to address management of landscape fragmentation, it is important that the agencies recognize the impacts of their regulations on the economic sustainability of the public grazer that holistically manages the landscape as a unit. The public generally does not understand this concept. LUP goals of enhancing the landscape will be hard to implement if the public land grazer is lost. The risk to the GRSG and its habitat is huge if landownership fragmentation is not a major consideration in developing the LUP/EIS alternatives

---

**Comment Number:** IDMTSG-14-0102-8

**Organization1:**NRCS

**Commenter1:**Pamela Dugan

**Comment Excerpt Text:**

Based on local media reports, it is our understanding that BLM and USFS intend to combine Alternatives D and E into a single proposed action in the Final EIS. NRCS encourages BLM and USFS to favor livestock grazing management actions in Alternative E over those in Alternative D when formulating the proposed action. Alternative E does more to ensure the persistence of large, intact range lands necessary for sage-grouse by allowing for the continuation of existing grazing management if habitat characteristics and populations are being maintained. This will help keep livestock producers in business while providing sage-grouse habitat on their operations. Alternative E also allows BLM and USFS to provide more flexibility in grazing management. Such flexibility could benefit sage-grouse as well as producers by allowing adjustments to grazing in response to changing range conditions.

As related to livestock grazing, it is obvious the U.S. Fish and Wildlife Service relied very little, if any, on the federal grazing regulations, especially 43 CFR Subpart 4180, in making their determination that BLM lacked an adequate regulatory mechanism to protect sage grouse. The law is very specific in stating "The authorized officer shall talstart of the next grazing year upon determining that existing grazing management needs to be modified to ensure that the following conditions exist.. .. (d) Habitats are, or are making significant progress toward being, restored or maintained for Federal threatened and endangered species, Federal Proposed, Category 1 and 2 Federal candidate and other special status species." Because of the clarity of the law in providing a regulatory mechanism to insure perpetuation of sage grouse habitat, the need to include matters relating to grazing within any of the action altematives is not warranted.

**Comment Excerpt Text:**

By the mid 1900s, Federal and State regulations were implemented and all of the grazing management practices discussed above were controlled and moderated. The greater sage-grouse population sizes moderated at about the same time. By the late 1960s, livestock numbers and grazing levels were significantly scaled back across the west, and predator control programs were largely curtailed. Fire fuel levels increased, and the incidence of large-scale wildfires rose exponentially. Greater sage-grouse population trends reversed and started to rapidly decline during the same period. Thus, intensive livestock management which diminished the frequency and size of wildfires, and concerted predator control which greatly reduced greater sage-grouse losses to these killers, are management actions in the Great Basin that seem to be highly relevant to the biology of the greater sage-grouse and help explain the trajectory of their populations over time. Returning to these practices would benefit greater sage-grouse.

**Comment Excerpt Text:**

The Idaho/SW Montana Draft LUP/EIS (plan) identifies 7,266,502 acres and 963,016 acres of preliminary priority habitat (priority habitat) administered by BLM and Forest Service, respectively, in the planning area (total: 8,229,518 acres) (vol 1, ES-3, Table ES-1). However, the preferred alternative would only designate 6,819,100 acres of priority habitat, plus an additional 1,348,100 acres of medial habitat (total: 8,167,200 acres) (vol 1, ES-13, Table ES-4; vol 2, 2-98, Table 2-18, D-SSS-1).3 Annual updates to the Idaho Sage-Grouse Habitat Planning Map may lead to adjustments in priority and medial habitat areas(?) (vol 2, 2-67). Medial habitat would have some level of development or disturbance that may impact sage-grouse, but still provides better quality habitat than general habitat areas (ES-15).

---

**Comment Number:** IDMTSG-14-0169-36

**Organization1:**Defenders of Wildlife

**Commenter1:**Mark Salvo

**Comment Excerpt Text:**

Prohibit new surface disturbance in priority sage-grouse habitat. Where new disturbance cannot be avoided (e.g., due to valid existing rights), (A) minimize impacts by limiting preexisting and permitted disturbance to one instance per section of sage-grouse habitat regardless of ownership, (B) with no more than three percent surface disturbance per section or priority area (SGNTT 2011: 8; Knick et al. 2013). Disturbances include but

are not limited to highways, roads, transmission lines, substations, wind turbines, oil and gas wells, heavily grazed areas, range developments, severely burned areas, pipelines, landfills, mines, and vegetation treatments that reduce sagebrush cover. (C) Where possible, buffer active sage-grouse leks against surface disturbance or occupancy by 4 miles<sup>4</sup> (SGNTT 2011: 23).

The management agencies would require no net unmitigated loss of priority habitat instead of a cap on surface disturbance (vol 2, 2-65; vol 2, 2-100, Table 2-18, D-SSS-3).

**Comment Number:** IDMTSG-14-0169-49

Alternatives C and F

Livestock Grazing Management: Closing or reducing livestock grazing within sage-grouse habitat removes a wildfire fuel management tool. Sustainable grazing where cattle are rotated, etc. is an effective management tool when monitored to ensure cattle are not overgrazing. This is particularly true on Saylor Creek Bombing Range where the BLM manages livestock grazing.

**Comment Number:** IDMTSG-14-0206-29

**Organization1:**The Nature Conservancy

**Commenter1:**William Whelan

**Comment Excerpt Text:**

The Conservancy supports a basic approach to grazing management that is both simple and sound. It calls for sage grouse objectives to be written into relevant federal land use plans and grazing permits. These objectives are derived primarily from Connelly et al (2000). As the permits are renewed and re-issued, they must include grazing systems designed to meet the habitat objectives. We think this requires the timely application of Standards 2, 4 and 8 of Idaho's Standards and Guidelines for Rangeland Health at the time new permits are issued. Most significantly, permits must employ grazing management that provides "adequate residual nesting cover" – which studies referenced in the Draft Alternative define as seven inches of herbaceous perennial grass height at the end of the breeding season.<sup>1</sup> Decisions should be based on monitoring conducted at a resolution sufficient to document habitat condition and local spatial and inter-annual variability

**Comment Number:** IDMTSG-14-0215-2

**Organization1:**Prairie Falcon Audubon

**Commenter1:**Julie Randell

**Comment Excerpt Text:**

PFA members are seeing heavy impacts from overgrazing in GRSG habitat due to continuing drought conditions on public land because responsible agencies, despite current GRSG management objectives, continue to allow grazing and trailing at normal to high stocking rates for entire seasons; as well as letting livestock graze burned allotments after wildfire with only two growing seasons of rest and recovery, thus greatly increasing invasive annual grasses and weeds.

**Comment Excerpt Text:**

Thank you for forwarding to me the Howe study concerning resource selection by nesting ravens. I quickly reviewed that study, and find it not particularly informative or helpful concerning our situation.

That study was conducted on the INL and looked at low voltage transmission lines with very short towers, 15.2 meters to 21.3 meters. These are dwarfed by our high voltage transmission lines for Gateway, which towers are in the range of 50 to 60 meters tall. The Gateway towers will be equipped with nesting prevention devices if the BLM requests. Although it was not addressed, I can only presume that the shorter, older, wooden posts studied on the INL had no nesting prevention features.

The study noted, ravens are primarily scavengers, picking off dead animals and the like near roads and highways. The study did not look at the Sage Grouse as a food source for ravens.

Again, what this study has taught us is that it is not focused on the interaction between raven nesting on large, high voltage transmission lines, and Sage Grouse populations near those lines. The Nonne study is precisely on that point.

Wild horses and wild burros are protected by federal law under the Wild Free-Roaming Horse and Burro Act, the Federal Land Policy and Management Act and the Public Rangelands Improvement Act. Excerpts below:

1. public land in areas where wild horses and wild burros resided at the time the legislation was passed to be “devoted principally, but not necessarily exclusively to their welfare” (WFRHBA, 1971)

2. “considered in the area where presently found, as an integral part of the natural system of the public lands.” (WFRHBA, 1971)
3. “wild horses and burros shall be managed as self-sustaining populations of healthy animals in balance with other uses ” (FLPMA, 1976).

It has been noticed that within the proposed EIS, the description of wild horse and wild burro use, only sections of the Wild Free Roaming Horse and Burro Act (WFRHBA) that could be interpreted as restricting wild horse and burro use are included – omitting the basic premise words such as “protected, integral and principally”. When quoting FLPMA, only the section that could be interpreted as limiting wild horse and wild burro use are quoted yet the fact that FLPMA was not intended to reduce any existing premise of law, such as protection of wild horses and wild burros on public land. One example of the possible misrepresentation of the WFRHBA can be seen in this statement made within the EIS: “BLM and Forest Service policies and regulations also direct that wild horses and burros are to be managed as self-sustaining populations of healthy animals at minimal feasible levels”. The actual language of the Act is: “all management activities shall be at the minimal feasible level”. The statement made in the GSGPS limits wild horses and wild burros although the actual statement in the Act limits management. This error must be rectified in the final proposal.

**Commenter1:** Eileen Hennessy

**Comment Excerpt Text:**

Moreover, when attempting to justify any plans to restrict wild horse/burro use of public lands and resources, the agency conveniently chooses to misquote or “misinterpret” passages from Federal Land Policy and Management Act (FLPMA) and the Wild Free-Roaming Horse and Burro Act to suit this end such as slyly omitting significant words to describe wild horses and burros like “integral” or “protected”, which they most certainly are but which the BLM seems to have forgotten, all in an attempt to shirk their responsibility to fulfill a federal mandate to protect these national treasures on our public lands. For example, on page 62 of Chapter 3, compare the following:

BLM MISQUOTE in EIS: “BLM and Forest Service policies and regulations also direct that wild horses and burros are to be managed as self-sustaining populations of healthy animals at minimal feasible levels.” A misquoted statement in the GSGPS allowing for the limiting of wild horses.

ACTUAL QUOTE of the Act: “All management activities shall be at the minimal feasible level.” An ACTUAL statement limiting management.

Table 2-18 is not very helpful for making comparisons of management actions between Alternatives. Table 2-18 contains many blank "placeholders" where management actions do not perfectly align across Alternatives or apply to all the various habitat types. There are also a number of management actions that are similar across Alternatives, but listed as though they are different because they are worded in a slightly different way. For the Final EIS, a Summary Table, organized by planning issue, with a list of the management actions in each Alternative would be more useful.

**Comment Number:** IDMTSG-14-0157-7

**Organization1:** Y-3 II Ranch

**Commenter1:** Christopher Clark

**Comment Excerpt Text:**

As noted in the introductory comments, Y -3 II straddles the Idaho and Nevada border and operates a single ranching entity to coordinate grazing on BLM allotments in both states. BLM, however, states in the Nevada DEIS that planning for the land use plans covering this part of both Idaho and Nevada will occur through the Nevada FEIS and Record of Decision but will be implemented and administered through the Jarbidge and Burley FEIS and Record of Decision. See Nevada DEIS Section ES.2. Additionally, the decisions and analyses for that portion of Y-3 II's allotments in Nevada will occur through the Nevada DEIS and will end at the Nevada state line apparently leaving decisions and analysis for Y-3 II's ranch operations north of the Nevada border to the Idaho DEIS. Id. This is confusing because just a few sentences earlier it is stated that planning for both Idaho and Nevada land use plans will occur through the Nevada DEIS. Id. Thus, within a few short sentences it is unclear how the lands utilized by Y-3 II in Nevada and Idaho are being analyzed, decided, implemented, and administered. If read correctly, it appears that actual management decisions are being made in each state's DEIS, but that Idaho will administer both Idaho's management decisions and Nevada's management decisions as they relate to Y -3 II. Consequently, Y -3 II must analyze and comment on both the Nevada and Idaho DEISs. Y -3 II also notes that this bifurcation of planning and management processes, while at least addressed by the Nevada DEIS, is not addressed in the Idaho DEIS as it should be.

12 The DEIS is also internally inconsistent, as to what BLM is proposing. In one place it states that it relates only to Forest Service decision making (implying BLM is not proposing any specific plan amendments) (DEIS at 5), and in another stating that "the BLM is proposing to amend the Battle Mountain/Tonopah Resource Management Plan (RMP) and the Carson City Field Office Consolidated RMP by adding to or changing some of the regulatory mechanisms to reduce, eliminate, or minimize threats to the Bi-state sage-grouse habitat on Federal lands administered under those plans" (DEIS at 1). This fundamental inconsistency also renders the DEIS inadequate as an informational document.

"The County Plan encourages the federal agencies (BLM and Forest Service) to coordinate and maintain communication with the county and the counties' Natural Resource Advisory Committee. As part of this coordination the county requests documentation and research be available to support management decisions."

This statement should be corrected. The County Plan "requires" the federal agencies to coordinate its plans

and policies as directed under the appropriate federal statutes. The Plan requires coordination with the Board of Commissioners. The Natural Resource Advisory Committee's purpose is to advise the Commissioners. All official communication should be with the Commissioners. The County Plan does more than request documentation and research, but requires that all policies of the federal and state agencies be coordinated with the County for the purpose of ensuring a comprehensive approach to greater sage-grouse management

CC Plan

Page 19

"A. The sage-grouse habitat in Custer County is found in narrow valleys and is naturally fragmented with non-sagebrush shrubs, meadows, mountains and conifers in the Plan Area. It is unlike most of the habitats studied, which contain vast expanses of contiguous sagebrush, and for which most conservation strategies are designed. Additionally, the population is currently static or increasing, and has been on a slight uptrend for the past twenty-five years. Because the Custer County population of sage-grouse is one of the most stable

populations range wide, it is essential that all policies and conservation measures recognize that current management activities are benefiting the species and that changes or additions, if any, to these be developed utilizing the detailed knowledge of local conditions and expertise."

Custer County Principle A is not referenced in the DEIS. It is consistent with Alternative A and inconsistent with Alternatives B-E.

The voluntary grazing permit retirement provisions in Alternatives B and F also require that land managers “[a]nalyze the adverse impacts of no livestock use on wildfire and invasive species threats (Crawford et al. 2004) in evaluating retirement proposals” (vol 2, 2-137, Table 2-18, D-LG/RM-7, F-LG/RM-7). While this provision was included in the NTT report and could rightly be included in Alternative B, it was not included in the Sage-Grouse Recovery Alternative. (It is interesting that the stipulation is also not included in the preferred alternative). We request that this stipulation be removed from Alternative F and not be added to the preferred alternative. Alternatively, if this provision is included in either alternative, we request that planners also be required to analyze the beneficial impacts of eliminating livestock grazing in sage-grouse habitat on sage-grouse ecology; native vegetation, including species composition and structure; biological crusts and soil retention; restoration and resiliency of riparian and upland habitats; plant and animal abundance and diversity; water infiltration, and water quality and quantity; and climate change

**Comment Excerpt Text:**

Measures for ameliorating the effects of climate change on species and landscapes include increasing the size and number of protected areas, maintaining and enhancing connectivity between protected areas, and identifying and protecting areas likely to retain suitable climate/habitat conditions in the future (even if not currently occupied by the species of concern). Management should also repulse invasive species, sustain ecosystem processes and functions, and restore degraded habitat to enhance ecosystem resilience to climate change (Chester et al. 2012; NFWPCAS 2012). The plan identifies climate change, specifically its contributions to the spread of cheatgrass and associated loss of sagebrush habitat, as a planning issue (vol 1, ES-7), but contends there “is no resource program for addressing this threat to [sage-grouse]” (vol 2, 2-5, Table 2-1). The plan claims to address the cumulative effects of climate change in section 4.15 (which is, unexpectedly, titled “Social and Economic Conditions (Including Environmental Justice”), but there is little discussion of the impacts of climate change in this section or anywhere in the plan.

The preferred alternative would generally attempt to increase the quality, extent and connectivity of sage-grouse habitat, “where possible, to accommodate the future effects of climate change” (vol 2, 2-97, Table 2-17, D-OBJ-10).

**Comment Excerpt Text:**

Pg. 4-8, 3rd bullet point

Assumption

Interstate highways at 4.7 miles (7.5 kilometers) and paved roads and primary and secondary routes can cause impacts at 1.9 miles (3 kilometers) based on indirect effects measured through road density studies (Connelly et al. 2004; Holloran 2005; Lyon 2000).

Connelly et al. (2004) stated that lekking and nesting sagegrouse *appear* (italics added) to avoid road infrastructure and related activities (especially traffic). Along Interstate 80 in Wyoming and Utah between 1970 and 2003, observers found no leks within 2 km (1.25 mi) of the interstate and fewer birds on leks within 7.5 km (4.7 mi) than within 7.5–15 km (4.7–9.3 mi) beyond the interstate. However, this is a post-hoc study and only the temporal relationship between leks and distance to the interstate were investigated, not the myriad of other changes that took place in the landscape. Therefore, IPC suggests that the conclusions as stated in the LUPA/DEIS should acknowledge the shortcomings of the study of Connelly et al. (2004) and restate the conclusions of this study accordingly.

**Comment Excerpt Text:**

BLM failed to state why further restrictions on infrastructure are necessary in the Great Basin region. Under existing RMPs, no large scale infrastructure has been built in CHZ. In fact the only potential project, known as the China Mountain Wind Energy project's EIS was put on hold, despite creating a sage-grouse conservation plan, an off-site mitigation plan with 1:3 and 1:5 ratios of acres lost and acres restored. This project is currently on hold. Another more recent example is the Gateway West Transmission project. The current proposal recommends building on private land to avoid what Alternative E maps as primarily IHZ, but is identified as PPH for BLM. This shows that existing regulations for site specific NEPA analysis works for restricting infrastructure development in the most important sage-grouse habitat in Idaho, and may already be overly restrictive. Yet, BLM does not address what existing infrastructure impacts on sage- grouse are and what, specifically, its regulations in Idaho are lacking.

To address our concerns, we are recommending that the Final LUPA FEIS identify an Environmentally Preferable Alternative, provide additional information to support evaluation of the conservation plan according to the USFWS's Evaluation Criteria for Conservation Plans, and, provide additional information to readily compare the action alternatives' population effects.

***Summary***

The FEIS needs to identify an Environmentally Preferred Alternative, evaluate the plan according to the USFWS's Evaluation Criteria for Conservation Plans, and provide a summary comparison of the population effects under each alternative.

***Response***

1. FEIS will identify an Environmentally Preferred Alternative per CEQ regulations.

2. NOTE TO BLM: Is there a requirement to evaluate the plan (assuming Proposed Plan) to the USFWS's Eval Criteria? Is this something that may be done as part of the agreement with USFWS? If not, should include rationale for why not.
3. May already be included in the Summary of Impacts table at the end of chapter 2. If so, include reference to this for the reader.

I urge BLM to publish the number of persons that respond to the Draft EIS. Show that you value every response on its own merits rather than labeling some as "form letters." The Constitution provides for the right of citizens to petition the Government for a redress of grievances. The Constitution does not require each complainant to formulate a unique letter. Indeed, the very word "petition" connotes a document that multiple parties sign in agreement and solidarity regarding a particular issue. At court, there are even class-action suits, wherein many plaintiffs join together to seek justice regarding a matter of mutual concern. One action, many parties.

BLM should just state the facts:

- How many persons responded to the Draft EIS,
- How many and what percentage favored each alternative course of action and why,
- What different alternatives were proposed, and
- What modifications, corrections, improvements could BLM make per the public input.

#### ***Summary***

BLM needs to publish the statistics for people that provided comment letters on the Draft EIS, as well as the comments, their responses, and changes made to the document in the FEIS .

#### ***Response***

Index of parties, comments, and responses will be provided in the FEIS. Changes made to the EIS will be noted [NOTE TO BLM: how did you want to show the changes? Grey highlight, strike out, etc.?]

**Organization1:**Central Idaho Rangelands Network (CIRN)

**Commenter1:**Aaron Harp

**Comment Excerpt Text:**

The restrictions needed to maintain 65% of the birds, as proposed by the Idaho Office of Species Conservation may well fall to our region as we have reduced levels of many primary threats to sage grouse populations such as wildfire, habitat fragmentation, cheatgrass, energy and human infrastructures that the other regions have. If this population trigger is maintained will the remainder of the region look to us to maintain dwindling sage grouse populations? Under such an outcome, none of the Alternatives offer a specific remedy for us as ranchers. In such a case, one alternative is a third-party voluntary and permanent buyout of

permits. Another is the compensation of ranchers for supplying and improving habitat on allotments. Each of these is preferable to having the value of the permit fall to nothing due to restrictions or further AUM cuts and the fragmentation of land ownership into smaller parcels with uncertain management goals. We would like to see language supporting future agency and Congressional language legalizing such options for BLM permits included in the final decision.

To what extent can the BLM and FS set overmature sagebrush back to an early stage to intervene in the succession process to improve the grass/forb condition for hens and chicks? I believe this is the major policy decision you have to make. If succession is not identified as an issue, it will not be addressed in the alternatives, and if succession is not addressed in the alternatives it will not be addressed in the environmental consequences, and therefore will play no role in the decision making process to determine which alternative best meets the long-term survival of sage grouse. This is exactly what happened in your DEIS. Sage grouse was not identified as an issue, was not addressed in the alternatives, and was not addressed in the environmental consequences. This seems like a huge oversight since sagebrush is the primary habitat for sage grouse.

**Comment Excerpt Text:**

New Alternative Proposal

I hereby propose a new alternative, one that is focused primarily on creating a mosaic of species and age classes on the landscape. Direction in livestock grazing, wildfire management and predator control play a supporting role in accomplishing this goal.

A landscape is defined as an area of land over 100,000 acres with similar characteristics of climate, vegetation and geologic features. So, for example, a landscape might be the upper end of the Snake River drainage that receives more than 12 inches of rain per year.

1. Vegetation

The objective would be to, within the larger 100,000 acre landscape, focus on creating large openings (200 to 300 acres) in mature/overmature sagebrush, with smaller patches of sagebrush scattered through the open matrix. The small leave patches would be about 4 acres (400' by 400') which occupy about 10% of the total

area (so within a 200 acre treatment area there might be 5 - four acre patches; 10% x 200 acres is 20 acres; 20 acres divided by 4 acre patch = 5 patches). A large patch is needed to protect sage grouse from predators.

In addition, there would be even smaller patches of sage approximately 25' x 25' up to 50' x 50', accounting for say, another 1% of the larger 200 acre area, or some 50 of these smaller patches per treatment area. These would provide temporary protection from predators.

The rest of the sagebrush in the treatment area would be removed by mechanical treatment. If necessary, the area should be seeded with grass and forbs following treatment. Also, thick patches of slash may have to be piled and burned to remove the greater concentrations of fuel. Roughly 89% of the 200 acre treatment area would be cleared of vegetation.

Overall, 30% of the sagebrush community, on a landscape basis, should be seedling age, 40% immature sagebrush, and 30 % mature/overmature vegetation.

Remove DF and pinyon-juniper that are encroaching into sagebrush to increase the total amount of sagebrush available to sage grouse.

## 2. Wildfire

Fight all wildfire in grouse habitat as soon as it is detected in June, July and August, the hottest part of the fire season. This will preserve as much of the sagebrush as possible for sage grouse.

Use prescribed fire outside of the June – August period whenever the window of opportunity for controlled burning allows. This would occur as a general maintenance program to keep sagebrush in a usable condition for grouse. Pre-approve a number of prescribed fire projects to take advantage of short windows of opportunity to burn.

## 3. Predator Control

Use predator control while hens are sitting on eggs and until the chicks can hatch and fly; do this the season following the 200 acre treatment. This generally is a 3 to 4 week period. This gives the chicks a chance to hatch and grow to a point where they can fend for themselves. I envision 2-3 people with shotguns walking through the 200 acre area and blasting away at ravens, hawks, coyotes and anything else that might want to eat a sage grouse. It might be necessary to do this for 2 or 3 seasons following the treatment.

## 4. Grazing

Allow grazing on all occupied GRSG habitat in order to remove fine fuels and keep large concentrations of fuel from accumulating in the habitat.

Also use the Alan Savory method of “stomp and poop” grazing on dry sites (and other sites where appropriate) to concentrate cattle for a brief time (3 to 20 days).” Cattle excretion inoculates the soil with key bacteria and fungi that are awakened in the soil by the influence of dung and urine. This works especially well in cheatgrass-invaded areas. Native seedlings simply wait for the cheatgrass to die in summer. The native plants then act as a water-conserving , sheltering mulch that mature on summer and fall rainfall. The following spring cheatgrass seeds (if present) do not even germinate in the presence of native perennials and their allied native bacteria and fungi” (quote from Stephen H. Rich, president of Rangeland Restoration Academy in Salt Lake City; [steve@rangelandandrestoration.com](mailto:steve@rangelandandrestoration.com)).

## 5. Invasive Species

Implement noxious weed and invasive species control using integrated weed management in cooperation with State and Federal agencies, counties, and private landowners.

## 6. Internet Grouse Site

Create a nationwide grouse.com site where agency employees can post management practices they have tried and the result they had, good or bad. Other employees could visit the site to see what is working, and what is not. A sort of clearing house, so to speak, for what other employees are experiencing with adaptive management in sage grouse management.

**Comment Number:** IDMTSG-14-0046-5

**Organization1:**

**Commenter1:** Jim Gerber

**Comment Excerpt Text:**

There is a very small range between the alternatives, except for Alternative C, which eliminates all grazing. Otherwise, the alternatives all occur in a tight band that reflects little difference between them. For instance, there is only 1.4 million acres difference in GRSG habitat between the highest and lowest alternatives, out of 11.6 million acres total. This is only a 12% difference from best to worst. I doubt if that qualifies as a reasonable range of alternatives that produce feasible, distinct and implementable management scenarios that 1) address the full range of identifiable major planning issues, 2) explore opportunities to enhance management resources, 3) resolve conflicts between resources, and 4) meet the purpose and need for the LUPA.

**Comment Number:** IDMTSG-14-0050-15

**Organization1:**

**Commenter1:** Kathleen Gregg

**Comment Excerpt Text:**

Since the EIS is analyzing a plan that may significantly impact wild horse and burro management, providing for the protection of a viable wild population of wild horses and burros (a population capable of reproducing itself without human interference and the resources available to sustain that population) is not outside the scope of this document. The EIS is analyzing an all-inclusive management plan that will significantly impact protected wild horses and burros; as a result, I require all of these issues to be addressed in the final EIS.

**Comment Number:** IDMTSG-14-0050-16

**Organization1:**

**Commenter1:** Kathleen Gregg

**Comment Excerpt Text:**

All alternatives must include Animal Unit Months (AUMs) available for wild horses and burros to the extent that a genetically viable population of wild horses and/or burros may be sustained. A written format must be included in the proposed EIS that activates increases of AUMs for wild horses and/or burro herds if information becomes available that the population is at risk of genetic loss. A current population of 200,000 sage grouse has generated this massive sage grouse management EIS endangered species listing document and yet the BLM estimates that only about 40,000 wild horses and burros are on their legal land – and to further

underline the necessity of providing protection, independent estimates range near only 20,000 wild horses and burros on their legally designated land, much of which is fragmented below the accepted healthy genetic pool of at least 150 reproducing animals. Since wild horses and burros are managed only within the areas designated for their use, all alternatives must include language that protects wild horses and burros in any and all overlapping areas.

---

**Comment Number:** IDMTSG-14-0050-18

**Organization1:**

**Commenter1:**Kathleen Gregg

**Comment Excerpt Text:**

The EIS proposal must include:

1. Any alternative adopted must include language that provides guidance to all districts that wild horses and burros must be preserved above a level that allows appropriate genetic diversity.
2. Genetic diversity must be specifically defined.
3. Provisions that state that at no time should there be a reduction of current AUMs for wild horse and/or wild burro use. Wild horses and wild burros are currently managed at numbers less than 25% of that of the greater sage grouse. To reduce the numbers of wild horses and/or wild burros to accommodate protection of the sage grouse is not acceptable.
4. Provisions must be made to allow increases of AML/AUMs if data becomes available that demonstrates genetic viability of wild horses and burros is threatened.

As currently written and proposed, none of the alternatives within the EIS plan are acceptable. Although stated in the report that no direct change would occur to areas allocated as Herd Management Areas and Wild Horse and Burro Territories for wild horses and burros, all alternatives appear to restrict wild horse and burro use.

---

**Comment Number:** IDMTSG-14-0050-19

**Organization1:**

**Commenter1:**Kathleen Gregg

**Comment Excerpt Text:**

The proposed EIS must not combine animal unit months for privately owned domestic livestock with wild horse and burro animal unit months. Privately owned domestic livestock are “permitted” whereas wild horses and burros are designated by the 1971 Congressional law to use this public land. There is a big difference in these two uses and with the alternatives, as written, discretion given to districts actually creates a situation of contradiction that could result in discretionary interpretation district by district that would likely result in inconsistent management practices. Wild horses and burros have a legal land base of approximately 12% of BLM/FS managed land whereas private domestic livestock allotments exist on over 65% of that same base. To utilize the same equation to manage both uses is non-equitable under any of the proposed alternatives.

---

**Comment Number:** IDMTSG-14-0050-20

**Organization1:**

**Commenter1:**Kathleen Gregg

**Comment Excerpt Text:**

Providing for the safeguard of a viable population of wild horses and wild burros that is capable of reproducing without interference and the resources available to sustain that population is the law and is essential, critical and within the scope of this sage grouse EIS document. This proposed EIS is an all-inclusive management plan that will significantly impact legally protected wild horses and wild burros on their legally authorized land and thus is highly significant and must be seriously considered within this or any sage grouse protection plan.

**Comment Number:** IDMTSG-14-0108-10

**Organization1:** Western Range Service

**Commenter1:** Quinton J. Barr

**Comment Excerpt Text:**

Inexplicably, when responding to scoping comments the Draft LUPA EISs claim that analysis of greater sage-grouse population levels is beyond the scope of the project, stating that comments “questioned population levels and the need to incorporate rangewide conservation measures” and concluding that such concerns “relate to decisions under the purview of the USFWS and are not (will not be) addressed” by the Draft LUPA EISs. See ID Draft LUPA/EIS, page 1-33 and NV Draft LUPA/EIS, page 1~18. Thus, the Draft LUPA EISs irrationally conclude that the overriding purpose and need identified for the project is itself beyond the scope of the project. As a result of this irrational decision, the Draft LUPA EISs devote little or no effort to disclose, discuss, or analyze greater sage-grouse population levels, viability, or persistence

---

**Comment Number:** IDMTSG-14-0108-11

**Organization1:** Western Range Service

**Commenter1:** Quinton J. Barr

**Comment Excerpt Text:**

the Draft LUPA EISs apparently accept the erroneous FWS Findings that the greater sage-grouse is warranted for listing under the ESA without undertaking any critical examination of such findings, and then choose to ignore analysis of population levels and trends in favor of a focus on habitat conditions and trends without any consideration for how such habitat factors ultimately affect the grouse populations. Such approach fails to conform to the overriding purpose and need identified for the Draft LUPA EISs which is specifically tied to the desire to avoid listing the greater sagegrouse under the ESA.

---

**Comment Number:** IDMTSG-14-0108-2

**Organization1:** Western Range Service

**Commenter1:** Quinton J. Barr

**Comment Excerpt Text:**

Because the evidence shows that there is no need to list the greater sage-grouse under the ESA, none of the action alternatives evaluated by the Draft LUPA EISs are necessary or reasonable. The only alternative that is reasonable and rational as a final decision in this case is a true no action alternative that continues the land use plan direction that was in place before the BLM imposed interim sage-grouse conservation measures through the 2011 BLM IMs

---

**Comment Number:** IDMTSG-14-0108-3

**Organization1:** Western Range Service

**Commenter1:** Quinton J. Barr

**Comment Excerpt Text:**

The ID Draft LUPA/EIS ignores the NOI purpose and substitutes a different purpose that merely seeks to “conserve, enhance, and restore GRSG (greater sage-grouse) habitat by reducing, eliminating, or minimizing

threats to that habitat.” See ID Draft LUPA/EIS<sup>1</sup>, page 1-12. This substitution disregards the original purpose of the NOI that specifically ties the need for preparing the Draft LUPA EISs to the desire to avoid a potential listing of the greater sage-grouse under the ESA. However, the ID Draft LUPA/EIS implicitly acknowledges the NOI purpose and need by stating that this “effort responds to the USFWS’s 2010 Finding” (see ID Draft LUPA/EIS<sup>1</sup>, page 1-11).

---

**Comment Number:** IDMTSG-14-0108-5

**Organization1:** Western Range Service

**Commenter1:** Quinton J. Barr

**Comment Excerpt Text:**

Given that the overriding purpose and need identified by the NOI and Draft LUPA EISs specifically ties to the desire to avoid listing the greater sage-grouse under the ESA, the Draft LUPA EISs have a fundamental obligation to address the extent to which the greater sage-grouse populations meet the criteria of the ESA as an endangered species or as a threatened species under current land use plan management direction before proposing action alternatives to change such management direction. Both Draft LUPA EISs completely fail to meet this fundamental obligation. The Draft LUPA EISs contain virtually no information, discussion, or analysis regarding existing greater sage-grouse population levels anywhere within their range, so are unable to evaluate the extent to which the species meets the qualifications for listing under the ESA

Although no current banking systems exist in Idaho for sage-grouse, there are programs that could potentially provide benefit and regulatory certainty to landowners. These programs are currently available for sage-grouse, though none are listed in any of these alternatives. These programs need to be included in the final action selected for the LUPA. A short summary of these programs and how they work are discussed below.

**The Working Lands for Wildlife Program**

The Working Lands for Wildlife Program (WLFWP) was announced in September 2012 (USFWS, 2012; NRCS, 2012). This program is a partnership between NRCS and the USFWS. It was designed to create a long-term approach to help landowners take action to improve habitat for seven at-risk wildlife species. The sage-grouse is one of the species covered by this program. Landowners who participate in the program receive regulatory predictability from the USFWS should the at-risk species the landowner is helping become listed at a later date. This regulatory predictability can be for a term of up to 30 years.

WLFWP gains its authority through the conference report that was completed by the USFWS (USFWS, 2010). This report analyzes the impacts of NRCS's main conservation practices on sage-grouse. The report summarizes how NRCS practices can be implemented to not have adverse effects to sage-grouse. The WLFWP then uses these USFWS findings to develop conservation plans which, according to the conference report, will not have adverse impacts to sagegrouse.

The premise behind this voluntary program is for landowners to work with NRCS or Technical Service Providers to develop conservation plans on their agricultural operations to promote at-risk species conservation and habitat improvements. These plans, if followed, give the landowner the regulatory predictability that the USFWS has already analyzed the impacts of the conservation practices used in the conservation plan. This means that should the species become listed, any incidental take of the species through the approved conservation plan should be exempt through Section 7 of the ESA, if the landowner continues to follow the plan (USFWS, 2012). The regulatory predictability this provides could prove to be beneficial for agricultural operations within the sage-grouse range.

**Candidate Conservation Agreements with Assurances**

Candidate Conservation Agreements with Assurances (CCAAs) are a tool that is similar to the WLFW program. CCAAs are agreements between the USFWS and landowners that provide regulatory assurances on private lands. CCAAs are developed for a candidate species, like the sage-grouse, prior to listing. These agreements provide landowners, who voluntarily manage their lands to remove threats to candidate species, assurances that their conservation efforts will not result in future regulatory requirements above and beyond what they already agreed to do. This assures landowners that they can enhance or restore habitat, create new habitat, and take measures to minimize risk for candidate species while protecting themselves from future regulatory actions should the species become listed as threatened or endangered.

These assurances give landowners guarantees that they can continue to manage their lands as agreed to in the CCAA even after the species becomes listed. Other benefits include the opportunity for authorizations of incidental take through the section 10(a)(1)(A) process of the ESA. This section authorizes issuance of permits that would allow participants to incidentally take individual animals or modify habitat conditions as specified in the agreement.

There are two types of CCAAs available. One is an individual CCAA where a landowner enters into the

agreement directly with the USFWS. The second option is an umbrella CCAA where a larger document is developed with a local government or non-profit and then landowners sign onto this larger document.

The six alternatives presented in the Draft LUPA/EIS are quite complex and most of them extremely prescriptive on uses other than sage-grouse habitat. Chapter 2 needs to provide adequate technical discussion to provide a legitimate basis for the prescriptive elements of the Alternatives; otherwise, the Alternatives should be modified to be less prescriptive. For example, for some of the alternatives there is an absolute cap of three (3) percent on anthropogenic disturbance, but no basis for the derivation of that number. Several Alternatives (B, C, D, and F) tend to treat each potential threat with a “one-size fits all” prescription; that prescription usually is the prohibition of other uses of the federal lands of interest. Finally, it is difficult to determine the consequences on specific locations, as the information in the Draft LUPA/EIS is not detailed enough. Examples include the exact locations of PPMA, PGMA, etc. and the status of anthropogenic disturbances (%) for each area.

**Comment Excerpt Text:**

the greater sage-grouse is not faced with imminent extinction, or extinction in the foreseeable future, and therefore does not meet the ESA definitions to be listed as either endangered or threatened. Thus, there is no need to change current management direction or to amend land use plans (BLM RMPs or USFS LRMPs) to avoid a potential listing under the ESA. Because the evidence shows that there is no need to list the greater sage-grouse under the ESA, none of the action alternatives evaluated by the Draft LUPA EISs are necessary or reasonable. The only alternative that is reasonable and rational as a final decision in this case is a true no action alternative that continues the land use plan direction that was in place before the BLM imposed interim sage-grouse conservation measures through the 2011 BLM IMs.

So, what should be done? Western Range Service urges that the following actions be taken:

- 1] the BLM should issue Records of Decision in this case enacting a true no action alternative that repeals the 2011 BLM IMs and does not amend any land use plans;
  - 2] the BLM should press for a final FWS listing decision that confirms that the greater sage-grouse does not qualify for listing under the ESA for the reasons discussed herein;
  - 3] agencies should continue to monitor greater sage-grouse population numbers and trends within priority portions of its range, particularly within the southwest Wyoming Basin (a conservation priority, see FWS Findings6, page 1393), within the Owyhee Wilderness complex\* in Idaho, and within the Black Rock Wilderness/Sheldon National Wildlife Refuge complex\* [such wilderness/refuge areas already operate under regulatory mechanisms which minimize human disturbance and limit or prohibit development.] in Nevada, with the aim of implementing additional sage-grouse conservation and protection measures within any of these three areas if its population declines below 5,750 greater sage-grouse† [The population size at which the current rate of decline would result in numbers falling below the minimum effective population of 5,000 individuals within ten years.];
  - 4] efforts to conserve and enhance the Gunnison Sage-Grouse (presently about 5,000 birds) should continue in order to preserve their unique genetic characteristics; and,
  - 5] efforts to conserve and enhance the Bi-State population (presently about 3,000 birds) should continue in order to preserve their unique genetic characteristics.
-

**Comment Excerpt Text:**

Instead, the Draft LUPA EISs apparently accept the erroneous FWS Findings that the greater sage-grouse is warranted for listing under the ESA without undertaking any critical examination of such findings, and then choose to ignore analysis of population levels and trends in favor of a focus on habitat conditions and trends without any consideration for how such habitat factors ultimately affect the grouse populations. Such approach fails to conform to the overriding purpose and need identified for the Draft LUPA EISs which is specifically tied to the desire to avoid listing the greater sage-grouse under the ESA. Because the evidence shows that the greater sage-grouse does not qualify for listing under the ESA, as discussed herein, there is no need for further action.

In order to fulfill the overriding purpose and need, the Final LUPA EISs must evaluate whether the greater sage-grouse meets the criteria of the ESA as an endangered species or as a threatened species under current land use plan management direction.

**Comment Number:** IDMTSG-14-0157-8

**Organization1:** Y-3 II Ranch

**Commenter1:** Christopher Clark

**Comment Excerpt Text:**

Y-3 II is concerned that some of the action alternatives and management actions within those alternatives are actually more restrictive than would be found on BLM lands should Sage-grouse be listed as threatened or endangered. Under the ESA, private parties may apply for an incidental take permit and, pending satisfaction of permit criteria, receive immunity for the take of wildlife associated with the permitted activity. 16 U.S.C. § 1539. The ESA also contemplates the submission of a habitat conservation plan that would allow an activity applicant to demonstrate mitigation measures and other means of minimizing wildlife impacts. *Id.* At § 1539(a)(2)(A). Conversely, Alternative C, which will be analyzed in further detail below, completely precludes livestock grazing with no opportunity for incidental take permits, habitat conservation plans, or other mitigation opportunities and thus, in this respect, is more restrictive than the ESA. For this and other reasons, outlined below, adoption of Alternative C or portions of other alternatives that would be more restrictive than the ESA is completely illogical and inappropriate in responding to the Service's request for additional regulatory mechanisms to avoid a listing under the ESA.

BLM offices should ensure that implementation of any of the measures is consistent with applicable statute and regulation. Where inconsistencies arise, BLM offices should consider the conservation measure(s) to the fullest extent consistent with such statute and regulation.

IM 2012-044. Although the DEIS complies with the IM directive to include at least one alternative based on the conservation measures in the NTT Report, the DEIS fails to respond to the second directive as stated in the second paragraph above: “BLM offices should ensure that implementation of any of the measures is consistent with applicable statute and regulation.” The “NTT-Only” Alternative contains many land use restrictions and prohibitions inconsistent with the multiple use mandates in FLPMA and NFMA and rights under the General Mining Law.

---

**Comment Number:** IDMTSG-14-0159-18

**Organization1:**American Exploration and Minind Association

**Commenter1:**Laura Skaer

**Comment Excerpt Text:**

The DEIS fails to fully account for Federal regulatory mechanisms that are currently in place and are not only adequate to address the threats to the species, but are extremely robust. An example of the type of stipulations on mining operations that presently protect non-listed species and their habitat (in this case Wyoming), every Federal coal lessee is required to sign a stipulation from the BLM which says that:

“Special Stipulation 2. Threatened and Endangered Species (Wyoming BLM)

“The lease area may now or hereafter contain plants, animals, or their habitats determined to be threatened or endangered under the Endangered Species Act of 1973, as amended, 16 U.S.C. 1531 et seq., or that have other special status. The Authorized Officer may recommend modifications to exploration and development proposals to further conservation and management objectives or to avoid activity that will contribute to a need to list such species or their habitat or to comply with any biological opinion issued by the Fish and Wildlife Service for the proposed action. The Authorized Officer will not approve any ground-disturbing activity that may affect any such species or critical habitat until it completes its obligations under applicable requirements of the Endangered Species Act. The Authorized Officer may require modifications to, or disapprove a proposed activity that is likely to result in jeopardy to the continuous existence of a proposed or listed threatened or endangered species, or result in the destruction or adverse modification of designated or proposed critical habitat.

The lessee shall comply with instructions from the Authorized Officer of the surface managing agency (BLM, if the surface is private) for ground disturbing activities associated with coal exploration on federal coal leases prior to approval of a mining and reclamation permit or outside an approved mining and reclamation permit area. The lessee shall comply with instructions from the Authorized Officer of the Office of Surface Mining Reclamation and Enforcement, or his designated representative, for all ground-disturbing activities taking place within an approved mining and reclamation permit area or associated with such a permit.”

Since the GRSG is presently a special status species, this stipulation authorizes BLM to modify the lease to avoid activity that will harm the GRSG, and prohibits the agency from approving any activity that would adversely affect such species if it would violate the ESA. It even authorizes BLM to modify the lease after mining has begun if necessary. These are very powerful protections, and they refute the suggestion that there are inadequate regulatory mechanisms to protect the GRSG and its habitat.

BLM and USFS failed to provide detailed analysis that supports why the No Action or Preferred Alternative is in the best interest of the agencies as well as the public.

BLM's Land Use Planning Manual and Land Use Planning Handbook, II.A.7, pg. 22 (Rel. I -1693 03/11/05) provides that BLM must identify how the Preferred Alternative best meets the multiple use and sustained yield requirements of FLPMA. BLM has failed to demonstrate how any of the Alternatives best satisfy statutory requirements; balance BLM goals, objectives, and polices; and which alternative represents the best way to satisfy the Purpose and Need, address key issues, and consider cooperating agencies' recommendations.

The USFS Land Use Planning Manual and Land Use Planning handbook procedures (FSM 1950 and FSH 1909.15) provide that USFS "must provide an evaluation of alternatives and identification of a preferred alternative to the extent required by NEPA, CEQ regulations, and Forest Service environmental policies." As discussed below, the USFS failed to provide adequate evaluation of alternatives and adequately identify the preferred alternative as required by NEPA, CEQ and USFS policies.

Alternatives B, C, D, E and F do not satisfy statutory requirements, do not balance BLM and USFS goals, objectives and policies, and are not the best fit for the Purpose and Need. The lack of meaningful analysis contained in the EIS constitutes a serious shortcoming that must be addressed. Consequently, the EIS is "inadequate as to preclude meaningful analysis" (40 CFR §I 502.9(a)); and therefore the BLM and USFS must prepare and re-issue a revised draft which provides the analysis necessary to support each of the alternatives.

**Comment Number:** IDMTSG-14-0168-6

**Organization1:**

**Commenter1:**C.L. Butch Otter

**Comment Excerpt Text:**

This EIS has six alternatives. However, two of the alternatives are based on the NTT Report. One of these should be removed. Instead of putting together an alternative that addressed the specific needs of Idaho public lands, and based on the primary threats to the species, BLM used their NTT Report as the foundation of their sub-regional planning efforts. In some cases, such as infrastructure development, especially in BLM's priority habitat, the other co-preferred appears to be more restrictive than the NTT Report. This does not meaningfully solve the problems identified in the 2010 decision; rather these alternatives employ an unnecessary top-down, one-size-fits-all approach of the NTT Report. And it likely does not meet the COT as evidenced by Service's letter on DEIS. Instead, it creates redundancy, as analysis of both alternative B and D reaches nearly identical conclusions throughout the entire document, despite significant revisions to

Alternative D to make it look more like Alternative E from the Administrative draft phase to the published draft phase. Alternatives C and F are no different. Environmental interest groups developed both of those incomplete alternatives which do not address the primary threats to sage-grouse, opting instead to use the NTT report to fill in the gaps. Alternative C's exclusive focus is to eliminate grazing on public land. Eliminating grazing is not only inconsistent with BLM's multiple use mandate, it also would likely exacerbate the primary threat of wildfire by increasing fuels across the range. These alternatives are inappropriate for several reasons, including the most important, that it does not address the primary threats. And these alternatives are outside the scope of Secretary Salazar's December 2011 statement that BLM needed to preclude the need to list while maintaining predictable levels of land use. Alternative F falls short too, which means BLM is spending time and resources analyzing two incomplete alternatives from environmental interest groups.

The description of the "Purpose and Need for the Land Use Plan Amendments" in Volume I of the DEIS omits key portions of Instructional Memorandum 2012-044, in particular this statement in the IM: "While these conservation measures are range-wide in scale, it is expected that at the regional and sub-regional planning scales there may be some adjustments of these conservation measures in order to address local ecological site variability." The DEIS fails to comply with FLPMA's requirement that there be coordination with local plans in order to resolve inconsistencies between plans, and the directive to ensure sustained multiple use. The DEIS does little to acknowledge or discuss how local information will be incorporated into conservation measures. The DEIS follows from on A Report on National Greater Sage-Grouse Conservation Measures (NIT 2011) ("the NTT Report"}, and its alternatives are also derived from that document. The same

is true of the Environmental Impact Statements regarding GRSG prepared or being prepared in other states. The action alternatives are remarkably similar in all of them. This bespeaks a failure to take into account local plans, and local variations in ecology.

**Comment Excerpt Text:**

The presumed need for a 3% disturbance cap originated with opinion expressed by Walker et al. (2007) in the discussion of their paper. They stated: "...we believe the conservation strategy most likely to meet the objective of maintaining or increasing sage-grouse distribution and abundance is to exclude energy development and other large scale disturbances from priority habitat and where valid existing rights exist, minimize those impacts by keeping disturbances to 1 per section with direct surface disturbance impacts held to 3% of the area or less." However, Walker et al., like Holloran (2005), who had previously proposed a restriction of one well per section, never actually measured the effectiveness of these disturbance caps. Instead they modeled sage grouse response in lek attendance in terms of distance(s) from potential sources of disturbance. Therefore, the need for a 3% disturbance cap (or 1% or 5% caps, and one-well per section) stated in the NTI Report and the DEIS, is merely the untested opinion of Holloran and Walker.

**Comment Excerpt Text:**

The 3% disturbance cap that came out of the NTT report seems to be based entirely on professional judgment. Coincidentally, research by Knick et al. (2013) later came up with a 3% threshold. However, the scale at which Knick suggest a 3% disturbance threshold is at an entirely different scale than what the BLM is proposing. They modeled greater sage-grouse presence based on known greater sage-grouse leks and measured variables for the 1-km<sup>2</sup> cell within which the lek was located, as well as in a 5- and 18-km radii surrounding the lek. Variables measured at an 18-km radius (11.2 miles) did not perform well and were dropped in subsequent analyses. This suggests that measured variables at this latter scale did not influence lek persistence. At the 5 km radius scale Knick et al. (2013) found that 95% of all active leks were in landscapes with <3% developed acreage. However, such results were not reported within a 1 km<sup>2</sup> cell within which the lek was located or for each 1 km<sup>2</sup> comprising the PPMA (Vol II, pg. 2-62). According to Knick et al. (2013) an area of 2.4 km<sup>2</sup> (0.9 mi<sup>2</sup>) could be developed in a 5-mile radius around an active lek (78.5 km<sup>2</sup>, or 30.3 mi<sup>2</sup>). This appears to be the smallest scale to be considered in PPMA. However, the LUPA/DEIS, considers the 1 mi<sup>2</sup> the smallest hierarchical arrangement allowing concentrated anthropogenic disturbance. Thus, Knick et al. (2013) study appears not to support the BLM's smallest scale at which anthropogenic disturbance is measured (30.3 mi<sup>2</sup> versus 1 mi<sup>2</sup> respectively). Furthermore, the LUPA/DEIS does not provide any guidance on how the 3% disturbance cap at either the smallest hierarchal scale or the largest scale (PPMA) should be spatially applied. Of particular concern is how the disturbance cap would be applied to long linear projects that could pass through multiple management areas or analysis zones.

**Comment Excerpt Text:**

The identification of “Preliminary Priority Management Area” (PPMA) and other zones is, in and of itself, a Land Use Plan – level decision that requires its own NEPA and Decision-making process. “Designation” of PPMA and other zones is akin to the agencies identifying de-facto “critical habitat” for the species, without the species having been listed. Such NEPA and appealable Decision-making relative to this “designation” is a necessary precursor to any decision-making process on how to manage the different zones.

The agencies should withdraw the proposed Land Use Plan Amendment until after completed a separate NEPA and decision-making process relative to what constitutes “priority habitat” that is of the “highest conservation value to maintaining or increasing GRSG populations” (and “other” habitat). This is particularly a necessary action because the “priority” habitat includes areas that are not sage-grouse habitat, i.e. perennial grasslands, annual grasslands, and juniper woodlands.

A. The purpose and need is inconsistent with the Agencies' multiple use obligations.

The purpose and need statement in the Draft LUPA/EIS does not ensure proper implementation of the Agencies' multiple-use obligations. The purpose and need statement directs the Agencies to incorporate new conservation measures into the LUPs and to consider directs the Agencies to incorporate new conservation measures into the LUPs and to consider such measures in the context of multiple-use. See Draft LUPA/EIS p. 1-12. This approach predetermines, however, that the affected public lands will be managed for sage-grouse conservation and all other uses may exist only where compatible with such conservation. In other words, the purpose and need statement improperly tips the scales in favor of one resource use over all other uses, rather than requiring the Agencies to consider each potential resource use on their merits and to provide "a combination of balanced and diverse resource uses" on BLM- managed lands. See 43 C.F.R. § 1702(c).

Although the Agencies mention the multiple-use mandate under FLPMA, the purpose and need statement does not provide for the consideration of the NFMA multiple-use requirements to provide for "harmonious and coordinated management of the various resources" on National Forest System lands. See 16 U.S.C. § 531(a). Because the purpose and need statement does not recognize the Agencies' NFMA multiple use mandate, the Draft LUPA/EIS is fundamentally flawed.

The Agencies cite the Fish and Wildlife Service's 2010 finding regarding the adequacy of the Agencies' sage-grouse regulatory mechanisms as a threat to the species that possibly could warrant listing the bird under the ESA. See Draft LUPA/EIS p. 1-12. If the potential ESA listing was the impetus for the LUP amendment process, the regulatory mechanisms resulting from the process should be no stricter than those potentially provided by an ESA listing. Otherwise, alternatives that are more stringent than the ESA would constitute regulatory mechanisms that are more than "adequate" and beyond the range of alternatives meeting the purpose and need. For example, because an ESA listing would not demand per se the closure of areas to phosphate leasing and rather the Fish and Wildlife Service would consider the merits of each proposed lease in sage-grouse habitat (including potential mitigation), the provisions of Alternatives B, C, D, and F that close areas to phosphate lease are more strict than an ESA listing. Therefore, these alternatives do not meet the purpose and need of the LUP process and do not constitute a reasonable range of alternatives and do not constitute a reasonable range of alternatives.

**Comment Excerpt Text:**

Sub-objective B-SSS-3 provides a three percent disturbance cap on anthropogenic disturbances on lands in PPMAs. See Draft LUPA/EIS p. 2-100 (Sub-Objective B-SSS-3). The disturbance cap is flawed for at least the following reasons. First, it is arbitrary and inflexible. The disturbance cap does not appear to take into consideration site-specific conditions or project- specific circumstances. It does not appear to allow for mitigation, which might provide a conservation benefit to the sage-grouse. In this way, the sub-objective B-SSS-3 does seem to be properly tailored to meet the Agencies’ goal of maintaining or increasing sage-grouse populations. See Draft LUPA/EIS p. 2-95 (Goal B-GOAL-1).

Second, it is unclear how the disturbance cap will be implemented. If it is implemented to close areas to phosphate mining after the three percent threshold is met, the disturbance cap possibly would be inconsistent with the Agencies’ multiple-use mandates, which suggest that the Agencies should seek to balance mining and conservation and not exclude mining completely from the public lands. At the very least, it should be a three percent unmitigated disturbance cap, allowing for continued development in sage-grouse habitat provided proper mitigation is implemented.

**Comment Excerpt Text:**

Alternative E provides for an exclusion on only 310,000 acres out of 13 million acres (DEIS Table 2.2 and 24) or roughly 2.0 percent. This small area is very unlikely to be effective, especially considering that GRSG are migratory and cover long distances. Connectivity among leking, nesting, brood rearing, and wintering areas is critical to the survival and perpetuation of the species and should be a major consideration. Unfortunately, Alternative E is not effective in protecting this connectivity. Another indication of the minimal conservation efforts in Alternative E is the definition of Sage Grouse Management Areas (SGMAs). Its definition includes all "relevant" (the term is undefined) BLM and FS lands (DEIS Appendix D at 53). This definition omits 20 percent of the GRSG habitat that is on state or private property. Nowhere does Alternative E indicate what has been done or will be done to protect GRSG habitats and populations on state or private property. Thus, it violates the PECE criteria that requires certainty of effectiveness.

There is no scientific study or data provided that Alternative E would be effective, and there is certainly no indication that effective conservation efforts will be implemented. The appointment of an implementation task force is mentioned (DEIS at D-79) but there is no indication of how or when it will be comprised or how it will be funded, with these elements being crucial to any degree of effectiveness. The Alternative lacks any kind of implementation schedule which is also an important criterion under PECE

**Comment Number:** IDMTSG-14-0325-3

**Commenter1:** William J. Mulder

**Comment Excerpt Text:**

Alternative B proposes a 3% anthropogenic disturbance cap. Not all anthropogenic influences have the same impact. For example, a buried stockwater pipeline would have negligible effect on GRSG whereas an airport would present a much more significant interruption even though both might impact equal areal extents. Accordingly, this alternative could act to prevent insignificant (or even beneficial) disturbances while more detrimental uses could be permitted.

---

***Summary***

1. The alternatives fail to meet NEPA adequacy because:
    - a. they (individually or collectively) do not meet the purpose and need for the action
    - b. alternatives were all largely the same, and that the BLM needed to provide more distinction (range) between them
    - c. BLM needs to consider the alternatives presented by Cooperating Agencies and Environmental Organizations, including the County alternatives, the Conservation Groups' alternative, and alternatives for the listing of the species or not listing the species.
    - d. Commenters felt there was no methodology or scientific backing for establishing the disturbance cap in the alternatives, and that the BLM/FS needed to demonstrate more range in the disturbance cap amounts presented in the alternatives.
    - e. specifically that Alternative D needed to include the Ecological Site Descriptions to provide adequate understanding of the current management
    - f. and the BLM and Forest Service failed to adequately define the No Action Alternative.
  
  2. Commenters also suggested that BLM and Forest Service did not provide adequate rationale for the need of the project.
- 

***Response***

1. a. In accordance with NEPA, the BLM and FS have discretion to establish the purpose and need for action (40 CFR 1502.13). CEQ regulations direct that an EIS "...shall briefly specify the underlying purpose and need to which the agency is responding in proposing the alternatives including the proposed action" (40 CFR 1502.13). Also, under the CEQ regulations, the BLM and the Forest Service are required to "study, develop, and describe appropriate alternatives to recommended courses of action in any proposal which involves unresolved conflicts concerning alternative uses of available resources as provided by section 102(2)(E) of the Act [NEPA]." (40 CFR 1501.2(c)). The breadth or narrowness of the purpose and need statement has a substantial influence on the scope of the subsequent analysis. The purpose and need statement provides a framework for issue identification and will inform the rationale for alternative selection. The range of alternatives developed are intended to meet the purpose and need and address the issue; thereby, providing a basis for eventual selection of an alternative in a decision (BLM NEPA handbook and Forest Service Handbook 1909.15 – National Environmental Policy Act Handbook Chapter 10 – Environmental Analysis).

As stated in the DLUPA/EIS, the BLM and the Forest Service prepared the Idaho LUP amendment with an associated EIS to be applied to lands with greater sage-grouse habitat. This effort responds to the FWS's March 2010 'warranted, but precluded' Endangered Species Act listing petition decision, and that existing regulatory mechanisms in BLM and the Forest Service land use plans was inadequate to protect the species and its habitat. The range of alternatives, including the preferred alternative and its components (such as the disturbance caps), focus on areas affected by threats to greater sage-grouse habitat identified by the FWS in the March 2010 listing decision. Formulated by the planning team, the preferred alternative represents those

goals, objectives, and actions determined to be most effective at resolving planning issues, balancing resource use at this stage of the process, and meet the stated purpose and need for action. While collaboration is critical in developing and evaluating alternatives, the final designation of a preferred alternative remains the exclusive responsibility of the BLM and Forest Service. See Section 1.2 and Section 2.7, Considerations for Selecting a Preferred Alternative for further details.

b. The BLM and the Forest Service considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM and the Forest Service consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and greater sage-grouse in the planning area, the BLM and the Forest Service fully considered the management opportunities presented in the Analysis of the Management Situation (AMS) and the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As a result, four alternatives were analyzed in detail in the DLUPA/EIS that best addressed the issues and concerns identified by the affected public. The range of alternatives in the DLUPA/EIS represented a full spectrum of options including a no action alternative (current management, Alternative A).

As described in Section 2.3 of the Draft EIS, the Idaho GRSG RMPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the RMPA. The BLM and Forest Service complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft RMPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions from the field office RMPs are acceptable and reasonable. In these instances, there was no need to develop alternative management prescriptions.

Public input received during the scoping process was considered to ensure that all issues and concerns would be addressed, as appropriate, in developing the alternatives. The planning team developed planning issues to be addressed in the RMPA, based on broad concerns or controversies related to conditions, trends, needs, and existing and potential uses of planning area lands and resources.

Additionally, the resulting action alternatives offer a range of possible management approaches for responding to planning issues and concerns identified through public scoping, and to maintain or increase GRSG abundance and distribution in the planning area. While the goal is the same across alternatives, each alternative contains a discrete set of objectives and management actions and constitutes a separate RMPA with the potential for different long-range outcomes and conditions.

The relative emphasis given to particular resources and resource uses differs as well, including allowable uses, restoration measures, and specific direction pertaining to individual resource programs. When resources or resource uses are mandated by law or are not tied to planning issues, there are typically few or no distinctions between alternatives. Meaningful differences among the four alternatives are described in Table 2-2, Comparative Summary of Alternatives, in Section 2.8, Summary Comparison of Alternatives, of the Draft EIS.

c. Based on this alternative development process, the BLM considered input from cooperating agencies, environmental organizations, and the public. As described in 2.4.2. Alternative B, the BLM used the GRSG conservation measures in A Report on National Greater Sage-Grouse Conservation Measures (NTT 2011) were used to form BLM management direction under Alternative B, which is consistent with the direction provided in BLM Washington Office Instruction Memorandum 2012-044 (the BLM must consider all applicable conservation measures developed by the NTT in at least one alternative in the land use planning

process).

During scoping for the IDaho GRSG RMPA/EIS, individuals and conservation groups submitted management direction recommendations for protection and conservation of GRSG and their habitat, including the Sage-grouse Recovery Alternative and proposed disturbance cap. The recommendations, in conjunction with resource allocation opportunities and internal sub-regional BLM input, were reviewed in order to develop BLM management direction for GRSG under Alternative C.

Alternative D incorporates adjustments to the NTT report (NTT 2011) to provide a balanced level of protection, restoration, enhancement, and use of resources and services to meet ongoing programs and land uses, and was developed in full cooperation with the Cooperating Agencies taking note of the agencies' concerns with socioeconomic issues.

Section 2.6, Alternatives Considered but not Analyzed in Detail, of the Draft EIS, the XXX Alternative was analyzed but not considered in detail in the DEIS primarily because it is contained within the existing range of alternatives.

The BLM and Forest Service considered the State of Idaho's Sage-Grouse Conservation Plan in its cumulative effects analysis (Draft EIS Chapter 5, Cumulative Effects, Section 5.4, Special Status Species).

Whether the Greater Sage-grouse is determined for listing by the USFWS is outside the jurisdiction of the BLM and beyond the scope of this EIS. As noted in the Purpose and Need, the BLM was to consider regulatory mechanisms that would protect the species and its habitat. As such, the BLM did not develop alternatives should the USFWS choose to list or not list the Greater Sage-grouse.

d. In determining the disturbance cap level for each alternative, the BLM utilized the recommendations and input specific to each alternative. For example, for Alternative B, the BLM utilized the cap levels recommended in the NTT Report. Conservation measures included in Alternative B focus primarily on GRSG PPH and include a 3-percent disturbance cap in PPH. PPH areas have the highest conservation value to maintaining or increasing GRSG populations.

For Alternative C, conservation measures were mostly focused on ADH (PPH, PGH, and linkage/connectivity habitat). These areas have been identified by CPW in coordination with respective BLM offices, and include a 3-percent cap on disturbance in ADH. This disturbance cap number for Alternatives B and C were incorporated as-is from the NTT Report and conservation group alternatives; the BLM did not modify the caps in the alternatives.

For Alternative D, the BLM intended to protect those areas that were most important for sage-grouse within PPH; in other words, the alternative would protect the best of the best habitat. The BLM utilized information from the Wyoming Core Strategy to support consideration of the five-percent disturbance cap, with the goal to represent the reasonable edge of the range of alternatives with a higher percentage.

While the caps would set a particular level of disturbance, the implementation of the disturbance caps would occur after the RMPA is approved in the Record of Decision. The BLM inventoried the habitat with the best available info at the time of the DEIS, but would also do additional in-depth analysis & inventory within management zones at the implementation stage.

2. While FWS has responsibility for threatened and endangered species, the BLM and the Forest Service manage a significant portion of sage-grouse habitat. Thus, although it is the FWS's responsibility to administer the Endangered Species Act, management of wildlife habitat is within the BLM and the Forest Service's multiple-use mandate and is properly a resource to be managed for in their planning decisions.

The No Action alternative is supposed to lay a firm foundation and provide substantive baseline conditions, with a hard look taken at environmental conditions. The No Action Alternative is presented in a way that makes it impossible to understand the current conditions on the lands, and the effects of the laundry list of actions in DEIS Appendix G. This DEIS refers a reader to an Appendix that is claimed to be the “detailed” No Action alternative. This Appendix is merely a long list of LUP provisions on pages G-1 to G-35. There are around 500 provisions of Land Use Plans. Some are very minimal – like the Magic MFP, others are far more elaborate. Some key provisions are missing altogether.

Appendix G is the “detailed” No Action Alt. It does not satisfy NEPA requirements for baseline information, a hard look, etc. Appendix G is a merely a list of existing LUP provisions by Plan. There is no analysis of how effective these are

**Comment Number:** IDMTSG-14-0159-15**Organization1:**American Exploration and Minind Association**Commenter1:**Laura Skaer**Other Sections:** 5.2**Comment Excerpt Text:**

The Agencies have artificially deflated Alternative A, the “No Action” Alternative because it fails to quantify the impacts associated with ongoing implementation of the many existing local, state and Federal conservation measures and the existing BLM policies designed to protect the GRSG and its habitat. The No Action Alternative must review the existing regulatory framework, including Federal, state, local and private efforts, including voluntary conservation measures, to determine what positive effects those measures will produce.

**Comment Number:** IDMTSG-14-0159-22**Organization1:**American Exploration and Minind Association**Commenter1:**Laura Skaer

**Comment Excerpt Text:**

The USFWS has had a long-standing policy of working to conserve “candidate” species through several means, including a grants program funds conservation projects by private landowners, states and territories; and two voluntary programs - Candidate Conservation Agreements (CCAs) and Candidate Conservation Agreements with Assurances (CCAAs) - engage participants to implement specific actions that remove or reduce the threats to candidate species, which helps stabilize or restore the species and can preclude the need for ESA listing.

2. Additionally, the Service is directed by Congress “make prompt use” of emergency listing authority under Section 7 of the ESA if warranted for candidate species, 16 U.S.C. § (b)(3)(C)(iii). None of these presently existing important ESA tools are accounted for in this NEPA process.

**Comment Number:** IDMTSG-14-0186-8

**Organization1:** Intermountain Range Consultants

**Commenter1:** Bob Schweigert

**Comment Excerpt Text:**

The document fails, except under Alternative E, to recognize State and Transition models (i.e. the best and latest science), but instead perpetuates under Alternative D the incorrect perception that any and all sagebrush areas or potential sagebrush areas can somehow become “ideal” sage-grouse habitat. Many of the subject rangelands in Idaho, particularly Wyoming big sagebrush sites, were altered even before the passage of the Taylor Grazing Act so that they may support sagebrush, but the understory is a virtual monoculture of Sandberg bluegrass; such understories lack any significant seed source of deep-rooted perennial grasses. While discussion of Alternative D touches on this condition, it should be more prominently and forthrightly discussed. This has ramifications relative to RHA’s, which often perpetuate the notion that Clementsian succession will proceed “if we just change the livestock management”. Numerous examples of this mis-perception (and therefore incorrect analysis of Rangeland Health capabilities) are evident in the RHAs for the “Owyhee 68” group of grazing allotments.

***Summary***

The EIS fails to meet NEPA adequacy for baseline data because the scale of baseline data used is too broad, the EIS failed to include the State and Transition models as part of the baseline information, and the No Action management actions, as presented, do not explain the regulatory mechanisms that are currently available to preserve sage grouse habitat.

***Response***

The CEQ regulations require an environmental impact statement to "succinctly describe the environment of the area(s) to be affected or created by the alternatives under consideration. The description shall be no longer than is necessary to understand the effects of the alternatives. Data and analyses in a statement shall be commensurate with the importance of the impact, with less important material summarized, consolidated, or simply referenced. Agencies shall avoid useless bulk in statements and shall concentrate effort and

attention on important issues" (40 CFR 1502.15). Additionally, the [name of particular amendment] is a programmatic NEPA effort to conserve greater sage-grouse and its habitat across a broad geographic area. As such, the BLM and the Forest Service described the current conditions and trends in the affected environment broadly, across a range of conditions, appropriate to program-level land use planning actions.

The BLM and the Forest Service complied with these regulations in describing the affected environment. The requisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The affected environment provided in [Chapter XX] and various appendices including [cite appendix(es)] in the [name of particular amendment] is sufficient to support, at the general land use planning-level of analysis, the environmental impact analysis resulting from management actions presented in the DLUPA/EIS. For example, [use relevant example for the particular issue...here's one provided: listing every water quality-impaired stream within the planning area by name would not provide useful information at this broad-scale analysis, particularly where the proposed plan alternatives did not vary the level of riparian protections to provide reduced levels for non-impaired streams. The riparian protections within each alternative were applied to all streams, whether or not they were water quality-impaired. However, understanding the miles of impaired BLM streams, as presented in the DLUPA/EIS at Section 3.5.7, is useful in establishing a baseline by which the BLM may analyze the relative effects of each alternative's broad-based approach.]

As specific actions come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. Site-specific concerns and more detailed environmental descriptions will be addressed when project-level reviews are tiered to the analysis in this EIS (40 CFR 1502.20, 40 CFR 1508.28). In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for any site-specific actions.

Is the 9,260,000 acre BLM and 2,095,300 acre Forest figure here based on habitats identified in LUPs? On the 2006 ID sage-grouse conservation Plan? Please clarify. How much of the land in these categories has been identified for restoration in the 2006 plan, or has had sagebrush or sage-grouse habitat species planted post-fire? We also note that an earlier Table, ES-4 appears to omit Medial areas and seems to only represent Idaho.

BLM's duty to ensure the scientific integrity of the FEIS is found at 40 C.F.R. § 1502.24. The information presented in the DEIS and FEIS must be sufficiently quantified and detailed to support the scientific and other

impact analysis conclusions and discussions in the FEIS. Of particular concern is whether the maps purporting to present PPMAs and PGMAs are sufficiently accurate and "ground-truthed." The maps presented in the DEIS are of such broad scale that it is difficult to determine whether they are accurate. They certainly are inaccurate to the extent that they cover lands known to be inhabitable to Sage-grouse including anthropogenic disturbances and physical barriers such as cliffs and water. The FEIS should provide that additional ground truthing will take place prior to any site-specific implementation of projects and decisions and that amendments to land use plans may be undertaken without further NEPA analysis to avoid unnecessary delays in project approval.

Likewise, PPH that is perennial grassland or annual grassland is not only non-habitat, it must also be considered not "occupied". Priority Habitats, if designated, should not include non-sage-grouse habitats such as crested wheatgrass and other perennial seedings or areas dominated by cheatgrass or areas of juniper encroachment and domination. While these areas may be important "restoration" zones, they should be so designated, but should not be considered "priority habitat" for a species of wildlife that does not occupy them. For example, according to Dr. Clait Braun, "crested wheatgrass is a biological desert and no value to sage grouse." (Braun testimony in Idaho U.S. Federal Court). In addition, whether to include them or not as "highest conservation value" is a LUP-level decision that should undergo its own analysis and decision-making, rather than being a "foregone conclusion" that serves as the basis for this DEIS.

**VI. The West Central (Weiser) and East Idaho Uplands Populations Do Not Need To Be Included in the IHZ But Do Deserve a Heightened Level of Protection.**

Alternative D proposes to include portions of the Weiser Basin and Upper Snake populations in PPMA, whereas Alternative E relegates both populations to the General Habitat Zone (GHZ). Both populations were included in the BLM’s mapping of preliminary priority habitat and IDFG’s mapping of key habitat for sage grouse in Idaho. Based on lek counts alone, these areas would likely qualify at least for inclusion in IHZ.

The State of Idaho downgraded these areas to GHZ because they are isolated from the main populations and are unlikely to influence the long-term viability of sage grouse populations in Idaho. We understand the State’s reasoning for this decision. Keeping these areas in the GHZ is acceptable because roughly 95% of the sage grouse population is included in the more protective IHZ and CHZ designations.

However, we are concerned that the level of protection in GHZ is so low that little effort will be made to take reasonable steps to conserve these two populations. Therefore, we recommend that major infrastructure projects proposed in these areas be required to mitigate their impacts within polygons shown as PPMA or PMMA in Alternative D. In addition, reasonable conditions to avoid and minimize impacts proposed for the IHZ should be extended to these two areas

**Commenter1:**Dennis Mackey

**Comment Excerpt Text:**

One important difference between Alternatives D and E is that Alternative E's thematic mapping criteria are based upon a measurable population objective. If the BLM considers mapping changes, we recommend that the final map be closely coordinated with the State and reflect scientifically-based population objectives similar to those described in Alternative E. This should include habitats that provide essential connectivity, and habitat restoration and population expansion

---

***Summary***

Commenters noted several issues with the GIS data and analysis conducted in the Draft EIS:

- The maps and data layers do not provide enough detail to address "local ecological site variability". The data are too coarse and do not provide assurances to more localized decision making; some habitat type areas are inaccurately identified in the maps.
- BLM used old data layers to develop maps; BLM should use the newer data layers.

--the BLM needs to be consistent in their edge-mapping across state boundaries when there are different data sets used.

NOTE TO BLM: some comments relate to specific changes for the maps presented in the DEIS, and for the data layers to be made available for download from the BLM website.

---

### ***Response***

Before beginning the Idaho Sage grouse EIS and throughout the planning effort, the BLM and the Forest Service considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The data needed to support broad-scale analysis of the planning area are substantially different than the data needed to support site-specific analysis of projects. The LUPA/EIS data and information is presented in map and table form and is sufficient to support the broad scale analyses required for land use planning.

Additionally, the BLM and the Forest Service consulted with, collected, and incorporated data from other agencies and sources, including but not limited to the U.S. Fish and Wildlife Service and [*list state agencies, including state wildlife agency*]. Considerations included but were not limited to [*list the types of data or GIS layers that were gathered/used. A few examples: threatened and endangered species and their habitats, water quality- limited (303d) streams, deer and elk herd management areas, invasive plants, and uses on State lands*]. It is not the responsibility of the BLM or FS to modify, change, update, or revise the specific modeling protocol and analysis developed by other agencies or groups. The Draft EIS notes that the BLM and FS would incorporate any refinements or updates if or when the data were made available. [*NOTE TO BLM: If and updates or new layers have become available, can note them here.*]

The BLM and the Forest Service described the current conditions and trends in the affected environment broadly, across a range of conditions, appropriate to program-level land use planning actions. The BLM and the Forest Service complied with the regulations in describing the affected environment. The requisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The affected environment provided in [Chapter XX] and various appendices including [cite appendix(ces)] in the [name of particular amendment] is sufficient to support, at the general land use planning-level of analysis, the environmental impact analysis resulting from management actions presented in the DLUPA/EIS.

As a result of these actions, the data gathered by the BLM and the Forest Service is of the appropriate scale and provided an adequate analysis that led to an adequate disclosure of the potential environmental consequences of the alternatives.

A land use planning-level decision is broad in scope. The BLM and the Forest Service realize that more data could always be gathered, the baseline data provides the necessary basis to make informed land use plan-level decisions. Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The BLM and the Forest Service will conduct subsequent project-specific NEPA analyses for projects proposed for implementation under the land use plan, which may include but are not limited to fuels treatment, habitat restoration, [*etc.; list others as applicable*]. The subsequent NEPA analyses for project-specific actions will tier to the land-use planning analysis and evaluate project impacts at the appropriate site-specific level (40 CFR 1502.20, 40 CFR 1508.28). As required by NEPA, the public will have the opportunity to participate in the NEPA process for site-specific actions.

Of the suggested studies and references put forth by the commenters, the BLM reviewed them to determine if they presented new information that would need to be incorporated into the FEIS, or if the references provided the same information as already used or described in the Draft EIS. Adjustments to mapping can be found in Appendix B, "Mapping Adjustments."

While BLM has considered various adaptive management proposals in land use plans, their efficacy is often compromised by a lack of baseline information, combined with undefined and indeterminate funding to conduct adequate monitoring and compliance. One of the foremost concerns with any reliance upon adaptive management as an integral part of any management plan is the inherent needs of additional funding to conduct additional monitoring, compliance and enforcement. The draft EIS does not illustrate when or where additional or new funding streams will be generated.

#### **Comment Excerpt Text:**

Further, if BLM adopts Alternative D's Population Areas as its method of delineating sage-grouse habitat, it may unwittingly give itself an unfunded mandate. Currently, little to no monitoring occurs in the East Central Idaho, Weiser, and the Sawtooth populations. This is for a variety of reasons, only one of which is funding. The primary reason for the lack of monitoring is that these populations are small and relatively unimportant to the overall sage-grouse population in Idaho. Thus, even if funding was available to monitor these areas, it would be very hard to justify diverting resources to these areas. Yet, Alternative D delineates all three of its zones in each of these populations, thus requiring monitoring to determine if triggers have been tripped. This is unnecessary and an unwise use of BLM resources. In contrast, Idaho Fish and Game currently monitors all of the lek routes in Alternative E's CHZ and IHZ, and has requested additional funding from the State to improve this monitoring. This means that Alternative E's

trigger program can be implemented immediately, with no additional funding from the State or from BLM, because IDFG is already collecting the data required to do so.

#### **Comment Excerpt Text:**

Overall, BLM's Chapter 4 analysis is inadequate, vague, and often inaccurate. Many conclusions are without support. Even when the conclusion is correct, it is difficult to determine why. Alternatives are lumped together in groups for various stages in the analysis, where BLM determines they all have similar effects. This

is unhelpful because this type of analysis does not allow the reader to distinguish between the effects of each individual alternative. It is also unlikely that 6 unique alternatives could all, at times, produce the exact same effects.

**Comment Excerpt Text:**

The DEIS Fails to fully evaluate the No Action Alternative.

40 CFR 1502.14(b) requires that an EIS "devote substantial treatment to each alternative considered in detail including the proposed action so that reviewers may evaluate their comparative merits." This includes the no action alternative. However, in this case, the no action alternative is sparsely described. In some cases, the policies detailed in the action alternatives are already authorized under current law, but the document fails to note this in the no action alternative. This may erroneously lead reviewers to believe existing laws do not contain conservation measures sufficient to protect the GRS. The DEIS fails to acknowledge that existing laws, regulations and policies already direct the BLM and USFS manage habitat for candidate, sensitive, threatened, endangered and other special species designations.

**Organization1:** Stevenson Intermountain Seed, Inc.

**Commenter1:** Ronald M. Stevenson

**Comment Excerpt Text:**

To correct the deficiency [of missing a plan of action that will provide how BLM will accomplish the goals/objectives], a valid recommendation is that the final EIS and its proposed preferred alternative contain the lacking information identified as well as proposed actions of goals and objectives. Not doing so would be a great neglect or oversight that many would find unacceptable and find the EIS very incomplete.

The addition of the following THREE items is suggested to correct the deficiency.

**Item 1. Sage-Grouse Habitat**

A significant discussion identifying that restoration of lost sage-grouse habitat through seeding of vegetation species that are important to good sage-grouse habitat will be a key component to reducing the current decline of sage-grouse numbers and move the sage-grouse numbers to an increasing trend. This discussion should include specific goals and objectives.

**Item 2. Funding for Sage-Grouse Habitat Restoration**

A discussion identifying how obtaining sufficient funding is a key issue of vital importance in restoring important sage-grouse habitat by seeding as stated in above Item 1. This discussion should include specific sources and amount of funding to be obtained to reach the desired goals and objectives. Currently the funding for this extremely important purpose is woefully inadequate.

A discussion detailing the woefully deficient funding currently available for sage-grouse habitat restoration being lost by yearly wildfires is presented in an article the SRM published in Rangelands Volume 35, Number 3, June 2013 authored by Tim Murphy, David E. Naugle, Randal Eardley, Jeremy D. Maestas, Tim Griffiths, Mike Pellant and Stan I. Stiver.

---

## **Summary**

BLM's overall impact analysis is deficient in the following areas:

1. lack of discussion for where, when, and how BLM will have sufficient funding to implement the actions;
  2. the analysis does not distinguish between the effects of each alternative;
  3. did not fully analyze the No Action alternative by not acknowledging the existing laws and actions already in place that would manage the habitat;
- 

## **Response**

1. As a landscape level planning effort, none of the alternatives prescribe project-level or site-specific activities on BLM or USFS managed lands. Furthermore, the agencies' selection of an alternative does not authorize funding to any specific project or activity nor does it directly tie into the agencies' budgets as appropriated annually through the Federal budget process. As a consequence, agencies' costs and differences in program costs across alternatives have not been quantified. Information has been presented in several resource impact sections on the types of costs that might be associated with various sage-grouse conservation measures. [NOTE TO BLM- above language from Josh Sidon, Lauren may want to use across all subregions.]
2. Direct the reader to the Effects Summary table in ch 2. Determine whether revisions to the table would be necessary to distinguish more between the effects.
3. Check for the No Action alternative to see if there already is a statement for how existing management/actions would impact the habitat. This may be to direct the reader to a specific section in Ch 4 or several sections.

**Commenter1:** Christopher Clark

**Comment Excerpt Text:**

Section 4.16 fails to adequately identify reasonably foreseeable future actions. For example, predator control is determined to be outside the scope of the DEIS. See Section 2.3.1. Yet, predation is "the most commonly identified cause of direct mortality for GRSG during all life stages." See Section 3.2.1, p. 3-11. Given that predator control is a known, identified and foreseeable future action, it must be analyzed as part of the cumulative impacts analysis even though it is considered to be outside of the scope of the action alternatives themselves. As BLM properly notes, the cumulative impacts analysis takes into account all reasonably foreseeable actions regardless of land ownership and jurisdiction.

**Comment Number:** IDMTSG-14-0157-26

**Organization1:** Y-3 II Ranch

**Commenter1:** Christopher Clark

**Comment Excerpt Text:**

Similarly, of particular interest and importance to Y-3 II is the China Mountain Wind Project. It is identified in the Nevada DEIS at Table 5.8 as a possible future action but there is no mention of that wind project in the Idaho DEIS Section 4.16.2 or .3. Some 75% of the project would be in Idaho. BLM should fully explain the status of the China Mountain Project and confirm whether it may or may not be a reasonably foreseeable future action. This wind project, as set forth in right-of-way applications to BLM, could impact several of the allotments used by Y-3 II including Player Canyon and Player Butte. BLM should provide more information on the status of China Mountain as a reasonably foreseeable future action. The Jarbidge RMP DEIS is being finalized pursuant to Table 4.75 but the DEIS does not explain how this NEPA process relates to the Idaho

and southwestern Montana greater Sage-grouse draft land use plan amendments and this DEIS.

---

**Comment Number:** IDMTSG-14-0159-13

**Organization1:** American Exploration and Minind Association

**Commenter1:** Laura Skaer

**Comment Excerpt Text:**

The DEIS documents are part of several related NEPA documents, including the DEISs for Oregon, Idaho and southwestern Montana, Nevada and northeastern California, and Utah. The total potential acreage withdrawn and the contribution in this DEIS to a broader total number of acres proposed to be withdrawn from future public use is not discussed. This is a fatal NEPA analytical gap.

---

**Comment Number:** IDMTSG-14-0210-10

**Organization1:** NorthWestern Energy

**Commenter1:** Mary Gail Sullivan

**Comment Excerpt Text:**

BLM Should Consider Interstate Planning Processes

NorthWestern Energy is concerned that this LUP revision does not adequately consider all neighboring states and adjoining BLM jurisdictions in its planning process. NorthWestern Energy requests that BLM consider how decisions made for this LUP would affect those decisions in neighboring states or BLM jurisdictions.

---

***Summary***

The EIS cumulative impacts analysis is inadequate because it does not adequately identify the reasonably foreseeable future actions, present a comprehensive listing of the effects across ALL subregions, nor analyze how the alternatives' actions would affect actions and decisions in neighbouring states/jurisdictions.

---

***Response***

Can direct reader to cumulative impacts; note that the cums impacts are updated based on work done between Draft & Final; see if there is anything specific you can add to clarify how actions in neighbouring jurisdictions/states were addressed in the cums.

Regional call on whether to roll up effects totals into a region wide estimate as suggested by commenter.

**Commenter1:** Wayne F. Butts

**Comment Excerpt Text:**

1-26

"Regulations at 43 CFR 1610.4-9 require that the proposed LUPA establish intervals and standards, as appropriate, for monitoring and evaluation of the plan, based on the sensitivity of the resource decisions involved. Progress in meeting the plan objectives and adherence to the management framework established by the plan is reviewed periodically."

Comment: The statement should be expanded to include monitoring requirements specified in the BLM Sensitive Species Manual 6840 and FSM 2670. Under the No Action Alternative as well as any action alternative, BLM and the US Forest Service must monitor GRSG habitat conditions as well as the habitat conditions of other sensitive and special status species.

As clearly stated in Manual 6840 and quoted verbatim herein:

C. Implementation. On BLM-administered lands, the BLM shall manage Bureau sensitive species and their habitats to minimize or eliminate threats affecting the status of the species or to improve the condition of the species habitat, by:

1. Determining, to the extent practicable, the distribution, abundance, population condition, current threats, and habitat needs for sensitive species, and evaluating the significance of BLM-administered lands and actions undertaken by the BLM in conserving those species.
2. Ensuring that BLM activities affecting Bureau sensitive species are carried out in a way that is consistent with its objectives for managing those species and their habitats at the appropriate spatial scale.
3. Monitoring populations and habitats of Bureau sensitive species to determine whether species management objectives are being met (emphasis added).

The US Forest Service lists sage-grouse as a sensitive species and has similar direction in Forest Service Manual 2670.

Additional evidence of statewide GRSG habitat monitoring can be found at

[http://www.blm.gov/pgdata/etc/medialib/blm/wo/Comrnunications\\_Directorate/public affairs/sage-grouse.Par.57380.File.dat/s-blm nevada web pdf](http://www.blm.gov/pgdata/etc/medialib/blm/wo/Comrnunications_Directorate/public%20affairs/sage-grouse.Par.57380.File.dat/s-blm%20nevada%20web.pdf)

Please add an explanation in the EIS to explain how the BLM Manual 6840 explicitly directs BLM to manage GRSG and other sensitive species and habitat to promote their conservation and to minimize the likelihood and need for listing under the ESA... In compliance with existing laws, including the BLM multiple use mission as specified in the FLPMA, the BLM shall designate Bureau sensitive species and implement measures to conserve these species and their habitats, including ESA proposed critical habitat, to promote their conservation and reduce the likelihood and need for such species to be listed pursuant to the ESA."

The US Forest Service lists sage-grouse as a sensitive species and has similar direction in Forest Service Manual 2670

**Adequate Regulatory Mechanism Needed for Travel Planning**

Even if travel plans are completed and travel is restricted to existing routes in the interim, we are concerned that travel plan implementation is not an adequate regulatory mechanism as it stands today. There are an extremely limited number of BLM enforcement officers available to educate and enforce user groups and compliance among user groups is problematic along designated routes. As such, we do not believe that the US Fish and Wildlife Service can make the determination that there is an adequate regulatory mechanism, funding, or agency commitment at this point.

As part of the implementation of the ROD, the State of Idaho and BLM are going to develop additional MOUs for implementation of various measures. We recommend that the BLM and State of Idaho also establish an MOU regarding enforcement actions on BLM lands. The Idaho Department of Fish and Game has a number of Conservation Officers who patrol BLM areas as part of their work. An MOU would enable Fish and Game Conservation Officers to help enforce travel management plans on BLM-managed lands. The Idaho Department of Fish and Game already has an MOU with the Forest Service for enforcement actions on National Forest property and this has been very useful in protecting forest resources.

**Commenter1:**John Robison

**Comment Excerpt Text:**

BLM needs to provide additional details on a comprehensive monitoring program regarding the efficacy of fire prevention, suppression and rehabilitation measures, fuel reduction programs, infrastructure avoidance and minimization, West Nile virus control efforts, habitat restoration projects, livestock grazing effects on rangeland conditions (particularly in riparian and upland areas), recreation impacts and efficacy of mitigation programs. The adaptive management triggers need to be based on conditions in both the CHZ and IHZ, and not just the CHZ as proposed in a more recent version of the State Alternative.

**Comment Number:** IDMTSG-14-0180-35

**Organization1:**

**Commenter1:**C.L. Butch Otter

**Comment Excerpt Text:**

When measured in isolation any of the conservation measures outlined in Alternative E very likely produce similar results as those identified in Alternative B and D. However, these measures cannot be assessed in a vacuum, as BLM did here. Instead, these measures should be analyzed in relationship to the triggers that make them operational. A conservation measure is just an idea, unless a management plan states how it will be implemented and then actually implements it.

**Comment Excerpt Text:**

Thus, in both the Section 10 and Section 7 context, there is no absolute prohibition on activities that might “take” a species. An ESA listing does not summarily put off limits mining projects that might adversely affect the species or its critical habitat. Rather, project approval is based on whether, after applying the mitigation measures proposed by the applicant, the action will appreciably reduce the likelihood of the survival or recovery of the species, or result in jeopardy, respectively. The ESA permitting processes encourage cooperation between the Service and the applicant to find solutions that allow the applicant’s project to move forward while conserving the species.

By contrast, the Agencies’ proposed phosphate lease and saleable minerals closures potentially would put up to nearly 11 million acres of public land off limits from such mineral development, regardless of site-specific species occurrence and habitat conditions or of mitigation opportunities that might be offered by the project proponent and authorized following ESA Section 7 consultation or pursuant to a Section 10 permit. In deciding what conservation measures should be imposed to avoid a listing, the Agencies must consider whether the measures proposed may cost more than the ESA listing that the Agencies are attempting to avoid. Further, if the Agencies’ objective in this land use planning process is to provide “adequate” regulatory mechanisms in response to the Fish and Wildlife Services’ “warranted, but precluded” finding and to avoid an ESA listing, each alternative that would impose restrictions beyond what is required or adequate under the ESA should not be considered within a reasonable range of alternatives to serving that objective.

The brief description of what the BLM hopes to present as a mitigation strategy following the completion of the NEPA process is inadequate. The lack of detail does not allow reviewers the opportunity to determine if mitigation will be appropriate for potential impacts. At a minimum, the Draft EIS should provide a “menu” of mitigation project types; criteria for determining appropriate mitigation sites and priorities; expected benefits of each mitigation type; mitigation ratios; and monitoring and success criteria.

Monitoring Strategy

The BLM and Forest Service are currently in the process of finalizing a Monitoring Framework which will be included in the Proposed LUP Amendment/FEIS; the major components of this Monitoring Framework can be found in Appendix E of this Draft EIS.

Only a draft of the Monitoring Framework is provided, with insufficient detail to provide a meaningful opportunity to comment. There is insufficient information provided to determine what monitoring efforts will be implemented by the BLM and if these monitoring efforts will support mitigation measures and to what extent. The Draft Monitoring Plan falls short of what can be reasonably expected of a DEIS to provide a meaningful opportunity to comment

P4 Production appreciates the Agencies’ incorporation in Alternative D of the concept of no net unmitigated loss of PPMAs and recognition of a suite of actions to offset or restore disturbed sage-grouse habitat. See Draft LUPA/EIS p. 2-74. However, the Agencies provide no explanation of the measures that would be applied to implement the standard. The Draft LUPA/EIS mentions “prescribed mitigation ratios” but goes no further to discuss the substance or calculation of such ratios. See Draft LUPA/EIS p. 2-75. In order for the public to fully evaluate the mitigation requirements proposed under this alternative, the Agencies should explain the ratio calculation that will be applied. Any such calculations should recognize that mitigation benefits may take years to develop. The temporal elements of a mitigation project should be incorporated into the mitigation credit calculation, however, there should be no blanket requirement that such benefits manifest before disturbance can proceed. Otherwise, the incentive for pursuing the mitigation project—i.e., to move forward with the development project—would be lost.

**Comment Excerpt Text:**

Adaptive regulatory triggers in Alternative E exclude GHZ and require that two of the following three factors occur in a conservation area before the CHZ restrictions apply within the 1HZ:

- (1) The finite rate of population change over three years is significantly less than 1.0. The term "significantly" is not defined.
- (2) Number of males on lek routes declines by greater than 20 percent over a three-year period compared to 2011.
- (3) A 30 percent or greater loss of sagebrush habitat within defined breeding or winter habitat in a three year period. (DEIS at D. 31).

These triggers are ineffective to deal with declining GRSG habitat or populations for several reasons. First, Factor (2) does not provide a true population index when it is based on the "number of males on lek routes." That number could easily be manipulated by simply counting more leks. The better, and more scientific measure, is the average number of males per lek or the average number of males per occupied lek. (DEIS at 2-73, 2-74). Using these numbers, Fish and Game lek counts from 2011 to 2013 show that populations have declined by 25.5 percent and 41.3 percent respectively in Zone 1 (Attachment B) and by 15.0 percent and 22 percent in Zone 2 (Attachment C).

Second, if the soft triggers are reached, no additional restrictions in IHZs are required (DEIS at 2-80). The population could be declining at 20 percent a year, but the trigger is not tripped until after the third year. At that point, it may be too late to effectively respond. This is demonstrated by a study cited in Alternative E where 16 percent of an area was lost, and the population declined by 73 percent. (DEIS Appendix D at 180.)

third, Attachments B and C show that the number of males counted has declined by 19 percent in Zone 1 in two years and by 26 percent in Zone 2.

Fourth, the 30 percent decline in breeding or wintering habitat used in Alternative E is not supported by the State's supporting material which states a hard trigger is set at a 20 percent loss of breeding or wintering habitat in a conservation area (DEIS Appendix D at 181.) By contrast, Alternative B sets the trigger at 20 percent habitat loss anywhere in a population area or a loss of 10 percent of the nesting or wintering habitat.

Fifth, the emergency clause proposed in Alternative E (DEIS Appendix D-32) is also inadequate because it only applies to the CHZ when 200,000 acres or more habitat is burned or when 50 percent or more of the important breeding or wintering habitat could be lost in the CHZ. If this loss occurs in the 1HZ or GHZ, the emergency clause would not apply.

Finally, there is no scientific evidence provided that these adaptive triggers will be effective.

**Comment Excerpt Text:**

Adaptive Management.

NTT and USGS purport to be the "best available science", not only in broad or general terms, but to very minute and specific standards (e.g. the exact percentage of anthropogenic influence each finds permissible.) This LUPA proposes to make numerous regulatory changes that will affect BLM land users based on the "science" and assumptions set forth in the NTT and USGS reports. If the conclusions and resulting use amendments are not effective to the degree that a management plan or action should be changed, BLM should revisit the matter by amending the LUPA, not by a 'trial and error' process.

Adaptive management, as specified in Alternatives B, C, D and F should not be used where it results in more restrictive conditions to existing uses. If BLM desires to implement more restrictive management changes based on "new" scientific information, the new information should be subject to the same LUPA procedure as current information. BLM should also review the reasons the current science is being replaced and hold the author(s) accountable for any bias or inaccuracy.

---

***Summary***

1. The BLM needs to include a monitoring, mitigation, and adaptive management plan/framework in the FEIS that will include specific criteria for determining sage grouse conservation success and how the disturbance percentages will be calculated.
2. BLM needs to clarify the relationship between the disturbance thresholds and the monitoring framework.
3. The BLM needs to release the mitigation strategy for public review.

---

***Response***

The BLM and the Forest Service complied with the NEPA by including a discussion of measures that may mitigate adverse environmental impacts of the alternatives in the DLUPA/EIS. See 40 CFR 1502.14(f), 1502.16(h). Potential forms of mitigation include: (1) avoiding the impact altogether by not taking a certain action or parts of an action; (2) minimizing impacts by limiting the degree or magnitude of the action and its implementation; (3) rectifying the impact by repairing, rehabilitating, or restoring the affected environment; (4) reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action; or (5) compensating for the impact by replacing or providing substitute resources or environments. 40 CFR 1508.20. Taking certain actions [or not taking action, depending on position of issue statement], such as [cite to any specific examples included with comments], is only one of many potential forms of mitigation. The BLM and the Forest Service must include mitigation measures in an EIS pursuant to the NEPA; yet the BLM and the Forest Service have full discretion in selecting which mitigation measures are most appropriate, including which forms of mitigation are inappropriate.

[Cite specifics relevant to the sub-regional for where the alternatives have incorporated mitigation measures designed to avoid or reduce impacts within the management actions and supporting information in the

appendices. If there are many, then note that the impacts presented in Chapter 4, therefore, are considered unavoidable and would result from implementing the management actions and mitigations. Cite a few examples of the actions that include specific mitigation measures as part of the alternative(s). Sample: “Action BIO-1: Implement the standard operating procedures (SOPs) contained in Appendix O (Biological Standard Operating Procedures) and Appendix P (Standard Operating Procedures for Oil and Gas) for all project work would help to mitigate effects as a result of oil and gas activities on biological resources.”]

A monitoring framework was developed by a Disturbance and Monitoring Team that focuses on the implementation and effectiveness of the conservation measures in the planning documents. The BLM and the Forest Service worked with WAFWA to define a standardized process for data sharing and definitions of priority areas of conservation boundaries. Monitoring methods and indicators were derived from the best available science. Corporate data-sets will be established so that data can easily be “rolled up” for reporting monitoring results across the range of greater sage-grouse, as defined by Schroeder et al. (2004); by populations and subpopulations as defined by Connelly et al. (2004); by LUP area; by the seven (WAFWA) Greater Sage-grouse Management Zones (Stiver et al. 2006), and by Priority Areas for Conservation (PACs) as defined in the greater sage-grouse Conservation Objectives Team (COT) Report (U.S. Fish and Wildlife Service 2013). [If needed, based on specifics of comments and/or summary statement, include statement to the effect that broad- and mid-scale monitoring will be conducted as funding allows.]

[Refer to the Monitoring Framework in the appendix.] To accomplish effective monitoring, the BLM and the Forest Service will analyze the monitoring data to characterize the relationship among disturbance, implementation actions, and habitat condition at the appropriate and applicable geographic scale or boundary. When available from WAFWA and/or state wildlife agencies, effectiveness monitoring can be supplemented with population trend information, taking into consideration the lag effect response of populations to habitat changes.

BLM/USFS must acknowledge that it is required to fully consider the need for mineral development along with the need for conservation of other resources. Simplot appreciates the difficult balancing act BLM/USFS

must achieve when dealing with competing resources; however, prohibiting mineral development cannot be the mode of action. BLM/USFS must recognize that the need for mineral development (to reduce the Nation's reliance on foreign sources of the minerals, to maintain our way of life and to provide for food security), may in fact be greater than the need to uniformly conserve millions of acres of sage-grouse habitat. As such BLM/USFS must demonstrate its compliance with the mandate under the Mining and Minerals Policy Act (30 U.S.C. §21(a)), and FLPMA (43 U.S.C. §1701(a)(12)) to recognize the Nation's need for domestic minerals.

**Organization 1:** Western Energy Alliance

**Commenter 1:** Kathleen M. Sgamma

**Comment Excerpt Text:**

FLPMA clearly identified mineral exploration and development as a principal or major use of the public lands. The Multiple-Use Sustained-Yield Act of 1960 specifically states: "Nothing herein shall be construed so as to affect the use or administration of the mineral resources of national forest lands ..."

The laws require the agencies to foster and develop mineral activities, not stifle and prohibit them. It does not appear this was a primary goal during the preparation of the LUPA/DEIS. The agencies must reconsider their view of oil, natural gas and mineral development when preparing the final LUPA/EIS and ROD.

**Organization1:** Wild Earth Guardians

**Commenter1:** Erik Molvar

**Comment Excerpt Text:**

The failure to look at the full range of reasonable alternatives is related to BLM's duty in any environmental analysis to develop, study, analyze and adopt mitigation measures to protect other resources. The ability to adopt post-leasing mitigation measures – see 43 C.F.R. § 3101.1-2 – is quite broad, as all reasonable measures not inconsistent with a given lease may be imposed by BLM. This is particularly true given that BLM, pursuant to FLPMA, must manage public lands in a manner that does not cause either “undue” or “unnecessary” degradation. 43 U.S.C. § 1732(b). Put simply, the failure of BLM to study and adopt these types of mitigation measures – especially when feasible and economic – means that the agency is proposing to allow this project to go forward with unnecessary impacts to public lands, in violation of FLPMA.

**Comment Excerpt Text:**

This alternative is noted as an "individual or conservation group" alternative in the DEIS but is identified in the Nevada DEIS as the alternative written by Western Watersheds Project ("WWP"). Transparency of this authorship allows the public to critically assess Alternative C in the context within which it was offered and intended. Consistent with WWP's mission, it would close 11 million acres of habitat to grazing. WWP's mission is succinctly stated on its website: "The time has come to end public lands ranching." See [www.westernwatersheds.org/issues/public-lands-ranching](http://www.westernwatersheds.org/issues/public-lands-ranching). This alternative cannot be adopted by BLM

because doing so would violate FLPMA, the Taylor Grazing Act, 43 U.S.C. 315a, et seq., the Public Rangelands Improvement Act, 43 U.S.C. 1901, et seq., and the Multiple Use Sustained Yield Act, 16 U.S.C. 528, et seq., all of which call for multiple use of federal lands including lands for livestock grazing.

---

**Comment Number:** IDMTSG-14-0180-6

**Organization1:**

**Commenter1:**C.L. Butch Otter

**Comment Excerpt Text:**

We recognize the difficult task the BLM faces in managing public lands; however, three of the alternatives do not fit within BLM's mission as a land manager. Alternative B is overly restrictive for infrastructure development and oil and gas activities. Alternative C would eliminate livestock grazing entirely and the addition of ACECs through Alternative F would restrict a variety of uses. Restricting uses or unnecessarily reducing agency discretion may seem to be the prudent course of action, but the result is BLM will lose the flexibility needed to anticipate future uses and needs of the country. Without a more complete analysis of how

infrastructure projects in the past decade have impacted the population of the species, such an overreaching proposal is unnecessary.

---

**Comment Number:** IDMTSG-14-0212-13

**Organization1:**Soda Springs Plant

**Commenter1:**Randy Vranes

**Comment Excerpt Text:**

Given the Agencies' multiple-use mandates for land use planning, and the flexibility provided under ESA Section 10 and Section 7, the Final LUP Amendment should not provide restrictions that manage solely for sage-grouse conservation to the exclusion of leasable mineral development. In both the Section 10 and Section 7 context, there is no absolute prohibition on activities that might "take" a species. Rather, project approval is based on whether, after applying the mitigation measures proposed by the applicant, the action will appreciably reduce the likelihood of the survival or recovery of the species, or result in jeopardy, respectively. The ESA permitting processes encourage cooperation between the Fish and Wildlife Service and the applicant to find solutions that allow the applicant's project to move forward while conserving the species. The Agencies should not, in an attempt to avoid an ESA-listing for the sage-grouse, make decisions that are more restrictive than if the species was listed under the ESA, and therefore, closing all federal nonenergy leasable minerals estate lands in PPMAs and PMMAs is unwarranted.

---

**Comment Number:** IDMTSG-14-0212-8

**Organization1:**Soda Springs Plant

**Commenter1:**Randy Vranes

**Other Sections:** 7.6

**Comment Excerpt Text:**

In Alternative B, the Agencies would close the PPMAs to phosphate leasing. See Draft LUPA/EIS pp. 2-181

(Management Action B-MNL-1), 2-26 (Table 2-2 showing closures by acreage). This would result in 8,304,600 acres being closed to non-energy leasable minerals (compared to 621,300 acres closed to leasables under existing LUPs). See Draft LUPA/EIS p. 2-26 (Table 2-2).

These management actions would unreasonably restrict the use of public lands for phosphate mining exploration or operations contrary to FLPMA's requirement to manage "in a manner which recognizes the Nation's need for domestic sources of minerals." 43 U.S.C. § 1701(a)(12). It is also contrary to FLPMA's requirement that land use plans observe principles of multiple use, which it defines to include "a combination of balanced and diverse resource uses that takes into account the long-term needs of future generations for renewable and non-renewable resources, including, but not limited to, recreation, range, timber, minerals, watershed, wildlife and fish, and natural scenic, scientific and historical values." Id. §§ 1702(c), 1712(c)(1) (emphasis added). Closing PPMAs to phosphate or other leasable minerals entries would be contrary to the Agencies' multiple use obligations and would not serve the proper combination of balanced and diverse resource uses. It also would eliminate or discourage significant opportunities for the Agencies to work with the mining industry to develop offsite mitigation or conservation plans that could provide a net benefit to sage-grouse or their habitat in exchange for allowing some mineral development within PPMAs. Further, the Agencies have not shown that leaseable minerals operations have in the past negatively impacted the long-term viability of the sage-grouse, and accordingly, why it now makes sense to eliminate the industry on certain public lands where there is no demonstrated track record of such negative impacts by the industry.

---

### ***Summary***

The DLUPA/EIS has failed to comply with the multiple-use mandates found in the BLM's FLPMA and the Forest Service's Multiple Use Sustained Yield Act because it has put protecting greater sage-grouse and sage-grouse habitat above legal requirements for balanced management.

---

### ***Response***

NOTE TO BLM: this is the full national response and has been reviewed by SOL:

The BLM's FLPMA (Section 103(c)) defines "multiple use" as the management of the public lands and their various resource values so that they are utilized in the combination that will best meet the present and future needs of the American people. Accordingly, the BLM is responsible for the complicated task of striking a balance among the many competing uses to which public lands can be put. The BLM's multiple-use mandate does not require that all uses be allowed on all areas of the public lands. The purpose of the mandate is to require the BLM to evaluate and choose an appropriate balance of resource uses which involves tradeoffs between competing uses. The FLPMA also directs the United States (US) Department of the Interior, Bureau of Land Management (BLM) to develop and periodically revise or amend its Resource Management Plans (RMPs), which guide management of BLM-administered lands, and provides an arena for making decisions regarding how public lands would be managed and used.

Consistent with the Multiple-Use Sustained-Yield Act of 1960 (16 U.S.C. 528–531) (MUSYA), the Forest Service manages National Forest System land to sustain the multiple use of its renewable resources in perpetuity while maintaining the long-term health and productivity of the land. Resources are managed through a combination of approaches and concepts for the benefit of human communities and natural resources. Land management plans guide sustainable, integrated resource management of the resources within the plan area in the context of the broader landscape, giving due consideration to the relative values of the

various resources in particular areas. The Forest Service is required by statute to have a national planning rule: the Forest and Rangeland Renewable Resources Planning Act of 1974, as amended by the National Forest Management Act of 1976, requires the Secretary of Agriculture to issue regulations under the principles of the Multiple-Use Sustained-Yield Act of 1960 for the development and revision of land management plans.

The [*name of particular amendment*] is a targeted amendment specifically addressing goals, objectives, and conservation measures to conserve greater sage-grouse and to respond to the potential of its being listed (see Section 1.XX, Purpose and Need). Both, the Forest Service's and BLM's planning processes allow for analysis and consideration of a range of alternatives in the DLUPA/EIS that identified and incorporated appropriate regulatory mechanisms to conserve, enhance, and restore greater sage-grouse habitat and to eliminate, reduce, or minimize threats to this habitat to ensure that a balanced management approach was recommended. The DLUPA/EIS includes alternatives that provide a greater and lesser degree of restrictions in various use programs, but would not eliminate or invalidate any valid existing development rights. For example, [*insert one or more examples of the range of actions considered, include references to sections/table where they can be found*].

Additionally, the BLM and the Forest Service developed the [*name LUPA/EIS*] with involvement from cooperating agencies, including [*name various agencies, including the state wildlife agency, state's governor's office, other fed agencies, any local agencies/governments*] to ensure that a balanced multiple-use management strategy to address the protection of greater sage-grouse while allowing for utilization of renewable and nonrenewable resources on the public lands.

"Since the direction in these plans is already included within the existing range of alternatives these county plans were not included as additional unique alternatives for detailed analysis."

We disagree with this statement as the authors of the DEIS failed to capture the comprehensive nature of the Custer County Plan. It was not designed to function properly if policies are randomly selected for the purpose of justifying different agendas. Rather it is to be implemented comprehensively. Each of the principles and policies were deliberately designed to work together to ensure that the relationship between the cause of impacts and conservation measures implemented would never be separated and would always be guided by an active and current science based perspective. Pointing to different alternatives, each agreeing with one or two of the Counties policies is bad governance. It does not satisfy NEPA's requirement that conflicts with the County's plan and the agency's proposed action be resolved in the NEPA document. A Custer County Alternative should be developed that could be selected as part of the proposed action for the area within the political boundaries of Custer County.

NEPA requires that "Where an inconsistency exists [with local plans] the statement should describe the extent to which the agency would reconcile its proposed action with the plan or law." (40 CFR 1506.2(d)) Because the agency has selected two possible alternatives, and plans to choose different parts of each, the parts of which are not specifically identified, then it becomes impossible for the county to comment on whether or not the proposed action is consistent with its plans. A proposed action should be clearly identified, and the draft document redistributed for comment to allow for adequate public and county input.

**Comment Excerpt Text:**

certain passages in Alternative E focus solely on protecting the CHZ, emphasize the use of the IHZ as the "buffer zone" to protect the CHZ, and appear to diminish the State's commitment to protecting the IHZ:

IHZ: Provide a population buffer to CHZ to minimize the risk of habitat loss from wildfire, invasive species while providing the opportunity to consider limited, high-value infrastructure development  
-Idaho and Southwestern Montana Greater Sage-Grouse DEIS, E-OBJ-2 on p. 2-95

This following citation appears to further demote the IHZ from a buffer zone to more of a sacrifice zone:

The State will be able to provide a level of protection to conserve at least 65% of the current known leks within the State, which are fully captured in the CHZ.

-State of Idaho Alternative, Idaho and Southwestern Montana Greater Sage-Grouse DEIS, Volume III-A, p. D-29.

We recommend that the BLM, Forest Service and State of Idaho commit to maintaining sage-grouse populations and habitat within the IHZ and restore habitat in strategic locations, as recommended:

In light of these significant uncertainties, impacts to sage-grouse and their habitats should be avoided to the maximum extent possible to retain conservation options. This approach will ensure that potentially unidentified key components to long- term viability of sage-grouse are not lost, and that management

flexibility and the ability to implement changes will be retained as current information gaps are filled.  
-Greater Sage-Grouse Conservation Objectives Final Report, page 31.

**Comment Excerpt Text:**

there is little or no discussion in any of the proposed alternatives as to how those alternatives, if adopted, would conflict with existing state and local plans, such as the State of Montana's sage-grouse management strategy.

---

***Summary***

The BLM's actions considered in the alternatives conflict with local and state agency plans and policies; furthermore, the BLM did not review all of the county and state plans to ensure that conservation measures are as consistent as possible with other planning jurisdictions.

---

***Response***

The BLM land use plans and amendments must be consistent with officially approved or adopted resource-related plans of Indian tribes, other Federal agencies, and State and local governments to the extent that these resource-related plans comport with FLPMA and other Federal laws and regulations (see 43 CFR 1610). The BLM has worked closely with State and local governments during preparation of the Draft LUPA/EIS. The Draft LUPA/EIS lists the cooperating agencies actively involved in the planning process in Section 6.XX. The BLM works to find a balance among uses and needs as reflected in these local government plans and has done so in the preparation of the LUPA/EIS; a list of these plans can be found in Chapter 1, Section 1.XX, Relationship to Other Policies, Plans, and Programs. While the BLM is not obligated to seek consistency, the agency is required to describe the inconsistencies between the proposed action and the other plans, policies, and/or controls within the EIS. This information has been updated in the FEIS. [NOTE TO BLM: Might need to add this sentence (regarding obligations) to Section 1.7, Relationship to Other Policies, Plans, and Programs, of the FEIS. Also need to ensure that the FEIS describes any such inconsistencies.]

The BLM coordinates with cooperating agencies commensurate with each agency's recognized jurisdiction or expertise. In areas where the State of Idaho has clear jurisdiction, such as wildlife populations, the BLM has worked closely with that State agency. In cases where a county or agency has expertise, such as local county socioeconomic information, the BLM has worked closely with the group to incorporate the information into

the EIS.

NOTE TO BLM: plans, policies that commenters felt needed to be reviewed for consistency:  
 Gooding conservation district sage grouse conservation plan  
 National Academy of Sciences 2013 recommendations for the WHB program  
 State of MT sage-grouse management strategy  
 Custer County plans  
 Owyhee County plans

Further, because mineral exploration and development are recognized and acceptable uses of public lands, the multiple use mandate requires BLM and the USFS to work diligently to find ways to remain flexible and ensure that resources can be developed in a manner that has minimal impacts to GRSG.

#### ***Summary***

The BLM did not provide an explanation for how and why they defined the planning area as they did.

#### ***Response***

[NOTE TO BLM: This is from a national response.]

The framework for the scope of analysis for the project is based upon the BLM and the Forest Service Planning and NEPA manual and handbooks definitions of the planning, decision, and analysis areas. Specifically, Forest Service Manual 1900-Planning Chapter, Zero Code defines the Area of Analysis as “The geographic area within which ecosystems, their components, or their processes are evaluated during analysis

and development of one or more plans, plan amendments, or plan revisions. This area may vary in size depending on the relevant planning issue. For a plan, an area of analysis may be larger than a plan area. For development of a plan amendment, an area of analysis may be smaller than the plan area and include multiple ownerships.”

For this environmental impact statement, decision areas are those public lands and mineral estates within the planning area that are encompassed by all designated habitat (ADH) (which includes preliminary priority habitat [PPH], preliminary general habitat [PGH], and linkage/connectivity habitat).

**Planning Area.** The geographic area within which the BLM will make decisions during a planning effort. A planning area boundary includes all lands regardless of jurisdiction; however the BLM will only make decisions on lands that fall under the BLM’s jurisdiction (including subsurface minerals). Unless the State Director determines otherwise, the planning area for a RMP is the geographic area associated with a particular field office (43 CFR 1610.1(b)). State Directors may also establish regional planning areas that encompass several field offices and/or states, as necessary.

**Plan areas.** National Forest System lands covered by land use plans. (36 CFR 219.16)

[If not included in DEIS already, make a notation that the FEIS will be updated to note definitions of planning, decision, and analysis areas to clarify these terms.]

Given the benefits shown above, any alternative that arbitrarily reduces, eliminates or allows retirement of livestock grazing AUMs is contradictory to the goal of long-term sage grouse conservation. In addition, there is statutory evidence and case law, that the BLM is overstepping its bounds in the DEIS by suggesting that grazing permits may be terminated permanently. The BLM is authorized to decrease or temporarily discontinue grazing through a decision process, but the Taylor Grazing Act and Federal Land Policy Management Act mandate that forage resources on grazing districts, if deemed healthy, are to be made available for livestock grazing. Eliminating grazing on public land will also result in reduced or eliminated grazing on intermingled state land and a subsequent decline in funding available to the endowed institutions of the state.

Section 363 of the Energy Policy Act of 2005 (EPAAct) requires federal land management agencies to ensure that lease stipulations are applied consistently and to ensure that the least restrictive stipulations are utilized to protect many of the resource values to be addressed. The LUPA/DEIS ignores established BLM policy that states “the least restrictive stipulation that effectively accomplished the resource objectives or uses for a given alternative should be used.” Moreover, the agencies have failed to demonstrate that less restrictive measures were considered but found insufficient to protect the resources identified. A statement that there are conflicting resource values or uses does not justify the application of restrictions. Discussion of the specific requirements of a resource to be safeguarded, along with a discussion of the perceived conflicts between it and oil and natural gas activities must be provided.

**[This comment refers specifically to Alternative D] The BLM should reconsider whether sage-grouse habitat is “chiefly valuable” for livestock grazing.**

Most grazing on BLM lands occurs within grazing districts established by the Taylor Grazing Act of 1934 (43 U.S.C. § 315). The act required the Secretary of Interior to determine that lands within grazing districts were “chiefly valuable” for livestock grazing (43 U.S.C. § 315). However, the Secretary can also separately conclude that any lands within grazing districts are “more valuable or suitable for any other use than for [grazing]” (43 U.S.C. § 315f). To meet the purpose and need of the National Greater Sage-Grouse Planning Strategy (76 Fed. Reg. 77009) and the draft Idaho/SW Montana plan (ES-4), the Secretary should, as part of the current planning process, reconsider whether sage-grouse habitat, or a subset of extant habitat (e.g., priority habitat), in grazing districts is still “chiefly valuable” for grazing as opposed to other priorities, such as sage-grouse conservation. The Secretary can adjust boundaries of grazing districts to exclude grazing where it may continue to harm the species.

it is unclear how the Agencies intend to apply the three percent disturbance cap to mining activities authorized under the Mining Law of 1872. BLM's land use planning process "cannot be used to preclude mining or restrict certain types of mining activities." BLM Surface Management Handbook, H-3809-1, at 8-14 (Sept. 17, 2012). Specifically, land use plans "cannot be used to 'zone' areas where open pit mining is not allowed . . . or generally place limits on the type or size of an operation." Id. If the Agencies intend that the disturbance cap will be used to preclude locatable minerals activities in certain areas once the threshold is met, the disturbance cap would create de facto mineral entry withdrawal "zones" in violation of the Agencies' mineral entry withdrawal regulations and policy. See Sw. Res. Council, 96 IBLA 105, 120 (1987); BLM Surface Management Handbook, at 8-14. In order to clarify that the three percent disturbance cap would not apply to locatable minerals activities, the Final LUP Amendment should clarify that the three percent cap would not be implemented in a manner to interfere with mining activities authorized under the Mining Law of 1872

**GOALS**

Goals expressed in B-GOAL-1 and D-GOAL-1 should not be pursued to the detriment of existing legal uses, should not be contrary to the Taylor Grazing Act or FLPMA, and should not be pursued to the detriment of BLM/USFS multiple-use mandates.

**Comment Number:** IDMTSG-14-0325-16**Organization1:****Commenter1:** William J. Mulder**Comment Excerpt Text:**

Livestock grazing on BLM lands is regulated by the Taylor Grazing Act and FLPMA.

Livestock grazing is regulated on USFS and BLM lands by permit conditions which specify use dates, livestock stocking rates, exclosures, salt/supplement locations, etc ..

Livestock grazing is subject to detailed forage use and rangeland health standards.

Every aspect of livestock grazing on USFS and BLM lands is regulated.

Livestock permit retirement and/or relinquishment are regulated under relevant statute. D-LG/RM-7 should be deleted.

***Summary***

The BLM has failed to document how the EIS and/or actions considered in the EIS comply with other laws, including all Onshore Orders regulating oil and gas development, the Energy Policy Act of 2005 and Energy Policy and Conservation Act of 2000, the Taylor Grazing Act, the Mining and Minerals Policy Act, the Information Quality Act, the Wild Horse and Burro Act, other multiple use mandates (e.g., Multiple-Use Sustained Yield Act of 1960, Forest and Rangeland Renewable Resources Planning Act of 1974, National Forest Management Act of 1976), and compliance with other federal agency regulations (e.g., XXX).

***Response***

[NOTE TO BLM: This response may need to go up the chain for review.]

As noted under Section 5 of this Report, the Draft LUPA/EIS is consistent with the BLM's FLPMA and the Forest Service's Multiple-Use Sustained-Yield Act of 1960 (16 U.S.C. 528–531) (MUSYA). The Idaho Greater Sage-Grouse Land Use Plan Amendment is a targeted amendment specifically addressing goals, objectives, and conservation measures to conserve greater sage-grouse and to respond to the potential of it being listed (see DEIS Section 1.2, Purpose of and Need for the Land Use Plan Amendments). Both the Forest Service's and BLM's planning processes allow for analysis and consideration of a range of alternatives in the DLUPA/EIS that identified and incorporated appropriate regulatory mechanisms to conserve, enhance, and restore greater sage-grouse habitat and to eliminate, reduce, or minimize threats to this habitat to ensure that a balanced management approach was recommended. The DLUPA/EIS includes alternatives that provide a greater and lesser degree of restrictions in various use programs, but would not eliminate or invalidate any

valid existing development rights.

Additionally, the BLM and the Forest Service developed the Idaho Greater Sage-Grouse Draft Land Use Plan Amendment/DEIS with involvement from cooperating agencies (see DEIS Section 6.3, Cooperating Agencies), including [*ID state wildlife agency, counties, etc.*] to ensure that a balanced multiple-use management strategy to address the protection of greater sage-grouse while allowing for utilization of renewable and nonrenewable resources on the public lands.

The Draft EIS Section 2.5, Management Common to All Alternatives (pages 39 and 40), states that all alternatives would comply with state and federal laws, regulations, policies, and standards, and implement actions originating from laws, regulations, and policies. Actions in the Proposed LUPA have been reviewed and found to be consistent and within the bounds of all required laws, regulations, and policies.

**Commenter1:**Kathleen M. Sgamma

**Comment Excerpt Text:**

The Department of the Interior (DOI) has been criticized by the Western Association of Fish and Wildlife Agencies (WAFWA) for using the NTT report as BLM’s only source of GSG management direction. In a letter sent to the Interior Secretary on May 16, 2013, WAFWA member states made it clear they never endorsed the sole use of the NTT or any other scientific publication. Rather, they believe that a wide variety of peer reviewed publications that collectively provide the best available science for GSG should form BLM’s basis for conserving the species. They went on to recommend that management and regulatory mechanisms be centered upon the best available science which would provide the best strategy for near- and long-term management of GSG and provide the best opportunity for precluding a listing under ESA.

We are concerned that many of the Required Design Features (RDF) recommended by the NTT are included in the LUPA/DEIS. These features fail to reflect the complexity of oil and natural gas exploration and development and represent a one-size-fits-all management approach that disregards topography, local conditions, and practicality. We recommend that the agencies revisit the RDFs proposed in the LUPA/DEIS to ensure they are technically feasible and appropriate. Further, the agencies must maintain flexibility required when considering design features on a site-specific basis. For these reasons, we strongly urge the agencies to refrain from directly incorporating any of the NTT report recommendations into the preferred alternative in the final LUPA/EIS and ROD.

**Comment Number:** IDMTSG-14-0149-6

**Organization1:** Western Energy Alliance

**Commenter1:** Kathleen M. Sgamma

**Comment Excerpt Text:**

To further elucidate these concerns, attached to these comments is an independent review of the NTT report, entitled Review of Data Quality Issues in A Report on National Greater Sage-Grouse Conservation Measures Produced by the BLM Sage-Grouse National Technical Team (NTT).<sup>2</sup> [Full citation provided for this report: Review of Data Quality Issues in A Report on National Greater GRSG Conservation Measures Produced by the BLM GRSG National Technical Team (NTT) Dated December 21, 2011. Dr. Rob Roy Ramey. (September 19, 2013)]

This review describes a number of shortcomings with the report, including:

- ? Failure to use the best available science
- ? Selective presentation of scientific information
- ? Misrepresentation of the impact of oil and natural gas operations on GSG
- ? Disproportionate influence from a small group of specialist advocates
- ? Bias against voluntary conservation
- ? Unnecessarily restrictive recommendations
- ? Undefined priority habitat
- ? Lack of credible peer review.

**Comment Excerpt Text:**

The NTT Report does not enjoy any presumption of validity; it never went through Administrative Procedure Act ("APA") rulemaking. The development of the NTT Report was a closed process lacking important insight and input from the public. When a federal agency issues a directive concerning the future exercise of discretionary power, APA notice and comment procedures are required if the directive constitutes a substantive rule. Even though BLM may have considered the NTT Report as a general statement of policy and not subject to the APA, the agency's label given to its exercise of administrative power is not determinative. The NTT Report constituted a legislative rule that should have been noticed for comment pursuant to APA Section 553 (5 U.S.C. § 553(b)-(c)). Because the NTT Report is a necessary element of BLM's planning pursuant to Instruction Memorandum 2012-044, the Report will determine the substantive outcome of the revisions of the land use plans and have a practical binding effect that will be applied to private parties including the delay or denial of applications or the imposition of certain terms and conditions for use of Sage-grouse habitat.

In an opinion by Idaho Federal District Judge B. Lynn Winmill, he made a statement in dicta that the NTT

Report is the best available science. See *Western Watersheds Project v. Salazar*, 2012 WL 5880658 at \*2 (D. Idaho Nov. 20, 2012). But Judge Winmill's comment was not based on a thorough discussion of the merits of the NTT Report, especially in light of subsequent reports and scientific statements that throw into question the validity of the NTT Report and its creation. For example, the Service's Conservation Objectives Team ("COT") Report also purports to be the best available science. See Section 1.1.1. The State of Nevada's plan purports to be the best available science. See Section ES.8.5.

WAFWA sent a letter to the Secretary of the Interior on May 16, 2013 cautioning against using the NTT Report's "one size fits all" approach. The NTT Report suffers from possible Federal Advisory Committee Act problems due to the constitution and makeup of the NTT Committee and the lack of compliance with Federal Advisory Committee Act's standards. 5 U.S.C. App. 2, §§ 1-16.

Peer review comments on the NTT Report dated December 18, 2012 also raise a number of concerns related to the scientific integrity of the Report. These reviewer comments were attached to correspondence from Secretary Salazar to Congressman Doc Hastings dated December 18, 2012. The review comments speak for themselves but specific comments raise significant concerns:

- "The approach taken in the document is rather short-term and narrow."
- "This seems a strange blend of policy loosely backed by citations, with no analysis of the science."
- "Lack of consideration of space, and particularly (in this document) time is a critical mistake that, to me, renders this document problematic, if not dangerous."

The FEIS should explain how these and other critical comments were incorporated into the final version of the NTT Report that was issued very shortly after this critical peer review.

**Comment Number:** IDMTSG-14-0157-2

**Organization1:** Y-3 II Ranch

**Commenter1:** Christopher Clark

**Comment Excerpt Text:**

The NTT Report was followed very shortly by BLM's Instruction Memorandum 2012-044 providing BLM's strategy for revision of the Idaho and other land use management plans. IM 2012-044 never went through the Administrative Procedure Act rulemaking process nor was it subjected to analysis under the National Environmental Policy Act. Therefore, it does not enjoy a presumption of validity. The same is true regarding the NTT Report. These concerns will be set forth below in the portion of these comments dedicated to a discussion of Alternative B that is based upon the NTT Report. Suffice it to say at this juncture that the concerns regarding the NTT Report both as to AP A and NEP A compliance and other concerns infect not only Alternative B but the other alternatives that are based in whole or in part upon the NTT Report including Alternative C, Alternative D, and Alternative F.

## Alternative D, the BLM “Co-Preferred” Alternative, Fails to Appropriately Balance Resource Use and Resources under FLPMA

### a. Alternative D is Fatally Tainted by the NTT Process and is Not Grounded in the Best Available Science

Alternative D, the Sub-regional “Adjusted” Alternative, would restrict large-scale infrastructure development across 8.3 million acres within Idaho and provides a laundry list of BMPs on the remainder of the identified threats. Alternative D also includes an additional 700,000 acres of habitat outside of what the USFWS called for the Priority Area Conservation areas, or PACs, under the COT approach.

The failure of the BLM Adjusted Sub-Regional Alternative is that it is dependent on assumptions developed from the fatally-flawed NTT process. As described earlier, the NTT Report is based on stale science and otherwise fails to properly account for categorical statutory commands under the Mining Law and FLPMA. In short, if the “NTT-only” Alternative, (Alternative B) cannot meet the purpose and need of this LUPA process, Alternative D cannot meet the purpose and need either.

The NTT Report was published in December 2011. Nearly two years have passed since its publication. The last two years, both Governor’s Alternative and the Service’s final COT Report were published and reflect the current best available science. The WAFWA has agreed, stating in a letter that the NTT alone is not the best available science for sage-grouse. See Exhibit 7.

Further, the NTT Report has been used to support a four-mile buffer around active leks. This buffer size is far greater than necessary and relies upon suspect data, unfounded assumptions, and uncertain modeling. The presumed necessity of 4-mile radius NSO buffer around sage grouse leks is based upon the subjective opinion of the NTT and selected authors. The practical effect of such a restriction would be to "protect" vast areas of non-habitat and marginal habitat with no demonstrable benefit to sage grouse populations. The area of this 4-mile radius circle surrounding each lek is 50 square miles per breeding area. This scientifically unsupported land reservation element in the proposed Alternative is not supported. Further, 50 square miles is equivalent to about 32,000 acres per lek—a withdrawal of which far exceeds 5,000 acres and thus violates FLPMA’s Congressional approval requirement. thus violates FLPMA’s Congressional approval requirement

The Instruction Memorandum Requiring Consideration of the NTT Report has Expired

In addition to having been overcome by subsequent scientific review and assessment of GRSG science, the use of the NTT Report to inform any “NTT-Only” Alternative or “Adjusted” Alternative is inappropriate because Instruction Memorandum (IM) 2012-044, directing consideration of the NTT Report, has expired. The IM expired September 9, 2013, well ahead of the publication date of the LUPA/DEIS reviewed here.

However, there is no acknowledgment in the DEIS documents of the expiration of the IM or explanation of any continuing authority to include any NTT Report recommendation for GRSG conservation into any proposed Alternative. This IM has apparently failed to continue as a policy directive for the agency. Additionally, the Purpose and Need Statement does not disclose that one of the main purposes of the DEIS to respond to Instruction Memorandum 2012-044, see discussion below.

**Comment Number:** IDMTSG-14-0159-6

**Organization1:**American Exploration and Minind Association

**Commenter1:**Laura Skaer

**Comment Excerpt Text:**

The DLUPA/DEIS incorporates the NTT Report’s habitat management recommendations for GRSG priority habitat, including prescriptive restrictions and categorical prohibitions on access and use of lands within priority habitat including, among others: 1) 3% limit on surface disturbance; 2) 50-70% sagebrush cover threshold; 3) four-mile No Surface Occupancy (NSO); 4) Right-of-Way (ROW) exclusion and avoidance areas; 5) one disturbance per 640 acres; and 6) mineral withdrawals.

The DLUPA/DEIS proposes arbitrary conservation measures based on unproven assumptions that: 1) a minimum range of 50 -70% of the acreage in sagebrush cover is required for long-term persistence of sage-grouse; 2) that discrete anthropogenic disturbances must be limited to less than 3% of the total sage-grouse habitat regardless of ownership, NTT Report at 6-7; and 3) a 15-25% minimum canopy cover is necessary in all sage-grouse seasonal habitats.

These arbitrary measures conflict with studies that indicate sagebrush cover preference differs between seasons. Thus, using a single percent cover is inappropriate and is not supported by the literature. A one-size-fits-all limit on disturbance to less than 3% of the total habitat is arbitrary, which is discussed in detail below. The United States Geological Survey (USGS) Report indicates that habitat fragmentation “generally begins to have significant effects on wildlife when suitable habitat becomes less than 30 to 50 percent of the landscape”, which directly contradicts the threshold stating that 70% of the landscape must be suitable habitat in order for the sage-grouse to persist.<sup>18</sup>

According to ES 14, Alternative B “focuses on restrictions on resource uses...”. Simply by reading the summary, it is clear that this alternative ignores the agencies’ multiple use mandates and proves that there is a predetermined desire to eliminate land use. Further, the use of the BLM National Technical Team (NTT) report is problematic as it contains overly burdensome recommendations that are not based on local conditions in Idaho. The NTT report fails to make use of the latest scientific and biological information available. According to an independent review of the report, it contains many methodological and technical errors, selectively presents scientific information to justify recommended conservation measures, and was disproportionately influenced by a small group of specialist advocates (Ramey, 2013). For these reasons, Alternative B and the NTT report should no longer be considered a suitable or appropriate management guide for sage grouse and no parts of the report should appear in the final LUPA/DEIS.

## 2. The NTT Report Does Not Provide Adequate Support for its Conclusions

The NTT Report has been used to support anthropogenic disturbance caps of less than five percent and total disturbance caps of less than 30 percent without any scientific data that they are: (1) scientifically defensible; (2) achievable; (3) would result in stable GSG populations; (4) would not result in irreparable harm to other species; and (5) would not unnecessarily have a negative effect on local economies.

The NTT report recommended numerous one-size-fits-all regulatory prescriptions, and made no allowance for recommendations for including local sage grouse conservation plans (i.e. county-level, working group, or private land) that have tailored conservation measures to local conditions, including unique habitat and threats, and socio-economic factors.

The new best management practices (BMP) proposed by the NTT are unnecessarily restrictive, are not supported by scientific information, and do not address specific cause and effect mechanisms that are known to be deleterious to sage grouse. The imposition of new BMPs was made without any tracking and testing of the effectiveness of currently required BMPs.

According to WAFWA, the NTT report provides valuable information, but it does not reflect all of the current science, especially that found in the Studies in Avian Biology volume “Greater Sage-Grouse: Ecology and Conservation of a Landscape Species and Its Habitats” and other recent peer-reviewed publications.<sup>58</sup>

**Comment Number:** IDMTSG-14-0180-7

**Organization1:**

**Commenter1:**C.L. Butch Otter

**Comment Excerpt Text:**

The NTT Report is part of the BLM’s National Sage-Grouse Conservation Strategy. This strategy is highly bureaucratic, relying on the development of 15 or more teams. It is led by a sage-grouse coordinator that appears to have no real experience with either sage-grouse or sagebrush. This approach is heavily dependent on the National Technical Team. The goal of the National Technical Team was to ensure BLM management actions were effective and based on the “best available science.” Should not the test isn’t best available science it’s the data that matters and that data comes from the species manager – the State. To achieve that end, logically, the team would be comprised of highly qualified and knowledgeable scientists that would largely be independent of BLM. Instead, 78% of this 23 member team were federal employees; with 61% coming directly from BLM. Of the 23 members, none have more than 15 years of experience with sage-grouse or sagebrush or a substantial publication record. This is not for lack of highly knowledgeable, independent scientists to call on for such a study. In fact, at least two state and two university biologists, one of which Idaho heavily relied on, with a combined total of more than 100 years of experience dealing with sage-grouse were not involved. Out of twenty senior authors of chapters in the SAB volume on sage-grouse, only two were on the Technical Team. Neither of those two team members has more than 15 years working on sage-grouse. There were four authors of sage-grouse management guidelines, which were used in Alternative E, but none of these authors were on the Technical Team. This seems to violate the decision in Western Watersheds where the court found that while the Service consulted experts, the agency excluded them from the listing decision, thus violating the statutory requirement that “best science” be applied.<sup>36</sup> This

creates “opacity when transparency is required.”<sup>37</sup>

the key studies cited in the NTT Report, Lyon and Anderson (2003), erroneously characterized oil and gas development as having a negative effect on sage grouse nest initiation rates. That unsupported opinion has been cited by the BLM as a scientifically valid conclusion in the NTT Report. However, the authors acknowledged that the data they developed was not statistically significant, stating that their conclusions were based on subjective believe, stating: "Finally, even though nest initiation between disturbed and undisturbed hens was not statistically significant, we believe lower initiation rates for disturbed hens were biologically significant and could result in lower overall sage grouse productivity." Additionally, Holloran (2005) reported that nest success that was virtually identical and not significantly different between disturbed and undisturbed areas, using a much larger sample size compared to Lyon and Anderson (i.e., n=213 used by Holloran vs. n=77 used by Lyon and Anderson). Holloran also reported results indicating the probability of sage grouse survival was higher (61.5 +6.4%) in disturbed areas compared to less disturbed areas (29.6 +18.1%) or control areas (48.5 +14.4%).

**Organization1:**SBS Associates LLC

**Commenter1:**Suzanne Budge

**Comment Excerpt Text:**

The requirement of 4-mile buffers and surface disturbance caps (whether they are 3% or 5%) is based on the

opinions of selected authors, some of whom were NTT members<sup>6</sup> and the erroneous assumption that a local and temporary displacement of sage grouse from an area of development establishes that a population decline has occurred. However, none of the cited studies actually ever documented a population decline. One of the most frequently cited reports, the unpublished dissertation by Holloran (2005), is outdated and proved incorrect in its prediction of population declines in the Pinedale area of -8.7 to -24-4% annually. More recent data from Wyoming has documented that the sage grouse population in Pinedale actually increased from 1990 to 2012. It has consistently been above statewide averages and has the highest density of sage grouse in the state.

6 The presence on the NIT of authors whose studies became the basis for the policy choices made in the NTI Report raises obvious questions regarding the quality and reliability of the analysis in the NTI Report, and consequently every NEPA document that relies upon it.

Development on previously existing oil and gas leases should be restricted to levels that will have no negative effect on sage grouse, in accordance with the recommendations of the BLM's own National Technical Team

---

***Summary***

Commenters contended that the NTT report is not based on the best available science, contains technical and methodological errors, is not based on local conditions, and has not undergone adequate peer review. Commenters questioned why the NTT report was used when the IM requiring its use has expired.

---

***Response***

A National Technical Team (NTT) was formed as an independent, science-based team to ensure that the best information about how to manage the greater sage-grouse is reviewed, evaluated, and provided to the BLM and the Forest Service in the planning process. The group produced a report in December 2011 that identified science-based management considerations to promote sustainable greater sage-grouse populations. The NTT report (NTT 2011) used the best current scientific knowledge to guide the BLM planning efforts through management considerations to ameliorate threats, focused primarily on priority greater sage-grouse habitats on public lands. The NTT report cited 122 references including published papers from the formal scientific literature such as Journal of Wildlife Management, Conservation Biology, Biological Conservation, Wildlife Biology, BioScience and others, as well as graduate theses and dissertations, conservation strategies, FWS 2010 finding, and others representing the best available science. The NTT report was intended to be used at a programmatic scale and may not reflect local conditions.

The BLM used the NTT report per BLM IM 2012-044 to construct an alternative that would meet the purpose and need. This report was not the only source of information for developing a range of alternatives (see Section 7.5, Range of Alternatives).

[NOTE TO BLM- Clarify in FEIS the policy requirements for Administrative Procedure Act (APA), NEPA relative to IM, and NTT and clarify the NTT process and FACA in the FEIS.]

BLM is implementing IM 2012-044 through the Greater Sage-grouse planning effort. When an IM expires without being superseded, it can still be applicable and provide guidance to the BLM. The fact that IM 2012-044 expired does not mean the BLM has no authority to continue to analyze the conservation measures identified in the NTT Report. The BLM is appropriately considering and evaluating the measures in the NTT

Report, in addition to any other relevant science, through the Greater Sage-grouse planning process.  
 {Note: Suggest asking for National justification of why the NTT was an appropriate source}

The Manier report also does not include a critical analysis of vegetation manipulation treatment harms. Recent review papers summarize large-scale problems with aggressive treatments of both sagebrush and pinyon-juniper. See Hess and Beck 2010 and 2012, Jones et al. 2013.

## ***Summary***

The BER contains outdated baseline literature and the EIS should be updated with suggested literature.

## ***Response***

[NOTE TO BLM: The BLM is reviewing suggested literature and will include where necessary.]

A baseline environmental report, titled Summary of Science, Activities, Programs, and Policies That Influence the Rangeland Conservation of Greater Sage-grouse (*Centrocercus urophasianus*) (referred to as the BER), was released on June 3, 2013, by the U.S. Geological Survey. The peer-reviewed report summarizes the current scientific understanding about the various impacts to greater sage-grouse populations and habitats and addresses the location, magnitude, and extent of each threat. The data for this report were gathered from BLM, Forest Service, and other sources and were the best available at the range-wide scale at the time collected. The report provides a framework for considering potential implications and management options, and demonstrates a regional context and perspective needed for local planning and decision-making.

The BLM reviewed the literature sources provided by commenters to determine if there were new or updated sources that should be considered in the EIS. BLM's findings of this review were... [insert the results from the literature review. While it doesn't directly address the BER report being updated, it's addressing the point that BLM did make the effort to consider new or updated info in the EIS in addition to the BER report.]

While there was consistent direction provided in alternative develop, such as BLM WO IM 2012-044, variation across sub-regionals was needed to accommodate the local issues and specific state and Forest Service requirements.

Alternative D was developed by the BLM in coordination with the Forest Service and local FWS. This alternative includes modifications to the conservation measures identified in the NTT report and is designed

to address local ecological site variability. This alternative also emphasizes balancing resources and resource use among competing human interests, land uses, and the conservation of greater sage-grouse habitat. Alternative E was developed from recommendations by the State of Idaho's greater sage-grouse task force and would apply to all BLM-administered and National Forest System lands located in the state. See Section 2.1.2 regarding alternative development and explanation of components of each alternative. {Note: Suggest including more justification of the BER in response}

Vol2, Page 2-37: Regarding Alternative D- Habitat Triggers

1. A net 20 percent loss in mid-late sagebrush cover anywhere within the population area.
2. A net 10 percent loss of nesting habitat within the population area.
3. A net 10 percent loss of winter habitat within the population area.

It is unclear as to how these would be applied since there is no definition of "population area". It is entirely unclear as to how the status of the triggers would be discovered. The wording implies a far greater ability to precisely determine habitat loss than is the actual case. The methods and protocols for distinguishing population areas, seasonal habitats and for assessing the status of habitat triggers are not adequately defined and described.

The trigger would cause all PMMA areas to be managed as PPMA. Thus, the scope of the effect (in all PPMAs) of hitting a trigger is substantially greater than the assessment of trigger status in a "population area". Thus, a disastrous fire in some remote "population area" would trigger a change in management for the entire planning area. Such action is neither warranted nor productive.

The concept of habitat triggers, assessment of trigger status and resulting action or location of actions is unworkable and the ambiguity leaves future application of the concept to multiple interpretations and inconsistent application.

The COT perpetuated the WAFWA categorization of sagebrush habitat that has been used to mask concerns about loss of increasingly isolated populations and openly track declines – the Management Zones. Grouse populations were lumped in SMZs – based on generalized vegetation communities. But the vegetation communities of the contrived MZs have no real relation to the health/condition of sage- grouse habitat, or the viability of the species. Sage-grouse can survive just fine in sagebrush vegetation in any of the SMZs – and can move between some of the SMZs. The use of this SMZ category allows agencies to overlook sharp declines (or the disappearance/extirpation) of entire populations (the Weiser population in ID or the Quinn PMU in NV for example), or overlook very low numbers until it is too late) The MZs typically lump several smaller or isolated populations in with a couple of larger ones in the 7 vegetation-based SMZs.

**Comment Excerpt Text:**

Alternative D's Population Areas are an unrealistic method of categorizing sage-grouse habitat. Alternative

D's Priority zone contains 7 million acres and the medial zone has 1.3 million acres. This is in contrast to more balanced approach in the Governor's Alternative of 4.9 million acres in CHZ and 2.7 million acres in IHZ.

As Alternative D is written, its implementation is virtually irrelevant tripping a trigger only extends protection to an additional 1.3 million acres. By contrast, the Governor's Alternative is able to protect twice the acreage so triggers will actually have an impact on habitat protection. The Governor's Alternative includes 95% of the sage-grouse population in Idaho within CHZ and IHZ's 7.6 million acres. Thus, BLM's inclusion of an additional 700,000 acres equates to saving at best, a few more percentage points, without affecting a listing determination.

Alternative D delineates habitat outside of the COT Priority Areas of Conservation (PACs) into all three of its zones. This is unnecessary and inefficient. The Governor's Alternative's CHZ contains 73% of the male sage-grouse population, whereas GHZ contains 5%. However, through BLM's map, it would dedicate resources to areas outside of PACs because it has designated these areas as higher priority. It is unclear why it has done so, when both the USFWS and the State have not. The BLM should comply with the COT's directive and coordinate these designations with the State to ensure efficiency in both priorities and use of scarce public resources.

**Commenter1:**John Robison

**Comment Excerpt Text:**

Regarding the time period to look at changes relative to the 2011 baseline, Alternative E currently proposes a three-year period. It should not be necessary to wait three years to determine that a trigger has been reached. If a 20% decline is detected in the first or second year, a determination should be made that a trigger has been reached.

Regarding the soft triggers, additional details are needed on what type of review would be required, how long such a review might take, what role the Local Working Groups would play, what types of adaptive management adjustments could be implemented, and how long it might take to implement them.

**Comment Number:** IDMTSG-14-0179-9

**Organization1:**Idaho Conservation League

**Commenter1:**John Robison

**Comment Excerpt Text:**

We strongly recommend that the trigger incorporate additional protections that focus on other primary threats as well as secondary threats. The Conservation Objectives Report does not simply say focus on any one single issue:

Stop population declines and habitat loss. There is an urgent need to “stop the bleeding” of continued population declines and habitat losses by acting immediately or reduce the impacts contributing to population declines and range erosion.

-Greater Sage-Grouse Conservation Objectives Final Report, p. 31.

**Comment Number:** IDMTSG-14-0206-6

**Organization1:**The Nature Conservancy

**Commenter1:**William Whelan

**Comment Excerpt Text:**

The adaptive management triggers should be based on habitat and population change in both IHZ and CHZ. As explained above, maintaining populations in IHZ is essential to accomplishing long-term conservation of sage grouse. Expanding the area covered by the adaptive management mechanism helps ensure, that the plan is capable of “stopping the bleeding” should significant habitat losses or population declines occur in the IHZ.

Another reason we favor Alternative D’s approach to the trigger is that limiting the adaptive management mechanism to CHZ is a significant change from the State of Idaho’s Draft Alternative for Sage Grouse Conservation (June 29, 2012), which was issued after the Idaho Sage Grouse Task Force deliberations. That draft proposed linking the triggers to changes in both CHZ and IHZ. We are not aware of any justification for altering the State’s original recommendation.

Therefore, we recommend adding “IHZ” to the adaptive management triggers recommended in Alternative E.

**Comment Number:** IDMTSG-14-0206-7

**Organization1:**The Nature Conservancy

**Commenter1:**William Whelan

**Comment Excerpt Text:**

The first “hard trigger” proposed in Alternative E should be edited for clarity. The current language would invoke the adaptive management response in the event of a:  
20% decline in maximum number of males counted and a finite rate of change significantly below 1.0 within CHZ within a CA over a period of three years

The final Plan should make it clear that the trigger is tripped in the event of a 20% decline in any three-year period relative to the 2011 baseline. Some might read the trigger as currently written to allow sequential three-year periods with population declines of up to 20% each. Such an interpretation, of course, would lead to a wholly insufficient level of protection.

**Organization1:****Commenter1:**Katie Fite**Comment Excerpt Text:**

There was no public process whatsoever associated with the COT. There was no public opportunity to provide comments or attend meetings held by the COT group. From what we have been able to determine, the USFWS COT group consisted of Bob Budd (who - as was shown in his talk in the State Capitol building in Boise two years ago - pushes the core model as a way to exclude habitat from protection so development can occur, and who also casts aside and pretty much scorns controls on grazing), some state game departments, and a handpicked group of federal officials from various agencies.

Not only are we are concerned that the COT group violated FACA, it appears that politics and not conservation, enhancement and restoration of sage-grouse habitats, drove this process to a significant degree.

In Idaho, nearly all sage-grouse habitat and populations in eastern Idaho were cut by the COT. This is mirrored by the ID Gov Plan. This area is targeted, as you may know, for large-scale phosphate development by Simplot and others with very close ties to the state of Idaho and the Governor (Simplot's former son-in-law).

Elsewhere in the state, areas with several occupied leks are inexplicably cut from the COT. The Weiser population, though small, has persisted for a considerable period of time - notably **without hunting** and (like the sharptail pop. occupying the same habitat,) relies significantly on CRP lands which **had not been being grazed much**. It is written off by the COT. This Weiser area just so happens to coincide with the area of Idaho now targeted for potential oil and gas leasing and where it is reported that 100,000 acres or more of leases are already held by energy interests.

In the area of Craters of the Moon, a very large portion of the Big Desert area was also cut by the COT and mirrored by ID- despite numerous very important active leks. I note that this and some other inexplicable cuts by the COT may be favoritism shown to a large group of woolgrowers or other grazing interests whose livestock annually inundate this Big Desert area in spring when sage-grouse are nesting.

**Comment Number:** IDMTSG-14-0242-5**Organization1:**U.S. Fish and Wildlife Services**Commenter1:**Dennis Mackey**Comment Excerpt Text:**

We recommend that the FEIS include both a hard and a soft trigger. Fire primarily impacts sage-grouse through the direct loss of sagebrush cover. Land cover of sagebrush has been identified through various research methodologies as one of the primary factors affecting the long-term persistence of sage-grouse within a landscape (Walker et al. 2007, Aldridge et al. 2008, Wisdom et al., 2011, Knick et al. 2013). Wisdom et al. (2011) found that "preferably 65% of the landscape needed to be dominated by sagebrush for long-term sage-grouse persistence." Similarly, Aldridge et al. (2008) found that a high probability (>0.9) of long-term sage-grouse persistence required 65% sagebrush cover within a 30.77-km radius scale and Knick et al. (2013) found that "90% of the active leks had at least 40% of the large-scale landscape dominated by sagebrush."

***Summary***

Commenters had two distinct views regarding the COT report. One group considered the report overly biased and not representative of the best available information. The other group suggested the DEIS was not fully consistent with the COT report habitat mapping and therefore requires revision to address those deficiencies.

---

### ***Response***

In March 2012, the FWS initiated a collaborative approach to develop range-wide conservation objectives for the greater sage-grouse to inform the 2015 decision about the need to list the species and to inform the collective conservation efforts of the many partners working to conserve the species. In March 2013, this team released the Conservation Objectives Team (COT) report based upon the best scientific and commercial data available at the time that identifies key areas for greater sage-grouse conservation, key threats in those areas, and the extent to which they need to be reduced for the species to be conserved. The report serves as guidance to Federal land management agencies, State greater sage-grouse teams, and others in focusing efforts to achieve effective conservation for this species.

Table 2-20 demonstrates how the BLM and Forest Service management actions under each alternative address the threats to the populations in the Idaho and southwestern Montana sub-region. In Idaho, Core and Important Habitat Zones under Alternative E were used to derive the PACs in the COT. The BLM and Forest Service have continued to work with the USFWS and State agencies to develop a proposed plan.

[NOTE TO BLM: Clarify in the FEIS the validity of NTT, COT, and BER as relative to the established standards of scientific integrity under the ESA, the Data Quality Act, and the Presidential and DOI memoranda and orders. Ensure the FEIS clarifies how PACs were delineated (IDFG delineated based on Core and Important zones, and provided to FWS). Clarify MZs and population monitoring efforts in the FEIS.]

### **Comment Excerpt Text:**

we recommend that the Final LUPAIEIS include additional information on the action alternatives' consistency with the USFWS's Evaluation Criteria for Conservation Plans. The evaluation criteria are (i) the certainty that the conservation effort will be implemented, and, (ii) the certainty that the conservation effort will be effective. Consider including the following information:

- the relative certainty of adequate resources for full implementation (i.e., funding, conservation partners etc.) under the alternatives;
- the relative consistency of the alternatives with existing management practices and regulations;
- indications of where procedural requirements, like further Land Use Plan amendments or acts of congress, would be required to implement a conservation measure;
- the relative reliance on voluntary participation to meet conservation objectives;
- a comparison of implementation schedules;
- indications that all necessary parties will approve required agreements - such as for collaborative monitoring efforts;
- more detailed comparisons of how the alternatives' conservation measures would reduce identified threats;
- incremental conservation objectives and dates for achieving them;
- quantifiable and scientifically defensible parameters that will demonstrate achievement of objectives;

- provisions for implementation and effectiveness monitoring

---

### ***Summary***

The BLM and Forest Service should include additional information to improve consistency with USFWS's Policy for Evaluation of Conservation Efforts.

---

### ***Response***

The BLM and Forest Service are working closely with the USFWS to ensure certainty of implementation and effectiveness to the extent possible. However, certain management actions, such as restoration activities, are contingent on funding availability and thus some uncertainty remains.

**Commenter1:**Greg Cooper

**Comment Excerpt Text:**

The Final draft strategy should include adequate buffers to occupied leks in order to conserve the species. The proposed 1-mile no surface occupancy buffer is not large enough to encourage the use of leks. (Strategy 14) 1 mile is too close to encourage breeding. According to the (NTT) report a buffer of 4 miles is necessary to provide adequate protection from surface disturbance. Four miles should be the surface disturbance buffer for surface disturbance of leks.

---

**Comment Number:** IDMTSG-14-0030-2

**Organization1:**

**Commenter1:**Greg Cooper

**Comment Excerpt Text:**

The NTT report recommends limiting surface disturbance to no more than 3 percent per section (SGNTT 2011:8) Knick (2013) found that 99 percent of active Greater Sage- Grouse leks are in landscapes with less than 3 percent disturbance within 5km of the lek. D has no limits (ES.6.5) and the E alternative recommends a 5% limit (ES.6.6). These alternatives allow for too great of disturbance levels and will lead to a further decline in Greater Sage-Grouse numbers.

**Comment Excerpt Text:**

We note that the DEIS identifies Alternatives D and E as co-Preferred Alternatives. We do not believe that either of these alternatives do enough to truly protect sage-grouse and sage-grouse habitat, and we believe that implementation of either of these alternatives would not rise to the level of adequate regulatory mechanisms sufficient to prevent listing of the sage-grouse under the Endangered Species Act. These two alternatives, in fact, are the weakest action alternatives in the DEIS and are not supported by the best available science. We thus urge the BLM and USFS to go further in adopting amendments that will truly benefit and help recover sage-grouse in this region.

**Organization1:** Greater Yellowstone Coalition

**Commenter1:** Barb Cestero

**Comment Excerpt Text:**

Structural range improvements can also cause negative impacts to sage-grouse. Water infrastructure and fences to manage livestock pose increased mortality risks to sage-grouse. Within specially designated priority sage-grouse habitats, development or modification of water infrastructure should be done in a way that minimizes the potential propagation of West Nile virus. Existing and new fencing should be marked, modified or removed to reduce sage-grouse strikes and mortality, particularly near leks, in known flight paths, in concentrated winter range, or where fence strikes have been documented.

---

**Comment Number:** IDMTSG-14-0049-23

**Organization1:** Greater Yellowstone Coalition

**Commenter1:** Barb Cestero

**Comment Excerpt Text:**

Based on the science, we propose that anthropogenic disturbances in general sage-grouse habitat are also limited to 3% of a square mile or section of habitat. Moreover, although we have proposed to designate all priority habitat as special designations for sage-grouse that would not allow for any discrete anthropogenic disturbances, if the agencies do not adopt that recommendation, we support applying this 3% cap to priority habitat. In both priority and general habitat, where the 3% cap is already exceeded, no new disturbances should be allowed and restoration activities should be employed.

**Comment Excerpt Text:**

Attempts have been made in recent published studies by various individuals to identify the impact of various activities on the GRSG and their behavior. These studies are then used to develop regulations designed to mitigate the activity or disturbance. Some activities may even be prohibited in core habitat. This exercise is necessary to satisfy the USFWS and the court that a plan has the structure necessary to mitigate an activity's threat to the GRSG and its habitat. These recent studies are short term and may not reflect the bird's ability to adapt to changes in its environment. The bird has been adapting for centuries and will continue to do so. It is important that regulations be made, but essential to recognize we need to better define, measure and monitor these disturbances and study how the bird adapts on a long term basis. This is where the adaptive management discussions in the plan become so important. The plan must allow the regulations designed to mitigate disturbances to be adjusted as we better understand all the threats and their impacts. It seems like regulations are easy to make, but hard to change

Vol 2, Page 2-37 & 38: Regarding Alternative D - Population Triggers

A net 20% decline in the average maximum count of males per lek within a consecutive 3 to 5 year period, relative to the appropriate 3 to 5 year baseline average (2009-2011).

A finite rate of population change significantly below 1.0 within the population area for a given 3 to 5 year period, relative to the appropriate 3 to 5 year baseline average (2009-2011)

It is unclear how any particular percentage decline in hard count numbers under the first trigger would translate to a downward trend relative to the second trigger. Thus, there is no rational basis for having two

triggers based on the same information but simply analyzed differently.

While the second trigger may seem more "scientific and precise" it is limited by application to imprecise data. The second "population trend" trigger is unnecessary and burdensome. Placing the first trigger on a 5 year rolling average would provide both direct population change and trend information that would also account for short term climatic variation and events. When coupled with a habitat trigger, population data would provide all information necessary to adjust management strategies. This approach may require some adjustment of the trigger point.

The triggers do not distinguish the area to which they would apply. Since they do not mention a "population area" it is assumed they apply to changes occurring within the entire planning area. Accordingly, management strategy changes based thereon would also apply to the entire planning area. Such action would be inefficient and ineffective

**Commenter1:** Alan L. Prouty

**Comment Excerpt Text:**

The Draft LUMA/EIS does not provide a detailed technical basis for these prescriptive recommendations. Furthermore, there is no or little discussion of the “science” that is the basis of conservation of the GSG and also the uncertainty of such “science”. For example, the NTT report has the objective of a minimum 50-70% of the acreage in sagebrush cover for long-term persistence of the GSG. However, other studies, such as a USGS review of the GSG (USGS 2013) states that fragmentation “generally begins to have significant effects on wildlife when suitable habitat becomes less than 30 to 50 percent of the landscape” (page 26).

**Comment Number:** IDMTSG-14-0151-10

**Organization1:** Western Watersheds Project

**Commenter1:** Katie Fite

**Comment Excerpt Text:**

In addition to failing to take a “hard look” at the range of ecological and socioeconomic issues identified in the preceding section, the analysis in the DRMPA/DEIS contains a number of flaws that must be remedied before the final plan amendment is issued.

The DEIS segregates habitat that BLM itself found to meet the Priority habitat requirements into a lesser “Medial” category, and otherwise minimizes conservation to levels far below the NTT. Varying habitat categories between the BLM and the state confuse the matter more.

The DEIS presents insufficient baseline information and an inadequate range of alternatives.

**Comment Number:** IDMTSG-14-0151-19

**Organization1:** Western Watersheds Project

**Commenter1:** Katie Fite

**Comment Excerpt Text:**

In addition, within any percentage limits on anthropogenic disturbance, fire should be included as was recently recommended by USFWS in its comments on the Northwest Colorado Greater Sage-grouse DLUPA/DEIS. TAILS 06E24100-2014-CPA-0001 at p. 1. The preferred alternative excludes fire from anthropogenic disturbance. Fences, small roads, and water developments must also be included in “anthropogenic disturbance.” BLM’s definition does not explicitly include fences, water developments /water haul sites, supplement sites or small roads often related to livestock facilities.

A major problem with the DEIS is its failure to define livestock grazing as a surface-disturbing activity. The NTT report defines grazing as a “diffuse disturbance,” which is also the way that fire is classified. Like fire, grazing should be considered as a surface-disturbing activity in the DEIS.

Alternative D's Approach to the "Threat" To Infrastructure is Overly Restrictive  
Alternative D is unnecessarily restrictive for an additional 2.1 million acres in their Priority designated areas, and 700,000 additional total acres. In contrast to the Governor's Alternative, in CHZ, infrastructure is generally precluded except for valid existing rights, rights and/or incremental upgrade and/or capacity increase of existing subject to some limitations. Essentially, CHZ is as restrictive as is legally allowed.

The CHZ protects 73% of the male lek population. Infrastructure is generally permitted subject to certain criteria in IHZ. This is a practical approach, reflective of what sage-grouse actually need, in contrast to blanket restrictive policies across a large landscape. The CHZ and IHZ were the result of Dr. Jack Connelly's extensive study of sage-grouse and his determination of how resources could be prioritized to ensure maximum viability and long-term preservation. This is also a realistic approach to future economic development in Idaho, being flexible to accommodate the needs of Idaho as its population grows.

As discussed earlier, although the "No-Action" Alternative is required by NEPA, it is nonetheless required to accurately portray the proposed environmental baseline to anchor the NEPA analysis. Notwithstanding that the GRSG has been in some state of official administrative status at the Department of the Interior since 2002, the No-Action Alternative fails to account for a key preexisting BLM tool: Manual 6840.

Additionally, Alternative A fails to catalog and calibrate the several voluntary candidate conservation agreements in existence in the proposed action area as they may be providing momentum to GRSG conservation. The Final EIS documents should not be published without a full, detailed and accurate No-Action Alternative that incorporates and analyzes a full range of conservation measures, including existing strategies, and will provide future monitoring data that will satisfy USFWS' requirements. This will better fit the Purpose, Need, and Objectives of the LUPA DEIS and would be consistent with FLPMA, the Mining Law of 1872, the Mining, Minerals and Policy Act, and BLM's sage-grouse conservation goals and objectives.

**Comment Excerpt Text:**

Alternative D states that its goal is to “Maintain and/or increase GRSG abundance and distribution by conserving, enhancing or restoring the sagebrush ecosystem upon which populations depend in cooperation with other conservation partners,” and Alternative E states that its goal is to “Conserve the GRSG and its habitat to avoid a listing under the ESA.”<sup>27</sup> However, the appropriate goal, used in Alternatives C and F should be “to maintain and increase abundance and distribution of greater sage grouse”.

Maintaining current populations, which have been in a continuous decline, will not provide secure long term populations well distributed across the range. Indeed, if current populations were adequate, the greater sage grouse would not have been found to be warranted for listing under the Endangered Species Act. Given current levels of habitat fragmentation, individual populations will become increasingly isolated reducing genetic interchange. Smaller populations are at greater risk of extirpation. Further, given the pervasive spread of highly flammable invasive plants (cheatgrass) largely from grazing and the resulting increase in wildfire, sage brush habitat will be lost to fires over the next several decades. Therefore, recovery efforts must take stochastic events into account and aim to increase, rather than maintain sage grouse populations.

The Preferred Alternatives fails to incorporate measures that would result in exclusion of activities known to be detrimental to sage-grouse or sage-grouse habitats, relies on discretionary measures such as “avoidance” rather than “exclusion” of activities, includes numerous exceptions and exemptions where protective measures will only apply on a conditional basis. This is particularly relevant to the BLM objective of initiating “proactive conservation measures that reduce or eliminate threats to Bureau sensitive species to minimize the likelihood of and need for listing of these species under the ESA” (Manual 6840.02(B)), since the lack of adequate regulatory mechanisms to conserve sage-grouse and their habitats was identified as a primary threat leading to the FWS’ warranted but precluded finding for the species.

**Comment Excerpt Text:**

The agencies recognize that management techniques will not be implemented uniformly across the planning region. Instead, the agency will “focus on the highest quality GRSG habitat [and] limit any impacts of disturbance from development in these areas.”<sup>39</sup> As noted by the BLM and the Forest Service, a consequence of this action is it could result in “shifting disturbance and related forage loss to nonhabitat on BLM-administered and other lands.” First, the term “highest quality” GRSG is undefined in the LUPA/EIS, making it impossible for us to determine how much GRSG habitats are actually covered under this criterion. Furthermore, the BLM fails to acknowledge that by focusing on the “highest quality” GRSG habitat it will essentially neglect all other GRSG habitats it does not deem to meet this standard. In providing that temporary or longer-term adjustments “may” be required Alternative D allows BLM to implement grazing adjustment at its discretion upon unsatisfactory allotment evaluations. Thus this discretionary approach will fail to improve sage-grouse habitats on all grazing allotments, which is necessary to conserve and recover sage-grouse populations in the Sub-Region’s grazing allotments.<sup>40</sup>

A coalition of environmental organizations<sup>73</sup> developed and previously submitted a new alternative for consideration entitled, the Sage-Grouse Recovery Alternative.<sup>74</sup> Our recommendations build upon some of the proposed actions contained in the Sage-Grouse Recovery Alternative (Alternative “F” in the DEIS, although the DEIS did not faithfully follow all of the recommendations), and so they are not identical. For instance, our recommendations also incorporate very recent research results on the impacts of noise and ravens on sage grouse. In addition, our proposed system of sage grouse conservation areas system includes winter

distribution habitat and does not solely focus on mapping breeding and brood-rearing areas; within sage grouse conservation areas we generally buffer active leks with a 10 km buffer for surface occupancy and new roads, and 7.6 km for new trails, while Alternative F uses more conservative buffers.

A. The BLM Should Designate a System of Sage Grouse Conservation Areas (“SGCA”)

The Center requests that the agencies map and implement a conservation reserve system for the recovery of the sage grouse. Tools to implement and sustain such as system are limited however the agencies should take advantage of all existing land designations to do so, and pursue more durable and lasting designations through rule-making and Congressional actions.<sup>75</sup> Primary among existing designations are the Area of Critical Environmental Concern authorized in the BLM’s regulations, and the USFS may “adopt special designations through plan amendment or revision” to conserve natural resources (36 CFR § 219.27). The USFWS should administratively designate sage grouse conservation areas in the current planning process with similar purpose and management as BLM ACECs to conserve sage-grouse and other sagebrush dependent species on National Wildlife Refuges in the planning area.

A primary concern is that none of the administrative designations now in existence provide for long term assurances that the lands will be managed for the recovery and conservation of the grouse. As a parallel effort, the Center urges the agencies to pursue new authorities to enter into long term conservation for the grouse another species that provide for durable protections.

<sup>73</sup> Including the American Bird Conservancy, Defenders of Wildlife, the Sierra Club, and Wild Earth Guardians.

<sup>74</sup> Attached

<sup>75</sup> For fuller discussion, refer to the Sage-Grouse Recovery Alternative, pages 28-31.

At the heart of the effort to avoid the extirpation and extinction of the sage grouse, there must be a profound and fundamental recognition that further habitat declines are very serious in nature. Early conservationist Aldo Leopold once said, “To keep every cog and wheel is the first precaution of intelligent tinkering.”<sup>76</sup> Due to the heavy impacts of man, fire and climate change on the landscape, we are facing a crisis of losing the “cogs” that form an intact and functional sage grouse ecosystem. Immediate steps are needed to stabilize the losses and lay the foundation for future recovery.<sup>77</sup>

Towards this end, the Center and others are proposing a system of habitat reserves to provide for the conservation and recovery of the grouse. Rationale and details for this proposed reserve system are now provided.

Greater sage grouse are a landscape species.<sup>78</sup> Migratory populations have large annual ranges that can encompass >2,700 km<sup>2</sup> / 667,184 ac.<sup>79</sup> Large-bodied birds like sage grouse are generally more strongly

affected by habitat loss and fragmentation.<sup>80</sup> Although conclusive data on minimum patch size is unavailable, conserving large expanses of sagebrush steppe is the highest priority to conserve sage-grouse.<sup>81</sup> <sup>82</sup> One study identified ten lek complexes that were >5,000 km<sup>2</sup> / 1,235,526 ac) (range 5,395–100,288 km<sup>2</sup>) and 8 of them contained >100 leks (range 143–1,139).<sup>83</sup> Some sagebrush-dependent species use different habitat composition, structure or succession than sage grouse prefer. Protecting large blocks of habitat will also help preserve a mosaic of different habitats of varying successional stages used by sage-grouse and other sagebrush-dependent species.

Preserving large habitat islands in itself is not enough – these centers must be inner-connected for several reasons.

Greater Sage-Grouse: ecology and conservation of a landscape species and its habitats. Studies in Avian Biol. Series, vol. 38, Univ. Calif. Press. Berkeley, CA.

Knick et al. stated that, “Species that have multiple interconnected populations are more likely to persist because risk of extirpation caused by regional events...connectivity among populations ensures that recolonization can occur following local extirpation assuming that sufficient habitat remains.”<sup>84</sup>

In addition, some sage grouse populations (known as “migratory”) move long distances between seasonal habitats, sometimes in two distinct movements.<sup>85</sup> Annual movements of 40-160 km by sage grouse along established routes have been reported.<sup>86</sup> Thus Beck et al. recommended conserving habitat corridors to facilitate easier movement for migratory sage grouse.<sup>87</sup>

Protecting smaller habitat patches can help connect larger areas. Successful conservation strategies for sage grouse would preserve networks of populations and/or habitat patches, including connecting smaller lek complexes within 18 km that could serve as intermediary islands of habitat for dispersing sage grouse.<sup>88</sup>

#### a. Reserve Components

Several habitat characteristics capable of being mapped are included as components in the reserve system—courtship, breeding and nesting areas, brood rearing areas, winter habitats and linkages.

## i. Courtship, breeding and nesting areas

In the spring, during the breeding season, sage-grouse males seek out courtship areas, known as “leks” that are open areas of bare soil, short grass steppe, windswept ridges, or exposed knolls in which to gather and perform their ritualized mating displays and breed with females.<sup>89</sup> An important factor affecting lek location appears to be proximity to as well as configuration and abundance of nesting habitat.<sup>90</sup>

Leks are normally “traditional”, and occur in the same location each year. Some leks studied by early investigators have persisted for 28–67 years since first counted. The presence of broken bird-point arrowheads on some leks suggests that sage-grouse had used those sites for at least 85 years. Leks and the number of attending males are regularly used to monitor the long-term status of populations because of their traditional locations.<sup>91</sup>

Connelly (eds). *Greater Sage-Grouse: ecology and conservation of a landscape species and its habitats*. Studies in Avian Biol. Series, vol. 38, Univ. Calif. Press. Berkeley, CA.

91 Ibid.

Although the actual lek sites are typically open areas, they are usually located in the midst of denser shrub stands, which together provide the necessary combination of visibility, protection, food, and thermal regulation.<sup>92</sup>

In a recent study looking at greater sage grouse across six western states, it was reported that 90% of the active leks were surrounded by areas having greater than 40% sagebrush cover. Further, 99% of the active leks were in landscapes with less than 3 % of the area in human development.<sup>93</sup> Successful leks occurred in areas with low road densities – less than 1 km/km<sup>2</sup> of secondary roads, less than .05km/km<sup>2</sup> of highways, and less than .01 km/km<sup>2</sup> of interstate highways. Another pertinent finding was that habitat suitability was highest when power line densities were less than .06 km/km<sup>2</sup>; leks were absent where power line densities exceeded .2 km/km<sup>2</sup>. With respect to communication/cellular towers, leks were absent when tower densities exceeded .08 km/km<sup>2</sup>.<sup>94</sup>

Wisdom et al. reported that areas extirpated of sage grouse had 27 times the human density, 3 times more area in agriculture, were 60% closer to highways, and had 25% higher density of roads than what was found in occupied habitat. Also, it was found that power lines and cellular towers had significant impacts on whether or not a habitat was occupied.<sup>95</sup>

Studies published by Braun in 1977 and Connelly in 2000 initially set the standard that leks should be buffered by a 3.2 km or 3.1 mile radius, both to provide security for the grouse and to acknowledge the fact that many, but by no means all, female grouse will nest in the immediate area of the lek.<sup>96</sup>

However, more recent studies have suggested that the 3.2 km is questionable as to whether or not it

adequately provides for the conditions needed for successful breeding and nesting.

It was found in one study that a 3 km buffer encompassed only 45% of the nesting females associated with that lek, while a 5 km buffer accommodated 64% of the nests. It was also reported that nests located within 1 km of another nest tended to have lower nesting success likely due to enhanced prey detection by predators.<sup>97</sup> The same study further suggests that to protect and maintain sage grouse populations residing in relatively contiguous sagebrush habitats, managers should minimize or halt actions that reduce the suitability of nesting habitats within 5 km of a lek until detailed site specific monitoring suggested otherwise. It also noted that a substantial number of females nested distances greater than 5 km from a lek and that this additional increment of individual recruitment could be important for population viability.<sup>98</sup>

97 Holloram, Matthew J. and Stanley H. Anderson. 2005. Spatial distribution of greater sage-grouse nests in relatively contiguous sagebrush habitats. *The Condor* 107:742-752.

98 Ibid.

For a related grouse, the U.S. Fish and Wildlife Service recommended "... avoiding placing wind turbines within 5 miles [8 km] of known leks (communal pair formation grounds) in known prairie grouse habitat".<sup>99</sup>

Johnsgard indicated that there was no obvious relationship between lek location and nest site. In 5 different studies involving more than 300 nests the average distance between lek and Sage-grouse nest where the females was first seen or captured was 3.5 mi (5.6 km).<sup>100</sup>

A majority (~90%) of nesting and brood-rearing habitat was within 10 km (6.2 miles) of active leks in Alberta (Aldridge and Boyce 2007); 97 percent of nests were found within 6.2 miles of leks where females were marked in the Powder River Basin in Montana and Wyoming.<sup>101</sup>

Walker et al. in another study found that the impacts from energy development on lek persistence and nesting were still apparent at a distance of 6.4 km from the disturbance.<sup>102</sup>

Connelly et al. reported in their assessment for the Western Governors' Association that road traffic within 7.6 km had adverse impacts on male grouse attendance at leks.<sup>103</sup>

## ii. Brood-raising areas

Brood rearing habitats are a very important component of sage-grouse habitats. A mosaic of upland sagebrush vegetation intermixed with mountain meadows and spring systems compose brood rearing habitat.

Placing a heavy focus on habitat protection around leks is not suitable for ensuring the viability of sage grouse populations. Studies have shown that both nest and brood rearing habitats are on average 6 km from leks, and it is not until 10 km from leks that one reaches the threshold where 90% of the habitat occurs.<sup>104</sup>

Brood occurrence is greater in more heterogeneous sagebrush stands, where patchy cover reduces predator efficiency but still affords necessary forb resources. Sage grouse are more abundant in patchy habitats containing a mix of mesic, forb-rich foraging areas interspersed within suitable sagebrush escape cover.<sup>105</sup>

- 105 Manier et al. 2013. Page 21.

Broods are typically found in areas near nest sites for the first 2–3 weeks after hatching. Such habitat needs to provide adequate cover and areas with sufficient forbs and insects to ensure chick survival in this life stage.  
106

As the chicks get older, sage-grouse tend to move into more moist areas (streambeds or wet meadows) because as herbaceous vegetation dries out, wetter areas provide more forbs and insects for hens and their chicks.<sup>107</sup> Droughts resulting in reduced cover can make these habitats risky for sage grouse chicks, particularly if livestock grazing intensities have exacerbated the vegetative declines.<sup>108</sup>  
iii. Wintering habitat

As previously mentioned, although leks are important focal points for breeding and subsequent nesting in the surrounding region, other seasonal use areas and habitat requirements may be equally limiting to sage-grouse populations.<sup>109</sup>

Suitable and diverse winter habitats are critical to the long-term persistence of grouse populations.<sup>110</sup> As summer ends, the diet of sage grouse shifts from a diet of insects, forbs and sagebrush to one comprised almost entirely of sagebrush.<sup>111</sup> In winter, the grouse depends heavily on sagebrush for cover, habitat selection being driven by snow depth, the availability of sagebrush above the snow, and topographic patterns that favorably mitigate the weather.<sup>112</sup>

Abundance of sagebrush at the landscape scale greatly influences the choice of wintering habitat. One study found that the grouse selected for landscapes where sagebrush dominates over 75% of the landscape with little tolerance for other cover types.<sup>113</sup> Because appropriate wintering habitat occurs on a limited basis and because yearly weather conditions influence its availability, impacts to wintering habitat can have large disproportional effects on regional populations. One study in Colorado found that 80% of the wintering use occurred on only 7% of the area of sagebrush available.<sup>114</sup> Additionally, some degree of site fidelity to winter areas is suspected to exist, and wintering areas not utilized in typical years may become critical in severe winters.<sup>115</sup>

Lower elevation sagebrush winter habitat used by sage grouse may also constitute important winter areas for big game and early spring forage areas for domestic livestock. Due to differing vegetative condition requirements, land treatments on lower elevation sagebrush areas to increase big game or livestock forage at the expense of sagebrush cover and density could have long-term negative consequences for the grouse.116

Sage grouse in the Powder River Basin were 1.3 times less likely to use otherwise suitable winter habitats that have been developed for energy (12 wells/4 km<sup>2</sup>), and avoidance was most pronounced in high-quality winter habitat with abundant sagebrush.117

#### iv. Linkages

Because use and availability of these seasonal habitats are spread across a given landscape, sage-grouse require vast areas of contiguous sagebrush to meet their needs on an annual basis.118 Although leks are important focal points for breeding and subsequent nesting in the surrounding region, other seasonal use areas and habitat requirements may be equally limiting to sage-grouse populations. Population size and isolation can have serious negative impacts on genetic variability and population persistence.119

Science informs us that populations of rare species in small, disjunct areas of occupied range have a high risk of extirpation, and that the probability for extinction increases for populations that become increasingly small and isolated.120

Naugle et al. recently observed, that the severity of impacts to sage grouse from human disturbances, in particular energy development dictate the need to shift from a local to a landscape view for basing conservation actions.121

Any conservation reserve system for sage grouse must ensure the connectivity between metapopulations are preserved. GIS modeling can identify sage-grouse habitat, at a larger scales. There are limitations to a GIS-designed reserve system—for instance, within areas identified by GIS modeling as nesting habitat, there is some local variability in which sites are actually suitable for nesting, nests may be clumped in one area and not another, or local topography makes a linear distance from a lek meaningless. Still, for purposes of identifying crucial habitat for the grouse it is a crucial first step. As inventory and telemetry work advance, the system can be fine-tuned. The important thing is that key habitats and linkages not be lost and the precautionary principle applied to sage grouse management. 122

Connelly (editors). *Greater Sage-Grouse: ecology and conservation of a landscape species and its habitats*. Studies in Avian Biology (vol. 38). University of California Press. Berkeley, CA.

122 The precautionary principle states: “Precautionary Principle states that when an activity causes some threat or harm to the public or the environment, general precautionary measures should be taken. When a

scientific investigation proves that there is a possible risk in doing some activity, then this principle should be applied. Internationally, one of the most important expression of the Precautionary principle is the Rio Declaration from the United Nations Conference on Environment and Development. Principle 15 of the Rio Declaration reads:

“In order to protect the environment, the precautionary approach shall be widely applied by States according to their capabilities. Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation.”

This principle is applied in the context of human activities on the environment and human health.

In U.S the precautionary principle is not expressly mentioned in any laws or policies. Despite U.S. acceptance of the precautionary principle in international treaties and other statements, little work has been done to implement this principle.” From: <http://definitions.uslegal.com/p/precautionary-principle/>

## A. Threats and Management Direction

The DEIS identified about a dozen issues and threats to be considered in the land use plan amendment process. What follows is the Centers brief reaction to theses and recommendations for addressing them. We separate our recommendations into two general categories – inside our proposed sage grouse conservation areas (“SGCAs”) and sage grouse habitat outside of them.

### a. Energy Development and Transmission

The Center strongly supports and advocates for energy policies that rapidly phase out fossil- based sources in favor of renewable sources, including ending fossil fuel extraction on public lands, and supports renewable sources of energy such as wind, solar and geothermal, with the goal in mind of halting the rapid rise of greenhouse gas concentrations in the atmosphere and slowing the tide of climate disruptions.

At the same time, the Center is highly concerned about the impacts from poorly sited renewable energy projects on rare species and their habitats. We advocate for locating renewable energy projects on private or previously disturbed lands near transmission lines, or through roof-top solar distributive-community systems.

The threats from energy developments are many pronged. In addition to the direct impacts of destruction of actual habitat by the footprint of the project, secondary and indirect impacts due to energy development include avoidance of previously used areas due to species psychology, increased predation, traffic-associated mortality, increased chance and spread of diseases such as the West Nile virus.

Transmission lines—a key component of renewable energy development—also negatively impact sage grouse populations. One study found that the mean distance to electric transmission lines was greater than 2 times further in occupied range than in extirpated range.<sup>123</sup>

<sup>123</sup> Wisdom et al. 2011.

The Center brings to your attention recent research on the impacts of ravens on sage grouse and other species in sagebrush habitats, with emphasis on how it relates to raven use of transmission lines.

Common raven populations in the western United States have more than quadrupled over the last 40 years.<sup>124</sup> This increase is believed to be a result of human alterations of natural habitats that provide subsidies and benefits to the ravens. For instance, road-kills, trash dumps and landfills, and livestock operations provide readily available sources of food. Water developments for livestock, irrigation and sewage lagoons provide new water sources. But with respect specifically to energy development, tall structures (e.g., power poles and transmission towers) constructed by humans provide ravens with elevated perches and

nesting substrate in areas where natural tall structures (e.g., trees) are rare or nonexistent. 125

Howe et al. found that ravens selected nest locations that were (1) in close proximity to transmission lines; (2) in close proximity to land cover edges; and (3) within areas that contained abundant edge formed by adjoining land cover types. Selection for edge-dominated areas, specifically edges between sagebrush and grasslands and nonnative cover types, suggests that ravens are taking advantage of new habitat conditions caused by a combination of habitat fragmentation and conversion. 126

In their research Howe and her co-authors, found that ravens preferred nest sites that were closer to transmission lines than expected based on availability. Transmission poles provided nesting substrates and perches taller than any other substrate present in their study area. 127

Increased presence of ravens can be deleterious to other species within the geographical range of ravens, and raven abundance has been positively correlated with predation of eggs or nestlings of other birds breeding within raven range, including eggs and nestlings of sage grouse. 128 In another study nests in fragmented habitats were approximately 9 times more likely to be depredated than those in contiguous habitat. 129

It is quite clear from observation and reported science that ravens are increasing and benefiting from fragmentation and human changes on the landscape. As this occurs, there will be continued negative consequences to sage grouse nesting success and recruitment into the breeding population.

124 Sauer, J. R., J. E. Hines, J. E. Fallon, K. L. Pardieck, D. J. Ziolkowski Jr., and W. A. Link (2011). The North

American Breeding Bird Survey, Results and Analysis 1966–2009, Version 3.23.2011.

125 Howe, Kristy B., Peter S. Coates and David J. Delehanty. 2014. Selection of anthropogenic features and vegetation characteristics by nesting Common Ravens in the sagebrush ecosystem. *The Condor, Ornithological Applications*, Vol. 116, 2014, pp. 35-49.

126 Howe et al. 2014.

127 Ibid.

128 Coates, P.S. and D. J. Delehanty. 2010. Nest predation of Greater Sage-Grouse in relation to microhabitat factors and predators. *J. of Wildlife Management*, 74:240-248.

129 Vander Haegen, W. M., M. A. Schroeder, and R. M. DeGraaf. 2002. Predation on real and artificial nests in shrubsteppe landscapes fragmented by agriculture. *The Condor* 104:496–506.

The infrastructure associated with energy development within sagebrush ecosystems threatens the contiguous habitats remaining in the western United States. The linear right-of-ways associated with wind and other energy developments likely provide anthropogenic nesting subsidies and fragmented landscapes, both of which increase nesting opportunities for ravens. Preventing fragmentation by transmission lines, roads, and other human interventions is integral to stemming the increase and range expansion of raven populations. 130

We recommend the following strengthened management approaches to minimize further degradation of sage grouse habitats from energy-related development.

Management Prescriptions:

i. Management Inside SGCAs in sage grouse habitat

- Exclude these areas from new energy leasing and rights-of-way.
- Whenever possible, bury existing transmission lines within 10 km from active leks.
- Institute seasonal restrictions on surface occupancy within 10 km from leks during courtship and early

brood-rearing periods.

- No new road construction within 7.6 km of active leks.
- If existing disturbed area in the SGRA exceeds 3% of the surface area, institute measures to provide additional mitigation to offset the impacts on the grouse.

ii. Management outside SGCAs in sage grouse habitat

- Institute seasonal restrictions on surface occupancy within 5 km from leks during courtship and early brood-rearing periods.

b. Livestock Grazing and Wild Horses

Grazing by settlers during the latter part of the 19th and early 20th centuries was largely unregulated and seriously depleted native forbs and grasses needed by sage-grouse. Historic grazing practices also facilitated invasions by non-native plants, including cheatgrass. A conservation assessment of sage grouse and its habitats found that impacts attributable to historic overgrazing have not been remedied, because, “plant communities still are not given rest from grazing” and “distribution of livestock has changed because water developments have increased the area that could be grazed.” Consequently, the assessment stated, “We cannot conclude that the effect of grazing has been reduced because even reduced numbers of livestock may still exert a larger influence on those habitats.” 131

130 Howe. Et al. 2014.

131 Connelly et al. 2004.

Livestock grazing remains the most widespread use of land in the sagebrush biome. Domestic livestock continue to alter the sagebrush steppe by consuming native grasses and forbs, trampling sagebrush, and spreading nonnative weeds like cheatgrass. The introduction of invasive plant species increases the risk and severity of wildfires, which can irreversibly alter the composition of the ecosystem. Livestock grazing also compacts the soil, destroying the microbotic soil crusts that retain moisture and limit wildfire. In addition, grazing livestock degrade riparian areas when, during hot periods, they congregate around water sources and shady areas, damaging streams, springs, seeps, and wet meadows, which are also crucial for the grouse.132  
133

Standards and guidelines for management of public grazing lands are established by local resource advisory councils and must address habitats and conservation measures for endangered, threatened, proposed, candidate, or other at-risk or special status species. Under this set of criteria for rangeland health, 58% of lands that have been assessed (25% of all lands under management by the U.S. Bureau of Land Management) (including non-sagebrush habitats) met the standards or were making progress towards meeting those standards. Livestock were a factor in 36% of the assessed lands not meeting standards (15% of the all lands). Another 6% of the assessed lands were not meeting standards for causes other than livestock grazing. Fifty-seven percent (>37 million ha) of the public lands managed by the U.S. Bureau of Land Management have not been assessed.134

For further documentation of the impacts of livestock and grazing on sage grouse and its habitats we refer you to the Sage-Grouse Recovery Alternative, and incorporate these comments as our own.135

The Center emphasizes our agreement with the Sage-Grouse Recovery Alternative regarding the treatment of livestock grazing as a diffuse disturbance on sage grouse habitat.136 The readily and all too often observed sacrifice zone of utter destruction that occurs around watering, salting and gathering corrals is anything but diffuse. As Holechek and others observed, depending on topography, areas of severe degradation, or “sacrifice areas” around water sources, including water developments, can extend from one to several miles from water sources.137

137 Holechek, J. L., R. D. Pieper, C. H. Herbel. 2001. RANGE MANAGEMENT: PRINCIPLES AND PRACTICES. 4th ed. Prentice-Hall. Upper Saddle River, NJ.

Given the state of degradation and the pervasive nature of livestock grazing, we recommend establishing a utilization rate of 25-30% while meeting sage grouse habitat objectives. While definitions of light grazing use vary, numerous references have settled on a general 25 percent harvest coefficient for allocating forage for livestock.<sup>138</sup> Although this rate is more conservative than others prescribed for light grazing, it allows both forage species and livestock to maximize their productivity, allows for error in forage production estimates, accounts for the potential effects of drought, and supports multiple use values.<sup>139</sup> Holecheck et al. also noted that, because most ranchers have difficulty monitoring and measuring annual grazing utilization (and the BLM doesn't regularly monitor and collect utilization information), use of grazing coefficients higher than 25 percent "invariably leads to land degradation...when drought occurs because of rancher reluctance [to reduce livestock numbers]."<sup>140</sup> Limiting livestock grazing to 25 percent utilization would also support other sage-grouse habitat objectives, such as maintaining a minimum stubble height.<sup>141</sup> A case study of the Antelope Springs Allotment in southern Idaho demonstrates that ranching operations can be successful and improve sage-grouse habitat using a 20 percent utilization standard.<sup>142</sup>

We recommend the following strengthened management approaches to minimize further degradation of sage grouse habitats from livestock grazing and the impacts from feral wild horses.

#### Management Prescriptions:

##### i. Management inside SGCAs in sage grouse habitat

- Issue no new grazing permits.
- Identify existing grazing allotments where permanent retirement of the grazing privileges are feasible, and proceed with such retirements.
- Avoid all new structural range improvements, and prohibit water developments and salting within 10 km of active leks.
- Authorize no new water developments for diversion from spring or seep sources.
- Ensure new or rehabilitated water developments are designed to use best management practices to limit and mitigate potential impacts from the West Nile virus.
- Remove, modify or mark fences in areas of moderate or high risk to sage grouse collisions.<sup>143</sup>
- Institute 25-30% grazing utilization standard on existing allotments while meeting objectives for sage grouse habitat conditions.
- Prioritize completion of land health assessments and ensure grazing systems and practices under permit are designed and required to meet sage grouse habitat objectives. Institute timely monitoring to ensure objectives are being met.
- Manage riparian and wetland areas to meet properly functioning condition standards. Manage wet meadows to maintain perennial forbs and a rich species mix needed for sage grouse brood-rearing.
- Review free-roaming horse and burro herd management plans with sage grouse habitat objectives in mind. Aggressively manage herds to maintain them at or below herd management objectives.

## ii. Management outside SGCAs in sage grouse habitat

- Identify existing grazing allotments where permanent retirement of the grazing privileges are feasible, and proceed with such retirements.
- Avoid all new structural range improvements, and prohibit water developments and salting within 10 km of active lets.
- Authorize no new water developments for diversion from spring or seep sources.
- Ensure new or rehabilitated water developments are designed to use best management practices to limit and mitigate potential impacts from the West Nile virus.
- Remove, modify or mark fences in areas of moderate or high risk to sage grouse collisions.<sup>144</sup>
- Institute 25-30% grazing utilization standard on existing allotments while meeting objectives for sage grouse habitat conditions.
- Manage rangelands to meet properly functioning condition standards. Manage wet meadows to maintain perennial forbs and a rich species mix needed for sage grouse brood-rearing.
- Manage free-roaming horse and burro populations at levels demonstrated to achieve and maintain sage grouse habitat objectives.

## c. Landscape-scale changes and vegetation management

The Center addresses this issue by defining vegetation management as treatments to achieve and protect sage grouse life-cycle habitat needs and the control and prevention of noxious and invasive species.

The need for vegetation management to manage for specific resource objectives arises from changes to the natural ecosystems, either through natural changes in succession or state, or from large scale disturbances such as wildfires, spread of invasive and non-native species, climate disruption, or other human alterations to ecosystems.

The DEIS does a credible job of documenting the ecosystem changes that have occurred over the past 100+ years.

144  
Ibid.

The Center believes it is important to state that human-induced landscape-scale changes to sage grouse ecosystems pose a dire threat to the long term continued existence of the species. We are not alone. Miller et al. noted that sagebrush habitats are severely stressed across much of the range, and their total area likely will decline in the relatively near future as a result of invasive species, fire, and climate change.<sup>145</sup>

At lower elevations and in the more arid portions of the sage grouse range, the catastrophic spread of cheatgrass, aided and abetted by the impacts from over-grazing and changes in fire frequency and intensity has led to a lasting, if not permanent changes in ecosystem states. Repeat fires that eliminate or reduce shrubs, native grasses, and forbs; disturb soils and biological crusts; and release nutrients have allowed cheatgrass and other introduced annuals to replace the native shrub and herb layers. The resultant landscape is largely composed of introduced annuals, and is more susceptible to annual weather patterns and varies greatly from year to year, depending on moisture availability. Long term changes in climate that facilitate or enhance invasion and establishment by invasive annual grasses further exacerbate the fire regime and accelerate loss of sagebrush habitats.146

At higher and cooler elevations, changes in fire frequency and intensity have come at the expense of sagebrush ecosystems in a different manner. Under pre-European settlement conditions, wildfires and indigenous planned fires kept pinyon pine and western junipers (“PJ”) confined to areas where fires would not typically reach – mainly rocky terrain where the fuels needed to carry the fire were patchy and disjunct. Once modern settlers arrived in the mid-1880s this pattern changed. Heavy livestock grazing initially greatly reduced the fine fuels needed to carry fires, and later active human intervention suppressed fires to prevent their spread. As a result, PJ species were able to establish seedlings in grass and shrubland areas where formerly fires would have eliminated them. This then was the beginning of the woodland expansion into sage grouse habitat that continues today.147 148 Prior to 1860 two-thirds of the landscape was treeless and occupied by sagebrush-steppe communities. Today, less than one-third of the landscape remains treeless and more than 90 percent of the trees have established since the 1860s. These data support the need for active management in tree removal. In the absence of disturbance, woodlands will continue to expand, mature, and close.149

#### Management Prescriptions:

##### i. Management inside of SGCAs in sage grouse habitat

Restoring sage grouse habitat that is degraded or fragmented might be useful tool for the benefitting the species. However, these programs are likely to be both difficult and expensive, and may take centuries to achieve a complete restoration of a functioning system of sagebrush habitats within a landscape mosaic.150 The obvious and best way to provide for the species at least in the short to intermediate term is to protect the remaining existing habitat, which is the intent of the Center’s proposed conservation reserve system.

- Where it will achieve sage grouse habitat objectives, passive restoration approaches should be favored over active methods.
- Any vegetation treatment plan must include pretreatment data on wildlife and habitat condition, establish non-grazing exclosures, and include long-term monitoring of treated areas.
- Ensure that vegetation treatments create landscape patterns which most benefit sage--grouse. Only allow treatments that are demonstrated to benefit sage-grouse and retain sagebrush height and cover consistent with sage-grouse habitat objectives (this includes treatments that benefit livestock as part of an AMP/Conservation Plan to improve sage--grouse habitat).
- Identify and prioritize sage-grouse habitat for restoration projects based on environmental variables that improve chances for project success.<sup>151</sup> Prioritize restoration in seasonal habitats that are thought to be limiting sage--grouse distribution and/or abundance and where factors causing degradation have already been addressed (e.g., changes in livestock management).
- Restrict activities in SGCAs that facilitate the spread of invasive species, including recreational and commercial use by off-road vehicles.
- Do not use prescribed fire as a tool in low elevation areas where the potential for cheatgrass invasion is above low.
- Retain sagebrush canopy cover at or above what is expected for that ecological site, consistent with sage-grouse habitat objectives unless a fuels management objective requires additional reduction in sagebrush cover to meet strategic protection of priority sage--grouse habitat and conserve habitat quality for the species.
- Aggressively monitor and control invasive vegetation in sagebrush steppe ecosystems. Rapidly restore burned or disturbed habitat to minimize or prevent the incursion of invasive plants.
- In areas of PJ, avoid treating the areas of persistent woodlands. Persistent woodlands are an ecological condition, irrespective current observed “fire condition class”, where site conditions and disturbance regimes are inherently favorable for PJ, and where trees are a major component of the vegetation unless recently disturbed. These woodlands do not represent twentieth century conversion of formerly non-wooded vegetation types, but are places where trees have been an important stand component for several hundred years.<sup>152</sup>
- In areas where sagebrush is prevalent or where cheatgrass is a concern, utilize mechanical methods rather than prescribed fire.
- Apply appropriate seasonal restrictions for implementing management treatments consistent with the types of seasonal habitats present.

## ii. Management outside SGCAs in sage grouse habitat

- Where it will achieve sage grouse habitat objectives, passive restoration approaches should be favored over active methods.
- Identify and prioritize sage-grouse habitat for restoration projects based on environmental variables that improve chances for project success.<sup>153</sup> Prioritize restoration in seasonal habitats that are thought to be limiting sage--grouse distribution and/or abundance and where factors causing degradation have already been addressed (e.g., changes in livestock management).
- Restrict activities in SGCAs that facilitate the spread of invasive species.
- Do not use prescribed fire as a tool in low elevation areas where the potential for cheatgrass invasion is above low.
- Retain sagebrush canopy cover at or above what is expected for that ecological site, consistent with sage-grouse habitat objectives unless a fuels management objective requires additional reduction in sagebrush cover to meet strategic protection of priority sage--grouse habitat and conserve habitat quality for the species.
- Aggressively monitor and control invasive vegetation in sagebrush steppe ecosystems. Rapidly restore burned or disturbed habitat to minimize or prevent the incursion of invasive plants.

- In areas of PJ, avoid treating the areas of persistent woodlands. Persistent woodlands are an ecological condition, irrespective current observed “fire condition class”, where site conditions and disturbance regimes are inherently favorable for PJ, and where trees are a major component of the vegetation unless recently disturbed. These woodlands do not represent twentieth century conversion of formerly non-wooded vegetation types, but are places where trees have been an important stand component for several hundred years.<sup>154</sup>
- In areas where sagebrush is prevalent or where cheatgrass is a concern, utilize mechanical methods rather than prescribed fire.
- Apply appropriate seasonal restrictions for implementing management treatments consistent with the types of seasonal habitats present.

153 Meinke et al.2009.

154 Romme et al. 2008.

#### d. Wildfire Operations

Wildfires present a huge threat to sage grouse ecosystems - between 2000 and 2012, over 2 million acres of GRSG habitat in the planning area were affected by wildland fire, and the threat of future wildfires are discussed in the DEIS.<sup>155</sup>

As discussed in Section 3 c of these comments, the best and most prudent approach is to protect and preserve existing sage grouse habitats as opposed to being in the position of restoring or replacing damaged or lost habitats.

Fire suppression activities should be aggressive and aimed at minimizing acres burned. Protecting sage grouse habitats should generally rank above protection of human property and always behind protection of human lives.

#### e. Recreation and Travel Management

Although specific work addressing effects of roads, trails, and OHV use on sagebrush habitats and sage-grouse has not been conducted, research suggests common effects including habitat loss and fragmentation, invasive plant spread, induced displacement or avoidance behavior, creation of movement barriers, noise, and direct encounters.<sup>156</sup> Reducing the extent and influence of roads and trails can be incorporated into near-term and long-term plans for consolidating, conserving, and improving priority habitat areas. The impacts of roads and other surface occupancy on grouse and their habitat needs are covered in Section 2 of these comments, and form the basis for our management recommendations.

Some non-inclusive examples of the motorized recreation threat to sage grouse could be useful and informative and are now provided.

In the late-2000s the U.S. Forest Service conducted travel management planning on its administrative units in

Nevada. The Center and other concerned groups and individuals raised the issue of conflicts and adverse impacts on sage grouse from such a public land use. The result demonstrated a general lack of concern by the Forest Service. In its final decisions, the Forest Service<sup>157</sup> allowed the following:<sup>158</sup>

155 DEIS, Chapter 3.7.

156 Knick, S.T., Hanser, S.E., Miller, R.F., Pyke, D.A., Wisdom, M.J., Finn, S.P., Rinkes, E.T., and Henny, C.J.,

2011, Ecological influence and pathways of land use in sagebrush, in Knick, S.T., and Connelly, J.W., eds., Greater Sage-Grouse: ecology of a landscape species and its habitats: Berkeley, Calif., University of California Press, Cooper Ornithological Union, p. 203–252.

157 In this case the Humboldt-Toiyabe National Forest

158 See decision documents at:

<http://www.fs.usda.gov/wps/portal/fsinternet/projects/htnf/landmanagement/projects?sortby=1&archive=1>

- On the Ely Ranger District, 79 miles of open motorized routes were allowed within 2- miles of an active lek. There were minimal seasonal closures.
- On the Austin and Tonopah Ranger Districts, 240 miles of open routes were approved in nesting and brood-raising areas, including 24 miles within .5 km of active leks. There were minimal seasonal closures.
- The Bridgeport Ranger Districts (partly in California and all within Bi-state sage grouse areas) left open 719 miles of routes in nesting and brood-raising areas, including 388 miles that “pass through leks”. There were minimal seasonal closures.
- The Mountain City, Jarbridge and Ruby Mountain Ranger Districts left open 146 miles in nesting areas, including 24-miles that came within .5 miles of an active lek. These districts did identify 86 miles of open routes to be seasonally closed to benefit sage grouse.

#### Management Prescriptions:

##### i. Management inside SGCAs in sage grouse habitat

- All travel must be on designated open roads and trails, subject to seasonal restrictions.
- Seasonal restriction should include the periods of courtship, nesting and early brood raising, as well as times when the grouse are on wintering habitats.
- No new trail construction within 7.6 km of active leks.
- Close existing trails and roads to achieve an open road and trail density not greater than 1 km/km<sup>2</sup>.<sup>159</sup>
- During travel management planning evaluate the closure of secondary and primary roads in the SGRA.
- Seasonally prohibit camping within 7.6 km of active leks.
- Allow no commercial or special use permitted activities in SGRAs unless there is a demonstrated beneficial affect for the grouse.

##### ii. Management outside SGCAs in sage grouse habitat

- All travel must be on designated open roads and trails, subject to seasonal restrictions.
- Seasonal restriction should include the periods of courtship and nesting, as well as times when the grouse are on wintering habitats.
- No new trail construction within 6.4 km of active leks.
- Seasonally prohibit camping within 6.4 km of active leks.

##### f. Mineral Development

The impacts from the various minerals development activities – fluid, coal, locatable, leasable and sand and gravel have been amply documented in by Connelly, Naugle and others and have been cited elsewhere in our comments.<sup>160</sup> <sup>161</sup> While the impacts are much akin to those of energy development, on-the-whole they

involve much greater human presence and activity and noise, and hence have a much greater impact on the grouse.

159 Knick et al. 2013.  
160 Connelly et al. 2011a  
161 Naugle et al. 2011.

In addition, we wish to highlight a few of the examples.

Energy development can cause radical changes to sagebrush ecosystems. Analysis of oil and gas developments found cases where such lands contained twice as many roads and power lines and the density of development far exceeded the grouse's threshold of tolerance. 162

Energy development and its related infrastructure impacts grouse in many ways, both direct and indirect, cumulatively and synergistically.

Males and females may abandon leks if repeatedly disturbed by raptors perching on power lines near leks, by vehicle traffic on nearby roads, or by noise and human activity associated with energy development. Collisions with power lines and vehicles and increased predation by raptors may increase mortality of birds at leks. Roads and power lines may also indirectly affect lek persistence by altering productivity of local populations or survival at other times of the year. Sage-grouse mortality associated with power lines and roads occurs year-round, and artificial ponds created by development that support breeding mosquitoes known to vector West Nile virus elevate risk of mortality from disease in late summer. Sage-grouse may also avoid otherwise suitable habitat as development. Impacts from well sites to leks were still evident out to 6.4 km from the well. 163

Sage-grouse in the Powder River Basin were 1.3 times less likely to use otherwise suitable winter habitats that have been developed for energy (12 wells/4 km<sup>2</sup>), and avoidance was most pronounced in high-quality winter habitat with abundant sagebrush. 164

Blickley found in a treatment-control paired study that there was an immediate and sustained decline in male grouse attendance on leks subjected to human noise associated with well sites (29% decline on drilling noise leks and 73% decline on traffic noise leks relative to paired non- noise leks) and evidence of similar declines in female attendance. 165

As reported in the Sage-Grouse Recovery Alternative,

162 Ibid.  
163 Ibid.  
164 Doherty et al. 2008.  
165 Blickley et al. 2012.

“A new study commissioned by the Bureau of Land Management has exposed major difficulties with the agency's current approach to sage-grouse conservation in the Powder River Basin, a region that is heavily developed for gas and oil. The study indicates that an increasing density of coalbed methane wells and conventional oil and gas wells coupled with an outbreak of West Nile virus could cause "functional extinction" of sage-grouse in the Powder River Basin. Under such a scenario, modeling predicts that 370 active leks known today in the Basin would be reduced to only six (Taylor et al. 2012). The authors estimate

that 27 percent of the pre-development sage grouse population has already been lost as a result of heavy coalbed methane and conventional drilling in the Powder River Basin, and predicts that only 39 percent of the original population will remain when coalbed methane is fully developed (with up to eight wells per section) in the Basin, even in the absence of a West Nile virus outbreak (Taylor et al. 2012). The study also found that sage-grouse censused at large leks would be expected to decline by 70 percent from pre-development numbers as well spacing reaches 4 wells per square mile. Finally, effects of drilling on sage-grouse were noticeable out to 12.4 miles from leks, indicating that current core areas may not be large enough to conserve and recover the species (Taylor et al. 2012).”166

#### Management Prescriptions:

##### i. Management inside SGCAs in sage grouse habitat

- Close/find unsuitable/withdraw all unleased or available areas to fluid, solid, locatable or salable mineral leasing.167
- Upon expiration or termination of existing leases, do not re-lease the area.
- Only allow geophysical exploration activities by helicopter portable drilling methods in accordance with appropriate seasonal and timing restrictions.
- Ensure that with any new leasing do not contribute to a total human disturbance exceeding 3% per section of that area.
- In existing leased and permitted areas, apply a 10 km non-surface occupancy around active leks and limit permitted disturbance to 1 per section and no more than 3% surface disturbance per section.
- Apply best management practices to minimize surface disturbing activities.
- Implement courtship, nesting, early-brood rearing and winter seasonal and timing restrictions for all human activities.
- Avoid the surface disposal of produced water168 unless it can be proven to be beneficial to sage grouse and includes measures to preclude the spread of West Nile virus.

##### ii. Management outside SGCAs in sage grouse habitat

- Apply a 10 km non-surface occupancy around active leks and limit permitted disturbance to 1 per section and no more than 3% surface disturbance per section.
- Apply best management practices to minimize surface disturbing activities.
- Implement courtship, nesting, early-brood rearing and winter seasonal and timing restrictions for all human activities, including exploration.
- Avoid the surface disposal of produced water unless it can be proven to be beneficial to sage grouse and includes measures to preclude the spread of West Nile virus.

**Analysis of Key Conservation Measures**

We developed a matrix comparing the key science-based conservation measures for sage-grouse with prescriptions in preferred Alternative D in the draft Idaho/SW Montana. We categorized the application of each conservation measure in the preferred alternatives into one of three categories: adopted the conservation measure (color coded green); adopted the conservation measure, but did not adopt the full prescription, did not make it mandatory, deferred application to future, project-level planning, or allowed for exception, waiver and modification of the measure (yellow); or did not adopt the prescription (red). Our analysis is presented in Table 1. We are concerned that the preferred alternative designates less priority habitat to conserve sage-grouse than other alternatives; fails to require buffers to protect sage-grouse leks and associated nesting and brood-rearing habitat from various land uses and disturbance; does not cap development density for most land uses in priority habitat; does not recommend withdrawal of priority habitat from entry for locatable minerals; fails to protect sage-grouse winter habitat; and does not clearly prescribe needed conservation measures for managing livestock grazing in sage-grouse range.

**Commenter1:**Mark Salvo

**Comment Excerpt Text:**

Smaller sage-grouse lek buffers may be justified where research demonstrates that most sage-grouse nests (i.e., > 90 percent) would be protected by the smaller buffer (see, e.g., Conservation Plan for Greater Sage-Grouse in Utah, unpublished: 9), although the impacts from continued and future land use (pursuant to valid existing rights) in nesting habitat would still advise adopting larger 4-mile lek buffers to conserve the species

**Comment Excerpt Text:**

While it appears that the adaptive management scheme prescribed in the preferred alternative would attempt to retain/restore sagebrush steppe to a minimum of 80 percent of land cover in sage-grouse seasonal habitats, the alternative doesn't actually commit to the minimum standard (vol 2, 2-73). Also, the concurrent allowance of habitat disturbance of between 10-20 percent could be negative for sage-grouse (vol 2, 2-73).

**Comment Number:** IDMTSG-14-0169-43

**Organization1:**Defenders of Wildlife

**Commenter1:**Mark Salvo

**Comment Excerpt Text:**

Designate restoration sage-grouse habitat to focus habitat restoration efforts to extend sage-grouse habitat and mitigate for future loss of priority habitat (BLM Memo MT-2010-017). Restoration habitat may be degraded or fragmented habitat that is currently unoccupied by sage-grouse, but might be useful to the species if restored to its potential natural community. Restoration habitat should be identified in management planning based on its importance to sage-grouse and the likelihood of successfully restoring sagebrush communities (Meinke et al. 2009; Wisdom et al. 2005a). Effective restoration requires a regional approach (e.g.,

sub/regional EISs) that identifies appropriate options across the landscape (Pyke 2011). Passive restoration is preferred for restoring these areas over active restoration methods.

Additional questions and concerns we have about Alternative D include, but are not limited to, the following:

- The alternative fails to recognize site potential to support sage grouse.
- 

**Comment Number:** IDMTSG-14-0178-15

**Organization1:**Idaho Cattle Association

**Commenter1:**Karen Williams

**Comment Excerpt Text:**

[This comment refers to Alternative D] Mitigation (2-74) – We are concerned that alternative’s “no unmitigated loss” goals will result in the arbitrary reduction of livestock grazing with no site-specific cause and effect decision-making ability. The document states that fires are expected so other uses will be used as mitigation. All too often, livestock grazing is used as the mitigating factor simply because it is the easiest use to manage and restrict.

A. Alternative A – Current Management

While the USFWS has determined that there are not adequate regulatory mechanisms in place to ensure the conservation of sage grouse, we assert that the agencies could have made stronger arguments in the LUPA/DEIS to explain how their existing regulations promote the viability of species and have safeguards to protect against habitat degradation.

According to ES 14, Alternative B “focuses on restrictions on resource uses...”. Simply by reading the summary, it is clear that this alternative ignores the agencies’ multiple use mandates and proves that there is a predetermined desire to eliminate land use. Further, the use of the BLM National Technical Team (NTT) report is problematic as it contains overly burdensome recommendations that are not based on local conditions in Idaho. The NTT report fails to make use of the latest scientific and biological information available. According to an independent review of the report, it contains many methodological and technical errors, selectively presents scientific information to justify recommended conservation measures, and was disproportionately influenced by a small group of specialist advocates (Ramey, 2013). For these reasons, Alternative B and the NTT report should no longer be considered a suitable or appropriate management guide for sage grouse and no parts of the report should appear in the final LUPA/DEIS.

**Comment Excerpt Text:**

Regarding suitable buffer zones, the GHZ is a large expanse of fairly compromised habitat that represents only 10% of known leks and 5% of male sage-grouse attending leks. Instead of utilizing the Important Habitat Zone as the buffer as described in Alternative E, we believe it makes more sense to utilize the interface between General Habitat Zone (GHZ) and the IHZ as the actual buffer zone for mechanical fuel breaks, experimental areas for intensive grazing for fuel reduction, and back fires during wildfire events.

In contrast, Alternative D has 10 Population Areas, that with individually applied adaptive triggers. While some of these Population Areas align well with Alternative E's Conservation Areas, several go beyond Alternative E's designated habitat and are relatively small areas. For example, Alternative D's Sawtooth population is roughly 27,000 acres. Tripping a trigger in this area is likely to occur often, due to its small size. Further, a trigger in this small of an area is likely not going to impact sage-grouse in the same way as a trigger would in a larger Population Area, like the Mountain Valleys population, which is over 4 million acres. This disparity makes it difficult for BLM to prioritize resources and land management decisions.

**Organization1:**  
**Commenter1:** C.L. Butch Otter

**Comment Excerpt Text:**

Alternative D's Population Areas are an unrealistic method of categorizing sage-grouse habitat. In fact, Alternative D includes protections for an additional 700,000 acres. Alternative D's Priority zone contains 7 million acres and the medial zone has 1.3. This is in contrast to Alternative E's more balanced approach of 4.9 million acres in CHZ and 2.7 million acres in IHZ. As Alternative D is written, its trigger program is rendered largely ineffective because tripping a trigger only extends protection to an additional 1.3 million acres. Alternative E is able to protect twice that, so triggers will actually have an impact. Alternative E includes 95% of the sage-grouse population in Idaho within CHZ and IHZ's 7.6 million acres. Thus, BLM's inclusion of an additional 700,000 acres equates to saving at best, a few more percentage points, without affecting a listing determination. BLM would be required to spend time and effort monitoring areas that the Service has not identified as significant for sage-grouse.

**Comment Excerpt Text:**

BLM argues that these areas are important for “connectivity” for sage-grouse, as the bird cannot appreciate the boundaries the government has created for it. However, the Service still has determined that these areas are relatively unimportant to the entire population and has excluded these areas from its PACs. It is unclear why BLM continues to insist on expending limited resources on these additional acres, when both the Service and the State identified other areas as higher priorities.

**Comment Excerpt Text:**

For both Alternative D and E, the triggers are individualized per conservation or population area. That means in Alternative D, a hard trigger, requiring immediate management change would become operative in any of the ten areas. This makes Alternative D’s trigger mechanism extremely sensitive. The Governor is not sure that this type of sensitive trigger is actually implementable by BLM. Further, BLM has not provided any scientific justification for this sensitive of a trigger. In contrast, Alternative E’s triggers are spread over much larger areas, providing a more manageable, practical mechanism for changing management when necessary. Even Alternative E’s trigger mechanism is conservative, and more sensitive than necessary. However, the Governor believed it was important to be proactive in addressing and minimizing threats across sage-grouse’s range. Alternative D goes too far and will ultimately be too sensitive to allow for efficient allocation of time and resources.

**Comment Excerpt Text:**

The Department is concerned by Alternative D's trigger application to the populations. The triggers propose to count all leks within a population over a 3-5 year period. Currently, approximately 50% of leks in Idaho are counted in any given year. Many leks across the state are not counted because of limited resources or leks are inaccessible during the breeding season. Thus, an effort to count all leks in a consistent manner called for under Alternative D is not logistically or financially feasible. Moreover, some populations (e.g., East Central and Sawtooth) may not have active leks or enough active leks for the proposed population triggers to accurately indicate population changes. Therefore, the Department is concerned that collecting the necessary information for the population trigger under Alternative D is not feasible.

The Department is concerned with Alternative D's habitat trigger that indicates a 20% loss of any sagegrouse

habitat in a population area will trip a trigger. Habitat triggers should focus on critical habitats (e.g., breeding or wintering habitats) rather than account for losses in all seasonal habitats (e.g., summer habitat) that are able to sustain additional losses. Moreover, Connelly et al. (2000) indicated that productive brood rearing or summer habitats are usually characterized by the area having over 40% sagebrush cover, not 80% as suggested in Alternative D.

**Comment Excerpt Text:**

Adaptive management actions for the protection of nesting and winter habitat would occur if there was a 10% net loss of either of these habitats within a population area. However, the mapping prepared to date is insufficient to identify either of these habitats at a scale such that a 10% change could be measured with confidence. Page 4-7 of the Draft

Environmental Impact Statement (EIS) states, “Seasonal ranges of migratory and non-migratory GRSG are largely encompassed within GRSG Habitat Designations but are not sufficiently mapped to provide an assessment of direct impacts.” The EIS should identify the specific measures the BLM and U.S. Forest Service (USFS) will implement to identify and accurately map seasonal habitat to correctly identify baseline conditions, measures that will be used to update mapping, and how the net loss will be calculated.

**Comment Excerpt Text:**

Alternative D proposes a “no net unmitigated loss of PPMA habitat.” On the surface, it makes good conservation sense to not lose more of the “best of the best”; however, “net” is not well defined. To effectively comment on no net unmitigated loss of PPMA habitat, it would be helpful to have answers to the following questions:

- Issues of habitat quality within a habitat category (e.g., areas within a PPMA may not be meeting functional sage grouse habitat needs or may have burned recently. Restoration of these areas such that they meet sage grouse habitat needs doesn’t change the number of acres of PPMA habitat and therefore would not meet the “net” definition).
- Can the mitigation/restoration of habitat in a lower-quality habitat category, such as a PGMA, move that area to a higher-quality habitat and therefore meet the “net” criteria? Is this the only way “net” can be met? What spatial correlation would such improved habitat need to have to PPMA to count as mitigated?

- How would non-restoration, protection mitigation be allocated toward “net”? If mitigation protects x thousands of acres from burning, how is that calculated toward net?
- How is the maturation of seeded restoration projects calculated? (i.e., the time it takes for plant communities to provide functional habitat).

Pg. 4-8, 2nd bullet point:

Assumption

Energy extraction such as oil and gas, geothermal, and plan of operation mining can cause impacts up to 11.8 miles (19 kilometers) based on direct impacts of field development, including associated infrastructure, noise, lighting, and traffic (Johnson et al. 2011; Taylor et al. 2012).

Research findings by Johnson et al. (2011) appear to be overstated. Johnson et al. (2011) stated that for oil and gas wells “leks tended to have more positive trends if they were farther away from producing wells.” Also, leks trends appeared to increase to about 20 km in the Great Plains and Wyoming Basin. Johnson et al. (2011) also reported a declining trend in leks within 5 km-, but a less strong relationship within 18 km for interstate highways. The presence of secondary roads appeared not to influence lek trends. Distance from lek to nearest powerline suggested no relationship across all sage grouse management zones (Johnson et al. 2011). Thus, the statement in the LUPA/DEIS, regarding the spatial direct impacts of energy extraction, based on Johnson et al. (2011) is inaccurate and misleading.

Coates et al. (2013) showed that nearly 90% of utilization distributions of sage grouse across four subpopulations and all four seasons in Mono County (CA) were contained within approximately 5-km radius of each lek. Coates et al. (2013) suggest that the distances between 5 and 7.5 km from leks—depending on migratory status of sage grouse—are likely to limit both direct and indirect adverse effects to sage-grouse nesting associated with anthropogenic disturbance—not 19 km

**Comment Excerpt Text:**

Pg. 4-15, 1st para.

Impacts from energy development accrue both locally and cumulatively at the landscape scale. Accumulated evidence across landscape-scale studies show that GRSG populations typically decline following oil and gas development (Holloran 2005; Walker et al. 2007; Doherty et al. 2008). Oil and gas infrastructure and associated human activity have been shown to adversely affect GRSG populations collectively and in some instances, impacts have been directly attributed to certain anthropogenic features (e.g., roads, power lines, noise, and associated infrastructure; Walker et al. 2007; Doherty et al. 2008; Lyon and Anderson 2003; Holloran 2005; Kaiser 2006; Aldridge and Boyce 2007).

Connelly et al. (2004) provided a broad and general review of powerline- sage-grouse interaction and combined powerlines with other energy developments such as oil and gas exploration and roads, as well as

other anthropogenic activities such as campgrounds, landfills, and agriculture activities. The authors state that non-renewable energy development—a large category that includes all industrial development from oil and gas exploration to the electric power grid—impacts sage-grouse habitat on a large spatial scale, but do not provide specific information on powerlines. Information on the impact of transmission lines on a landscape level by Leu and Hanser (2011) and Johnson et al. (2011) would be more appropriate to reference in relation to sage-grouse persistence in the landscape.

Walker et al. (2007) showed that all top models to explain lek persistence included a strong positive effect of sagebrush habitat and a strong negative effect of Coal Bed Natural Gas (CBNG) development. Furthermore, the best habitat-plus-CBNG model was 28 times more likely to explain patterns of lek persistence than the best habitat-plus-infrastructure model (including powerlines) and 50 times more likely than the best habitat-only model. Lastly, models with powerline effects were weakly supported compared to models with CBNG, although powerlines appear to have a negative effect on lek persistence. The powerline variable included lines associated with CBNG as well as non-CBNG powerlines. So no attempt was made to isolate the effect of powerlines from the confounding effect of CBNG development. IPC suggest that a more complete statement is included in the USGS report regarding the effects of energy developments on sage-grouse lek persistence in relation to Walker et al. (2007) study. It appears that selective use is being made of the information provided by Walker et al. (2007), narrowly focusing on the (weak) effect of powerlines on sage-grouse lek persistence.

Doherty et al. (2008, Holloran (2005) and Aldridge and Boyce (2007) evaluated Coal Bed Natural Gas wells, but did not evaluate effect of powerlines. Lyon and Anderson (2003) evaluated the effect of vehicular traffic associated with natural gas developments. Therefore, none of these studies provide information on the effects of powerlines.

**Comment Excerpt Text:**

We are uncertain, however, about the meaning of the two quoted objectives in Alternative E in light of the statement that immediately follows them. In the following paragraph, the DEIS explains that: “This would enable the State of Idaho to maintain a viable population of at least 65 percent of the GRSG leks for the foreseeable future.” DEIS at 2-78. Table 2-17 paraphrases the same language in describing the objectives of Alternative E. DEIS at 2-95. Table 2-17 does not mention the objective of stabilizing populations in the IHZ, which is referred to merely as a “buffer” for the CHZ.

We worry that this language could be read to suggest that the State’s objective is to protect just the CHZ with 65% of the leks in Idaho and that a population decline in the IHZ would be consistent with this objective. This could lead state and federal agencies to “manage down” to a lower population level rather than seek to prevent further decline. An “objective” of permitting a one-third reduction in the number of leks and an unstated but presumably greater population decline is not appropriate. Such a decline could lead to a decision to list the sage grouse under the Endangered Species Act.

**Organization1:**The Nature Conservancy

**Commenter1:**William Whelan

**Comment Excerpt Text:**

At a general level, both the “no net unmitigated loss” wording of Alternative D and the “no population decline” wording of Alternative E provide important narrative standards. Both ideas should be included in the final plan.

However, we are very concerned that neither alternative adequately explains what the standards mean and how they would be implemented. The lack of such an explanation will lead to prolonged fights, confusion, and needless expense when future infrastructure proposals come before the federal agencies for approval

**Comment Number:** IDMTSG-14-0206-12

**Organization1:**The Nature Conservancy

**Commenter1:**William Whelan

**Comment Excerpt Text:**

The central problem with the “no net unmitigated loss” standard is that not all infrastructure impacts can be offset with any reasonable level of confidence.

**Comment Number:** IDMTSG-14-0206-13

**Organization1:**The Nature Conservancy

**Commenter1:**William Whelan

**Comment Excerpt Text:**

The “no net unmitigated loss” standard is particularly difficult to apply as an avoidance policy because it couples two inherently uncertain tasks: estimating project impacts and determining the effectiveness of proposed mitigation. Uncertainty expands geometrically when the agency decision hinges on making defensible findings in both dimensions.

A better approach would be to apply the “no net unmitigated loss” policy only after applying a standard setting a maximum allowable impact on sage grouse populations and habitat. The “no net unmitigated loss” could be a valuable addition to the final Plan but it should not come into play until the agency has decided that the overall impact of the project is at an acceptable level

**Comment Number:** IDMTSG-14-0206-14

**Organization1:**The Nature Conservancy

**Commenter1:**William Whelan

**Comment Excerpt Text:**

The central problem with the quoted “no population decline” standard is that it is a general narrative standard that provides little guidance in determining an acceptable level of impact. The standard should be accompanied by metrics and methods for determining the level of disturbance that produces “unnecessary and undue habitat fragmentation” and “decline in population.”

**Comment Number:** IDMTSG-14-0206-15

**Organization1:**The Nature Conservancy

**Commenter1:**William Whelan

**Comment Excerpt Text:**

We urge BLM/USFS to adopt the 3% surface disturbance cap in the final Plan and to apply it to CHZ. Best available scientific literature has identified that many populations show negative impacts at disturbance values lower than 3% and there are significant, demonstrable negative impacts to the species at 3% disturbance (Knick et al. 2013). Therefore a 5% cap is not sufficient and would limit the ability to achieve the objectives of sage grouse conservation and increase the risk that this species will continue to decline in areas that exceed the recommended 3% cap (see Holloran 2005, Naugle et al. 2011, Baruch-Mordo et al. 2013)

---

**Comment Number:** IDMTSG-14-0206-2

**Organization1:**The Nature Conservancy

**Commenter1:**William Whelan

**Comment Excerpt Text:**

Therefore, we recommend deleting the language referring to maintaining the viability of 65% of leks from the objectives section. Table 2-17 should be changed to include the objective of stabilizing populations at the current level in both CHZ and IHZ, as stated on page 2-78.

**Commenter1:**Randy Vranes

**Comment Excerpt Text:**

The majority of the phosphate leasable minerals resources are located in Western Association of Fish and Wildlife Agencies (“WAFWA”) Sage-Grouse Management Zone IV. See Draft LUPA/EIS pp. 3-6 (Figure 3-1 showing WAFWA management zones), 3-115 (Figure 3-13 showing unleased KPLAs). Pursuant to the Draft LUPA/EIS, wildfire, invasive weed species, and small population size—and not minerals development—are the major threats to sage-grouse in WAFWA Management Zone IV. See Draft LUPA/EIS p. 4-297. Closing these areas to leasable minerals development will not address the primary threats to the species. See, e.g., Draft LUPA/EIS p. 4-297 (concluding that all action alternatives, including the State’s alternative that does not propose any leasable minerals closures, “would likely prevent the threat of isolation/small size from worsening”). Further, by eliminating leasable minerals development, the Agencies are foreclosing potentially beneficial cooperation opportunities to provide a net benefit to the species through mitigation or conservation programs developed by the entities engaged in leasable minerals development. In this way, closing the areas is inconsistent with the goal of Alternative D, which is to conserve sage-grouse “in cooperation with other conservation partners.” Draft LUPA/EIS p. 2-95 (Goal D-GOAL-1).

**Commenter1:**Dennis Mackey

**Comment Excerpt Text:**

PACs/Habitat Categorization

We recommend that the habitat categories included in the FEIS be biologically meaningful and pragmatically effective. To be biologically meaningful, the Important Habitat Zone (Alternative E) or Medial Management Area (Alternative D) must represent an adequate portion of Idaho's GRSG population. It is currently unclear how biologically meaningful Alternative D's Medial Habitat Area is, whereas Alternative E's Important Habitat Zone supports 22 percent of Idaho's GRSG population within approximately 4 million acres of habitat. To be pragmatically effective, the habitat categories must include enough land area (i.e., acres) to discourage a habitat or population loss trigger being tripped. The Important Habitat Zone (Alternative E) includes approximately twice as many acres of federal lands as the Medial Habitat Area (Alternative D), therefore we believe that Alternative E's current habitat categorization more effectively discourages a trigger being tripped, and thus is more protective of the species and its habitat because of increased incentive to take early management actions

**Comment Number:** IDMTSG-14-0242-28

**Organization1:**U.S. Fish and Wildlife Services

**Commenter1:**Dennis Mackey

**Comment Excerpt Text:**

The DEIS does not provide adequate specificity regarding how the "no net habitat loss" standard would be implemented to determine its consistency with the COT objective. If it is the intent of Alternative D to implement a 3 percent disturbance cap as well as the above mentioned NSOs and noise stipulations, it would be consistent with the COT objective. Although Alternative E is largely consistent with the COT, we would recommend that the 3 percent disturbance cap be consistently applied across the P ACs (CHZ and the 1HZ) and that it include other anthropogenic disturbances (as discussed above).

**Comment Excerpt Text:**

Noise and seasonal stipulations should be considerations during the construction and long-term implementation of land use activities. Your proposed implementation of noise and seasonal stipulations across all alternatives appears to be applied only to initial construction activities. However, most land use activities result in permanent disturbances on the landscape and the associated human activity, traffic, and noise disturbances have long-term effects to GRSG. Although the surface area covered by various types of development can be relatively small, the effects of noise extend far beyond the development itself (Blickley and Patricelli 2010). For example, the construction of a compressor station may have short-term implications to GRSG use of seasonal habitats, but the long-term operation and noise of the compressor station may result in GRSG habitat abandonment (Blickley and Patricelli 2012, Blickley et al. 2012). Similarly, seasonal restrictions applied only to drilling and construction do not address effects to populations over long periods of time (Walker et al. 2007).

**Organization1:** 06 Livestock

**Commenter1:** Dennis L. Stanford

**Comment Excerpt Text:**

Also not having livestock in a pasture at the time of hatching and brood rearing is harmful to the sage grouse young as they are dependent on high protein for survival, mostly insects. Fresh cow manure is where most face flies, horn flies and bot flies lay their eggs (dinner for young sage grouse).

---

### ***Summary***

Commenters proposed revisions or requested additional details and clarifications to the alternatives related to GRSG. Topics of concern included:

- The size of lek buffers
- Level of predator control
- Need for and size of disturbance cap
- Restrictions on wind energy development
- Noise restrictions
- Livestock grazing management changes
- Inadequate description of adaptive management and monitoring
- Need for an improved definition of no net unmitigated loss
- Leasable mineral restrictions
- Juniper removal
- Existing and new fencing as they relate to sage-grouse strikes and mortality
- Lack of active habitat restoration
- Habitat monitoring

Commenters were concerned about greater sage-grouse habitat mapping, including suggesting clarifications or revisions to the habitat map and concerns about using the map for site-scale projects.

Commenters were also concerned that Manual 6840 was not used as the baseline policy governing present GRSG conservation in the No Action alternative.

---

### ***Response***

As noted above in the response in Section 4.3, Range of Alternatives, Section 2.1 of the Draft EIS describes how the Idaho and southwestern Montana GRSG LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA and worked closely with the State with assistance from the USFWS.

Meaningful differences among the six alternatives are described in Table 2-2, Comparative Summary of Alternatives by Acres Allotted, and in Section 2.6, Detailed Description of Alternatives, of the Draft EIS. [Specify where changes have been made to the FEIS regarding each of the bullets below]. Refer to tab 32 regarding predator control. All of these issues have been addressed in new management actions prepared for the proposed plan and analyzed in Chapter 4 (and reference relevant appendices regarding AM and monitoring, etc).

Regarding the following issues:

The size of lek buffers -lek buffers will be revised in final plan/FEIS reflecting additional review of best science.

- Level of predator control
- Need for and size of disturbance cap- Additional specificity regarding the disturbance cap has been further explained in the FEIS.
- Restrictions on wind energy development
- Noise restrictions. Noise and seasonal stipulations for both construction and long-term implementation of land use activities has been included in the final EIS. [NOTE TO BLM (from Makela)- Project leads should discuss how to consistently address impacts from military flights and firm up discussion at 4-15. Consider adding additional detail from Mt. Home AFB Integrated Resource Mgt. Plan.]

- Livestock grazing management changes
- Inadequate description of adaptive management and monitoring. The BLM and FS believe the management actions described in the Proposed Plan will adequately address sage-grouse conservation needs without the need for additional large scale designations.
- Need for an improved definition of no net unmitigated loss- Additional specificity regarding the no net habitat loss objectives has been further explained in the FEIS.
- Leasable mineral restrictions
- Juniper removal
- Existing and new fencing as they relate to sage-grouse strikes and mortality. The BLM and FS used the latest science in developing management actions relatives to fences that adequately address collision risk. No change has been made to the document regarding this issue in the FEIS.
- Lack of active habitat restoration- Site specific projects are not identified in the broad scale plan, but there are a number of restoration actions described in Table 2-18 Vegetation/Restoration section in the DEIS and in the Proposed Plan.
- Habitat monitoring- The BLM and FS, in coordination with the state, have clarified monitoring and mapping expectations in the FEIS.

A description of the habitat mapping process for each alternative is presented in Section 2.6, Detailed Description of Alternatives. The Proposed Plan will contain a mechanism that allows for evaluation of circumstances on case by case basis at the site specific scale that would be addressed via subsequent project level NEPA analysis.

Manual 6840 is referenced in Chapter 1, Section 1.x, Planning Criteria, and provides general guidance for special status species, but it does not provide language relative to specific conservation actions for specific species. [BLM- ensure Manual 6840 is discussed in Alternative A and also relevant FS policy].

[NOTE TO BLM: Ensure Proposed Plan has appropriate provisions/clarity for actions in General management areas. Needs additional discussion.]

**Comment Excerpt Text:**

In Table 2-2 the LUP/DEIS identifies the estimated acres in each alternative for the different GRSG habitat categories. The number of acres and size of the habitat is huge. The GRSG population has steadily trended downward since the 1960's and will probably continue until equilibrium is reached with all the threats. Given the millions of acres of habitat spread throughout the eleven western states where little development is foreseen, it is not reasonable to believe the GRSG will become extinct. No population number has been suggested as the lowest recoverable figure by the USFWS or anyone else.

**Commenter1:**Jim Hagenbarth

**Comment Excerpt Text:**

How the LUP/EIS proposes to measure GRSG population is reasonable given the difficulty of counting every single bird. Male lek counts are the only parameter we have to develop population trends. My concern is that the artificially high numbers in the past will impact our ability to recognize when the downward trend will level off to a population that is stable given the current threats. I am not that familiar with the ESA, but there is too much good sagebrush habitat in the west that will remain ecological sustainable in the future. The value and availability of water will insure millions of acres of intact sagebrush habitat. We most likely will be converting abandoned desert farm ground back to its native sagebrush habitat. The plaintiffs are attempting to use the GRSG and the ESA to change land use based on decreasing bird numbers. The USFWS needs to come up with a finite number before listing is warranted, not just a declining population trend. We have and will continue to have suitable habitat to sustain a healthy population of GRSG.

**Comment Excerpt Text:**

Predation in the list of threats has been given a lower priority, yet most infrastructure placement/height regulations are based on either infrastructure use as perches and/or nesting by avian predators and vegetative cover guidelines relate to hiding and nest cover from all predators. There is no question that many predator populations have increase exponentially in the last 40 years and their impact is significant on bird populations. Raven populations on the INEL have increased 900% since 1985. Predator populations are dynamic and are very difficult and cost prohibitive to manage without using lethal poisons and this is not an option. There is a smorgasbord of nutrition through out the west that supports many predator populations. GRSG will adapt to these predators, but I believe their numbers are going to adjust downward more than is anticipated. In the alternative chosen it is important we mitigate infrastructure design as much as possible to reduce perching and nesting of avian predators. As GRSG numbers continue to decline lower to more stable levels, it is appropriate that human predation of the GRSG be stopped. It is not acceptable to allow hunting when all other activities are being marginalized. Hunting does not give us a lot of pertinent management data.

- Alternative E includes the requirement for any assessment to determine whether or not a given area has the ability to provide sage grouse habitat (See Appendix D, page D-36). This is critical because as the maps are difficult to decipher on the large scale, and personal knowledge of the area reflects that some areas identified

as within PPGH or Core habitat do not have the ability to provide for sage grouse needs.

Recent research

suggests that oil and gas development and associated infrastructure can negatively impact sage-grouse lek persistence up to 4 miles from the lek (Holloran 2005, Walker et al. 2007, Harju et al. 2010).

Approximately 5%, 28%, and 90% of the total area used by sage-grouse has been documented in a different study area to be encompassed by buffers of 0.25, 0.60, and 3 miles around leks, respectively (Coates et al. 2013). Research also suggests that cumulative anthropogenic surface disturbance in excess of 3% of the landscape has negative impacts on sage-grouse lek occurrence (Knick et al. 2013). We encourage the BLM and USFS to use this science to help guide final decisions regarding oil and gas surface occupancy and controlled use in southwestern Montana.

**Comment Excerpt Text:**

A concern that is not addressed in any of the alternatives is threetip sagebrush (*Artemisia tripartita*) dominance on the landscape following fire (wildfire, or repeated fires, both controlled and prescribed) and repeated chemical treatment of big sagebrush. (Lowe, B. 2006), found sage grouse nest success was lower when nests were associated with threetip sagebrush compared to sage grouse nests associated big sagebrush species. My own observations suggest that sage grouse are seldom associated with threetip sagebrush during winter.

Threetip sagebrush is a natural component of sagebrush steppe communities across southern Idaho. However, following large-hot wildfires, or repeated controlled or prescribed fire, or chemical brush management treatments threetip sagebrush becomes the dominant sagebrush species. Today, there are sizable acreages of threetip sagebrush monocultures following wildfire or brush management projects across southern Idaho. Once threetip becomes dominant on the landscape it appears to suppress recovery of Wyoming and mountain big sagebrush species. Historical literature (Winward) indicates this dominance persists at least 50 years in Clark County, Idaho. Conversion from big sagebrush species to threetip sagebrush following wildfires and brush management practices can be observed the mountain valley, north side Snake, south side Snake and east central Idaho population areas. The dominance of threetip sagebrush on the landscape may be the primary reason sage grouse numbers are so limited and their distribution so fragmented in the east central Idaho population area.

There are a number of instances where the methods and protocol for conducting assessment of GRSG populations and habitat need to be clearly and concisely described. The need is not just to describe the on ground procedures but to establish the kinds and amount of data necessary to justify a conclusion, (e.g. a lek route must be counted at least x times in a given year to yield actionable results). Any time that future actions or decisions are to be based on any specific data or information, there must be assurance that the data and information is sufficiently reliable to justify the action. The BLM self-inflicted time crunch to renew the Owyhee 68 permits has resulted in numerous abbreviated and shortcut methods that are incapable of yielding trustworthy data and information yet they are the basis for drastic change.

The Draft LUPA EISs devote voluminous space to the current status of the affected environment and to the expected environmental consequences of the various alternatives under consideration for almost everything under the sun, except for the status and environmental consequences with respect to greater sage-grouse population levels and trends, thereby failing to meet the overriding purpose for the project. The EISs analyze the status and environmental consequences with respect to other special status species, vegetation, fish and wildlife, wild horses and burros, wildfire, livestock grazing, recreation, travel management, lands and realty, mineral resources, special designations, soil resources, water resources, cultural resources, tribal interests, visual resources, roadless areas, air quality, climate change, social and economic conditions, and forest and woodland products, among other things. But the Draft LUPA EISs give only cursory attention to the current status of greater sage-grouse populations and essentially no attention to the environmental consequences of the various alternatives under consideration on greater sage-grouse population levels and trends.

**Comment Excerpt Text:**

Neither of the Draft LUPA EISs analyzes whether the greater sage-grouse meets the ESA definitions for listing as endangered or threatened. Thus, both the Draft LUPA EISs fail to meet the overall purpose for the EISs identified by the NOI. To evaluate whether the greater sagegrouse presently meets the criteria to be listed as endangered or threatened under the ESA, one must answer two questions: 1] How many greater sage-grouse are needed to safeguard the species against extinction; and, 2] Do current greater sage-grouse population numbers and trends put the greater sage-grouse at risk for imminent extinction or for eventual extinction in the foreseeable future?

The U.S. Fish and Wildlife Service (FWS) provided the information required to answer these questions in its 2010 FWS Findings. The FWS Findings identified greater sage-grouse populations below 50 breeding adults “as being at short-term risk of extinction” and identified populations below 500 breeding adults “as being at long-term risk for extinction.” See FWS Findings<sup>6</sup>, page 13959. The FWS Findings further qualified that the minimum effective population size needed to protect the species long-term may be as high as 5,000 individuals in order to “maintain an effective population size of 500 birds” (see, FWS Findings<sup>6</sup>, page 13985) and to maintain “minimal viable population(s)” (see, FWS Findings<sup>6</sup>, pages 13959 and 13985). Thus, a population that exceeds 50 breeding adult sage-grouse is needed to safeguard the species against the short-term risk of imminent extinction, and as many as 5,000 individual sage-grouse may be needed as a

minimum effective population to safeguard the species against the long-term risk of extinction in the foreseeable future.

The FWS Findings estimated that the recent range-wide greater sage-grouse population totals over 535,000 birds, which is 107 times larger than the minimum effective population of 5,000 birds. See FWS Findings<sup>6</sup>, Table 4, page 13921. All eleven of the locations reported in Table 4 greatly exceed a population of 50 breeding adults. Likewise, given the estimated number of males by Management Zone reported in Table 6 of the FWS Findings (see FWS Findings<sup>6</sup>, page 13923) and the female skewed sex ratio for greater sage-grouse (reported to average about two females to one male, FWS Findings<sup>6</sup>, pages 13916 and 13992), it is evident that all seven Management Zones greatly exceed a population of 50 breeding adults. Thus, all seven Zones exceed the population size below which greater sage-grouse are considered to be at risk for short-term extinction, so there are at least seven areas that support sufficient populations to prevent the greater sage-grouse from being listed as endangered under the ESA.

In fact, all seven of the Management Zones exceed a population of 500 breeding adults, and five of the Zones greatly exceed the minimum effective population of 5,000 individual birds below which greater sage-grouse are considered to be at risk for long-term extinction. Additionally, estimates for the rate of decline in greater sage-grouse populations from 1985 through 2007 have averaged about 1.4% per year. See FWS Findings<sup>6</sup>, page 13922. Assuming that current management practices endure and this rate of decline continues indefinitely, it would take more than 330 years for the existing greater sage-grouse population to dwindle below the minimum effective population. Speculating what might occur over three centuries from now reaches well beyond the foreseeable future. Thus, there are now numerous areas that will support populations that exceed the minimum effective population of 5,000 birds into the foreseeable future to preclude listing the greater sage-grouse as threatened under the ESA.

1. We all recognize that the GRSG habitat in the west is in the midst of a severe drought, GRSG “hen survival July-August, 2003” was about 76% with no WNV and 20% with WNV.

2 Thus the hen population decreases by nearly 75% and further information showed that WNV reduced the GESG population by 25% in 2003!

3 The GESG population had a lek attendance decline of about 85% in 2004 due to WNV. WNV was detected in the GESG in the states of CO, ID, MT, ND, NV, OR, SD, UT, & WY.

4 “WNV affects both sexes and all age classes”

5 and “Lab tests confirm that all birds that contact disease die”

6 GRSG Survival scenarios show a decrease of GESG of 6-9% per year!

7 The presentation also suggests ways to manage the land to reduce mosquito’s population.

**Comment Excerpt Text:**

Studies that address the effects of anthropogenic disturbances on sage-grouse have primarily focused on the effects of oil and gas developments, as well as human induced fires. In addition, due to the recent increase in

energy developments within the western United States, researchers have begun to study the potential effects that tall structures can have on sage-grouse. The potential effects of surface mining activities (i.e., the extraction of non-liquid minerals such as phosphate) on sage-grouse have been largely neglected by researchers. As a result, the magnitude and extent of impacts from mining activities on sage-grouse and sagebrush habitats is largely unknown (Braun 1998, USGS 2013). However, a few small studies have shown that mining activities in sagegrouse habitats can result in a decline of sage-grouse within the mining area.

Eng et al. (1979) found that male sage-grouse attendance decreased at a lek located near a coal mine (distance between lek and mine was not reported), with 23 male sagegrouse observed at the lek in 1974, and only 6 males by 1979. The researchers stated that the overall increase in traffic and noise level from the mine may have contributed to the decline.

A study of a coal mine found that the number of displaying sage-grouse on two leks located within 2 kilometers of an active mine in northern Colorado declined by approximately 94 percent during a 5-year period following an increase in mining activity (Remington and Braun 1991).

Braun (1998) and Tate et al. (1979) reported that recovery of sage-grouse populations may occur after initial development and subsequent reclamation of mine sites, although populations do not recover to pre-development sizes.

Based on the limited information available, the exact extent that sage-grouse numbers may decline as a result of mining activities is uncertain. For example, the USFWS (2010) presented the results of a study conducted in northeast Wyoming where no decline in female survival was detected in a population of sage-grouse located near a large surface coal mine and nest success did not appear to be reduced either; they did however, conclude that continued mining would result in fragmentation and eventual impacts to the population if adequate reclamation and restoration of disturbed areas was not conducted (USFWS 2010).

The FWS Findings estimated that the recent range-wide greater sage-grouse population totals over 535,000 birds, which is 107 times larger than the minimum effective population of 5,000 birds. See FWS Findings6, Table 4, page 13921. Given the estimated number of males by Management Zone reported in Table 6 of the FWS Findings (see FWS Findings6, page 13923) and the female skewed sex ratio for greater sage-grouse (reported to average about two females to one male, FWS Findings6, pages 13916 and 13992), it is evident that all seven Management Zones exceed a population of 500 breeding adults, and five of the Zones greatly exceed the minimum effective population of 5,000 individual birds which precludes a population from the long-term risk of extinction. Thus, five Management Zones exceed the population size below which greater sage-grouse are considered to be at risk for long-term extinction, so there are at least five areas that support sufficient populations to preclude the greater sage-grouse from being listed as threatened under the ESA according to data reported within the FWS Findings.

When discussing two stronghold habitat areas, the FWS Findings implicitly concede that the greater sage-grouse does not qualify to be listed as threatened under the ESA. The FWS Findings state “the ability of these strongholds to maintain high densities to date in the presence of several threats indicates that there are sufficient habitats currently to support the greater sage-grouse in these areas” (see FWS Findings6, page 13962) and admits that the FWS expects that these “two strongholds of contiguous habitat will still remain in fifty years even though the threats discussed above will continue there” (see FWS Findings6, page 14009). The FWS expectation that these two stronghold areas will maintain high densities (large populations) in fifty years, even in the face of existing threats, demonstrates that the species does not face extinction in the foreseeable future, so the greater sage-grouse is not threatened as defined under the ESA.

Given the proportional distribution of breeding males within the ten population areas identified for the Nevada sub-region (see NV Draft LUPA/EIS1, pages 3~26 – 3~32) and the total estimated greater sage-grouse population of 88,000 birds in California/Nevada (see FWS Findings6, table 4, page 13921), it is estimated that at least four populations in this sub-region greatly exceed the minimum effective population of 5,000 individual birds which precludes a population from the long-term risk of extinction. Thus, four Nevada populations likely support sufficient numbers to preclude the greater sage-grouse from being listed as threatened under the ESA.

The DEIS does not discuss how the key areas used in Standards & Guidelines assessments referred to in the DEIS overlap with sage-grouse habitat or whether the S&G parameters specifically measure the impacts of livestock at specific points in sage-grouse lifecycles. The DEIS does not explicitly link the measurements of the S&G assessments to the criteria established for sage-grouse nesting and brooding success. Without site-specific monitoring or a clear connection between the rangeland health standards and the habitat needs of sage-grouse, meeting the S&Gs cannot be considered an adequate regulatory mechanism to prevent listing. The DEIS also does not disclose exactly when the S&Gs were evaluated on the allotments, making it uncertain whether BLM's conclusions here are even timely. This type of land health assessment monitoring should also be available online.

**Comment Excerpt Text:**

The DEIS has virtually no information whatsoever regarding current conditions of sage-grouse habitat at the allotment level. Determinations regarding rangeland health standards do not conclusively demonstrate that an allotment is meeting sage-grouse habitat needs. This is especially the case because of the often arbitrary and livestock –industry-biased FRH processes that many BLM Offices conduct (such as those of the Idaho Falls District). Whereas the DEIS claims that BLM uses rangeland health standards to determine wildlife habitat conditions, the current rangeland health standards are general, superficial, qualitative assessments designed to provide an overarching idea of the ecological conditions of a given area, and may not be specific to habitat for any given species

In 2013, FWS considered it “best available science” to base population information on lek data that was over 5 years old. The population analysis in the COT Report Table used the Garton (Knick and Connelly 2009/2011) population analysis numbers of 2007 or 2008, and the prior decade. Using 5 year old lek data in 2013 to draw conclusions on the status of populations impacted especially by the 2007- 2008 fires makes little sense. We are not certain of the vintage of the numbers used in some of the GRSG EISs. WWP had specifically commented in Scoping that current information that reflected possible loss of leks or population declines needed to be presented in the DEISs, and it must be tied to specific areas and mapping so that the losses can be understood and immediate protective action to cushion declines taken.

FWS in the COT appears to have used 500 birds as a threshold for population viability. See COT Table Population abundance and estimated quasi-extinction risk. Yet recent science, such as the BSSG Proposed Rule – shows a much higher number, citing Traill.

Anderson and Inouye<sup>34</sup> [Anderson, Jay E. and Rishard S. Inouye. 2001. Landscape-Scale Changes in Plant Species Abundance and Biodiversity of a Sagebrush Steppe Over 45 Years. Ecological Monographs, 71(4), 2001, pp. 531-556.] found that viable remnant populations of native grasses and forbs are able to take advantage of improved growing conditions when livestock are removed. They found further that despite depauperate and homogenous conditions of permanent plots in 1950, after 45 years of no livestock grazing, vegetation had been anything but static, clearly refuting claims of long-term stability under shrub dominance. Mean richness per plot of ALL growth forms increased steadily in the absence of domestic livestock grazing. Grasses and forbs increased significantly. This information should be integrated into the “No Grazing” or “Reduced Grazing” alternatives and, given these findings, the BLM should analyze the impacts of long-term authorized grazing and its impacts on sagebrush communities and obligates compared to the impacts of removing livestock and allowing these communities to recover naturally

**Comment Excerpt Text:**

It is a significant concern that in this Idaho EIS, BLM mirrors the COT cuts in its down-grading of areas of Priority Habitat into a lesser “**Medial**” category. It is an even greater concern that BLM considers the state plan, which downgrades part of the COT “Priority Areas for Conservation” PACs into the non-Priority habitat sacrifice category of “Important”, to be a reasonable alternative. The COT Report, after making the cuts, then states that all the PAC habitats must be protected.

There is no information provided in the DEIS on why the habitat cuts were made, or how downgrading habitat is a conservation action in the context of declining and increasingly fragmented populations. DEIS at 3-23, describes the “Affected Environment”, but it fails to provide information based on actual populations. It uses what appear to be the Idaho 2006 Plan Key habitat categories of East-Central, Mountain Valleys, North Side Snake South Side Snake, Sawtooth (extirpated), Bear Lake, and Weiser. The text states that the number of males from 2007-2011 were used. No explanation is provided for why. There were 905 occupied leks in 2011, inclusive of land ownership based on IDF, MFWP, UDWR, and WGFD data.

**Comment Excerpt Text:**

PACs are termed highly important for long-term viability. PAC “encourages but does not require” that attention be paid to important habitat outside PACs. (If it is important, it should have been in the PAC). The COT Report at 10 also admits that vegetation treatments for livestock forage result in loss or fragmentation of habitat. This is ignored in the DEIS.

**Comment Excerpt Text:**

All livestock allotments are managed under a rotational pattern, some using herding and others using fencing. However, scientific studies are split on the effectiveness of this approach, with many studies pointing out that it is the number of Animal Unit Months, not the pattern of grazing, that is the key factor in maintaining rangeland health. Bock et al. (1993) noted that rotational or uniform grazing pressure leads to uniform habitat types rather than a mosaic of successional stages, a result of the slow recovery of ecological succession compared to the typically rapid frequency of grazing rotation. But while optimization for livestock weight gain may maximize livestock production while maintaining net primary productivity, it may also shift the community away from late-successional dominants (which have high value to grouse) to mid- to early-successional annuals, including introduced weed species (Briske 1993). Given that fencing is a major cause of collision mortality for sage grouse, the use of fencing for rotational grazing should be discontinued, and allotments with fences within designated sage grouse habitat should have their fences removed

**Comment Number:** IDMTSG-14-0157-9

**Organization1:** Y-3 II Ranch

**Commenter1:** Christopher Clark

**Comment Excerpt Text:**

Y -3 II is concerned about the lack of discussion within the DEIS of the impact of predators and disease on Sage-grouse populations. Disease and predation are among the explicit factors that the Secretary must consider when determining whether to list a species as threatened or endangered. 16 U.S.C. § 1533(a)(1)(C). Y-3 II recognizes that the Service concluded that disease and predation were not significant threats to the species so as to require a listing under the Act. However, the Service did provide significant details on the effects of both West Nile Virus and predation in its warranted but precluded finding. See 75 Fed. Reg. at 13966-973. Specifically, the Service's discussion of disease is dominated by West Nile Virus analysis. It is an important issue in southern Idaho where Y-3 II operates. Idaho identified West Nile Virus as a threat in 2006. See Table 1.2. For example, Sage-grouse hunting in adjacent Owyhee County was closed in both 2008 and 2009 due to population declines resulting from West Nile Virus. Id at 13968. The disease has been detected in ten states and one Canadian province and Sage-grouse survival is extremely low. Id. at 13969. The Service notes the need for a comprehensive monitoring program to determine the extent and effects of the disease range-wide. The disease is a "significant mortality factor for greater sage-grouse when an outbreak occurs ...." Id. At 13970.

Sage-grouse management guidelines recommend that grazing maintain = 18 cm grass height in nesting and brood-rearing-rearing habitat (Connelly et al. (2000); see also Braun et al. 2005). Gregg et al. (1994: 165) noted that “[I]and management practices that decrease tall grass and medium height shrub cover at potential nest sites may be detrimental to sage grouse populations because of increased nest predation. ... Grazing of tall grasses to <18 cm would decrease their value for nest concealment. ... Management activities should allow for maintenance of tall, residual grasses or, where necessary, restoration of grass cover within these stands.” Kaczor (2008: 26) found that taller grass height was positively correlated with sage-grouse nest success in South Dakota and recommended that “[I]and managers should attempt to leave or maintain maximum grass heights [greater than or equal to] 26 cm, the inflection point for 50% nest success.” Because sage-grouse nesting generally begins prior to the onset of the growing season, residual vegetation from the previous year dictates available hiding cover (Cagney et al. 2010). Consequently, management must ensure

that grass height averages = 18 cm after the growing season to support sage-grouse nesting the following year.

**Best Available Information**

**The plan should consider important, new information concerning sage-grouse and sagebrush steppe.**

The National Environmental Policy Act requires agencies to use “high quality” information in planning (40 C.F.R. § 1500.1(b)) and the BLM’s own sensitive species policy requires the agency to “obtain and use the best available information deemed necessary to evaluate the status of special status species in areas affected by land use plans” (BLM Manual 6840.22A) (see also BLM NEPA Handbook H-1790-1, 6.8.1.2 (January 2008), “Use the best available science to support NEPA analyses...”). The Forest Service, a cooperating agency in the Planning Strategy, also committed to using best available science in land use planning in its transitional 2000 planning rule (36 CFR § 219.35) and its new 2012 planning rule (77 Fed. Reg. 21162). Finally, planning criteria for the draft Idaho/SW Montana plan assures that all proposed management actions will be based on current scientific information and technology (vol 2, 1-35). The following new information related to sage-grouse and sagebrush steppe was published during preparation of the draft plan and should be considered in the final plan, as appropriate.

2 Sage-Grouse Recovery Alternative for criteria for designating sagebrush reserves, p. 41 ([www.sagebrushsea.org/pdf/Sage-Grouse\\_Recovery\\_Alternative.pdf](http://www.sagebrushsea.org/pdf/Sage-Grouse_Recovery_Alternative.pdf)).

- Domestic livestock and other ungulates alter vegetation, soils, hydrology, and wildlife species composition and abundances that exacerbate the effects of climate change on western landscapes. Removing or reducing livestock grazing across large areas of public land would alleviate a widely recognized and long-term stressor and make ecosystems less susceptible to the effects of climate change.

2. Knick, S. T., S. E. Hanser, K. L. Preston. 2013. Modeling ecological minimum requirements for distribution of greater sage-grouse leks: implications for population connectivity across their western range, U.S.A. Ecology and Evolution, available at <http://onlinelibrary.wiley.com/doi/10.1002/ece3.557/pdf>.

- Sage-grouse require sagebrush-dominated landscapes containing minimal levels of anthropogenic disturbance. Ninety-nine percent of remaining active sage-grouse leks were in landscapes with less than 3 percent disturbance within 5 km of the lek, and 79 percent of the area within 5 km was in sagebrush cover.

3. Copeland, H. E., A. Pocewicz, D. E. Naugle, T. Griffiths, D. Keinath, J. Evans, J. Platt. 2013. Measuring the effectiveness of conservation: a novel framework to quantify the benefits of sage-grouse conservation policy and easements in Wyoming. PLoS ONE 8(6): e67261. doi:10.1371/journal.pone.0067261. Available at [www.plosone.org/article/fetchObject.action?uri=info%3Adoi%2F10.1371%2Fjournal.pone.0067261&representation=PDF](http://www.plosone.org/article/fetchObject.action?uri=info%3Adoi%2F10.1371%2Fjournal.pone.0067261&representation=PDF).

- Modeling indicates that the Wyoming sage-grouse core area conservation strategy, fully applied, plus \$250 million invested in targeted conservation easements, would slow, but not stop projected sage-grouse population declines in the state. The Wyoming core area policy prohibits or restricts surface occupancy within 0.6 miles of sage-grouse leks, generally limits development to one site per 640 acres, and limits cumulative surface disturbance to 5 percent per 640 acres in core habitat.

4. Taylor, R. L., J. D. Tack, D. E. Naugle, L. S. Mills. 2013. Combined effects of energy development and

disease on greater sage-grouse. PLoS ONE 8(8): e71256. doi:10.1371/journal.pone.0071256. Available at <http://www.plosone.org/article/info%3Adoi%2F10.1371%2Fjournal.pone.0071256>.

- The predicted cumulative impact of dense fluid minerals development (3.1 wells/km<sup>2</sup>) and West Nile virus outbreaks on greater sage-grouse quadrupled inactivity at leks in northeast Wyoming compared to the individual impacts of development or disease. Noting the deleterious effects of cumulative impacts on sage-grouse, the researchers concluded that "conservation measures should maintain sagebrush landscapes large and intact enough so that leks are not chronically reduced in size due to energy development, and therefore vulnerable to becoming inactive due to additional stressors." They also advised "placing new developments outside of core [habitat] areas has the greatest likelihood of sustaining [sage-grouse] populations."

5. Howe, K. B., P. S. Coates, D. J. Delehanty. 2014. Selection of anthropogenic features and vegetation characteristics by nesting Common Ravens in the sagebrush ecosystem. *Condor* 116: 35-49.

- The proximity of transmission lines was, among other factors, predictive of nest location for common ravens in/near sagebrush steppe. The research supports other findings that transmission lines subsidize ravens, a predator of sage-grouse.

Activities must not result in a decrease in sage-grouse populations within the given Conservation Area. Negative effects from energy infrastructure have been measured up to 12.4 km from leks.<sup>4</sup> Within high potential areas in the IHZ, we recommend a disturbance threshold of 3% instead of 5%. As discussed earlier, strong protective measures need to be implemented within the IHZ and it is well-documented that a 5% threshold is insufficient to protect sage-grouse.<sup>5</sup> Limiting the density of development features to no more than one well pad per square mile is a significant factor in conserving sage-grouse as well. <sup>6</sup> The NTT report also recommends utilizing closed-loop drilling systems.

The estimate of how much GRSG habitat has been lost is speculative. Connelly (2004) used a hypothetical "pre-European sage grouse distribution" but provides no data or evidence of historic sage grouse habitat or populations. The Final EIS must be based on science, not speculation. Connelly's 2004 monograph relies on extensive GIS analysis to translate speculative habitat conditions into theoretical historical habitat, which is then compared to current potential sage grouse habitat. The theoretical habitat loss since European settlement is calculated through this exercise. Areas known to be occupied historically by sage grouse were not included, and areas where there is no data of sage grouse occupancy are included.

Pg. 2-70.

Table 2-7 Fine-Scale Indicators Suitability Characteristics for GRSB Lek Sites

Suitable Habitat Characteristics: Trees or other tall structures are not within line of sight of lek and absent or uncommon within 3 km of the lek.

Very limited information is available on the direct behavioral response of sage-grouse to tall structures. Walters et al. (2014) reviewed the effect of tall structures on birds, primarily functional habitat loss due to avoidance. They did not detect any consistent response to tall structures and concluded that a structure's "tallness" could not be isolated from other factors associated with the development such as human activity. The most frequently cited literature supposedly providing evidence of avoidance of tall structures by sage-grouse are either unpublished or non-peer reviewed reports (Ellis 1985, 1987; Braun 1998; Braun et al. 2002). There is no empirical evidence that "tall structures" would impact leks up to 3 km. Recent studies have shown that sage-grouse responses to tall structures are variable and do not necessarily show avoidance of structures and associated habitat. LeBeau (2012) also found that sage-grouse selected nesting habitat closer to transmission lines that have existed for over 10 years and are within quality habitat at Simpson Ridge. Also, female survival in the study area was greatest at closer proximity to the transmission lines. Nest site selection was higher closer to transmission lines in one study area and not a factor in the other study area. Brood rearing habitat selection in one study area increased with distance to the transmission line up to 4.7 km and then declined, but in the other study area brood rearing habitat selection was highest in the area around the transmission line. The risk of nest failure increased as distance from the transmission line increased. Brood survival was not impacted by distance to transmission lines. The study found female survival was highest near the transmission lines throughout the study area. Long-term studies associated with the Falcon-Gondor transmission line Nonne et al. (2013) conducted a 10-year study of greater sage-grouse in response to a (major) transmission line in central Nevada and reported that habitat conditions had the greater effect on sage grouse nests, brood success, and overall survival than did proximity to the transmission line

Messmer et al. (2013), citing UWIN's stakeholder-based literature and knowledge-based review of tall-structure impacts on sage grouse, states that "Stakeholder's concluded that there were no results in the published, peer-reviewed literature of experimental studies designed to evaluate the potential landscape effects of tall structures on sage-grouse." The article goes on to state the following:

Stakeholders concluded that a major impediment they encountered in reviewing the papers or reports cited regarding the potential effects of tall structures on sage-grouse were largely related to a lack of BACI experimental designs. Specific stakeholder concerns included:

- (1) observational studies or observations based on personal communication or unpublished data;
- (2) inadequate descriptions of control and treatments or pre-existing habitat conditions;
- (3) inferences to sage-grouse from studies conducted on other species;
- (4) retrospective studies that did not quantify related environmental conditions;
- (5) inappropriate or misuse of citations;
- (6) the use of results from cumulative impact studies of other energy development to make inferences about the effects of tall structures on sage-grouse; and
- (7) small sample sizes.

(Utah Wildlife-in-Need Foundation 2010)

These same limitations plague the BLM's Draft Land Use-Plan Amendment (LUPA)/EIS evaluation of powerline impacts. The literature and research findings used by the BLM appear selective, at times appear misrepresentative of the actual research results, use observations as if they are peer reviewed research, and fail to recognize the contradictory findings in studies.

Pg. 3-11 and 3-12. Predation

Predation is the most commonly identified cause of direct mortality for GRSG during all life stages (Connelly et al. 2011; USFWS 2010a citing others), but studies suggest that predation is not limiting populations (Hagen 2011).

In areas where habitat is not limited and of good quality, predation is not a threat to the persistence of the species (USFWS 2010a). However, predation may limit population growth in fragmented habitats or areas where predator populations have supplemental food sources, [...], or where electrical transmission or other human-made structures facilitate nesting and perching by avian predators such as ravens (Howe 2012; Hagen 2011).

These statements are in apparent contradiction. At the one hand, the BLM argues that predation is not limiting greater sage-grouse populations, or not a threat to greater sagegrouse if "habitat is not limited and of good quality". Electrical transmission lines or human-made structures may facilitate nesting and perching by avian predators, but the direct impacts of human-made structures to nesting populations of greater sage-grouse have not been clearly demonstrated given all other environmental factors that influence predators and habitat conditions. In fact, Walters et al. (2014) in a review of the effects of tall structures on birds and concluded that none of the reviewed studies provided data on presence of predatory birds or measured survival associated with distance from a structure. Moreover, ideas presented in the discussion of the reviewed papers presented as hypotheses to explain an observed pattern were assumed by other researchers to represent an empirically tested causal mechanism. Howe (2012) showed that transmission lines, in association with human presence in the landscape, and non-native habitat increased the likelihood of the presence of common ravens. However, if habitat is not fragmented, or otherwise degraded and there are no

food subsidies available to common ravens, there is little evidence that common ravens are impacting greater sage-grouse populations. Nonne et al. (2013) conducted a 10-year study of greater sage-grouse in response to a (major) transmission line in central Nevada and reported that habitat conditions had the greater effect on sage grouse nests, brood success, and overall survival than did proximity to the transmission line. Furthermore, Nonne et al. (2013) found no evidence that predation increased with distance to the transmission line, because nest survival and female survival did not show a relationship to distance to the line. Thus, assuming increased predation by avian predators, including common ravens with the presence of either an existing or newly-built distribution/transmission line is too simplistic and does not take into account other parameters that influence predator presence and likelihood of greater sage-grouse nest predation.

**Comment Excerpt Text:**

GRSG exhibit extremely high site fidelity which strongly suggests that unfamiliarity with new habitats may also reduce survival (Baxter et al. 2008), as evidenced in other grouse species (Yoder et al. 2004). GRSG avoid other anthropogenic features such as roads, power lines, oil and gas wells, and buildings (Lyon and Anderson 2003; Pruett et al. 2009).

This is an inaccurate characterization of the (potential) effects of powerlines on alleged avoidance behavior of sage-grouse of “tall structures”. Very limited information is available on the direct behavioral response of sage-grouse to tall structures. The most frequently cited literature supposedly providing evidence of avoidance of tall structures by sage-grouse are either unpublished or nonpeer reviewed reports (Ellis 1985, 1987; Braun 1998; Braun et al. 2002). Avoidance by sage-grouse of leks and habitats that are near energy developments have been well documented (Lyon and Anderson 2003, Holloran et al. 2010, Walker et al. 2007, Hess and Beck 2012).

Recent studies have shown that sage-grouse responses to tall structures are variable and do not necessarily show avoidance of structures and associated habitat. LeBeau (2012) found that sage-grouse did not avoid wind turbines during the nesting and brood-rearing periods, but selected for habitats closer to turbines during the summer season. Although sage-grouse nest and brood survival decreased in habitats in close proximity to wind turbines, female survival appeared not to be affected by wind turbines. Also, wind energy infrastructure appears not to be affecting male lek attendance 4 years post development. Ongoing studies associated with the Falcon-Gondor transmission line (Nonne et al. 2011, 2013) did not show avoidance behavior of radio-tracked sage-grouse of tall structures (powerline corridors).

Pruett et al. (2009) examined radio-telemetry tracking locations of lesser prairie chicken and greater prairie chicken in Oklahoma, not greater sage-grouse. Furthermore, Pruett et al. (2009) did not provide the contextual details of the study area that allow for the assessment of effect magnitude.

Following are examples of literature used in the Draft LUPA/EIS and by Manier et al. (2013), which is relied on heavily in the Draft LUPA/EIS document.

Observational Study or Observations Based on Personal Communication or an Unpublished Study  
GRSG may abandon leks if repeatedly disturbed by raptors perching on power lines or other tall vertical structures near leks (Ellis 1984), by vehicular traffic on roads (Lyon and Anderson 2003) or by noise and human activity associated with energy development (Braun et al. 2002; Holloran 2005; Kaiser 2006). (Idaho/Montana [ID/MT] Draft LUPA/EIS)

Ellis (1984) describes the behavioral response of sage grouse to golden eagles at a lek. Some males flushed, others remained (“master cocks”) and continued displaying after a while. There is no evidence provided that the lek was abandoned because of the presence of golden eagles. IPC suggest the BLM carefully evaluates Ellis (1984) and makes changes to the statement in the Draft EIS accordingly.

Manier et al. (2013) - Braun (1998b) reported that use of areas near transmission lines by sage-grouse increased as distance from transmission lines increased up to 1970 ft (600 m). (Presentation abstract from unpublished data) Braun (1998) did not provide information on how many transects were established, the frequency and timing of surveys, and habitats that were surveyed. No controls or treatments were identified. This is unreliable data and should not be perpetuated as science.

GRSG avoid other anthropogenic features such as roads, power lines, oil and gas wells, and buildings (Lyon and Anderson 2003; Pruett et al. 2009). (ID/MT Draft LUPA/EIS)

Pruett et al. 2009 evaluates the response of prairie chicken to roads and powerlines, not greater sage grouse. They found that prairie chickens avoided the powerline by at least 100 meters (m) and documented prairie chickens crossing powerlines, finding that 17 fewer prairie chickens with locations within 2 kilometers (km) of the powerline crossed the line 1 to 4 times. They also found that 8 greater prairie chickens with locations within 2 km of the powerline crossed the line 2 to 5 times. An analysis of the data showed prairie chickens crossed the powerline less often than expected if birds moved randomly. No attempt was made in the study to relate movements to other habitat features present in the landscape, including agricultural fields, oil/gas wells and houses, which were present in the same landscape but not accounted for in the analysis of the data, potentially confounding the outcome of this investigation.

**Comment Excerpt Text:**

One study reported that the frequency of raptor/GRSG interactions during the breeding season increased 65 percent and golden eagle interactions alone increased 47 percent in an area in pre- and post-transmission line comparisons (Manier et al. 2013, pp. 81-82). (ID/MT Draft LUPA/EIS)

The data provided by Ellis (1985) in an unpublished report and incorrectly quoted by Manier et al. (2013), lack detailed information and do not provide firm evidence for most of the study conclusions. Therefore, Ellis (1985) conclusions, as quoted by Manier et al. (2013), cannot be substantiated and should be interpreted with caution rather than accepted as fact. Specifically, there is scant evidence that

sage grouse do not tolerate construction of a new transmission line near a lek (200 m). Raptors will use transmission towers as perching and hunting sites, but there is no evidence this would result in increased predation of sage grouse. Ellis (1985) conducted his study during 3 field seasons (1983 through 1985); 2 years prior to construction (1983 and 1984) and 1 year after the construction (1985) of a new transmission line. The number of sage grouse displaying decreased over the period of study at the observed lek but increased at a “new” lek discovered in 1985, 1 km from the observed lek (Ellis 1987). It is unclear if the new lek discovered in 1985 had been used in previous years and could be considered a satellite lek. Interestingly, Walker et al. (2007) grouped leks within 2.5 km of each other in the same lek complex to avoid lek-count problems with leks close to each other. Therefore, the conclusion drawn by Ellis (1985) is premature because sage grouse could either be displaced by golden eagles perching on the (newly) constructed transmission line or some other dynamic that influenced sage grouse leks.

Relative to assessment of trends concurrent with the current LUPs, Garton et al 2011 should not be relied upon, for at least six reasons:

The first reason is that Garton et al 2011 uses “effective population sizes” that have not been established as relevant for Sage-grouse, at least as so far as I could determine from reading Garton et al 2011.

The second reason is that Garton et al 2011 analyzes a period of 1965-2007; however, the period of 1965-1980 pre-dates the existence of almost all, if not all, of the LUPs that comprise Alternative A. To condemn management under the existing LUPs, one cannot reasonably start with an extremely high baseline (i.e. sage-grouse populations in 1965) which pre-dates the existence of, and beneficial effects of, the various LUPs.

The third reason is that Garton et al 2011 uses discreet, but ARBITRARY, five-year time periods. It is not rational to conclude that a population size in, for example, 1980, was not influenced by the population size in 1979; that the population size in 2000 was not influenced by the population size in 1999, and so on. I am not a statistician, but as a biologist it seems more reasonable to conduct analyses upon a running five year average, rather than discreet “chunks of time” that are entirely arbitrary. Why, for example, did Garton et al 2011 not begin with the most recent data (i.e. 2007) and work their way back through 5-year time periods? It is entirely likely that the numbers generated would look different, and the conclusions may be different, depending on where one “starts and stops the clock”.

The fourth reason is that the analysis is biased toward the negative when the data do not present such negative:

One example is found at Garton’s Table 15.52 (Knicht et al 2011, p. 350), and the accompanying narrative, wherein Garton states, relative to the Snake River Plain Management Zone, that “The proportion of active leks decreased over the assessment period, declining from 88% in 1975-1979 to 64% by 2005-2007 (Table 15.52).” However, as to the “proportion of active leks”, the total number of leks counted increased by 563% from the 1965-70 period (when researchers generally agree only the largest leks and/or easiest to access were counted – thus resulting in a relatively high “proportion of active leks”). Through time, as some groups of birds moved to new leks<sup>2</sup>, the “inactive” leks continued to be “counted.” Additionally, Table 15.52 indicates that more than five-times as many leks were active in 2002-2007 (643 leks) as were active in 1965-1970 (125 leks). This is like saying, “In 1965 my parking lot contained 146 parking spots (counted leks), and 125 of those spots had vehicles parked in them. We expanded our parking lot over time until in 2007 we had 1012

parking spots (counted leks) and 643 of those spots had vehicles parked in them. Therefore we have a downward trend in the population of vehicles.” This is not a reasonable conclusion.

Further as to Garton et al. 2011, the narrative states, relative to the Snake River Plain Management Zone that “Population trends, as indicated by average number of males per lek decreased over the assessment period by 54%, and average number of males per active lek decreased by 39% (Table 15.52).” However, this statement is relative only to the false “timeline” that starts in 1965, i.e., about 15 years before any of the current LUPs were in place. (See also fifth reason, below). Table 15.52 reports that there has not been any decline between 1980-84 and 2000-07. The 1980-84 period saw an average of 19 males/active lek, whereas in 2000-07, there were 20 males/active lek. This is a 5% increase in males/active lek. It is also a 35% increase over the 1995-99 period (which itself was the lowest level in the 1980-2007 period).

2 I have personal knowledge of a population of sage-grouse changing lek locations from a site on BLM land where a meadow (created by a livestock trough overflow in a sagebrush-dominated crested wheatgrass seeding) was used for lekking until the adjacent Forest Service land, also severely dominated by sagebrush, burned. Once the population had a new open area on the Forest, they moved the lek to the Forest, and ceased to use the BLM (now “inactive”) lek. In this individual case, the “proportion of active leks” went from “100%” to “50%”, since the agencies continue to consider the original lek site. Further there exists “little published research documenting the fluidity of lek establishment, formation, and extinction.” Connelly et al 2004.

The fifth reason is that Garton et al 2011 analysis only begins in 1965, and does not assess against the longer term of sage-grouse populations at the time of European settlement or even the date of passage of the Taylor Grazing Act. Instead, 1965 was during a time of long-term high-intensity predator control, including control of coyotes, eagles, hawks, ravens, and other avian and mammalian predators. For example Compound 1080 (sodium fluoroacetate) was used extensively on the federal rangelands from about the 1940s through about 1972. Likewise, M-44s (containing sodium cyanide) had a long history of use for predator control, and was also banned on federal rangelands in 1972. In addition, there were much higher numbers of sheep, and therefore sheepherders with their guns and dogs, during the 1960s than there have been since 1980. It is highly likely that the high numbers of sage-grouse, deer, and other prey species that existed during that time period, is directly correlated to the 1940s-through-1970s long-term spacial and temporal predator control. The 1965 (and surrounding) sage-grouse numbers must therefore be considered an artificially elevated number of sage-grouse (above that which existed prior to the 1940s or after the 1970s).

The sixth reason is that Garton et al 2011 is itself based upon methods of counting sage-grouse on leks that are themselves not consistent and/or consistently applied, and the underlying base data is not uniformly collected.

However, if Garton et al 2011 is relied upon, it demonstrates that only a small percentage of populations (13% of the populations, but NONE of the SMZs) are predicted to decline below “effective population size” within the next 30 years. The agencies, if they rely upon Garton et al 2011, should concentrate on management and restoration of the areas associated with those populations (not the SMZs and not the overall population) identified by Garton.

Page 2-73 and 2-74 [143 and 144]. The DEIS fails to identify how maximum lek counts within the whole population area constitutes “best science”, when it is established that counts associated with lek routes provide more reliable data. Connelly et al 2004 state that “lek routes are preferable to lek counts because they should increase the probability of detection of male grouse”. Connelly et al 2004, p 6-7[204]. Further, these authors stated that: “Standard techniques for censusing leks have been available for a number of years (Patterson 1952, Eng 1963, Jenni and Hartzler 1978, Emmons and Braun 1984) and were recently summarized (Connelly et al. 2003). Connelly et al.(2003) differentiated between lek survey, lek count and lek route (see Population Database section in this chapter) and recommended the use of lek routes whenever possible.” Connelly et al 2004, p. 6-16 [213].

Page 2-73 [143]. The document states that “Connelly et al (2000) suggested at least 80 percent of a seasonal habitat’s area should reflect rangeland characteristics indicative of productive GRSG habitat as noted in the Guidelines”, and that a “loss of 10% of nesting and winter habitat were also selected as triggers, since these are especially important for population maintenance.” However, Connelly et al 2000 did not make the stated suggestion relative to all habitats, and that paper specifically recommends “>40%” relative to brood rearing habitat. Therefore, there is no rational basis to apply “80%” (i.e. a trigger of 20%) to brood rearing habitat based upon Connelly et al 2000. Likewise, Connelly et al 2000 did recommend the “80%” relative to nesting and winter habitats, and there exists no rational basis to apply “90%” (i.e. triggers of 10%) relative to these habitats based upon Connelly et al 2000. If any “triggers” are adopted in the final document, the final document should accurately portray Connelly et al 2000.

Page 2-139 [209]. E-LG/RM-13. While the idea of retaining residual vegetation for nesting sage-grouse is proper, the proper criterion is not necessarily reflected in the referenced Appendix D. Appendix D of the Idaho State Plan references Connelly et al. 2000, Hausleitner 2003, and Holloran et al. 2005. However, all three of these works report residual vegetation cover and height post-hatch, and in at least the case of

Holloran et al 2005, post-evacuation of the area by all hens. These do not reflect residual heights at the time of nest initiation, because plants continued to grow while nesting was occurring. In contrast, Hausleitner et al, 2005 assessed available residual heights at nest-initiation, at nest bushes that had been successful in the previous year. Hausleitner et al 2005 should be relied upon. This same comment applies to E-LG/RM-14 at 2-139 to 2-140 [209-210], and to wherever the Idaho State Plan Appendix D “standards” are described.

**Comment Excerpt Text:**

Appendix I reports that grasslands and areas of juniper are included as PPH. However, tills is a discretionary administrative Decision, in and of itself, that should have been subject to the NEPA and Decision making process. In other words, BLM & FS included areas that are specifically known NOT to support sage-grouse, and included them as areas of "highest priority". This is pre-deciding what is "critical habitat". This is not a biological fact, but instead is a LUP-level decision as to what areas BLM will manage for sage-grouse. The agencies should withdraw the current DEIS/LUPA, provide opportunity for the public to comment upon what vegetation types constitute the " highest conservation value", should issue a LUPA on such designation, and only then should rerelease the (amended and corrected) DEIS relative to how to manage such areas.

**Commenter 1:** Bob Schweigert

**Comment Excerpt Text:**

BLM’s modeling of habitat is first of all flawed in at least three ways. The first way is that BLM did not use all of the available lek count years that are available, and did not provide a rational basis for why it included or excluded certain years. The second is that BLM did not follow the best science, i.e. Connelly et al 2000, and included leks that had been used only one year out of the past five, rather than two years out of the past five. The third way is that BLM applied a “buffer” which is not supported by the best science (i.e. Connelly et al 2000, Knicht et al 2011).

**Other Sections:** 3

**Comment Excerpt Text:**

The document appears to contain numerous internal inconsistencies. Appendix I reports 5% sagebrush cover as “suitable” in Montana (Appendix I), whereas 10% is required at page 2-68 [pdf 138]. Likewise, Connelly et al 2000 reports that 80% (or 40%) of sage-grouse-occupied rangeland should be maintained with certain characteristics, whereas the NTT states that 50-70% of the seasonal habitats should contain those same characteristics. I could find no rational basis expressed for the DEIS’s use of 70% for analysis (Appendix I). While this appears to “split the baby”, Connelly et al 2000 and the NTT are two

disparate recommendations that are not scientifically rectified/justified by the DEIS.

**Comment Excerpt Text:**

Overall, the “best available science” is not consistently used. For example, as to residual vegetation heights for nesting sage-grouse, the entire document is silent to the fact that the cited authors measured residual vegetation after the hens had left their nests, not at nest-initiation. Hausleitner et al 2005 1 is not even referenced by the document, let alone relied upon; however, Hausleitner et al 2005 established that residual heights of 3.5-3.9 inches characterized the nest bowl and surrounding 1 meter around the nest bowl at the time of nest-initiation. Significant vegetative growth occurs between nest-initiation and post-hatch.

**A Literature Review of Transmission Line Effect Distances**

ENTER TABLE ON PAGE 25-27

Effect Distance Value	Source	Comments
No effect detected at 5 and 18km of	(Johnson et al. 2011)	Authors examined trends in lek counts and anthropogenic features (1997-2007). No general pattern/association was found across the entire study area with transmission at tested 5km and 18km of lek.

a lek.		
200 m	(Ellis 1985)	The erection of a transmission line located within 650ft (200 m) of an active sage-grouse lek, and between the lek and day-use areas, in northeastern Utah resulted in a 72 percent decline in the mean number of displaying males and an alteration in daily dispersal patterns during the breeding season within 2 years. This project also reported that the frequency of raptor–sage-grouse interactions during the breeding season increased 65 percent and golden eagle interactions alone increased 47 percent between preand post-transmission line comparisons.
360 m +/- 60, 630 m +/- 40	(Robel et al. 2004)	Data are from a 6 year study of energy development on lesser prairie-chickens in Kansas. Distances are mean (+/- SE) distance to electric power lines avoided by 90% of 187 nesting prairie checking and mean distance to power lines across which 95% of 18,866 telemetry locations of prairie chickens were absent, respectively.
450-650 m	(Hagen et al. 2004)	In Kansas, the average displacement of prairiechicken use sites was about 450 meters from power lines and the average displacement of nests was about 650 meters from power lines.
400m	(Pitman et al. 2005)	Data are from a study on lesser prairie-chickens in Kansas and found that nest proximity was “seldom less than 400 meters from a transmission line” (Table 3)
500m	(Hanser et al. 2011)	Wyoming Basins Ecoregional Assessment: Study of responses of sage-grouse to anthropogenic effects. Authors tested effects at .5 km and 1km and found the most significant effect of transmission lines on sage-grouse abundance at .5 km.
500m	(Pruett et al. 2009)	Oklahoma prairie-chicken study found that displacement of prairie-chickens was at least 500m from a power line.
600 m	(Braun 1998)	In Colorado, pellet transects illustrated declining habitat use by sage-grouse up to 600 meters from power lines.
600 m	(Gillan et al. 2013)	Using a spatial statistical approach with telemetry data from Idaho, this study found that sage-grouse avoided power transmission lines by 600 m.
0-4.7 km	(LeBeau 2012)	A wind turbine effects and infrastructure study that examined infrastructure related to wind development within the two study areas in SE Wyoming and found that the estimated odds of sage-grouse selecting brood-rearing habitat within the Seven Mile Hill study area increased as distance from nearest overhead transmission line increased up to 4.7 km (90% CI: 2.2–18.5 km), then declined. However, LeBeau also found that sage-grouse selected for nesting habitat closer to transmission lines within Simpson Ridge study area.
4.8 km	(Rodgers 2003)	In California, power lines resulted in sage-grouse lek abandonment and reduced lek attendance up to 3 miles away.
6.4 km	(Steenhof et al. 1993, Connelly et al. 2004)	Additionally, higher densities of power lines within 4mi (6.4 km) of a lek may negatively influence lek persistence. Power lines may be locally significant causes of mortality due to collisions. Potentially more important, poles and towers associated with transmission lines have been shown to influence raptor and corvid distributions and hunting efficiency resulting in increased predation on sage-grouse.

**Comment Excerpt Text:**

Current Literature Does Not Support Sage-Grouse Avoidance of Power Lines

Two recent studies have used radio-telemetry to assess impacts of energy infrastructure on sage-grouse. LeBeau (2012) investigated the impacts of wind facilities and an associated transmission line in Wyoming, and Nonne et al. (2013) released a final report of a 10-year study of a transmission line in Nevada. The Nonne study is currently the only long-term study conducted that specifically evaluates potential impacts of a power line on sage-grouse.

The LeBeau study indicated that habitat quality is a significant influencer of sage-grouse occupancy, regardless of the presence of a transmission line. Sage-grouse selected for nesting habitat closer to transmission lines at Simpson Ridge, where the lines have existed for over 10 years and are within quality habitat. Also, female survival in the study area was greatest at closer proximity to the transmission lines. While the DEIS cites the LeBeau study, it fails to mention these study results that do not show a negative power line impact. NorthWestern Energy requests that the BLM assess valid scientific studies, regardless of the results.

LeBeau, C.W. 2012. Evaluation of Greater Sage-Grouse Reproductive Habitat and Response to Wind Energy Development in south-Central Wyoming, MS, Department of Ecosystem Science and Management, University of Wyoming. August 2012.

In February 2013, Nonne et al. released the final progress report of a 10-year research study of sage-grouse near the Falcon-Gondor transmission line in central Nevada. This report is the only long term study of impacts from a high voltage transmission line on sage-grouse. The authors were unable to document negative effects on sage grouse which could be explained by proximity to the transmission line. While the Nonne study is included in the literature cited of the DEIS, the results were not mentioned in the DEIS text.

Nonne, D., E. Blomberg, and J. Sedinger. 2013. Dynamics of Greater Sage-grouse (*Centrocercus urophasianus*) populations in response to transmission lines in central Nevada. Progress Report: Year 10. February 2013. Department of Natural Resources and Environmental Sciences, University of Nevada, Reno. 75pp.

Recently Messmer et al. (2013) summarizes stakeholder workshop results and a literature review specifically related to sage-grouse and tall structures, such as power lines. The paper concludes that there are no peer-reviewed, published papers that address sage-grouse interactions with power lines using experimental design (Note: the Nonne et al. (2013) study referenced above is the only study that has used an experimental design to assess impacts of a power line on sage-grouse, but it is not yet published). Preliminary studies of radio-tagged sage-grouse in Utah, also conducted by Dr. Messmer, do not support a power line avoidance theory.

Messmer, T., A., R. Hasenyager, J. Burruss, and S. Liguori. 2013. Stakeholder contemporary knowledge needs regarding the potential effects of tall structures on sage-grouse. *Human-Wildlife Interactions* 7(2):273-298.

NorthWestern Energy requests that the BLM consider these new studies, which use current telemetry techniques and specifically investigate sage-grouse responses to power lines, when addressing power lines in its LUP update.

The DEIS cites Manier et al. (2013) in regard to power line impacts of sage-grouse. The page references to Manier et al. in the DEIS are incorrect, and how Manier et al. is portrayed in the DEIS is misleading. The DEIS cites Manier et al. (2013) as if it is new data on sage-grouse/power line interactions, whereas the Manier paper summarizes older literature (e.g., references to Ellis, 1985, regarding golden eagle predation of sage-grouse).

Site-specific determination or confirmation of sage-grouse habitat

The Agencies recognize that the sage-grouse habitat designations provided in the Draft LUPA/EIS are “preliminary,” but they do not specify a clear process whereby project proponents may provide site-specific information or data to change habitat designations or habitat designation boundaries without amending the relevant LUP. The Draft LUPA/EIS provides for changes to habitat designations through “LUP maintenance.” See Draft LUPA/EIS p. 4-3. Because public land users should not be burdened by restrictive sage-grouse conservation measures on areas that are not suitable for the species or burdened with seeking a LUP amendment if it is determined the Agencies’ habitat designations are incorrect, the Final LUP Amendment should clarify that “LUP maintenance” does not mean that a LUP amendment would be required to modify the relevant, preliminary sage-grouse designations based on new data.

**Comment Excerpt Text:**

In Alternative B, the Agencies would close the PPMAs to phosphate leasing. See Draft LUPA/EIS pp. 2-181 (Management Action B-MNL-1), 2-26 (Table 2-2 showing closures by acreage). This would result in 8,304,600 acres being closed to non-energy leasable minerals (compared to 621,300 acres closed to leasables under existing LUPs). See Draft LUPA/EIS p. 2-26 (Table 2-2).

These management actions would unreasonably restrict the use of public lands for phosphate mining exploration or operations contrary to FLPMA's requirement to manage "in a manner which recognizes the Nation's need for domestic sources of minerals." 43 U.S.C. § 1701(a)(12). It is also contrary to FLPMA's requirement that land use plans observe principles of multiple use, which it defines to include "a combination of balanced and diverse resource uses that takes into account the long-term needs of future generations for renewable and non-renewable resources, including, but not limited to, recreation, range, timber, minerals, watershed, wildlife and fish, and natural scenic, scientific and historical values." *Id.* §§ 1702(c), 1712(c)(1) (emphasis added). Closing PPMAs to phosphate or other leasable minerals entries would be contrary to the Agencies' multiple use obligations and would not serve the proper combination of balanced and diverse resource uses. It also would eliminate or discourage significant opportunities for the Agencies to work with the mining industry to develop offsite mitigation or conservation plans that could provide a net benefit to sage-grouse or their habitat in exchange for allowing some mineral development within PPMAs. Further, the Agencies have not shown that leaseable minerals operations have in the past negatively impacted the long-term viability of the sage-grouse, and accordingly, why it now makes sense to eliminate the industry on certain public lands where there is no demonstrated track record of such negative impacts by the industry.

**Comment Excerpt Text:**

PFA believes the mismanagement of livestock grazing (overgrazing) is the number one issue facing GRSG conservation in Idaho. Overgrazing largely contributes to the loss of GRSG, and other sagebrush obligate species' habitat due to degradation of important sage-steppe ecosystems across the state.

Below is a list that was included in our 2012 scoping comments of impacts PFA members have observed and documented over the last twenty or more years:

- Soil erosion and compaction (we believe in most cases, the degree of severity is limited only by topography)
- Dysfunctional watersheds and the loss of:
  - mesic and riparian vegetation; and bank integrity, resulting in gulley and wash formation
  - lowering of the water table
  - water quality condition from temperature, chemical, and nutrient pollution e.i. introduction of livestock feces and urine
- Little or no native understory in many areas and the loss of:•
  - mosses and biotic soils
  - native vegetation such as forbs, shrubs, trees, and grasses
- Trampling of nesting and brooding areas of ground nesting birds including GRSG;
- Invasive weeds and grasses
- Large “sacrifice” areas near streams, springs, seeps, and water developments (improvements?)
- Over-utilized and diminished crested-wheat seedings
- Plant pedestalling, surrounding bare ground, and exposed roots
- Large areas of open and connecting bare ground
- Fencing unfriendly to wildlife, netting and many strand fencing still found on BLM, Forest and State Lands
- Increased fuel loads from invasive annual grasses and weeds and repeated fire cycle;
- Loss of reseeded areas, burns and vegetation treatment projects by allowing livestock back before plants have sufficient growth to survive (less then two years);
- Grazing in early spring, late winter, prolonged wet seasons, and year round
- Insufficient cover for wildlife
- Frequent aerial gunning (observed and documented by PFA members in Burley F.O.);
- Failure to maintain water troughs. Substituting with ponds that quickly become polluted and may encourage the spread of West Nile Virus
- Failure to rehabilitate pipelines and burns (invasive weeds, grasses and bare ground).

Noise and seasonal stipulations should be considerations during the construction and long-term implementation of land use activities. Your proposed implementation of noise and seasonal stipulations across all alternatives appears to be applied only to initial construction activities. However, most land use activities result in permanent disturbances on the landscape and the associated human activity, traffic, and noise disturbances have long-term effects to GRSG. Although the surface area covered by various types of development can be relatively small, the effects of noise extend far beyond the development itself (Blickley and Patricelli 2010). For example, the construction of a compressor station may have short-term implications to GRSG use of seasonal habitats, but the long-term operation and noise of the compressor station may result in GRSG habitat abandonment (Blickley and Patricelli 2012, Blickley et al. 2012). Similarly, seasonal restrictions applied only to drilling and construction do not address effects to populations over long periods of time (Walker et al. 2007).

[This comment corresponds to the headings in Table 2-17 and Table 2-18] Goals expressed in B-GOAL-1, D-GOAL-1 and F-GOAL-1 may not be appropriate as no base population number of GRSG proven necessary to perpetuate the species has been established. To assume that an increase in population (and the management actions indicated to effect such increase) is necessary or desirable may be beyond the proper scope of LUPA

***Summary***

Commenters suggested new or additional literature for the BLM and Forest Service to consider in the DLUPA/EIS related to:

- Determination of GRSG population size and trends – inaccuracy of past counts; insufficient data to determine trend.
- Effects of livestock grazing, predation, drought, noise, and anthropogenic development
- Appropriate lek buffers and disturbance cap to incorporate
- Mitigation
- Hunting– outside scope but managed via the Idaho and Montana state plans
- GRSG habitat requirements
- Accuracy of the habitat mapping
- Infrastructure
- West Nile virus

---

## ***Response***

As described in Section 4.4 of this comment report, The BLM and the Forest Service used the most recent and best information available that was relevant to a land-use planning-level analysis including the Baseline Environmental Report (BER; Manier et al. 2013), NTT report (NTT 2011), and COT report (USFWS 2013). Additionally, the BLM and the Forest Service consulted with, collected, and incorporated data from other agencies and sources, including but not limited to the U.S. Fish and Wildlife Service, Idaho Department of Fish and Game, scientific literature, field and district office data. Considerations included but were not limited to [list the types of data or GIS layers that were gathered/used.].

Of the suggested studies and references put forth by the commenters, the BLM and Forest Service reviewed them to determine if they presented new information that would need to be incorporated into the FEIS, were references already included in the draft EIS, or if the references provided the same information as already used or described in the Draft EIS. The BLM determined that several of these references contained new or relevant information regarding xxx resources and the analysis was clarified and references cited in Sections XXX of the FEIS. In some cases, the additional literature was essentially the same as existing sources and was not incorporated.

A description of the habitat mapping process for each alternative is presented in Section 2.6, Detailed Description of Alternatives.

**Commenter1:** Jim Gerber

**Comment Excerpt Text:**

At least one of the alternatives ( Alt. A) talks about maintaining a mosaic of species and age classes on the landscape to protect grouse habitat, which I thought was a great idea. But when I went to the environmental consequences section of the DEIS to see what the benefits of having a mosaic are, there were none. In fact, there was no discussion of a mosaic of age classes at all. Call me crazy, but if you are going to have an alternative that strives to maintain a mosaic of species and age classes, there should be some benefit from doing that, and that benefit should show up in the consequences. The fact that you prescribe an alternative with the objective of producing a mosaic of age classes on the landscape, but that objective is never achieved, makes it appear like this is a straw man alternative designed to achieve some purpose, when in fact it does not.

**Comment Number:** IDMTSG-14-0131-3

**Organization1:** J.R. Simplot Company

**Commenter1:** Alan L. Prouty

**Comment Excerpt Text:**

The effects from mineral development on GSG habitat and populations vary. The discussion of the threats to GSG from mining (pages 2-202 and 4-202) fails to discuss this spectrum of study results. For example, certain reclamation practices can improve existing habitat for GSG. Mineral development is localized, and not a constant disturbance feature across the landscape. Mineral development activities can be adjusted to address sensitive environmental conditions at the location of the mineral. The restrictions and prohibitions on mineral development in the alternatives need to have proportionality to the actual and potential effects of mineral development on GSG.

**Comment Number:** IDMTSG-14-0131-6

**Organization1:** J.R. Simplot Company

**Commenter1:** Alan L. Prouty

**Comment Excerpt Text:**

While some surface mine activities may be similar to those found at oil and gas facilities, the two disturbances differ enough that it may be speculative to assume that the effects on sage-grouse from an oil and gas facility would be the same at a surface mine. For example, the Draft LUPA/EIS (at pages 4-12 through 4-13) cites oil and gas studies to describe the effects that mineral development may have on sage-grouse. While oil and gas research may be considered the best available science on the effects of surface disturbance on sage-grouse, the BLM/USFS's reliance on these studies in shaping management guidelines for other BLM authorized actions may be overly conservative and restrict the BLM/USFS from meeting its obligation to manage lands for multiple use.

The Draft LUMA/EIS fails to look at how potential effects, such as noise can be mitigated. For example, noise levels can be reduced by blasting techniques such as electronic blasting.

**Comment Excerpt Text:**

The BLM & USFS should have analyzed the effectiveness of current rangeland health standards and guidelines before developing alternatives, and should have used that analysis for considering appropriate changes to the RMP with respect to livestock grazing and range management.

**Comment Number:** IDMTSG-14-0150-5

**Organization1:** Western Range Service

**Commenter1:** QuintonJ. Barr

**Comment Excerpt Text:**

Inexplicably, when responding to scoping comments the Draft LUPA EISs claim that analysis of greater sage-grouse population levels is beyond the scope of the project, stating that comments “questioned population levels and the need to incorporate range-wide conservation measures” and concluding that such concerns “relate to decisions under the purview of the USFWS and are not (will not be) addressed” by the Draft LUPA EISs. See ID Draft LUPA/EIS2, page 1-33 and NV Draft LUPA/EIS1, page 1~18. Thus, the Draft LUPA EISs irrationally conclude that the overriding purpose and need identified for the project is itself beyond the scope of the project. As a result of this irrational decision, the Draft LUPA EISs devote little or no effort to disclose, discuss, or analyze greater sage-grouse population levels, viability, or persistence.

---

**Comment Number:** IDMTSG-14-0150-6

**Organization1:** Western Range Service

**Commenter1:** QuintonJ. Barr

**Other Sections:** 7.6

**Comment Excerpt Text:**

The Draft LUPA EISs devote voluminous space to the current status of the affected environment and to the expected environmental consequences of the various alternatives under consideration for almost everything under the sun, except for the status and environmental consequences with respect to greater sage-grouse population levels and trends, thereby failing to meet the overriding purpose for the project. The EISs analyze the status and environmental consequences with respect to other special status species, vegetation, fish and wildlife, wild horses and burros, wildfire, livestock grazing, recreation, travel management, lands and realty, mineral resources, special designations, soil resources, water resources, cultural resources, tribal interests, visual resources, roadless areas, air quality, climate change, social and economic conditions, and forest and woodland products, among other things. But the Draft LUPA EISs give only cursory attention to the current status of greater sage-grouse populations and essentially no attention to the environmental consequences of the various alternatives under consideration on greater sage-grouse population levels and trends.

**Comment Excerpt Text:**

In the Idaho – Southwest Montana RMP Amendment EIS, BLM has failed to apply in its preferred Alternative D or E the recommended sage grouse protections presented to it by its own experts (the BLM National Technical Team), and as a result development approved under several of the alternatives analyzed (and particularly Alternatives A, D, and E) will result in both unnecessary and undue degradation of sage grouse Priority Habitats and result in sage grouse population declines in these areas, undermining the effectiveness of the Core Area strategy as an adequate regulatory mechanism in the context of the decision

---

**Comment Number:** IDMTSG-14-0153-14  
**Organization1:** Wild Earth Guardians  
**Commenter1:** Erik Molvar

**Comment Excerpt Text:**

In particular, we are concerned that under Alternatives D, the prescribed conservation measures may not apply in areas not identified as sage grouse habitat. BLM states, “by including a rule set to release areas from PPMA, PMMA, PGMA protection, some vegetation communities that do not provide habitat for GRSG could receive less protection under this alternative and could be subject to removal, damage, or reduced condition caused by human disturbances.” DEIS at 4-102. This is a key flaw because, as BLM notes throughout the DEIS, many types of human- caused disturbances cause displacement of sage grouse and reduction or

elimination of habitat effectiveness for the surrounding areas, not just the lands directly subjected to surface disturbance, and these impacts can extend for miles beyond the disturbed site. For this reason, such a “rule set” undermines the effectiveness of the prescribed protections. BLM needs to further evaluate the magnitude of these impacts for developments that would be allowed inside designated habitats but located on microsites not identified as sage grouse habitat

---

**Comment Excerpt Text:**

New research (Copeland et al. 2013) projects continued sage grouse population declines at 14-29 percent in Wyoming if its Core Area standards are fully enforced; the Idaho – Southwest Montana Alternatives D and E do not even meet this bar. The same study estimates that, even when bolstered by \$250 million in targeted conservation easements on private property (a very unlikely assumption), the Core Area policies would only cut anticipated sage grouse population declines by half in Wyoming, and by two-thirds within high abundance areas. We are concerned that sage grouse in Idaho and Montana will fare even worse given that BLM’s Alternatives D and E are less protective in many respects than the State of Wyoming Core Area policy in many respects.

---

**Comment Number:** IDMTSG-14-0153-32

**Organization1:**Wild Earth Guardians

**Commenter1:**Erik Molvar

**Comment Excerpt Text:**

We are concerned that many, if not most, of these “habitat improvement” projects are actually harming sage grouse habitat in the long term and that the remainder will cause short-term impacts to sage grouse populations that contribute to the multiple serious threats to their existence. The scientific basis for many such projects (which include prescribed burns and mechanical or herbicidal thinning or removal of sagebrush) is extremely shaky, and given the lack of familiarity of the project proponents with basic sage grouse habitat requirements, such projects may unintentionally cause additional damage to sage grouse habitats. The impacts

(positive and/or negative) of such projects have not been rigorously tested, and thus their results for improving (or harming) sagebrush habitats remain open to speculation.

---

**Comment Number:** IDMTSG-14-0153-35

**Organization1:** Wild Earth Guardians

**Commenter1:** Erik Molvar

**Comment Excerpt Text:**

BLM proposes to continue to allow the use of prescribed fire in Priority Habitats, which will cause negative impacts to sage grouse populations. Prescribed fire not only harms sage grouse by eliminating the sagebrush that is their key habitat element, but also promotes the spread of cheatgrass, which are becoming ever more widespread, particularly in southern Idaho. Required measures for prescribed fires reduce the negative effects but do not drop them below the threshold of a significant impact to sage grouse

---

**Comment Number:** IDMTSG-14-0153-39

**Organization1:** Wild Earth Guardians

**Commenter1:** Erik Molvar

**Comment Excerpt Text:**

BLM acknowledges that there is little potential for coal mining in the planning area; the agencies should therefore find Priority Habitats unsuitable for surface mining for coal in order to provide regulatory certainty. We are concerned that BLM's approach of sidestepping this potential impact creates uncertainty and also undermines the BLM's ability to describe the magnitude of impacts under the various alternatives, rendering the legally required 'hard look' impossible.

**Commenter1:** Erik Molvar

**Other Sections:** 7.6

**Comment Excerpt Text:**

Please also make a formal determination regarding the disturbance cap in the context of sagebrush canopy cover, and if 3% is not the scientifically defensible threshold, then where that threshold should be set, for the same reasons as noted above for the 3% and 5% disturbance caps. Please review the studies listed above, and any and all additional studies that directly address the efficacy of a 3% disturbance cap, if any. Knick et al. (2013) found that almost all active leks were found in areas with less than 10% cropland (Figure 5). This study included all of Idaho (Knick et al. 2013, Figure 2), indicating that its findings are directly relevant to this EIS. We are unaware of any such studies, and in their absence federal agencies should employ the precautionary principle and utilize a 3% cumulative disturbance cap for all forms of disturbance

---

**Comment Number:** IDMTSG-14-0153-47

**Organization1:** Wild Earth Guardians

**Commenter1:** Erik Molvar

**Comment Excerpt Text:**

In addition, the presence of livestock in nesting habitats can cause problems for sage grouse. Livestock drives

could also negatively impact sage grouse populations during the nesting season. According to Call and Maser (1985:18), “Hens abandon their nests with little provocation during the egg-laying period (mid-April through early May). Yearling hens are prone to abandon their nests even when disturbed during incubation. The impact of a livestock drive could, therefore, be great because yearling hens are usually the largest reproductive age class.” For allotments where sage grouse nesting is known to occur, shifting on-off dates (if necessary) could minimize the chances of impacts to nesting sage grouse, and livestock drives should be routed to avoid sage grouse leks during the strutting and nesting seasons

---

**Commenter1:** Erik Molvar

**Comment Excerpt Text:**

We are also concerned that this assumption has biased the results of Tables 4-2 and 4-3 and the impacts analysis (DEIS at 4-49) regarding Alternative C, which should have the best performance in long-term range

health due to removal of the leading cause of range health decline, domestic livestock. BLM repeatedly refers to the potential of certain grazing patterns (without specifying which ones) to reduce fine fuels and thereby reduce fire risk. See e.g., DEIS at 4-125. Conversely, the agency systematically argues that restrictions on or removal of livestock increases fire risk. E.g., DEIS at 4-126. However, the agency systematically downplays the primary role that livestock grazing plays in spreading cheatgrass, which is the primary factor other than climate in increasing fire risk. Conclusions such as the statement that “the prohibition on grazing would reduce weed spread, in some areas, in conjunction with efforts to reintroduce perennial vegetation, may experience a shorter fire season and less frequent and intense wildfires” do not appear to have been taken into consideration in the overall comparison of fire risks between alternatives. We are concerned that this bias in impacts analysis leads the agencies to erroneous conclusions regarding relative fire risk across alternatives.

Minimizing the use of herbicides inside sage grouse habitats, and using them as a last resort, is also a good approach for sage grouse Priority Habitats. We are concerned that aerial applications of herbicides and pesticides are reasonably foreseeable in the planning area. Insects are an important food source for sage grouse; this is particularly true during the early brood-rearing phase. Insecticide application could not only sicken or kill grouse directly, but it could also deprive them of an important food source. Aerial herbicide and pesticide applications should be precluded within one mile of sage grouse habitats to avoid inadvertent poisoning of sage grouse. Although the use of Plateau in heavily cheatgrass-infested areas might be allowed in cases where sage grouse are not using the treated habitats, aerial spraying of herbicides and insecticides over or within one mile of sage grouse habitats should not be allowed. Hand spraying might be accomplished by deliberately driving grouse off by teams on foot prior to treatment, and by treating from backpack units rather than aerial or truck/ATV application

The DEIS contains very little discussion of the effects of disease and particularly West Nile Virus although it is discussed in Appendix Table C-2 regarding best management practices. Where the agency lacks sufficient information to determine the impacts, as noted by the Service, it is incumbent upon BLM to obtain the missing information or to explain to the public why the information is either unavailable or exorbitantly

expensive to obtain. See 42 U.S.C. § 4332(2)(c); 40 C.F.R. § 1503.1(a)(1). The FEIS should explain how BLM obtained sufficient information on the effects of West Nile Virus following publication of the DEIS to determine its impacts on the species or, in the alternative, why the information could not be obtained or was too expensive to obtain and how the lack of information affects the FEIS.

"The analysis includes the following assumptions:

Alternative A would neither result in the designation of PPH or PGH nor assign additional management actions to PPH or PGH areas."

Comment:

Chapter 4 needs to be rewritten to fairly assess Alternative A. Under BLM Manual 6840 and Forest Service Manual 2670, the federal agencies are required to manage sensitive and special status species including sage-grouse to keep them from being listed. This includes "additional management actions" in sage-grouse habitat (referred to in the EIS as PPH and PGH).

**[This comment refers specifically to Alternative D] The plan needs to include additional information on the effects of livestock grazing on sage-grouse.**

The draft Idaho/SW Montana plan only briefly reviewed the impacts of livestock grazing on sage-grouse and sagebrush steppe (e.g., 3-70 – 3-74). Livestock grazing is the most pervasive use of sage-grouse habitat in the planning area (vol 1, Figure 2-10) and grazing has myriad negative effects on the species. A more thoughtful review of the literature would not likely support a conclusion—like that included in this plan—that “the effects of removing grazing in [sage-grouse] habitats on a landscape scale are unknown, and it is unclear whether complete removal would improve [sage-grouse] habitat or increase population levels” (4-50).

**Analysis of Key Conservation Measures**

We developed a matrix comparing the key science-based conservation measures for sage-grouse with prescriptions in preferred Alternative D in the draft Idaho/SW Montana. We categorized the application of each conservation measure in the preferred alternatives into one of three categories: adopted the conservation measure (color coded green); adopted the conservation measure, but did not adopt the full prescription, did not make it mandatory, deferred application to future, project-level planning, or allowed for exception, waiver and modification of the measure (yellow); or did not adopt the prescription (red). Our analysis is presented in Table 1. We are concerned that the preferred alternative designates less priority habitat to conserve sage-grouse than other alternatives; fails to require buffers to protect sage-grouse leks and associated nesting and brood-rearing habitat from various land uses and disturbance; does not cap development density for most land uses in priority habitat; does not recommend withdrawal of priority habitat from entry for locatable minerals; fails to protect sage-grouse winter habitat; and does not clearly prescribe needed conservation measures for managing livestock grazing in sage-grouse range.

While it appears that the adaptive management scheme prescribed in the preferred alternative would attempt to retain/restore sagebrush steppe to a minimum of 80 percent of land cover in sage-grouse seasonal habitats, the alternative doesn't actually commit to the minimum standard (vol 2, 2-73). Also, the concurrent allowance of habitat disturbance of between 10-20 percent could be negative for sage-grouse (vol 2, 2-73).

**Commenter1:**Brett Dumas

**Comment Excerpt Text:**

Oil and gas infrastructure and associated human activity have been shown to adversely affect GRSG populations collectively and in some instances, impacts have been directly attributed to certain anthropogenic features (e.g., roads, power lines, noise, and associated infrastructure; Walker et al. 2007; Doherty et al. 2008; Lyon and Anderson 2003; Holloran 2005; Kaiser 2006; Aldridge and Boyce 2007). (ID/MT Draft LUPA/EIS)

Doherty et al. (2008), Holloran (2005), and Aldridge and Boyce (2007) evaluated coal-bed natural-gas wells (CBNG) but did not evaluate the effect of powerlines. Lyon and Anderson (2003) evaluated the effect of vehicular traffic associated with natural-gas developments. Therefore, none of these studies provide information on the effects of powerlines. These studies fail to control for, among other variables, breeding habitat availability, presence of roads and other infrastructure, cultivation, and natural events.

Only Walker et al. (2007) evaluated the impact of powerlines, and they found only weak effects. Walker et al. (2007) showed that all top models to explain lek persistence included a strong positive effect of sagebrush habitat and a strong negative effect of CBNG development. Furthermore, the best habitat-plus-CBNG model was 28 times more likely to explain patterns of lek persistence than the best habitat-plus-infrastructure model (including powerlines) and 50 times more likely than the best habitat-only model. Last, models with powerline effects were weakly

supported compared to models with CNBG, although powerlines appear to have a negative effect on lek persistence. The powerline variable included lines associated with CBNG, as well as non-CBNG powerlines. So no attempt was made to isolate the effect of powerlines from the confounding effect of CBNG development. We suggest a more complete statement be included in the Draft LUPA/EIS regarding the effects of energy developments on sage grouse lek persistence regarding the Walker et al. (2007) study. It appears selective use is being made of the information provided by Walker et al. (2007), narrowly focusing on the (weak) effect of powerlines on sage grouse lek persistence.

Sage-grouse avoided brood-rearing habitats within 2.9 mi (4.7 km) of transmission lines in south-central Wyoming (LeBeau, 2012). (Manier et al. ([2013])

This statement is incomplete and is another example of the selective use of the literature. LeBeau (2012) found that brood-rearing habitat selection in 1 study area increased with distance to the transmission line up to 4.7 km, then declined, but in the other study area, brood-rearing habitat selection was highest in the area around the transmission line. LeBeau (2012) also found that sage grouse selected nesting habitat closer to transmission lines that have existed for over 10 years and are within quality habitat at Simpson Ridge. Also, female survival in the study area was greatest at closer proximity to the transmission lines. Nest site selection was higher closer to transmission lines in one study area and not a factor in the other study area. The risk of nest failure increased as distance from the transmission line increased. Brood survival was not impacted by distance to transmission lines. The study found female survival was highest near the transmission lines throughout the study area.

underground power lines result in significant cost increases, reduced reliability, greater ground disturbance during construction and repairs, longer outage periods for customers, and may not always be feasible from an engineering and operations perspective. Underground power lines can result in impacts to other federally listed species, pose a threat of negative impacts on cultural resources, and may have a negative impact to waterways. Underground power lines require a continuous excavation, including blasting in rocky terrain, through all habitat types. In sagebrush habitat, this would result in ground disturbance for the entire line route and associated access roads.

Inappropriate or Misuse of Citations

Collisions with power lines, vehicles, property fencing, and increased predation by raptors may increase mortality of birds at leks (Connelly et al. 2000a; Lammers and Collopy 2007). (ID/MT Draft LUPA/EIS)

Lammers and Collopy (2007) evaluated the effectiveness of perch deterrents in discouraging raptors from perching on powerlines structures. They found that perch deterrents did not prevent perching but decreased the perching duration of raptors on the deterrents compared to other perching substrate. They concluded that “Perching of raptors indicated that some hunting most likely took place from the towers; therefore, the deterrents did not completely obviate the threat that avian predators posed to greater sage-grouse.” The study did not document increased predation by raptors using powerlines, only suggested it may be taking place.

Connelly et al. (2000a) evaluated the cause of death for 117 adult greater sage grouse and found 62% of

documented deaths were attributed to predation, 32% were attributed to hunting, 3% were attributed to vehicle collision, and less than 1% (1 adult male) hit a powerline. Is it appropriate to use 1 collision with a powerline to indicate an impact? The Draft LUPA/EIS implies that since raptor prey on sage grouse and raptors use powerlines to perch, powerlines impact sage grouse. This is not a cause and effect relationship, necessarily, but a spurious correlation.

**Comment Excerpt Text:**

Roads and power lines may also indirectly affect lek persistence by altering productivity of local populations or survival at other times of the year. GRSG mortality associated with power lines and roads occur year round (Aldridge and Boyce 2007). (ID/MT Draft LUPA/EIS)

Adridge and Boyce (2007) did not include powerlines as an explanatory variable in their model evaluating nest and brood occurrence and survival models. They state they “found no effect of edge habitats, or other human features on Sage-Grouse nest success.” The only reference to powerlines in the article states sage grouse “are killed by raptorial predators, such as Golden Eagles (*Aquila chrysaetos*) and Great Horned Owls (*Bubo virginianus*) that perch on the powerlines leading to well sites.” No data is cited to support or document that predation was occurring at the study site. Rather, the author is stating that golden eagle and great-horned owls are known predators and that they were observed perching on powerlines in the study area. Again, the BLM has made a spurious correlation appear to be a scientific fact.

**Comment Number:** IDMTSG-14-0210-5

**Organization1:**NorthWestern Energy

**Commenter1:**Mary Gail Sullivan

**Comment Excerpt Text:**

- Perch discouragers were originally designed to reduce raptor electrocutions by moving birds from an unsafe (electrocution risk) perching location to a safer alternative, either on the same structure or an alternate structure located nearby. Recent data has documented poor effectiveness in perch discouragers and greater effectiveness of covers for preventing electrocutions (see Suggested Practices for Avian Protection on Power Lines: The State of the Art in 2006 (APLIC 2006), pages 17-18). Despite their declining use by electric utilities, perch discouragers have been installed in attempts to dissuade raptors and ravens from perching or nesting on power poles in areas with sage-grouse or other sensitive prey species. Perch discourager research

has shown limited effectiveness in preventing perching, potential for increased nesting on discouragers, and increased electrocution risk associated with perch discouragers. In areas where raven predation on sage-grouse nests is a concern, perch discouragers may aid in the accumulation of nest material (APLIC 2006), and could potentially increase raven predation pressure due to nest construction on discouragers in sensitive areas. The negative impacts of perch discouragers must be weighed against the limited benefits they may provide, particularly if they are contributing to mortalities of protected birds and facilitating increases in predator nesting populations. The avian predators of sage-grouse should also be considered, as different species exhibit different hunting strategies, and employ different hunting techniques for different prey species. For example, golden eagle diet is largely mammalian (80-90%, Kochert et al. 2002). Golden eagle hunting behavior of sage-grouse is not accurately represented in the DEIS. Golden eagles prey on sage-grouse opportunistically, and typically hunt sage-grouse by stooping from a high soar or low, coursing ambush flight (Watson 1997, Kochert et al. 2002). Consequently, power poles may not play an important role in eagle predation of sage-grouse. Golden eagles are vulnerable to electrocution mortality (APLIC 2006) and perch discouragers have been correlated with increased eagle electrocution risk (PacifiCorp, in prep.). Common ravens are known predators of sage-grouse nests, yet ravens are able to overcome perch discouragers and may experience higher nesting rates on poles with perch discouragers

Our analysis of the DEIS focused on those impacts associated with GRSG and its habitat for all of the alternatives. We recommend that the impact analysis be improved through the following ways:

- a. We need more clarity as to the extent to which proposed actions within each alternative would ameliorate the threats to GRSG within the identified analysis areas. This is not to suggest that the current conservation measures within the range of alternatives are inadequate, but rather to emphasize the need for a more comprehensive impact analysis. Currently, the analysis demonstrates the extent to which an impact is reduced within a Population Area. However, it should also incorporate the best available science to show how that reduction could ameliorate the associated threat and consequently impact GRSG individuals and populations. The impacts to individuals and associated populations should then be compared across alternatives.
- b. The analysis should consider the beneficial impacts of best management practices and required specific design features where appropriate.
- c. The analysis should address the extent to which conservation measures within the alternatives meet the objectives of the COT. For example, we recommend inclusion of the COT matrix with an associated narrative. We remain committed to providing technical assistance to you and your staff to complete and incorporate this analysis.

**Comment Excerpt Text:**

- Alternative D would place a relatively larger area of priority GRSG habitat under the most protective designation compared to Alternative E. This larger area is preferable because it would provide stronger protection for a larger amount of more types of GRSG habitat (especially brood-rearing, winter, and connectivity habitats). Protecting a larger area with the strongest requirements would also create more habitat and population expansion opportunities, and provide greater flexibility for managing habitat changes that may result from climate change. We note that two of the four primary threats to GRSG in the Idaho SW Montana sub-region, wildfire and invasives, are likely to be exacerbated by climate change.<sup>5</sup>
- Alternative D's "no net unmitigated loss" standard for Priority Management Areas appears to be more protective than the other action alternatives' disturbance caps. We appreciate, however, that the Sage-Grouse National Technical Team Report included a three percent disturbance cap. To help determine which of these approaches is environmentally preferable for this sub-region, we recommend that the Final LUP A FEIS include additional information comparing the long term effects of each approach. Consider describing, for example, each approach's relative certainty of (i) full implementation, and, (ii) effectiveness in conserving GRSG habitat and populations.

***Summary***

The BLM and Forest Service should conduct additional, more comprehensive analysis of the impacts on greater sage-grouse to provide more substantiated conclusions.

Commenters provided suggestions on how to improve or modify the impact analysis for greater sage-grouse in several topic areas including:

- Hunting
- Predation
- Anthropogenic disturbance, disturbance caps, and lek buffers
- Expanding on beneficial effects on GRSG from range improvements
- Greater sage-grouse population size and trend
- Livestock grazing, fences, and trailing
- Noise as related to low-level military overflights
- Success of habitat improvement projects
- Prescribed fire
- Herbicides
- West Nile virus
- More detailed analysis of Alternative A
- Climate change
- Need to identify areas for restoration
- Coal suitability

The EIS fails to provide justification as to why “withdrawal from mineral entry” is necessary to protect GRSG and its habitat when the same objective can be achieved through avoidance, minimization of impacts, and mitigation of impacts within the designated areas.

***Response***

The LUPA/FEIS provides an updated and expanded discussion of the environmental consequences, including

the cumulative impacts, of the presented alternatives. As described in Chapter 2.3.2, coal was not an issue for analysis. As required by 40 CFR 1502.16, the LUPA/FEIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources should the proposal be implemented. The LUPA/FEIS provided sufficiently detailed information to aid in determining whether to proceed with the proposed plan in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. Therefore, effects on GRSG population levels are not required to be quantified as part of the impact analysis. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

[BLM: Eventually need to fill this in:] Impacts from XX on greater sage-grouse were considered in Section 4.x of the Draft EIS. Include discussion of what changes were made and where. If no change made, describe why the impact analysis is adequate for that topic. Some template text:

While a land use planning-level action is broad in scope and, therefore, does not require site specific impact analysis, a thorough review of the EIS's impact analysis relevant to [speak to the specific topic or theme of the issue statement, e.g., anticipated fluid mineral development of the planning area] was found to need additional information and support for the conclusions/findings. The BLM and the Forest Service have updated this information in the Proposed Land Use Plan Amendment/FEIS to provide the necessary information to make informed land use plan-level decisions. Specifically, [insert a summary of the information that was updated and include a citation for where the reader could find it in the FEIS.]

The facts that sage brush takes decades to re-establish and that disturbance from light and noise affect GRSG mean that avoidance, minimization of impacts and mitigation of impacts are not sufficient methods of protecting GRSG and sage brush habitat. Additionally, this concept was considered within the range of alternatives- Alternative D does not withdraw lands from mineral entry. No change to the EIS has resulted from this comment. [NOTE TO BLM: Consider whether inserting text to this effect into the EIS is appropriate.]

Now that the analysis has been broken down this way, it places a very high burden on the agencies to properly assess the welter of indirect and cumulative effects and threats facing biologically interacting sage-grouse populations and their habitats where populations span state lines. The indirect and cumulative effects analysis must extend beyond state lines. Full current analysis of declines, losses and increasing fragmentation of habitat up to the present must be provided in a SEIS. For example, how much has the habitat for the Northern Great Basin population been impacted by fires? By expansion of cheatgrass/medusahead /exotic bromes/bulbous bluegrass, including in understories? The Idaho plan must examine the cumulative effects, and threats facing the northern Great Basin population in Nevada, Oregon and Utah. It also must examine the meager management actions now proposed for sage-grouse habitats in other states, and the potential adverse impacts of agencies adopting the BLM or state alternatives

We are also concerned that the direct and cumulative impact analyses in the Draft EIS offer only a laundry list of conservation measures, without evaluating their efficacy and overall impact on sage grouse under each alternative. Area sage grouse populations expected to increase or decrease under each alternative in 10 years, 50 years, and 100 years? What would be the magnitude of population changes for each alternative? Copeland et al. (2013) evaluated just this question for Wyoming using a modeling approach, and we call upon the federal agencies to adopt such a modeling approach to come up with projections for sage grouse population trends under each alternative.

---

***Summary***

The BLM and Forest Service need to provide additional analysis regarding the cumulative effects of livestock grazing and land treatments. In addition, the agencies should predict greater sage-grouse population changes based on expected cumulative actions.

---

***Response***

As described in Section 4.7 of this comment report, the BLM and Forest Service analyzed cumulative effects to GRSG in the DLUPA/EIS in Section 4.16 of the EIS. The BLM and Forest Service expanded and quantified cumulative impacts for the proposed LUPA/FEIS. Section 7.7 of this comment report describes how land treatments and domestic livestock were addressed in the Environmental Consequences section of the DEIS. The DLUPA/EIS considered the present effects of past actions, to the extent that they are relevant, and present and reasonably foreseeable (not highly speculative) Federal and non-Federal actions, taking into account the relationship between the proposed alternatives and these reasonably foreseeable actions. This

discussion summarizes CEQ guidance from June 24, 2005, stating that "[g]enerally, agencies can conduct an adequate cumulative effects analysis by focusing on the current aggregate effects of past actions without delving into the historical details of individual past actions." This is because a description of the current state of the environment inherently includes the effects of past actions. Information on the current conditions is more comprehensive and more accurate for establishing a useful starting point for cumulative effects analysis. The CEQ interpretation was accepted by the Ninth in *NW Env'tl. Advoc. v. Nat'l Marine Fisheries Serv.*, 460 F.3d 1125, 1141 (9th Cir. 2006). The BLM and the Forest Service explicitly described their assumptions regarding proposed projects and other reasonably foreseeable future actions. On Forest Service-administered lands, reasonably foreseeable actions are those that would occur under their current land use plans from a broad-scale perspective.

The BLM and Forest Service have complied with the requirements of 40 CFR 1508.7 and prepared a cumulative impact analysis to the extent possible based on the broad nature and scope of the proposed management options under consideration at the land use planning level. Therefore, effects on GRSG population levels are not required to be quantified as part of the cumulative impact analysis.

The BLM and Forest Service added quantitative analysis to Section 4.16 related to XXX topics. [Note to BLM/FS: insert description of any revisions made]

### **Comment Excerpt Text:**

there are numerous methods available for restoration or conservation of sage grouse habitat. Developing a sage grouse "banking program/system" in which the implementation of these methods would result in the generation of credits for sale or trade would be a major step towards a regulatory system that provides protection for the species while still allowing development consistent with federal law. Utah, Idaho, and Nevada have developed wording in their state plans to address the development of sage-grouse conservation banks

### **Comment Excerpt Text:**

We are concerned that many of the Required Design Features (RDF) recommended by the NTT are included in the LUPA/DEIS. These features fail to reflect the complexity of oil and natural gas exploration and development and represent a one-size-fits-all management approach that disregards topography, local conditions, and practicality. We recommend that the agencies revisit the RDFs proposed in the LUPA/DEIS to ensure they are technically feasible and appropriate. Further, the agencies must maintain flexibility required when considering design features on a site-specific basis. For these reasons, we strongly urge the agencies to refrain from directly incorporating any of the NTT report recommendations into the preferred alternative in the final LUPA/EIS and ROD.

Provisions like WL 4.4-2 g “restrict during March-May any intensive ground disturbance activities” must be extended by this process through June 20, to be compatible with the Braun (2006) guidelines, and the needs of sage-grouse. Livestock grazing must be considered to be a disturbance that disturbs and displaces birds, promotes predation during sensitive periods, and strips protective nesting cover exposing nests and nesting birds to predators and weather extremes. See Connelly et al. 2004, WBP Finding discussing Coates et al. and Coates and Delehanty, Knick and Connelly 2011,

**Comment Excerpt Text:**

We are concerned that BLM may not fully apply mitigation measures identified in the RMP revision, using agency discretion to create loopholes in cases where project proponents find mitigation measures to be onerous. This concern is underscored by repeated references throughout the document to exceptions granted to plan standards either with or without compensatory mitigation. RMP language should be clearly articulated that standards are indeed standards and will be applied rigorously throughout the life of the Plan

**Comment Number:** IDMTSG-14-0153-33

**Organization1:** Wild Earth Guardians

**Commenter1:** Erik Molvar

**Comment Excerpt Text:**

The net result is that, under the offsite mitigation model, immediate welfare of the sage grouse today is being mortgaged for eventual habitat improvements that are speculative at best. However, unlike pheasants, sage grouse are known to respond poorly if at all to habitat enhancement projects (WGFD 2007). In the WAFWA forum participants noted,

“It’s important for people to understand that if we are doing habitat projects, it often takes a matter of 10, 20, even 30 years to restore shrub habitat. Habitat treatments that put money on the ground today are speculating on the long-term success of the treatment, and of the sage grouse response to those treatments. So we’ll have to find a way to figure this much longer time frame into our calculations” (WAFWA 2006b: 13).

In the absence of rigorous scientific evidence supporting the translation of habitat enhancement projects into increased sage grouse population numbers, BLM should exclude such projects from sage grouse Priority and General habitats

**Comment Number:** IDMTSG-14-0153-5

**Organization1:** Wild Earth Guardians

**Commenter1:** Erik Molvar

**Comment Excerpt Text:**

Finally, we would ask the responsible official to render a formal determination regarding any scientific support for allowing exceptions to the disturbance cap to be granted with or without mitigation when sage grouse populations are at or above population targets and stable. Please cite to scientifically valid studies that provide examples of mitigation that have increased the populations of sage grouse where they have been

implemented, to offset losses to sage grouse populations in developed areas

**Other Sections:** 7.6

**Comment Excerpt Text:**

The federal agencies propose to compensatory mitigation as a key element of Alternative D DEIS at 2-74. These are intended to offset impacts. Id. We call upon the Forest Service to reach a determination regarding the effectiveness of the proposed compensatory mitigation to result in no net loss of sagebrush populations for the area in question. Please document any and all scientific studies that conclude that compensatory mitigation efforts have yielded an increase in sage grouse populations for the area to which mitigation efforts apply. We are unaware of any cases in which a compensatory mitigation program has resulted in a significant increase in sage grouse compared to an untreated landscape. The fact that “compensatory mitigation” funding frequently is used to purchase conservation easements is problematic, because this is a paper transaction with legal ramifications preventing future potential losses, but can never yield population gains to offset the very real and immediate losses of sage grouse habitats and populations incurred as a result of industrial development

**Commenter1:** John Robison

**Comment Excerpt Text:**

Conservation Area are still met, among other conditions (E-LR-11 through 14: Idaho-CHZ and IHZ on p. 2-166 through 168). The Idaho Conservation League was involved in the development of this exemptions process and a high bar was set. That said, our preference would be to first avoid any infrastructure development within the CHZ and secondly within the IHZ. Even with the best-intentioned avoidance and mitigation plan, some projects are simply “unmitigatable” due to the type or location of the project. As such, we recommend expanding the list of excluded projects in CHZ to include the following:

- Landfills in sage-grouse habitats or within 5 km of sage-grouse habitats<sup>2</sup>
- (especially because landfills subsidize synanthropic predators such as ravens)
- Airports
- Mineral development (leasable, locatable and salable) and associated infrastructure (processing, milling and stockpiling facilities)
- Quarries and gravel pits over a certain size, based on best management practices
- Oil and gas development
- Commercial wind, solar, geothermal, hydroelectric and nuclear projects

**Commenter1:**C.L. Butch Otter

**Comment Excerpt Text:**

Alternative D's mitigation strategy is "no net unmitigated loss" which means at best, a 1:1 ratio of acres. However, Alternative D essentially excludes infrastructure in its most restrictive management zone, so there would be no real opportunity for mitigation.

---

**Comment Number:** IDMTSG-14-0180-28

**Organization1:**

**Commenter1:**C.L. Butch Otter

**Comment Excerpt Text:**

Protection mitigation should also be clarified. This type of mitigation can protect thousands of acres from burning, but could potentially not meet the "net" criteria. This definition does not define how maturation of seeded restoration projects is calculated. And this is only appropriate for large- scale infrastructure, not other activities. Overall, this idea needs to be fleshed out to determine whether it is an effective strategy for infrastructure development and mitigation.

**Comment Number:** IDMTSG-14-0206-16

**Organization1:**The Nature Conservancy

**Commenter1:**William Whelan

**Comment Excerpt Text:**

The five gaps in Alternative D's treatment of compensatory mitigation are: (1) absence of a clear statement of BLM's authority to require compensatory mitigation; (2) failure to explain the no net unmitigated loss standard; (3) lack of policies and processes needed to ensure delivery of sound mitigation; (4) lack of guidance for conducting mitigation on federal lands; and (5) failure to explain how compensatory mitigation is linked to the metrics in the adaptive management mechanism. Each of these problems is addressed below

---

**Comment Number:** IDMTSG-14-0206-17

**Organization1:**The Nature Conservancy

**Commenter1:**William Whelan

**Comment Excerpt Text:**

Alternative D currently references that policy, the final Plan should explicitly re-state its core provisions, including the following points:

- BLM has the authority to require compensatory mitigation as a condition for a right-of-way or other land use authorization or permit;
- BLM has the authority to deny applications if appropriate mitigation is not achievable through avoidance, minimization or reasonable compensation;
- Regional mitigation planning and implementation should be a routine and standard aspect of BLM's planning and permitting processes;
- A regional or landscape-scale mitigation approach will help BLM maximize the management of conservation values while providing transparency and surety to both developers and other public lands users;
- Compensatory mitigation strategies may be implemented after project approval but before construction;

- Adequate bonding to ensure compensatory mitigation compliance is required; and
- Compensatory mitigation must be durable over the life of the impact

**Comment Number:** IDMTSG-14-0206-18

**Organization1:**The Nature Conservancy

**Commenter1:**William Whelan

**Comment Excerpt Text:**

The Plan should state the basic criteria that will be employed in evaluating the adequacy of mitigation proposals designed to meet the “no net unmitigated loss” standard. These criteria include:

- Losses to be considered include those that stem from direct, indirect and cumulative impacts based on best available scientific evidence (i.e., there should be no burden of proof that makes it easier to overlook credible but uncertain impacts);
- Losses will be assessed from baseline habitat conditions and functions and post-project or activity conditions and functions;
- Impact assessments will weigh the value of the habitat affected, including any special or unique features important to sage grouse conservation;
- The mitigation standard is to offset these losses fully;
- Losses to be mitigated include temporary impacts of the project;
- Mitigation should be scaled to reflect the lag time between the time of project impact and the time that benefits of mitigation actions are achieved; and
- In determining the adequacy of mitigation proposals, BLM will consider the risk that mitigation actions will fail to achieve their expected benefits and adjust the amount of mitigation required to provide a high probability of success.

**Comment Number:** IDMTSG-14-0206-19

**Organization1:**The Nature Conservancy

**Commenter1:**William Whelan

**Comment Excerpt Text:**

Alternative D provides little guidance on the policies and processes that the agency will use to ensure the delivery of sound mitigation.

Fortunately, the Mitigation Framework that is incorporated into Alternative E does a good job in articulating many of these policies and processes. The Mitigation Framework was developed by a subcommittee of the Idaho Sage Grouse Advisory Committee as an outline for an in lieu fee program that would offer infrastructure developers one option for delivering mitigation. However, the principles used in the document have broader application to the task of delivering sound mitigation.

The following principles and policies from the Mitigation Framework should guide the federal agencies’ approach to mitigation under the RMP revisions.

- A compensatory mitigation policy oversight committee, a science team, and a program administrator should be established to oversee and manage compensatory mitigation in Idaho. These committees should include responsible federal and state land and wildlife management agencies and tribes. Local government representatives, implementation organizations such, the Natural Resource Conservation Service, Soil and Water Conservation Districts, non-profit conservation organizations, private landowners and stakeholders

should participate as appropriate.

- The federal agencies should have an active role on the policy oversight committee and science team to ensure that mitigation efforts deliver the promised results.
- The Idaho Department of Fish and Game and Office of Species Conservation should have a lead role in organizing a statewide mitigation strategy and administering any in lieu fee mitigation program.
- Mitigation should be guided by a statewide strategy that: defines agency roles and responsibilities for implementing mitigation actions; provides guidance on how mitigation investments will be made in a statewide context for maximum benefit to the long-term viability of sage grouse populations; establishes a “common currency” (e.g., acres, habitat units) for assessing project impacts and mitigation benefits; establishes a crediting system that ensures that project impacts are actually offset with mitigation benefits in accordance with the concept of “additionality;” uses landscape-scale conservation planning to target mitigation action; identifies approved mitigation methods; and sets a fee schedule for any in lieu fee program.
- Mitigation actions should be adequately funded, including the full cost of project planning, administration, and monitoring.
- Mitigation should be subject to both implementation and effectiveness monitoring. Results of monitoring should be available to the interagency mitigation committees and to the public. The mitigation program should be adjusted to reflect the outcomes from monitoring.

**Comment Number:** IDMTSG-14-0206-20

**Organization 1:** The Nature Conservancy

**Commenter 1:** William Whelan

**Comment Excerpt Text:**

However, we also recommend that mitigation delivery be organized on a statewide basis because of the importance of involving the state fish and wildlife agencies and other agencies and organizations that are organized along state lines. Management Zone IV, which includes all of Idaho but only small portions of Montana and Utah is not a logical unit for organizing and delivering mitigation actions. It would make more sense to include the small corners of Montana and Utah that are inside of Management Zone IV within comprehensive mitigation programs in their respective states

**Comment Number:** IDMTSG-14-0206-21

**Organization 1:** The Nature Conservancy

**Commenter 1:** William Whelan

**Comment Excerpt Text:**

We recommend federal land managers explicitly state that the proximity to impacts should not be the primary factor in identifying mitigation investment. Rather, priority should be given to sites that present the best options for successful mitigation and conservation co-benefits. The offset and impact need to be ecologically similar but the assumption that “closer is better” in mitigation siting is often not defensible ecologically, especially given the associated edge effects caused by nearby infrastructure. Mitigation sites should be selected based on a large landscape (e.g., conservation area or statewide) planning that allows consideration of sage grouse population demographics and distribution as well as the project impacts in selecting mitigation areas

**Comment Number:** IDMTSG-14-0206-22

**Organization1:**The Nature Conservancy

**Commenter1:**William Whelan

**Comment Excerpt Text:**

Appendix 2 of this document addresses policies related to the durability of these mitigation investments. Durability of mitigation investments, i.e., ensuring that compensatory mitigation investments lasts over the life of the impact, in some instances in perpetuity, is critical to achieving BLM resource value goals and long-term conservation of sage grouse and their habitats. Durability cannot be achieved if mitigation for impacts to the species and its habitat continue to be negatively impacted by uses or activities that are incompatible with its conservation. BLM has numerous tools it can use to ensure a high level of mitigation durability, many of which are possible through the land use revision process. Building durability measures into the resource management plan will help ensure that mitigation investments yield their intended ecological goals

---

**Comment Number:** IDMTSG-14-0206-23

**Organization1:**The Nature Conservancy

**Commenter1:**William Whelan

**Comment Excerpt Text:**

Both Alternative D and E propose adaptive management mechanisms that are triggered when habitat losses exceed a particular threshold, either 10% or 20%. And, Alternative E provides for disturbance caps that involve calculating habitat disturbance and loss. It is not clear how either of these two policies will assess habitat losses associated with infrastructure projects that will provide compensatory mitigation. Mitigation actions will typically occur after project construction and may not result in full biological benefits until a period of years or decades after the project is complete.

The Conservancy recommends that the final Plan provide that mitigation actions will be credited for purposes of applying disturbance cap at the time that the biological benefits of those actions accrue on the ground. The same approach would work for assessing whether an adaptive management trigger has been tripped.

**Comment Number:** IDMTSG-14-0206-24

**Organization1:**The Nature Conservancy

**Commenter1:**William Whelan

**Comment Excerpt Text:**

However, the Appendix D includes incidental language that could limit the mitigation effectiveness and lead to future conflict. Specifically, the alternative states that projects would be “subject to compensatory mitigation if new, significant and unavoidable impacts are demonstrated to be associated with the project.” Id.

The problem with this formulation is that the apparently innocuous word “significant” can lead to endless debates about its meaning as applied in specific situations. There is little value in assessing whether residual impacts are “significant” as that term is typically used in the NEPA context. Compensatory mitigation should be a tool to offset all sage grouse impacts that are not merely negligible.

We are also uncertain about what the phrase “demonstrated to be” adds to the sentence quoted above. There should be no extra burden of proof imposed on the compensatory mitigation program. Decisions about which impacts should be mitigated should be based on available evidence under existing standards. Remote and speculative impacts have never been within the scope of NEPA’s requirement to consider the environmental effects of proposed actions.

Therefore we suggest that Alternative D call for mitigation that will apply to “new unavoidable impacts associated with the project.”

---

**Comment Number:** IDMTSG-14-0206-26

**Organization1:** The Nature Conservancy

**Commenter1:** William Whelan

**Comment Excerpt Text:**

Based on this information, The Nature Conservancy recommends that compensatory mitigation be based on loss of habitat services within .6 kilometers either side of the centerline of a 500 kV or other large transmission line. We note that the literature supports the conclusion that indirect impacts, such as predation, occur at much larger distances. Therefore, a 600 meter “band” on either side of the transmission line represents a moderate approach to quantifying habitat services losses that should be subject to compensatory mitigation based on available information for the habitat types affected.

---

**Comment Number:** IDMTSG-14-0210-8

**Organization1:** NorthWestern Energy

**Commenter1:** Mary Gail Sullivan

**Comment Excerpt Text:**

NorthWestern Energy submits that stipulations for sage-grouse included in the BLM RMP revision should not include any mitigation requirement unless it is based on valid science, not anecdotal or casual observation, and is specific to sage-grouse. NorthWestern Energy encourages the BLM to apply the APLIC/agency sage-grouse BMPs (described above), much like the BLM has for APPs, to serve as the current best practices for sage-grouse issues related to electric utility facilities.

---

**Comment Number:** IDMTSG-14-0210-9

**Organization1:** NorthWestern Energy

**Commenter1:** Mary Gail Sullivan

**Comment Excerpt Text:**

NorthWestern Energy encourages the BLM to develop incentives for industry that meet these conservation and customer goals. Numerous state sage-grouse plans have either included or are developing incentive programs for industry and private landowners, as these are critical to the overall conservation of sage-grouse and their habitat. NorthWestern Energy encourages the BLM to consider mitigation banks and offsite mitigation as mechanisms to pool habitat conservation resources and target conservation efforts in highest priority areas. Because habitat is the primary factor influencing sage-grouse populations, habitat conservation and enhancement efforts should be a primary focus of minimization and mitigation efforts.

---

**Comment Number:** IDMTSG-14-0212-16

**Organization1:** Soda Springs Plant

**Commenter1:** Randy Vranes

**Comment Excerpt Text:**

the Final LUP Amendment should clarify that sage-grouse conservation stipulations should be a preference and should not be used to unduly burden or eliminate leasable minerals development. For example, mine exploration drilling programs in sage-grouse habitat, under certain circumstances, might be able to avoid surface uses during seasonal or daily time limitations. However, impacts of actual mining in sage-grouse habitat cannot avoid surface disturbance in areas where the resource is located. Thus, the Final LUP

Amendment should recognize that, although surface use limitations might be implemented to mitigate or minimize impacts of a drilling program, such limitations might not be applicable to a mine development, the impacts of which might need to be mitigated through other means (e.g., habitat restoration).

---

**Comment Number:** IDMTSG-14-0212-17

**Organization1:** Soda Springs Plant

**Commenter1:** Randy Vranes

**Comment Excerpt Text:**

To incentivize immediate conservation efforts while ensuring realistic opportunities for development, the Agencies' Final LUP Amendment provisions should provide a clearer, more robust, mitigation credit program. The elements of the mitigation program should include, at a minimum, the ability of federal project proponents to pursue, and receive mitigation credits for, mitigation projects on private or state lands to offset future federal project impacts. Mitigation credit opportunities also should not be limited to traditional habitat improvement and protection activities. The Agencies should work with project proponents to develop alternative mitigation actions that could be used to offset project impacts. For example, where wildfire is the primary threat to sage-grouse habitat in Idaho, mitigation credits could be earned by providing firefighting resources that otherwise would not be available to private or state resource managers. Other examples include marking fences near leks to prevent sage-grouse collisions, which could directly and quickly provide benefits to local populations, and remediating pinyon/juniper encroachment. These non-traditional mitigation actions could provide quick, range-wide and substantial benefits, and thus, the Final LUP Amendment should recognize these for potential mitigation crediting.

---

**Comment Number:** IDMTSG-14-0212-19

**Organization1:** Soda Springs Plant

**Commenter1:** Randy Vranes

**Comment Excerpt Text:**

IHZ infrastructure development

It is unclear in the State's Alternative whether, or to what extent, mitigation or mitigation credits will be considered in the 10% habitat objective and population decline measurements. See Draft LUPA/EIS p. 2-95 (Objective E-OBJ-2). To encourage immediate conservation actions while providing for multiple uses of the public lands, the Final LUP Amendment should provide that project proponents are able to rely on mitigation benefits to show that the 10% habitat objective and population decline measures would be achieved.

Alternative E provides that the 10% habitat objective and population decline measures must be met "within a particular [Conservation Area]." See, e.g., Draft LUPA/EIS p. 2-95 (Objective E-OBJ-2). However, there could be mitigation opportunities outside of the project Conservation Area that could provide a benefit to the species overall. If a project proponent can show there will be an overall net benefit to the species through mitigation opportunities outside the project Conservation Area, the project proponent should be able to rely on that mitigation to offset impacts inside the area. In addition, the Agencies should provide in the Final LUP Amendment that, because it's unclear how mitigation projects on private or state lands would be considered, federal project proponents should be allowed to pursue, and receive mitigation credit for, mitigation projects on private and state lands to offset federal project impacts.

**Comment Number:** IDMTSG-14-0325-5  
**Organization1:**  
**Commenter1:**William J. Mulder

**Comment Excerpt Text:**

[This comment corresponds to the headings in Table 2-17 and Table 2-18] SSS-GRSG  
 Monitoring.

Alternatives B, C, D and Fat SSS-4 are inadequate because they lack standardized monitoring of GRSG

population and mortality factors. As is carried throughout Alternatives B, C, D and F in this draft LUPA/EIS, BLM chooses to essentially ignore GRSG population factors and instead focus on purely regulatory "habitat" actions. It is convenient to "monitor" habitat by HAF or similar methods, but without accurate and consistent population and mortality information it is impossible to determine if success/lack of success of a management action is due to habitat management or is instead due to other life-cycle variations (e.g. weather, predation, disease, direct take, etc.).

---

### ***Summary***

The BLM and Forest Service mitigation strategy is inadequate or needs clarifications. Topics of concern include:

- Certainty that mitigation will be implemented
- Lack of scientific evidence that mitigation and habitat restoration results in greater sage-grouse population increases
- Adequacy of the monitoring program
- Effectiveness of compensatory mitigation
- How mitigation proposals will be evaluated
- Siting of mitigation actions
- Durability of mitigation investments
- Consideration of using mitigation banks
- Creation of a mitigation program
- Framework behind exceptions and associated mitigation, e.g., science behind allowing exceptions; offsetting losses and prove mitigation is successful
- Need for mitigation given the restrictive management in the alternatives
- Link between compensatory mitigation and adaptive management

---

### ***Response***

The Mitigation, Monitoring, and Adaptive Management strategies are described more fully in Section XX of this comment report and included in Chapter 2 and Appendices X, X, and X of the DEIS. Refer to BLM Mitigation Manual.

**Organization 1:** Western Watersheds Project

**Commenter 1:** Katie Fite

**Comment Excerpt Text:**

BLM also places ACECs in the Issues Not Addressed Category. Yet these were part of the Preliminary Planning Criteria. Designation of special management areas is not outside the Scope of this process. ACECs are special management areas. They are adopted by Land Use Plan amendments. The Scoping and Fed Reg Notices stated that the agencies may consider ACECs. This is serious Idaho (and E MT- UT) BLM BLM backpedaling. FLPMA allows the public to nominate ACECs at any time. Numerous ACEC proposals were submitted to BLM. In fact, as discussed below, BLM appears to have prepared a small number of its own proposals, and the Forest a Zoological Area, but that effort may have run into a political blockade. See oddly unlabeled map DEIS Figure 2-46. BLM itself considered ACECs in Alternatives C and F.

**Comment Excerpt Text:**

Even if these priority areas are not designated as ACECs, BLM can identify them as other administrative designations, which will still provide for areas of more protective management. For example, the HiLine RMP in Montana incorporated 2 designation approaches that are used to protect sage-grouse and minimize habitat fragmentation: Grassland Bird/Greater Sage-Grouse Priority Areas, and Greater Sage-Grouse Protection Priority Areas<sup>2</sup> [2 See Draft HiLine RMP, available at [http://www.blm.gov/pgdata/etc/medialib/blm/mt/field\\_offices/malta/rmp/draft\\_rmp.Par.77898.File.dat/HL%20Fact%20Sheet-Sage%20Grouse.pdf](http://www.blm.gov/pgdata/etc/medialib/blm/mt/field_offices/malta/rmp/draft_rmp.Par.77898.File.dat/HL%20Fact%20Sheet-Sage%20Grouse.pdf)]. In the HiLine RMP, these areas had low potential for oil and gas development and were given a high level of protection in the RMP.

Designate a subset of sage-grouse priority habitat areas as sagebrush reserves (e.g., Areas of Critical Environmental Concern (Bureau of Land Management), Zoological Areas (Forest Service),<sup>10</sup> research natural areas (Bureau of Land Management, Forest Service), or national wildlife refuges (Fish and Wildlife Service), etc.) to be specially managed refugia for sage-grouse and other sagebrush-dependent species.<sup>11</sup> Sagebrush reserves should encompass centers of sage-grouse abundance on the landscape and protect a sufficiently large proportion of habitat in each planning area to sustain biological processes, recover species and mitigate for the systematic effects of climate change, invasion by nonnative plants and unnatural fire.<sup>12</sup> Sagebrush reserves should offer additional conservation benefits for sage-grouse and other sagebrush-dependent species over priority habitat. They may be withdrawn from locatable and leasable minerals development (43 U.S.C. § 1714); closed to new surface disturbance; and prioritized for grazing permit retirement and removal of infrastructure (unnneeded oil and gas equipment, roads, range developments, fencing, etc.).

The preferred alternative would not designate any sagebrush reserves (ACECs, Zoological Areas) (vol 2, 2-194, Table 2-19). Alternative C analyzed 3,603,100 acres for designation as 39 new ACECs to conserve sage-grouse (vol 1, ES-15; vol 2, 2-27, Table 2-2). Alternative F would designate 7,791,693 acres as ACECs and Zoological Areas (including 3,460 acres as restoration habitat) (vol 2, 2-27, Table 2-2).

**Commenter1:** Christine B.

**Comment Excerpt Text:**

Areas of Critical Environmental Concern

We are concerned that Alternative D does not include the establishment of any new or additional Areas of Critical Environmental Concern because we believe that establishing ACECs would be an effective method of protecting relevant and important values. We recommend that the Final LUPA/EIS include additional information describing why the BLM decided not to include ACECs in the co-preferred alternatives.

***Summary***

Issue 1: In the Draft EIS/LUPA, the BLM/FS did not accurately or consistently represent the number of ACECs being proposed under each alternative, particularly Alternative C.

Issue 2: Alternatives in the Draft EIS/LUPA do not provide an adequate range of management actions for ACECs by only considering new ACECs under two of the action alternatives (C and F).

Issue 3: Whether ACECs or another administrative designation, the BLM/FS must ensure any administrative designation established for the protection of sage-grouse habitat will provide adequate non-discretionary protections.

***Response***

Response 1: The FEIS has been revised to ensure consistent representation of proposed ACECs under Alternatives C and F.

[NOTE TO BLM: Review EIS/LUPA for consistent representation of proposed ACECs under Alternatives C and F.]

Responses 2 and 3: As noted in section 4.3, NEPA Range of Alternatives, of this report, the alternatives, including the management actions for the fire ACEC program, meet the purpose and need for the EIS. Alternatives within the EIS have established that not all protective management for the Greater Sage Grouse is limited to ACEC designation. Only Alternatives C and F proposed to establish ACECs for the protection and management of the Greater Sage Grouse. While the other alternatives do not propose such designations, they still contain similarly specific management prescriptions to manage and protect the Greater Sage Grouse

and its habitat that would be equivalent to protections afforded via an ACEC or other designations.

**Comment Excerpt Text:**

The DEIS does not adequately address the significant cumulative stress of climate change and incorporate recent science suggesting that a reduction in ungulate grazing would improve ecological resilience in the face of temperature and precipitation changes. See Beschta et al 2012. The DEIS does not discuss the impacts of livestock grazing on the climate resilience or the contributions of GHGs from the planning area. The impacts of climate change on a healthy resilient system are far less than on a system where resource extraction, such as livestock grazing is the predominant use. The levels of livestock grazing utilization that takes place on BLM lands place unnatural stress upon the vegetative communities which did not evolve with this non-native invasive species, cattle. There is much research regarding the impacts of drought under various levels of herbivory, the majority of which shows significant impacts to vegetation from the level of utilization generally authorized or allowed by the BLM. The impacts of drought are quite similar to that predicted from global warming. So the research regarding herbivory effects and drought are quite analogous and useful for the analysis of the impacts of climate change.

Account for the effects of climate change in management planning (Secretarial Order 3289, 02-22-2010; CEQ Memo, 02-18-2010 (draft)). Climate change is a recognized threat to sage-grouse (Connelly et al. 2011b: 556, Table 24.2; Blomberg et al. 2012; van Kooten et al. 2007) that is also predicted to have deleterious impacts on sagebrush steppe (Schlaepfer et al. 2012; Neilson et al. 2005). Most climate change simulations predict sagebrush steppe will contract as mean temperatures increase and the frost line shifts northward (Blomberg et al. 2012; Neilson et al. 2005). In the worst case scenario, sagebrush species are simulated to contract to just 20 percent of current distribution (Wisdom et al. 2005b: 206, citing Neilson et al. 2005). The largest remaining areas will be in southern Wyoming and in the gap between the northern and central Rocky Mountains, followed by areas along the northern edge of the Snake River Plateau and small patches in Washington, Oregon and Nevada (see Miller et al. 2011: 181, Fig. 10.19). Sagebrush steppe may also shift northward in response to increased temperatures (Schlaepfer et al. 2012; Shafer et al. 2001).

**Comment Excerpt Text:**

Measures for ameliorating the effects of climate change on species and landscapes include increasing the size and number of protected areas, maintaining and enhancing connectivity between protected areas, and identifying and protecting areas likely to retain suitable climate/habitat conditions in the future (even if not currently occupied by the species of concern). Management should also repulse invasive species, sustain ecosystem processes and functions, and restore degraded habitat to enhance ecosystem resilience to climate change (Chester et al. 2012; NFWPCAS 2012). The plan identifies climate change, specifically its contributions to the spread of cheatgrass and associated loss of sagebrush habitat, as a planning issue (vol 1, ES-7), but contends there “is no resource program for addressing this threat to [sage-grouse]” (vol 2, 2-5, Table 2-1). The plan claims to address the cumulative effects of climate change in section 4.15 (which is, unexpectedly, titled “Social and Economic Conditions (Including Environmental Justice”), but there is little discussion of the impacts of climate change in this section or anywhere in the plan.

The preferred alternative would generally attempt to increase the quality, extent and connectivity of sage-grouse habitat, “where possible, to accommodate the future effects of climate change” (vol 2, 2-97, Table 2-17, D-OBJ-10).

---

***Summary***

The EIS does not adequately address the cumulative effects of climate change on sage-grouse or sage-grouse habitat, including the cumulative effects of livestock grazing on vegetation communities and the likelihood of a changing climate to result in an increase in invasive weeds.

---

### ***Response***

Assessing the impacts of grazing on climate change is outside the scope of this document, except as it pertains to reducing impacts on GRS and GRS habitat within the planning area and in consideration of valid existing rights and the BLM's multiple use mandate under the Federal Land Policy and Management Act. The PRMP/FEIS does disclose the potential effects associated with global climate change on the Greater Sage-grouse in Section XX. However, pursuant to 40 CFR 1500.1(b), information must be "of high quality" in order to be considered in the analysis. As explained in Section xx of the EIS, it is speculative to attempt to predict the specific nature or magnitude of such changes.

NOTE TO BLM: Based on the NEPA and CEQ guidance for cumulative impacts analysis, determine if the DEIS analysis is adequate or not. If not, make necessary corrections and note what was modified here. Include direction to reader where to find revised analysis (e.g., "See Section 5.XXX for additional information.").

The BLM will review. Follow up needed with Bryce.

#### **Comment Excerpt Text:**

Recovery of sagebrush lands impacted by fire is long-term and may often take decades or even centuries. Species composition, pre-burn site conditions, fire size and intensity, fire frequency, and availability of seed sources all play a role in the ability of sagebrush habitats to recover. Without readily available sagebrush habitat, most sites affected by fire are of little to no value to sage-grouse prior to recovery.

At the same time, some priority sage-grouse habitats include substantial non-sagebrush habitat interspersed with sagebrush steppe, such as low-elevation Douglas-fir forests, where fire is a critical natural process. In the absence of fire on these landscapes or due to unnatural fire suppression efforts, there has been significant conifer expansion into sagebrush steppe and grasslands.

For this reason, we suggest that prescribed fire be used sparingly in areas specially designated for sage-grouse conservation and prohibited completely in areas dominated by xeric sagebrush species such as Wyoming big sagebrush. Prescribed fire treatments should not be designed to remove sagebrush, but rather should only be used to address issues such as conifer encroachment that may contribute to declining health in sagebrush habitats

**Comment Number:** IDMTSG-14-0053-8

**Organization1:** Hagenbarth Livestock

#### **Comment Excerpt Text:**

Most of the alternatives dwell on core habitat fire suppression actions and the prevention of wildfire through education of all users. Alternative D speaks of revegetating green strips with native vegetation. Any responsible plan must include a comprehensive map of all natural and manmade firebreaks in priority habitat and then use fire specialists, landscape architects, and vegetative specialists to design additional green strip fuel breaks to further break up these fuel loads in GRSG habitats that are prone to burning. The loss of habitat from developing these green strips is minimal, compared to these huge uncontrollable fires. The cost of green stripping will be minimal compared to the cost of suppression. The ARS Forage and Range Resource Lab in Logan, Utah, has developed vegetation that can be used in green stripping. Forage kochia is one of these plants. It is very high in protein during the winter months and GRSG use of this plant has been documented. It is imperative that green stripping become a larger component in fire management.

• [This comment refers to Alternative D] Mitigation (2-75) – The LUPA/DEIS mentions grazing management for post-fire restoration treatments. The final LUPA/EIS must make clear the need for flexibility in developing such treatments. In many cases, grazing restrictions post-fire only serve to exacerbate the invasive species problem which creates a cyclical negative impact on sage grouse.

---

**Comment Number:** IDMTSG-14-0179-15

**Organization1:**Idaho Conservation League

**Commenter1:**John Robison

**Comment Excerpt Text:**

It is important to note that the Idaho Fire Restrictions Plan is just one aspect of a larger public education and prevention program.

11 <http://www.idahofireinfo.blm.gov/southwest/firerestrictions.htm>

The following criteria are among those to be considered when assessing the need for restrictions, but these criteria can be customized for each area:

- 1,000-hour fuel moisture content
- Live fuel moisture content
- Fire danger rating adjective class is at very high or extreme
- Fires are impacting available suppression resources making adequate initial attack difficult
- Area is receiving a high occurrence of human-caused fires
- Adverse fire weather conditions and risks are predicted to continue
- Social, political and economic impacts
- Life safety is jeopardized

If a certain number of the above conditions are met, Stage 1 Restrictions may be set in place which restrict building campfires and smoking beyond an enclosed vehicle or building. If even more of the above conditions are met, Stage 2 Restrictions may be set in place, which add operating motorized vehicles off designated road and trails, operating internal combustion engine such as a chainsaw, welding and using explosives.

This program was successfully utilized to protect remaining sage-grouse habitat following the Murphy Fire when extreme fire conditions were still present. These restrictions were enacted specifically to prevent human-caused fires from impacting other sage-grouse habitat during a time when resources were stretched thin. As such, this program may be able to serve as an adequate and at least partially effective regulatory mechanism.

**Comment Number:** IDMTSG-14-0180-37

**Organization1:**

**Commenter1:**C.L. Butch Otter

**Comment Excerpt Text:**

However, the distinction between Alternative E and its co-preferred partner Alternative D is that Alternative E is the only one that responds to the Service's concern that existing fire mechanisms were only implemented through temporary IMs that expired every two years. The table provided in Appendix D for Alternative E and also noted as Table 2-13 in this EIS provides timelines for both BLM and the Forest Service to implement long term fire management measures. This ensures that measures are not only effective in reducing the impact of fires, but also that fires can continue to managed consistently at the local level. No other Alternative in the DEIS addresses fire in this way. In fact, Alternatives C and F merely defer to Alternative B for the primary threat facing sage-grouse. Thus, while the impacts of the measures themselves may not differ substantially from Alternative A or B, Alternative E's impacts are much bigger as they are paired with a mechanism to ensure they are actually implemented.

**Comment Excerpt Text:**

We recommend that the FEIS include provisions to eliminate prescribed burning in sage-grouse wintering and breeding [i.e., lekking, nesting and early brood rearing (Connelly et al. 2004, Connelly et al. 2011)] habitats unless biologically justified. The ecological role of fire in reducing sagebrush canopy and stimulating regeneration may justify the use of prescribed fire in site-specific circumstances (Manier et al. 2013). If prescribed fire is allowed in GRSG habitats, then we recommend that the FEIS commit to using the risk analysis tool currently in development by WAFWA. We also recommend incorporating literature by the Fire and Invasive Species Team (FIST), which is currently developing landscape prioritization for fire and invasive species, as well as step down assessments

---

**Comment Number:** IDMTSG-14-0325-10

**Organization1:**

**Commenter1:** William J. Mulder

**Comment Excerpt Text:**

Once a wildfire is started, BLM has shown it will use BMP with available resources to suppress the fire, regardless of whether in GRSG habitat or not.

Effective control of wildfire will need to take place well before a fire occurs. None of the Alternatives adequately address this situation. Some general items that could reduce the wildfire threat are:

- develop working relationships and agreements between all firefighting entities that would minimize jurisdictional delays in initial attack (see E-WFM-8);
  - specifically develop and maintain MOU's with local Rangeland Fire Protection Associations ("RFPAs"), which can greatly reduce response times to minimize wildfire impacts;
  - in addition to Fuels Management items below, avoid Wilderness and/or Lands with Wilderness Character designations and restrictions that promote road/trail closures or prohibit significant firebreak, fire lane and fire management projects; and
  - re-allocate BLM resources from a focus on over-regulating low-threat uses (e.g. grazing, underground rights-of-way, etc.) toward developing and maintaining effective fire-control measures.
- 

**Comment Number:** IDMTSG-14-0325-11

**Organization1:**

**Commenter1:** William J. Mulder

**Comment Excerpt Text:**

[This comment corresponds to the headings in Table 2-17 and Table 2-18] Fuels Management. Mature sagebrush is arguably the most significant source of fire fuel in GRSG habitat. BLM's stated objective is conservation and rehabilitation of GRSG habitat to not less than 15% canopy. Alternatives B, C, D and F (B-FM1-F-FM1) resist any significant reduction in sage brush and the 15% cover objective, except under onerous conditions. Incredibly, many of the Alternatives are more concerned with regulating nearly insignificant uses as they relate to fuels treatments than in recognizing the problem on a broad scale (B, C and F -FM1 actions).

Failure to deal with fuel management by developing mosaic or linear breaks has contributed to massively detrimental wildfires (e.g. Murphy Complex, Long Draw, Holloway, etc.). Emphasis on actually increasing sage brush cover with more restrictive fuel treatment options will exacerbate the already primary threat.

In addition to the considerations outlined in "General" (above), the adopted Alternative should promote the "... aggressive wildlife [sic-"wildfire"] and invasive species management practices ..." outlined in EFMI-6, as well as D-FM-6-9 and D-FM13-16.

---

## **Summary**

The BLM and the Forest Service should examine the location and size of proposed fuel breaks in further detail as fuel breaks in large areas of intact sagebrush limit fire and related habitat destruction. Specifically, one commenter requests use of green-strips, including non-native species, for fuel breaks. Use of prescriptive fire as a management tool should be further examined.

Timelines for long-term fire management measures should be established in the FEIS. One commenter recommends that measures be implemented one year after the ROD. Implementation details of fire control measures should be specified. The BLM/Forest Service should acknowledge the importance of flexibility in fire management plans in the FEIS and allow for on-the ground decision making for effective fire-management. Alternative language should be revised for clarity.

---

## **Response**

Fuel breaks are site-specific - see Oregon response. Use of prescribed fire varies by alternative. [needs more subregional input]

### **Comment Excerpt Text:**

Alternative E involves the widespread creation of 300-foot-wide “green strips” as fire breaks DEIS at 2-85. This is a practice unsupported by science. Please provide peer-reviewed, scientific literature that demonstrates that such “green strips” in sagebrush steppe habitat have been demonstrated to reduce fire. Our review of the literature uncovered only unpublished white papers and “fact sheets” that cited no actual scientific studies to support the assertion that “green strips” slow or halt the spread of fire. If no such evidence can be provided, such “green strips” should be explicitly forbidden in the RMP amendment. It is obvious that “green strips” will only be green in the spring, when precipitation occurs and the risk of fire is negligible. During the dry periods when fire ignitions occur and spread most readily, “green strips” will be brown and represent a concentrated source of fine fuels that will do nothing to slow the advance of a flame

front, and may indeed accelerate it.

**Comment Excerpt Text:**

Livestock grazing is a key tool to reducing the threat of catastrophic wildfires and should be recognized in the draft for the benefits it provides. Peer-reviewed studies have clearly demonstrated that grazing livestock reduces the threat of catastrophic wildfire by controlling the fuel load and increasing productivity of grasses that are less fire prone (Davies 2011). According to a newly released study entitled, “Livestock Grazing Effects on Fuel Loads for Wildland Fire in Sagebrush Dominated Ecosystems.” (2014 – Journal of Rangeland Applications, in press), grazing provides assistance in fuels management in the following ways:

- A window of opportunity may exist for targeted grazing to reduce annual grasses before perennial grasses initiate bolting or during dormancy.
- Livestock grazing can reduce the standing crop of perennial and annual grasses to levels that can reduce fuel loads, fire ignition potential and spread.
- Grazing after perennial grasses produce seed and enter a dormant state can reduce the residual biomass left on the site and thereby decrease the fire hazard the following spring and summer.
- Grazing can reduce the continuity of fuels, including the amount of herbaceous biomass between shrubs, in sagebrush ecosystems.

As stated above, ranchers are often the first responders to wildfires (Davies, 2010). Recently, several Rangeland Fire Protection Associations (RFPAs) have been established to enable ranchers’ ability to safely respond to wildfire alongside BLM and to enhance their capabilities of limiting the spread of wildfires before they grown to catastrophic and unmanageable sizes. For the 2013 fire season, four established RFPAs covered 3,622,000 acres and comprised 168 ranchers and other private citizens who are RFPA members. Additional RFPAs are in the process of developing and will further increase this proactive step to reduce the size of wildfires in sage grouse habitat. Alternative E identifies, RFPAs are a critical and innovative component to preventing and controlling the spread of wildfires. Their existence can only bring positive impacts on the rangeland and on sage grouse. RFPAs are almost entirely made up of ranchers who also graze on public lands. With reduced or eliminated livestock grazing on the range comes the reduced or eliminated presence of ranchers on the range. The effectiveness of the RFPAs, which have proven to be extremely effectual in initial attack of wildfires, correlates directly with the continuance of livestock grazing on public lands. If grazing is reduced as a result of implementation of this LUP/EIS, ranchers will not be around to operate the RFPAs and ensure their continuation, to immediately respond to fire starts, nor to coordinate fire suppression efforts with the agencies. Please refer to attachments 4 and 5 for published new stories regarding RFPAs and the value that rancher provide in protecting sage grouse habitat from wildfire.

**Comment Excerpt Text:**

Control of invasive species has a direct correlation with controlling wildfires. For the reasons mentioned above, grazing can be used as a tool to reduce many of the invasive species which also serve as fine fuel loads for fires. Peer-reviewed studies have proven that when rangeland is burned, it is much less prone to invasion by annual invasive weeds like cheat grass if it has been grazed (Davies, 2009). Due to reduced fuel loads and cooler burn temperatures, grazed rangeland is more likely to reestablish native bunch grass communities, while burned ground that has not been grazed is more likely to establish cheat grass communities. In light of

these findings, appropriate grazing should be recognized in the RMPA as a primary tool in the prevention of wildfire and reduction of invasive weeds—two of the primary threats to sage grouse habitat. Diamond et al. (2009) found that targeted grazing may be a critical tool for breaking the exotic annual grass-fire cycle by decreasing the probability of fire disturbance.

Additionally, Diamond et al. (2009) found that, on areas already invaded by exotic annual grasses, strategic grazing could reduce fuel loads and continuity enough to prevent a flame front from carrying across the treated areas, even under peak fire conditions. Ample research, including that of Olson and Lacey (1994) and Walker et al. (1994), has found livestock grazing to be an effective tool for the control of invasive plant communities.

**Comment Excerpt Text:**

We observed in several places where prescribed fire is mentioned and implied as a tool for management (e.g., Chapter 2, Table 2-1, page 2-4). We would argue that there is no science-based evidence to support using prescribed fire as a means of improving sage grouse habitat and in fact, studies indicate that prescribed fire will not improve habitat characteristics for sage grouse (e.g., Rhodes et al. 2010, Bates et al. 2011, Beck et al. 2011, 2012).

***Summary***

The FEIS should include citations indicating that implementation of fuel breaks in sagebrush systems reduces the rate of spread of fire. In addition, citations should be provided to support the use of prescribed fire to improve GRS habitat. The BLM and Forest Service should recognize livestock grazing as an effective fire management tool due to its role in controlling invasive plants and decreasing fuel loads.

***Response***

The EIS affected environment section provides the appropriate information for the scope and scale of the project (see section 4.4, NEPA Baseline Information of this report). However, upon BLM and Forest Service reviews and public comment suggestions, some sections in Chapter 3 have been updated and revised to include clarifications or new information. Section 3.XX, [insert section name], in the FEIS has been revised to update information regarding fuelbreaks and section 3.XX, [insert section name], has been updated to clarify the relationship between livestock grazing and fire.

Vol 2, Page 2-83: Regarding Alternative E -Fire Suppression

Table 2-11 mentions Rangeland Fire Protection Associations. These have proven extremely effective in wildfire response and suppression. However, it should be kept in mind that the ranchers involved are there because they are able to maintain viable ranching operations and thus are not only present but have a vested interest in assuring that wildfire effects are minimized. The recent grazing permit renewals in the Owyhee Field Office have the potential to substantially alter the number of such ranch operations that will remain viable and present. The wide spread public benefit of Rangeland Fire Protection Association activity and their benefit to preservation of GRSG habitat should be considered in the evaluation of Alternative impacts on grazing opportunity.

**Comment Excerpt Text:**

Natural fire return intervals in Wyoming big sagebrush average 100-240 years (Baker 2007). Wyoming big sagebrush recovers slowly after fires, which typically result in 100% sagebrush mortality; recovery to pre-fire canopy cover takes over 100 years (Cooper et al. 2007). The Idaho – Southwest Montana DEIS mischaracterizes this as 15 to 30 years, citing Manier et al. (2013:133-134). DEIS at 4-69. Manier et al. (2013) repeatedly reference the very slow recovery times of sagebrush following fire, and the closest that they come to supporting the DEIS characterization is to note that in mountain big sagebrush habitats (as opposed to the drier Wyoming big sagebrush communities that dominate the planning area) with ideal soil and climate parameters, recovery can be as little as 20 years (at p. 79). However, even mountain big sagebrush

can take 75 years or more to recover in certain circumstances (Baker 2011). Please rectify this apparent hard-look failure in the impacts analysis

**Comment Excerpt Text:**

The July 1 Clarification and Refinement letter sent to BLM by the Governor outlines a wildfire strategy that focuses on prevention, suppression, and restoration. These measures also require BLM to take certain actions within one year of signing the Record of Decision. This strategy provides certainty that the measures will be implemented and that action will be taken.

Additionally, in 2012, Idaho, in collaboration with BLM established Rural Fire Protection Associations. These Associations, discussed in further detail in the attached comments from the Idaho Department of Lands, have already been established, and funded by the Idaho State Legislature and assisted BLM in the 2013 fire season. Additional Associations continue to be added and IDL recently established a full time position in their office to manage them.

In contrast, under Alternative B and D, “impacts on sage-grouse from fire suppression activities would largely be the same as Alternative A.” This determination is shocking, considering inadequate regulatory mechanisms for wildfire control was the primary purpose for the “warranted but precluded” determination. However, Alternative B does not alter the status quo. BLM reaches the same conclusions for Alternative D, saying on page 4-55, “overall, Alternative D would reduce impacts to wildfire similar to Alternative B.”

---

**Comment Number:** IDMTSG-14-0180-44

**Organization1:**

**Commenter1:**C.L. Butch Otter

**Comment Excerpt Text:**

The present DEIS is comprised of general statements about possible effects and do not constitute a “hard look.” For example, on page 4-296, the DEIS is quick to dismiss Alternative E’s extensive fire management approach because it “overall has fewer management actions to protect [sage-grouse] from fire than other action alternatives.” In contrast, the DEIS praises Alternative B, while providing vague descriptions of how that alternative can affect the impacts of fire. Again, BLM fails to understand that the Service wanted a coherent strategy to address this threat, rather than a laundry list of conservation measures. This effects analysis does not address the fact that only Alternative E provides certainty of implementation for fire management, and every other threat.

---

***Summary***

The DEIS does not contain sufficient analysis of indirect impacts of reduced grazing on fuel loads and related wildfire risk. Additionally, the analysis of impacts of fire suppression activities should be reexamined. It is particularly important that this analysis is clarified as lack of sufficient regulatory mechanisms for wildland fire was cited as a primary threat to GRSG in the FWS listing decision.

---

***Response***

The impact analysis provides the appropriate information for the scope and scale of the project (see section

4.6, NEPA Impact Analysis, of this report). Upon BLM and Forest Service reviews and public comment suggestions, some sections in Chapter 4 have been updated and revised to include clarifications to the text. Section 4.XX, [insert section name], in the FEIS has been revised to clarify the impacts of reduced grazing on fuel loads. [BLM/Forest Service- need to add review impacts in Ch 4 for consistency with this language added to chapter 3 for relation between grazing and fire. .Review impacts analysis to make sure that impacts analysis has sufficient info on impacts of reduced grazing on fuel loads]  
 In addition, impacts analysis discussion has been modified to clarify the impacts of different suppression measures proposed by Alternative.[BLM/Forest Service- need to review and modify discussion of impacts of fire suppression measures (i.e. specific conservation measures under B vs. approach under E)]

#### **Comment Excerpt Text:**

The purpose identified for the EISs by the December 9, 2011 Notice of Intent (NOI)<sup>3</sup> is “to avoid a potential listing under the Endangered Species Act.” Our review found that the analyses and alternatives considered in both Draft LUPA EISs entirely fail to address such purpose. Neither of the Draft LUPA EISs analyzes whether the greater sage-grouse presently meets the qualifications for listing (as either endangered or threatened) under the Endangered Species Act (ESA)<sup>4</sup> if current land use plan management direction continues. Western Range Service’s analysis demonstrates that the greater sage-grouse does not presently meet the criteria to be listed as either endangered or threatened, so there is no need to change current management direction anywhere within the species range to avoid a potential listing under the ESA. Thus, the only alternative that is reasonable and rational as a final decision in this case is a true no action alternative to continue the management that was in place before the BLM implemented interim sage-grouse conservation measures through their December 27, 2011 Instruction Memorandums (2011 BLM IMs)<sup>5</sup>.

**Organization1:**Center for Biological Diversity

**Commenter1:**Randi Spivak

#### **Comment Excerpt Text:**

The Plan Amendments also do not meet the PECE Policy standards for ensuring that conservation measures are certain to be effective when implemented. First, the Preferred Alternatives D and E do not provide

explicit incremental objectives and dates for the conservation effort, and do not describe the steps necessary for implementing the conservation effort. The draft monitoring framework merely states an implementation workbook will be completed within one year of the ROD to track the status of implementation of each management action, and that it will be “maintained as actions occur.”<sup>13</sup> The draft mitigation strategy states that BLM will establish a Mitigation Implementation Team for each management zone covering the planning area that will “coordinate mitigation strategies” among various federal and state land management agencies. However, the strategy provides no clarity on when the team be assembled, what strategies they will adopt, and how mitigation strategies will ensure sage-grouse survival and recovery in conjunction with the implementation of the alternatives in this LUPA/DEIS.<sup>14</sup>

Furthermore, many of the alternatives do not provide quantifiable, scientific valid parameters that will allow BLM and Forest Service to measure the success of these efforts. In its framework regarding effectiveness monitoring the LUP/EIS merely states in one single paragraph that the BLM and Forest Service in coordination with state agencies will analyze monitoring data to accomplish effective monitoring for the Amendment as implemented. Additionally, the LUP/EIS provides that effectiveness monitoring will be used to inform the BLM and USFS’ adaptive management strategy, without further detailing any metrics or even measurable timelines.<sup>15</sup>

Finally, although the LUP Amendments mention monitoring and evaluating the success of conservation efforts, they provide no further details regarding the framework for the monitoring and evaluation process, a timeline for monitoring and evaluation, and as mentioned above metrics for evaluating conservation success. In its draft monitoring and evaluation plan the BLM and USFS state they will begin working with the Western Association of Fish and Wildlife Agencies (WAFWA) collecting various data including baseline vegetation cover data and disturbance data, and document progress annually toward full implementation of the land use plan. However, the agencies do not provide further detail on a deadline for data collection.<sup>16</sup> Furthermore, the agencies propose that data will be reported every five years “or as needed to respond to emerging issues,” providing no assurance that the public will be able access monitoring and evaluation data.<sup>17</sup> Thus the LUP Amendments are not certain to be effective because they lack quantifiable parameters and provisions for monitoring and evaluating the implementation status or the success of conservation efforts, without which BLM will be unable to evaluate whether the Amendments will actually conserve and restore sage-grouse populations and habitats.

**Other Sections:** 4.9

**Comment Excerpt Text:**

Thus, in both the Section 10 and Section 7 context, there is no absolute prohibition on activities that might “take” a species. An ESA listing does not summarily put off limits mining projects that might adversely affect the species or its critical habitat. Rather, project approval is based on whether, after applying the mitigation measures proposed by the applicant, the action will appreciably reduce the likelihood of the survival or recovery of the species, or result in jeopardy, respectively. The ESA permitting processes encourage cooperation between the Service and the applicant to find solutions that allow the applicant’s project to move forward while conserving the species.

By contrast, the Agencies’ proposed phosphate lease and saleable minerals closures potentially would put up to nearly 11 million acres of public land off limits from such mineral development, regardless of site-specific species occurrence and habitat conditions or of mitigation opportunities that might be offered by the project proponent and authorized following ESA Section 7 consultation or pursuant to a Section 10 permit. In deciding what conservation measures should be imposed to avoid a listing, the Agencies must consider

whether the measures proposed may cost more than the ESA listing that the Agencies are attempting to avoid. Further, if the Agencies' objective in this land use planning process is to provide "adequate" regulatory mechanisms in response to the Fish and Wildlife Services' "warranted, but precluded" finding and to avoid an ESA listing, each alternative that would impose restrictions beyond what is required or adequate under the ESA should not be considered within a reasonable range of alternatives to serving that objective.

---

### ***Summary***

The BLM fails to address avoiding the potential to list the GRSG under the Endangered Species Act (ESA) and that the bird does not meet the criteria to be listed under the ESA.

---

### ***Response***

As stated in Chapter 1, Section 1.1, Background in the DRMP, this plan amendment effort is the result of the July 2011, BLM National Greater Sage-Grouse Planning Strategy (BLM 2011). The Strategy responds to the March 2010, US Fish and Wildlife Service (USFWS) 12-Month Finding for Petitions to List the Greater Sage-Grouse (*Centrocercus urophasianus*) as Threatened or Endangered (75 Federal Register [FR] 13910, March 23, 2010) (2010 Finding). In the 2010 Finding, the USFWS concluded that GRSG was "warranted, but precluded" for listing as a threatened or endangered species.

**Comment Number:** IDMTSG-14-0049-24

**Organization1:** Greater Yellowstone Coalition

**Commenter1:** Barb Cestero

**Comment Excerpt Text:**

We propose that general sage-grouse habitat should be managed as ROW avoidance areas, and therefore no ROWs should be permitted unless there is no other reasonable and less intrusive alternative. Where possible, ROWs should be co-located with existing ROWs in order to limit the footprint of the ROW and the associated developments. The National Technical Team Report supports these approaches for general sage-grouse habitat.<sup>25</sup> Additionally, new or valid-existing rights to develop should always include a thorough evaluation that prioritizes burying powerlines where possible, to limit the above-ground disturbance and to avoid creating perches for predators.

---

**Comment Number:** IDMTSG-14-0049-7

**Organization1:** Greater Yellowstone Coalition

**Commenter1:** Barb Cestero

**Comment Excerpt Text:**

As noted in the DEIS, developments associated with Rights-of Ways (“ROWs”) -- including but not limited to powerlines, pipelines, and renewable energy projects -- can significantly disrupt sage-grouse, “altering their behavior and potentially disrupting aspects of their life history requirements, leading to lowered productivity and reduced populations.” DEIS at 1-29. For this reason, Alternatives B, C, and F all consider PPMAs as ROW exclusion areas. DEIS Table 2-3 at 2-33. Under this paradigm, there shall be no new authorizations in PPMAs unless development occurs within an existing developed footprint. DEIS Table 2-3 at 2-33. We agree that areas specially designated for sage-grouse protection should be managed as ROW exclusion areas, and thus we request that all land set aside under a special management designation for sage-grouse be managed as ROW exclusion areas.

---

5 Management measure D-LR-3, which states that new authorizations would be denied for new commercial geothermal and oil and gas development, and mineral development, appears to contradict other measures in the preferred alternative that would allow fluid minerals development, and locatable and salable mineral development in priority habitat.

---

**Comment Number:** IDMTSG-14-0183-16

**Organization1:** Idaho Power

**Commenter1:** Brett Dumas

**Comment Excerpt Text:**

The second point of concern is safety. If powerlines and buried pipelines are nearby, a fault on the electric line can cause a dangerous rise in electrical potential in the earth, which can result in an impressed voltage potential on the pipeline. This situation is only a problem for a short amount of time until the protective equipment on the powerline senses the fault and trips the line. However, if a pipeline worker is working on any aboveground pipeline equipment (i.e., test stations, valves, etc.) at the time of the fault, the worker can be exposed to high-voltage potentials (both step and touch potentials) that could cause harm to the worker. For this reason, some pipeline companies are hesitant to colocate facilities with powerlines and others require special design measures to mitigate the potential threat.

The authorized alternative needs to recognize that colocation is not always practicable or even feasible and should provide for a process to allow additional ROWs where colocation cannot be accommodated. Given the importance of the western electric grid to the safety and well-being of those who live in the West, IPC encourages the BLM to coordinate with WECC to accommodate priority pathways that need upgraded or expanded in the final sage grouse management plan.

Unless they involve valid existing rights or an incremental upgrade of an existing facility, the following types of development should be excluded from CHZ:

- Oil and gas development (subject to the specific discussion, below);
- Commercial wind energy projects, including met towers;
- Nuclear development;
- Commercial solar energy projects;
- Mineral development (leasable minerals, common varieties);
- Commercial scale hydroelectric projects;
- Airports
- Landfills;
- Commercial geothermal projects; and
- Ancillary facilities, such as roads, landfills, and support buildings associated with these types of infrastructure projects.

The rationale for excluding these projects is that they are not needed to serve an existing need and involve large-scale construction and maintenance activities that adversely affect sage grouse.

**Comment Number:** IDMTSG-14-0206-9

**Organization1:**The Nature Conservancy

**Commenter1:**William Whelan

**Comment Excerpt Text:**

However, Alternative D would categorically exclude a number of activities that could be essential to serving existing needs. We believe that the following activities excluded in Alternative D should be allowed to go through the CHZ exemption process provided by Alternative E:

- Transmission lines;
- Small hydropower projects;
- Paved and gravel roads; and
- Small sand and gravel extraction sites needed for road or other maintenance activities

**Comment Number:** IDMTSG-14-0210-7

**Organization1:**NorthWestern Energy

**Commenter1:**Mary Gail Sullivan

**Comment Excerpt Text:**

Rather than call for the use of perch discouragers, NorthWestern Energy recommends the BLM reference the BMPs (see below) for power lines in sage-grouse habitat they are currently helping develop. Likewise, current APLIC guidance should be applied to minimize avian electrocution and collision risks.

**Comment Excerpt Text:**

the Agencies should clarify in the Final LUP Amendment that the ROW or travel management provisions should recognize the ability of valid existing rights, including mineral lessees or leasable minerals exploration projects, to develop infrastructure necessary for the development of projects, subject to appropriate mitigation.

---

**Comment Number:** IDMTSG-14-0212-6

**Organization1:** Soda Springs Plant

**Commenter1:** Randy Vranes

**Comment Excerpt Text:**

For any management action that potentially would interfere with the exercise of valid existing rights, the Final LUP Amendment should provide flexibility for case-by-case exceptions to protect such rights without the need to amend the LUP. For example, the Final LUP Amendment should recognize that, if a BLM right-of-way through sage-grouse habitat is required to access an existing phosphate lease, the right-of-way exclusion area provisions of the LUP or other restrictions on rights-of-way will not be applied in a manner so as to make accessing the lease area unreasonable or unduly uneconomical—e.g., by requiring a 25-mile road detour around sage-grouse habitat where two miles of road would provide proper access—and without considering possible mitigation. With respect to future phosphate mining opportunities, the Final LUP Amendment should similarly allow sufficient flexibility for mineral development to coexist with sage-grouse conservation.

**Comment Excerpt Text:**

The COT objective is to avoid development of infrastructure within P ACs. Alternative D proposes to implement conservation measures that are consistent with the COT. Alternative E proposes to implement conservation measures that are largely consistent with the COT, but includes an exception process for large scale infrastructure development. To be consistent with the COT, Alternative E would need to provide some reasonable certainty that those exceptions will only be granted if they are consistent with the COT. Additionally, Alternative E would need to be modified to ensure that impacts from any exceptions would be avoided, minimized or mitigated, in that order. We encourage close coordination with the State on this element in order to maintain their important collaborative conservation process.

Ex-Urban Development

The COT objective is to limit urban and ex-urban development in GRSG habitats and maintain intact native sagebrush communities. Alternative D proposes conservation measures that directly addresses this and meets

the COT objectives. Alternative E does not propose conservation measures that directly address this threat and is currently inconsistent with the COT

---

### ***Summary***

Commenters requested clarification regarding: types of exclusions, valid existing rights, aboveground fiber optic lines, and disposal under current land use plans.

Commenters also suggested additions to the range of alternatives considered and provided information on the feasibility of the alternatives (e.g., co-location, perch diverters, and burying lines).

Commenters noted that the document has contradicting management actions regarding geothermal development between lands and minerals sections.

Commenters noted that Alternative E did not adequately address the purpose and need.

Need to include:

Comment #14-0049-8: reclaim areas that have been developed for powerlines that are no longer in use.

Comment #14-0153-41: Comment stated that BLM did not evaluate the NTT recommendation that all electrical distribution lines be buried within Core Areas.

---

### ***Response***

The BLM and the Forest Service considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM and the Forest Service consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and greater sage-grouse in the planning area, the BLM and the Forest Service fully considered the management opportunities presented in the Analysis of the Management Situation (AMS) and the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As a result, six alternatives were analyzed in detail in the DLUPA/EIS that best addressed the issues and concerns identified by the affected public. The range of alternatives in the DLUPA/EIS represented a full spectrum of options including a no action alternative (Alternative A).

Proposed avoidance and exclusion area designations vary by alternative, as explained on page 2-33 in Table 2-3. Under Alternative D, all new ROWs, unless specifically excluded, would be avoided, whenever possible, see LR-3 (ex. wind facilities, etc). Required design features that would apply to specific types of facilities in greater sage-grouse habitat are located in Appendix C.

The EIS/LUP includes an alternative that allows for placement of fiber optic lines on existing infrastructure (Alternative D Action LR-6 and LR-7 in Table 2-18).

Under Alternative D Table 2-18, LR-9, new power lines outside of existing ROWs, would be buried, where feasible. Reclamation of lands, once facilities are removed, are part of standard BMPs, Appendix C. Amendments to existing facilities that are otherwise excluded may be allowed under Alternative D, LR-6. Under Alternative D, lands currently identified for retention within priority greater sage-grouse habitat would be retained unless disposal of those lands would increase the extent or provide for connectivity of priority habitat (LR -19 and LR-21), Alternatives A through F propose retention of all utility corridors (Table 2-18).

Lands and Minerals management actions did contradict on the topic of geothermal development (D-LR-3, page 2-162 and D-MLM-1, page 2-180) and the FEIS will correct this contradiction.

The first of the assumptions under Lands and Realty Assumptions, Page 4-158, is that BLM and the Forest Service will protect valid existing rights, as long as those ROWs comply with the terms and conditions of their ROW grant. The agencies will consider all safety concerns into all decisions to authorize a pipeline, including burying a transmission line.

Science also notes that the existence of powerlines may have a direct impact on the use of leks, breeding success, and mortality. For example, the DEIS notes that there is an increase in predator concentration within 4.25 mile of powerlines. DEIS at 4-8. For these reasons, we propose that the LUPA include a minimum four-mile buffer from active leks for new powerlines or similar ROW developments.

**Commenter1:** Brad Brooks

### **Comment Excerpt Text:**

the BLM should work with ROW holders to identify conflict areas and get anti-perching devices installed on existing overhead powerlines in these same habitats. Because approximately 74-80% of sage-grouse females nest within 4 miles of leks (Moynahan 20043, Holloran and Anderson 20054), this measure will help to reduce predatory pressures on nesting and foraging grouse. We recommend deterrent devices on H-frame structures because recent research indicates they are effective tools in reducing perch use of such structures (Lammers and Collopy 20075, Slater and Smith 20106).

Pg. 4-158.

## Assumptions

Power lines and other vertical structures in areas naturally devoid of perching opportunities provide a perch for raptors and increase the potential for GRSG to abandon leks (Ellis 1984). Mitigation by burying lines or including design features that do not encourage perching on lines would reduce perching opportunities and subsequent impacts on GRSG (Connelly et al. 2000).

IPC suggest that the BLM carefully evaluates this assumption, which is based on largely scant and anecdotal information.

Vertical Structures--Power poles, towers, and fence posts may provide attractive hunting and roosting perches for common raven and raptors, in addition to natural substrate (e.g., cliffs and rock outcrops). Several studies have shown that predation of sage-grouse, their nests and chicks is not a serious threat when habitat is not limited and of good quality (e.g., Coates and Delehanty 2010, Conover et al. 2009, USFWS 2010). Hagen (2011) reviewing sage-grouse predation literature, concluded that on average predation is not limiting sage-grouse populations, except in fragmented landscapes.

Very limited information is available on the direct behavioral response of sage-grouse to tall structures. The most frequently cited literature supposedly providing evidence of avoidance of tall structures by sage-grouse are either unpublished or non-peer reviewed reports (Ellis 1985, 1987; Braun 1998; Braun et al. 2002).

Walters et al. (2014) concluded reviewing published literature on the effect of tall structures on birds that there was no consistent response to tall structures and that the structure's "tallness" could not be isolated from other factors associated with the development such as human activity. Moreover, ideas presented in the discussion of the reviewed papers presented as hypotheses to explain an observed pattern were assumed by other researchers to represent an empirically tested causal mechanism.

Lek Abandonment--Ellis (1984) describes the behavioral response of sage grouse to golden eagles at a lek. Some males flushed, others remained ("master cocks") and continued displaying after a while. This study is based on a single observation and should be considered anecdotal, rather than providing evidence of predation of sage grouse by golden eagles. There is no evidence provided that the lek was abandoned because of the presence of golden eagles. IPC suggest that the BLM carefully evaluates Ellis (1984) and make changes to the statement in the DEIS accordingly.

Perch Deterrents--Mesmer et al. (2013) reviewed available information on the effectiveness of perch deterrents and concluded that these devices had not proven effective in eliminating raptor or corvid perching on transmission and distribution lines (APLIC 2006, Lammers and Collopy 2007). In fact, perch deterrents may encourage raptors and corvids to nest on structures and may increase the level of risk of electrocution for raptors. The negative impacts of perch discouragers must be weighed against the limited benefits they may provide, particularly if they are contributing to mortalities of protected birds and facilitating increases in predator nesting populations.

**Organization1:**NorthWestern Energy

**Commenter1:**Mary Gail Sullivan

**Comment Excerpt Text:**

• Installing new power lines underground or converting existing lines from overhead to underground result in significantly increased cost, reduced reliability, greater ground disturbance during construction and repairs, longer outage periods for customers, and may not always be feasible from engineering and operations perspectives. Underground power lines require a continuous excavation through all habitat types. In sagebrush habitat, this would result in ground disturbance for the entire line route thus creating a linear corridor and greatly increasing edge habitat favored by predators. This is in contrast to overhead lines, which result in a disturbance only at the structure locations. Underground lines also require excavation for repairs or maintenance, which would result in ground disturbance occurring temporally over the life of the line, not just during initial construction. Lengthy linear ground disturbance during construction, repairs, and maintenance can result in large, permanent displacement of excavated soil and subsequent issues with re-establishing native vegetation and preventing the overgrowth of invasive species. A University of California study (Bumby et al. 2009) found that underground power lines have more environmental impacts than overhead power lines for all categories and most scenarios in southern California. For more detailed discussion of environmental and engineering constraints associated with underground power lines, see Reducing Avian Collisions with Power Lines: The State of the Art in 2012 (APLIC 2012), pages 62-63. NorthWestern Energy encourages the BLM to allow overhead power lines as an acceptable alternative in the Idaho and Southwestern Montana LUP and requests that perceived impacts of overhead lines be compared with increased vegetative fragmentation, creation of both linear corridors and edge habitat for predators, loss of sage brush for extended periods and the re-creation of these impacts when repairs are needed.

**Comment Excerpt Text:**

Installing new power lines underground or converting existing lines from overhead to underground are often raised as possible permit stipulations or mitigation options. I however, underground power lines result in increased cost, reduced reliability, greater ground disturbance during construction and repairs, longer outage periods for customers, and may not always be feasible from engineering and operations perspectives. Underground power lines require a continuous excavation through all habitat types. In sagebrush habitat, this would result in ground disturbance for the entire line route. This is in contrast to overhead lines, which result in a disturbance only at the structure locations. Underground lines would also require excavation for repairs or maintenance, which would result in ground disturbance occurring temporally over the life of the line, not just during initial construction. Ground disturbance during construction, repairs, and maintenance can result in large, permanent displacement of excavated soil and subsequent issues with re-establishing native vegetation and preventing the overgrowth of invasive species. A University of California study (Bumby et al. 2009) found that underground power lines have more environmental impacts than overhead power lines for all categories and most scenarios in southern California. For more detailed discussion of environmental and engineering constraints associated with underground power lines, see Reducing Avian Collisions with Power Lines: The State of the Art in 2012 (APLIC 2012), pages 62-63. Rocky Mountain Power encourages the BLM to allow overhead power lines an acceptable alternative in the Idaho and Southwestern Montana LUP and requests that requirements for placement of lines underground be removed.

---

***Summary***

Commenters raised concerns with the baseline assumption (as noted in Ellis 1984 and Connelly et al. 2000) that power lines and other vertical structures increase perching opportunities for raptors and increase the potential for GRSG to abandon leks).

Commenters suggested that the BLM and the FS should have considered several additional references in their analysis, related to the relationship between GRSG and transmission lines. For example, commenters noted the DEIS did not include studies that found underground powerlines have more environmental impacts than overhead powerline placement.

Commenters questioned the data in Table 3-36, which includes the acreage of transmission lines within greater sage-grouse habitat.

Need to include:

Comment #14-0049-25 requested the LUPA include a minimum four-mile buffer from active leks for new powerlines or similar ROW developments.

Comment #14-0049-31 request to include that infrastructure would be co-located when possible.

---

***Response***

Many reports have been prepared for the development of management recommendations, strategies, and regulatory guidelines. The National Technical Team report (NTT 2011), Conservations Objectives Team (COT; FWS 2013), and the Summary of Science, Activities, Programs and Policies that Influence the Rangeland Conservation of Greater Sage-Grouse (also referred to as the Baseline Environmental Report [BER]; Manier et al. 2013) are the most widely used reports that have been incorporated in BLM and Forest Service EISs that address the effects of implementing greater sage-grouse conservation measures on lands

they manage. Additionally, the BLM and the Forest Service developed the Idaho Draft Environment Impact Statement/Land Use Plan Amendment with involvement from cooperating agencies, including Idaho Department of Fish and Game to ensure that a balanced multiple-use management strategy to address the protection of greater sage-grouse while allowing for utilization of renewable and nonrenewable resources on the public lands.

Management actions included in the Draft EIS/LUPA for the underground placement of powerlines are intended to reduce the potential for long-term impacts on GRSG habitat and species viability. Literature referenced in the FEIS demonstrates that overhead powerlines provide perching opportunities for ravens and other avian predators.

BLM and the Forest Service has reviewed scientific literature provided by commenters regarding the effects of powerlines on greater sage-grouse, buffers, perch diverters, and overhead versus burying lines, and the DEIS has been revised, as appropriate.

Transmission acreages came from the peer-reviewed Baseline Environmental Report (Manier et al. 2013).

BLM provides an analysis for three separate types of infrastructure development and the impacts for each under Alternative E. Surprisingly, different conclusions are reached for each type, despite the fact that Alternative E makes no such distinction itself.

**Comment Number:** IDMTSG-14-0180-42

**Organization1:**

**Commenter1:**C.L. Butch Otter

**Comment Excerpt Text:**

BLM does not provide a conclusion as to the impacts from Land Uses and Realty Management with respect to wind energy for Alternative E. Again, the Implementation Commission would make a recommendation for any potential wind energy project, relying on the data provided by the Idaho Department of Fish and Game. Infrastructure development also has the potential to activate a trigger. If a necessary development activates a hard trigger, IHZ is managed as CHZ for the purposes of future infrastructure development. Thus, BLM should have concluded that impacts from wind energy would be reduced, relative to Alternative A. Further, BLM should have concluded that because of Alternative E's adaptive trigger strategy, that impacts would be reduced as compared to any other alternative included in the DEIS.

**Comment Number:** IDMTSG-14-0183-29

**Comment Excerpt Text:**

Pg. 4-15, 1st para.

Impacts from energy development accrue both locally and cumulatively at the landscape scale. Accumulated evidence across landscape-scale studies show that GRSG populations typically decline following oil and gas development (Holloran 2005; Walker et al. 2007; Doherty et al. 2008). Oil and gas infrastructure and associated human activity have been shown to adversely affect GRSG populations collectively and in some instances, impacts have been directly attributed to certain anthropogenic features (e.g., roads, power lines, noise, and associated infrastructure; Walker et al. 2007; Doherty et al. 2008; Lyon and Anderson 2003; Holloran 2005; Kaiser 2006; Aldridge and Boyce 2007).

Connelly et al. (2004) provided a broad and general review of powerline- sage-grouse interaction and combined powerlines with other energy developments such as oil and gas exploration and roads, as well as other anthropogenic activities such as campgrounds, landfills, and agriculture activities. The authors state that non-renewable energy development—a large category that includes all industrial development from oil and gas exploration to the electric power grid—impacts sage-grouse habitat on a large spatial scale, but do not provide specific information on powerlines. Information on the impact of transmission lines on a landscape level by Leu and Hanser (2011) and Johnson et al. (2011) would be more appropriate to reference in relation to sage-grouse persistence in the landscape.

Walker et al. (2007) showed that all top models to explain lek persistence included a strong positive effect of sagebrush habitat and a strong negative effect of Coal Bed Natural Gas (CBNG) development. Furthermore, the best habitat-plus-CBNG model was 28 times more likely to explain patterns of lek persistence than the best habitat-plus-infrastructure model (including powerlines) and 50 times more likely than the best habitat-only model. Lastly, models with powerline effects were weakly supported compared to models with CNBG, although powerlines appear to have a negative effect on lek persistence. The powerline variable included lines associated with CBNG as well as non-CBNG powerlines. So no attempt was made to isolate the effect of powerlines from the confounding effect of CBNG development. IPC suggest that a more complete statement is included in the USGS report regarding the effects of energy developments on sage-grouse lek persistence in relation to Walker et al. (2007) study. It appears that selective use is being made of the information provided by Walker et al. (2007), narrowly focusing on the (weak) effect of powerlines on sage-grouse lek persistence.

Doherty et al. (2008), Holloran (2005) and Aldridge and Boyce (2007) evaluated Coal Bed Natural Gas wells, but did not evaluate effect of powerlines. Lyon and Anderson (2003) evaluated the effect of vehicular traffic associated with natural gas developments. Therefore, none of these studies provide information on the effects of powerlines.

**Commenter1:**Brett Dumas

**Comment Excerpt Text:**

Table C-1, GOA Number 284

Place new utility developments (powerlines, pipelines, etc) and transportation routes in existing utility or transportation corridors.

Idaho Power is required to comply with a variety of federal regulations and the North American Electric Reliability Corporation (NERC) and Western Electricity Coordinating Council (WECC) standards that affect our ability to collocate facilities. Transmission lines are rated and the rating determines the amount of energy that can be carried on the lines. An economically viable project must achieve a certain capacity rating. Ratings are affected by a number of factors including adjacency to other transmission lines that serve the same pathway. Co-locating a line could result in a derating of the existing line and/or a lower rating of the proposed line, resulting in an overall decrease in transfer capability that would require construction of even more lines. WECC reliability practices may require the reduction of path transfer capability if two circuits located in close proximity experience simultaneous outages. Due to reliability impacts and potential reduction in transfer capability, Idaho Power strongly prefers a 1,500 foot minimum separation between high voltage circuits. Idaho Power also tries to minimize co-location so that IPC is able to maintain service to our customers in case of an outage. Areas are typically served by more than one line and IPC is able to change the path used to deliver power if one line goes out. If lines are co-located, our ability to do this is limited and areas may experience more frequent and /or longer outages. Thus, the BLM should be carefully evaluating the impacts of stipulating that electrical powerlines be co-located in right-of ways.

---

***Summary***

Commenters stated that the BLM/FS should have concluded that because of Alternative E's adaptive trigger strategy the impacts from wind energy would be reduced compared to Alternative A.

Commenters stated that the agencies should carefully evaluate the impacts of stipulating co-location of electrical powerlines.

Commenters requested information on the impact of transmission lines on a landscape level would be more appropriate to reference in relation to sage-grouse persistence in the landscape and that information from Walker et al. 2007 has been used selectively in regards to transmission infrastructure.

Include:

Comment #14-183-38: Request that BLM re-consider and evaluate the stipulation that electrical powerlines must be co-located

---

***Response***

The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the

proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

Impacts from lands and realty to wind energy were discussed in DEIS/LUPA Chapter 4, page 4-331. BLM groups Alternative A and Alternative E together in regards to impacts on wind energy. Under Alternative E, the BLM and the Forest Service would limit impacts from wind and solar energy development through the use of triggers in addition to the general stipulations identified in the GRSG section, as well as required design features. This is clarified in the FEIS (see section).

Management actions included in the Draft EIS/LUPA for the co-location of new infrastructure in existing ROWs are intended to reduce the amount of surface disturbance in GRSG habitat and concentrate new development in habitat areas already affected by anthropogenic activities. The BLM and FS recognize that co-location is not feasible in all circumstances, particularly for new powerlines. Under all alternatives, the BLM and FS would continue to review proposed infrastructure projects on a case-by-case basis. Such a review would include preparation of the appropriate NEPA documentation and coordination with the responsible federal, state, and local permitting agencies.

#### **Comment Excerpt Text:**

There are currently 17 leases in Idaho located in sage-grouse habitat. DEIS at 3-103. Under Alternative B, all PPMAs would be closed to geothermal leasing; under Alternative C, 3,725,100 acres would be closed to geothermal leasing; and under Alternative F, 2,727,800 acres would be closed to geothermal leasing. DEIS at 4-187, 4-188, & 4-190. The DEIS assumes that all existing leases would be managed under the stipulations in effect when the leases were issued and that no new stipulations would apply. DEIS at 4-187. Although many of these leases contain stipulations in order to minimally impact sage-grouse and other wildlife, we propose that there should be no new leasing in specially designated areas, and valid existing rights should be subject to a No Surface Occupancy (“NSO”) stipulation. If there is a legal reason why new stipulations cannot be imposed, the federal agencies must explain those legalities in the DEIS. In any event, we propose that areas under a special designation for sage-grouse protection should be managed as closed to geothermal leasing moving forward.

**Comment Excerpt Text:**

Seasonal restrictions should also be considered. For example, the National Technical Team Report recommends applying a seasonal restriction on exploratory drilling that would prohibit surface-disturbing activities during the nesting and early brood-rearing season in all priority sage-grouse habitat. We propose that these seasonal restrictions are employed in general sagegrouse habitat. Because there is very little oil and gas potential in Idaho and southwestern Montana, these restrictions are reasonable and will not have a significant impact on economic potential in this subregion.

---

**Comment Number:** IDMTSG-14-0049-29

**Organization1:** Greater Yellowstone Coalition

**Commenter1:** Barb Cestero

**Comment Excerpt Text:**

Unfortunately in southeast Idaho, we have seen firsthand on several occasions the negative impacts from phosphate mining on fish and wildlife. When selenium is released during mining, the surrounding lands and waters are poisoned to a level that is fatal to fish, birds, wildlife, and even livestock. The impacts from phosphate mining are not contained in the land immediately surrounding the mine, however, as selenium travels and bioaccumulates in the atmosphere and in water. This problem may impact riparian areas that sage-grouse rely on for brood-rearing and during their life cycle. We have also seen that the implementation of Best Management Practices (“BMPs”) in southeast Idaho has not done enough to minimize the fatal impacts of selenium contamination.

Due to these widespread and deadly impacts, we propose that no new phosphate mining should be permitted in any sage-grouse habitat unless and until there is proven technology to capture and contain all selenium that may be released during mining. Anything less will be ineffective in protecting sage-grouse and sage-grouse habitat around phosphate mines, especially in the Pocatello BLM Field Office.

**Comment Excerpt Text:**

According to the DEIS, there has never been a single producing oil and gas well in the entire state of Idaho, and while the Dillon Field Office in Montana has 47 active oil and gas leases, none of them are producing. DEIS at 3-102 to 3-103. During the development of the 2006 Resource Management Plan for the Dillon Field Office, the BLM's evaluation of development potential found no areas of "high" development potential and only 190,722 acres of moderate potential in the area covered by the RMP (which includes over 1.3 million acres of federal mineral estate). Thus, asking that special designation areas for sage-grouse be closed to fluid minerals leasing should be an easily enforced stipulation that will not have any major negative economic impact. Additionally, because we request that special designation areas be managed as ROW exclusion areas, it may not be cost effective to develop fluid mineral resources if there is no easy means for transporting fluid minerals to processing facilities and markets. See DEIS at 4-173

It is important for the agencies to recognize that oil and natural gas leases are existing rights that cannot be modified by a land use plan. *Sierra Club v. Peterson*, 717 F.2d 1409, 1411 (D.C. Cir. 1983); Solicitor's Opinion M-36910, 88 I.D. 909, 912 (1981). Once BLM has issued a lease without a No Surface Occupancy (NSO) stipulation and in the absence of a nondiscretionary statutory prohibition against development, the BLM cannot completely deny development on the leasehold. As such, BLM has no legal authority to impose mitigation measures such as an NSO Condition of Approval (COA) if it would exceed the terms and conditions of previously issued lease.

The description in the DEIS documents as to what precisely constitute the “valid existing rights” that will survive the proposed LUPA process is obscure. What is better-defined in the proposed LUPA process is that there is a working assumption by BLM and the USFS that future proposed mineral lease modifications will have restrictions on modifying existing leases without any underlying authority to insist on those modifications

Under the Pickett Act, Presidents Taft and Wilson withdrew approximately 10,500 km<sup>2</sup> in Idaho, Utah and Wyoming and formally created the Western Phosphate Reserve. The Mineral Leasing Act of 1920 ended the acquisition of phosphate through the Mining Law and rendered moot the need for phosphate withdrawal and classification actions. In the 1960’s and 1980’s, government investigations in the Western Phosphate Reserve resulted in the identification of Known Phosphate Leasing Areas (KPLA). KPLAs are areas where the phosphate resource is available only through the competitive leasing provisions of the Mineral Leasing Act.

The DLUPA/DEIS indicates that in the planning area, there are 34,000 acres of unleased KPLAs. DEIS Vol. II B at 4-314. Under the No-Action Alternative (Alternative A) and the Governor’s Alternative (Alternative E), 11% of the unleased minerals in the planning area within KPLAs would be closed to non-energy solid mineral leasing. Six hundred and twenty acres (2%) would be open subject to net surface occupancy stipulations. be open subject to net surface occupancy stipulations.

Under the BLM/USFS Preferred Alternative, Alternative D, 3,900 of unleased KPLA-designated acres minerals in the planning area would be closed. This is in addition to an astonishing 10,882,600 of non KPLA-designated acres proposed to be closed for nonenergy solid mineral leasing in Alternative D. This is four times as many nonenergy solid mineral leasing acres subject to closure as the Governor’s Alternative.

There is no explanation or discussion for the authority to simply close public lands to non-energy leasable mineral prospecting and leasing under the LUPA process under Alternatives B, C and D. Importantly, there is no reconciliation of the multiple-use mandate under FLPMA and the KPLA designation or why, under law, KPLA-designated areas important to the Nation’s food security must simply yield to severe restrictions from access to phosphate needed to make nutrients essential for American agriculture.

**Comment Excerpt Text:**

The phosphate lease area closures in Alternatives B, C, D, and F are not properly tailored. Rather, the closures potentially are stricter than an ESA listing and do not adequately consider mitigation. The Agencies' objective in amending the LUPs was to conserve the sage-grouse and preclude the need to list the species under the ESA. While a potential sage-grouse listing and its regulatory consequences may be discouraging, the phosphate lease closures may be even more so. Indeed, the ESA permits the Agencies to at least consider each proposed action individually, taking into consideration project-specific circumstances, species and habitat conditions, potential effects to the species, and potential mitigation. In fact, the ESA specifically provides processes to obtain "take" authorization for both private projects and those with a federal nexus. For private projects that might result in take—defined broadly to include any activity that would or would attempt to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect a species, see 50 C.F.R. § 17.3—an applicant can obtain an Incidental Take Permit under ESA Section 10 after preparing an approved Habitat Conservation Plan that specifies the actions that will be taken by the project proponent to minimize and mitigate effects to the listed species, see 16 U.S.C. § 1539(a)(1)(B); 50 C.F.R. § 17.22(b)(1)(iii). Similarly, if an agency such as BLM or the Forest Service permits an activity that is likely to adversely affect a listed species, it must initiate Section 7 consultation with the Fish and Wildlife Service to ensure that the proposed action will not jeopardize the continued existence of the species. See 50 C.F.R. § 402.14(a). If the Service determines that the project may adversely affect the species but is not likely to jeopardize its continued existence, the Service may issue an incidental take statement allowing a specific level of take, while also allowing the project to move forward.

Thus, in both the Section 10 and Section 7 context, there is no absolute prohibition on activities that might "take" a species. An ESA listing does not summarily put off limits mining projects that might adversely affect the species or its critical habitat. Rather, project approval is based on whether, after applying the mitigation measures proposed by the applicant, the action will appreciably reduce the likelihood of the survival or recovery of the species, or result in jeopardy, respectively. The ESA permitting processes encourage cooperation between the Service and the applicant to find solutions that allow the applicant's project to move forward while conserving the species.

By contrast, the Agencies' proposed phosphate lease closures potentially would put up to nearly 11 million acres of public land off limits from phosphate development, regardless of site-specific species occurrence and habitat conditions or of mitigation opportunities that might be offered by the project proponent and authorized following ESA Section 7 consultation or pursuant to a Section 10 permit. In deciding what conservation measures should be imposed to avoid a listing, the Agencies must consider whether the measures proposed may cost more than the ESA listing that the Agencies are attempting to avoid. Further, if the Agencies' objective in this land use planning process is to provide "adequate" regulatory mechanisms to avoid an ESA listing, each alternative that would impose restrictions beyond what is required or adequate under the ESA should not be considered within a reasonable range of alternatives to serving that objective.

**Comment Excerpt Text:**

The management actions in Alternatives B, C, D, or F that would close certain areas to phosphate leasing potentially could make phosphate development in open areas technically or economically infeasible. Mineral resources do not recognize lease boundaries, and often times a phosphate resource will cross two or more lease areas. If the resource is found to be trending into an adjacent lease area, the prospector often will seek a “fringe” or “preference right” lease for the adjacent area to chase the resource. If the full resource originating on an open lease cannot be developed because fringe or adjacent leases are closed, it might not be economically or technically feasible to develop the resource on the open lease or at all. Because the management actions in Alternatives B, C, D, or F do not ensure that such fringe or preference right leases would be available in the future, the alternatives potentially are not “reasonable.”

D. The Agencies failed to properly define the environmental baseline regarding the impacts of leasable minerals development.

To determine the effects of a proposed action on the environment, an EIS must first disclose the baseline conditions of the affected environment. See 40 C.F.R. § 1502.15. The affected environment includes biological, physical, social and economic elements of the environment. See BLM NEPA Handbook, at 53. Although the Agencies proposed to close large areas to phosphate leases to protect the sage-grouse or its habitat, the Agencies provided little, if any, explanation of impacts that phosphate mining has had on the species in past, particularly the near past. Our understanding is that the impacts on sage-grouse from phosphate mining in Idaho has been limited, particularly within the last decade, where no new mines have been started in high-value sage-grouse habitat or impacted significant amounts of the bird’s habitat. Because the Agencies failed to provide the environmental baseline information regarding past impacts of phosphate mining, the Agencies’ analysis is flawed.

In the same vein, the Agencies’ justifications for closing the areas to phosphate leases despite the lack of information showing significant prior impacts from such activities cannot withstand scrutiny. The error was arbitrary and capricious because the Agencies failed to withstand scrutiny. The error was arbitrary and capricious because the Agencies failed to articulate a satisfactory explanation for its action including a rational connection between the facts found and the choice made, show a relationship between the information and the decision, and demonstrate that it did not act on the basis of speculation or surmise. See,

e.g., 16 U.S.C. §§ 1533(b)(8), (3).

---

### **Summary**

The DEIS needs a better explanation on how valid existing rights are defined and how they will be protected, including fringe or preference right leases. The alternatives need to follow the NTT report recommendations more closely, as well as reflect current USFWS policy recommendations.

The BLM needs to clarify the location of non-leased Known Phosphate Areas in relation to GRSG habitat. The plan is potentially more restrictive to phosphate leasing than a listing under the ESA and did not properly define the environmental baseline for leasable minerals. Without prohibiting new phosphate mining in GRSG habitat, the LUPA does not protect GRSG from the potential impacts of selenium being released to the environment and poisoning wildlife, including GRSG, through transport in air and water and subsequent bioaccumulation. The EIS fails to explain or discuss the authority that the BLM has to close public lands to leasable mineral prospecting and leasing under the LUPA process under Alternatives B, C and D.

The reliance upon vague RDFs under Alternative D is a failure of the BLM to adopt best science that calls for specific restrictions based on observed GRSG response to surface disturbances.

---

### **Response**

[NOTE TO BLM: The BLM should examine the existing discussion of valid existing rights that will survive the proposed LUPA and should expand that discussion if it seems insufficient.]

The BLM and the Forest Service considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM and the Forest Service consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and greater sage-grouse in the planning area, the BLM and the Forest Service fully considered the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As a result, six alternatives were analyzed in detail in the DLUPA/DEIS that best addressed the issues and concerns identified by the affected public. The DLUPA/DEIS includes alternatives that provide a greater and lesser degree of restrictions in various use programs, but would not eliminate or invalidate any valid existing development rights. BLM agrees that it cannot impose an NSO on an existing lease. A definition of valid and existing rights has been added to the Glossary in the FEIS.

[NOTE TO BLM: Multiple changes were recommended to the FEIS by Porter- see separate tracking sheet.]

[NOTE TO BLM: Have minerals program elaborate on where the phosphate leases are relative to the management designations for the various Alternatives. Makela- is there an adequate baseline description for leaseable minerals? Also, BLM look into the issue of restrictions in proposed plan relative to restrictions under an ESA listing for minerals development.]

[NOTE TO BLM: determine whether there are mineral leases in the ACECs proposed by Alts C and F. Determine mineral potential in ACECs proposed by Alts. C and F.]

[NOTE TO BLM: Add to GLOSSARY- Valid Existing Rights]

[NOTE TO BLM: Discuss how the NTT recommendations and USFWS policy were included in the alternatives development.]

Selenium bioaccumulation is not identified by the US Fish and Wildlife Service or the NTT Report as a major threat to GRSG and is not part of the conservation strategy being applied by the BLM. No change to the EIS

has resulted from this comment.

[NOTE TO BLM: BLM to examine its jurisdiction to prioritize GRSG conservation over laws relating to KPLAs and to describe that result in the comment response, along with any appropriate changes to the EIS.]  
 [NOTE TO BLM: BLM's preferred alternative may be changed in the FEIS, to keep all lands in KPLAs open to future non-energy solid mineral leasing, but to close areas in PPMA and PMMA outside of KPLAs. An exception would be made when additional lands are needed to recover ore on the lease (fringe acreage leasing, lease modifications).]

The RDFs were adopted from BMPs in Appendix D of the NTT report. In that appendix, it states that "BMPs are continuously improving as new science and technology become available and therefore are subject to change. Include from the following BMPs those that are appropriate to mitigate effects from the approved action." Wording from NNT report has been added to the discussion of RDFs in the FEIS.

It is important to note that the current oil and gas development in the Payette area is unlike the unconventional (shale) development in states such as Wyoming and Colorado which were the subject of the study upon which the NTT Report is based. To date it has involved vertical drilling into conventional sands in a lacustrine basin, without the heavy truck traffic generated by horizontal drilling and multi-stage hydraulic fracturing. However, the DEIS does not take into account this difference, and to the extent its conclusions about fluid mineral development in Idaho are based on literature developed in other states, they are misplaced and arbitrary.

### ***Summary***

The oil and gas conditions in the Payette area are different than those studied in the NTT report and should not be used as baseline data. The impacts described by Johnson et al 2011 are overstated and should be replaced by information from Coates et al 2013.

### ***Response***

The reasonably foreseeable development scenario for oil and gas assumes a conventional oil and gas field. The current development occurring in the Payette area of Idaho is not within sage grouse habitat. BLM's preferred management action has been changed in the FEIS to applying a year-round No Surface Occupancy stipulation in PPMA and PMMA. Seasonal restrictions would be applied in PGMA. Lands outside of GRSG habitat would not be subject to stipulations developed in this EIS.

*[NOTE TO BLM: Review section on 4-8 for best available science for basis of decisions. Have a biologist help determine.]*

This statement of “consequences” is wholly deficient and fails to disclose the following:

? Minerals can only be developed where they exist; the development will only occur where it is economically possible to do so. The development of any mineral resource is very capital intensive and entails significant financial risk. If a resource cannot be economically developed, the resource simply will not be developed. The draft LUPA/EIS needs to disclose the millions of tons of minerals (such as phosphate) that will not be available for development as a consequence of the Alternatives.

---

**Comment Number:** IDMTSG-14-0180-41**Organization1:****Commenter1:**C.L. Butch Otter**Comment Excerpt Text:**

BLM states that Alternative E does not provide assurance that oil and gas development would only occur in IHZ if it would not cause a decline in sage-grouse populations. However, this assurance is provided through the Implementation Commission, as discussed in detail above. The Implementation Commission will review development projects and make recommendations to the Governor, who in turn will make recommendations to BLM, as to whether certain projects would activate a hard or soft trigger.

---

**Comment Number:** IDMTSG-14-0180-43**Organization1:****Commenter1:**C.L. Butch Otter**Comment Excerpt Text:**

Further, without providing any evidence to support it, BLM concludes that Impacts with respect to geo-thermal energy are the same as Alternative A. Again, impacts here would be the same as other types of energy development. It is unclear why BLM reached this determination and why, if Alternative E treats all types of development the same, why geothermal impacts would be the same as Alternative A, while oil and gas development impacts would be reduced relative to Alternative A. What distinction has BLM found in the state’s treatment of these types of infrastructure development? There should be none and thus, BLM’s conclusion that impacts from geothermal energy would be the same as Alternative A, with no supporting analysis is incorrect.

---

**Comment Number:** IDMTSG-14-0212-29**Organization1:**Soda Springs Plant**Commenter1:**Randy Vranes**Comment Excerpt Text:**

## Alternative B and C

Alternative B states that “10,429,290 acres, or 33 percent of the federal nonenergy solid leasable mineral estate decision area (including all federal nonenergy solid leasable mineral estate in PPMA), would be closed to prospecting and leasing.” Draft LUPA/EIS p. 4-203. However, merely restating the amount of acres that would be closed for minerals leasing does not constitute an analysis of how the closures would impact leasable minerals in the planning area. BLM must explain in detail the significant impacts that such proposed closures would have on leasable minerals.

Alternative C provides a similarly inadequate description of the impacts on leasable minerals and suffers the same flaws. See Draft LUPA/EIS p. 4-204 to -205.

## 2. Alternative D

The Agencies’ analysis of the impacts to leasable minerals development is inadequate. There is no analysis of the impacts that mitigation requirements, application of the Agencies’ restrictions and design features, and limitations of surface disturbance could have on leasable minerals development. The Agencies must analyze and disclose the potential effects that these management actions could have on leasable minerals.

**Comment Number:** IDMTSG-14-0212-30

**Organization1:** Soda Springs Plant

**Commenter1:** Randy Vranes

**Comment Excerpt Text:**

Alternative F

Alternative F states that the impacts from nonenergy leasable minerals would be similar to the impacts described in Alternative B, implying that the restrictions that could impact leasable minerals are the same as in Alternative B, which is not the case. See Draft LUPA/EIS p. 4-207. For example, Alternative F would implement a three percent disturbance cap that includes fire impacts and Alternative B’s disturbance cap would not consider fire in the determination. Because the management actions and restrictions that could impact leasable minerals differ between Alternatives B and F, the Agencies must provide an analysis of how Alternative F would impact leasable minerals development, not just assume that the impacts will be the same as Alternative B.

### *Summary*

The impact analysis in the DEIS of management actions on leasable mineral development is insufficient.

### *Response*

The acres of unleased KPLA land unavailable for development by alternative has been corrected in the Ch. 4 tables in the FEIS. The section describing the impacts from leasable minerals management for Alt E has been revised. The impacts of non-energy leasable minerals management actions to socio-economics have been included in the FEIS and the impacts with respect to disturbance caps have been analyzed in more detail.

[NOTE TO BLM: Tables of acres of unleased KPLA land unavailable for development by alternative in Ch. 4

need to be corrected.]

[NOTE TO BLM: Impacts from leasable minerals management in alt E needs to be revised.]

[NOTE TO BLM: Include a discussion of the effects of phosphate management actions to socio-economics in Ch 4. Also, references to section 4.11.2 should be corrected and should refer to section 4.12.2.]

[NOTE TO BLM: Distinguish between Impacts from Alts F and B. Note: This is a disturbance cap question.]

#### **Comment Excerpt Text:**

A very significant shortcoming of the draft LUPA/DEIS is that it fails to analyze the cumulative effects of the draft LUPA/DEIS for other parts of the Western Phosphate Field. The draft LUPA/DEIS for Utah contains similar alternatives resulting in over 26,000 acres of KPLA being off-limits for phosphate development. The cumulative effect of the selection of any of these alternatives for these state plans could result in two-thirds (67%) of the known phosphate leasing areas being unavailable for development. Such a prohibition will severely restrict the ability to access phosphate needed to make nutrients essential for American agriculture. Furthermore, the Draft LUPA/EIS needs to discuss the effects of Alternatives on the KPLA and the consequences of eliminating or greatly restricting access to the KPLA, an area that already has been set aside by the federal government for competitive phosphate leasing.

**Comment Number:** IDMTSG-14-0131-20

**Commenter1:**Randy Vranes

**Comment Excerpt Text:**

In fact, mining companies can bring valuable resources and knowledge to sage-grouse conservation. P4 Productions has developed conservation or mitigation plans for sage-grouse or other upland birds as part of its development of restoration plans for mine projects or future mine projects. The company also owns or controls private ranching properties that contain sage- grouse habitat. Working in partnership with the mining companies to conserve non-federal lands or federal lease lands through voluntary agreements can offer direct, immediate benefits to sage- grouse. If the Agencies close all federal nonenergy leasable mineral estate lands to prospecting or leasing, the Agencies potentially will be missing valuable opportunities to provide a net benefit to sage-grouse conservation. The opportunity cost would be particularly stark with respect to conservation on private lands. If P4 Production is no longer able to develop phosphate on BLM lands, there might no longer be an incentive for the company to pursue or implement sage-grouse conservation strategies on its private lands and the species would lose the benefit of those potential actions.

**Comment Number:** IDMTSG-14-0212-31

**Organization1:**Soda Springs Plant

**Commenter1:**Randy Vranes

**Comment Excerpt Text:**

Draft LUPA/EIS p. 4-314.

NEPA requires more than this. The Agencies did not attempt to quantify the extent to which the reasonably foreseeable future actions may affect nonenergy leasable minerals or to describe with any particularity the nature of those impacts, beyond the statement that Alternative C would result in the largest closure area. The various projects identified in table of reasonable foreseeable actions, Table 4-75, are not specifically mentioned again, nor is there any discussion of the various acreages of vegetation that may be impacted by such projects. Additionally, there is no discussion in the Draft LUPA/EIS of the combined impacts resulting from the sage-grouse conservation measures provided in the alternatives with the reasonably foreseeable nonenergy leasable minerals projects. The Agencies must discuss how the proposed conservation measures will impact the environment by altering existing management of past, present, or foreseeable activities on or uses of the public lands. The Agencies' analysis of the cumulative impacts of the proposed LUP amendment and leaseable minerals development (or other uses of the public lands) was insufficient and therefore violated NEPA. See *Te-Moak Tribe*, 608 F.3d at 606. NEPA requires the Agencies to take a hard look at the cumulative impacts of the proposed LUP amendment and other projects; this the Agencies failed to do.

**Comment Number:** IDMTSG-14-0212-5

**Organization1:**Soda Springs Plant

**Commenter1:**Randy Vranes

**Comment Excerpt Text:**

The Agencies should consider the economic and strategic importance of phosphorus in developing sage-grouse conservation measures that could impact phosphate mining. Food production requires application of fertilizers containing phosphorus in order to sustain crop yields. Modern agriculture is dependent on phosphorus derived from phosphate rock. Southeast Idaho's open-pit phosphate mines are a major supplier of

phosphate, producing approximately 15% of the nation's and 4% of the world's phosphate. See <http://www.blm.gov/id/st/en/prog/energyminerals/minerals/phosphate/Phosphate.html>. However, current global phosphate reserves are projected to be depleted in 50-100 years. See Codell et. al., *The Story of Phosphorus: Global food security and food for thought*, 19 *Global Env'tl. Change* 292 (2009) (attached hereto as Attachment 4). While phosphorus demand is projected to increase, the expected global peak in phosphorus production is predicted to occur around 2030. See *id.* The Agencies should take a hard look at the depletion of global phosphate reserves and related food scarcity, and the potential impacts that draconian sage-grouse conservation measures that close areas to or unduly burden phosphate mining might have on phosphate and food supplies.

---

### ***Summary***

The DEIS did not adequately analyze cumulative impacts of management actions on leasable mineral development, including impacts to the Western Phosphate Field, the American agriculture industry, and national food security.

---

### ***Response***

The BLM and the Forest Service thoroughly explained their consideration and analysis of cumulative effects in the DLUPA/EIS in Section 4.24.20. The DLUPA/EIS considered the present effects of past actions, to the extent that they are relevant, and present and reasonably foreseeable (not highly speculative) Federal and non-Federal actions, taking into account the relationship between the proposed alternatives and these reasonably foreseeable actions. This discussion summarizes CEQ guidance from June 24, 2005, stating that "[g]enerally, agencies can conduct an adequate cumulative effects analysis by focusing on the current aggregate effects of past actions without delving into the historical details of individual past actions." This is because a description of the current state of the environment inherently includes the effects of past actions. Information on the current conditions is more comprehensive and more accurate for establishing a useful starting point for cumulative effects analysis. The CEQ interpretation was accepted by the Ninth in *NW Env'tl. Advoc. v. Nat'l Marine Fisheries Serv.*, 460 F.3d 1125, 1141 (9th Cir. 2006). The BLM and the Forest Service explicitly described their assumptions regarding proposed projects and other reasonably foreseeable future actions. On Forest Service-administered lands, reasonably foreseeable actions are those that would occur under their current land use plans from a broad-scale perspective.

Additional information on the cumulative impacts on the Western Phosphate Field, unleased KPLAs, socio-economic impacts from loss of phosphate resources, reasonably foreseeable actions, and proposed conservation measures have been added to Sections XXX and XXX (minerals and socio-economics cumulative impacts). [NOTE TO BLM: Review cumulative section and add necessary information.]

#### **Comment Excerpt Text:**

Put simply, the TGA places limits on the BLM's discretion to devote grazing districts for purposes other than grazing and, in proposing sage-grouse specific management standards and guidelines, the BLM is crossing the bounds of its discretion.

---

**Response**

[ NOTE TO BLM: May need to go up to solicitor’s office for review.]

FLPMA grants the Interior Secretary the authority to make land use planning decisions, taking into consideration multiple use and sustained yield, areas of critical environmental concern, present and potential uses of the land, relative scarcity of values, and long-term and short-term benefits, among other resource values (43USC 1711 Sec 201 (a)). 43 CFR § 4100.0-8 provides that the BLM shall manage livestock grazing on public lands in accordance with applicable land use plans. Further, the BLM may designate lands as “available” or “unavailable” for livestock grazing through the land use planning process (H-1601, Land Use Planning Handbook, Appendix C). A decision to cease livestock grazing is not permanent. It is subject to reconsideration, modification and reversal in subsequent land use plan decisions.

The Taylor Grazing Act requires that the Secretary “make such rules and regulations ... [and] do any and all things necessary ... to insure the objects of ... grazing districts, namely, to regulate their occupancy and use, to preserve the land and its resources from destruction or unnecessary injury [and] to provide for the orderly use, improvement and development of the range.” (43 USC § 315a).

FLPMA grants the Interior Secretary the authority to make land use planning decisions, taking into consideration multiple use and sustained yield, areas of critical environmental concern, present and potential uses of the land, relative scarcity of values, and long-term and short-term benefits, among other resource values (43USC 1711 Sec 201 (a)). 43 CFR § 4100.0-8 provides that the BLM shall manage livestock grazing on public lands in accordance with applicable land use plans. Actions taken under land use plans may include making some, or all of the land within grazing districts, unavailable for grazing during the life of the plan as well as imposing grazing use restrictions, limitations or other grazing management related actions intended to achieve such goals and objectives (H-1601, Land Use Planning Handbook, Appendix C).

A “chiefly-valuable-for-grazing” determination is required only when the Secretary is considering creating or changing grazing district boundaries. Such a determination is neither required nor appropriate when establishing grazing levels within a district. (See USDI Solicitor Memorandum Clarification of M-37008 (May 13, 2003)). This RMP is not considering creating or changing grazing district boundaries. Although lands have been identified as “chiefly-valuable-for-grazing” per the Taylor Grazing Act for purposes of establishing grazing districts within the public domain (see, 43 U.S.C. § 315) this does not negate the BLM’s authority or responsibility to manage those lands to achieve resource condition goals and objectives under the principals of multiple use and sustained yield as required by FLPMA and its implementing regulations.

LG/RM-2 discussed grazing management measures and habitat objectives under Alternative D. The discussion should include language such as “not meeting one indicator or characteristic does not necessarily mean an area is not providing suitable sage-grouse habitat”. This is important because site potential and capability need to be taken into account and Land Managers need to have the ability to adjust objectives based on principals of adaptive management

Alternative D allows further declines in rangeland health. Alternative D emphasizes the need for livestock permittees to achieve the Idaho Rangelands Health Standards. This clearly does not work. Currently 61 allotments in Idaho are not meeting rangeland health standards. (DEIS at 3-73) Allotments that are not meeting Rangeland Health Standards should to be closed to grazing until they can meet the standards.

**Commenter1:**Barb Cestero

**Comment Excerpt Text:**

The LUPA should incorporate coordinated livestock grazing and sage-grouse habitat objectives in all grazing allotments or permit renewals in priority sage-grouse habitat. Particular emphasis should be placed on how grazing affects sage-grouse nesting and early brood-rearing habitat. The National Technical Team specifically recommends managing livestock grazing to maintain residual cover of herbaceous vegetation to reduce predation during nesting. The BLM and USFS should consider modifying grazing management to meet seasonal sage-grouse habitat requirements though changes in season or timing of use; number of livestock; distribution of livestock use; intensity of use; and type of livestock.<sup>18</sup>

**Commenter1:**Barb Cestero

**Comment Excerpt Text:**

Fires have the capacity to harm sage-grouse habitat in a number of ways. First, fires destroy vegetation necessary for sage-grouse survival. Additionally, following a fire, cheatgrass and other invasive species may thrive while sagebrush and native grasses need longer to recover. Livestock grazing after a fire can exacerbate

these impacts. We therefore recommend that livestock not be introduced into a fire-impacted landscape for a minimum of two years after a fire. We urge the federal agencies to review the best available science on an ongoing basis to determine if a longer period is advisable.

**Commenter1:**Kathleen Gregg

**Comment Excerpt Text:**

The federal government, via the agencies BLM and USFS management, permits privately owned domestic livestock grazing on the majority of the public lands it manages. The negative impacts of domestic livestock grazing are well documented. The BLM and USFS know that domestic livestock grazing is the most widespread land use in the sagebrush landscape but continues denying domestic livestock's negative impact on sage-grouse habitat. Research indicates that the removal of domestic livestock from public land is the recommended strategy to improve ecological conditions and protect public resources (Fleischner, 1994) (Donahue, 1999) (Belsky, Matzke, Uselman, 1999) (Wuerthner, Matteson, 2002). The no domestic livestock grazing alternative must be included and seriously considered in order to avoid violation of NEPA that imposes a duty on Federal agencies to take a "hard look at environmental consequences" of its actions.

Given the benefits shown above, any alternative that arbitrarily reduces, eliminates or allows retirement of livestock grazing AUMs is contradictory to the goal of long-term sage grouse conservation. In addition, there is statutory evidence and case law, that the BLM is overstepping its bounds in the DEIS by suggesting that grazing permits may be terminated permanently. The BLM is authorized to decrease or temporarily discontinue grazing through a decision process, but the Taylor Grazing Act and Federal Land Policy Management Act mandate that forage resources on grazing districts, if deemed healthy, are to be made available for livestock grazing. Eliminating grazing on public land will also result in reduced or eliminated grazing on intermingled state land and a subsequent decline in funding available to the endowed institutions of the state.

**Commenter1:**Katie Fite

**Comment Excerpt Text:**

BLM rightly fulfilled its legal obligation to consider a no-grazing option. It also included a reduced-grazing alternative that would have reduced grazing by 25%. However, Alternative F was sketchy and unclear because the DEIS did not outline how the reductions in grazing would be accomplished; which allotments would be closed, when, and for how long; how BLM would decide those things; or any other specifics of the plan. Obviously, affected permittees would have wanted explicit answers to all of those concerns and many more. Thus, ultimately, like the no-grazing alternative, it was clearly not meant to be seriously considered by BLM, or it would have been analyzed in much more detailed. In reality, this is not a reduced grazing alternative, because it maintains livestock at levels close to actual use. BLM should have included alternatives that significantly reduced livestock grazing. BLM should have included alternatives that applied specific mandatory measurable use criteria to conserve sage-grouse habitats and populations, along with reductions in livestock numbers. Very importantly, BLM should have considered an alternative that conducted a capability and suitability-type analysis of grazing conflicts with sage-grouse needs, and acted to remove a grazing allocation from lands with a high degree of conflict, and apply mandatory measurable conservative use periods, and avoid breeding period and winter use in sage-grouse habitats in any lands where grazing might continue.

**Comment Number:** IDMTSG-14-0151-15

**Organization1:**Western Watersheds Project

**Commenter1:**Katie Fite

**Comment Excerpt Text:**

The DEIS is not explicit about its timeframe for allotment NEPA analyses. Given the agencies' frequent and repeated use of the renewal rider, the site-specific planning might not happen for ten, twenty, or more years. Where BLM has recently renewed a permit, it won't come around again for at least ten years, and that is under the best case scenario where BLM actually conducts timely NEPA according to a schedule, something it has never demonstrably achieved. To demonstrate the likelihood and timeliness of any proposed actions to protect sage-grouse, the BLM should have included a spreadsheet of the permit expirations for all allotments in the planning area and the date when BLM planned to undertake analyses. In the meantime, BLM must apply mandatory measurable standards of use, as WWP decried in Scoping comments.

**Organization1:** Western Watersheds Project  
**Commenter1:** Katie Fite

**Comment Excerpt Text:**

First and foremost, BLM's DEIS has failed to recognize the serious and detrimental impact of livestock grazing on Greater sage-grouse habitat in the planning area. A good example of the level of recognition that is necessary can be found in the BLM's HiLine DRMP, released in Montana in June 2013. This document recognizes the impact of livestock grazing on naturalness, stating:

Livestock grazing has the potential to impact naturalness, the undeveloped character, and to create conflict with recreation users. Manipulation of vegetation, alteration of soils, and the presence of fecal matter would create unnatural conditions and would impact opportunities for solitude, particularly in areas where livestock congregate. Range facilities, such as fences, water troughs, and tanks have the potential to degrade wilderness characteristics by creating new developments, disturbing visual resources, and influencing wildlife migration, reproduction, and mortality (e.g., sage-grouse/fence collisions).<sup>27</sup>[HiLine Draft Resource Management Plan and Environmental Impact Statement at 671.]

Here, the DEIS fails to recognize the basic realities that livestock grazing is ecologically deleterious, economically inefficient, and socially unnecessary. Instead, the preferred alternative maintains the status quo grazing management throughout the project area without a "hard look" at the reality of grazing impacts, including impacts to native vegetation communities, soil resources, microbiotic crusts, and wildlife habitat quality and quantity

**Comment Number:** IDMTSG-14-0151-20  
**Organization1:** Western Watersheds Project  
**Commenter1:** Katie Fite

**Comment Excerpt Text:**

The COT Report specifically stated that "Adequate monitoring of grazing strategies and their results, with necessary changes in strategies, is essential to ensuring that desired ecological conditions and sage-grouse response are achieved." COT at 45. Specific language about monitoring of grazing should be included in the DEIS. Mandatory measurable use standards must be applied, and these must be triggers for removal of livestock from the pasture or allotment.

**Comment Number:** IDMTSG-14-0151-49  
**Organization1:** Western Watersheds Project  
**Commenter1:** Katie Fite

**Comment Excerpt Text:**

ID DEIS at 1-33 claims that grazing being limited or stopped is outside the scope of the EIS. That is not the case. In fact, BLM includes an alternative it constructed to remove or limit grazing to be reasonable alternatives in Idaho (see Alt C, and Alt F 25% AU reduction based on 3 years average actual use). The Oregon DEIS Preferred Alternative would eliminate grazing on 100,000 acres between Hart Mountain and Steens. Idaho BLM failed to take a hard look at removal of livestock from significant habitat areas for sage-grouse needed to protect sage-grouse habitats and populations

**Comment Number:** IDMTSG-14-0151-51  
**Organization1:** Western Watersheds Project  
**Commenter1:** Katie Fite

**Comment Excerpt Text:**

BLM chose to analyze a No Grazing alternative (it appears that BLM interpreted WWP's alternative to mean No Grazing). We described the need for BLM to look at the magnitude of threats that grazing posed so that grazing disturbance could be removed from particular high risk areas. In areas where grazing disturbance continued to be imposed after a fair analysis – we requested agencies consider conservative measurable use standards and triggers for livestock removal from pastures or allotments as standards were met; seasonal avoidance of grazing disturbance to sage-grouse breeding habitats, and other basic conservation measures. We knew BLM would never choose a full No Grazing alternative, All of these components are absent from the DEIS and its analysis.

---

**Comment Number:** IDMTSG-14-0151-52

**Organization1:** Western Watersheds Project

**Commenter1:** Katie Fite

**Comment Excerpt Text:**

Thus, BLM cannot both analyze a No Grazing alternative – and at the same time under Planning Criteria claim it cannot address allocations. Further, DEIS at 1-35 states that BLM will consider habitat. These are missing from the DEIS in regards to grazing. A valid rationale and analysis of why there are no clear, measurable use standards and strong action requirements related to grazing disturbance are missing from the DEIS. There are no concrete regulatory controls on livestock grazing disturbance in the DEIS.

**Commenter1:**Katie Fite

**Comment Excerpt Text:**

Further, utilization standards must be applied to the array of native forage species. As described in the Catlin 2013 report on cd, in depleted landscapes, BLM's range monitoring methods result in focus only on some larger grass species.

---

**Comment Number:** IDMTSG-14-0151-65

**Organization1:**Western Watersheds Project

**Commenter1:**Katie Fite

**Comment Excerpt Text:**

It is also necessary for biologists developing measurable use standards to understand that the agency method relies not on total plant height, but plant biomass. So 40% or 50% utilization typically results in a very short residual cover or stubble height (less than 4 inches) on nearly all native species. See Forest Service utilization gauge on cd. This supports WWP's alternative suggestion of 10% utilization, especially on the characteristically depleted sagebrush habitats across much of the species range.

**Comment Excerpt Text:**

In addition to these standards, for sage grouse Priority and General Habitats there should be a decision procedure and actions described below, depending on habitat conditions.

1. Assess which lands meet the Connelly et al. (2000) guidelines both in riparian areas and upland areas in Table 3. Include the conservation community and grazers in this assessment.

2. For those not meeting these guidelines, determine that the allotment does not meet rangeland health standards. To meet these standards, the sagebrush community must meet or exceed the height and percent canopy cover percents for sagebrush, native grasses, and forbs in Table 3 (Connelly et al. 2000).
3. Change grazing use as necessary so that upland and riparian areas have a positive 2 or better Grazing Response Index (GRI) score for allotments not meeting standards.
4. For allotments that meet standards, insure grazing practices produce a "0" or plus net GRI score.
5. In sage grouse nesting areas, do not allow grazing until after the 20th of June (Braun 2006).
6. During permit renewal, inventory the amount of forage produced in the allotment, assess the allotment ecological conditions, and document past grazing use. As a part of permit renewal, conduct a range capacity analysis to assess the stocking rate for the allotment. Stocking levels for allotments that meet standards should lead to less than 25% utilization (Braun 2006) and for allotments not meeting standards, less than 15% utilization.
7. For allotments not meeting the rangeland health standards, prohibit grazing during a severe or worse droughts as defined by the national drought monitor.
8. For allotments that meet the standards, reduce grazing use prior to a drought to utilization levels less than 10-15% utilization for forage expected during the drought.
9. In sage grouse habitats, produce an annual end-of-season report for each allotment. This report should note the planned grazing use for the season, note the grazing use that occurred, report the results of any monitoring, document precipitation/drought information, describe any projects completed, and note successes or problems encountered. These should include conservation community and grazer information and be posted on the web.

Placing salt blocks in upland areas is not an effective means of drawing cattle use away from riparian areas.

Bryant (1982:784) found that salt placement and alternate water sources did not influence cattle preference for riparian habitats, and came to the following conclusion: “These cattle used the salt when convenient but did not alter behavior patterns to obtain it.” Thus, the BLM should not rely on the placement of salt blocks as a means to draw livestock away from riparian habitats.

**Comment Excerpt Text:**

**[This comment refers specifically to Alternative D] The plan should limit grazing utilization to 25 percent annually on uplands, meadows, flood plains and riparian habitat.**

Decades of livestock grazing have altered plant communities and soil and reduced productivity in sagebrush steppe (Knick et al. 2003; West 1983). Impacts attributable to historic or heavy grazing in sage-grouse habitat have not been remedied because plant communities are still not given rest from grazing, even under ecologically oriented grazing schemes (Connelly et al. 2004: 7-30 – 7-31, citing others). Furthermore, the water developments have increased the area that can be grazed, increasing the distribution and often the intensity of grazing, so that even where livestock numbers have been reduced, they still exert a significant influence on those habitats (Connelly et al. 2004: 7-33). The BLM has also identified continued problems associated with “historic overgrazing” (e.g., NW Colorado: 512) and many areas still do not exhibit habitat characteristics preferred by sage-grouse.

**Commenter1:**Mark Salvo

**Comment Excerpt Text:**

Limiting grazing is recommended to support rangeland restoration (Van Poolen and Lacey 1979, defining light utilization as 20-40 percent utilization of annual forage production by weight; Holecheck et al. 1999, defining light-moderate utilization as 30-35 percent utilization). Holechek et al. (2010: 290), citing Gregg et al. (1994) and Sveum et al. (1998), noted that grazing must be kept at conservative levels (25 to 35 percent use) "for high nesting success by sage-grouse." Braun (2006, unpublished) similarly recommended limiting grazing use to 25-30 percent utilization.

**[This comment refers specifically to Alternative D] The plan should require that livestock grazing maintain = 18 cm grass height in sage-grouse nesting and brood-rearing habitat.**

It is unclear if the preferred alternative would require that livestock grazing maintain a minimum grass height in sage-grouse nesting and brood-rearing habitats (see Table 1). The loss and degradation of nesting and brood-rearing habitats, which leads to reduced nesting success and increased chick mortality, appears to be a primary cause of declining sage-grouse populations rangewide (see Aldridge and Boyce 2007; Holloran et al. 2005, review of the literature). The final Idaho/SW Montana plan should explicitly require that livestock grazing maintain = 18 cm grass height in sage-grouse nesting and brood-rearing that are critical to sage-grouse reproduction.

**Comment Excerpt Text:**

**[This comment refers specifically to Alternative D] The BLM should reconsider whether sage-grouse habitat is “chiefly valuable” for livestock grazing.**

Most grazing on BLM lands occurs within grazing districts established by the Taylor Grazing Act of 1934 (43 U.S.C. § 315). The act required the Secretary of Interior to determine that lands within grazing districts were “chiefly valuable” for livestock grazing (43 U.S.C. § 315). However, the Secretary can also separately conclude that any lands within grazing districts are “more valuable or suitable for any other use than for [grazing]” (43 U.S.C. § 315f). To meet the purpose and need of the National Greater Sage-Grouse Planning Strategy (76 Fed. Reg. 77009) and the draft Idaho/SW Montana plan (ES-4), the Secretary should, as part of the current planning process, reconsider whether sage-grouse habitat, or a subset of extant habitat (e.g., priority habitat), in grazing districts is still “chiefly valuable” for grazing as opposed to other priorities, such as sage-grouse conservation. The Secretary can adjust boundaries of grazing districts to exclude grazing where it may continue to harm the species.

For range management, sage-grouse habitat objectives should be based on, in priority order, potential natural community within the applicable Ecological Site Description, Connelly et al. (2000: 977, Table 3), or other objectives that have been demonstrated to be associated with increasing sage-grouse populations. Utilization levels should not exceed 25 percent annually on uplands, meadows, flood plains and riparian habitat (Holecheck et al. 2010 and others). Habitat objectives should be applied to all sage-grouse habitat areas.

**Comment Excerpt Text:**

Management plans should include three specific conservation measures:

1. Grazing should maintain = 18 cm grass height in nesting and brood-rearing-rearing habitat (Connelly et al. 2000; Braun et al. 2005).
2. Livestock grazing should be restricted where cheatgrass (*Bromus tectorum*) occurs in sagebrush steppe to avoid contributing further to its incursion on the landscape (Reisner et al. 2013).
3. Grazing permit retirement should be prioritized in sage-grouse habitat.

**Commenter1:**Karen Williams

**Comment Excerpt Text:**

Most of the alternatives in the Draft would result in reduced grazing. Reducing livestock numbers is not effective as a mitigation strategy, and would in fact be detrimental to sage grouse habitat and, ultimately, sage grouse numbers. Grazing should be used to reduce the risk of catastrophic wildfire, improve forage, remove invasive species and provide open space. Stability in grazing management allows ranches to maintain intact and prevents urbanization and fragmentation of sage grouse habitat.

**Comment Excerpt Text:**

[This comment refers to Alternative D] We are particularly concerned with the use of standards that will be prescribed as a result of Table 2-8, in particular, the 7” stubble height. Annual variations, landscape variations, the technical intricacies of measuring stubble height, and other limitations would make this standard a counterproductive way to address nesting cover. The LUPA/DEIS does not identify when residual cover measurements should be taken, nor do they identify that different standards apply at different times. The Connelly reference for 7 inches is to be used post hatch, not at nest-initiation. Consequently, these measurements would need to occur at the end of the growing season, allowing regrowth from fall. Research indicates that residual heights of 3.5-3.9 inches are adequate prior to nesting (Hausleitner, 2005) Therefore, if measurements are taken of residual height in the fall or just prior to nesting this standard should be applied instead of the 7 inch standard. The difference and the time of the monitoring is critical to accurately determining the health of the range in relation to sage grouse needs.

**Comment Excerpt Text:**

Our concerns related to, what we believe to be, the arbitrary reduction of grazing on BLM/FS lands as described above are carried into Alternative D. This co-preferred alternative assumes “moderate decline in permitted grazing,” (2-190). However, the structure of the LUPA/DEIS makes it very difficult to conduct a detailed assessment of what will precipitate or justify those predetermined grazing cuts.

**Commenter1:**Karen Williams

**Comment Excerpt Text:**

[This comment refers to Alternative D] Though Table 2-8 provides useful guidelines in the conservation of the species, it is essential that it is applied appropriately as intended by the author. Both reality and sound science show that only by use of the continued proper grazing management tool can the goals of this table be met. These habitat characteristics are listed in table form, yet the alternative is silent on ensuring that any conservation measures, allocations or prescriptions (Management Actions), to be imposed for any particular use will be predicated upon existing vegetation and be within the ecological potential of the site. That is, BLM should not impose grazing restrictions based on herbaceous cover needed for nesting when there is not any existing sagebrush within the area in question; or BLM cannot mandate a particular residual grass cover height if the existing grasses do not have the potential to grow to the prescribed residual height and/or the prescribed grass heights are not within the ecological potential of the area in question. Arbitrarily mandating specific Required Design Features (RDF's) or Best Management Practices (BMP's) at a land use planning level is unacceptable. These items should only be considered as a "tool box" to be used at the activity plan level and then only used after an impact assessment has been made. This will avoid indiscriminant and unnecessary restrictions on land uses.

**Comment Excerpt Text:**

We cannot agree with the generalized statement on 2-21 that "there are currently no science-based studies that demonstrate that increased livestock grazing on public lands would enhance or restore GRSG habitat or maintain or increase GRSG abundance and distribution." We are troubled that this attitude, that grazing use is a negative impact and that no evidence to the contrary exists, seems to pervade the Draft. Particularly in regards to fuels management and invasive species control, flexibility in managing livestock numbers can, and should, be utilized as an invaluable tool. Authorized grazing on public lands has decreased steadily over the past several years, which has also coincided with increased fire prevalence in Idaho and down trending sage grouse populations. It is unrealistic to state that there is not room for increasing grazing given these facts. Furthermore, there are multiple studies which indicate the benefits of livestock grazing. Where livestock grazing has been reduced, arbitrarily in many circumstances, it is inaccurate for this LUPA/DEIS to imply that increased grazing would not benefit sage grouse nor its habitat. Please see below and refer to Attachment 1 for a detailed list of scientific studies that show the benefits of grazing in sage grouse habitat.

The following points and references further delineate the benefit of grazing on public lands.

- The western ecosystem evolved with large-herbivore grazing, and losing public lands grazing would severely damage ecological balance (Burkhardt, 1995).
- Improving range science and management practices are bettering the condition of the range (CAST, 1996). Ranching on both public and private land "has been found to support biodiversity that is of conservation concern" (Knight, 2007). Areas with flourishing and diverse plant and wildlife populations are often found in their present state because of, and not despite, the practice of grazing (NRCS, 2004).
- Grazing improves greater sage-grouse habitat by increasing the quality and accessibility of forbs for sage grouse (Neel 1980, Derner et al.1994, Evans 1986). Grazing stimulates plant and root growth and allows sunlight to get through to the growth points. Hoof movements soften the hardened earth so that seeds can germinate and grow and water can penetrate (Savory, 2010).
- Livestock grazing can reduce and modify fuel loads in a way that decreases the potential spread and extent of wildfires (Diamond et al. 2009). Ranchers are often first responders to wildfire, and grazing greatly reduces

the risk of catastrophic wildfire (Davies, 2010). (See details below)

- Grazing can also be used to control invasive weeds (Olson and Lacey 1994, Walker et al.1994). (See details below)
- Grazing with appropriate range improvements can be utilized in some areas to improve greater sage-grouse habitat to mitigate for the disturbance caused by other multiple-use activities, such as mineral development.
- Ranchers' water improvements provide habitat where none existed before (Marty, 2006).
- Grazing makes productive use of a renewable, otherwise unusable resource—grasses and shrubs out on the range—turning them into a high quality source of protein and fiber for a growing population. This is particularly significant given the fact that thousands of acres of open space are lost in the United States each day (USDA Forest Service, 2006).
- Reduced grazing on federal lands will result in greater grazing pressure on private lands which typically provide the best sage grouse habitat. The net effect of reducing livestock on federal lands is negative for sage grouse.

It should not be overlooked that, only through continued grazing use, ranchers and land managers have the ability to manage range conditions that sage grouse thrive in. According to the Natural Resources Conservation Service (NRCS), grazing “has been responsible for retaining expansive tracts of sagebrush-dominated rangeland from conversion to cropland” and can “stimulate growth of grasses and forbs, and thus livestock can be used to manipulate the plant community toward a desired condition.”

**Comment Excerpt Text:**

Alternative C “focuses on the complete removal of livestock grazing from all occupied sage grouse habitat...” (ES-15, 2-64) while Alternative F “focuses on restrictions...” (ES-16). For the reasons described above in the “Benefits of Livestock Grazing” section, these alternatives will prove to be disastrous to both the environment and the economy of the planning area.

Given the benefits shown above, any alternative that arbitrarily reduces, eliminates or allows retirement of livestock grazing AUMs is contradictory to the goal of long-term sage grouse conservation. In addition, there is statutory evidence and case law, that the BLM is overstepping its bounds in the LUPA/DEIS by suggesting that grazing permits may be terminated permanently. The BLM is authorized to decrease or temporarily discontinue grazing through a decision process, but the Taylor Grazing Act and Federal Land Policy Management Act (FLPMA) mandate that forage resources on grazing districts, if deemed healthy, are to be made available for livestock grazing.

**Comment Excerpt Text:**

it is critical for the BLM, Forest Service and State to better describe the regulatory mechanism for monitoring range conditions including forbs, hiding cover, riparian conditions and upland conditions. In addition, the condition of nesting and brood rearing habitats needs to be monitored. Waiting until a sage-grouse population is in decline over a broad area would appear to be too late to start reviewing range conditions and grazing practices. It is better to make several small course corrections over time than to abruptly attempt to change course. If a trigger is tripped and grazing is determined to be a primary cause, it is also unclear whether

grazing would suspended until conditions improve, or just slightly altered until there is an upward trend and an undetermined timeline for meeting objectives.

Not every failure to meet sage grouse objectives on an allotment necessarily will lead to a change in grazing management. Two situations stand out. First, some areas lack the ecological potential to meet the objectives. These areas have passed an ecological threshold – typically conversion to annual grasslands – that makes it impractical to restore a vegetation community composed of sagebrush and native grasses and forbs. In these areas, other resource management objectives should guide decisions on grazing management. Second, current grazing is not always a causal contributor to the failure to meet the habitat objectives. Current grazing should not be blamed where it does not contribute to the failure to meet habitat objectives

Alternative D & E, the BLM's preferred alternatives, and Alternative E, created by the state of Idaho, allow BLM discretion in determining wild horse and grazing levels and set the stage for the reduction of AMLs or even zeroing out of HMAs. These alternatives do not address the major threats to sage grouse, specifically the massive livestock grazing that is occurring on 100% of PPH and 97% of PGH. Indeed, Alternative D envisions no change in areas open to livestock grazing, and Alternative E would actually increase the area available for livestock grazing in the planning area! This despite the fact that at least 1.9 million acres of livestock grazing allotments in in PGH and PPH are not meeting rangeland health standards.

These alternatives should be revised to include a clear description of the BLM's legal mandate to manage wild horses and burros as natural components of the public lands and a specification that grazing/AUM reductions should be borne by discretionary livestock grazing and not by wild horse and burros, which the BLM is mandated to protect.

Alternative F, which would reduce wild horse AMLs by 25% in the occupied habitat areas is not justified given the minimal overlap of wild horses with such habitat (just 3% in PPH and 1% in PGH) and the small number of wild horses (617/7,404 AUMS) vs. the massive number of livestock (2.2 million AUMs/183,000 cows [year round equivalent]).

### Range Improvements.

Alternatives B-F require that range improvements conserve, enhance and restore GRSG habitat. Most range improvements are not intended to benefit GRSG or GRSG habitat. They are intended to provide a grazing function, such as cattle containment, supplemental feed distribution or water supply. None of these Alternatives contain adequate standards to clearly determine if a proposed improvement fulfills these requirements. Without clear and quantifiable standards, it will be essentially impossible to demonstrate compliance.

It has not been demonstrated that rangeland improvements constitute a significant threat to GRSG or its habitat. Rangeland improvements have not resulted insignificant habitat loss.

Inclusion of these management actions will provide no significant benefit while severely limiting or eliminating compatible land uses.

### *Summary*

Multiple commenters requested that the alternatives require closure of voluntarily relinquished allotments. Commenters questioned why changes to grazing management are needed when livestock grazing is not listed as a primary threat to GRSG. More than one commenter noted that grazing should only be restricted where it can be shown that grazing is directly related to the failure to meet GRSG habitat objectives. Additionally, commenters stated that the DEIS failed to consider increased grazing and question the rationale behind this decision. Some commenters also requested additional consideration of reduced grazing levels and utilization levels, as well as temporary or permanent closure of all or some GRSG habitat to grazing.

Several commenters requested that the LUPA/EIS provide specifics regarding habitat assessments schedules and application of standards, and use of ecological site descriptions, require immediate application of certain terms and condition to permits, and impose grazing restrictions for priority or general habitat

### *Response*

The ID/SWMT LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA. See response in section 4.3 NEPA Range of Alternatives of this report. The DEIS analyzed a range of alternatives including no grazing and a 25 percent reduction in grazing. Reduction in AUMs under Alternative F would be specified in site specific decisions at the permit renewal level. Language in the FEIS for Alternative F reduction has been clarified [BLM and Forest Service- need to review the language in Alt F mgmt. actions related to the 25% reduction and review related analysis. Determine if revision needed to table 4-5].

Livestock grazing is identified by USFWS as a threat to GRSG in the March 23, 2010 Federal Register Notice, and therefore it is addressed in this LUPA. Existing regulatory mechanisms, including the fundamentals for rangeland health, would continue to provide the basis for managing grazing in GRSG habitat. However, the preferred alternative would provide additional consistency in application of BLM rangeland health standards and guidelines relative to GRSG habitat, and would provide additional guidance for prioritizing land health assessments and review of grazing permits to ensure that grazing management is compatible with attainment of sage-grouse habitat objectives within the planning area. In addition, RDFs and best management practices would be adopted to reduce effects of range improvements and livestock trailing across public lands. Grazing use would be modified when it is identified as the cause for not meeting Sage Grouse objectives. The intent of the land use plan amendment is to change management under all resource programs, where necessary, to benefit Sage Grouse habitat. Standards and Guidelines assessments result in a determination of causal factors for non-achievement of any applicable standard, including standards for wildlife habitat Where livestock management is determined to be a causal factor for non-achievement of a standard, management must be

modified to conform with applicable guidelines.

The BLM is required to follow the the grazing regulations, including the decision process at 43 CFR 4160, when modifying permit or leases. Therefore, modifications to terms and conditions of permits and leases would be applied as needed during the permit renewal process.

As stated in the preferred alternative [mgmt. action #] habitat objectives would be adjusted based on site potential. Site specific requirements would be specified in NEPA for permit renewal. Language in the preferred alt. has been modified to clarify (see section X.X.X).

Decreasing or eliminating the authorized levels of privately owned domestic livestock grazing and limiting seasons of use will:

1. Prevent and limit future increases in ecological departure
2. Reduce the existing direct impacts from domestic livestock on sage-grouse and sagegrouse habitat
3. Allow the removal of fences to decrease sage-grouse/fence collision risks and mortality, and to decrease predation
4. Help reduce wildfire risks by reducing spread and establishment of invasive weeds
5. Allow recovery of meadows, and riparian areas on those allotments that failed to meet rangeland health standards
6. Allow recruitment of sage-brush in domestic livestock impacted areas
7. Ensure recovery of aspen groves
8. Protect pinyon-juniper communities

Domestic livestock grazing has at least the following major impacts and:

- Significantly Alters Plant and Animal Communities (Wagner 1978, Jones 1981, Mosconi & Hutto 1982, Szaro et al. 1985, Quinn & Wal-Genbach 1990, as cited in Fleischner, 1994) (Belsky, Matzke, Uselman, 1999) (Donahue, 1999) (Wuerthner, Matteson, 2002)
- Decreases Biodiversity (Fleischner, 1994) (Wilcove, Rothstein, Dubow, Phillips, Losos, 1998) (Belsky, Matzke, Uselman, 1999) (Wuerthner, Matteson, 2002)
- Leads to Elimination of Native Predators (Donahue, 1999) (Wuerthner, Matteson, 2002) (GAO, 2005)
- Leads to Introduction of Invasive Plants and Diseases (Mackie 1978, Longhurst et al. 1983, Menke, Bradford 1992, as cited in Fleischner, 1994) (Wilcove, Rothstein, Dubow, Phillips, Losos, 1998) (Donahue, 1999)
- Leads to Soil Compaction and Accelerated Erosion (Fleischner, 1994) (Belsky, Matzke, Uselman, 1999) (Donahue, 1999) (Wuerthner, Matteson, 2002)
- Leads to Hydrologic Disruption and Contamination (Fleischner, 1994) (Belsky, Matzke, Uselman, 1999) (Wuerthner, Matteson, 2002)

- Leads to Habitat Destruction (Fleischner, 1994) (Wilcove, Rothstein, Dubow, Phillips, Losos, 1998) (Belsky, Matzke, Uselman, 1999) (Donahue, 1999) (Wuerthner, Matteson, 2002)

Pages 3-63 to 3-66 3.7.1 Conditions within the Planning Area Emergency Stabilization and Rehab ( ESR) Management actions by Alternative E. Table 2-18

This discusses Intensive livestock grazing as controlling cheatgrass competition. It states that "a sufficient number of livestock cannot be concentrated on a small enough area to reduce the cheatgrass seed. In addition, this type of grazing can be detrimental to remaining perennial grasses". It should be noted that if grazing were applied early enough, even late winter in some of the affected areas, that cheatgrass would not mature to seed level, or at least would be reduced. The perennial grasses are slower to emerge and would not be affected by the intensive grazing.

Contact herbicides such as Glyphosate and pre-emergence herbicides such as imazapic and sulfomenturon methyl are listed as being highly effective in controlling invasive annual grasses. This is true, in small areas, but when dealing with cheatgrass invasion on a landscape level, these herbicides are not cost-effective.

Pre-emergence herbicides are exactly that, they inhibit sprouting of the seeds in the ground. If you want to have the perennial grasses expand, there must be also seed in the ground to sprout and grow. Perennial

grasses that are there and rooted will not be involved, but there will be no new seeding from the plants. This was tried several years ago on Highway 78 by the Cove Recreation Area of Strike Dam. A good kill resulted, but even now there is very little grass growing and this area is susceptible to the wind and dust storms that frequent this area. The only way that pre-emergence herbicides will work is to seed with perennial grasses after the initial treatment. This has been tried several years ago on Highway 78 by the Cove Recreation Area of Strike Dam. The Air Force has had great success rate applying the herbicide imazapic at their Training Range on Saylor Creek. This particular herbicide, not only inhibits cheat grass, but encourages growth of the native grasses and Sage Brush. Again, it is not cost effective, but has good results with favorable moisture conditions. Targeted or intensive grazing is very cost effective and if the timing is correct, may help control the cheatgrass. This is ongoing research by the University of Idaho Rangeland Center. See prospectus, "Grouse and Grazing: How does spring livestock grazing influence sage-grouse populations?" December 2012. Cheat

grass is a primary threat to habitat. To not consider grazing as a viable, cost-effective management tool has not been studied enough. USDA/ARS in Nevada where the precipitation is equal or less has had significant results in reductions of cheat grass through grazing in late season.

Without information on existing grazing in the planning area, it is more difficult to tell whether the DEIS is really making substantive changes to benefit sage-grouse. Nowhere does the DEIS provide a thorough disclosure of existing grazing management, as required by NEPA. Specifically, failing to indicate actual recent livestock use on the cattle allotments makes the preferred alternative unclear. The DEIS should have included actual use for each allotment in the chart that lists authorized AUMs in Appendix N. Because the DEIS lacks sufficient and accurate baseline information, it lacks a barometer with which to measure the proposed actions in sage-grouse habitats.

Nowhere does the DEIS disclose the seasonality of grazing within the planning area, which prevents the reader from understanding how spring or spring-fall grazing regimes could affect sage-grouse in the planning area. It also does not provide trailing routes, pasture rotation plans, etc. It does not overlay grazing use that occurs by allotment on top of sage-grouse breeding habitats (lek, nesting, early brood rearing period), or on top of sage-grouse winter habitats.

If monitoring and habitat assessments and changes only occur as part and parcel of site-specific grazing decisions (as the DEIS repeatedly implies), the chance to “adapt” to changing conditions will be limited. In light of the agency’s own acknowledgment/assumptions about climate change affecting the habitat availability for GRSG, it would have been a reasonable alternative to include some across-the-board adaptations (lowered livestock authorizations, for example) in the DEIS.

**Comment Excerpt Text:****Livestock Weight**

The BLM must clarify the weight of livestock the DEIS is using for an AUM’s or HM’s forage consumption. The NV DEIS is based on the claim that an AUM is **800 lbs.** of air-dried material per AUM. Current range analyses use, at a minimum, 1000 lbs. per AUM. This really is based on a 1980s management mindset. Plus, forage impacts of large calves must also be taken into account. The agencies must specify what forage consumption ID BLM AUMs and Forest HMs are currently being based. What forage consumption is stocking based on under all DEIS Alts.? What weight was the current allocation in the LUPs to be amended based on? If it was 800 lbs., lands will be significantly over-stocked as 1000 lbs. per AUM or more is the current agency allocation assumption, due to breeding of larger sized animals, hormones, supplements, etc.

**Comment Excerpt Text:**

The failure to recognize the key role of livestock grazing in cheatgrass-wildfire dynamics (see DEIS at 4-10,

4-120) is a key ‘hard look’ problem with the Draft EIS. Livestock grazing also leads to cheatgrass invasion, as overgrazing eliminates native bunchgrasses and degrades biological soil crusts, both of which represent the ecosystem’s natural defenses against this invasive weed (Reisner et al. 2013, Attachment 18). Cheatgrass invasions, spread by livestock overgrazing, increase fire frequency to unnatural levels (D’Antonio and Vitousek 1992). By itself, livestock grazing doubles to triples the spread of cheatgrass, and fire alone increases by two to six times the spread of cheatgrass; but for any fire that occurs in an area that is grazed by domestic livestock the spread of cheatgrass is multiplied, to 10 to 20 times the rate in an ungrazed natural system in the absence of fire (Chambers et al. 2007). Once established, cheatgrass accelerates fire in sagebrush habitats to unnaturally frequent levels (Balch et al. 2013), wiping out the sagebrush that sage grouse depend on for their survival, and laying the groundwork for a cheatgrass monoculture where wildlife habitat values are completely destroyed. Thus, livestock grazing plays a key role in the spread of cheatgrass, both pre-fire in the sagebrush understory, and post-fire leading to conversion to annual grasslands. BLM states,

The cheatgrass fire cycle causes GRS habitat loss and degradation on an annual basis. Currently, there are no management actions that can effectively alter this trend.

DEIS at 4-11. This statement is erroneous, and is directly contradicted by the finding of Yeo (2005), who demonstrated that cessation of livestock grazing leads to recovery of grass cover in sagebrush ecosystems, and restoration of rangeland health. BLM’s ‘hard look’ failure in this instance leads to the result that the appropriate management actions (removal of livestock grazing entirely from cheatgrass-infested ranges, or at the very least removal of livestock from allotments that have burned for a minimum of three years) are not applied in either of the Preferred Alternatives.

The federal agencies must pursuant to NFMA reach a determination regarding the science that is most relevant, reliable, and accurate regarding the amount of forage that needs to remain to provide sage grouse hiding cover. Connelly et al. (2000) recommended leaving residual grass cover at least 18 cm in height, available during the nesting season. This finding was empirically confirmed by Hagen et al. (2007). Gregg et al. (2012) found that forb components are critical for early brood rearing, and recommended that land managers establish standards for these. We are concerned that the BLM’s emphasis on grazing to reduce cheatgrass in some alternatives will collaterally reduce nesting cover below this critical threshold. Herman-Brunson et al. (2009) found that sage grouse nest survival decreased when residual grass cover was < 16 cm in height. According to Kaczor (2008: 26) grass height is positively correlated with nest success, and this researcher recommended, “Land managers should attempt to leave or maintain maximum grass heights [greater than or equal to] 26 cm, the inflection point for 50% nest success.” See Attachment 8, and see Kaczor et al. (2011), Attachment 9. Heath et al (1997) also found that near Farson, Wyoming, nests with taller grass heights were more successful than those with shorter heights. The agencies should implement a standard within the plan to address a measurable stubble height that must remain throughout the nesting season in grouse nesting habitat. We recommend at minimum using the 7.1-inch residual stubble height standard as recommended by Connelly et al. (2000). Attachment 10. The Forest Service should evaluate this standard and other residual stubble height standards for nesting and other habitats to determine which approach best represents the best science.

In addition, Braun (2006) recommended a maximum 25% forage utilization standard for livestock. Please review the scientific literature and make a determination regarding what percentage of available forage should

be dedicated to forage utilization for domestic livestock

Alternative B would allow livestock grazing on 10.9 million acres in Sage-grouse habitat, at least in theory. However, there are a number of restrictive provisions that undermine access to habitat, especially Preliminary Priority Management Areas ("PPMAs"). Alternative B should make crystal clear that the NTT Report's recommendation of no more than 3 percent anthropogenic disturbance does not apply to livestock grazing. Although this appears to be the case in the NTT Report itself, that report could have been more clearly written. The 3 percent cap appears to apply to "discrete anthropogenic disturbances." NTT Report at 7. Disturbances are later defined as either discrete, and covered by the 3 percent cap, or diffuse and apparently not covered by the cap. Livestock grazing is considered a diffuse disturbance. Id. at 8. However, the DEIS did not clearly state that the NTT Report's 3 percent cap is inapplicable to livestock grazing. This omission should be clearly corrected in the FEIS.

Specifically to the issue of ranching and Sage-grouse, scientists from the U.S. Department of Agriculture, the Service, and the University of Wyoming have studied effective ecosystem conservation of sagebrush plant communities. See Kirk W. Davies, et al., *Saving the Sagebrush Sea: An Ecosystem Conservation Plan for Big Sagebrush Plant Communities*, 144 Biological Conservation 2573-2584 (Nov. 2011), available at [www.sciencedirect.com/science/article/pii/S0006320711002692](http://www.sciencedirect.com/science/article/pii/S0006320711002692). The scientists recognized that livestock grazing is "nearly ubiquitous" across the sagebrush ecosystem but that its impacts vary considerably by management. Id. at 2575. The scientists also determined that moderate levels of grazing and periods of rest and/or growing season deferment do not negatively impact sagebrush plant communities and can serve to decrease the risk, size, and severity of wildfires. Id. The scientists concluded that the sagebrush ecosystem can be conserved so as to protect sagebrush-obligate species such as the Sage-grouse, sustain livestock production, maintain

ecosystem functions, and decrease the risk of catastrophic wildfires. Like the paper published in the Rangeland Ecology and Management periodical, this study concludes that well-managed livestock grazing has either a limited negative impact or beneficial impacts to sagebrush communities. !d. at 2579. Reducing incentives for ranchers to sell their base ranch property "is critical to successfully protecting remaining sagebrush communities." Id.

"There are currently no science-based studies that demonstrate that increased livestock grazing on public lands would enhance or restore GRSG habitat or maintain or increase GRSG abundance and distribution."

Comment

Please delete the statement. The same sentence occurs in the Nevada — NE California Sage-Grouse EIS. The top down, one-size-fits-all EIS template presents a less than knowledgeable view of the scientific process. To write a science-based study demonstrating that increased livestock grazing on public lands would enhance or restore GRSG habitat or maintain or increase GRSG abundance and distribution would require the researcher to study a specific number of acres in an area for a long period of time, preferably an area with few if any livestock, then increase the livestock for a long time and show positive GRSG results. That study would arguably only apply to that piece of land.

There are numerous BLM and US Forest Service studies as well as academic studies that demonstrate that allowing livestock grazing on public lands can enhance or restore native vegetation by reducing cheatgrass, which will directly enhance and restore GRSG habitat and maintain and increase GRSG abundance and distribution. Two examples include Pellant, Mike. 1996. Cheatgrass: The Invader That Won the West, Bureau of Land Management, Idaho State Office, 3380 Americana Terrace, Boise, Idaho 83706) and Field Guide for Managing Cheatgrass in the Southwest, United States Department of Agriculture Forest Service Southwestern Region TP-R3-16-4 December 2012).

Also see "Targeted Grazing: A Natural Approach to Vegetation Management and Landscape Enhancement."

(Launchbaugh 2006)

There are numerous research papers including Davies (2011) that state that though "appropriately managed grazing is critical to protecting the sagebrush ecosystem, livestock grazing per se is not a stressor threatening the sustainability of the ecosystem. Thus, cessation of livestock grazing will not conserve the sagebrush ecosystem."

**Commenter1:** Wayne F. Butts

**Comment Excerpt Text:**

3-64-3-65

"Intensive livestock grazing is often suggested for controlling cheatgrass competition. Although targeted grazing may have some applications for fuels management, it is not effective in reducing cheatgrass competition (Hempy-Mayer and Pyke 2008). During the short time when cheatgrass is highly palatable in the spring, a sufficient number of livestock cannot be concentrated on a small enough area to reduce the cheatgrass seed significantly or reduce cheatgrass seed lying on the soil surface. In addition, this type of grazing can be detrimental to remaining perennial grasses, opening the site up for further cheatgrass expansion in the future"

Comment:

As cited above, both BLM and US Forest Service have scientific publications detailing how livestock grazing successfully controls cheatgrass. For the EIS authors to ignore their own agency publications in favor Hempy et al does not meet the IQA requirements nor does it meet NEPA and CEQ guidelines for best available science.

Grazing management was identified as a threat to sage-grouse by three expert panels and in recent reviews (Connelly et al. 2011b: 555-556, Tables 24.1, 24.2). Federal government scientists have suggested that "livestock grazing across the public lands of western landscapes has impacted and will continue to impact the quality of those habitats and their ability to support source populations of sagebrush bird species" (Rich et al. 2005: 592). In their study on sage-grouse in eastern Oregon, Call and Maser (1985: 3) made the following basic assumption: "[w]here there are conflicts between sage grouse and livestock on public lands, it may be essential to give priority to sage-grouse if they are to continue to exist on these areas."

Livestock grazing appears to spread cheatgrass through multiple effects (Chambers 2008) and grazing is probably not effective to control cheatgrass in preparation for restoring sagebrush steppe (Hempy-Mayer and Pyke 2008). Other information suggests that there are simply not enough livestock available to graze at the preferred locations, at the preferred intensity, at the preferred times during the year, to control cheatgrass at a

landscape-level (McAdoo et al., undated, factsheet). The number of livestock and grazing intensity required to control cheatgrass would also probably have additional negative effects on native vegetation, soil, and other resources in sagebrush steppe that could outweigh any potential benefits from cheatgrass control. The removal of herbaceous perennials by grazing may increase water and nitrate availability to cheatgrass, and less perennial herbaceous cover may increase cheatgrass invasion (Chambers et al. 2007). The removal of cheatgrass by grazing may also increase cheatgrass seed production the following year (Chambers et al. 2007). Cheatgrass invasibility is lowest on sites with relatively high cover of perennial herbaceous species (Chambers et al. 2007).

**Comment Excerpt Text:**

Cheatgrass incursion in sagebrush steppe began in the 1850s with the introduction of domestic livestock, which trampled the biological soil crust that occupied the interspaces between native vegetation (Mack 1981) and facilitated the species' spread. Intact, lichen-dominated biological soil crusts can significantly inhibit germination and root penetration of cheatgrass (Deines et al. 2007), while the presence of cheatgrass can negatively affect biological soil crust richness and cover (Ponzetti et al. 2007). Moss-dominated biological soil crusts may also effect germination of annual grasses, including cheatgrass (Serpe et al. 2006). The diversity, cover and resiliency of biological crusts are positively correlated to low abundance of cheatgrass, low level of soil disturbance and high moss cover (Ponzetti et al. 2007). Shinneman et al. (2008) discovered that herbaceous and biological soil crust cover and species richness and diversity were generally greater on ungrazed than grazed areas in semi-arid shrubsteppe in western Colorado. Reisner et al. (2013) found that livestock contribute to the spread of cheatgrass by trampling the soil crust.

Developing and implementing grazing systems that are positive or neutral for sage-grouse is complex (Vavra 2005) (and may be impossible). Kuipers (2004) found (weak evidence) that nesting habitat selected by sage-grouse hens, nest success and brood-rearing habitat were associated with greater canopy cover, residual grass, and forb availability, respectively, on sites that were not grazed, or only lightly grazed in spring in Wyoming. Woodward (2006) (c.f. Adams et al. 2004) confirmed some of these findings and noted that reduced grazing/light grazing and/or deferred grazing in sage-grouse nesting habitat in spring lessened impacts on shrubsteppe vegetation and reduced conflicts with sage-grouse. Aldridge et al. (2008) recommended altering grazing practices in sagebrush steppe during times of drought to conserve herbaceous vegetation for sage-grouse.

Range scientists have determined that stocking rate rather than grazing system is the primary factor affecting rangeland production (Briske et al. 2008; Holechek et al. 1998; Van Poollen and Lacey 1979), yet agencies continue to place emphasis on water developments and increased fencing rather than addressing current forage capacity and landscape constraints. For example, cattle heavily graze riparian areas before moving on to adjacent uplands to seek forage (Pinchak et al. 1991). Deferred rotation grazing resulted in higher use of meadows and there was no correlation of upland presence of cattle with upland water developments (Gillen et al. 1984).

While definitions of light grazing use vary, numerous references have settled on a general 25 percent harvest coefficient for allocating forage for livestock (Holechek et al. 2010: 157, citing Troxel and White 1989; Galt et al. 2000; Lacey et al. 1994; Johnson et al. 1996; White and McGinty 1997; NRCS 1997). Although this rate is more conservative than others prescribed for light grazing, it allows both forage species and livestock to maximize their productivity, allows for error in forage production estimates, accounts for the potential effects of drought, and supports multiple use values (Holechek et al. 2010). Holechek et al. (2010: 157) also noted that, because most ranchers have difficulty monitoring and measuring annual grazing utilization (and

the BLM doesn't regularly monitor and collect utilization information), use of grazing coefficients higher than 25 percent "invariably leads to land degradation...when drought occurs because of rancher reluctance [to reduce livestock numbers]." Limiting livestock grazing to 25 percent utilization would also support other sage-grouse habitat objectives, such as maintaining a minimum stubble height (see Holechek et al. 2010: 164). A case study of the Antelope Springs Allotment in southern Idaho demonstrates that ranching operations can be successful and improve sage-grouse habitat using a 20 percent utilization standard (Stuebner, Times-News, 12/29/13).

**[This comment refers specifically to Alternative D] The plan should restrict livestock grazing where cheatgrass occurs in sagebrush steppe to avoid contributing further to its incursion on the landscape.**

We commend planners for recognizing that livestock grazing is an ineffective tool for controlling cheatgrass in sagebrush steppe (vol 2, 3-64 – 3-65). The Oregon, Nevada/NE California and Utah sub-regional draft sage-grouse plans fail to recognize the futility of managing cheatgrass with livestock. Each would apply early or late season grazing to suppress cheatgrass, potentially to the detriment of sage-grouse (e.g., removal of residual grasses that are important to sage-grouse nesting success).

**Comment Number:** IDMTSG-14-0169-27

**Organization1:**Defenders of Wildlife

**Commenter1:**Mark Salvo

**Comment Excerpt Text:**

New research, cited in the draft Idaho/SW Montana plan, also recommends restricting livestock grazing, as appropriate, to avoid contributing further to its incursion on the landscape. Reisner et al. (2013) found that, even after controlling for other factors that may contribute to the spread of cheatgrass, there was a strong correlation between grazing effects and cheatgrass incursion. "If the goal is to conserve and restore resistance of [big sagebrush] systems, managers should consider maintaining or restoring: (i) high bunchgrass cover and structure characterized by spatially dispersed bunchgrasses and small gaps between them; (ii) a diverse assemblage of bunchgrass species to maximize competitive interactions with *B. tectorum* in time and space; and (iii) biological soil crusts to limit *B. tectorum* establishment. Passive restoration by reducing cumulative cattle grazing may be one of the most effective means of achieving these three goals" (Reisner et al. 2013: 1).

**Comment Number:** IDMTSG-14-0169-28

**Comment Excerpt Text:**

Although Strand and Launchbaugh (2013) is a useful review, planners should beware of its limitations. It fails to acknowledge that sagebrush systems in the Intermountain West evolved with little herbivory by large, hooved mammals and that grazing fundamentally affects ecosystem processes in sagebrush steppe. It does not acknowledge the role of biological soil crust in impeding cheatgrass incursion or the negative effects of grazing on soil crust. The review suggests that livestock removal and trampling of understory vegetation and plant litter (including in early spring) can help reduce fire fuel loads, but this could be deleterious to sage-grouse. As the draft Idaho/SW Montana plan acknowledged, "[r]esidual cover, especially grass and litter, has often been noted as essential for GRSG for concealment during nesting and brood-rearing" (vol 2,

4-8, citing Sveum et al. 1998; Kirol et al. 2012). Grazing during the dormant season, which is also recommended by Braun (2006, unpublished)

**Commenter1:**Mark Salvo

**Comment Excerpt Text:**

[**This comment refers specifically to Alternative D**] Livestock grazing is considered the single most important influence on sagebrush habitats and fire regimes throughout the Intermountain West in the past 140 years (Knick et al. 2005: 68). Grazing remains the most widespread use of sagebrush steppe and almost all sagebrush habitat is managed for grazing (Connelly et al. 2004; Knick et al. 2003; Knick et al. 2011).<sup>1</sup> Livestock grazing disturbs the soil, removes native vegetation, and spreads invasive species in sagebrush steppe (Knick et al. 2005). Cattle or sheep grazing in sage-grouse nesting and brood-rearing habitat can negatively affect habitat quality; nutrition for gravid hens; clutch size; nesting success; and/or chick survival (Connelly and Braun 1997; Beck and Mitchell 2000; Barnett and Crawford 1994; Coggins 1998; Aldridge and Brigham 2003). Livestock may directly compete with sage-grouse for grasses, forbs and shrub species; trample vegetation and sage-grouse nests; disturb individual birds and cause nest abandonment (Valentine 1990; Pederson et al. 2003; Call and Maser 1985; Holloran and Anderson 2005; Coates 2007). The potential conflict between livestock grazing and sage-grouse intensifies near riparian and mesic habitats due to the importance of these areas to sage-grouse, particularly during brood-rearing and in summer. Heavy cattle grazing near springs, seeps, and riparian areas can remove grasses used for cover by grouse (Klebenow 1982). According to Call and Maser (1985:17), “rapid removal of forbs by livestock on spring or summer ranges may have a substantial adverse impact on young grouse, especially where forbs are already scarce.” Manier et al. (2013) also reviewed effects of grazing on sage-grouse habitat.

<sup>1</sup> One expert contended that the “livestock industry has had [a] more negative impact on sage-grouse than any other single factor” and “[i]t’s rare to find any place that hasn’t been grazed” Hudak (2007: 28-29).

Grazing infrastructure, such as water developments and fences, also fragment and degrade sage-grouse habitat (Connelly et al. 2004; Braun 1998; Call and Maser 1985; Knick et al. 2003). Fatal collisions with fences were “relatively common and widespread” in sage-grouse breeding habitat in southern Idaho (Stevens 2011), corroborating other evidence that fences may pose a significant risk to low flying sage-grouse (e.g., Danvir 2002, unpublished report). Fences (like other high structures) may serve as perches for raptors and other avian predators of sage-grouse nests, chicks and adults (Connelly et al. 2011b). Fence densities exceed 2 km/km<sup>2</sup> in many areas occupied by sage grouse (Knick et al. 2011).

**Comment Excerpt Text:**

Sagebrush steppe in the Great Basin region did not evolve with significant grazing pressure by large ungulates (Mack and Thompson 1982). Excessive grazing by domestic livestock during the late 1800s and early 1900s had significant impacts on sagebrush steppe and those effects persist today (Knick et al. 2003). Grazing (in addition to other factors) is implicated in the encroachment of conifers in sagebrush steppe, including western juniper (*Juniperus occidentalis*) (Knick et al. 2011, citing Miller and Rose 1999; Kerr and Salvo 2007, unpublished report). Decades of livestock grazing have altered plant communities and soil and reduced productivity in sagebrush steppe (Knick et al. 2003). Cattle grazed at “conservative” levels in sagebrush steppe in the northern Great Basin initially selected bunchgrasses in interspaces between sagebrush plants (France et al. 2008). The removal of native species from interspaces by cattle, in conjunction with other factors, appears to facilitate invasion by cheatgrass (*Bromus tectorum*) into these areas (Reisner et al. 2013; Reisner 2010). The spread of cheatgrass and other invasive plants into degraded rangelands has accelerated the natural fire cycle and threatens to convert vast areas of sagebrush habitat into annual grasslands (Wisdom et al. 2005c; Miller et al. 2011).

Beck and Mitchell (2000) concluded that livestock grazing appears to most affect productivity of sage grouse populations. Moynahan et al. (2007) also noted that condition of greater sage-grouse nesting habitat, an important factor in sage-grouse productivity, is likely affected by livestock grazing, among other influences. Holloran et al. (2005: 648) documented the importance of herbaceous cover, including residual grass, to

sage-grouse nesting success and concluded that “annual grazing in nesting habitat, regardless of the timing, could negatively impact the following year’s nesting success [by reducing residual vegetation].” Aldridge and Boyce (2007: 522), citing Manier and Hobbs (2006), suggested that removing cattle or reducing livestock intensity may result in increased shrub cover and/or plant diversity in shrubsteppe. They also suggested that eliminating water impoundments (such as earthen livestock watering holes) may allow water to recharge former mesic sites in sagebrush steppe, which would benefit sage-grouse (Aldridge and Boyce 2007: 523).

**Comment Excerpt Text:**

Livestock grazing is a key tool to reducing the threat of catastrophic wildfires and should be recognized in the draft for the benefits it provides. Peer-reviewed studies have clearly demonstrated that grazing livestock reduces the threat of catastrophic wildfire by controlling the fuel load and increasing productivity of grasses that are less fire prone (Davies 2011). According to a newly released study entitled, “Livestock Grazing Effects on Fuel Loads for Wildland Fire in Sagebrush Dominated Ecosystems.” (2014 – Journal of Rangeland Applications, in press), grazing provides assistance in fuels management in the following ways:

- A window of opportunity may exist for targeted grazing to reduce annual grasses before perennial grasses initiate bolting or during dormancy.
- Livestock grazing can reduce the standing crop of perennial and annual grasses to levels that can reduce fuel loads, fire ignition potential and spread.
- Grazing after perennial grasses produce seed and enter a dormant state can reduce the residual biomass left on the site and thereby decrease the fire hazard the following spring and summer.
- Grazing can reduce the continuity of fuels, including the amount of herbaceous biomass between shrubs, in sagebrush ecosystems.

As stated above, ranchers are often the first responders to wildfires (Davies, 2010). Recently, several Rangeland Fire Protection Associations (RFPAs) have been established to enable ranchers’ ability to safely respond to wildfire alongside BLM and to enhance their capabilities of limiting the spread of wildfires before they grown to catastrophic and unmanageable sizes. For the 2013 fire season, four established RFPAs covered 3,622,000 acres and comprised 168 ranchers and other private citizens who are RFPA members. Additional RFPAs are in the process of developing and will further increase this proactive step to reduce the size of

wildfires in sage grouse habitat. Alternative E identifies, RFPAs are a critical and innovative component to preventing and controlling the spread of wildfires. Their existence can only bring positive impacts on the rangeland and on sage grouse. RFPAs are almost entirely made up of ranchers who also graze on public lands. With reduced or eliminated livestock grazing on the range comes the reduced or eliminated presence of ranchers on the range. The effectiveness of the RFPAs, which have proven to be extremely effectual in initial attack of wildfires, correlates directly with the continuance of livestock grazing on public lands. If grazing is reduced as a result of implementation of this LUP/EIS, ranchers will not be around to operate the RFPAs and ensure their continuation, to immediately respond to fire starts, nor to coordinate fire suppression efforts with the agencies. Please refer to attachments 4 and 5 for published new stories regarding RFPAs and the value that rancher provide in protecting sage grouse habitat from wildfire.

Page 2-152-53 [222-23]. D-LG/RM-43, as well as the Idaho State Plan (E-LG/RM-47 at page 2-154 [224]). There exists no rational basis in the science to restrict livestock water developments to lower-quality sage-grouse habitat or to restrict improved livestock distribution into areas that have not had significant prior grazing use. There is no nexus between the mere presence, or mere increased presence, of livestock within a given area and negative impacts upon sage-grouse. In fact, increased presence of livestock may improve the vigor and condition of areas that have become decadent due to lack of livestock use in the past. Further, Davies et al 2010 (relied upon by the DEIS) showed that moderate livestock grazing decreases the risk of wildfire in sagebrush steppe, and that wildfires that do occur in moderately grazed sagebrush rangelands have decreased severity, continuity, and size of the burn as compared to ungrazed rangelands. Those researchers also concluded that moderately grazed rangelands probably increase the efficiency of fire-fighting efforts. Weber et al( \_\_\_ ) (not cited by the DEIS, but should have been), in another recent study conducted in southeast Idaho, found similar results.

**Comment Excerpt Text:**

It should be recognized that GRSG often use watering and salting areas as leks, as opposed to salt/supplement and water troughs being placed in pre-established GRSG leks.

## **Summary**

Multiple commenters asserted and presented citations supporting their position that grazing has the potential to benefits GRSG by controlling cheatgrass and reducing wildfire risk. Other commenters presented citations supporting the position that grazing damages GRSG habitat and increases cheatgrass risk. Several commenters requested more detailed information about current grazing management and habitat conditions in the planning area. Other commenters noted the importance of ranching in the local economy, and also that ongoing collaboration between private ranchers and federal agencies has helped preserve GRSG habitat and should be acknowledged in the EIS.

---

## **Response**

Before beginning the LUPA/EIS and throughout the planning effort, the BLM and the Forest Service considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The BLM and the Forest Service also used the most recent and best information available that was relevant to a land-use planning-level analysis (refer to response in section 4.4, NEPA Baseline data- Best Available Science for additional information). *[NOTE TO BLM- review text in section 4.4 response once complete to ensure consistency]* Section 3.X, livestock grazing discusses the current level of grazing in the planning area and management systems in place. Impacts of current and historic grazing on other resource and resource uses are discussed under the appropriate resource and resource use headings (i.e. Section 3.X, Sage grouse Habitat). Section 4.2.2 in the DEIS provides an overview of the ecological impacts of livestock grazing. The DEIS analyzed the effects of no grazing and reduced grazing on components of sage-grouse habitat, including changes in wildfire risk and cheatgrass incursion.

See changes to Section 3.X, fire management, for additional discussion of cheat grass-wildfire dynamics.

*[NOTE TO BLM/EMPSi-Review the text in Ch 3 veg related to fire/livestock.]*

Discussion of socioeconomic impacts of current grazing operations in the planning area is discussed in Section 3.X, Socioeconomics.

Additional language has been added to the FEIS (section X.X.X) recognizing the role of Rural Fire Protection Districts and other collaboration efforts *[ Note- need to add language to FEIS]*

This region's sage grouse production is in good shape due to decades of cooperation between ranchers and the BLM. The EIS must adequately acknowledge this condition.

Issue:

The EIS should include an analysis of the importance of this public-private partnership to the sage grouse. Please explore things the FS and BLM can do to strengthen this partnership by keeping ranches economically viable.

**Comment Number:** IDMTSG-14-0102-4

**Organization1:**NRCS

**Commenter1:**Pamela Dugan

**Comment Excerpt Text:**

The adverse social and economic impacts associated with Alternatives C and F could also result in unintended adverse effects on sage-grouse and its habitat. Private lands with livestock operations dependent upon public land grazing are usually located in moister, more productive valley bottoms. Valley bottoms are often used by sage-grouse as brood-rearing habitat. Adverse effects could occur due to increased livestock utilization of these areas and other private and state lands in response to a reduction in AUMs or season of use on federal lands. NRCS Field Office staff report that they are already observing increased livestock utilization of private lands in Owyhee County in response to recent changes in grazing permits there.

**Comment Number:** IDMTSG-14-0102-5

**Organization1:**NRCS

**Commenter1:**Pamela Dugan

**Comment Excerpt Text:**

In addition, producers may convert these valley bottoms or their other private land to introduced perennial forage species in an attempt to provide enough livestock feed to continue in business. Others will choose to go out of business and sell their land, potentially for development. Either way, valuable sage-grouse habitat could be lost.

**Comment Number:** IDMTSG-14-0102-7

**Organization1:**NRCS

**Commenter1:**Pamela Dugan

**Other Sections:** 22.3

**Comment Excerpt Text:**

Further, it is unnecessary to impose severe restrictions like those in Alternatives C and F on livestock grazing use of public lands because appropriate livestock management is compatible with providing sage-grouse habitat. As the U.S. Fish and Wildlife Service (USFWS) stated in their Greater Sage-grouse Conservation Objectives: Final Report, the loss and fragmentation of sagebrush habitats is a primary cause of the decline of sage-grouse populations. NRCS believes maintaining managed livestock grazing as the prevailing land use in sagebrush habitats is the best way to ensure the persistence of large, intact sagebrush habitats for sage-grouse and other species. The USFWS agreed with NRCS in the Conference Report for the Natural Resources Conservation Service Sage-grouse Initiative, which states: " ... a unique opportunity exists to focus NRCS resources to benefit sage-grouse, improve ranch sustainability, and maintain livestock grazing as the prevailing land use to ensure the persistence of large and intact range lands. There is a significant link between

conditions required to support sustainable ranching operations and habitat characteristics that support healthy sage-grouse populations."

Ultimately, the effects of removing grazing in GRSG habitats on a landscape scale are unknown, and it is unclear whether complete removal would improve GRSG habitat or increase population levels."

Comment:

This statement contradicts with dozens of other statements in the EIS and with scientific literature produced by both the BLM and Forest Service about the benefits of managed livestock grazing to both reduce cheatgrass and improve sage-grouse habitat. There are numerous research papers including Davies (2011) that state that though "appropriately managed grazing is critical to protecting the sagebrush ecosystem, livestock grazing per se is not a stressor threatening the sustainability of the ecosystem. Thus, cessation of livestock grazing will not conserve the sagebrush ecosystem."

**Comment Number:** IDMTSG-14-0178-22

**Organization1:** Idaho Cattle Association

**Commenter1:** Karen Williams

**Comment Excerpt Text:**

In instances where alternate forage is available, Torell et al. (2010) note, ranchers are likely to "use deeded lands and meadows more intensively as grazing alternatives to public lands... Unfortunately, these same acreages are often prime habitat for sage grouse, and adjusting seasons of use and stocking levels on deeded rangelands and meadows could be counterproductive."

Additionally, eliminating grazing on public land will also result in reduced or eliminated grazing on intermingled state land and a subsequent decline in funding available to the endowed institutions of the state.

Without public lands grazing, grazing use of significant portions of state and private lands would necessarily cease, and the cattle industry would be dramatically downsized, threatening infrastructure and the entire market structure.

**Comment Excerpt Text:**

In a newly released paper studying the effects of long-term rest compared to grazing under current practices, conclusive evidence was demonstrated that removing grazing from the land provides no benefit to the rangeland (Davies, et al 2014). It finds that:

- Long-term rest causes an accumulation of fine fuels that increases wildfire risk and potential severity and subsequently the cost of fire suppression efforts and the likelihood of conversion to exotic annual grasslands.
- The loss of a forage base with long-term rest may result in livestock producers increasing grazing pressure on other land, converting sagebrush rangelands to introduced grasslands and irrigated forage to off-set forage loss, or if ranching is no longer profitable, selling their private lands for development.

**Comment Number:** IDMTSG-14-0178-24

**Comment Excerpt Text:**

Considering that NEPA requires the agencies to weigh the socio-economic impacts of their decisions, it is abundantly clear, and this new study verifies it, that removing, or significantly reducing livestock grazing has a net negative impact on the species, the ecological balance and on the economy, not to mention the livelihoods of countless ranching families. Why then would the agency consider implementing any alternative that arbitrarily reduces grazing, thereby causing devastating impacts to the livelihoods of ranchers and the viability of local communities' economies, while offering no measurable benefit to the ecology of the land and its species?

**Comment Number:** IDMTSG-14-0178-7

**Organization1:**Idaho Cattle Association

**Commenter1:**Karen Williams

**Comment Excerpt Text:**

[This comment is in reference to Alternative A] The BLM & USFS should have more fully analyzed the effectiveness of current rangeland health standards and guidelines before developing alternatives, and should have used that analysis for considering appropriate changes to their LUPA/DEISs with respect to livestock grazing and range management. We believe this type of review would have provided further justification for Alternative E's use of existing Idaho Rangeland Health Standards (IRHS)

***Summary***

Some comments detailed beneficial impacts of grazing, and the adverse impacts of grazing restrictions on to livestock operations, Rangeland Fire Protection Associations, and the local economy. One commenter notes that limitations on water developments can have impacts on grazing management and need to be clarified and analyzed in greater detail.

***Response***

Impacts to livestock grazing from current livestock grazing management are addressed in section 4.9.4 of the DEIS. Impacts to the socioeconomic aspect of livestock grazing are discussed in Section 4.19 of the DEIS. While a land use planning-level action is broad in scope and, therefore, does not require site specific impact analysis, a thorough review of the EIS's impact analysis relevant to grazing and indirect socioeconomic impacts and was found to need additional information and support for the conclusions/findings. The BLM and the Forest Service have updated this information in the Proposed Land Use Plan Amendment/FEIS to provide the necessary information to make informed land use plan-level decisions (see changes in section 4.19). Impacts to Rangeland Fire Protection Associations are discussed in section 4.X, fire management. BMPs for livestock developments including water have been revised in the FEIS and related impacts on livestock grazing management have been clarified.

#### Summary

The EIS fails to provide justification as to why “withdrawal from mineral entry” is necessary to protect GRSG and its habitat when the same objective can be achieved through avoidance, minimization of impacts, and mitigation of impacts within the designated areas. The current approach in the EIS does not meet FLPMA requirements for finding ways to remain flexible in balancing conservation and resource uses.

---

#### Response

The facts that sage brush takes decades to re-establish and that disturbance from light and noise affect GRSG mean that avoidance, minimization of impacts and mitigation of impacts are not sufficient methods of protecting GRSG and sage brush habitat. Additionally, this concept was considered within the range of alternatives- Alternative D does not withdraw lands from mineral entry. No change to the EIS has resulted from this comment. *[NOTE TO BLM: Consider whether inserting text to this effect into the EIS is appropriate.]*

Note to EMPSi - check all comments under Issue 17 - any related to phosphate should be moved to [nonenergy] leasable minerals

#### **Comment Excerpt Text:**

A discussion of the range-wide withdrawal for the GRSG is important, as the purpose and need of each DEIS is aimed at shoring up a perceived inadequacy under the ESA and focused on avoiding a range-wide listing for the GRSG. Accordingly, it is important to gain a better understanding of the total number of acres proposed for withdrawal by the Agencies in order to determine whether there is a possibility of avoiding the listing – an essential element of the

Purpose and Need of this LUPA process - because the boundaries for purposes of the ESA are not confined by state borders. See *Defenders of Wildlife et al. v. Salazar*, 729 F.Supp 1207 (D.

Montana 2010) (rejecting a USFWS proposal to delist gray wolf populations in Idaho and Montana.)

Here, the Agencies are considering major withdrawals in the States of Idaho, Nevada, and Utah in separate DEIS documents. However, there is no review or analysis of the cumulative withdrawals throughout these three states. In fact, not only has BLM failed to consider the total withdrawals in all three plans, but has likewise failed to consider the cumulative effects of these withdrawals in all 11 Western states in sage grouse habitat.

## **Summary**

The DLUPA/DEIS fails to adequately analyze the cumulative impact of locatable mineral withdrawals across the GRSG range.

---

## **Response**

Additional information on the cumulative effect of withdrawals across GRSG range has been added to Section XXX (locatables cumulative effects section) of the EIS. *[NOTE TO BLM: Could include roll-up of withdrawals from plans for incorporation into EIS]*

**Comment Number:** IDMTSG-14-0050-21

**Organization1:**

**Commenter1:**Kathleen Gregg

**Comment Excerpt Text:**

Although I realize that the BLM and USFS do not control hunting of sage grouse on federal land, an alternative must be proposed in conjunction with state laws to activate a moratorium on all sage grouse hunting until which time the species has returned to a healthy and self-sustaining population. It is absurd that our government should "manage" any wildlife in order to increase wildlife populations so that they can later be hunted by an insignificant segment of the public but even more absurd in any wildlife population that is being considered under the endangered species listing. The below paragraph is taken from the online BLM

website and states that there is no evidence that hunting of the sage grouse “poses a significant threat to the species”. How ridiculous that anyone would be as reckless and irresponsible as to say that killing of a threatened species does not hurt the population! An immediate moratorium to stop all sage grouse hunting must be included as an alternative within the proposed EIS.

“Does hunting Greater Sage-Grouse pose a threat to the species?”

In its March 2010 warranted but precluded finding on listing the Greater Sage-Grouse under the Endangered Species Act, the U.S. Fish and Wildlife Service (FWS) specifically looked at the threats to the species posed by hunting. The FWS found that “In the United States, sage-grouse hunting is regulated by State wildlife agencies and hunting regulations are reevaluated yearly. . . . We have no evidence suggesting that gun and bow sport hunting has been a primary cause of range-wide declines of the greater sage-grouse in the past, or that it currently is at a level that poses a significant threat to the species.”

[http://www.blm.gov/wo/st/en/prog/more/sagegrouse/frequently\\_asked\\_questions.print.html#hunting](http://www.blm.gov/wo/st/en/prog/more/sagegrouse/frequently_asked_questions.print.html#hunting)

### ***Summary***

In the EIS/LUPA, the BLM/FS should incorporate additional management actions (e.g. SRP/SUP stipulations, OHV noise regulations, seasonal restrictions on OHV events near leks, and rerouting of OHV events away from leks, and hunting) to limit the potential for impacts on Sage-Grouse from recreation activities. Any management actions limiting recreation activities in sage-grouse habitat should be based on the best available science with proven habitat conservation results.

### ***Response***

The EIS considers an adequate range of alternatives to protect GRSG, including varying levels of restriction on recreational activities and special recreation permits/special use permits (insert correct management actions and table number). During subsequent implementation-level travel management planning, new travel management plans would evaluate vehicle routes and determine the need for permanent or seasonal road closures, and mode of travel (e.g. motorcycle, ATV, and UTV) restrictions, including speed. New travel management plans would evaluate vehicle routes and determine the need for permanent or seasonal road closures, and mode of travel (e.g. motorcycle, ATV, and UTV) restrictions during subsequent implementation level travel management planning. 43 CFR 8340 requires all OHVs to comply with state laws including noise and spark arrester requirements.

Contemporary hunting seasons in the Idaho and Southwest Montana Sub-region are very conservative with respect to their length and bag limits. GRSG hunting and its effects are described in more detail in Sections XX and XX of the FEIS.

**Comment Number:** IDMTSG-14-0008-2

**Organization1:**

**Commenter1:** Stephen Bauchman

**Comment Excerpt Text:**

Furthermore the adoption of the alternatives, other than perhaps E, do not meet the requirements of NEPA (40 CFR 1500-1508) that requires a consideration of the impact on the 'human environment' as the result of any action. The socio-economic analysis within the EIS provides only a macro analysis. With the adoption of Alternative D {B, C, F} there will be a reduction in grazing permits as well as other multiple uses [mining & recreation] within the Intermountain MA/CZ. The impact on the social, cultural, and economic environment of the communities will be significant, and require further analysis than included therein.

---

**Comment Number:** IDMTSG-14-0008-4

**Organization1:**

**Commenter1:** Stephen Bauchman

**Comment Excerpt Text:**

While the EIS addresses Macro Social and Economic Impacts it doesn't meet NEPA requirements with regards to considering Micro Social Economic Impacts. Specifically ““The council on Environmental Quality's (CEQ's) Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act (40 CFR 1500-1508) point-out that the "human environment" is to be "interpreted comprehensively" to include "the natural and physical environment and the relationship of people with that environment" (40 CFR 1508.14). Agencies need to assess not only so-called, "direct" effects, but also "aesthetic, historic, cultural, economic, social, or health" effects, "whether direct, indirect, or cumulative" (40 CFR 1508.8). Furthermore, the Act stipulates “... when an EIS is prepared "and economic or social and natural or physical environmental effects are interrelated, then the environmental impact statement will discuss all of these effects on the human environment" (40 CFR 1508.14). The EIS's are thus intended to provide a kind of full-disclosure procedure for federal decision-makers, who are then expected to consider the negative as well as the positive implications of potential courses of action, and the unintended as well as the intended consequences, before they proceed.”

The main economic basis in Custer County is mining and then agriculture/ranching. A reduction or major modification to livestock grazing permits would impact the viability of the ranches within the area. While there has been some transition from family owned ranches to corporate/investor owned, local business is heavily dependent on the ranching community and the associated grazing permits. Any implementation of a Sage Grouse Management Plan that would have major changes in the grazing would severely impact the historical cultural economic affect on the community.

**Commenter1:** Neil Helmick

**Comment Excerpt Text:**

As are many other western states ranchers, our operation is dependent on public land grazing in order to sustain a viable year around livestock operation. My ranch is made up of BLM and USFS permits in addition to private and state lands. Most of my private holdings are wet meadows that are heavily used by sage grouse broods during the summer months. I have participated in NRCS Sage Grouse Initiative Projects to enhance those meadows specifically for sage grouse. If I were to lose even a portion of my federal AUMs my ranching operation would no longer be viable, and I would have to consider all options, which would include selling my private meadows for development. The DEIS fails to take this into consideration when analysis impacts of the analysis.

**Comment Excerpt Text:**

NRCS is concerned with ensuring the health and welfare of the agricultural community impacted by the DEIS. We concur with the analysis of the impacts of Alternatives C and F on livestock grazing in 4.6.6, 4.6.9, and 4.16.7. We appreciate the inclusion and detailed analysis of Social and Economic Conditions in Chapters 3 and 4 and urge the BLM and U.S. Forest Service (USFS) to give the effects on social and economic conditions equal consideration as those on natural resources in the Final EIS.

---

**Comment Number:** IDMTSG-14-0102-7

**Organization1:**NRCS

**Commenter1:**Pamela Dugan

**Other Sections:** 16.3

**Comment Excerpt Text:**

Further, it is unnecessary to impose severe restrictions like those in Alternatives C and F on livestock grazing use of public lands because appropriate livestock management is compatible with providing sage-grouse habitat. As the U.S. Fish and Wildlife Service (USFWS) stated in their Greater Sage-grouse Conservation Objectives: Final Report, the loss and fragmentation of sagebrush habitats is a primary cause of the decline of sage-grouse populations. NRCS believes maintaining managed livestock grazing as the prevailing land use in sagebrush habitats is the best way to ensure the persistence of large, intact sagebrush habitats for sage-grouse and other species. The USFWS agreed with NRCS in the Conference Report for the Natural Resources Conservation Service Sage-grouse Initiative, which states: " ... a unique opportunity exists to focus NRCS resources to benefit sage-grouse, improve ranch sustainability, and maintain livestock grazing as the prevailing land use to ensure the persistence of large and intact range lands. There is a significant link between conditions required to support sustainable ranching operations and habitat characteristics that support healthy sage-grouse populations."

**Commenter1:** Alan L. Prouty

**Comment Excerpt Text:**

Besides the effects to American agriculture and national food security, the Draft LUMA/EIS is significantly deficient in describing the potential losses to local economies. The Alternatives will reduce future phosphate development in Southeastern Idaho. The jobs and economic benefits from mineral development are important to the local business community and an important source of tax revenues to federal, state and local governments. For example, in Southeast Idaho the wages and salaries paid to employees of Idaho Mining Association operating member companies was nearly \$140 million in 2006 dollars (Idaho Economics 2007). Total secondary impacts upon total personal income in Southeast Idaho were calculated to be \$250,000,000 for 2006. These mining and mineral processing operations are often a significant part of the local tax base; in 2006 22.5 percent of the total property taxes paid in Caribou County were from mining and mineral processing operations.

The draft LUMA/EIS needs to discuss the specific economic consequences of prohibiting or greatly restricting access to this strategic mineral.

**Comment Number:** IDMTSG-14-0131-29

**Organization1:** J.R. Simplot Company

**Commenter1:** Alan L. Prouty

**Comment Excerpt Text:**

The Draft LUPA/EIS fails to discuss how the effective withdrawal of thousands of acres of phosphate minerals will affect fertilizer supply and prices along with potential consequences on national food security. As discussed in these comments, the importance of phosphate to national security was recognized over 100 years ago as thousands of acres of phosphate deposits were reserved by the federal government. The cumulative effect of such restricted access needs to be examined as there are alternatives in the Utah Greater Sage-Grouse LUPA/EIS that also eliminate access to phosphate deposits. The LUPA/EIS must discuss the consequences of the cumulative loss of such resources, the effects on food production and costs, and losses to local economies including tax revenue because of the prevention of mineral development.

**Comment Number:** IDMTSG-14-0148-2

**Organization1:**Custer County Commissioners

**Commenter1:**Wayne F. Butts

**Comment Excerpt Text:**

Table 3-64

"Unemployment"

Comment

The unemployment in Idaho has gone from an average of 3% to an average of 8.7% in the past 5 years! This fact needs to be carried through Chapter 4 and the full extent of the increases in unemployment from implementation of each action alternative need to be thoroughly discussed.

**Comment Number:** IDMTSG-14-0168-32

**Organization1:**Custer County Commissioners

**Commenter1:**Wayne F. Butts

**Comment Excerpt Text:**

Page 3-191

"The proportion of employment associated with mining industries varied by county, from zero percent in 12 of the counties up to 30.4 percent of total employment in Custer County and 22.7 percent of total employment in Caribou County. The average annual earnings per mining-related job in the Socioeconomic Study Area are higher than non-mining jobs."

Comment:

Discuss the detailed economic effects of mineral withdrawals, NSO and CSU restrictions, etc to Custer County employment as well as all other counties in the planning area. Include lost revenue from geology studies, claim staking, plan of operation studies, and mining. Include the lost opportunity taxes; fire, school and hospital revenues; equipment sales, maintenance and rentals and all other factors in Chapter 4. Include the true current situation and impacts to locatable, saleable and fluid minerals, as well as renewable and nonrenewable energy resources not already listed.

For every acre of land proposed for withdrawal, NSO, CSU, and other restrictions the EIS needs to itemize all costs to society. The EIS needs to determine mineral potential and discuss it in Chapter 3 and detail all consequences in Chapter 4, as required by NEPA and CEQ guidelines.

**Comment Number:** IDMTSG-14-0168-33

**Organization1:** Custer County Commissioners

**Commenter1:** Wayne F. Butts

**Comment Excerpt Text:**

The federal government set up the system of livestock grazing as a combination of private and federal lands. The federal government requires private land be appurtenant to federal lands in order to obtain a federal grazing permit.

The EIS does not recognize that oil and gas development occurs across multiple jurisdictional boundaries (public lands, split-estate, and fee simple lands) and does not fit neatly into lands managed only by the BLM. The result is that the EIS has ignored an enormous amount of oil and gas development activity on private lands due to the nature of their development (projects with a federal nexus, etc.) that are clearly subject to management policies contained in each of the action alternatives. As such, the alternatives are either silent on or severely underestimate the resulting impacts which directly impact communities in Idaho and SW Montana.

Chapter 4 needs to be rewritten to recognize the federal — private land interactions.

**Commenter1:** Wayne F. Butts

**Comment Excerpt Text:**

4-51

"Mineral entry withdrawal would be recommended for all ACECs, including all PPMAs, under this alternative, protecting all occupied or potentially occupied GRSG habitat and increasing the level of protection to all associated GRSG populations and sub-populations."

Comment:

Mineral entry withdrawals are normally permanent. The impacts of these withdrawals need to be analyzed for each alternative. Include the revenue to BLM that would be lost due to location and maintenance fees on claims (\$66 million in revenues to BLM in 2012); revenues and jobs lost to geologists and surveyors that locate, stake and file said claims (over \$100 million per year); revenues and jobs lost to those employed to perform exploration drilling on mining claims (over \$1 billion per year); jobs lost by people who manufacture, sell and maintain drill rigs used in mining (over \$2 billion year); jobs lost to people who write plans of operation; jobs lost to federal employees that record mining claims or review plans of operation; jobs lost to companies that would otherwise mine the minerals (this can be estimated from the mineral assessment data), jobs lost to BLM and state employees that inspect mines, and so forth. The direct and indirect losses to service industries, local and state government, fire stations, hospitals, schools and so forth needs to be

assessed. Also include the national security risks associated with said withdrawals. Once the mining know-how and exploration and mining equipment are gone, they cannot be retrieved without significant time and costs to society. The entire mining cycle in the US needs to be analyzed and the true impacts need to be revealed.

The same needs to be done for fluid minerals, saleable minerals, etc.

**Commenter1:** Karen Williams

**Comment Excerpt Text:**

4. Economic Impacts

In our estimation, the LUPA/DEIS seriously undermines the value of a grazing permit to the local and state economy. It also underestimates the socio-economic impacts of grazing permit reductions. The agencies must consider not only the environmental consequences in their analysis, but also the impacts to the human environment and economy, including grazing, mining, oil and gas and other multiple-use industries. If grazing permits are reduced as a result of this effort, the negative economic impact to rural communities would be significant and it is important that the final EIS acknowledge this.

**Comment Number:** IDMTSG-14-0178-20

**Organization1:** Idaho Cattle Association

**Commenter1:** Karen Williams

**Comment Excerpt Text:**

The LUPA/DEIS bases its economic review of the value of grazing permits based on “billed AUMs as a baseline, estimated as a multi-year average share of active AUMs...” (4-221). This analysis entirely fails to consider the value of a ranch to the local economy and the trickledown effect that a lost AUM causes to an entire rural community.

In Idaho, where well over half of the land is federally-owned, countless rural communities rely on public lands grazing for their tax base, commerce, and jobs. Few other industries in western rural communities are as stabilizing and longstanding. Ranchers provide seasonal and year-round jobs, bring steady, reliable business to local supply stores and other services, and provide a tax base for rural communities that have little other economic activity. In a study of one western rural community, for example, a 25% reduction in federal

grazing led to a 7.3% decrease in sales and a 6.4% loss of jobs (Rimbey et al., 2001)

---

**Comment Number:** IDMTSG-14-0178-21

**Organization1:**Idaho Cattle Association

**Commenter1:**Karen Williams

**Comment Excerpt Text:**

Use of the IMPLAN model may have resulted in an underestimation of the socio-economic impacts of the alternatives in the DEIS. In counties that are at capacity for grazing, removing grazing from federal lands will result in a reduction of AUMs for the entire year. As described by Torell (2010), “If the ranch is dependent seasonally on federal forage, a reduction in federal AUMs may create forage imbalances and produce a greater reduction in grazing capacity than just the loss of the federal AUMs.”

---

**Comment Number:** IDMTSG-14-0178-24

**Organization1:**Idaho Cattle Association

**Commenter1:**Karen Williams

**Other Sections:** 16.3

**Comment Excerpt Text:**

Considering that NEPA requires the agencies to weigh the socio-economic impacts of their decisions, it is abundantly clear, and this new study verifies it, that removing, or significantly reducing livestock grazing has a net negative impact on the species, the ecological balance and on the economy, not to mention the livelihoods of countless ranching families. Why then would the agency consider implementing any alternative that arbitrarily reduces grazing, thereby causing devastating impacts to the livelihoods of ranchers and the viability of local communities’ economies, while offering no measurable benefit to the ecology of the land and its species?

**Commenter1:**Brett Dumas

**Comment Excerpt Text:**

IPC's typical construction costs for overhead distribution lines range from \$80,000 per mile to \$150,000 per mile, and typical costs for underground distribution lines of comparable service range from \$500,000 to \$1.5 million per mile for an all-conduit system (which is IPC's standard). Underground lines also require aboveground facilities for terminating, switching, and transforming equipment. Pulling and splicing vaults may be located aboveground or belowground and are placed along the line as well.

---

**Comment Number:** IDMTSG-14-0183-39

**Organization1:** Idaho Power

**Commenter1:** Brett Dumas

**Comment Excerpt Text:**

cost is a major concern as electric utilities have mandates to serve customers with high quality, reliable electric service at the lowest cost possible. Idaho Power's typical construction costs for overhead distribution lines range from \$80,000 per mile to \$150,000 per mile and typical costs for underground distribution lines of comparable service ranges from \$500,000 thousand to \$1.5 million per mile for an all conduit system (which is Idaho Power's standard). These costs would be charged to customers. Consequently, the PUCs would have to make a ruling concerning such costs. Underground lines also require aboveground facilities for terminating, switching, and transforming equipment. The BLM should take into account all environmental, economical, and social impacts of undergrounding powerlines as a seemingly simple proposed mitigation measure in the LUPA/DEIS.

---

**Comment Number:** IDMTSG-14-0210-11

**Organization1:** NorthWestern Energy

**Commenter1:** Mary Gail Sullivan

**Comment Excerpt Text:**

Socioeconomics

NorthWestern Energy is concerned that the BLM's socioeconomic analysis in the DEIS is inadequate. Based on the current demand for energy, especially renewable energy such as wind in the western United States, the benefits of transmission lines outweigh impacts associated with the construction, operation and maintenance of properly sited and mitigated lines. NorthWestern Energy recommends that the BLM revise the socioeconomics section of the DEIS to include a discussion of the benefits of enhancing the reliability and redundancy of high-voltage transmission in the west.

**Comment Excerpt Text:**

7. Social impacts of proposed alternatives must be considered.

NEPA requires federal agencies to consider environmental effects that include, among others, impacts on social, cultural, and economic resources, as well as natural resources. Thus the BLM must consider both legal and social factors and impacts, in making land use decisions, such as setting and maintenance of AML and grazing allocations. This was highlighted in a 1982 National Academy of Sciences/National Research Council report on the BLM's wild horse and burro program:

“Attitudes and values that influence and direct public priorities regarding the size, distribution, and condition of horse herds, as well as their accessibility to public viewing and study, must be an important factor in the determination of what constitutes excess numbers of animals in any area . . . [A]n otherwise satisfactory population level may be controversial or unacceptable if the strategy for achieving it is not appropriately responsive to public attitudes and values. . . .

Biologically, the area may be able to support 500 cattle and 500 horses, and may be carrying them. But if the weight of public opinion calls for 1,000 horses, the area can be said in this context to have an excess of 500 cattle. For these reasons, the term excess has both biological and social components. In the above example, biological excess constitutes any number of animals, regardless of which class above 1,000. Social excess depends on management policies, legal issues, and prevailing public preference..”

The importance of social considerations was reaffirmed in the NAS report of 2013. (Attachment 4).

The prevailing public preference for protecting wild horses and burros in any sage grouse conservation plans can be seen by the more than 7400 public comments that have been submitted on this LUP/EIS, along with recent polls that show 72% of Americans support protecting wild horses and burros on public lands, while just 29% want public lands used for livestock grazing. (Attachment 5).

These social impacts must be analyzed when considering any alternatives that could result in a reduction of wild horse and burro population numbers.

**Comment Excerpt Text:**

If I were to lose even a portion of the AUMs that I use on BLM/FS, my operation would no longer be viable. BLM/FS must study the impacts of the unintended consequences to sage-grouse from reduced livestock grazing on public lands.

---

**Comment Number:** IDMTSG-14-0263-1

**Organization1:**

**Commenter1:**Glenda Gammett

**Comment Excerpt Text:**

The agencies, in choosing the final alternative, must consider all, the economic impacts as well as the environmental impacts. Not only is the ranching industry impacted, mining, oil and gas, hunting, tourism, and other multiple industries are impacted. If one of the radical alternatives is selected that drastically reduces or eliminates grazing it will impact everyone economically as the livestock industry loses their grazing capabilities and cattle numbers are reduced. The dollars generated by ranchers also generate a lot of income throughout the communities. Also, beef and all the by products of beef will be reduced thus creating higher prices for consumers for food and a lot of other products.

---

***Summary***

The socioeconomic analysis in the DEIS is overall broad and does not provide sufficient analysis of impacts to individuals, local communities or counties. The DEIS should also expand analysis of the restrictive management actions on planning area operators, communities and services including but not limited to grazing operators and mining.

Finally, the analysis methodology is inadequate to provide a comprehensive analysis of direct, indirect, and cumulative analysis of the socioeconomic impacts on the planning area communities.

---

***Response***

The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

[BLM provide input on why county level analysis was not completed]

Impacts were considered on numerous resources, resource uses, and socioeconomic conditions, which included [list noted issues]. See Section 4.22 of the Draft EIS.

The DLUPA/EIS describes the methodology and assumptions used for conducting the impact analysis (see

Section 4.22.2 of the Draft EIS). The methodology and assumptions provide an adequate starting point for discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.24, the DLUPA/EIS identified methodologies used and made reference to the scientific and other sources relied upon for conclusions in the analysis. Based on these methodologies and assumptions, the DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

[Add language on budget issues as appropriate: As a landscape level planning effort, none of the alternatives prescribe project specific analysis on BLM or USFWS managed lands. Furthermore, the agencies' selection of an alternative does not authorize funding to any specific project or activity nor does it directly tie into the agencies budgets as appropriated annually through the federal budget process. As a consequence, agencies' costs and differences in differences in program costs across alternatives have not been quantified. Information has been presented in several resource impacts sections on the types of costs that might be associated with various sage-grouse conservation measures]

We ask that all BLM and Forest Service actions include proper recognition of the agreement behind the 3-State OHV and National Route Designation decisions which allow continued use of the existing networks of motorized roads and trails without massive motorized closures.

**Comment Number:** IDMTSG-14-0049-14

**Organization1:**Greater Yellowstone Coalition

**Commenter1:**Barb Cestero

**Comment Excerpt Text:**

On federal lands in the planning area, there are currently close to 14,000 miles of roads in preliminary priority habitat for sage-grouse and another 4,400 miles in preliminary general habitat. DEIS at 3-85. We propose that the LUPA prohibit the construction of new roads in areas specially designated for sage-grouse and

additionally provide for closing and reclaiming roads as opportunities arise.

---

**Comment Number:** IDMTSG-14-0049-15

**Organization1:** Greater Yellowstone Coalition

**Commenter1:** Barb Cestero

**Comment Excerpt Text:**

At a minimum, we propose that all recreational travel should be limited to existing roads and trails in all areas specially designated for sage-grouse protection. For BLM lands where a LWC designation is used to protect sage-grouse habitat, motorized recreation should be prohibited and existing roads and trails closed to OHV use.

---

**Comment Number:** IDMTSG-14-0049-16

**Organization1:** Greater Yellowstone Coalition

**Commenter1:** Barb Cestero

**Comment Excerpt Text:**

To further lessen the impacts of motorized recreation on sage grouse, the Forest Service and BLM should also consider additional seasonal restrictions in areas with active leks (for example, seasonal closures of trails otherwise open). Roads and trails not designated for motorized recreation within designated areas should be obliterated and restored to native vegetation to improve sage-grouse habitat. Further research into the impacts of recreational use on sage-grouse is warranted.

---

**Comment Number:** IDMTSG-14-0049-30

**Organization1:** Greater Yellowstone Coalition

**Commenter1:** Barb Cestero

**Comment Excerpt Text:**

In general sage-grouse habitat, the LUPA should recommend restoring and reclaiming closed or unused roads and trails. Even if these roads are no longer used, roads and trails may be avoided by sage-grouse as they are more vulnerable to predation in these open spaces. Additionally, cross-country OHV travel may impact sage-grouse by disturbing leks, nesting sites, and through direct mortality. We request that all OHV travel in sage-grouse habitat is restricted to designated trails. Additionally, because illegal user-created trails off of designated trails is a reasonably foreseeable impact, we request that no trails are designated within three miles of known existing or active leks.

Vol 2, Page 2-158 & Page 2-66: Alternative D and E-Travel Management

Both alternatives rely on a blanket restriction on motorized use to existing roads and trails until travel management planning is completed. However, access for administrative use and, in the case of permittees, access to accomplish necessary and/or required maintenance is not exempted in the interim period. Furthermore, at least some existing travel management plans have not recognized and adequately provided for administrative/management access.

**Organization1:**

**Commenter1:** Thom Seal

**Comment Excerpt Text:**

We strongly disagree with the any other Proposed Alternative. Do not limit motorized travel for ranchers to access their grazing allotment to inspect vegetation and salt their livestock, as well as for miners to access their claims, and for exploration of valuable mineral deposits. These roads are also important for off road recreation vehicles (ORV). Many of these roads lead to old pioneer grave sites. Also a lot of our people have their loved ones ashes buried in these remote sites only accessed by these roads and trails. This is part of the Custom and Culture of the western US. The roads for the most part existed before the creation of BLM/USFS and therefore fall under RS2477 and are under the Counties jurisdiction and control.

---

**Comment Number:** IDMTSG-14-0143-1

**Organization1:** Twin Falls Highway District

**Commenter1:** Scott Allen

**Comment Excerpt Text:**

[specifically referring to Twin Falls Highway District roads]. In order to maintain roadways, both asphalt and gravel surfaced, we need to access our various material sources. Some of these sources, along with the access roads, are located within habitat areas. What is proposed for continued access to our material sources to allow TFHD to provide perpetual maintenance and operation of our roadways?

2. The roadways within our system, which are located within habitat areas, are used by sportsman, ranchers, private land owners and recreationalists. It should be noted that these roads are also used by governmental agencies, such as BLM, Forest Service, Fish & Game, etc...for access to public lands necessary to complete their own studies and maintenance.

Are the TFHD roads providing service to the aforementioned people and agencies going to be closed, seasonally or permanently, or will they remain on an open basis annually? This decision has a tremendous impact on our annual maintenance planning and budgetary allocations.

3. Part of our normal roadway system maintenance is to maintain cross-drains under our roads. If roadways are to be closed seasonally this would prohibit TFHD from maintaining the roads and drain systems on an as needed basis. If the roads are closed seasonally how do you propose that TFHD maintains the aforementioned drains?

**Organization1:** Idaho Cattle Association

**Commenter1:** Karen Williams

**Comment Excerpt Text:**

The final LUP/EIS needs to contain language allowing for off-road travel for administrative use by grazing permit holders. Travel restrictions should not impact the ability of permittees to access and manage allotments.

---

***Summary***

The Draft EIS/LUPA failed to consider a full suite of travel management-related management actions that would protect sage grouse habitat while allowing for continued administrative access, particularly for existing livestock grazing permittees. Commenters proposed that management actions should be included in the proposed plan to prohibit and reclaim/restore roads in GRSG habitat, limit motorized events, close PPHP to OHV use, apply additional seasonal travel restrictions, and apply a maximum route density within proximity of leks in PPH and PGH. Commenters also requested that proposed management actions preserve motorized access on existing routes per the 3-State OHV and National Route Designation decisions and maintain administrative access in grazing allotments.

---

***Response***

Section 1.4 of the Draft EIS describes how the Idaho Montana GRSG LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA. The BLM and Forest Service complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft LUPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions from the field office RMPs are acceptable and reasonable. In these instances, there was no need to develop alternative management prescriptions.

During subsequent implementation-level travel management planning new travel management plans would evaluate vehicle routes and determine the need for permanent or seasonal road closures, and mode of travel (e.g. motorcycle, ATV, and UTV) restrictions, including noise levels and speed. The route designation process will be completed as subsequent implementation level planning using current Travel Management policies and will include public and local agency involvement. Addressing these issues at the implementation level allows the BLM and Forest Service to take new information into account as it becomes available.

Needs for administrative access to valid existing rights, grandfathered uses, or permitted activities would taken into consideration during site-specific NEPA analysis. Restrictions applied to recreational OHV use may not apply to permitted administrative uses.

The BLM and Forest Service have not added a restriction that would limit road densities to less than 0.09 km per km squared (Wisdom et al. 2011) in GRSG habitat because the threshold established by Wisdom used coarse road data. When taking into consideration actual road density information, use of this threshold is not appropriate. The BLM and Forest Service have included surface disturbance thresholds, which would restrict the density of disturbance tied to new and existing roads in GRSG habitat.

**Organization1:**Idaho Power

**Commenter1:**Brett Dumas

**Comment Excerpt Text:**

Pg. 2-41, Table 2-3, Travel and Transportation

Alternatives D and E would be the same as Alternative B which would “Designate all occupied habitat as limited to existing roads and trails until travel management planning is completed. At that time, all occupied habitat would be limited to designated routes.”

The BLM’s travel management planning process would not start until after this NEPA process is complete. Given the BLMs current work load and time spent on recent RMP amendments and Travel Management Plans (TMP), it is unlikely that the BLM will have completed TMPs in the near future. Existing authorization holders will likely need to create new access to existing facilities (e.g., reroute around a land slide or to avoid another sensitive biological or cultural resource) and create new access to new facilities. The ban on new roads until a TMP is completed will prevent projects that meet all of the other criteria from moving forward.

---

**Comment Number:** IDMTSG-14-0183-35

**Organization1:**Idaho Power

**Commenter1:**Brett Dumas

**Comment Excerpt Text:**

Pg. 4-16, 3rd para.

Road densities have been directly correlated with GRSG persistence. Compared with occupied GRSG range, extirpated range was 60 percent closer to highways and had 25 percent higher road densities (Manier et al. 2013 citing Wisdom et al. 2011). Within the GRSG range, 95 percent of the mapped sagebrush habitats are within 1.6 miles (2.5 kilometers) of a mapped road; density of secondary roads exceeds 3.1 miles per 247 acres (5 kilometers per square kilometer) in some regions (Knick et al. 2011).

Wisdom et al. (2011) conducted a correlative study where cause and effect cannot be determined. Various anthropogenic factors are likely to co-occur (autocorrelated) and individual contributions of these factors could not be isolated. Therefore, correlations between road densities and GRSG persistence should be interpreted with due caution.

---

### ***Summary***

For various reasons, commenters assert that the Draft EIS/LUPA does not adequately analyze the impacts of proposed management actions on travel management. For example, commenters contend that the analysis is not based on sound science or is narrowly focused and biasedly uses studies that only demonstrate the negative effects from OHV use; does not adequately describe the magnitude of OHV vs. “naturally occurring” impacts across alternatives; and does not distinguish between motorized and non-motorized impacts. Commenters further request the BLM/FS consider conducting site-specific studies to support proposed management and assert that there would be indirect effects (e.g. ban on new road construction) incurred by existing ROW authorization holders by deferring travel management planning.

---

### ***Response***

As described in Section 4.6 of this comment report, the LUPA/FEIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. Further, as described in Section 4.4. of this comment report, the BLM used the most recent and best available information that was relevant to a land-use planning-level analysis.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29). The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

The mechanism being used to determine landscape level travel area designations (open/limited/closed) is 43 CFR 8340 which regulates OHV travel on public lands. BLM does not have a similar regulation for non-motorized travel. Non-motorized travel can be regulated through supplementary rules. Supplemental rules and site specific route designations will be addressed at the implementation level in the future.

New construction related to power line access would be exempted under 43 CFR 8340.05 (3).

While multiple studies on OHV use have been cited, BLM is using the BLM Travel Management Manual and Handbook (M-1626 & H-83421) to address travel planning in the EIS and will continue to use the same policy for future implementation and planning.

### **Comment Excerpt Text:**

Oil and gas leasing has high potential to destroy and fragment important GRSG, especially in the Bear Lake Plateau, Idaho and region between Lima to Dillion, Montana. This has been well demonstrated in areas with Oil and Gas reserves. Therefore, the first bullet on page 2-12 should be stricken from “Management Common to All Action Alternatives (Alternatives B, through F)” as this action is in direct contradiction to the purpose and need for the LEIS and would contribute to further losses of opportunities for Tribal members to exercise

off-reservation rights to hunt, fish, and gather.

---

**Comment Number:** IDMTSG-14-0236-3

**Organization1:** Shoshone-Bannock Tribes

**Commenter1:** Cleve Davis

**Comment Excerpt Text:**

Unless the BLM and FS take drastic measures to conserve the GRSG habitat there will be high likelihood of extinction. This would have a direct impact upon subsistence activities and uses of the GRSG by the Shoshone-Bannock Tribes. Considering this, we support Alternative C, but only if the management allow us opportunities to freely access the public domain, exercise our off-reservation Treaty rights, and continue our traditional customs and practices. Therefore, the LEIS and Record of Decision must acknowledge and honor the rights, customs, and practices of the Shoshone-Bannock Tribes. We also feel that the other alternatives would result in continued loss of subsistence opportunities through the degradation and fragmentation of sagebrush habitat by management actions associated with the alternatives.

---

***Summary***

The BLM must ensure tribes, in particular the Shoshone-Bannock Tribe, maintain opportunities to access the public domain, exercise off-reservation treaty rights, and continue their traditional customs and practices.

---

***Response***

The BLM, Forest Service recognize their responsibility to consider potential impacts to Tribal resources.

Article 4 of the Fort Bridger Treaty, signed in 1868, retains the Eastern Band Shoshone and Bannock Tribes' rights to hunt, fish, gather natural resources, and provide other associative right necessary to effectuate these rights. Other treaties ensure similar rights for other tribes.

Additionally, we strongly encourage the agencies to use sagebrush “treatments,” including prescribed fire and herbicides, sparingly. There is very little data that points to the benefits of these so-called treatments, and the short-term impacts appear inarguably detrimental to sagegrouse.

---

**Comment Number:** IDMTSG-14-0100-2

**Organization1:**

**Commenter1:**Justin Naderman

**Comment Excerpt Text:**

Restoration of sagebrush steppe to provide seasonal sage grouse habitat is wanting in all alternatives. There is a high probability that sage grouse will be listed unless there is a commitment to restore ‘X’ number of acres of sagebrush steppe per year that will meet all the seasonal needs of sage grouse.

All of the alternatives emphasize control of invasive species through various treatments – mechanical, chemical, and grazing management. However, this is what the agencies have been doing without success. Control of invasive species should be considered just one step in the restoration process and not the only or final step.

Most of the invasive species have been dominant on the landscape for an extended period of time. Consequently, the soil seed bank of the invasive species so overwhelms the soil seed banks of desirable native plant species that they cannot become established after the invasive species control.

**Commenter1:**Erik Molvar

**Comment Excerpt Text:**

We strongly urge the federal agencies to prohibit vegetation treatments in Priority Habitats except where they are consistent with maintaining optimal sage grouse habitat (NTT 2011). There is a growing scientific consensus that burns and mechanical treatments are deleterious to sage grouse. The agencies also need to

assess non-native seedings and restore them to native vegetation if this is the most optimal option for sage grouse habitat, as has been proposed under the Northwest Colorado RMP Amendment Preferred Alternative. BLM and the Forest Service should also adopt a requirement for grazing exclosures and long-term monitoring following vegetation treatments. It is important to rest burned areas from livestock grazing for 3 full seasons following disturbance

---

**Comment Number:** IDMTSG-14-0153-42

**Organization1:** Wild Earth Guardians

**Commenter1:** Erik Molvar

**Comment Excerpt Text:**

BLM asserts that junipers have been expanding into sagebrush habitats as a result of fire suppression over the past century. This is a somewhat dubious claim, given that sagebrush also is eliminated by natural fire, and is contradicted by the management priority of suppressing natural fires in sagebrush habitat. Although natural fire may well have modified distribution of both sagebrush and juniper in presettlement times, such fires were infrequent (as noted elsewhere in these comments). In addition, BLM's presumed management strategy of mechanical removal of junipers, while perhaps beneficial to sage grouse if done in a non-invasive way (i.e., removal of the entire tree from the site), has no natural counterpart under reference conditions. Instead of focusing exclusively on fire as a mediator of juniper spread, BLM should also examine the effects of radical increases in ungulate grazing that have occurred with the onset of large-scale ranching in this area, which could potentially confer competitive advantage on junipers through the removal of both grasses (cattle) and sagebrush (sheep).

**Organization1:** Wild Earth Guardians

**Commenter1:** Erik Molvar

**Other Sections:** 7.7

**Comment Excerpt Text:**

Minimizing the use of herbicides inside sage grouse habitats, and using them as a last resort, is also a good approach for sage grouse Priority Habitats. We are concerned that aerial applications of herbicides and pesticides are reasonably foreseeable in the planning area. Insects are an important food source for sage grouse; this is particularly true during the early brood-rearing phase. Insecticide application could not only sicken or kill grouse directly, but it could also deprive them of an important food source. Aerial herbicide and pesticide applications should be precluded within one mile of sage grouse habitats to avoid inadvertent poisoning of sage grouse. Although the use of Plateau in heavily cheatgrass-infested areas might be allowed in cases where sage grouse are not using the treated habitats, aerial spraying of herbicides and insecticides over or within one mile of sage grouse habitats should not be allowed. Hand spraying might be accomplished by deliberately driving grouse off by teams on foot prior to treatment, and by treating from backpack units rather than aerial or truck/ATV application

**Comment Excerpt Text:****Non-native/Invasive Plant Species**

The COT objective is to maintain and restore healthy, native sagebrush communities. Both Alternatives D and E propose to implement similar conservation measures to address this objective. We need additional clarity for both Alternative D and E as to site-specific actions to meet the COT objective. Both preferred alternatives have appropriately identified the need to work more extensively at a local scale to coordinate and implement actions that will result in improved wildfire and invasive species management strategies. As discussed above for fire, inclusion of commitments to implement conservation projects identified in the step-down assessments will be needed to increase our certainty that actions, necessary for GRSG conservation, will occur. The subsequent incursion of invasive nonnative plant species after fire events is extremely difficult to manage. However, as described above for fire, the State has developed a comprehensive strategy including legislative changes and funding that will directly address fire and the potential subsequent invasion of annual grass species

**Comment Number:** IDMTSG-14-0242-23

**Organization1:**U.S. Fish and Wildlife Services

**Commenter1:**Dennis Mackey

**Comment Excerpt Text:****Sagebrush Removal**

The COT objective is to avoid sagebrush removal or manipulation in sage-grouse breeding or wintering habitats with minor exceptions. Appropriate regulatory and incentive-based mechanisms will be needed to encourage the maintenance of sagebrush. Alternative D proposes conservation measures that directly addresses this and meets the COT objectives. Alternative E does not propose conservation measures that directly address this threat and is currently inconsistent with the COT

**Comment Number:** IDMTSG-14-0242-25

**Organization1:**U.S. Fish and Wildlife Services

**Commenter1:**Dennis Mackey

**Comment Excerpt Text:****Pinyon-Juniper Expansion**

The COT objective is to remove pinyon-juniper from areas of sagebrush that are most likely to support sage-grouse (post removal) at a rate that is at least equal to the rate of pinyon-juniper incursion. Both Alternative D and Alternative E are similar in addressing this threat. We recommend the selected alternative identify a rate at which treatments should be implemented to meet the COT objective. Additionally, removal of pinyon-juniper trees encroaching within 1000 meters of a lek should be the highest priority.

**Comment Number:** IDMTSG-14-0325-9

**Organization1:**

**Commenter1:**William J. Mulder

**Other Sections:** 26.5

**Comment Excerpt Text:**

[This comment corresponds to the headings in Table 2-17 and Table 2-18] Integrated Invasive Species. Loss of habitat due to invasive species was identified as a primary threat to GRSG by FWS. The only "action" proposed by Alternatives B, C, D and F is to mention GRSG habitat (D-IIS-1), to monitor and treat areas

"associated with existing range improvements" (B-IIS-4) and to regulate project construction (in D-IIS-5).

Other than these, management of integrated invasive species is essentially no different than BLM's existing policy which has been detrimentally ineffective for various reasons. Further, BLM's efforts at integrated invasive species eradication have been opposed by groups closely associated with Alternatives C and F.

Given the relative importance of this threat as identified by FWS, NTT and USGS, BLM should commit to a program that actively plans, funds, executes and monitors large-scale integrated invasive species infestation eradication projects in a measurable timeframe. Alternatives A, B, C, D and F fail to do this.

### ***Summary***

Commenters recommended that the preferred alternative include:

- Specific vegetation treatment acreage objectives
- Passive sagebrush restoration
- Limitations on vegetation treatments in sagebrush areas. To meet COT report objectives, include regulatory mechanisms to avoid sagebrush removal or manipulation in sage-grouse breeding or wintering habitats with minor exceptions.
- Establish Priorities for pinyon-juniper removal including reduced grazing in conjunction with pinyon-juniper treatment.
- Restore non-native seedings to increase GRSG habitat
- Apply additional restrictions for herbicide application in GRSG habitat
- Commit to a program to plan, fund, execute and monitor large scale integrated invasive species infestation and eradication projects in a measurable timeframe.
- Include specific objectives to measure success in invasive species eradication

### ***Response***

As described in Section 4.3, the ID/SWMT LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA.

Some of the recommended components were addressed in the DEIS and additional info will be included in the FEIS as detailed below.

- Specific vegetation treatment acreage objectives [need National Policy team input- to decide how treatment objectives will be incorporated]
- Passive sagebrush restoration: In the DEIS Alternative C and management changes that allow progress towards standards and guidelines allow for passive sagebrush restoration. In some areas passive restoration may not be sufficient to improve GRSG habitat and active restoration may be necessary (Davies et al. 2011) (see pp 4-54 DEIS [- check page]).
- Limiting vegetation treatments in sagebrush areas is covered under Alternative D ([provide pg reference]. To meet COT report objectives, include regulatory mechanisms to avoid sagebrush removal or manipulation in sage-grouse breeding or wintering habitats with minor exceptions. [include info from FEIS specific to meeting COT report objectives if appropriate])
- Establish Priorities for pinyon-juniper removal including reduced grazing in conjunction with pinyon-juniper treatment: Priorities for PJ removal are addressed in the DEIS ([check that preferred alt includes removal within 1000m of leks per COT report objectives, if not explain rational])
- Restore non-native seedings when beneficial to GRSG habitat: Alternative C in the DEIS supports restoration of native vegetation to areas that have been seeded with non-native species when beneficial to GRSG [site mgmt. action]. The preferred alternative provides direction for restoring non-native seedings. [provide mgmt. action number and check language to refine if needed in mgmt. action]

- Apply additional restrictions for herbicide application in GRSG habitat: Herbicide/Pesticide BMPs are covered under the Veg treatment PEIS (BLM 2007x). The IDMT GRSG EIS tiers to the analysis in this document.
- Commit to a program to plan, fund, execute and monitor large scale integrated invasive species infestation and eradication projects in a measurable timeframe. Include specific objectives to measure success: This EIS is intended to provide treatment methods, priority and objectives and the conditions under which these treatment objectives would occur. Specifics regarding treatment effectiveness, funding and implementation would be covered in site specific management actions. BLM and Forest Service would follow agency specific monitoring requirements.

### **Comment Excerpt Text:**

There have been recommendations made that when sagebrush canopy cover exceeds certain percentages it be treated back to a 15% canopy cover in nesting habitat and 80% of nesting habitat be maintained between 15-25% canopy cover. This is not reasonable in our area. You need to get back to an early seral condition in order for the grasses and forbs to build root mass and vigor allowing them to compete longer with sagebrush when it returns to site potential. To short circuit this process will only lead to unsustainable sagebrush ecosystems that will eventually lose their grass and forb components and possibly end up as perennial grasslands. We as managers are obligated to manage to enhance the sustained productivity of the sagebrush rangelands. Any alternative should have that goal and not limit the tools necessary to accomplish this task.

**Comment Excerpt Text:**

Most of the research driving habitat guidelines developed through WAWFA and the NTT were done on arid Wyoming Big Sagebrush and shorter sagebrush habitats. These sagebrush habitats recover from disturbance much slower than sagebrush in mesic sites with good soils. The WAWFA and NTT authors admit they reviewed little research about the management of Mountain Big Sage on mesic sites for long term sustainability. In the Upper Snake there are thousands of acres of superb nesting habitat on mesic Mountain Big Sage sites that is important. These sites have some of the most robust sagebrush growth and productive GRSG habitats in Idaho. Some of this area is on Sheep Station land north of Dubois and scientists have compiled years of research on treatment and grazing of Mountain Big Sage stands in a mesic setting. A research paper is currently being peer reviewed that indicates Mountain Big Sage habitat in this setting returns to climax condition on average in 18.33 years after treatment with prescribed fire. In 1989, 1991, and 1993 we used prescribed fire to manage Mountain Big Sagebrush stands on a 5500 acre BLM allotment. When an EA was done for permit renewal in 2013, the areas treated carried sagebrush canopy covers of 44%, 25% and 18% after being burned 24, 22 and 20 years previously. After managing over 20,000 acres of mountain big sagebrush habitat in the Spencer, Kilgore, Shotgun areas for over 40 years using fire and herbicide treatments repeatedly, our habitat is native, intact and productive as GRSG habitat meeting the WAWFA guidelines for sagebrush cover and exceeding the guidelines for native grasses and forbs. We need to manage these stands to keep them sustainable and prevent fuel loading. Prescriptive management regulations in the LUP/EIS need to give the agencies and lessees the adaptive management to manage site specific sagebrush habitats.

**Comment Excerpt Text:**

Range renovation must not be included under the disturbance cap or in a no non mitigated disturbance scenario as proposed in Alternative D. On the lower elevations of the GRSG habitat that we manage, there are healthy stands of other brushes that are sprouters (antelope bitterbrush, chokecherry, shiny leaf ceanothus, and snowberry) and increase when burned. Some habitats in areas along the Red Road are carrying total brush canopy covers over 50% and need to be treated. Under this scenario herbicide would be the best choice. We have been using herbicide because the liability of fire is too great, we can control these sprouters better (including Three Tip sagebrush), we have absolute control of what is treated, and with heavy fuel loads fires get hot and can do more damage to the native seed bank. We see minimal impact on forbs in two or three years after herbicide treatment. Terrain and lava flows prohibit mechanical treatment.

Anyone familiar with the sagebrush steppe across southern Idaho can point to the numerous restoration attempts that have failed for one or more reasons. Many associated with the management of sagebrush steppe across southern Idaho can also tell you about the few projects that were successful. Unfortunately, probably no one can explain why the few projects were successful. Agency's record the kind of equipment used and who the contractor was but fail to document pre-existing conditions, soil types, seedbed condition, seed placement, etc. Some will argue that restoration of sagebrush steppe across southern Idaho is prone to failure. If this argument is accepted, sage grouse will become listed sometime in the future.

The key to understanding the factors that will consistently result in successful restoration of sagebrush steppe (big sagebrush species and native perennial forbs and grasses) across southern Idaho is conducting basic plant/seed physiology and agronomy research. Forget about the kind of equipment used and focus on the seedbed preparation and seed placement. Study seedling growth and development under different seedbed preparations, seed placements, moisture regimes, and soil types. Document the soil moisture conditions before and changes in moisture after seeding. Document soil seed banks before seeding and seedling reestablishment after seeding. We cannot continue to spend millions of dollars throwing seed out there in hopes that the next time will be more successful. Start with the necessary documentation and research to ensure future seeding is consistently successful.

"70 percent of an area should be in 10 to 30 percent sagebrush canopy cover to meet GRSG sagebrush habitat objectives. "

Comment:

The 70 percent figure comes directly from the NTT Report. The NTT presents no scientific data that a one-size-fits-all goal of 70% sagebrush cover is scientifically defensible, achievable, would result in stable sage grouse populations, would not result in irreparable harm to other species, and would not negatively affect local economies.

**Comment Excerpt Text:**

Cheatgrass incursion in sagebrush steppe began in the 1850s with the introduction of domestic livestock, which trampled the biological soil crust that occupied the interspaces between native vegetation (Mack 1981) and facilitated the species' spread. Intact, lichen-dominated biological soil crusts can significantly inhibit germination and root penetration of cheatgrass (Deines et al. 2007), while the presence of cheatgrass can negatively affect biological soil crust richness and cover (Ponzetti et al. 2007). Moss-dominated biological soil crusts may also effect germination of annual grasses, including cheatgrass (Serpe et al. 2006). The diversity, cover and resiliency of biological crusts are positively correlated to low abundance of cheatgrass, low level of soil disturbance and high moss cover (Ponzetti et al. 2007). Shinneman et al. (2008) discovered that herbaceous and biological soil crust cover and species richness and diversity were generally greater on ungrazed than grazed areas in semi-arid shrubsteppe in western Colorado. Reisner et al. (2013) found that livestock contribute to the spread of cheatgrass by trampling the soil crust.

Native bunchgrasses in sagebrush steppe, such as bluebunch wheatgrass and Idaho fescue, also require rest after being grazed during the growing season. Hormay and Talbot (1961) designed rest-rotation grazing to allow recovery after each grazing session, allowing sensitive native bunchgrasses to recover their vigor. Other BLM and USFS researchers have provided guidance for recovery of native bunchgrasses that may require multiple years of rest to restore vigor (Anderson 1991; Mueggler 1975). Anderson and Inouye (2001) working in sagebrush steppe in southern Idaho determined that native perennial grasses were recovering after 45 years of livestock exclusion and the increasing trend of these native grasses was inversely correlated to non-native invasive species such as cheatgrass.

Tall, dense, vegetational cover may provide scent, visual and physical barriers to predation on nesting

sage-grouse hens, sage-grouse nests and chicks, and may enhance nest success (Gregg et al. 1994; Herman-Brunson et al. 2009). Holloran et al. (2005) also found that taller, thicker residual grass cover in dense sagebrush with moderate-high canopy cover (up to 40 percent) appears to increase the probability of sage-grouse nest success. Their research indicated that herbaceous cover and height were more important than shrub cover or height to nest success (Holloran et al. 2005; see also Rebholz 2007). Rebholz (2007) similarly found that increased grass cover improved the likelihood of nest success. Hagen et al. (2007) conducted a quantitative meta-analysis of existing research on greater sage-grouse nesting and brood-rearing habitat and confirmed that female sage-grouse typically select nesting sites with greater sagebrush cover and grass height compared to random locations, and that brood areas usually had less sagebrush, taller grasses, and greater forb and grass cover than at random sites.

Although Strand and Launchbaugh (2013) is a useful review, planners should beware of its limitations. It fails to acknowledge that sagebrush systems in the Intermountain West evolved with little herbivory by large, hooved mammals and that grazing fundamentally affects ecosystem processes in sagebrush steppe. It does not acknowledge the role of biological soil crust in impeding cheatgrass incursion or the negative effects of grazing on soil crust. The review suggests that livestock removal and trampling of understory vegetation and plant litter (including in early spring) can help reduce fire fuel loads, but this could be deleterious to sage-grouse. As the draft Idaho/SW Montana plan acknowledged, “[r]esidual cover, especially grass and litter, has often been noted as essential for GRSB for concealment during nesting and brood-rearing” (vol 2, 4-8, citing Sveum et al. 1998; Kirol et al. 2012). Grazing during the dormant season, which is also recommended by Braun (2006, unpublished)

Control of invasive species has a direct correlation with controlling wildfires. For the reasons mentioned above, grazing can be used as a tool to reduce many of the invasive species which also serve as fine fuel loads for fires. Peer-reviewed studies have proven that when rangeland is burned, it is much less prone to invasion by annual invasive weeds like cheat grass if it has been grazed (Davies, 2009). Due to reduced fuel loads and cooler burn temperatures, grazed rangeland is more likely to reestablish native bunch grass communities, while burned ground that has not been grazed is more likely to establish cheat grass communities. In light of these findings, appropriate grazing should be recognized in the RMPA as a primary tool in the prevention of wildfire and reduction of invasive weeds—two of the primary threats to sage grouse habitat. Diamond et al. (2009) found that targeted grazing may be a critical tool for breaking the exotic annual grass-fire cycle by decreasing the probability of fire disturbance.

Additionally, Diamond et al. (2009) found that, on areas already invaded by exotic annual grasses, strategic grazing could reduce fuel loads and continuity enough to prevent a flame front from carrying across the treated areas, even under peak fire conditions. Ample research, including that of Olson and Lacey (1994) and Walker et al. (1994), has found livestock grazing to be an effective tool for the control of invasive plant communities.

Encroachment of another species, pinion juniper, also poses a primary threat to sage grouse. Conifer encroachment is detrimental to sagebrush obligate wildlife because of the loss of sagebrush, fragmentation of sagebrush habitats, potential decreases in herbaceous forage, and increased predation (Connelly et al., 2000; Miller et al., 2005). The trees use significantly more water and out-compete bunchgrasses, forbs and sagebrush as they grow. This reduces forage for sage grouse as well as for livestock. To combat this, ranchers have partnered with NRCS to remove early-phase invading conifers. They have contributed to the treatment 200,000 acres of lands range-wide in core habitats. Again, refer to Attachment 2 for just one of many examples of these efforts. The LUPA/DEIS should focus on encouraging more such public/private partnerships for juniper removal.

Pg. 4-69, 5th para.

Depending on the species and the size of a burn, sagebrush can reestablish itself within five years of a burn, but a return to a full pre-burn community cover can take 15 to 30 years (Manier et al. 2013, pp. 133-134).

According to Bukowski and Baker (2013), historical fire rotations were estimated at 171-343 years for Wyoming sagebrush (*Artemisia tridentata tridentata*) and 132-217 years for mountain big sagebrush (*Artemisia tridentata vaseyana*). The authors conclude that historical sagebrush landscapes were complex, often dominated by large expanses of mature sagebrush that varied in density, but with finer-scale sagebrush mosaics, recently burned areas, and significant areas of sagebrush with trees. These landscapes fluctuated over decades to centuries at both local and landscape scales. Given this information, it is unlikely that sagebrush can return to a full pre-burn community cover 15 to 30 years after a burn

The BLM ID SG EIS bases its current habitat analysis on what is referred to in a Footnote in Table 3-4 as info coming from the Idaho Governor's Sage Grouse Task Force in 2012. EIS Table 3-4 Col. 1, "Existing condition based on **modeled vegetation**" has a footnote showing the info came from the ID Gov Task Force.

I assume this is the source of the info?

<http://cloud.insideidaho.org/webapps/search/search.aspx?searchterm=sage%20grouse>

Does this information specifically identify all areas of crested wheat/Siberian wheat seedings undertaken by BLM? This includes forage seedings, as well as post-fire ESR seedings. If not, where can we obtain this information? Who do we contact in BLM if we have questions about vegetation info used, and how it was categorized? For example, in looking at page 3-13 of the EIS "Existing condition of modeled vegetation in east central Idaho", it shows 97% of the mountain big sage, and 92% of the Wyoming big sage in East-central ID have 10-30% canopy cover. How was this arrived at? Given that there are large areas of rabbitbrush or other veg types? Is it ONLY the undisturbed vegetation shown here. And if that is the case, how much land area that should naturally be occupied by these vegetation types does not fit the 10-30% mold?

---

### **Summary**

The DEIS fails to provide adequate baseline information related to sagebrush vegetation. Commenters questioned the source of BLM data and requested the FEIS utilize additional baseline data on cheatgrass extent and evaluate effectiveness of continuing programs against weeds and juniper encroachment. Commenters provided additional literature to consider. Commenters also advocated an adaptive approach to vegetation management based on site-specific habitats.

---

### **Response**

As described in Section 4.4, the BLM and FS considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land use plan-level.

Adaptive management would be incorporated into vegetation treatment and restoration programs under Alternatives D and E. Adaptive management would allow BLM increased flexibility to adjust programs based on data collected during operation, to respond to changing conditions and improve effectiveness of vegetation management programs.

[BLM: provide direction if any change to analysis is necessary. Notes during cmt response mtg: Clarify use of 70% cover from NTT; update EIS with new rare plant list.]

Change to make: Footnote in Table 3-4 change source to – ID team input and EIS vegetation model. Cite the VDDT appendix.

The BLM and Forest Service has clarified the vegetation modeling and data sources in Chapter 3. [Insert details regarding location and changes made]

VEGETATION [This comment corresponds to the headings in Table 2-17 and Table 2-18]

Habitat Restoration.

C-VG-10 is shortsighted as this would eliminate livestock water sources, eliminate options to move livestock water area away from viable springs/seeps, and possibly dry-up water sources for livestock, GRSG and other wildlife.

---

**Comment Number:** IDMTSG-14-0325-8

**Organization1:**

**Commenter1:** William J. Mulder

**Comment Excerpt Text:**

[This comment corresponds to the headings in Table 2-17 and Table 2-18] C-VG-11 is shortsighted in trying to eliminate crested wheatgrass. Crested Wheatgrass and other nonnatives may have potential to restabilize areas where native seed is unlikely to survive or is unavailable; it may out-compete invasives; and it is also beneficial as a preferential alternative forage source for cattle and wildlife, leaving native grasses and forbs more available for GRSG.

"Active restoration of cheatgrass infestation areas" promoted by C-VG-11 is a desirable action. As it may relate to all VG Alternatives, the prejudice toward eliminating or prohibiting annual grasses is misdirected. Mosaic open areas comprised of [non-invasive] annual or other non-native grasses can be a valuable management option. As mentioned above, these areas are likely to be grazed preferentially by livestock and wildlife, removing pressure for the more dispersed native forbs and grasses. These areas could also serve as valuable fire breaks and access areas without disruption of sagebrush stands.

---

***Summary***

Commenters express concern about unintended or undesirable impacts of vegetation management programs to control weeds or restore sagebrush habitat. The DEIS inadequately analyzes impacts from vegetation restoration

---

***Response***

As described in Section 4.6, the DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives.

Contiguous blocks: Site-specific calculations will be conducted at the implementation level.

PJ: Clarification will be provided in Section XX.

**Comment Excerpt Text:**

[This comment corresponds to the headings in Table 2-17 and Table 2-18] Integrated Invasive Species. Loss of habitat due to invasive species was identified as a primary threat to GRSG by FWS. The only "action" proposed by Alternatives B, C, D and F is to mention GRSG habitat (D-IIS-1), to monitor and treat areas "associated with existing range improvements" (B-IIS-4) and to regulate project construction (in D-IIS-5).

Other than these, management of integrated invasive species is essentially no different than BLM's existing policy which has been detrimentally ineffective for various reasons. Further, BLM's efforts at integrated invasive species eradication have been opposed by groups closely associated with Alternatives C and F.

Given the relative importance of this threat as identified by FWS, NTT and USGS, BLM should commit to a program that actively plans, funds, executes and monitors large-scale integrated invasive species infestation eradication projects in a measureable timeframe. Alternatives A, B, C, D and F fail to do this.

---

***Summary***

Commenters requested detailed plans of action and clarification on mitigation and monitoring, including timing of re-seeding and restoration after fire.

---

***Response***

Mitigation has been further defined as a Regional Mitigation Framework and is detailed in Appendix X. The

Framework is incorporated in the [insert Proposed Plan/Proposed Plan Amendment] and was developed to achieve a net conservation gain to the species by implementing conservation actions. Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can help achieve the greatest conservation benefit for greater sage-grouse and its habitats.

If impacts to greater sage-grouse or its habitat from authorized land uses remain after applying avoidance and minimization measures, then compensatory mitigation projects will be used to fully offset impacts to achieve conservation benefits. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation.

Specific mitigation strategies, based on the Framework, will be developed by regional teams within one year of the issuance of the Record of Decision and be consistent with the BLM's Regional Mitigation Manual MS-1794, Forest Service Handbook FSH 1909.15, and CEQ regulations at 40 CFR 1508.20.

Mitigation measures for specific projects are implementation level decisions and will be included in site-specific analysis which is outside the scope of this EIS.

#### **Comment Excerpt Text:**

If the BLM and USFS truly want to restore riparian and meadow areas to benefit wildlife it needs to permanently remove the domestic livestock from those areas. It would seem much more likely that the ongoing degradation of riparian areas and meadows by domestic livestock is a limiting factor for sage-grouse because those areas are important brood-rearing habitat.

36 C.F.R § 219.8(a)(3). The plan must establish widths for riparian management zones, to which the management outlined in the quoted section above will apply

**Comment Number:** IDMTSG-14-0153-44

**Organization1:**Wild Earth Guardians

**Commenter1:**Erik Molvar

#### **Comment Excerpt Text:**

While not necessarily associated with livestock grazing, in some areas, tamarisk and Russian olive are increasing in riparian areas; we are concerned that this will also degrade brood-rearing habitats through sage grouse avoidance of trees and creation of raptor perching and nesting habitat. What is the relationship between tamarisk and Russian olive invasion and livestock overgrazing in riparian habitats, and what does

BLM propose to do to address the spread of these invasive trees?

---

**Summary**

Commenters suggested management approaches for riparian vegetation, including removal of invasive tamarisk, limitations on or removal of livestock grazing, and maintenance of sage-grouse habitat objectives.

---

**Response**

As described in Section 4.3, the ID/SWMT LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA.  
[BLM: provide direction if any change to analysis is necessary.]

**Comment Excerpt Text:**

Functioning condition of riparian/wetlands does not indicate ‘stability’, as PFC areas erode and headcut all the time. It does not represent sustainable use on often very limited and desertifying meadow/spring seep riparian areas. Why are there no meadow grazing, trampling standards here? Or sources of weeds/ Potential sources of West Nile, and other threats?

---

**Comment Number:** IDMTSG-14-0153-45

**Organization1:** Wild Earth Guardians

**Commenter1:** Erik Molvar

**Comment Excerpt Text:**

There appear to be deficiencies in BLM’s riparian and wetland surveys across the planning area, and the DEIS does not present summary statistics for acreage of sage grouse habitat that is not meeting Properly Functioning Condition criteria. Please address this deficiency in baseline information, as riparian areas are crucial to sage grouse as brood-rearing habitats, and present this information in full in the FEIS

---

**Summary**

Commenter requests baseline data related to Proper Functioning Condition of riparian areas in sage-grouse habitat. Commenter questions whether PFC protects stability of riparian habitat for sage-grouse.

Commenter notes that current PFC assessment methods should be modified to address sage-grouse needs. Commenter requests site-specific management of riparian habitat to balance competing uses.

**Response**

Comprehensive PFC data is not available on a sub-regional level but is displayed when available. Proper Functioning Condition of riparian systems according to BLM Manual 1737 includes stabilization of streambanks, maintenance of ponding, reduction in erosion, and other features beneficial to sage-grouse. Modifications to PFC methods are outside the scope of this planning effort.

**Comment Excerpt Text:**

Page 2-141 [211]. D-LG/RM-16. As stated elsewhere herein, there exists an inherent discrepancy between riparian and lentic condition that is better for sage-grouse, and “proper functioning condition” of the riparian/lentic resource. Specifically, some forbs (a specific example being dandelion) are highly preferred by sage-grouse, but are non-native species. The presence of these non-natives on a riparian/lentic area usually is used to justify an assessment by the agencies of less-than proper functioning condition. Likewise, moist or wet meadows in “proper functioning condition” are often – almost always – composed of deep-rooted perennial, sod-forming, grasses that preclude or severely curtail the presence of forbs. The agencies cannot simultaneously manage the same spot on the landscape for both. The FEIS/LUPA must rectify this discrepancy

**Comment Number:** IDMTSG-14-0191-1

**Organization1:** The University of Montana-Western

**Commenter1:** Jack Kirkley

**Comment Excerpt Text:**

Reduce first year mortality by focusing the chosen alternative on the improvement/protection of riparian habitat, leaving an abundance of woody and herbaceous vegetation standing tall enough to provide optimal cover for nesting and brood-rearing. This will mean excluding cattle from these riparian strips for most of the growing season.... particularly late in the season, when vegetation must be allowed to remain tall and dense. These riparian strips need to be kept intact through the nesting and brood-rearing months. Once the young grouse have dispersed from the cover of the riparian zone, then short duration cattle grazing could occur in these zones, as long as the vegetation has a sufficient period of time for recovery before the end of the growing season. In some regions, cattle grazing in riparian zones may simply be incompatible with

maintaining the proper vegetative condition for grouse nesting and brood-rearing. So, cattle exclusion should be an option on a site-specific basis.

---

### **Summary**

Commenter notes that current PFC assessment methods should be modified to address sage-grouse needs. Commenter requests site-specific management of riparian habitat to balance competing uses.

---

### **Response**

Proper Functioning Condition of riparian systems according to BLM Manual 1737 includes stabilization of streambanks, maintenance of ponding, reduction in erosion, and other features beneficial to sage-grouse.

Under the proposed plan, adaptive management would be incorporated into vegetation treatment and restoration programs, including riparian management. Adaptive management would allow BLM increased flexibility to adjust programs based on data collected during operation, to respond to changing conditions and improve effectiveness of vegetation management programs.

**Comment Excerpt Text:**

Alternative D & E, the BLM's preferred alternatives, and Alternative E, created by the state of Idaho, allow BLM discretion in determining wild horse and grazing levels and set the stage for the reduction of AMLs or even zeroing out of HMAs. These alternatives do not address the major threats to sage grouse, specifically the massive livestock grazing that is occurring on 100% of PPH and 97% of PGH. Indeed, Alternative D envisions no change in areas open to livestock grazing, and Alternative E would actually increase the area available for livestock grazing in the planning area! This despite the fact that at least 1.9 million acres of livestock grazing allotments in in PGH and PPH are not meeting rangeland health standards.

These alternatives should be revised to include a clear description of the BLM's legal mandate to manage wild horses and burros as natural components of the public lands and a specification that grazing/AUM reductions should be borne by discretionary livestock grazing and not by wild horse and burros, which the BLM is mandated to protect.

Alternative F, which would reduce wild horse AMLs by 25% in the occupied habitat areas is not justified given the minimal overlap of wild horses with such habitat (just 3% in PPH and 1% in PGH) and the small number of wild horses (617/7,404 AUMS) vs. the massive number of livestock (2.2 million AUMs/183,000 cows [year round equivalent]).

**Comment Number:** IDMTSG-14-0228-5

**Organization1:** WHE/AWHPC

**Commenter1:** Suzanne Roy

**Comment Excerpt Text:**

National Academy of Sciences review of and recommendations for the BLM Wild Horse and Burro Program must be considered.

When creating a final agency action all available pertinent data must be evaluated. Currently the management practices employed by the BLM wild horse and burro program have received severe criticism in the National Academy of Sciences (NAS) report released in June of 2013. (Attachment 4). It is notable that the BLM itself commissioned the study, set the scope of review and paid for it with over \$1 million in tax dollars. More than nine months after its release, the BLM is still “reviewing” its contents. The public and Congress’ expectation is that changes will be made within the program based on the findings that indicate a severe deficit in the data used to manage wild horses. Any alternative adopted must allow provisions for increasing habitat (repatriation of HA) and increasing AUMs/AML where genetic threat is shown to be encroaching.

As the adoption of any alternative for management of GRSG must clearly protect and preserve wild horses and burros. Any lack of clear direction is negligent fiscally as it is known that significant changes to managing wild horses and burros are imminent. Deficits in data that support current AMLs must be rectified. Any plan to manage GSG must consider all possible scenarios.

Presently, the LUP/EIS does address overall wild horse and burro management strategy, but omits entirely any mention, let alone consideration of the NAS report. This must be rectified in the final LUP/EIS, and any designated alternatives must allow for the full implementation of the NAS’ recommendations.

---

***Summary***

Commenters stated that livestock and wild horses were inappropriately grouped together in management actions. Some commenters were also concerned with the 25% proposed reduction of AML under Alternative F and the basis for reduction; they requested reevaluation of reduction based on the fact that wild horse habitat overlaps a minimal percentage of GRSG habitat.

Some commenters also stated that the proposed management should provide flexibility to increase AML/AUM and/or open HAs if data becomes available demonstrating that genetic viability of wild horses and burros is threatened.

Commenters also stated that the preferred alternative would give the BLM too much discretion to reduce AMLs or zero out HMAs which would violate the BLM’s legal mandate to protect WHB.

---

***Response***

The BLM and the Forest Service considered a reasonable range of alternatives during the greater sagegrouse planning process in full compliance with the NEPA. See Section 4.3, NEPA Range of Alternatives, in this report for an expanded explanation on what constitutes a reasonable range of alternatives. *[NOTE TO BLM-check final response in section 4.3 for consistency]*

The BLM protects, manages, and controls wild horses in accordance with the Wild Free-Roaming Horses and Burros Act of 1971 (Public Law 92-195, as amended), the purpose of which is to "manage wild horses and burros within herd management areas (HMAs) designated for their long-term maintenance, in a manner designed to achieve and maintain a thriving natural ecological balance (TNEB) and multiple use relationships." The FLPMA directs the BLM to manage wild horses and burros as one of numerous multiple uses including mining, recreation, domestic grazing, and fish and wildlife. It also required a current inventory of wild horses and burros. Additional guidance is found in 43 CFR 4700, Protection, Management, and Control of Wild Free-roaming Horses and Burros.

Adjusting AML does fall within the legal mandate of the BLM to protect WHB and other resources. Through the BLMs program of monitoring and analysis of data, AMLs have been established and will continue to be adjusted based on the analysis of data. AMLs can be adjusted based on the limitations and capability of the range, including the four habitat components (forage, water, cover, and space), while managing for healthy populations of WHBs in balance with other uses and resources (including sage grouse). An explanation of the relationship between AMLs and AUMs has been included in the FEIS in section X.X.X.

Should the 25% reduction be carried forward in the preferred alternative, genetic viability would be considered in the adjustment of AMLs. Increasing AMLs and/or opening HAs is outside the purpose and need for this project.

The plan and the proposed Environmental Impact Statement (EIS) do not adequately protect wild horses and burros in accordance with federal laws and regulations. The information included in these documents is outdated and incomplete. The EIS does not adequately reflect the Bureau of Land Management (BLM) and Forest Service (USFS) MANDATE to protect wild horses and burros vs. its DISCRETION to authorize domestic livestock grazing.

**Comment Number:** IDMTSG-14-0057-10

**Organization1:**

**Commenter1:**Eileen Hennessy

**Comment Excerpt Text:**

Clearly defined maps must be provided that will differentiate between all of the different Herd Management Areas (HMAs) and Herd Areas (HAs) to allow for the restoration of HAs as a feasible alternative. Also factual data on the exact populations -- not guesstimates -- of wild horses within each and a listing of every designated area and data on the difference in AUM allocation of wild horses/burros vs. livestock must be included in the final EIS for the purpose of creating a plan for sage grouse whose protection is not at the expense of federally protected wild equines.

**Comment Number:** IDMTSG-14-0057-2

**Organization1:**

**Commenter1:**Eileen Hennessy

**Comment Excerpt Text:**

the EIS arbitrarily and wrongly attempts to categorize livestock AND wild horses together under the description of livestock

---

***Summary***

Commenters requested documentation of critical genetic data on each of the wild horse and burro herds in the planning area. This will provide BLM basis for identifying which HMAs would not be feasible to place AML reductions on while maintaining genetically viable herds. Commentors also requested exact population data for all wild horse populations in HMAs and HAs and clearly defined maps of HMAs and HAs. Finally, commenters stated that any land policy changes resulting from the sage grouse plan must be in conformance with the National Academy of Sciences 2013 recommendations for reform of the federal wild horse management program.

---

***Response***

The prerequisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The baseline data provided in Chapter 3 and various appendixes in the Draft LUPA/DEIS is sufficient to support, at the general land use planning-level of analysis, the environmental impact analysis resulting from management actions presented in the Draft LUPA/DEIS. A land use planning-level decision is broad in scope and, therefore, does not require an exhaustive gathering and monitoring of baseline data (see response to section 4.4 in this report for more details). *[NOTE TO BLM-check final language in section 4.4 response for consistency]*

Much of the data in the DLUPA/DEIS is presented in qualitative and map form, and is sufficient to support the gross scale analyses required for land use planning. The DEIS includes maps of HMAs and HAs. Population data is included in Table 3.X of the DEIS. These maps and tables have been reviewed for accuracy prior to inclusion in the FEIS.

Genetic documentation of WHB is an ongoing implementation level process used to monitor the genetic health of BLM's wild horse and burro populations (see IM 2009-061).

The NAS report has been considered in the development of the FEIS and actions appropriate the the land management planning level included as appropriate. Findings of the NAS would also be considered under separate site-specific NEPA actions.

**Comment Number:** IDMTSG-14-0050-13

**Organization1:**

**Commenter1:**Kathleen Gregg

**Comment Excerpt Text:**

The proposed EIS fails to consider wild horses as required under the law “as an integral part of the natural system of the public lands” (WFRHBA, 1971). Wild horses and burros contribute to the biological diversity, and are unique in possessing less efficient post-gastric digestive systems that contribute to higher material passage rates (Feldhamer, Thompson, Chapman, 2003). Horses also tend to utilize more abundant, but poorer nutritional quality plant species (Feldhamer, Thompson, Chapman, 2003). Horse droppings pass most seeds intact, which facilitates seed dispersal, and cycles nutrient rich material that builds soil moisture retention resulting in an increase in native plant diversity near horse trails (Downer, 2007) (Ostermann- Kelm, Atwill, Rubin, Hendrickson, Boyce, 2009). Competition between wild horses and burros and other native or domestic species has not been substantiated (Feldhamer, Thompson, Chapman, 2003). Wild horses utilize a broader range of plant species in their diet and are one of the least-selective grazers in the western states (Beever, 2003). Approximately 80% of their diet is composed of shrub and grasslands with less than 1% comprised of riparian vegetation (Berger, 1986). Wild horses use the land and resources at different intensities throughout the year, allowing for a natural rest and rotation of foraging pressures (Downer, 2007). Also, wild horses tend to use relatively few trails to travel to and from grazing, resting and water sources minimizing trampling and riparian damage near waterways (Beever, 2003) (Ganskopp, Vavra, 1986). These wild horse and burros “natural systems of the public lands” adaptations minimize impacts to their environment and illustrate sustainable integration within the ecosystem and assist in rebuilding and maintaining health of the sage grouse habitat.

---

**Comment Number:** IDMTSG-14-0050-6

**Organization1:**

**Commenter1:**Kathleen Gregg

**Comment Excerpt Text:**

Also omitted from the alternative(s) evaluation is the impact of private domestic livestock grazing as opposed to impacts from wild horse and burro use. There are extreme differences in the impacts generated by these users of public land and both the Center for Biological Diversity and Western Watersheds (WWP) have done extensive papers showing the impact of domestic livestock production to public land management. Wild horses, wild burros and other wildlife have minimal impact to the land when not impeded by allotment fencing, cattle guards and large turnouts of domestic livestock. To treat both of these uses as “grazing” is irresponsible to the purpose of the assessment to create an equitable management plan that is compatible with other provisions of the law and to protect the sage grouse.

---

**Comment Number:** IDMTSG-14-0057-1

**Organization1:**WHE/AWHPC

**Commenter1:**Suzanne Roy

**Comment Excerpt Text:**

1. Livestock vs. wild horses

The LUP/EIS fails to quantify the relative impacts of wild horses vs. livestock in the GRSG mapped occupied habitat areas. The LUP/EIS n Volume 2, Section 4.4 under most alternatives states that reduction in wild horse Allowable Management Levels (AMLS) could occur if GRSG objectives are not achieved.

However, the data presented in the LUP/EIS do not support the contention that wild horses are a threat to sage grouse in this planning region. In fact, wild horses were not identified as a major threat to sage grouse in Idaho by the Independent Scientific Panel referenced in Chapter 3, pdf p. 286.

---

**Comment Number:** IDMTSG-14-0228-4

**Organization1:**WHE/AWHPC

**Commenter1:**Suzanne Roy

**Comment Excerpt Text:**

Not only was the relative impact of wild horses vs. livestock on sage grouse habitat, in terms of acreage and AUMs, omitted, but also omitted was an evaluation of the rangeland impact of private livestock grazing as opposed to impacts from wild horse and burros. There are extreme differences in the impacts generated by these users of public land. These differences were clearly delineated in the National Marine Fisheries

Service's biological opinion regarding impacts of wild horses in the Murderers Creek Wild Horse Territory in Oregon. (Attachment 3) Additionally, both the Center for Biological Diversity and Western Watersheds have written extensive reports showing the impact of livestock production (and its cost) to public land management.

---

### **Summary**

Commenters stated that the analysis on GRSG from wild horses and burros are not distinguished from livestock which inaccurately increases the threat.

Commenters identified contradictions in the document such as where the document states that "Under all alternatives, no direct change would occur to areas allocated as HMAs/WHBTs for wild horses and burros", then the report proceeds to summarize how every single alternative would restrict wild horse and burro usage in their own federally designated habitats.

---

### **Response**

The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives for a land use planning effort (see detailed response in section 4.6, NEPA Impacts Analysis). *[NOTE TO BLM- check final response in section 4.6 to ensure consistency]*

The USFWS identified grazing as a threat in the NTT and COT report but did not specifically delineate between livestock and WHB grazing. However, within the DEIS, the BLM and Forest Service did analyze impacts on WHB and domestic livestock grazing separately and also analyzed the impacts on GRSG from WHB and domestic livestock grazing separately. Impacts on GRSG from WHB and domestic livestock grazing are identified in Section 4.X of the DLUPA/DEIS. Impacts on WHB from GSRG management strategies are identified in Section 4.X of the DLUPA/DEIS. BLM appropriately analyzed the impacts to WHB from actions not related to changes in AML.

Text in the WHB impact section has been reviewed and relationship between allocation and management actions clarified in the FEIS.

*[NOTE TO BLM- insert the recommended text below in the FEIS: Under all alternatives, with the exception of Alternative XX, management actions for wild horses and burros would not result in direct changes to HMA status, to AMLs within designated HMAs, or acreage designated as HMAs. Impacts under all alternatives, with the exception of Alternative XX, would be limited to any future changes that may result in AML and/or acreage adjustment as well as reconsideration of HMA status that are based on achievement of GRSG habitat objectives for improving habitat conditions, as described in further detail below.*

*Under Alternative XX, in contrast, AMLs would be directly reduced by 25 percent for all HMAs within PPMAs. This would result in a reduction of the established AMLs for all HMAs that are located entirely or partially within mapped occupied GRSG habitat. As a result of AML reduction under Alternative XX, costs of wild horse and burro management would increase, due to a need for additional horse gathers for removal and/or population growth suppression (PGS) treatments.]*

**Organization1:** The Wilderness Society

**Commenter1:** Brad Brooks

**Comment Excerpt Text:**

BLM should identify lands with overlapping conservation values for protective designation, including considering whether and how protecting lands with wilderness characteristics would contribute to protecting and recovering sage-grouse in the planning area, and incorporate an analysis of these benefits into developing and selecting a proposed plan. BLM should complete LWC inventories as part of this planning process in accordance with Manual 6310, or at the very least identify potential LWCs across the planning area and include all of those areas in its analysis and management decisions for this EIS.

**Comment Number:** IDMTSG-14-0157-13

**Organization1:** Y-3 II Ranch

**Commenter1:** Christopher Clark

**Comment Excerpt Text:**

One of the planning criteria developed by BLM for the Idaho DEIS is compliance with BLM's Manuals 6310 and 6320 regarding Lands with Wilderness Characteristics. Secretary Salazar's Secretarial Order No. 3310, Section 5( d), requires land use planning decisions to take wilderness characteristics into consideration and to manage lands with those characteristics in a manner that protects those characteristics as part of BLM's planning process. However, Secretarial Order No. 3310 may not, under the Department of the Interior, Environment, and Related Agencies Appropriations Act of 2014, be implemented, administered, or enforced in any manner. Id., § 124. The law does not affect the Secretary's authorities under Sections 201 and 202 of FLPMA that call for inventorying of wilderness characteristics and general land use planning and the DEIS recognizes its limited role in inventorying these lands. Section 3.20. Y -3 II remains attentive to these issues since some of our Idaho allotments appear to be designated as lands with wilderness characteristics. See Figure 3-16. Section 4.13.3 seems to state that these lands would be closed to motorized travel. This idea of road closures on these lands is repeated in Sections 4-13.4-.9. To the extent that these lands with wilderness characteristics are incorporated into the actual management plans pursuant to any chosen alternative, any resulting road closures will be inconsistent with the statutory prohibition on the implementation of Order No. 3310.

***Summary***

All lands with wilderness characteristics that overlap with Greater Sage-Grouse habitat represent good opportunities for Greater Sage-Grouse conservation and should be analyzed to see how managing those lands to protect wilderness characteristics would coincide with Greater Sage-Grouse conservation. The BLM should consider lands with wilderness protection as an alternative to ACEC protection for some areas. The BLM should complete Lands with Wilderness Characteristics inventories and the DEIS should consider potential Lands with Wilderness Characteristics in the scope of this process.

***Response***

Per BLM Manual 6320, Considering Lands with Wilderness Characteristics in the BLM Land Use Planning Process, "In some circumstances, consideration of management alternatives for lands with wilderness characteristics may be outside the scope of a particular planning process (as dictated by the statement of purpose and need for the planning effort). For example, a targeted amendment to address a specific project or proposal may not in all circumstances require consideration of an alternative that would protect wilderness

characteristics. In these situations, the NEPA document associated with the plan amendment must still analyze effects of the alternatives on lands with wilderness characteristics.” Therefore, analysis in this planning document regarding lands with wilderness characteristics will not be completed.

As described in Section 8 of this comment report, Alternative C considers ACEC designation for Greater Sage Grouse habitat and species protection.

#### **Comment Excerpt Text:**

Additionally, lands with wilderness characteristics are subject to continuation of existing uses including grazing in a manner and to a degree in which the same were being conducted in 1976 at the time of the passage of FLPMA. If the FEIS and Record of Decision call for management under any alternative so as to exclude grazing, even by road closures, the issue once again arises as to whether that form of management is consistent with the Tenth Circuit's decision in *Public Lands Council v. Babbitt*, 167 F.3d 1287 (10th Cir. 1999), *affirmed on other grounds*, 529 U.S. 728 (2000). The court criticized BLM's grazing regulations that would have allowed the placement of grazing districts into non-use status for the entire duration of a grazing permit absent designation of the lands as wilderness study areas through the FLPMA Section 603( c) process. The FEIS should explain how BLM is in compliance with the 2014 Interior appropriations act prohibitions on

funding and implementing Secretarial Order No. 3310. Any alternative that may be selected by BLM must not manage lands with wilderness characteristics as de facto wilderness, including road closures.

The letter on ACEC maps telling a reader which Alt. the ACEC maps go with is missing in the ID SG EIS Figures 2-46 and 2-47. So a reader cannot tell what Alternatives the mapping goes with.

---

***Summary***

The BLM should work with Upper Snake staff to ensure lands with wilderness characteristics inventories and management are consistent between this EIS/LUPA and the Upper Snake RMP.

The BLM must provide a map of the lands with wilderness characteristics and where it overlaps with priority habitat.

The FEIS should explain how the BLM will comply with the 2014 appropriations bill for the Department of the Interior, Environment and Related Agencies and with Secretary Salazar's Secretarial Order No. 3310.

---

***Response***

*BLM Upper Snake Field Office continues to evaluate lands with wilderness characteristics within the planning area. Decisions related to lands with wilderness characteristics will be addressed in the Upper Snake EIS/LUP.*

*Per BLM Manual 6320, Considering Lands with Wilderness Characteristics in the BLM Land Use Planning Process, "In some circumstances, consideration of management alternatives for lands with wilderness characteristics may be outside the scope of a particular planning process (as dictated by the statement of purpose and need for the planning effort). For example, a targeted amendment to address a specific project or proposal may not in all circumstances require consideration of an alternative that would protect wilderness characteristics. In these situations, the NEPA document associated with the plan amendment must still analyze effects of the alternatives on lands with wilderness characteristics." Therefore, analysis in this planning document related to lands with wilderness characteristics will not be completed.*

*The BLM is not making decisions on lands with wilderness characteristics in this planning effort. Doing so is outside the purpose and need and scope of this EIS.*

*[NOTE TO BLM: Consider including a map displaying the overlap of lands with wilderness characteristics and priority habitat should be included in the EIS.]*

NCT note: Consider using similar language to section 8 of this document. Language relevant to ACEC issues may be applicable to LWC and may help clarify why LWC is out of scope.

It does not seem that the response fully addresses the issue statement. Answer to Secretary Salazar's Secretarial Order No. 3310? Possibly use some of the language developed by NVCA in section 31.0 of this document.

**Section 31.3 - Impact Analysis***Total Number of Submissions: 2**Total Number of Comments: 2***Comment Number:** IDMTSG-14-0154-2**Organization1:**The Wilderness Society**Commenter1:**Brad Brooks**Comment Excerpt Text:**

The Draft EIS states that, “Currently no Field Offices have taken their lands with wilderness characteristics through a complete planning process to determine how they will be managed” (Draft EIS, p. 3-161. However, the Draft EIS goes on to state that there are about 452,000 acres of lands with wilderness characteristics in the planning area. Ibid. We expect there is substantially more acreage at issue that will eventually be inventoried and analyzed through future land use planning; however, deferring inventory and management decisions at this time will preclude the agency from capitalizing on this opportunity to strategically protect lands with multiple conservation values. We recommend BLM conduct a GIS-based roadless analysis to determine potential lands with wilderness characteristics to inform this EIS, if full LWC inventories are not completed as part of this planning process.

**Comment Number:** IDMTSG-14-0168-38**Organization1:**Custer County Commissioners**Commenter1:**Wayne F. Butts**Comment Excerpt Text:**

4-16

"Within the GRSR range, 95 percent of the mapped sagebrush habitats are within 1.6 miles (2.5 kilometers) of a mapped road; density of secondary roads exceeds 3.1 miles per 247 acres (5 kilometers per square kilometer) in some regions (Knick et al. 2011). "

Comment:

We are very glad that both the Nevada — NE California and the Idaho — SW Montana EISs used the same template to point this out. Since this is the case that means that at least 95 % of mapped sage-grouse habitat is ineligible for wilderness classification, WSA status, inventoried roadless classification, etc according to the statement above. The portions of the EIS that contradict this need to be re-written accordingly. Federal agencies and environmental extremist groups cannot have it both ways. The lands either have roads or don't. As written the EIS contradicts itself.

Table 4-70 needs to be explained in light of the above statement. The acres of "lands with wilderness characteristics" does not correlate with Knicks.

***Summary***

If the BLM does not complete lands with wilderness characteristics inventories, the BLM should use GIS to inventory roadless areas and consider those as potential lands with wilderness characteristics for planning purposes.

***Response***

No decisions related to the management of lands with wilderness characteristics will be made at this part of the planning effort . Decision related to the management of lands with wilderness characteristics are out of the scope of this plan amendment process.

NCT note: It seems like this response could be combined with section 31.2 of this document. Responses are nearly identical and basically already included in the summary.

C. Predator Control

Although the LUP accurately states that the BLM and USFS do not have management or control authority over predators, we are concerned about the very real threat that the overabundance of predators have on sage grouse. Because the LUP is proposing to alter land use activities to protect the species, it must be stated in the selected final alternative that before land use is limited, adequate measures must be undertaken to limit predator populations. Regardless of the amount of perceived suitable habitat for sage grouse, if predator populations are above sustainable and natural levels, they will have a big impact on the survival of the sage grouse species. It cannot be overlooked that the decline of sage grouse closely mirrors both the decline in grazing numbers on public lands and the decline in predator control efforts.

**Comment Number:** IDMTSG-14-0157-11

**Organization1:** Y-3 II Ranch

**Commenter1:** Christopher Clark

**Comment Excerpt Text:**

The DEIS' discussion of predation is similarly inadequate. The Service's warranted but precluded finding states that predation may be limiting Sage-grouse populations in nearby northeastern Nevada where Y-3 II also operates. 75 Fed. Reg. at 13973. The Service notes that landscape fragmentation, habitat degradation and human populations have the potential to increase predator populations including increased suitability for ravens among other species that attack Sage-grouse. Idaho identified predation as a threat to Sage-grouse in 2006. See Table 1-2. Like the discussion of West Nile Virus, the Service concludes that definitive data are lacking to link Sage-grouse population trends with predator abundance. As with West Nile Virus, BLM has a duty to obtain this information or explain why it is either unavailable or too expensive to obtain. There is vast anecdotal information available as indicated by comments from ranchers across the West about the increase in predation on Sage-grouse and other species.

---

**Comment Number:** IDMTSG-14-0157-12

**Organization1:** Y-3 II Ranch

**Commenter1:** Christopher Clark

**Comment Excerpt Text:**

the Service's warranted but precluded finding raises concerns about anthropogenic causes of the species' decline including transmission corridors, wind energy structures, and other tall structures as providing perching points for avian predators and yet a full discussion and disclosure of the impact of those predators on Sage-grouse is not provided in the DEIS. If predators are not a significant threat to the species as concluded by the Service, then why is BLM analyzing the effects of anthropogenic structures that would lead to predation of Sage-grouse? The FEIS should not dodge the predator issue simply by the notion that predator control is primarily a state-regulated action and therefore outside the scope of the plan amendments. See Section 2.3.1. The absence of detailed analysis of the impact of predators and disease in the current environment and their effects on the alternatives results is a major omission of the DEIS, especially since disease and predation are among the five specific ESA factors that could lead to a listing.

**Comment Number:** IDMTSG-14-0325-4

**Organization1:**

**Commenter1:** William J. Mulder

**Comment Excerpt Text:**

[This comment corresponds to the headings in Table 2-17 and Table 2-18] FWS has not determined that

disease or predation are primary threats to GRSG (D-OBJ-13)

---

### **Summary**

Some commenters state that the BLM does not adequately address the threat of predation or fully analyze the direct, indirect, and cumulative impacts of predation on GRSG populations; Predation was identified as a threat by the state of Idaho. Others question the inclusion of analysis of impacts of anthropogenic structures on predators of GRSG, given that the USFWS did not identify predation as a primary threat to GRSG.

---

### **Response**

As stated in Section 2.3.1 in the DRMPA/DEIS, predator removal is outside the scope of LUPA. The BLM and the Forest Service have updated the description of the threat of predation in Section 3.2.1 and addressed the potential effects of predation on GRSG populations in the Section 4.x.

The BLM and the Forest Service have authority to manage the habitat and have provided an updated analysis in Section 4.x of the FEIS to describe how the numerous management actions across the range of alternatives could affect the habitat and indirectly the effects of predation. Altering the sagebrush habitat of the greater sage-grouse can create an influx of predators into an area and lead to a population decline. Roads, fences, power lines, and other infrastructure as well as the development of trails and other disturbances may improve access for potential predators near GRSG habitat and increase risks to the species.

### **Comment Excerpt Text:**

Most of the data used in the noise studies cited by the EIS is from the NTT Report. It is not in compliance with the Information Quality Act of 2001 and should not be cited. The data are not public and the authors relied on speculation to support their claims. The underlying data used by the cited noise studies are not public, and therefore, the results are not reproducible. No data were reported from: 1) objectively-measured noise generated during various phases of drilling activities, 2) noise generated during production, 3) road noise, or 4) the occurrence of these over a 24 hour period. No data were reported on the environmental parameters under which any data were collected, or the ambient sound levels in the study area based upon professional standards (which include wind). Instead, the authors cited "unpublished data" and speculation about the accuracy of their playback noise levels, in support of their claims (emphasis in bold below): "We played drilling noise and road noise on leks at 70 dB(F) sound pressure level (unweighted decibels) measured 16 m directly in front of the speakers (Fig. 1 & Supporting Information). This is similar to noise levels measured approximately 400 m from drilling rigs and main access roads in Pinedale, Wyoming (JIB and G.L.P., unpublished data).

"To minimize disturbance, we took propagation measurements during the day. Daytime ambient noise levels are typically 5-10 dBA higher than those in the early morning (J.L.B and G.L.P., unpublished data) and are likely higher than those heard by birds at a lek."

"For leks treated with drilling noise, recordings from 3 drilling sites were spliced into a 13-minute mp3 file

that played on continuous repeat. On leks treated with road noise we randomly interspersed mp3 recordings of 56 semi trailers and 6 I light trucks with 170 30-second silent files to simulate average levels of traffic on an access road (Holloran 2005). Noise playback on experimental leks continued throughout April in 2006, from mid February or early March through late April in 2007, and from late February through late April in 2008. We played back noise on leks 24 hours a day because noise from deep natural-gas drilling and vehicular traffic is present at all times."

There was no data presented in the cited studies that the playback sound was an accurate rendition of actual frequencies and sound pressure levels from oil and gas operations as measured at set-back distances required by the BLM, or that it occurred at the same levels 24 hours a day. Instead, the authors relied upon "unpublished data" or speculation. The BLM cannot rely upon data that are not publicly available (unverifiable data), or speculation, as the basis for its decision making.

The EIS did not accurately portray the methods and results of the studies by Patricelli et al. (2010) and Blickley et al. (in preparation). As an initial matter, Patricelli et al. (2010) is an unpublished, 16-page powerpoint presentation, it is not a scientific paper or report.

Recordings of operations and traffic noise were played back at the edges of leks at sound pressure levels in excess of what they would be on the majority of lands managed by the BLM where oil and gas operations occur. While a 0.25 mile buffer has been the minimum set back distance required by the BLM, most oil and gas operations are found at far greater distances from leks (Wyoming Oil and Gas Conservation Commission well data and Wyoming Game and Fish lek count and location data). Thus, the reported effects on sage grouse were biased in the cited studies to achieve a negative response by sage grouse rather than measure responses from sound pressure levels as they would occur at the required set back distances.

Blickley et al. (in press) maximized projected sound from recordings at the edges of leks, which were as high as the noise levels occurring within 200m of a busy freeway (as measured across an open field with traffic loads of greater than 50,000 cars per day, or 55-70 decibels as shown in Figure 2 of Reijnen et al. 1995). Below, is a relevant excerpt from Blickley et al. (in press):

"Drilling-noise recordings were broadcast on experimental leks at an equivalent sound level (Leq) of 71.4±1.7 dBF (unweighted decibels) SPL re 20 Pa (56.1±0.5 dBA [A-weighted decibels]) as measured at 16 meters; on road-noise leks, where the amplitude of the noise varied with the simulated passing of vehicles, noise was broadcast at an Lmax (maximum RMS amplitude) of 67.6±2.0 dBF SPL (51.7±0.8 dBA)."

The fact that authors broadcast such high levels of noise in such close proximity to leks biased the results, an error of omission by the authors and the EIS that cites them and proposed regulations based upon their recommendations.

The EIS and the NTT Report where much of the information came from cannot have it both ways, claiming a negative effect on sage grouse populations but admitting that there was "low statistical support for a cumulative effect of noise over time" in the study by Blickley et al. (in press). As noted above, there are no data showing a long-term cumulative decline in the sage grouse population in the Pinedale Planning Area.

Deficiencies in Blickley et al.'s equipment, as documented by Dr. Ramey, are detailed below.

Microphone:

According to the manufacturer (<http://en-us.sennheiser.com/k6-microphone-system>), "the ME 62 [microphone used by Blickley et al.] is an omni-directional microphone head suitable for K6 and K6P powering modules. It can be used for reporting, discussions and interviews. The ME 62 is particularly suitable for good reproduction of 'room' ambience and 'spaced omni' stereo recording. Matt black, anodized, scratch-

resistant finish."

Recorder:

The Marantz model PMD670 used by Blickley et al. does not offer high-resolution (88.2 or 96 KS/s) sampling rates, its metering characteristics are unknown, and it is limited to 16/48 recording and thus is not considered a high-resolution recorder. It retails online for \$700.

Playback speakers:

The speakers used in the study were standard outdoor speakers camouflaged as rocks and designed for background music playing in home, hotel, and amusement park applications. They were not designed for accurately reproducing industrial sounds. The specifications for the speakers may be found on the manufacturers website:

<http://www.ticcorp.com/specifications/tfs14.pdf>. The speakers were powered by 12 volt car batteries rather than 120 volt AC power and a car stereo amplifier of unknown make and model was used to boost the output. Packed into each simulated rock speaker housing was a 10" woofer with an injection molded cone, a 5.5" midrange cone, and 2" soft dome tweeter. The size and quality of the speakers, and the small speaker housing, severely limits the physical capability of the system to accurately reproduce either low or high frequency sound produced by oil and gas operations or traffic.

As a result of substandard equipment and lack of expertise in sound recording and reproduction, Blickley et al. (in press) resorted to placing their speakers at the edge of leaks and to playing their systems at high levels in order to elicit a behavioral response. This is a biased approach to obtain a preferred result. The BLM cannot rely on biased research in its decision-making.

The recommended noise levels are not based upon any standardized, repeatable data collection, or accepted methods of sound measurement.

The methods used by Blickley et al. (in press), and reported results did not contain any credible, professional analysis of local ambient sound levels or oil and gas noise (e.g. the type, duration, frequencies, sound pressure levels, and power of sound produced by different oil and gas drilling or production operations; equipment being recorded); or employ the use of professionally accepted standards, such as International Organization for Standardization (ISO) standards for quantifying industrial and traffic noise (<http://www.iso.org/iso/home/standards.htm>). The standards not followed by the cited studies include, but are not limited to: ISO 1996-1:2003 Acoustics -- Description, measurement and assessment of environmental noise -- Part I: Basic quantities and assessment procedures; ISO 9613-2:1996 Acoustics Attenuation of sound during propagation outdoors -- Part 2: General method of calculation; ISO 4871:1996 Acoustics -- Declaration and verification of noise emission values of machinery and equipment; ISO 532:1975 Acoustics -- Method for calculating loudness level; ISO 7196:1995. Acoustics -- Frequency-weighting characteristic for infrasound measurements; ISO 8297:1994 Acoustics -- Determination of sound power levels of multisource industrial plants for evaluation of sound pressure levels in the environment -- Engineering method; and IEC 61672-1:2002(E) Electroacoustics, Sound level meters -- Part I: Specifications).

Blickley et al. did not employ any sound propagation models in their study to quantify the confounding effect of temperature, relative humidity, topography, ground cover and surface porosity, wind direction, the direction noise was generated from, the geographic extent of the noise, its duration, frequency of occurrence, or permanence, (Attenborough 2007). Nor did they provide any correlation of their playbacks compared to the industrial and traffic sources they had attempted to duplicate. Furthermore, no graphic equalizer was used which would have allowed for the adjustment of sound pressures in different frequency ranges (at standardized 1/3 octave band frequencies), and no measurement of sound pressure levels was taken in front of playback speakers, which together would have allowed for the accurate reproduction of the sound at the same frequencies and sound pressure levels as the original noise. Therefore, BLM cannot base regulations upon no data and results based upon arbitrary methods that are not compliant with accepted professional

standards in the noise control industry (i.e. Bies and Hansen 2009; ISO).

Noise limits recommended in the EIS, base on the NTT Report, are biased downward.

What is being proposed for noise thresholds is an "impossible to achieve" standard found in an idyllic wilderness setting, on quiet days when the wind does not blow, the leaves do not rustle, birds do not sing, humans are completely absent, streams are not close by, and no aircraft fly overhead. While this may be appropriate for management of anthropogenic sound in the wilderness areas of some national parks (Lynch et al. 2011), it is not appropriate and would be impossible to achieve on most of the BLM lands in the West that are administered for multiple uses.

There are no data to justify the minimum sound levels used as a basis in Blickley et al.'s (in press) recommendations, or the supposed "disruptive activities" that an increase of I OdbA above these would cause. There are no data to show that the minimum levels recommended in the NTT based alternatives in the EIS occur for extended periods of time in any of the sage-grouse core areas, including the Pinedale Planning Area.

The EIS, based on the NTT Report, or cited studies, did not present the results of other studies of noise generated by the oil and gas industry (especially in the Pinedale Planning Area), even though those studies and data were available at the time the EIS was being prepared (i.e., Harvey 2009).

The cited studies were biased in a way to find a measurable impact, the speakers were increased from two to four during the course of the study, and the sound pressures measured in front of the speakers, and effect on sage grouse, were made without regard to the increased sound gradient created by their close distance (i.e. due to the physics of sound attenuation over distances, also known as a the inverse square law, where sound decreases four times for every doubling of distance from its source) as compared to leks at the required BLM setback distances of 0.25 or 0.6 miles.

---

### ***Summary***

Commentor states that noise studies cited in the DEIS are not public and therefore the results are not reproducible; alternative data should be utilized.

---

### ***Response***

Bilcley et al's research on noise and GRSG as since been published :

Bicklet J.L, D. Blackwood, and G.L. Patricelli. 2012. Experimental evidence for the effects of chronic anthropogenic noise on abundance of greater sage-grouse at leks. Conservation Biology Vol 26. No 3. 461-471

This literature has been added to the noise section in the FEIS.

[Change to FEIS- add citation and daat from this study in noise section. Consider addition of other data to support claims]

**Comment Excerpt Text:**

Since agencies are clearly planning vast and sprawling treatments, a new and current analysis of all the direct indirect and cumulative adverse effects of herbicide use and drift, on land, air, water, sagebrush habitats, wild lands recreation, and public health must be provided

The PER Report that accompanied the Weed EIS was not a valid Plan. There has been no full and integrated analysis of the cumulative adverse direct, indirect and cumulative impacts of the battery of highly disturbing cutting, chaining, logging, roller-beating, mowing, chopping, chipping, road building, etc. involved with the PER's radical treatment regime – and all of their direct, indirect and cumulative adverse impacts to soils, water quality and quantity, local climate, desertification processes, watershed integrity, sagebrush vegetation, forested vegetation, riparian area springs, seeps, streams and meadows, cultural sites, and recreational uses and enjoyment of the public lands. Nor any analysis of effects on sensitive species, including sage-grouse.

In fact, if BLM would have conducted NEPA on the PER, it may have found what is now being shown in Hess and Beck et al. 2010 and 2012, Jones et al. Review 2013. The series of large-scale vegetation manipulation treatments and “tools in the toolbox” of the PER (many of which BLM in Idaho would use in treatments of trees and sage under the uncertain “GOAs” and BMPs of the DEIS) were harmful, produced cheatgrass, did not result in claimed beneficial outcomes, and were highly risky. Not to mention these are often extremely expensive.

**Comment Number:** IDMTSG-14-0168-36  
**Organization1:** Custer County Commissioners  
**Commenter1:** Wayne F. Butts

**Comment Excerpt Text:**

4-11

"The cheatgrass fire cycle causes GRSG habitat loss and degradation on an annual basis. Currently, due to the

extent of the threat, there are no management actions that can effectively alter this trend, and fires are estimated to reduce GRSG habitat within the Great Basin by 58 percent in the next 30 years (Miller et al. 2011)."

Comment:

Delete the above sentences. This one-size fits all sentence is also in the Nevada — NW California Sage-Grouse EIS. This is the crux of the problem and it is unacceptable for the agencies to ignore it. The highlighted portions of the sentence are untrue, as explained below.

Insert: Fire is a primary threat to GRSG populations and habitat where increasing exotic annual grasses, primarily cheatgrass, are resulting in sagebrush loss and degradation (USFWS 201 Oa, p. 13,932). Under all actions proposed in the EIS, including the No Action Alternative, the BLM and US Forest Service will take immediate, aggressive actions to reverse the cheatgrass fire cycle with existing known tools listed below as well as develop new science and management tools to eradicate cheatgrass. In the alternative, the agencies will dispose of the land and allow private landowners to manage it. Private landowners know the value of proper vegetative management and have the financial incentives to return the land to productive use.

The BLM and US Forest Service understand that restricting mining, grazing, oil and gas and other energy development, roads, etc. will not truly help the sage-grouse. Instead, provide incentives to these industries to create the economic engines to drive habitat restoration and reverse the cheatgrass fire cycle.

Incorporate the following information throughout the EIS:

Cheatgrass can be controlled mechanically, biologically, chemically or by applying fire under controlled conditions. The best results come from a combination of some or all of these techniques. The key to eradicating cheatgrass is diligence — once you begin the process you must be persistent and continue follow-up treatments for up to four or five years (or however long it might take because cheatgrass seeds may survive in soils this long).

#### Mechanical Treatments

Hand pulling — during spring and fall; repeat when new plants appear; effective in small areas only.

Disking/tilling (live plants) — spring and fall before the seed heads turn purple; repeat when new plants appear; use disk, rototiller, spike-tooth harrow, etc.

Disking/tilling (seeds) — once in late spring before seeding with desirable species in the fall; bury seeds at least three inches deep to prevent germination.

Mowing — not recommended as a long-term control technique as seed may be produced by mown plants.

#### Biological Treatments

Livestock grazing — graze, very heavily, twice early in spring (approximately three weeks apart) when the grass is green but prior to seed formation; repeat for at least two years.

#### Chemical Treatments

A few chemical formulations exist, such as Plateau or Roundup, that may control or even eradicate cheatgrass. No one herbicide will control all weed species. Combinations of herbicides may be required for control. For more assistance with chemical cheatgrass control, contact your county weed office or your local University Extension office.

Controlled Burning Treatment — late spring and summer; controlled burning has associated risks which should be addressed in a prescribed burn plan. If not done correctly, prescribed burns may escape control and become wildfires, produce smoke that impairs visibility on highways or impacts individuals with respiratory problems, and may cause damage to desirable vegetation. Consultation with a prescribed fire/controlled burn specialist is recommended when developing a prescribed burn plan.

---

## ***Summary***

Issue 1: Commenters request analysis of past vegetation treatment programs and recommend scientific literature on effects of vegetation treatments.

Issue 2: One commenter requests baseline data on cheatgrass in planning area.

Issue 3: Partnerships with private landowners to control cheatgrass should be considered in the FEIS.

---

## ***Response***

Response 1: As described in Section 4.4, the BLM and FS considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land use plan-level.

As a result of these actions, the BLM and Forest Service gathered the necessary data essential to make a reasoned choice among the alternatives analyzed in detail in the DLUPA/DEIS. The BLM and Forest Service utilized the available data to provide an adequate analysis that led to an adequate disclosure of the potential environmental consequences of the alternatives. [Insert any changes that were made to the EIS as a result of comment received. If no changes necessary, reference the section in the EIS that contain the relevant information].

Analysis of proposed weed treatment methods tiers off of analysis in the Final Vegetation Treatments Using Herbicides on Bureau of Land Management Lands in 17 Western States Programmatic Environmental Impact Statement (PEIS) [BLM 2007x]

Response 2: Potential occurrence of cheatgrass has been modeled (section 3.3.5). Acre of cheatgrass potential in GRSG habitat are shown in the DEIS based on Manier et al. 2013 (see Ttable 3-15, Acres of Cheatgrass Potential within GRSG) [Can incorporate concept of limited info regarding cheatgrass mapping] Information presented is appropriate for the planning level actions and analysis. Further analysis will occur on a site-specific basis at the implementation level.

Response 3: Cooperation with all landowners would be undertaken as feasible and is included in the range of alternatives.

## Section 3 - Edits Total

Number of Submissions: 27

Total Number of Comments: 62

---

## Section 4 – NEPA

Total Number of Submissions: 2

Total Number of Comments: 2

[NOTE: Section 4 has not been updated with final responses]

---

### Summary

The FEIS needs to identify an Environmentally Preferred Alternative, evaluate the plan according to the USFWS's Evaluation Criteria for Conservation Plans, and provide a summary comparison of the population effects under each alternative.

---

### Response

1. FEIS will identify an Environmentally Preferred Alternative per CEQ regulations.
2. NOTE TO BLM: Is there a requirement to evaluate the plan (assuming Proposed Plan) to the USFWS's Eval Criteria? Is this something that may be done as part of the agreement with USFWS? If not, should include rationale for why not.
3. May already be included in the Summary of Impacts table at the end of chapter 2. If so, include reference to this for the reader.

## Section 4.1 - Public Notification

Total Number of Submissions: 1

Total Number of Comments: 1

---

### Summary

BLM needs to publish the statistics for people that provided comment letters on the Draft EIS, as well as the comments, their responses, and changes made to the document in the FEIS.

---

### Response

Index of parties, comments, and responses will be provided in the FEIS. Changes made to the EIS will be noted [NOTE TO BLM: how did you want to show the changes? Grey highlight, strike out, etc.?]

## Section 4.2 - Cooperating Agency Relationships

Total Number of Submissions: 5

Total Number of Comments: 5

---

## Summary

See note to BLM in response.

---

## Response

NOTE TO BLM: In reviewing the comments, the theme among all of them is "BLM should work with cooperating agencies, recognize the work done with other groups, and notify the military when doing burns" which I would suggest are not something that would result in changes to the FEIS or actions; therefore, I would recommend not including this summary. I would suggest that if the information is not already in the FEIS, then you could provide further clarification of the role of cooperating agencies, additional discussions or work with other groups, or information of the follow up actions that would occur with cooperating agencies. If all of this information is already in the document, then the entire summary/response could be eliminated.

## Section 4.3 - Range of Alternatives

Total Number of Submissions: 29

Total Number of Comments: 80

---

## Summary

1. The alternatives fail to meet NEPA adequacy because:

- a. they (individually or collectively) do not meet the purpose and need for the action
- b. alternatives were all largely the same, and that the BLM needed to provide more distinction (range) between them
- c. BLM needs to consider the alternatives presented by Cooperating Agencies and Environmental Organizations, including the County alternatives, the Conservation Groups' alternative, and alternatives for the listing of the species or not listing the species.
- d. Commenters felt there was no methodology or scientific backing for establishing the disturbance cap in the alternatives, and that the BLM/FS needed to demonstrate more range in the disturbance cap amounts presented in the alternatives.
- e. specifically that Alternative D needed to include the Ecological Site Descriptions to provide adequate understanding of the current management
- f. and the BLM and Forest Service failed to adequately define the No Action Alternative.

2. Commenters also suggested that BLM and Forest Service did not provide adequate rationale for the need of the project.

---

## Response

1. a. In accordance with NEPA , the BLM and FS have discretion to establish the purpose and need for action (40 CFR 1502.13). CEQ regulations direct that an EIS "...shall briefly specify the underlying purpose and need to which the agency is responding in proposing the alternatives including the proposed action" (40 CFR 1502.13). Also, under the CEQ regulations, the BLM and the Forest Service are required to "study, develop, and describe appropriate alternatives to recommended courses of action in any proposal which involves unresolved conflicts concerning alternative uses of available resources as provided by section 102(2)(E) of the Act [NEPA]." (40 CFR 1501.2(c)). The breadth or narrowness of the purpose and need statement has a substantial influence on the scope of the subsequent analysis. The purpose and need statement provides a framework for issue identification and will inform the rationale for alternative selection. The range of alternatives developed are intended to meet the purpose and need and address the issue;

thereby, providing a basis for eventual selection of an alternative in a decision (BLM NEPA handbook and Forest Service Handbook 1909.15 – National Environmental Policy Act Handbook Chapter 10 – Environmental Analysis).

As stated in the DLUPA/EIS, the BLM and the Forest Service prepared the Idaho LUP amendment with an associated EIS to be applied to lands with greater sage-grouse habitat. This effort responds to the FWS's March 2010 'warranted, but precluded' Endangered Species Act listing petition decision, and that existing regulatory mechanisms in BLM and the Forest Service land use plans was inadequate to protect the species and its habitat. The range of alternatives, including the preferred alternative and its components (such as the disturbance caps), focus on areas affected by threats to greater sage-grouse habitat identified by the FWS in the March 2010 listing decision. Formulated by the planning team, the preferred alternative represents those goals, objectives, and actions determined to be most effective at resolving planning issues, balancing resource use at this stage of the process, and meet the stated purpose and need for action. While collaboration is critical in developing and evaluating alternatives, the final designation of a preferred alternative remains the exclusive responsibility of the BLM and Forest Service. See Section 1.2 and Section 2.7, Considerations for Selecting a Preferred Alternative for further details.

b. The BLM and the Forest Service considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM and the Forest Service consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and greater sage-grouse in the planning area, the BLM and the Forest Service fully considered the management opportunities presented in the Analysis of the Management Situation (AMS) and the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As a result, four alternatives were analyzed in detail in the DLUPA/EIS that best addressed the issues and concerns identified by the affected public. The range of alternatives in the DLUPA/EIS represented a full spectrum of options including a no action alternative (current management, Alternative A).

As described in Section 2.3 of the Draft EIS, the Idaho GRSG RMPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the RMPA. The BLM and Forest Service complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft RMPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions from the field office RMPs are acceptable and reasonable. In these instances, there was no need to develop alternative management prescriptions.

Public input received during the scoping process was considered to ensure that all issues and concerns would be addressed, as appropriate, in developing the alternatives. The planning team developed planning issues to be addressed in the RMPA, based on broad concerns or controversies related to conditions, trends, needs, and existing and potential uses of planning area lands and resources.

Additionally, the resulting action alternatives offer a range of possible management approaches for responding to planning issues and concerns identified through public scoping, and to maintain or increase GRSG abundance and distribution in the planning area. While the goal is the same across alternatives, each alternative contains a discrete set of objectives and management actions and constitutes a separate RMPA with the potential for different long-range outcomes and conditions.

The relative emphasis given to particular resources and resource uses differs as well, including allowable uses, restoration measures, and specific direction pertaining to individual resource programs. When resources or resource uses are mandated by law or are not tied to planning issues, there are typically few or no distinctions between alternatives. Meaningful differences among the four alternatives are described in Table 2-2, Comparative Summary of Alternatives, in Section 2.8, Summary Comparison of Alternatives, of the Draft EIS.

c. Based on this alternative development process, the BLM considered input from cooperating agencies, environmental

organizations, and the public. As described in 2.4.2. Alternative B, the BLM used the GRSG conservation measures in A Report on National Greater Sage-Grouse Conservation Measures (NTT 2011) were used to form BLM management direction under Alternative B, which is consistent with the direction provided in BLM Washington Office Instruction Memorandum 2012-044 (the BLM must consider all applicable conservation measures developed by the NTT in at least one alternative in the land use planning process).

During scoping for the Idaho GRSG RMPA/EIS, individuals and conservation groups submitted management direction recommendations for protection and conservation of GRSG and their habitat, including the Sage-grouse Recovery Alternative and proposed disturbance cap. The recommendations, in conjunction with resource allocation opportunities and internal sub-regional BLM input, were reviewed in order to develop BLM management direction for GRSG under Alternative C.

Alternative D incorporates adjustments to the NTT report (NTT 2011) to provide a balanced level of protection, restoration, enhancement, and use of resources and services to meet ongoing programs and land uses, and was developed in full cooperation with the Cooperating Agencies taking note of the agencies' concerns with socioeconomic issues.

Section 2.6, Alternatives Considered but not Analyzed in Detail, of the Draft EIS, the XXX Alternative was analyzed but not considered in detail in the DEIS primarily because it is contained within the existing range of alternatives.

The BLM and Forest Service considered the State of Idaho's Sage-Grouse Conservation Plan in its cumulative effects analysis (Draft EIS Chapter 5, Cumulative Effects, Section 5.4, Special Status Species).

Whether the Greater Sage-grouse is determined for listing by the USFWS is outside the jurisdiction of the BLM and beyond the scope of this EIS. As noted in the Purpose and Need, the BLM was to consider regulatory mechanisms that would protect the species and its habitat. As such, the BLM did not develop alternatives should the USFWS choose to list or not list the Greater Sage-grouse.

d. In determining the disturbance cap level for each alternative, the BLM utilized the recommendations and input specific to each alternative. For example, for Alternative B, the BLM utilized the cap levels recommended in the NTT Report. Conservation measures included in Alternative B focus primarily on GRSG PPH and include a 3-percent disturbance cap in PPH. PPH areas have the highest conservation value to maintaining or increasing GRSG populations.

For Alternative C, conservation measures were mostly focused on ADH (PPH, PGH, and linkage/connectivity habitat). These areas have been identified by CPW in coordination with respective BLM offices, and include a 3-percent cap on disturbance in ADH. This disturbance cap number for Alternatives B and C were incorporated as-is from the NTT Report and conservation group alternatives; the BLM did not modify the caps in the alternatives.

For Alternative D, the BLM intended to protect those areas that were most important for sage-grouse within PPH; in other words, the alternative would protect the best of the best habitat. The BLM utilized information from the Wyoming Core Strategy to support consideration of the five-percent disturbance cap, with the goal to represent the reasonable edge of the range of alternatives with a higher percentage.

While the caps would set a particular level of disturbance, the implementation of the disturbance caps would occur after the RMPA is approved in the Record of Decision. The BLM inventoried the habitat with the best available info at the time of the DEIS, but would also do additional in-depth analysis & inventory within management zones at the implementation stage.

2. While FWS has responsibility for threatened and endangered species, the BLM and the Forest Service manage a significant portion of sage-grouse habitat. Thus, although it is the FWS's responsibility to administer the Endangered Species Act, management of wildlife habitat is within the BLM and the Forest Service's multiple-use mandate and is properly a resource to be managed for in their planning decisions.

## Section 4.4 - Best Available Info Baseline Data

Total Number of Submissions: 4

Total Number of Comments: 5

---

### Summary

The EIS fails to meet NEPA adequacy for baseline data because the scale of baseline data used is too broad, the EIS failed to include the State and Transition models as part of the baseline information, and the No Action management actions, as presented, do not explain the regulatory mechanisms that are currently available to preserve sage grouse habitat.

---

### Response

The CEQ regulations require an environmental impact statement to "succinctly describe the environment of the area(s) to be affected or created by the alternatives under consideration. The description shall be no longer than is necessary to understand the effects of the alternatives. Data and analyses in a statement shall be commensurate with the importance of the impact, with less important material summarized, consolidated, or simply referenced. Agencies shall avoid useless bulk in statements and shall concentrate effort and attention on important issues" (40 CFR 1502.15). Additionally, the [name of particular amendment] is a programmatic NEPA effort to conserve greater sage-grouse and its habitat across a broad geographic area. As such, the BLM and the Forest Service described the current conditions and trends in the affected environment broadly, across a range of conditions, appropriate to program-level land use planning actions. The BLM and the Forest Service complied with these regulations in describing the affected environment. The requisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The affected environment provided in [Chapter XX] and various appendices including [cite appendix(ces)] in the [name of particular amendment] is sufficient to support, at the general land use planning-level of analysis, the environmental impact analysis resulting from management actions presented in the DLUPA/EIS. For example, [use relevant example for the particular issue...here's one provided: listing every water quality-impaired stream within the planning area by name would not provide useful information at this broad-scale analysis, particularly where the proposed plan alternatives did not vary the level of riparian protections to provide reduced levels for non-impaired streams. The riparian protections within each alternative were applied to all streams, whether or not they were water quality-impaired. However, understanding the miles of impaired BLM streams, as presented in the DLUPA/EIS at Section 3.5.7, is useful in establishing a baseline by which the BLM may analyze the relative effects of each alternative's broad-based approach.]

As specific actions come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. Site-specific concerns and more detailed environmental descriptions will be addressed when project-level reviews are tiered to the analysis in this EIS (40 CFR 1502.20, 40 CFR 1508.28). In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for any site-specific actions.

## Section 4.5 - GIS Data and Analysis

Total Number of Submissions: 8

Total Number of Comments: 13

---

### Summary

Commenters noted several issues with the GIS data and analysis conducted in the Draft EIS:

- The maps and data layers do not provide enough detail to address "local ecological site variability". The data are too

course and do not provide assurances to more localized decision making; some habitat type areas are inaccurately identified in the maps.

- BLM used old data layers to develop maps; BLM should use the newer data layers.

--the BLM needs to be consistent in their edge-mapping across state boundaries when there are different data sets used.

NOTE TO BLM: some comments relate to specific changes for the maps presented in the DEIS, and for the data layers to be made available for download from the BLM website.

---

## Response

Before beginning the Idaho Sage grouse EIS and throughout the planning effort, the BLM and the Forest Service considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The data needed to support broad-scale analysis of the planning area are substantially different than the data needed to support site-specific analysis of projects. The LUPA/EIS data and information is presented in map and table form and is sufficient to support the broad scale analyses required for land use planning.

Additionally, the BLM and the Forest Service consulted with, collected, and incorporated data from other agencies and sources, including but not limited to the U.S. Fish and Wildlife Service and [list state agencies, including state wildlife agency]. Considerations included but were not limited to [list the types of data or GIS layers that were gathered/used. A few examples: threatened and endangered species and their habitats, water quality- limited (303d) streams, deer and elk herd management areas, invasive plants, and uses on State lands]. It is not the responsibility of the BLM or FS to modify, change, update, or revise the specific modeling protocol and analysis developed by other agencies or groups. The Draft EIS notes that the BLM and FS would incorporate any refinements or updates if or when the data were made available. [NOTE TO BLM: If any updates or new layers have become available, can note them here.]

The BLM and the Forest Service described the current conditions and trends in the affected environment broadly, across a range of conditions, appropriate to program-level land use planning actions. The BLM and the Forest Service complied with the regulations in describing the affected environment. The requisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The affected environment provided in [Chapter XX] and various appendices including [cite appendix(ces)] in the [name of particular amendment] is sufficient to support, at the general land use planning-level of analysis, the environmental impact analysis resulting from management actions presented in the DLUPA/EIS.

As a result of these actions, the data gathered by the BLM and the Forest Service is of the appropriate scale and provided an adequate analysis that led to an adequate disclosure of the potential environmental consequences of the alternatives.

A land use planning-level decision is broad in scope. The BLM and the Forest Service realize that more data could always be gathered, the baseline data provides the necessary basis to make informed land use plan-level decisions. Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The BLM and the Forest Service will conduct subsequent project-specific NEPA analyses for projects proposed for implementation under the land use plan, which may include but are not limited to fuels treatment, habitat restoration, [etc.; list others as applicable]. The subsequent NEPA analyses for project-specific actions will tier to the land-use planning analysis and evaluate project impacts at the appropriate site-specific level (40 CFR 1502.20, 40 CFR 1508.28). As required by NEPA, the public will have the opportunity to participate in the NEPA process for site-specific actions.

Of the suggested studies and references put forth by the commenters, the BLM reviewed them to determine if they presented new information that would need to be incorporated into the FEIS, or if the references provided the same information as already used or described in the Draft EIS. Adjustments to mapping can be found in Appendix B,

"Mapping Adjustments."

## Section 4.6 - Indirect Impacts

Total Number of Submissions: 4

Total Number of Comments: 5

---

### Summary

BLM's overall impact analysis is deficient in the following areas:

1. lack of discussion for where, when, and how BLM will have sufficient funding to implement the actions;
2. the analysis does not distinguish between the effects of each alternative;
3. did not fully analyze the No Action alternative by not acknowledging the existing laws and actions already in place that would manage the habitat;

---

### Response

1. As a landscape level planning effort, none of the alternatives prescribe project-level or site-specific activities on BLM or USFS managed lands. Furthermore, the agencies' selection of an alternative does not authorize funding to any specific project or activity nor does it directly tie into the agencies' budgets as appropriated annually through the Federal budget process. As a consequence, agencies' costs and differences in program costs across alternatives have not been quantified. Information has been presented in several resource impact sections on the types of costs that might be associated with various sage-grouse conservation measures. [NOTE TO BLM- above language from Josh Sidon, Lauren may want to use across all subregions.]
2. Direct the reader to the Effects Summary table in ch 2. Determine whether revisions to the table would be necessary to distinguish more between the effects.
3. Check for the No Action alternative to see if there already is a statement for how existing management/actions would impact the habitat. This may be to direct the reader to a specific section in Ch 4 or several sections.

## Section 4.7 - Cumulative Impacts

Total Number of Submissions: 6

Total Number of Comments: 7

---

### Summary

The EIS cumulative impacts analysis is inadequate because it does not adequately identify the reasonably foreseeable future actions, present a comprehensive listing of the effects across ALL subregions, nor analyze how the alternatives' actions would affect actions and decisions in neighboring states/jurisdictions.

---

### Response

Can direct reader to cumulative impacts; note that the cums impacts are updated based on work done between Draft & Final; see if there is anything specific you can add to clarify how actions in neighboring jurisdictions/states were addressed in the cums.

Regional call on whether to roll up effects totals into a region wide estimate as suggested by commenter.

## Section 4.8 – Residual Effects – Unavoidable Impacts

*No comments are associated with this issue.*

---

## Section 4.9 - Mitigation Measures

Total Number of Submissions: 13

Total Number of Comments: 18

---

### Summary

1. The BLM needs to include a monitoring, mitigation, and adaptive management plan/framework in the FEIS that will include specific criteria for determining sage grouse conservation success and how the disturbance percentages will be calculated.

2. BLM needs to clarify the relationship between the disturbance thresholds and the monitoring framework.

3. The BLM needs to release the mitigation strategy for public review.

---

### Response

The BLM and the Forest Service complied with the NEPA by including a discussion of measures that may mitigate adverse environmental impacts of the alternatives in the DLUPA/EIS. See 40 CFR 1502.14(f), 1502.16(h). Potential forms of mitigation include: (1) avoiding the impact altogether by not taking a certain action or parts of an action; (2) minimizing impacts by limiting the degree or magnitude of the action and its implementation; (3) rectifying the impact by repairing, rehabilitating, or restoring the affected environment; (4) reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action; or (5) compensating for the impact by replacing or providing substitute resources or environments. 40 CFR 1508.20. Taking certain actions [or not taking action, depending on position of issue statement], such as [cite to any specific examples included with comments], is only one of many potential forms of mitigation. The BLM and the Forest Service must include mitigation measures in an EIS pursuant to the NEPA; yet the BLM and the Forest Service have full discretion in selecting which mitigation measures are most appropriate, including which forms of mitigation are inappropriate.

[Cite specifics relevant to the sub-regional for where the alternatives have incorporated mitigation measures designed to avoid or reduce impacts within the management actions and supporting information in the appendices. If there are many, then note that the impacts presented in Chapter 4, therefore, are considered unavoidable and would result from implementing the management actions and mitigations. Cite a few examples of the actions that include specific mitigation measures as part of the alternative(s). Sample: “Action BIO-1: Implement the standard operating procedures (SOPs) contained in Appendix O (Biological Standard Operating Procedures) and Appendix P (Standard Operating Procedures for Oil and Gas) for all project work would help to mitigate effects as a result of oil and gas activities on biological resources.”]

A monitoring framework was developed by a Disturbance and Monitoring Team that focuses on the implementation and effectiveness of the conservation measures in the planning documents. The BLM and the Forest Service worked with WAFWA to define a standardized process for data sharing and definitions of priority areas of conservation boundaries. Monitoring methods and indicators were derived from the best available science. Corporate data-sets will be established

so that data can easily be “rolled up” for reporting monitoring results across the range of greater sage-grouse, as defined by Schroeder et al. (2004); by populations and subpopulations as defined by Connelly et al. (2004); by LUP area; by the seven (WAFWA) Greater Sage-grouse Management Zones (Stiver et al. 2006), and by Priority Areas for Conservation (PACs) as defined in the greater sage-grouse Conservation Objectives Team (COT) Report (U.S. Fish and Wildlife Service 2013). [If needed, based on specifics of comments and/or summary statement, include statement to the effect that broad- and mid-scale monitoring will be conducted as funding allows.]

[Refer to the Monitoring Framework in the appendix.] To accomplish effective monitoring, the BLM and the Forest Service will analyze the monitoring data to characterize the relationship among disturbance, implementation actions, and habitat condition at the appropriate and applicable geographic scale or boundary. When available from WAFWA and/or state wildlife agencies, effectiveness monitoring can be supplemented with population trend information, taking into consideration the lag effect response of populations to habitat changes.

## Section 5 – FLPMA

Total Number of Submissions: 7

Total Number of Comments: 12

[NOTE: Section 5 has not been updated with final responses]

---

### Summary

The DLUPA/EIS has failed to comply with the multiple-use mandates found in the BLM’s FLPMA and the Forest Service’s Multiple Use Sustained Yield Act because it has put protecting greater sage-grouse and sage-grouse habitat above legal requirements for balanced management.

---

### Response

NOTE TO BLM: this is the full national response and has been reviewed by SOL:

The BLM’s FLPMA (Section 103(c)) defines "multiple use" as the management of the public lands and their various resource values so that they are utilized in the combination that will best meet the present and future needs of the American people. Accordingly, the BLM is responsible for the complicated task of striking a balance among the many competing uses to which public lands can be put. The BLM’s multiple-use mandate does not require that all uses be allowed on all areas of the public lands. The purpose of the mandate is to require the BLM to evaluate and choose an appropriate balance of resource uses which involves tradeoffs between competing uses. The FLPMA also directs the United States (US) Department of the Interior, Bureau of Land Management (BLM) to develop and periodically revise or amend its Resource Management Plans (RMPs), which guide management of BLM-administered lands, and provides an arena for making decisions regarding how public lands would be managed and used.

Consistent with the Multiple-Use Sustained-Yield Act of 1960 (16 U.S.C. 528–531) (MUSYA), the Forest Service manages National Forest System land to sustain the multiple use of its renewable resources in perpetuity while maintaining the long-term health and productivity of the land. Resources are managed through a combination of approaches and concepts for the benefit of human communities and natural resources. Land management plans guide sustainable, integrated resource management of the resources within the plan area in the context of the broader landscape, giving due consideration to the relative values of the various resources in particular areas. The Forest Service is required by statute to have a national planning rule: the Forest and Rangeland Renewable Resources Planning Act of 1974, as amended by the National Forest Management Act of 1976, requires the Secretary of Agriculture to issue regulations under the principles of the Multiple-Use Sustained-Yield Act of 1960 for the development and revision of land management plans.

The [name of particular amendment] is a targeted amendment specifically addressing goals, objectives, and conservation measures to conserve greater sage-grouse and to respond to the potential of its being listed (see Section I.XX, Purpose and Need). Both, the Forest Service's and BLM's planning processes allow for analysis and consideration of a range of alternatives in the DLUPA/EIS that identified and incorporated appropriate regulatory mechanisms to conserve, enhance, and restore greater sage-grouse habitat and to eliminate, reduce, or minimize threats to this habitat to ensure that a balanced management approach was recommended. The DLUPA/EIS includes alternatives that provide a greater and lesser degree of restrictions in various use programs, but would not eliminate or invalidate any valid existing development rights. For example, [insert one or more examples of the range of actions considered, include references to sections/table where they can be found].

Additionally, the BLM and the Forest Service developed the [name LUPA/EIS] with involvement from cooperating agencies, including [name various agencies, including the state wildlife agency, state's governor's office, other fed agencies, any local agencies/governments] to ensure that a balanced multiple-use management strategy to address the protection of greater sage-grouse while allowing for utilization of renewable and nonrenewable resources on the public lands.

## Section 5.1 - Inventories

*No comments are associated with this issue.*

---

## Section 5.2 - Consistency with other state, county, or local plans

Total Number of Submissions: 8

Total Number of Comments: 14

---

### Summary

The BLM's actions considered in the alternatives conflict with local and state agency plans and policies; furthermore, the BLM did not review all of the county and state plans to ensure that conservation measures are as consistent as possible with other planning jurisdictions.

---

### Response

The BLM land use plans and amendments must be consistent with officially approved or adopted resource-related plans of Indian tribes, other Federal agencies, and State and local governments to the extent that these resource-related plans comport with FLPMA and other Federal laws and regulations (see 43 CFR 1610). The BLM has worked closely with State and local governments during preparation of the Draft LUPA/EIS. The Draft LUPA/EIS lists the cooperating agencies actively involved in the planning process in Section 6.XX. The BLM works to find a balance among uses and needs as reflected in these local government plans and has done so in the preparation of the LUPA/EIS; a list of these plans can be found in Chapter I, Section I.XX, Relationship to Other Policies, Plans, and Programs. While the BLM is not obligated to seek consistency, the agency is required to describe the inconsistencies between the proposed action and the other plans, policies, and/or controls within the EIS. This information has been updated in the FEIS. [NOTE TO BLM: Might need to add this sentence (regarding obligations) to Section I.7, Relationship to Other Policies, Plans, and Programs, of the FEIS. Also need to ensure that the FEIS describes any such inconsistencies.]

The BLM coordinates with cooperating agencies commensurate with each agency's recognized jurisdiction or expertise. In areas where the State of Idaho has clear jurisdiction, such as wildlife populations, the BLM has worked closely with

that State agency. In cases where a county or agency has expertise, such as local county socioeconomic information, the BLM has worked closely with the group to incorporate the information into the EIS.

NOTE TO BLM: plans, policies that commenters felt needed to be reviewed for consistency:

Gooding conservation district sage grouse conservation plan  
National Academy of Sciences 2013 recommendations for the WHB program  
State of MT sage-grouse management strategy  
Custer County plans  
Owyhee County plans

## Section 5.4 - Planning Regs 43 CFR 1600

Total Number of Submissions: 2

Total Number of Comments: 2

---

### Summary

The BLM did not provide an explanation for how and why they defined the planning area as they did.

---

### Response

[NOTE TO BLM: This is from a national response.]

The framework for the scope of analysis for the project is based upon the BLM and the Forest Service Planning and NEPA manual and handbooks definitions of the planning, decision, and analysis areas. Specifically, Forest Service Manual 1900-Planning Chapter, Zero Code defines the Area of Analysis as “The geographic area within which ecosystems, their components, or their processes are evaluated during analysis and development of one or more plans, plan amendments, or plan revisions. This area may vary in size depending on the relevant planning issue. For a plan, an area of analysis may be larger than a plan area. For development of a plan amendment, an area of analysis may be smaller than the plan area and include multiple ownerships.”

For this environmental impact statement, decision areas are those public lands and mineral estates within the planning area that are encompassed by all designated habitat (ADH) (which includes preliminary priority habitat [PPH], preliminary general habitat [PGH], and linkage/connectivity habitat).

Planning Area. The geographic area within which the BLM will make decisions during a planning effort. A planning area boundary includes all lands regardless of jurisdiction; however the BLM will only make decisions on lands that fall under the BLM’s jurisdiction (including subsurface minerals). Unless the State Director determines otherwise, the planning area for a RMP is the geographic area associated with a particular field office (43 CFR 1610.1(b)). State Directors may also establish regional planning areas that encompass several field offices and/or states, as necessary.

Plan areas. National Forest System lands covered by land use plans. (36 CFR 219.16)

[If not included in DEIS already, make a notation that the FEIS will be updated to note definitions of planning, decision, and analysis areas to clarify these terms.]

## Section 6 - Other Laws

Total Number of Submissions: 11

Total Number of Comments: 15

[NOTE: Section 6 has not been updated with final responses]

---

### Summary

The BLM has failed to document how the EIS and/or actions considered in the EIS comply with other laws, including all Onshore Orders regulating oil and gas development, the Energy Policy Act of 2005 and Energy Policy and Conservation Act of 2000, the Taylor Grazing Act, the Mining and Minerals Policy Act, the Information Quality Act, the Wild Horse and Burro Act, other multiple use mandates (e.g., Multiple-Use Sustained Yield Act of 1960, Forest and Rangeland Renewable Resources Planning Act of 1974, National Forest Management Act of 1976), and compliance with other federal agency regulations (e.g., XXX).

---

### Response

[NOTE TO BLM: This response may need to go up the chain for review.]

As noted under Section 5 of this Report, the Draft LUPA/EIS is consistent with the BLM's FLPMA and the Forest Service's Multiple-Use Sustained-Yield Act of 1960 (16 U.S.C. 528–531) (MUSYA). The Idaho Greater Sage-Grouse Land Use Plan Amendment is a targeted amendment specifically addressing goals, objectives, and conservation measures to conserve greater sage-grouse and to respond to the potential of it being listed (see DEIS Section 1.2, Purpose of and Need for the Land Use Plan Amendments). Both the Forest Service's and BLM's planning processes allow for analysis and consideration of a range of alternatives in the DLUPA/EIS that identified and incorporated appropriate regulatory mechanisms to conserve, enhance, and restore greater sage-grouse habitat and to eliminate, reduce, or minimize threats to this habitat to ensure that a balanced management approach was recommended. The DLUPA/EIS includes alternatives that provide a greater and lesser degree of restrictions in various use programs, but would not eliminate or invalidate any valid existing development rights.

Additionally, the BLM and the Forest Service developed the Idaho Greater Sage-Grouse Draft Land Use Plan Amendment/DEIS with involvement from cooperating agencies (see DEIS Section 6.3, Cooperating Agencies), including [ID state wildlife agency, counties, etc.] to ensure that a balanced multiple-use management strategy to address the protection of greater sage-grouse while allowing for utilization of renewable and nonrenewable resources on the public lands.

The Draft EIS Section 2.5, Management Common to All Alternatives (pages 39 and 40), states that all alternatives would comply with state and federal laws, regulations, policies, and standards, and implement actions originating from laws, regulations, and policies. Actions in the Proposed LUPA have been reviewed and found to be consistent and within the bounds of all required laws, regulations, and policies.

## Section 7 - Sage Grouse

*No comments are associated with this issue.*

---

### Section 7.1 - NTT report/findings

Total Number of Submissions: 11

Total Number of Comments: 32

---

## Summary

Commenters contended that the NTT report is not based on the best available science, contains technical and methodological errors, is not based on local conditions, and has not undergone adequate peer review. Commenters questioned why the NTT report was used when the IM requiring its use has expired.

---

## Response

A National Technical Team (NTT) was formed as an independent, science-based team to ensure that the best information about how to manage the greater sage-grouse is reviewed, evaluated, and provided to the BLM and the Forest Service in the planning process. The group produced a report in December 2011 that identified science-based management considerations to promote sustainable greater sage-grouse populations. The NTT report (NTT 2011) used the best current scientific knowledge to guide the BLM planning efforts through management considerations to ameliorate threats, focused primarily on priority greater sage-grouse habitats on public lands. The NTT report cited 122 references including published papers from the formal scientific literature such as Journal of Wildlife Management, Conservation Biology, Biological Conservation, Wildlife Biology, BioScience and others, as well as graduate theses and dissertations, conservation strategies, FWS 2010 finding, and others representing the best available science. The NTT report was intended to be used at a programmatic scale and may not reflect local conditions.

The BLM used the NTT report per BLM IM 2012-044 to construct an alternative that would meet the purpose and need. This report was not the only source of information for developing a range of alternatives (see Section 7.5, Range of Alternatives).

[NOTE TO BLM- Clarify in FEIS the policy requirements for Administrative Procedure Act (APA), NEPA relative to IM, and NTT and clarify the NTT process and FACA in the FEIS.]

BLM is implementing IM 2012-044 through the Greater Sage-grouse planning effort. When an IM expires without being superseded, it can still be applicable and provide guidance to the BLM. The fact that IM 2012-044 expired does not mean the BLM has no authority to continue to analyze the conservation measures identified in the NTT Report. The BLM is appropriately considering and evaluating the measures in the NTT Report, in addition to any other relevant science, through the Greater Sage-grouse planning process.

{Note: Suggest asking for National justification of why the NTT was an appropriate source}

## Section 7.2 – BER

Total Number of Submissions: 1

Total Number of Comments: 2

---

## Summary

The BER contains outdated baseline literature and should be updated with suggested literature.

---

## Response

[NOTE TO BLM: The BLM is reviewing suggested literature and will include where necessary.]

A baseline environmental report, titled Summary of Science, Activities, Programs, and Policies That Influence the Rangeland Conservation of Greater Sage-grouse (*Centrocercus urophasianus*) (referred to as the BER), was released on June 3, 2013, by the U.S. Geological Survey. The peer-reviewed report summarizes the current scientific understanding about the various impacts to greater sage-grouse populations and habitats and addresses the location, magnitude, and extent of each threat. The data for this report were gathered from BLM, Forest Service, and other sources and were the best available at the range-wide scale at the time collected. The report provides a framework for considering potential implications and management options, and demonstrates a regional context and perspective needed for local planning and decision-making.

The BLM reviewed the literature sources provided by commenters to determine if there were new or updated sources that should be considered in the EIS. BLM's findings of this review were... [insert the results from the literature review. While it doesn't directly address the BER report being updated, it's addressing the point that BLM did make the effort to consider new or updated info in the EIS in addition to the BER report.]

While there was consistent direction provided in alternative develop, such as BLM WO IM 2012-044, variation across sub-regionals was needed to accommodate the local issues and specific state and Forest Service requirements. Alternative D was developed by the BLM in coordination with the Forest Service and local FWS. This alternative includes modifications to the conservation measures identified in the NTT report and is designed to address local ecological site variability. This alternative also emphasizes balancing resources and resource use among competing human interests, land uses, and the conservation of greater sage-grouse habitat. Alternative E was developed from recommendations by the State of Idaho's greater sage-grouse task force and would apply to all BLM-administered and National Forest System lands located in the state. See Section 2.1.2 regarding alternative development and explanation of components of each alternative. {Note: Suggest including more justification of the BER in response}

## Section 7.3 – COT

Total Number of Submissions: 9

Total Number of Comments: 17

---

## Summary

Commenters had two distinct views regarding the COT report. One group considered the report overly biased and not representative of the best available information. The other group suggested the DEIS was not fully consistent with the COT report habitat mapping and therefore requires revision to address those deficiencies.

---

## Response

In March 2012, the FWS initiated a collaborative approach to develop range-wide conservation objectives for the greater sage-grouse to inform the 2015 decision about the need to list the species and to inform the collective conservation efforts of the many partners working to conserve the species. In March 2013, this team released the Conservation Objectives Team (COT) report based upon the best scientific and commercial data available at the time that identifies key areas for greater sage-grouse conservation, key threats in those areas, and the extent to which they need to be reduced for the species to be conserved. The report serves as guidance to Federal land management agencies, State greater sage-grouse teams, and others in focusing efforts to achieve effective conservation for this species.

Table 2-20 demonstrates how the BLM and Forest Service management actions under each alternative address the threats to the populations in the Idaho and southwestern Montana sub-region. In Idaho, Core and Important Habitat Zones under Alternative E were used to derive the PACs in the COT. The BLM and Forest Service have continued to work with the USFWS and State agencies to develop a proposed plan.

[NOTE TO BLM: Clarify in the FEIS the validity of NTT, COT, and BER as relative to the established standards of scientific integrity under the ESA, the Data Quality Act, and the Presidential and DOI memoranda and orders. Ensure the FEIS clarifies how PACs were delineated (IDFG delineated based on Core and Important zones, and provided to FWS). Clarify MZs and population monitoring efforts in the FEIS.]

## Section 7.4 - Policy Guidance

Total Number of Submissions: 1

Total Number of Comments: 1

---

### Summary

The BLM and Forest Service should include additional information to improve consistency with USFWS's Policy for Evaluation of Conservation Efforts.

---

### Response

The BLM and Forest Service are working closely with the USFWS to ensure certainty of implementation and effectiveness to the extent possible. However, certain management actions, such as restoration activities, are contingent on funding availability and thus some uncertainty remains.

## Section 7.5 - Range of Alternatives

Total Number of Submissions: 28

Total Number of Comments: 90

---

### Summary

Commenters proposed revisions or requested additional details and clarifications to the alternatives related to GRSG.

Topics of concern included:

- The size of lek buffers
- Level of predator control
- Need for and size of disturbance cap
- Restrictions on wind energy development
- Noise restrictions
- Livestock grazing management changes
- Inadequate description of adaptive management and monitoring
- Need for an improved definition of no net unmitigated loss
- Leasable mineral restrictions
- Juniper removal
- Existing and new fencing as they relate to sage-grouse strikes and mortality
- Lack of active habitat restoration

- Habitat monitoring

Commenters were concerned about greater sage-grouse habitat mapping, including suggesting clarifications or revisions to the habitat map and concerns about using the map for site-scale projects.

Commenters were also concerned that Manual 6840 was not used as the baseline policy governing present GRSG conservation in the No Action alternative.

## Response

As noted above in the response in Section 4.3, Range of Alternatives, Section 2.1 of the Draft EIS describes how the Idaho and southwestern Montana GRSG LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA and worked closely with the State with assistance from the USFWS.

Meaningful differences among the six alternatives are described in Table 2-2, Comparative Summary of Alternatives by Acres Allotted, and in Section 2.6, Detailed Description of Alternatives, of the Draft EIS. [Specify where changes have been made to the FEIS regarding each of the bullets below]. Refer to tab 32 regarding predator control. All of these issues have been addressed in new management actions prepared for the proposed plan and analyzed in Chapter 4 (and reference relevant appendices regarding AM and monitoring, etc.).

Regarding the following issues:

The size of lek buffers -lek buffers will be revised in final plan/FEIS reflecting additional review of best science.

- Level of predator control
- Need for and size of disturbance cap- Additional specificity regarding the disturbance cap has been further explained in the FEIS.
- Restrictions on wind energy development
- Noise restrictions. Noise and seasonal stipulations for both construction and long-term implementation of land use activities has been included in the final EIS. [NOTE TO BLM (from Makela)- Project leads should discuss how to consistently address impacts from military flights and firm up discussion at 4-15. Consider adding additional detail from Mt. Home AFB Integrated Resource Mgt. Plan.]
- Livestock grazing management changes
- Inadequate description of adaptive management and monitoring. The BLM and FS believe the management actions described in the Proposed Plan will adequately address sage-grouse conservation needs without the need for additional large scale designations.
- Need for an improved definition of no net unmitigated loss- Additional specificity regarding the no net habitat loss objectives has been further explained in the FEIS.
- Leasable mineral restrictions
- Juniper removal
- Existing and new fencing as they relate to sage-grouse strikes and mortality. The BLM and FS used the latest science in developing management actions relatives to fences that adequately address collision risk. No change has been made to the document regarding this issue in the FEIS.
- Lack of active habitat restoration- Site specific projects are not identified in the broad scale plan, but there are a number of restoration actions described in Table 2-18 Vegetation/Restoration section in the DEIS and in the Proposed Plan.
- Habitat monitoring- The BLM and FS, in coordination with the state, have clarified monitoring and mapping expectations in the FEIS.

A description of the habitat mapping process for each alternative is presented in Section 2.6, Detailed Description of Alternatives. The Proposed Plan will contain a mechanism that allows for evaluation of circumstances on case by case basis at the site specific scale that would be addressed via subsequent project level NEPA analysis.

Manual 6840 is referenced in Chapter 1, Section 1.x, Planning Criteria, and provides general guidance for special status species, but it does not provide language relative to specific conservation actions for specific species. [BLM- ensure Manual 6840 is discussed in Alternative A and also relevant FS policy].

[NOTE TO BLM: Ensure Proposed Plan has appropriate provisions/clarity for actions in General management areas. Needs additional discussion.]

## Section 7.6 - Best Available Info Baseline Data

Total Number of Submissions: 38

Total Number of Comments: 97

---

### Summary

Commenters suggested new or additional literature for the BLM and Forest Service to consider in the DLUPA/EIS related to:

- Determination of GRSG population size and trends – inaccuracy of past counts; insufficient data to determine trend.
- Effects of livestock grazing, predation, drought, noise, and anthropogenic development
- Appropriate lek buffers and disturbance cap to incorporate
- Mitigation
- Hunting– outside scope but managed via the Idaho and Montana state plans
- GRSG habitat requirements
- Accuracy of the habitat mapping
- Infrastructure
- West Nile virus

### Response

As described in Section 4.4 of this comment report, The BLM and the Forest Service used the most recent and best information available that was relevant to a land-use planning-level analysis including the Baseline Environmental Report (BER; Manier et al. 2013), NTT report (NTT 2011), and COT report (USFWS 2013). Additionally, the BLM and the Forest Service consulted with, collected, and incorporated data from other agencies and sources, including but not limited to the U.S. Fish and Wildlife Service, Idaho Department of Fish and Game, scientific literature, field and district office data. Considerations included but were not limited to [list the types of data or GIS layers that were gathered/used.].

Of the suggested studies and references put forth by the commenters, the BLM and Forest Service reviewed them to determine if they presented new information that would need to be incorporated into the FEIS, were references already included in the draft EIS, or if the references provided the same information as already used or described in the Draft EIS. The BLM determined that several of these references contained new or relevant information regarding xxx resources and the analysis was clarified and references cited in Sections XXX of the FEIS. In some cases, the additional literature was essentially the same as existing sources and was not incorporated.

A description of the habitat mapping process for each alternative is presented in Section 2.6, Detailed Description of Alternatives.

## Section 7.7 - Impact Analysis

Total Number of Submissions: 22

Total Number of Comments: 70

---

### Summary

The BLM and Forest Service should conduct additional, more comprehensive analysis of the impacts on greater sage-grouse to provide more substantiated conclusions.

Commenters provided suggestions on how to improve or modify the impact analysis for greater sage-grouse in several topic areas including:

- Hunting
- Predation
- Anthropogenic disturbance, disturbance caps, and lek buffers
- Expanding on beneficial effects on GRSG from range improvements
- Greater sage-grouse population size and trend
- Livestock grazing, fences, and trailing
- Noise as related to low-level military overflights
- Success of habitat improvement projects
- Prescribed fire
- Herbicides
- West Nile virus
- More detailed analysis of Alternative A
- Climate change
- Need to identify areas for restoration
- Coal suitability

The EIS fails to provide justification as to why “withdrawal from mineral entry” is necessary to protect GRSG and its habitat when the same objective can be achieved through avoidance, minimization of impacts, and mitigation of impacts within the designated areas.

---

## Response

The LUPA/FEIS provides an updated and expanded discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As described in Chapter 2.3.2, coal was not an issue for analysis. As required by 40 CFR 1502.16, the LUPA/FEIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man’s environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources should the proposal be implemented. The LUPA/FEIS provided sufficiently detailed information to aid in determining whether to proceed with the proposed plan in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. Therefore, effects on GRSG population levels are not required to be quantified as part of the impact analysis. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

[BLM: Eventually need to fill this in:] Impacts from XX on greater sage-grouse were considered in Section 4.x of the Draft EIS. Include discussion of what changes were made and where. If no change made, describe why the impact analysis is adequate for that topic. Some template text:

While a land use planning-level action is broad in scope and, therefore, does not require site specific impact analysis, a thorough review of the EIS’s impact analysis relevant to [speak to the specific topic or theme of the issue statement, e.g., anticipated fluid mineral development of the planning area] was found to need additional information and support for the

conclusions/findings. The BLM and the Forest Service have updated this information in the Proposed Land Use Plan Amendment/FEIS to provide the necessary information to make informed land use plan-level decisions. Specifically, [insert a summary of the information that was updated and include a citation for where the reader could find it in the FEIS.]

The facts that sagebrush takes decades to re-establish and that disturbance from light and noise affect GRSG mean that avoidance, minimization of impacts and mitigation of impacts are not sufficient methods of protecting GRSG and sage brush habitat. Additionally, this concept was considered within the range of alternatives- Alternative D does not withdraw lands from mineral entry. No change to the EIS has resulted from this comment. [NOTE TO BLM: Consider whether inserting text to this effect into the EIS is appropriate.]

## Section 7.8 - Cumulative Impact Analysis

Total Number of Submissions: 3

Total Number of Comments: 3

---

### Summary

The BLM and Forest Service need to provide additional analysis regarding the cumulative effects of livestock grazing and land treatments. In addition, the agencies should predict greater sage-grouse population changes based on expected cumulative actions.

---

### Response

As described in Section 4.7 of this comment report, the BLM and Forest Service analyzed cumulative effects to GRSG in the DLUPA/EIS in Section 4.16 of the EIS. The BLM and Forest Service expanded and quantified cumulative impacts for the proposed LUPA/FEIS. Section 7.7 of this comment report describes how land treatments and domestic livestock were addressed in the Environmental Consequences section of the DEIS. The DLUPA/EIS considered the present effects of past actions, to the extent that they are relevant, and present and reasonably foreseeable (not highly speculative) Federal and non-Federal actions, taking into account the relationship between the proposed alternatives and these reasonably foreseeable actions. This discussion summarizes CEQ guidance from June 24, 2005, stating that "[g]enerally, agencies can conduct an adequate cumulative effects analysis by focusing on the current aggregate effects of past actions without delving into the historical details of individual past actions." This is because a description of the current state of the environment inherently includes the effects of past actions. Information on the current conditions is more comprehensive and more accurate for establishing a useful starting point for cumulative effects analysis. The CEQ interpretation was accepted by the Ninth in *NW Env'tl. Advoc. v. Nat'l Marine Fisheries Serv.*, 460 F.3d 1125, 1141 (9th Cir. 2006). The BLM and the Forest Service explicitly described their assumptions regarding proposed projects and other reasonably foreseeable future actions. On Forest Service-administered lands, reasonably foreseeable actions are those that would occur under their current land use plans from a broad-scale perspective.

The BLM and Forest Service have complied with the requirements of 40 CFR 1508.7 and prepared a cumulative impact analysis to the extent possible based on the broad nature and scope of the proposed management options under consideration at the land use planning level. Therefore, effects on GRSG population levels are not required to be quantified as part of the cumulative impact analysis.

The BLM and Forest Service added quantitative analysis to Section 4.16 related to XXX topics. [Note to BLM/FS: insert description of any revisions made]

## Section 7.9 - Mitigation Measures

Total Number of Submissions: 12

Total Number of Comments: 34

---

### Summary

The BLM and Forest Service mitigation strategy is inadequate or needs clarifications. Topics of concern include:

- Certainty that mitigation will be implemented
  - Lack of scientific evidence that mitigation and habitat restoration results in greater sage-grouse population increases
  - Adequacy of the monitoring program
  - Effectiveness of compensatory mitigation
  - How mitigation proposals will be evaluated
  - Siting of mitigation actions
  - Durability of mitigation investments
  - Consideration of using mitigation banks
  - Creation of a mitigation program
  - Framework behind exceptions and associated mitigation, e.g., science behind allowing exceptions; offsetting losses and prove mitigation is successful
  - Need for mitigation given the restrictive management in the alternatives
  - Link between compensatory mitigation and adaptive management
- 

### Response

The Mitigation, Monitoring, and Adaptive Management strategies are described more fully in **Section XX** of this comment report and included in Chapter 2 and **Appendices X, X, and X** of the DEIS. Refer to BLM Mitigation Manual.

## Section 8 – ACECs

*No comments are associated with this issue.*

---

### Section 8.1 - Range of Alternatives

Total Number of Submissions: 9

Total Number of Comments: 10

---

### Summary

Issue 1: In the Draft EIS/LUPA, the BLM/FS did not accurately or consistently represent the number of ACECs being proposed under each alternative, particularly Alternative C.

Issue 2: Alternatives in the Draft EIS/LUPA do not provide an adequate range of management actions for ACECs by only considering new ACECs under two of the action alternatives (C and F).

Issue 3: Whether ACECs or another administrative designation, the BLM/FS should ensure any administrative designation established for the protection of sage-grouse habitat will provide adequate non-discretionary protections.

---

## Response

Response 1: The FEIS has been revised to ensure consistent representation of proposed ACECs under Alternatives C and F.

[NOTE TO BLM: Review EIS/LUPA for consistent representation of proposed ACECs under Alternatives C and F.]

Responses 2 and 3: As noted in section 4.3, NEPA Range of Alternatives, of this report, the alternatives, including the management actions for the fire ACEC program, meet the purpose and need for the EIS. Alternatives within the EIS have established that not all protective management for the Greater Sage Grouse is limited to ACEC designation. Only Alternatives C and F proposed to establish ACECs for the protection and management of the Greater Sage Grouse. While the other alternatives do not propose such designations, they still contain similarly specific management prescriptions to manage and protect the Greater Sage Grouse and its habitat that would be equivalent to protections afforded via an ACEC or other designations.

## Section 10 - Climate Change

### Section 10.4 - Cumulative Impact Analysis

Total Number of Submissions: 2

Total Number of Comments: 5

---

## Summary

The EIS does not adequately address the cumulative effects of climate change on sage-grouse or sage-grouse habitat, including the cumulative effects of livestock grazing on vegetation communities and the likelihood of a changing climate to result in an increase in invasive weeds.

---

## Response

Assessing the impacts of grazing on climate change is outside the scope of this document, except as it pertains to reducing impacts on GRS and GRS habitat within the planning area and in consideration of valid existing rights and the BLM's multiple use mandate under the Federal Land Policy and Management Act. The PRMP/FEIS does disclose the potential effects associated with global climate change on the Greater Sage-grouse in Section XX. However, pursuant to 40 CFR 1500.1(b), information must be "of high quality" in order to be considered in the analysis. As explained in Section xx of the EIS, it is speculative to attempt to predict the specific nature or magnitude of such changes.

NOTE TO BLM: Based on the NEPA and CEQ guidance for cumulative impacts analysis, determine if the DEIS analysis is adequate or not. If not, make necessary corrections and note what was modified here. Include direction to reader where to find revised analysis (e.g., "See Section 5.XXX for additional information.").

The BLM will review. Follow up needed with Bryce.

## Section 12 - Fire and Fuels

### Section 12.1 - Range of Alternatives

Total Number of Submissions: 11

Total Number of Comments: 15

---

#### Summary

The BLM and the Forest Service should examine the location and size of proposed fuel breaks in further detail as fuel breaks in large areas of intact sagebrush limit fire and related habitat destruction. Specifically, one commenter requests use of green-strips, including non-native species, for fuel breaks. Use of prescriptive fire as a management tool should be further examined.

Timelines for long-term fire management measures should be established in the FEIS. One commenter recommends that measures be implemented one year after the ROD. Implementation details of fire control measures should be specified. The BLM/Forest Service should acknowledge the importance of flexibility in fire management plans in the FEIS and allow for on-the-ground decision making for effective fire-management. Alternative language should be revised for clarity.

---

#### Response

Fuel breaks are site-specific - see Oregon response. Use of prescribed fire varies by alternative. [needs more subregional input].

### Section 12.2 - Best available information baseline data

Total Number of Submissions: 4

Total Number of Comments: 5

---

#### Summary

The FEIS should include citations indicating that implementation of fuel breaks in sagebrush systems reduces the rate of spread of fire. In addition, citations should be provided to support the use of prescribed fire to improve GRSG habitat. The BLM and Forest Service should recognize livestock grazing as an effective fire management tool due to its role in controlling invasive plants and decreasing fuel loads.

---

#### Response

The EIS affected environment section provides the appropriate information for the scope and scale of the project (see section 4.4, NEPA Baseline Information of this report). However, upon BLM and Forest Service reviews and public comment suggestions, some sections in Chapter 3 have been updated and revised to include clarifications or new information. Section 3.XX, [insert section name], in the FEIS has been revised to update information regarding fuel breaks and Section 3.XX, [insert section name], has been updated to clarify the relationship between livestock grazing and fire.

## Section 12.3 - Impact Analysis

Total Number of Submissions: 6

Total Number of Comments: 7

---

### Summary

The DEIS does not contain sufficient analysis of indirect impacts of reduced grazing on fuel loads and related wildfire risk. Additionally, the analysis of impacts of fire suppression activities should be reexamined. It is particularly important that this analysis is clarified as lack of sufficient regulatory mechanisms for wildland fire was cited as a primary threat to GRSG in the FWS listing decision.

---

### Response

The impact analysis provides the appropriate information for the scope and scale of the project (see section 4.6, NEPA Impact Analysis, of this report). Upon BLM and Forest Service reviews and public comment suggestions, some sections in Chapter 4 have been updated and revised to include clarifications to the text. Section 4.XX, [insert section name], in the FEIS has been revised to clarify the impacts of reduced grazing on fuel loads. [BLM/Forest Service- need to add review impacts in Ch 4 for consistency with this language added to chapter 3 for relation between grazing and fire. Review impacts analysis to make sure that impacts analysis has sufficient info on impacts of reduced grazing on fuel loads]

In addition, impacts analysis discussion has been modified to clarify the impacts of different suppression measures proposed by Alternative. [BLM/Forest Service- need to review and modify discussion of impacts of fire suppression measures (i.e. specific conservation measures under B vs. approach under E)]

## Section 13 - Fish and Wildlife

### Section 13.1 - ESA Consultation

Total Number of Submissions: 3

Total Number of Comments: 3

---

### Summary

The BLM fails to address avoiding the potential to list the GRSG under the Endangered Species Act (ESA) and that the bird does not meet the criteria to be listed under the ESA.

---

### Response

As stated in Chapter 1, Section 1.1, Background in the DRMP, this plan amendment effort is the result of the July 2011, BLM National Greater Sage-Grouse Planning Strategy (BLM 2011). The Strategy responds to the March 2010, US Fish and Wildlife Service (USFWS) 12-Month Finding for Petitions to List the Greater Sage-Grouse (*Centrocercus urophasianus*) as Threatened or Endangered (75 Federal Register [FR] 13910, March 23, 2010) (2010 Finding). In the 2010 Finding, the USFWS concluded that GRSG was “warranted, but precluded” for listing as a threatened or endangered species.

## Section 14 - Lands and Realty

Total Number of Submissions: 1

Total Number of Comments: 1

---

### Summary

The BLM should prohibit the construction of new permanent infrastructure within lands specially designated for sage-grouse protection, because studies show GRSG avoid areas with development.

---

### Response

The alternatives consider a range of alternatives regarding ROW avoidance and exclusion. Table 2-3 identifies existing ROW avoidance and exclusion areas in the lands and realty section.

## Section 14.1 - Range of Alternatives

Total Number of Submissions: 11

Total Number of Comments: 20

---

### Summary

Commenters requested clarification regarding: types of exclusions, valid existing rights, aboveground fiber optic lines, and disposal under current land use plans.

Commenters also suggested additions to the range of alternatives considered and provided information on the feasibility of the alternatives (e.g., co-location, perch diverters, and burying lines).

Commenters noted that the document has contradicting management actions regarding geothermal development between lands and minerals sections.

Commenters noted that Alternative E did not adequately address the purpose and need.

Need to include:

Comment #14-0049-8: reclaim areas that have been developed for powerlines that are no longer in use.

Comment #14-0153-41: Comment stated that BLM did not evaluate the NTT recommendation that all electrical distribution lines be buried within Core Areas.

---

### Response

The BLM and the Forest Service considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM and the Forest Service consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and greater sage-grouse in the planning area, the BLM and the Forest Service fully considered the management opportunities presented in

the Analysis of the Management Situation (AMS) and the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As a result, six alternatives were analyzed in detail in the DLUPA/EIS that best addressed the issues and concerns identified by the affected public. The range of alternatives in the DLUPA/EIS represented a full spectrum of options including a no action alternative (Alternative A).

Proposed avoidance and exclusion area designations vary by alternative, as explained on page 2-33 in Table 2-3. Under Alternative D, all new ROWs, unless specifically excluded, would be avoided, whenever possible, see LR-3 (ex. wind facilities, etc). Required design features that would apply to specific types of facilities in greater sage-grouse habitat are located in Appendix C.

The EIS/LUP includes an alternative that allows for placement of fiber optic lines on existing infrastructure (Alternative D Action LR-6 and LR-7 in Table 2-18).

Under Alternative D Table 2-18, LR-9, new power lines outside of existing ROWs, would be buried, where feasible. Reclamation of lands, once facilities are removed, are part of standard BMPs, Appendix C. Amendments to existing facilities that are otherwise excluded may be allowed under Alternative D, LR-6. Under Alternative D, lands currently identified for retention within priority greater sage-grouse habitat would be retained unless disposal of those lands would increase the extent or provide for connectivity of priority habitat (LR -19 and LR-21), Alternatives A through F propose retention of all utility corridors (Table 2-18).

Lands and Minerals management actions did contradict on the topic of geothermal development (D-LR-3, page 2-162 and D-MLM-1, page 2-180) and the FEIS will correct this contradiction.

The first of the assumptions under Lands and Realty Assumptions, Page 4-158, is that BLM and the Forest Service will protect valid existing rights, as long as those ROWs comply with the terms and conditions of their ROW grant. The agencies will consider all safety concerns into all decisions to authorize a pipeline, including burying a transmission line.

## Section 14.2 - Best available information baseline data

Total Number of Submissions: 5

Total Number of Comments: 9

---

### Summary

Commenters raised concerns with the baseline assumption (as noted in Ellis 1984 and Connelly et al. 2000) that power lines and other vertical structures increase perching opportunities for raptors and increase the potential for GRSG to abandon leks).

Commenters suggested that the BLM and the FS should have considered several additional references in their analysis, related to the relationship between GRSG and transmission lines. For example, commenters noted the DEIS did not include studies that found underground powerlines have more environmental impacts than overhead powerline placement.

Commenters questioned the data in Table 3-36, which includes the acreage of transmission lines within greater sage-grouse habitat.

Need to include:

Comment #14-0049-25 requested the LUPA include a minimum four-mile buffer from active leks for new powerlines or similar ROW developments.

Comment #14-0049-31 request to include that infrastructure would be co-located when possible.

---

## Response

Many reports have been prepared for the development of management recommendations, strategies, and regulatory guidelines. The National Technical Team report (NTT 2011), Conservations Objectives Team (COT; FWS 2013), and the Summary of Science, Activities, Programs and Policies that Influence the Rangeland Conservation of Greater Sage-Grouse (also referred to as the Baseline Environmental Report [BER]; Manier et al. 2013) are the most widely used reports that have been incorporated in BLM and Forest Service EISs that address the effects of implementing greater sage-grouse conservation measures on lands they manage. Additionally, the BLM and the Forest Service developed the Idaho Draft Environment Impact Statement/Land Use Plan Amendment with involvement from cooperating agencies, including Idaho Department of Fish and Game to ensure that a balanced multiple-use management strategy to address the protection of greater sage-grouse while allowing for utilization of renewable and nonrenewable resources on the public lands.

Management actions included in the Draft EIS/LUPA for the underground placement of powerlines are intended to reduce the potential for long-term impacts on GRSG habitat and species viability. Literature referenced in the FEIS demonstrates that overhead powerlines provide perching opportunities for ravens and other avian predators.

BLM and the Forest Service has reviewed scientific literature provided by commenters regarding the effects of powerlines on greater sage-grouse, buffers, perch diverters, and overhead versus burying lines, and the DEIS has been revised, as appropriate.

Transmission acreages came from the peer-reviewed Baseline Environmental Report (Manier et al. 2013).

## Section 14.3 - Impact Analysis

Total Number of Submissions: 2

Total Number of Comments: 5

---

### Summary

Commenters stated that the BLM/FS should have concluded that because of Alternative E's adaptive trigger strategy the impacts from wind energy would be reduced compared to Alternative A.

Commenters stated that the agencies should carefully evaluate the impacts of stipulating co-location of electrical powerlines.

Commenters requested information on the impact of transmission lines on a landscape level would be more appropriate to reference in relation to sage-grouse persistence in the landscape and that information from Walker et al. 2007 has been used selectively in regards to transmission infrastructure.

Include:

Comment #14-183-38: Request that BLM re-consider and evaluate the stipulation that electrical powerlines must be co-located

---

### Response

The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of

resources that would be involved in the proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

Impacts from lands and realty to wind energy were discussed in DEIS/LUPA Chapter 4, page 4-331. BLM groups Alternative A and Alternative E together in regards to impacts on wind energy. Under Alternative E, the BLM and the Forest Service would limit impacts from wind and solar energy development through the use of triggers in addition to the general stipulations identified in the GRSG section, as well as required design features. This is clarified in the FEIS (see section).

Management actions included in the Draft EIS/LUPA for the co-location of new infrastructure in existing ROWs are intended to reduce the amount of surface disturbance in GRSG habitat and concentrate new development in habitat areas already affected by anthropogenic activities. The BLM and FS recognize that co-location is not feasible in all circumstances, particularly for new powerlines. Under all alternatives, the BLM and FS would continue to review proposed infrastructure projects on a case-by-case basis. Such a review would include preparation of the appropriate NEPA documentation and coordination with the responsible federal, state, and local permitting agencies.

## Section 15 - Leasable Minerals

[NOTE: Section 15 has not been updated with final responses]

### Section 15.1 - Range of alternatives

Total Number of Submissions: 6

Total Number of Comments: 14

---

#### Summary

The DEIS needs a better explanation on how valid existing rights are defined and how they will be protected, including fringe or preference right leases. The alternatives need to follow the NTT report recommendations more closely, as well as reflect current USFWS policy recommendations.

The BLM needs to clarify the location of non-leased Known Phosphate Areas in relation to GRSG habitat. The plan is potentially more restrictive to phosphate leasing than a listing under the ESA and did not properly define the environmental baseline for leasable minerals. Without prohibiting new phosphate mining in GRSG habitat, the LUPA does not protect GRSG from the potential impacts of selenium being released to the environment and poisoning wildlife, including GRSG, through transport in air and water and subsequent bioaccumulation. The EIS fails to explain or discuss the authority that the BLM has to close public lands to leasable mineral prospecting and leasing under the LUPA process under Alternatives B, C and D.

The reliance upon vague RDFs under Alternative D is a failure of the BLM to adopt best science that calls for specific restrictions based on observed GRSG response to surface disturbances.

---

## Response

[NOTE TO BLM: The BLM should examine the existing discussion of valid existing rights that will survive the proposed LUPA and should expand that discussion if it seems insufficient.]

The BLM and the Forest Service considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM and the Forest Service consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and greater sage-grouse in the planning area, the BLM and the Forest Service fully considered the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As a result, six alternatives were analyzed in detail in the DLUPA/DEIS that best addressed the issues and concerns identified by the affected public. The DLUPA/DEIS includes alternatives that provide a greater and lesser degree of restrictions in various use programs, but would not eliminate or invalidate any valid existing development rights. BLM agrees that it cannot impose an NSO on an existing lease. A definition of valid and existing rights has been added to the Glossary in the FEIS.

[NOTE TO BLM: Multiple changes were recommended to the FEIS by Porter- see separate tracking sheet.]

[NOTE TO BLM: Have minerals program elaborate on where the phosphate leases are relative to the management designations for the various Alternatives. Makela- is there an adequate baseline description for leaseable minerals? Also, BLM look into the issue of restrictions in proposed plan relative to restriction under an ESA listing for minerals development.]

[NOTE TO BLM: determine whether there are mineral leases in the ACECs proposed by Alts C and F. Determine mineral potential in ACECs proposed by Alts. C and F.]

[NOTE TO BLM: Add to GLOSSARY- Valid Existing Rights]

[NOTE TO BLM: Discuss how the NTT recommendations and USFWS policy were included in the alternatives development.]

Selenium bioaccumulation is not identified by the US Fish and Wildlife Service or the NTT Report as a major threat to GRSG and is not part of the conservation strategy being applied by the BLM. No change to the EIS has resulted from this comment.

[NOTE TO BLM: BLM to examine its jurisdiction to prioritize GRSG conservation over laws relating to KPLAs and to describe that result in the comment response, along with any appropriate changes to the EIS.]

[NOTE TO BLM: BLM's preferred alternative may be changed in the FEIS, to keep all lands in KPLAs open to future non-energy solid mineral leasing, but to close areas in PPMA and PMMA outside of KPLAs. An exception would be made when additional lands are needed to recover ore on the lease (fringe acreage leasing, lease modifications).]

The RDFs were adopted from BMPs in Appendix D of the NTT report. In that appendix, it states that "BMPs are continuously improving as new science and technology become available and therefore are subject to change. Include from the following BMPs those that are appropriate to mitigate effects from the approved action." Wording from NNT report has been added to the discussion of RDFs in the FEIS.

## Section 15.2 - Best available information baseline data

Total Number of Submissions: 1

Total Number of Comments: 1

---

## Summary

The oil and gas conditions in the Payette area are different than those studied in the NTT report and should not be used

as baseline data. The impacts described by Johnson et al 2011 are overstated and should be replaced by information from Coates et al 2013.

---

## Response

The reasonably foreseeable development scenario for oil and gas assumes a conventional oil and gas field. The current development occurring in the Payette area of Idaho is not within sage grouse habitat. BLM's preferred management action has been changed in the FEIS to applying a year-round No Surface Occupancy stipulation in PPMA and PMMA. Seasonal restrictions would be applied in PGMA. Lands outside of GRS habitat would not be subject to stipulations developed in this EIS.

[NOTE TO BLM: Review section on 4-8 for best available science for basis of decisions. Have a biologist help determine.]

## Section 15.3 - Impact Analysis

Total Number of Submissions: 3

Total Number of Comments: 5

---

## Summary

The impact analysis in the DEIS of management actions on leasable mineral development is insufficient.

---

## Response

The acres of unleased KPLA land unavailable for development by alternative has been corrected in the Ch. 4 tables in the FEIS. The section describing the impacts from leasable minerals management for Alt E has been revised. The impacts of non-energy leasable minerals management actions to socio-economics have been included in the FEIS and the impacts with respect to disturbance caps have been analyzed in more detail.

[NOTE TO BLM: Tables of acres of unleased KPLA land unavailable for development by alternative in Ch. 4 need to be corrected.]

[NOTE TO BLM: Impacts from leasable minerals management in alt E needs to be revised.]

[NOTE TO BLM: Include a discussion of the effects of phosphate management actions to socio-economics in Ch 4. Also, references to section 4.11.2 should be corrected and should refer to section 4.12.2.]

[NOTE TO BLM: Distinguish between Impacts from Alts F and B. Note: This is a disturbance cap question.]

## Section 15.4 - Cumulative impact analysis

Total Number of Submissions: 2

Total Number of Comments: 6

---

## Summary

The DEIS did not adequately analyze cumulative impacts of management actions on leasable mineral development, including impacts to the Western Phosphate Field, the American agriculture industry, and national food security.

---

## Response

The BLM and the Forest Service thoroughly explained their consideration and analysis of cumulative effects in the DLUPA/EIS in Section 4.24.20. The DLUPA/EIS considered the present effects of past actions, to the extent that they are relevant, and present and reasonably foreseeable (not highly speculative) Federal and non-Federal actions, taking into account the relationship between the proposed alternatives and these reasonably foreseeable actions. This discussion summarizes CEQ guidance from June 24, 2005, stating that "[g]enerally, agencies can conduct an adequate cumulative effects analysis by focusing on the current aggregate effects of past actions without delving into the historical details of individual past actions." This is because a description of the current state of the environment inherently includes the effects of past actions. Information on the current conditions is more comprehensive and more accurate for establishing a useful starting point for cumulative effects analysis. The CEQ interpretation was accepted by the Ninth in *NW Env'tl. Advoc. v. Nat'l Marine Fisheries Serv.*, 460 F.3d 1125, 1141 (9th Cir. 2006). The BLM and the Forest Service explicitly described their assumptions regarding proposed projects and other reasonably foreseeable future actions. On Forest Service-administered lands, reasonably foreseeable actions are those that would occur under their current land use plans from a broad-scale perspective.

Additional information on the cumulative impacts on the Western Phosphate Field, unleased KPLAs, socio-economic impacts from loss of phosphate resources, reasonably foreseeable actions, and proposed conservation measures have been added to Sections XXX and XXX (minerals and socio-economics cumulative impacts). [NOTE TO BLM: Review cumulative section and add necessary information.]

## Section 16 - Livestock Grazing

Total Number of Submissions: 2  
Total Number of Comments: 3

---

## Summary

---

## Response

[NOTE TO BLM: May need to go up to solicitor's office for review.]

FLPMA grants the Interior Secretary the authority to make land use planning decisions, taking into consideration multiple use and sustained yield, areas of critical environmental concern, present and potential uses of the land, relative scarcity of values, and long-term and short-term benefits, among other resource values (43USC 1711 Sec 201 (a)). 43 CFR § 4100.0-8 provides that the BLM shall manage livestock grazing on public lands in accordance with applicable land use plans. Further, the BLM may designate lands as "available" or "unavailable" for livestock grazing through the land use planning process (H-1601, Land Use Planning Handbook, Appendix C). A decision to cease livestock grazing is not permanent. It is subject to reconsideration, modification and reversal in subsequent land use plan decisions. The Taylor Grazing Act requires that the Secretary "make such rules and regulations ... [and] do any and all things necessary ... to insure the objects of ... grazing districts, namely, to regulate their occupancy and use, to preserve the land and its resources from destruction or unnecessary injury [and] to provide for the orderly use, improvement and development of the range." (43 USC § 315a).

FLPMA grants the Interior Secretary the authority to make land use planning decisions, taking into consideration multiple use and sustained yield, areas of critical environmental concern, present and potential uses of the land, relative

scarcity of values, and long-term and short-term benefits, among other resource values (43USC 1711 Sec 201 (a)). 43 CFR § 4100.0-8 provides that the BLM shall manage livestock grazing on public lands in accordance with applicable land use plans. Actions taken under land use plans may include making some, or all of the land within grazing districts, unavailable for grazing during the life of the plan as well as imposing grazing use restrictions, limitations or other grazing management related actions intended to achieve such goals and objectives (H-1601, Land Use Planning Handbook, Appendix C).

A “chiefly-valuable-for-grazing” determination is required only when the Secretary is considering creating or changing grazing district boundaries. Such a determination is neither required nor appropriate when establishing grazing levels within a district. (See USDI Solicitor Memorandum Clarification of M-37008 (May 13, 2003)). This RMP is not considering creating or changing grazing district boundaries. Although lands have been identified as “chiefly-valuable-for-grazing” per the Taylor Grazing Act for purposes of establishing grazing districts within the public domain (see, 43 U.S.C. § 315) this does not negate the BLM’s authority or responsibility to manage those lands to achieve resource condition goals and objectives under the principals of multiple use and sustained yield as required by FLPMA and its implementing regulations.

## Section 16.1 - Range of alternatives

Total Number of Submissions: 24

Total Number of Comments: 64

---

### Summary

Multiple commenters requested that the alternatives require closure of voluntarily relinquished allotments. Commenters questioned why changes to grazing management are needed when livestock grazing is not listed as a primary threat to GRSG. More than one commenter noted that grazing should only be restricted where it can be shown that grazing is directly related to the failure to meet GRSG habitat objectives. Additionally, commenters stated that the DEIS failed to consider increased grazing and question the rationale behind this decision. Some commenters also requested additional consideration of reduced grazing levels and utilization levels, as well as temporary or permanent closure of all or some GRSG habitat to grazing.

Several commenters requested that the LUPA/EIS provide specifics regarding habitat assessments schedules and application of standards, and use of ecological site descriptions, require immediate application of certain terms and condition to permits, and impose grazing restrictions for priority or general habitat.

---

### Response

The ID/SWMT LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA. See response in section 4.3 NEPA Range of Alternatives of this report. The DEIS analyzed a range of alternatives including no grazing and a 25 percent reduction in grazing. Reduction in AUMs under Alternative F would be specified in site specific decisions at the permit renewal level. Language in the FEIS for Alternative F reduction has been clarified.

[BLM and Forest Service- need to review the language in Alt F mgmt. actions related to the 25% reduction and review related analysis. Determine if revision needed to table 4-5].

Livestock grazing is identified by USFWS as a threat to GRSG in the March 23, 2010 Federal Register Notice, and therefore it is addressed in this LUPA. Existing regulatory mechanisms, including the fundamentals for rangeland health, would continue to provide the basis for managing grazing in GRSG habitat. However, the preferred alternative would provide additional consistency in application of BLM rangeland health standards and guidelines relative to GRSG habitat, and would provide additional guidance for prioritizing land health assessments and review of grazing permits to ensure

that grazing management is compatible with attainment of sage-grouse habitat objectives within the planning area. In addition, RDFs and best management practices would be adopted to reduce effects of range improvements and livestock trailing across public lands. Grazing use would be modified when it is identified as the cause for not meeting Sage Grouse objectives. The intent of the land use plan amendment is to change management under all resource programs, where necessary, to benefit Sage Grouse habitat. Standards and Guidelines assessments result in a determination of causal factors for non-achievement of any applicable standard, including standards for wildlife habitat. Where livestock management is determined to be a causal factor for non-achievement of a standard, management must be modified to conform with applicable guidelines.

The BLM is required to follow the grazing regulations, including the decision process at 43 CFR 4160, when modifying permit or leases. Therefore, modifications to terms and conditions of permits and leases would be applied as needed during the permit renewal process.

As stated in the preferred alternative [mgmt. action #] habitat objectives would be adjusted based on site potential. Site specific requirements would be specified in NEPA for permit renewal. Language in the preferred alt. has been modified to clarify (see section X.X.X).

## Section 16.2 - Best available information baseline data

Total Number of Submissions: 13

Total Number of Comments: 42

---

### Summary

Multiple commenters asserted and presented citations supporting their position that grazing has the potential to benefits GRSG by controlling cheatgrass and reducing wildfire risk. Other commenters presented citations supporting the position that grazing damages GRSG habitat and increases cheatgrass risk.

Several commenters requested more detailed information about current grazing management and habitat conditions in the planning area.

Other commenters noted the importance of ranching in the local economy, and also that ongoing collaboration between private ranchers and federal agencies has helped preserve GRSG habitat and should be acknowledged in the EIS.

---

### Response

Before beginning the LUPA/EIS and throughout the planning effort, the BLM and the Forest Service considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The BLM and the Forest Service also used the most recent and best information available that was relevant to a land-use planning-level analysis (refer to response in section 4.4, NEPA Baseline data- Best Available Science for additional information). [NOTE TO BLM- review text in section 4.4 response once complete to ensure consistency]

Section 3.X, livestock grazing discusses the current level of grazing in the planning area and management systems in place. Impacts of current and historic grazing on other resource and resource uses are discussed under the appropriate resource and resource use headings (i.e. Section 3.X, Sage grouse Habitat). Section 4.2.2 in the DEIS provides an overview of the ecological impacts of livestock grazing. The DEIS analyzed the effects of no grazing and reduced grazing on components of sage-grouse habitat, including changes in wildfire risk and cheatgrass incursion.

See changes to Section 3.X, fire management, for additional discussion of cheat grass-wildfire dynamics. [NOTE TO BLM/EMPSi-Review the text in Ch 3 veg related to fire/livestock.]

Discussion of socioeconomic impacts of current grazing operations in the planning area is discussed in **Section 3.X**, Socioeconomics.

Additional language has been added to the FEIS (**section X.X.X**) recognizing the role of Rural Fire Protection Districts and other collaboration efforts [**Note- need to add language to FEIS**]

## Section 16.3 - Impact Analysis

Total Number of Submissions: 6

Total Number of Comments: 11

---

### Summary

Some comments detailed beneficial impacts of grazing, and the adverse impacts of grazing restrictions on to livestock operations, Rangeland Fire Protection Associations, and the local economy.

One commenter notes that limitations on water developments can have impacts on grazing management and need to be clarified and analyzed in greater detail.

---

### Response

Impacts to livestock grazing from current livestock grazing management are addressed in section 4.9.4 of the DEIS. Impacts to the socioeconomic aspect of livestock grazing are discussed in Section 4.19 of the DEIS.

While a land use planning-level action is broad in scope and, therefore, does not require site specific impact analysis, a thorough review of the EIS's impact analysis relevant to grazing and indirect socioeconomic impacts and was found to need additional information and support for the conclusions/findings. The BLM and the Forest Service have updated this information in the Proposed Land Use Plan Amendment/FEIS to provide the necessary information to make informed land use plan-level decisions (see changes in section 4.19). Impacts to Rangeland Fire Protection Associations are discussed in **section 4.X**, fire management. BMPs for livestock developments including water have been revised in the FEIS and related impacts on livestock grazing management have been clarified.

## Section 17 - Locatable Minerals

[**NOTE: Section 17 has not been updated with final responses**]

### Section 17.3 - Impact Analysis

*No comments are associated with this issue.*

---

## Summary

The EIS fails to provide justification as to why “withdrawal from mineral entry” is necessary to protect GRSG and its habitat when the same objective can be achieved through avoidance, minimization of impacts, and mitigation of impacts within the designated areas. The current approach in the EIS does not meet FLPMA requirements for finding ways to remain flexible in balancing conservation and resource uses.

---

## Response

The facts that sage brush takes decades to re-establish and that disturbance from light and noise affect GRSG mean that avoidance, minimization of impacts and mitigation of impacts are not sufficient methods of protecting GRSG and sage brush habitat. Additionally, this concept was considered within the range of alternatives- Alternative D does not withdraw lands from mineral entry. No change to the EIS has resulted from this comment. [NOTE TO BLM: Consider whether inserting text to this effect into the EIS is appropriate.]

Note to EMPSi - check all comments under Issue 17 - any related to phosphate should be moved to [nonenergy] leasable minerals

## Section 17.4 - Cumulative impact analysis

Total Number of Submissions: 1

Total Number of Comments: 1

---

## Summary

The DLUPA/DEIS fails to adequately analyze the cumulative impact of locatable mineral withdrawals across the GRSG range.

---

## Response

Additional information on the cumulative effect of withdrawals across GRSG range has been added to Section XXX (locatables cumulative effects section) of the EIS. [NOTE TO BLM: Could include roll-up of withdrawals from plans for incorporation into EIS]

## Section 20 - Recreation

### Section 20.1 - Range of alternatives

Total Number of Submissions: 2

Total Number of Comments: 3

---

## Summary

In the EIS/LUPA, the BLM/FS should incorporate additional management actions (e.g. SRP/SUP stipulations, OHV noise regulations, seasonal restrictions on OHV events near leks, and rerouting of OHV events away from leks, and hunting)

to limit the potential for impacts on Sage-Grouse from recreation activities. Any management actions limiting recreation activities in sage-grouse habitat should be based on the best available science with proven habitat conservation results.

---

## Response

The EIS considers an adequate range of alternatives to protect GRSG, including varying levels of restriction on recreational activities and special recreation permits/special use permits (insert correct management actions and table number). During subsequent implementation-level travel management planning, new travel management plans would evaluate vehicle routes and determine the need for permanent or seasonal road closures, and mode of travel (e.g. motorcycle, ATV, and UTV) restrictions, including speed. New travel management plans would evaluate vehicle routes and determine the need for permanent or seasonal road closures, and mode of travel (e.g. motorcycle, ATV, and UTV) restrictions during subsequent implementation level travel management planning. 43 CFR 8340 requires all OHVs to comply with state laws including noise and spark arrester requirements.

Contemporary hunting seasons in the Idaho and Southwest Montana Sub-region are very conservative with respect to their length and bag limits. GRSG hunting and its effects are described in more detail in Sections XX and XX of the FEIS.

## Section 22 - Socioeconomics and Environmental Justice

### Section 22.3 - Impact Analysis

Total Number of Submissions: 22

Total Number of Comments: 39

---

## Summary

The socioeconomic analysis in the DEIS is overly broad and does not provide sufficient analysis of impacts to individuals, local communities or counties. The DEIS should also expand analysis of the restrictive management actions on planning area operators, communities and services including but not limited to grazing operators and mining.

Finally, the analysis methodology is inadequate to provide a comprehensive analysis of direct, indirect, and cumulative analysis of the socioeconomic impacts on the planning area communities.

---

## Response

The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions

(BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

[BLM provide input on why county level analysis was not completed]

Impacts were considered on numerous resources, resource uses, and socioeconomic conditions, which included [list noted issues]. See Section 4.22 of the Draft EIS.

The DLUPA/EIS describes the methodology and assumptions used for conducting the impact analysis (see Section 4.22.2 of the Draft EIS). The methodology and assumptions provide an adequate starting point for discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.24, the DLUPA/EIS identified methodologies used and made reference to the scientific and other sources relied upon for conclusions in the analysis. Based on these methodologies and assumptions, the DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

[Add language on budget issues as appropriate: As a landscape level planning effort, none of the alternatives prescribe project specific analysis on BLM or USFWS managed lands. Furthermore, the agencies' selection of an alternative does not authorize funding to any specific project or activity nor does it directly tie into the agencies budgets as appropriated annually through the federal budget process. As a consequence, agencies' costs and differences in differences in program costs across alternatives have not been quantified. Information has been presented in several resource impacts sections on the types of costs that might be associated with various sage-grouse conservation measures]

## Section 23 - Soil

### Section 23.2 - Best available information baseline data

Total Number of Submissions: 1

Total Number of Comments: 1

---

#### Summary

One commentor notes that the DEIS lacks references to support discussion of macrobiotic crusts.

---

#### Response

[BLM/Forest Service- review soils section to determine if references needed to support discussion]

## Section 24 - Travel Management

## Section 24.1 - Range of alternatives

Total Number of Submissions: 8

Total Number of Comments: 11

---

### Summary

The Draft EIS/LUPA failed to consider a full suite of travel management-related management actions that would protect sage grouse habitat while allowing for continued administrative access, particularly for existing livestock grazing permittees. Commenters proposed that management actions should be included in the proposed plan to prohibit and reclaim/restore roads in GRSG habitat, limit motorized events, close PPHP to OHV use, apply additional seasonal travel restrictions, and apply a maximum route density within proximity of leks in PPH and PGH. Commenters also requested that proposed management actions preserve motorized access on existing routes per the 3-State OHV and National Route Designation decisions and maintain administrative access in grazing allotments.

---

### Response

Section 1.4 of the Draft EIS describes how the Idaho Montana GRSG LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA. The BLM and Forest Service complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft LUPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions from the field office RMPs are acceptable and reasonable. In these instances, there was no need to develop alternative management prescriptions.

During subsequent implementation-level travel management planning new travel management plans would evaluate vehicle routes and determine the need for permanent or seasonal road closures, and mode of travel (e.g. motorcycle, ATV, and UTV) restrictions, including noise levels and speed. The route designation process will be completed as subsequent implementation level planning using current Travel Management policies and will include public and local agency involvement. Addressing these issues at the implementation level allows the BLM and Forest Service to take new information into account as it becomes available.

Needs for administrative access to valid existing rights, grandfathered uses, or permitted activities would taken into consideration during site-specific NEPA analysis. Restrictions applied to recreational OHV use may not apply to permitted administrative uses.

The BLM and Forest Service have not added a restriction that would limit road densities to less than 0.09 km per km squared (Wisdom et al. 2011) in GRSG habitat because the threshold established by Wisdom used coarse road data. When taking into consideration actual road density information, use of this threshold is not appropriate. The BLM and Forest Service have included surface disturbance thresholds, which would restrict the density of disturbance tied to new and existing roads in GRSG habitat.

## Section 24.2 - Best available information baseline data

Total Number of Submissions: 2

Total Number of Comments: 2

---

## Summary

Chapter 3 of the Draft EIS/LUPA does not depict the number of acres designated as open to cross-country motorized travel.

---

## Response

[NOTE TO BLM: Add current CTTM area designation acres to Chapter 3.]

## Section 24.3 - Impact Analysis

Total Number of Submissions: 3  
Total Number of Comments: 6

---

## Summary

For various reasons, commenters assert that the Draft EIS/LUPA does not adequately analyze the impacts of proposed management actions on travel management. For example, commenters contend that the analysis is not based on sound science or is narrowly focused and biasedly uses studies that only demonstrate the negative effects from OHV use; does not adequately describe the magnitude of OHV vs. “naturally occurring” impacts across alternatives; and does not distinguish between motorized and non-motorized impacts. Commenters further request the BLM/FS consider conducting site-specific studies to support proposed management and assert that there would be indirect effects (e.g. ban on new road construction) incurred by existing ROW authorization holders by deferring travel management planning.

---

## Response

As described in Section 4.6 of this comment report, the LUPA/FEIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. Further, as described in Section 4.4. of this comment report, the BLM used the most recent and best available information that was relevant to a land-use planning-level analysis.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29). The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

The mechanism being used to determine landscape level travel area designations (open/limited/closed) is 43 CFR 8340 which regulates OHV travel on public lands. BLM does not have a similar regulation for non-motorized travel. Non-motorized travel can be regulated through supplementary rules. Supplemental rules and site specific route designations will be addressed at the implementation level in the future.

New construction related to power line access would be exempted under 43 CFR 8340.05 (3).

While multiple studies on OHV use have been cited, BLM is using the BLM Travel Management Manual and Handbook (M-1626 & H-83421) to address travel planning in the EIS and will continue to use the same policy for future implementation and planning.

## Section 24.5 - Mitigation measures

Total Number of Submissions: 1

Total Number of Comments: 1

---

### Summary

The LUPA/EIS should adopt additional travel-related mitigation measures to educate the public and prevent the spread of invasive species from travel-related sources through mitigation measures such as those described at playcleango.org.

---

### Response

Appendix C of the DEIS/LUPA includes required design features and best management practices, including those that are based on the best available science to prevent the spread and effects of non-native plant species. See RDF # 290.

NCT note: ID and NV should use the same response as it is the same issue statement.

1. BLM reviewed the measures provided by commenters on playcleango.org
2. they were found to be the same as (similar as?) those already provided in Appendix XX.
3. Review of the impact analysis confirmed that the outcomes from the suggested mitigation measures would be the same as those described in the EIS (see section XX).
4. Conclusion (e.g., no changes needed).

## Section 25 - Tribal Interest

### Section 25.1 - Consultation requirements

Total Number of Submissions: 1

Total Number of Comments: 1

---

### Summary

The BLM should consider additional areas for ACEC designation and should consult with the Shoshone-Bannock Tribes about these designations.

---

### Response

The BLM and Forest Service recognize their responsibility to ensure that meaningful consultation and coordination concerning GRSG planning is conducted with federally recognized tribes, including the Shoshone-Bannock Tribes, to consider tribal treaty rights and trust resources. [BLM-FS-include relevant legal citations. Note consultation efforts to

date]

## Section 25.4 - Impact Analysis

Total Number of Submissions: 1

Total Number of Comments: 2

---

### Summary

The BLM must ensure tribes, in particular the Shoshone-Bannock Tribe, maintain opportunities to access the public domain, exercise off-reservation treaty rights, and continue their traditional customs and practices.

---

### Response

The BLM, Forest Service recognize their responsibility to consider potential impacts to Tribal resources.

Article 4 of the Fort Bridger Treaty, signed in 1868, retains the Eastern Band Shoshone and Bannock Tribes' rights to hunt, fish, gather natural resources, and provide other associative right necessary to effectuate these rights. Other treaties ensure similar rights for other tribes.

## Section 26 - Vegetation Sagebrush

### Section 26.1 - Range of alternatives

Total Number of Submissions: 6

Total Number of Comments: 12

---

### Summary

Commenters recommended that the preferred alternative include:

- Specific vegetation treatment acreage objectives
  - Passive sagebrush restoration
  - Limitations on vegetation treatments in sagebrush areas. To meet COT report objectives, include regulatory mechanisms to avoid sagebrush removal or manipulation in sage-grouse breeding or wintering habitats with minor exceptions.
  - Establish Priorities for pinyon-juniper removal including reduced grazing in conjunction with pinyon-juniper treatment.
  - Restore non-native seedings to increase GRSG habitat
  - Apply additional restrictions for herbicide application in GRSG habitat
  - Commit to a program to plan, fund, execute and monitor large scale integrated invasive species infestation and eradication projects in a measurable timeframe.
  - Include specific objectives to measure success in invasive species eradication
- 

### Response

As described in Section 4.3, the ID/SWMT LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA.

Some of the recommended components were addressed in the DEIS and additional info will be included in the FEIS as

detailed below.

- Specific vegetation treatment acreage objectives [need National Policy team input- to decide how treatment objectives will be incorporated]
- Passive sagebrush restoration: In the DEIS Alternative C and management changes that allow progress towards standards and guidelines allow for passive sagebrush restoration. In some areas passive restoration may not be sufficient to improve GRSG habitat and active restoration may be necessary (Davies et al. 2011) (see pp 4-54 DEIS [- check page]).
- Limiting vegetation treatments in sagebrush areas is covered under Alternative D ([provide pg reference]). To meet COT report objectives, include regulatory mechanisms to avoid sagebrush removal or manipulation in sage-grouse breeding or wintering habitats with minor exceptions. [include info from FEIS specific to meeting COT report objectives if appropriate]
- Establish Priorities for pinyon-juniper removal including reduced grazing in conjunction with pinyon-juniper treatment: Priorities for PJ removal are addressed in the DEIS ([check that preferred alt includes removal within 1000m of leks per COT report objectives, if not explain rationale])
- Restore non-native seedings when beneficial to GRSG habitat: Alternative C in the DEIS supports restoration of native vegetation to areas that have been seeded with non-native species when beneficial to GRSG [cite mgmt. action]. The preferred alternative provides direction for restoring non-native seedings. [provide mgmt. action number and check language to refine if needed in mgmt. action]
- Apply additional restrictions for herbicide application in GRSG habitat: Herbicide/Pesticide BMPs are covered under the Veg treatment PEIS (BLM 2007x). The IDMT GRSG EIS tiers to the analysis in this document.
- Commit to a program to plan, fund, execute and monitor large scale integrated invasive species infestation and eradication projects in a measurable timeframe. Include specific objectives to measure success: This EIS is intended to provide treatment methods, priority and objectives and the conditions under which these treatment objectives would occur. Specifics regarding treatment effectiveness, funding and implementation would be covered in site specific management actions. BLM and Forest Service would follow agency specific monitoring requirements.

## Section 26.2 - Best available information baseline data

Total Number of Submissions: 13

Total Number of Comments: 24

---

### Summary

The DEIS fails to provide adequate baseline information related to sagebrush vegetation. Commenters questioned the source of BLM data and requested the FEIS utilize additional baseline data on cheatgrass extent and evaluate effectiveness of continuing programs against weeds and juniper encroachment. Commenters provided additional literature to consider. Commenters also advocated an adaptive approach to vegetation management based on site-specific habitats.

---

### Response

As described in Section 4.4, the BLM and FS considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land use plan-level. Adaptive management would be incorporated into vegetation treatment and restoration programs under Alternatives D and E. Adaptive management would allow BLM increased flexibility to adjust programs based on data collected during operation, to respond to changing conditions and improve effectiveness of vegetation management programs. [BLM: provide direction if any change to analysis is necessary. Notes during cmt response mtg: Clarify use of 70% cover from NTT; update EIS with new rare plant list.]

Change to make: Footnote in Table 3-4 change source to – ID team input and EIS vegetation model. Cite the VDDT appendix.]

The BLM and Forest Service has clarified the vegetation modeling and data sources in Chapter 3. [Insert details regarding location and changes made]

## Section 26.3 - Impact Analysis

Total Number of Submissions: 2

Total Number of Comments: 3

---

### Summary

Commenters express concern about unintended or undesirable impacts of vegetation management programs to control weeds or restore sagebrush habitat. The DEIS inadequately analyzes impacts from vegetation restoration

---

### Response

As described in Section 4.6, the DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives.

Contiguous blocks: Site-specific calculations will be conducted at the implementation level.

PJ: Clarification will be provided in [Section XX](#).

## Section 26.4 - Cumulative impact analysis

Total Number of Submissions: 1

Total Number of Comments: 1

---

### Summary

BLM's cumulative impacts analysis for vegetation failed to consider the impacts of limited resources on sage-grouse protection.

---

### Response

Funding and availability of resources is outside the scope of this EIS.

## Section 26.5 - Mitigation measures

Total Number of Submissions: 3

Total Number of Comments: 7

## Summary

Commenters requested detailed plans of action and clarification on mitigation and monitoring, including timing of re-seeding and restoration after fire.

---

## Response

Mitigation has been further defined as a Regional Mitigation Framework and is detailed in Appendix X. The Framework is incorporated in the [insert Proposed Plan/Proposed Plan Amendment] and was developed to achieve a net conservation gain to the species by implementing conservation actions. Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can help achieve the greatest conservation benefit for greater sage-grouse and its habitats. If impacts to greater sage-grouse or its habitat from authorized land uses remain after applying avoidance and minimization measures, then compensatory mitigation projects will be used to fully offset impacts to achieve conservation benefits. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation.

Specific mitigation strategies, based on the Framework, will be developed by regional teams within one year of the issuance of the Record of Decision and be consistent with the BLM's Regional Mitigation Manual MS-1794, Forest Service Handbook FSH 1909.15, and CEQ regulations at 40 CFR 1508.20.

Mitigation measures for specific projects are implementation level decisions and will be included in site-specific analysis which is outside the scope of this EIS.

## Section 27 - Vegetation Riparian

### Section 27.1 - Range of Alternatives

Total Number of Submissions: 2

Total Number of Comments: 3

---

## Summary

Commenters suggested management approaches for riparian vegetation, including removal of invasive tamarisk, limitations on or removal of livestock grazing, and maintenance of sage-grouse habitat objectives.

---

## Response

As described in Section 4.3, the Idaho and Southwestern Montana LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA.

[BLM: provide direction if any change to analysis is necessary.]

## Section 27.2 - Best Available Info Baseline Data

Total Number of Submissions: 2

Total Number of Comments: 2

---

### Summary

Commenter requests baseline data related to Proper Functioning Condition of riparian areas in sage-grouse habitat. Commenter questions whether PFC protects stability of riparian habitat for sage-grouse.

Commenter notes that current PFC assessment methods should be modified to address sage-grouse needs. Commenter requests site-specific management of riparian habitat to balance competing uses.

---

### Response

Comprehensive PFC data is not available on a sub-regional level but is displayed when available. Proper Functioning Condition of riparian systems according to BLM Manual 1737 includes stabilization of streambanks, maintenance of ponding, reduction in erosion, and other features beneficial to sage-grouse. Modifications to PFC methods are outside the scope of this planning effort.

## Section 27.5 - Mitigation Measures

Total Number of Submissions: 2

Total Number of Comments: 2

---

### Summary

Commenter notes that current PFC assessment methods should be modified to address sage-grouse needs. Commenter requests site-specific management of riparian habitat to balance competing uses.

---

### Response

Proper Functioning Condition of riparian systems according to BLM Manual 1737 includes stabilization of streambanks, maintenance of ponding, reduction in erosion, and other features beneficial to sage-grouse.

Under the proposed plan, adaptive management would be incorporated into vegetation treatment and restoration programs, including riparian management. Adaptive management would allow BLM increased flexibility to adjust programs based on data collected during operation, to respond to changing conditions and improve effectiveness of vegetation management programs.

*[BLM: provide direction if any change to analysis is necessary.]*

## Section 29 - Water

### Section 29.3 - Impact Analysis

Total Number of Submissions: 2

Total Number of Comments: 2

---

#### Summary

The EIS fails to address impacts on the soil and watershed conditions resulting from grazing-sourced manure, soil erosion and pathogen contamination under each alternative and to provide appropriate mitigation measures. Such an analysis should include a list of impaired waters and the sources of contamination for those waters. The EIS also fails to address the negative impact on GRSG of restricting or removing water developments under Alternative D.

---

#### Response

*NOTE TO BLM: BLM should review impact discussions under soil and water resources under each alternative and consider mentioning any appropriate beneficial impacts on soils and watersheds that would result from grazing restrictions.*

*NOTE TO BLM: BLM should review impacts on GRSG from grazing under Alternative D and consider whether it is appropriate to identify adverse impacts on GRSG through the restriction or removal of grazing-related water developments.*

*[NOTE TO BLM: Discuss with biologists the impacts of the removal of water development on Sage Grouse.]*

*303d listed streams are discussed in Section 3.16.2.*

## Section 30 - Wild Horse and Burros

Total Number of Submissions: 4

Total Number of Comments: 6

---

#### Summary

Commenters stated that livestock and wild horses were inappropriately grouped together in management actions. Some commenters were also concerned with the 25% proposed reduction of AML under Alternative F and the basis for reduction; they requested reevaluation of reduction based on the fact that wild horse habitat overlaps a minimal percentage of GRSG habitat.

Some commenters also stated that the proposed management should provide flexibility to increase AML/AUM and/or open HAs if data becomes available demonstrating that genetic viability of wild horses and burros is threatened.

Commenters also stated that the preferred alternative would give the BLM too much discretion to reduce AMLs or zero out HMAs which would violate the BLM's legal mandate to protect WHB.

---

#### Response

The BLM and the Forest Service considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. See Section 4.3, NEPA Range of Alternatives, in this report for an expanded explanation on what constitutes a reasonable range of alternatives. *[NOTE TO BLM-check final response in section 4.3 for consistency]*

The BLM protects, manages, and controls wild horses in accordance with the Wild Free-Roaming Horses and Burros Act of 1971 (Public Law 92-195, as amended), the purpose of which is to "manage wild horses and burros within herd management areas (HMAs) designated for their long-term maintenance, in a manner designed to achieve and maintain a thriving natural ecological balance (TNEB) and multiple use relationships." The FLPMA directs the BLM to manage wild horses and burros as one of numerous multiple uses including mining, recreation, domestic grazing, and fish and wildlife. It also required a current inventory of wild horses and burros. Additional guidance is found in 43 CFR 4700, Protection, Management, and Control of Wild Free-roaming Horses and Burros.

Adjusting AML does fall within the legal mandate of the BLM to protect WHB and other resources. Through the BLMs program of monitoring and analysis of data, AMLs have been established and will continue to be adjusted based on the analysis of data. AMLs can be adjusted based on the limitations and capability of the range, including the four habitat components (forage, water, cover, and space), while managing for healthy populations of WHBs in balance with other uses and resources (including sage grouse). An explanation of the relationship between AMLs and AUMs has been included in the FEIS in [section X.X.X](#).

Should the 25% reduction be carried forward in the preferred alternative, genetic viability would be considered in the adjustment of AMLs. Increasing AMLs and/or opening HAs is outside the purpose and need for this project.

## Section 30.1 - Best available information baseline data

Total Number of Submissions: 2

Total Number of Comments: 3

---

### Summary

Commenters requested documentation of critical genetic data on each of the wild horse and burro herds in the planning area. This will provide BLM basis for identifying which HMAs would not be feasible to place AML reductions on while maintaining genetically viable herds. Commenters also requested exact population data for all wild horse populations in HMAs and HAs and clearly defined maps of HMAs and HAs. Finally, commenters stated that any land policy changes resulting from the sage grouse plan must be in conformance with the National Academy of Sciences 2013 recommendations for reform of the federal wild horse management program.

---

### Response

The prerequisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The baseline data provided in Chapter 3 and various appendixes in the Draft LUPA/DEIS is sufficient to support, at the general land use planning-level of analysis, the environmental impact analysis resulting from management actions presented in the Draft LUPA/DEIS. A land use planning-level decision is broad in scope and, therefore, does not require an exhaustive gathering and monitoring of baseline data (see response to section 4.4 in this report for more details). *[NOTE TO BLM- check final language in section 4.4 response for consistency]* Much of the data in the DLUPA/DEIS is presented in qualitative and map form, and is sufficient to support the gross scale analyses required for land use planning. The DEIS includes maps of HMAs and HAs. Population data is included in [Table 3.X](#) of the DEIS. These maps and tables have been reviewed for accuracy prior to inclusion in the FEIS. Genetic documentation of WHB is an ongoing implementation level process used to monitor the genetic health of BLM's wild horse and burro populations (see IM 2009-061).

The NAS report has been considered in the development of the FEIS and actions appropriate the land management planning level included as appropriate. Findings of the NAS would also be considered under separate site-specific NEPA actions.

## Section 30.2 - Impact Analysis

Total Number of Submissions: 6

Total Number of Comments: 9

---

### Summary

Commenters stated that the analysis on GRSG from wild horses and burros are not distinguished from livestock which inaccurately increases the threat.

Commenters identified contradictions in the document such as where the document states that "Under all alternatives, no direct change would occur to areas allocated as HMAs/WHBTs for wild horses and burros", then the report proceeds to summarize how every single alternative would restrict wild horse and burro usage in their own federally designated habitats.

---

### Response

The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives for a land use planning effort (see detailed response in section 4.6, NEPA Impacts Analysis).  
*[NOTE TO BLM- check final response in section 4.6 to ensure consistency]*

The USFWS identified grazing as a threat in the NTT and COT report but did not specifically delineate between livestock and WHB grazing. However, within the DEIS, the BLM and Forest Service did analyze impacts on WHB and domestic livestock grazing separately and also analyzed the impacts on GRSG from WHB and domestic livestock grazing separately. Impacts on GRSG from WHB and domestic livestock grazing are identified in Section 4.X of the DLUPA/DEIS. Impacts on WHB from GSRG management strategies are identified in Section 4.X of the DLUPA/DEIS. BLM appropriately analyzed the impacts to WHB from actions not related to changes in AML.

Text in the WHB impact section has been reviewed and relationship between allocation and management actions clarified in the FEIS.

*[NOTE TO BLM- insert the recommended text below in the FEIS: Under all alternatives, with the exception of Alternative XX, management actions for wild horses and burros would not result in direct changes to HMA status, to AMLs within designated HMAs, or acreage designated as HMAs. Impacts under all alternatives, with the exception of Alternative XX, would be limited to any future changes that may result in AML and/or acreage adjustment as well as reconsideration of HMA status that are based on achievement of GRSG habitat objectives for improving habitat conditions, as described in further detail below.*

*Under Alternative XX, in contrast, AMLs would be directly reduced by 25 percent for all HMAs within PPMAs. This would result in a reduction of the established AMLs for all HMAs that are located entirely or partially within mapped occupied GRSG habitat. As a result of AML reduction under Alternative XX, costs of wild horse and burro management would increase, due to a need for additional horse gathers for removal and/or population growth suppression (PGS) treatments.]*

## Section 31 – Lands with Wilderness Characteristics

## Section 31.1 - Range of Alternatives

Total Number of Submissions: 3

Total Number of Comments: 4

---

### Summary

All lands with wilderness characteristics that overlap with Greater Sage-Grouse habitat represent good opportunities for Greater Sage-Grouse conservation and should be analyzed to see how managing those lands to protect wilderness characteristics would coincide with Greater Sage-Grouse conservation. The BLM should consider lands with wilderness protection as an alternative to ACEC protection for some areas.

The BLM should complete Lands with Wilderness Characteristics inventories and the DEIS should consider potential Lands with Wilderness Characteristics in the scope of this process.

---

### Response

Per BLM Manual 6320, Considering Lands with Wilderness Characteristics in the BLM Land Use Planning Process, “In some circumstances, consideration of management alternatives for lands with wilderness characteristics may be outside the scope of a particular planning process (as dictated by the statement of purpose and need for the planning effort). For example, a targeted amendment to address a specific project or proposal may not in all circumstances require consideration of an alternative that would protect wilderness characteristics. In these situations, the NEPA document associated with the plan amendment must still analyze effects of the alternatives on lands with wilderness characteristics.” Therefore, analysis in this planning document regarding lands with wilderness characteristics will not be completed.

As described in Section 8 of this comment report, Alternative C considers ACEC designation for Greater Sage Grouse habitat and species protection.

## Section 31.2 - Best Available Info Baseline Data

Total Number of Submissions: 4

Total Number of Comments: 4

---

### Summary

The BLM should work with Upper Snake staff to ensure lands with wilderness characteristics inventories and management are consistent between this EIS/LUPA and the Upper Snake RMP.

The BLM must provide a map of the lands with wilderness characteristics and where it overlaps with priority habitat. The FEIS should explain how the BLM will comply with the 2014 appropriations bill for the Department of the Interior, Environment and Related Agencies and with Secretary Salazar’s Secretarial Order No. 3310.

---

### Response

BLM Upper Snake Field Office continues to evaluate lands with wilderness characteristics within the planning area. Decisions related to lands with wilderness characteristics will be addressed in the Upper Snake EIS/LUP.

Per BLM Manual 6320, Considering Lands with Wilderness Characteristics in the BLM Land Use Planning Process, “In some circumstances, consideration of management alternatives for lands with wilderness characteristics may be outside the scope of a particular planning process (as dictated by the statement of purpose and need for the planning effort). For example, a targeted amendment to address a specific project or proposal may not in all circumstances require consideration of an alternative that would protect wilderness characteristics. In these situations, the NEPA document associated with the plan amendment must still analyze effects of the alternatives on lands with wilderness characteristics.” Therefore, analysis in this planning document related to lands with wilderness characteristics will not be completed.

The BLM is not making decisions on lands with wilderness characteristics in this planning effort. Doing so is outside the purpose and need and scope of this EIS.

*[NOTE TO BLM: Consider including a map displaying the overlap of lands with wilderness characteristics and priority habitat should be included in the EIS.]*

NCT note: Consider using similar language to section 8 of this document. Language relevant to ACEC issues may be applicable to LWC and may help clarify why LWC is out of scope.

It does not seem that the response fully addresses the issue statement. Answer to Secretary Salazar's Secretarial Order No. 3310? Possibly use some of the language developed by NVCA in section 31.0 of this document.

## Section 31.3 - Impact Analysis

Total Number of Submissions: 2

Total Number of Comments: 2

---

### Summary

If the BLM does not complete lands with wilderness characteristics inventories, the BLM should use GIS to inventory roadless areas and consider those as potential lands with wilderness characteristics for planning purposes.

---

### Response

No decisions related to the management of lands with wilderness characteristics will be made at this part of the planning effort. Decision related to the management of lands with wilderness characteristics are out of the scope of this plan amendment process.

NCT note: It seems like this response could be combined with section 31.2 of this document. Responses are nearly identical and basically already included in the summary.

## Section 32.1 - Predation

Total Number of Submissions: 5

Total Number of Comments: 6

---

### Summary

Some commenters state that the BLM does not adequately address the threat of predation or fully analyze the direct, indirect, and cumulative impacts of predation on GRSG populations; Predation was identified as a threat by the state of

Idaho. Others question the inclusion of analysis of impacts of anthropogenic structures on predators of GRSG, given that the USFWS did not identify predation as a primary threat to GRSG.

---

## Response

As stated in Section 2.3.1 in the DRMPA/DEIS, predator removal is outside the scope of LUPA. The BLM and the Forest Service have updated the description of the threat of predation in Section 3.2.1 and addressed the potential effects of predation on GRSG populations in the **Section 4.x**.

The BLM and the Forest Service have authority to manage the habitat and have provided an updated analysis in **Section 4.x** of the FEIS to describe how the numerous management actions across the range of alternatives could affect the habitat and indirectly the effects of predation. Altering the sagebrush habitat of the greater sage-grouse can create an influx of predators into an area and lead to a population decline. Roads, fences, power lines, and other infrastructure as well as the development of trails and other disturbances may improve access for potential predators near GRSG habitat and increase risks to the species.

## Section 32.2 – Noise

Total Number of Comments: 1

---

### Summary

Commentor states that noise studies cited in the DEIS are not public and therefore the results are not reproducible; alternative data should be utilized.

---

### Response

Bilckley et al.'s research on noise and GRSG has since been published:

Blickley J.L, D. Blackwood, and G.L. Patricelli. 2012. Experimental evidence for the effects of chronic anthropogenic noise on abundance of greater sage-grouse at leks. Conservation Biology Vol 26. No 3. 461-471

This literature has been added to the noise section in the FEIS.

[Change to FEIS- add citation and data from this study in noise section. Consider addition of other data to support claims]

## Section 32.3 - Weeds

Total Number of Submissions: 2

Total Number of Comments: 4

---

### Summary

Issue 1: Commenters request analysis of past vegetation treatment programs and recommend scientific literature on effects of vegetation treatments.

Issue 2: One commenter requests baseline data on cheatgrass in planning area.

Issue 3: Partnerships with private landowners to control cheatgrass should be considered in the FEIS.

---

## Response

Response 1: As described in Section 4.4, the BLM and FS considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land use plan-level.

As a result of these actions, the BLM and Forest Service gathered the necessary data essential to make a reasoned choice among the alternatives analyzed in detail in the DLUPA/DEIS. The BLM and Forest Service utilized the available data to provide an adequate analysis that led to an adequate disclosure of the potential environmental consequences of the alternatives. [Insert any changes that were made to the EIS as a result of comment received. If no changes necessary, reference the section in the EIS that contain the relevant information].

Analysis of proposed weed treatment methods tiers off of analysis in the Final Vegetation Treatments Using Herbicides on Bureau of Land Management Lands in 17 Western States Programmatic Environmental Impact Statement (PEIS) [BLM 2007x]

Response 2: Potential occurrence of cheatgrass has been modeled (section 3.3.5). Acre of cheatgrass potential in GRSG habitat are shown in the DEIS based on Manier et al. 2013 (see Ttable 3-15, Acres of Cheatgrass Potential within GRSG) [Can incorporate concept of limited info regarding cheatgrass mapping] Information presented is appropriate for the planning level actions and analysis. Further analysis will occur on a site-specific basis at the implementation level.

Response 3: Cooperation with all landowners would be undertaken as feasible and is included in the range of alternatives.

## **Lands and Realty Follow-Up for FEIS**

Per Comment Number 26-9, we will need to make sure it is clear that lands currently identified for “disposal”, will be changed to “retain.”

Per Comment Number 49-24, the question about buried powerlines vs. overhead lines causing impact to sage grouse needs to be answered (by biology), so that Lands and Realty management actions can lay out the recommendations.

Per Comment Number 49-7, we may need to explain that complete exclusion is unrealistic.

Per Comment Number 183-16 and 183-17, co-location is not always practicable or feasible; we may need to add flexibility into our Alt G lands and realty actions.

Per Comment Number 206-9, the suggestion that excluded activities in Alt D should go through the State’s proposed exemption process, may be one to add in Alt G.

Per Comment Number 210-7, we may want to reference APLIC standards.

Per Comment Number 212-6, need to ask Karen Porter about lease development and what is authorized. Do they contain a valid existing right to roads...?

Per Comment Number 242-20, may need to reference the COT in developing Alt G.

Per Comment Number 49-25, maybe some of the buffer’s bio’s are drafting will fit this comment?

Per Comment Number 183-37 and 49-31, biologists need to answer to the conflicting requests for perch divereters and then we need to make a recommendation for powerline in Alt. G.

Per Comment Number 210-4, with conflicting opinions, biologists may need to decide/recommend overhead vs. buried for Alt G and explain why.

Per Comment Number 180-42, we need to provide a conclusion on impacts of wind energy in Alt E.

Per Comment Number 183-29, we need to clarify what the acreages mean according to the BER report.

Per Comment Number 183-38, need to look at WECC and NERC standards to see if co-locating can have some flexibility; otherwise co-locations could cause reliability issues and outages.

Change D-LR-19. "Acquire habitat when possible and retain ownership of habitat, except if a ~~land exchange~~ would allow..." "land exchange" needs to be changed to "disposal" (a more correct terminology)

**In 2.6.4 Alternative D**, "Required" needs to be changed to "allowed" in the following sentence: The following are examples of ROWs that could be required in PPMA"

This statement does not seem accurate... I think it should be "decreasing" instead of "increasing:" "Alternatives A, B, C, and F would force wind energy ROWs outside GRSG habitat, thereby increasing the potential for indirect effects in the planning areas, such as requests for new transmission line ROWs and access roads.

The following needs to be clarified in the FEIS: "Impacts from lands and realty to wind energy were discussed in Chapter 4, page 4-331. BLM groups Alternative A and Alternative E together in regards to impacts on wind energy. Under Alternative E, the BLM and the Forest Service would limit impacts from wind and solar energy development through the use of triggers in addition to the general stipulations identified in the GRSG section, as well as best management practices that would also apply to Alternative A.

**Subject:** Internal and public DEIS comments & responses

Hi Brent,

Attached are two tables – one tracks the internal BLM comments on the DEIS. The other tracks changes to the FEIS needed based on public comments. I tried to identify where the change needs to be made and by whom. I did not see public comment responses (and changes to the FEIS) on the following topics:

- NEPA, etc
- ACECs
- Climate change
- Soils
- Water
- Fire/fuels
- Recreation
- Travel management
- Tribal interest
- Vegetation
- Wild horse and burro
- Lands with wilderness characteristics
- Livestock grazing

Meredith

GHB response 4-9-14.

IDMTSG-14-0049-22, Greater Yellowstone Coalition, Barb Cestero, 12.1, Range of Alternatives, 12.1: Recovery of sagebrush lands impacted by fire is long-term and may often take decades or even centuries. Species composition, pre-burn site conditions, fire size and intensity, fire frequency, and availability of seed sources all play a role in the ability of sagebrush habitats to recover. Without readily available sagebrush habitat, most sites affected by fire are of little to no value to sage-grouse prior to recovery. At the same time, some priority sage-grouse habitats include substantial non-sagebrush habitat interspersed with sagebrush steppe, such as low-elevation Douglas-fir forests, where fire is a critical natural process. In the absence of fire on these landscapes or due to unnatural fire suppression efforts, there has been significant conifer expansion into sagebrush steppe and grasslands. For this reason, we suggest that prescribed fire be used sparingly in areas specially designated for sage-grouse conservation and prohibited completely in areas dominated by xeric sagebrush species such as Wyoming big sagebrush. Prescribed fire treatments should not be designed to remove sagebrush, but rather should only be used to address issues such as conifer encroachment that may contribute to declining health in sagebrush habitats.

Response: Prescribed fire is applied to meet resource goals in a variety of fuel models. Some habitat areas benefit from fire applications and this is analyzed from a landscape level, desired future condition.

IDMTSG-14-0053-8, Hagenbarth Livestock, Jim Hagenbarth, 12.1, Range of Alternatives, 12.1: Most of the alternatives dwell on core habitat fire suppression actions and the prevention of wildfire through education of all users. Alternative D speaks of revegetating green strips with native vegetation. Any responsible plan must include a comprehensive map of all natural and manmade firebreaks in priority habitat and then use fire specialists, landscape architects, and vegetative specialists to design additional green strip fuel breaks to further break up these fuel loads in GRSG habitats that are prone to burning. The loss of habitat from developing these green strips is minimal, compared to these huge uncontrollable fires. The cost of green stripping will be minimal compared to the cost of suppression. The ARS Forage and Range Resource Lab in Logan, Utah, has developed vegetation that can be used in green stripping. Forage kochia is one of these plants. It is very high in protein during the winter months and GRSG use of this plant has been documented. It is imperative that green stripping become a larger component in fire management.

Response: Green stripping or fuel breaks are an important part of the fuels management program in Idaho BLM.

IDMTSG-14-0159-23, American Exploration and Minind Association, Laura Skaer, 12.1, Range of Alternatives, 12.1: Alternatives B and F in the Idaho DEISs propose fire and fuels management within a

key/core habitat with an emphasis on protecting existing sagebrush ecosystems, but do not take into account the quality, suitability or relative importance of the habitat to GRSG. It may not be appropriate to maintain 15% sagebrush canopy in all key/core habitat in an area where removal and creation of a fuel break would have net beneficial effects on GRSG.

Response: 15% sage brush canopy would be an overall, landscape level goal. Some site specific areas may contain more or less.

IDMTSG-14-0159-26, American Exploration and Minind Association, Laura Skaer, 12.1, Range of Alternatives, 12.1: Governor's Alternative's prevention measures include fuel breaks, fuels reduction, and fire restrictions and closures. Governor's Alternative requires that strategy and associated NEPA for these prevention efforts should be completed within two years of signing the Record of Decision for this current EIS. Fire suppression measures include creating additional Rural Fire Protection Associations (RFPAs), response time analysis, suppression capacity analysis, water capacity analysis and implementation, and firefighter education on the importance of protection CHZ and IHZ. These measures should be implemented within one year of the Record of Decision for this EIS.

Response: Every effort will be made to implement measures in a timely manner, pending budgets, personnel and capacities.

IDMTSG-14-0168-15, Custer County Commissioners, Wayne F. Butts, 12.1, Range of Alternatives, 12.1: C-9"On critical fire weather days, pre-position additional fire suppression resources to optimize a quick and efficient response in sage-grouse habitat areas."This RDF would apply to alternative B and F, and is inconsistent with the policies of Custer County. Under this policy the agencies are required to prioritize protection of the Greater Sage-Grouse over human life and property. All fire suppression resources in Custer County should be positioned for the protection of human life first. Coordination of this RDF should be coordinated with the Fire Districts within this planning region, and specifically within Custer County, to determine whether or not it is consistent with their existing policies, and if this policy creates conflicts that must be resolved. A discussion as to how this will be resolved needs to be included in the DEIS.

Response: Life and Property are always the top priorities in fire suppression, followed by resource protection. This will remain our priority unless policy changes for the Bureau of Land Management.

IDMTSG-14-0178-14, Idaho Cattle Association, Karen Williams, 12.1, Range of Alternatives, 12.1: " [This comment refers to Alternative D] Fire Management (2-30, Appendix K) " It is important that the agencies' fire management efforts are not restricted only to written language in a plan, but rather ensures that on-the-ground decision making will be enabled and encouraged. Fire patterns vary based on circumstances and suppression efforts cannot always be managed by the book

Response: Fire suppression efforts are directed by a qualified Incident Commander. On the ground decision making is encouraged and expected from these highly trained individuals.

IDMTSG-14-0178-16, Idaho Cattle Association, Karen Williams, 12.1, Range of Alternatives, 12.1: [This comment refers to Alternative D] Mitigation (2-75) The LUPA/DEIS mentions grazing management for post-fire restoration treatments. The final LUPA/EIS must make clear the need for flexibility in developing such treatments. In many cases, grazing restrictions post-fire only serve to exacerbate the invasive species problem which creates a cyclical negative impact on sage grouse.

Response: Grazing restrictions are generally put into place to allow post-fire rehabilitation efforts to meet certain criteria prior to re-establishing grazing practices.

IDMTSG-14-0179-15, Idaho Conservation League, John Robison, 12.1, Range of Alternatives, 12.1: It is important to note that the Idaho Fire Restrictions Plan is just one aspect of a larger public education and prevention program.<sup>11</sup> <http://www.idahofireinfo.blm.gov/southwest/firerestrictions.htm>The following criteria are among those to be considered when assessing the need for restrictions, but these criteria can be customized for each area:

- 1,000-hour fuel moisture content
- Live fuel moisture content
- Fire danger rating adjective class is at very high or extreme
- Fires are impacting available suppression resources making adequate initial attack difficult
- Area is receiving a high occurrence of human-caused fires
- Adverse fire weather conditions and risks are predicted to continue
- Social, political and economic impacts
- Life safety is jeopardized

If a certain number of the above conditions are met, Stage 1 Restrictions may be set in place which restrict building campfires and smoking beyond an enclosed vehicle or building. If even more of the above conditions are met, Stage 2 Restrictions may be set in place, which add operating motorized vehicles off designated road and trails, operating internal combustion engine such as a chainsaw, welding and using explosives. This program was successfully utilized to protect remaining sage-grouse habitat following the Murphy Fire when extreme fire conditions were still present. These restrictions were enacted specifically to prevent human-caused fires from impacting other sage-grouse habitat during a time when resources were stretched thin. As such, this program may be able to serve as an adequate and at least partially effective regulatory mechanism.

Response: All Stages of Fire Restrictions and plan will be utilized as conditions warrant to prevent unwanted human caused fires.

IDMTSG-14-0180-37, C.L. Butch Otter, 12.1, Range of Alternatives, 12.1: However, the distinction between Alternative E and its co-preferred partner Alternative D is that Alternative E is the only one that responds to the Service's concern that existing fire mechanisms were only implemented through temporary IMs that expired every two years. The table provided in Appendix D for Alternative E and also noted as Table 2-13 in this EIS provides timelines for both BLM and the Forest Service to implement long

term fire management measures. This ensures that measures are not only effective in reducing the impact of fires, but also that fires can continue to be managed consistently at the local level. No other Alternative in the DEIS addresses fire in this way. In fact, Alternatives C and F merely defer to Alternative B for the primary threat facing sage-grouse. Thus, while the impacts of the measures themselves may not differ substantially from Alternative A or B, Alternative E's impacts are much bigger as they are paired with a mechanism to ensure they are actually implemented.

Response: I.M.'s are generally re-issued if they are found viable and useful. All involved partners, federal, state and private are responsible to implement long term fire management measures.

IDMTSG-14-0206-27, The Nature Conservancy, William Whelan, 12.1, Range of Alternatives, 12.1: Fuel breaks can involve ground disturbing vegetation treatments that may provide a foothold for invasive weeds and may further fragment sage grouse habitat by removing shrub cover. For this reason, constructing fuel breaks outside of CHZ and IHZ habitats but in locations that help protect these habitat area may be preferred. Nevertheless, we do not propose a per se rule excluding fuel breaks from sage grouse habitats in all instances.

Response: N/A no question.

IDMTSG-14-0206-28, The Nature Conservancy, William Whelan, 12.1, Range of Alternatives, 12.1: Alternative E recommends prioritizing fuel breaks at the wildland-urban interface (WUI). We believe that a landscape scale analysis provides a better opportunity to place fuel breaks at locations that will be more effective at protecting sage grouse habitat than a WUI-focused strategy. Therefore, we suggest that the WUI preference not be carried forward into the final Plan.

Response: The Hazardous Fuels Reduction Program requires, both, resource and wildland/urban interface efforts. Unless policy changes both areas will remain priorities.

IDMTSG-14-0242-21, U.S. Fish and Wildlife Services, Dennis Mackey, 12.1, Range of Alternatives, 12.1: We recommend that the FEIS include provisions to eliminate prescribed burning in sage-grouse wintering and breeding [i.e., lekking, nesting and early brood rearing (Connelly et al. 2004, Connelly et al. 2011)] habitats unless biologically justified. The ecological role of fire in reducing sagebrush canopy and stimulating regeneration may justify the use of prescribed fire in site-specific circumstances (Manier et al. 2013). If prescribed fire is allowed in GRS habitat, then we recommend that the FEIS commit to using the risk analysis tool currently in development by WAFWA. We also recommend incorporating literature by the Fire and Invasive Species Team (FIST), which is currently developing landscape prioritization for fire and invasive species, as well as step down assessments

Response: Prescribed fire is applied to meet resource goals in a variety of fuel models. Some habitat areas benefit from fire applications and this is analyzed from a landscape level, desired future condition.

IDMTSG-14-0325-10, William J. Mulder, 12.1, Range of Alternatives, 12.1: Once a wildfire is started, BLM has shown it will use BMP with available resources to suppress the fire, regardless of whether in GRSG habitat or not. Effective control of wildfire will need to take place well before a fire occurs. None of the Alternatives adequately address this situation. Some general items that could reduce the wildfire threat are: -develop working relationships and agreements between all firefighting entities that would minimize jurisdictional delays in initial attack (see E-WFM-8); -specifically develop and maintain MOU's with local Rangeland Fire Protection Associations ("RFPAs"), which can greatly reduce response times to minimize wildfire impacts; -in addition to Fuels Management items below, avoid Wilderness and/or Lands with Wilderness Character designations and restrictions that promote road/trail closures or prohibit significant firebreak, fire lane and fire management projects; and -re-allocate BLM resources from a focus on over-regulating low-threat uses (e.g. grazing, underground rights-of-way, etc.) toward developing and maintaining effective fire-control measures.

Response: The Hazardous Fuels Reduction Program requires, both, resource and wildland/urban interface efforts. Unless policy changes both areas will remain priorities. Designations, closures and uses are land use decisions and not under the fire management program.

IDMTSG-14-0325-11, William J. Mulder, 12.1, Range of Alternatives, 12.1: [This comment corresponds to the headings in Table 2-17 and Table 2-18] Fuels Management. Mature sagebrush is arguably the most significant source of fire fuel in GRSG habitat. BLM's stated objective is conservation and rehabilitation of GRSG habitat to not less than 15% canopy. Alternatives B, C, D and F (B-FM1-F-FM1) resist any significant reduction in sage brush and the 15% cover objective, except under onerous conditions. Incredibly, many of the Alternatives are more concerned with regulating nearly insignificant uses as they relate to fuels treatments than in recognizing the problem on a broad scale B, C and F -FM1 actions). Failure to deal with fuel management by developing mosaic or linear breaks has contributed to massively detrimental wildfires (e.g. Murphy Complex, Long Draw, Holloway, etc.). Emphasis on actually increasing sage brush cover with more restrictive fuel treatment options will exacerbate the already primary threat. In addition to the considerations outlined in "General" (above), the adopted Alternative should promote the " ... aggressive wildlife [sic-"wildfire"] and invasive species management practices ... ) outlined in EFMI-6, as well as D-FM-6-9 and D-FM13-16.

Response: N/A opinion.

IDMTSG-14-0105-2, Owyhee County, Brook Russell, 12.2, Best available information baseline data, 12.2: A soon to be published study from the USGS shows that reseeding after fire has not been beneficial for Sage Grouse. And there is long term reduction in SG use in both the untreated and treated burned areas. BLM, in this LUP AIEIS, should be focusing to reduce any potential for fire with livestock grazing to reduced fuels.

Response: Livestock grazing is a grazing decision and must meet permit requirements.

IDMTSG-14-0153-63, Wild Earth Guardians, Erik Molvar, 12.2, Best available information baseline data, 12.2: Alternative E involves the widespread creation of 300-foot-wide “green strips” as fire breaks DEIS at 2-85. This is a practice unsupported by science. Please provide peer-reviewed, scientific literature that demonstrates that such “green strips” in sagebrush steppe habitat have been demonstrated to reduce fire. Our review of the literature uncovered only unpublished white papers and “fact sheets” that cited no actual scientific studies to support the assertion that “green strips” slow or halt the spread of fire. If no such evidence can be provided, such “green strips” should be explicitly forbidden in the RMP amendment. It is obvious that “green strips” will only be green in the spring, when precipitation occurs and the risk of fire is negligible. During the dry periods when fire ignitions occur and spread most readily, “green strips” will be brown and represent a concentrated source of fine fuels that will do nothing to slow the advance of a flame front, and may indeed accelerate it.

Response: Fire spread modelling, utilizing Behave software, has shown that perennial species will decrease fire behavior. This assumes that perennial species will retain higher live fuel moistures than the existing annual components, longer into the normal fire season, thus, reducing chance of ignition.

IDMTSG-14-0178-4, Idaho Cattle Association, Karen Williams, 12.2, Best available information baseline data, 12.2,26.2: Control of invasive species has a direct correlation with controlling wildfires. For the reasons mentioned above, grazing can be used as a tool to reduce many of the invasive species which also serve as fine fuel loads for fires. Peer-reviewed studies have proven that when rangeland is burned, it is much less prone to invasion by annual invasive weeds like cheat grass if it has been grazed (Davies, 2009). Due to reduced fuel loads and cooler burn temperatures, grazed rangeland is more likely to reestablish native bunch grass communities, while burned ground that has not been grazed is more likely to establish cheat grass communities. In light of these findings, appropriate grazing should be recognized in the RMPA as a primary tool in the prevention of wildfire and reduction of invasive weeds”two of the primary threats to sage grouse habitat. Diamond et al. (2009) found that targeted grazing may be a critical tool for breaking the exotic annual grass-fire cycle by decreasing the probability of fire disturbance. Additionally, Diamond et al. (2009) found that, on areas already invaded by exotic annual grasses, strategic grazing could reduce fuel loads and continuity enough to prevent a flame front from carrying across the treated areas, even under peak fire conditions. Ample research, including that of Olson and Lacey (1994) and Walker et al. (1994), has found livestock grazing to be an effective tool for the control of invasive plant communities.

Response: Livestock grazing is a grazing decision and must meet permit requirements. Grazing may also spread annual/invasive/noxious weed seed into areas where it does not occur or is a minimal part of the community.

IDMTSG-14-0223-3, Theodore Roosevelt Conservation Partnership, Edward B. Arnett, 12.2, Best available information baseline data, 12.2: We observed in several places where prescribed fire is mentioned and implied as a tool for management (e.g., Chapter 2, Table 2-1, page 2-4). We would argue that there is no science-based evidence to support using prescribed fire as a means of improving sage grouse habitat and in fact, studies indicate that prescribed fire will not improve habitat characteristics for sage grouse (e.g., Rhodes et al. 2010, Bates et al. 2011, Beck et al. 2011, 2012).

Response: Prescribed fire is applied to meet resource goals in a variety of fuel models. Some habitat areas benefit from fire applications and this is analyzed from a landscape level, desired future condition.

IDMTSG-14-0056-13, Helmick Ranch, Neil Helmick, 12.3, Impact Analysis, 12.3: Analysis of unintended consequences that are created by increased fuel loading attributable to reduced livestock grazing need to be considered in the document

Response: Livestock grazing is a grazing decision and must meet permit requirements.

IDMTSG-14-0105-15, Owyhee County, Brook Russell, 12.3, Impact Analysis, 12.3: Vol 2, Page 2-83: Regarding Alternative E -Fire Suppression Table 2-11 mentions Rangeland Fire Protection Associations. These have proven extremely effective in wildfire response and suppression. However, it should be kept in mind that the ranchers involved are there because they are able to maintain viable ranching operations and thus are not only present but have a vested interest in assuring that wildfire effects are minimized. The recent grazing permit renewals in the Owyhee Field Office have the potential to substantially alter the number of such ranch operations that will remain viable and present. The wide spread public benefit of Rangeland Fire Protection Association activity and their benefit to preservation of GRSG habitat should be considered in the evaluation of Alternative impacts on grazing opportunity.

Response: Address in Socio-economics section or in future plan amendments if this occurs?

IDMTSG-14-0130-16, Wild Earth Guardians, Erik Molvar, 12.3, Impact Analysis, 12.3: Natural fire return intervals in Wyoming big sagebrush average 100-240 years (Baker 2007). Wyoming big sagebrush recovers slowly after fires, which typically result in 100% sagebrush mortality; recovery to pre-fire canopy cover takes over 100 years (Cooper et al. 2007). The Idaho "Southwest Montana DEIS mischaracterizes this as 15 to 30 years, citing Manier et al. (2013:133-134). DEIS at 4-69. Manier et al.

(2013) repeatedly reference the very slow recovery times of sagebrush following fire, and the closest that they come to supporting the DEIS characterization is to note that in mountain big sagebrush habitats (as opposed to the drier Wyoming big sagebrush communities that dominate the planning area) with ideal soil and climate parameters, recovery can be as little as 20 years (at p. 79). However, even mountain big sagebrush can take 75 years or more to recover in certain circumstances (Baker 2011). Please rectify this apparent hard-look failure in the impacts analysis

Response: Add to research cited portion of document.

IDMTSG-14-0180-36, C.L. Butch Otter, 12.3, Impact Analysis, 12.3: The July 1 Clarification and Refinement letter sent to BLM by the Governor outlines a wildfire strategy that focuses on prevention, suppression, and restoration. These measures also require BLM to take certain actions within one year of signing the Record of Decision. This strategy provides certainty that the measures will be implemented and that action will be taken. Additionally, in 2012, Idaho, in collaboration with BLM established Rural Fire Protection Associations. These Associations, discussed in further detail in the attached comments from the Idaho Department of Lands, have already been established, and funded by the Idaho State Legislature and assisted BLM in the 2013 fire season. Additional Associations continue to be added and IDL recently established a full time position in their office to manage them. In contrast, under Alternative B and D, "impacts on sage-grouse from fire suppression activities would largely be the same as Alternative A." This determination is shocking, considering inadequate regulatory mechanisms for wildfire control was the primary purpose for the "warranted but precluded" determination. However, Alternative B does not alter the status quo. BLM reaches the same conclusions for Alternative D, saying on page 4-55, "overall, Alternative D would reduce impacts to wildfire similar to Alternative B."

Response: All involved partners, federal, state and private are responsible to implement long term fire management measures. BLM is still training and supporting RFPAs.

IDMTSG-14-0180-44, C.L. Butch Otter, 12.3, Impact Analysis, 12.3: The present DEIS is comprised of general statements about possible effects and do not constitute a "hard look." For example, on page 4-296, the DEIS is quick to dismiss Alternative E's extensive fire management approach because it "overall has fewer management actions to protect [sage-grouse] from fire than other action alternatives." In contrast, the DEIS praises Alternative B, while providing vague descriptions of how that alternative can affect the impacts of fire. Again, BLM fails to understand that the Service wanted a coherent strategy to address this threat, rather than a laundry list of conservation measures. This effects analysis does not address the fact that only Alternative E provides certainty of implementation for fire management, and every other threat.

Response: N/A opinion.

All-

I am very sorry this is days late at this point. I've been in depositions for the last 2 weeks and I haven't caught up on all my SOL email, let alone BLM email.

I've made some edits to this response. I've not changed anything substantive but I've reorganized a bit and removed some redundancy.

Please let me know if you have an concerns with my suggestions.

Vonnie

Hi Vonnie,

Ken Visser recommended that I request your review of one of our comment responses for the Idaho/MT Sage-Grouse EIS. We received several comments to the effect that BLM does not have authority to close grazing allotments, or that a new "chiefly valuable" determination would need to be made. The following is our response. Could you please review it by August 7th and let me know if any changes are needed?

Thank You,  
Nika

FLPMA grants the Interior Secretary the authority to make land use planning decisions, taking into consideration multiple use and sustained yield, areas of critical environmental concern, present and potential uses of the land, relative scarcity of values, and long-term and short-term benefits, among other resource values (43USC 1711 Sec 201 (a)). 43 CFR § 4100.0-8 provides that the BLM shall manage livestock grazing on public lands in accordance with applicable land use plans. Further, the BLM may designate lands as "available" or "unavailable" for livestock grazing through the land use planning process (H-1601, Land Use Planning Handbook, Appendix C). A decision to cease livestock grazing is not permanent. It is subject to reconsideration, modification and reversal in subsequent land use plan decisions.

The Taylor Grazing Act requires that the Secretary "make such rules and regulations ... [and] do any and all things necessary ... to insure the objects of ... grazing districts, namely, to regulate their occupancy and use, to preserve the land and its resources from destruction or unnecessary injury [and] to provide for the orderly use, improvement and development of the range." (43 USC § 315a).

FLPMA grants the Interior Secretary the authority to make land use planning decisions, taking into consideration multiple use and sustained yield, areas of critical environmental concern, present and potential uses of the land, relative scarcity of values, and long-term and short-term benefits, among other resource values (43USC 1711 Sec 201 (a)). 43 CFR § 4100.0-8 provides that the BLM shall manage livestock grazing on public lands in accordance with applicable land use plans. Actions taken under land use plans may

include making some, or all of the land within grazing districts, unavailable for grazing during the life of the plan as well as imposing grazing use restrictions, limitations or other grazing management related actions intended to achieve such goals and objectives (H-1601, Land Use Planning Handbook, Appendix C).

A "chiefly-valuable-for-grazing" determination is required only when the Secretary is considering creating or changing grazing district boundaries. Such a determination is neither required nor appropriate when establishing grazing levels within a district. (See USDI Solicitor Memorandum Clarification of M-37008 (May 13, 2003)). This RMP is not considering creating or changing grazing district boundaries. Although lands have been identified as "chiefly-valuable-for-grazing" per the Taylor Grazing Act for purposes of establishing grazing districts within the public domain (see, 43 U.S.C. § 315) this does not negate the BLM's authority or responsibility to manage those lands to achieve resource condition goals and objectives under the principals of multiple use and sustained yield as required by FLPMA and its implementing regulations.

[dlepak@blm.gov](mailto:dlepak@blm.gov)

FLPMA grants the Interior Secretary the authority to make land use planning decisions, taking into consideration multiple use and sustained yield. . . present and potential uses of the land, relative scarcity of values, and long-term and short-term benefits, among other resource values (43 USC 1711 Sec 201 (a)). BLM land use planning regulations, found at 43 CFR § 4100.0-8 provide that the BLM shall manage livestock grazing on public lands in accordance with applicable land use plans. The BLM may designate lands as “available” or “unavailable” for livestock grazing through the land use planning process (H-1601, Land Use Planning Handbook, Appendix C). A decision to make lands unavailable for livestock grazing is not permanent. It is subject to reconsideration, modification and reversal in subsequent land use plan decisions. □ BLM land use plans may make some, or all, of the land within grazing districts unavailable for grazing during the life of the plan. Further, land use plans may impose restrictions and limitations on grazing or any other grazing management related action intended to achieve the land use planning goals and objectives (H-1601, Land Use Planning Handbook, Appendix C).

The Taylor Grazing Act requires that the Secretary “make such rules and regulations ... [and] do any and all things necessary ... to insure the objects of ... grazing districts, namely, to regulate their occupancy and use, to preserve the land and its resources from destruction or unnecessary injury [and] to provide for the orderly use, improvement and development of the range.”.

A “chiefly-valuable-for-grazing” determination was originally made for most of the public lands pursuant to the Taylor Grazing Act (“TGA,” see, 43 USC § 315a). This determination need only be revisited when the Secretary is considering creating or changing grazing district boundaries. Such a determination is neither required nor appropriate when establishing grazing levels within a district during FLPMA land use planning. (See USDI Solicitor Opinion, “Clarification of M-37008, May 13, 2003”). This RMP is not considering creating or changing grazing district boundaries. Although lands have been identified as “chiefly-valuable-for-grazing” per the TGA for purposes of establishing

grazing districts within the public domain. This TGA determination does not contradict the BLM's authority or responsibility to manage those lands to achieve resource condition goals and objectives identified during land use planning as required by FLPMA's multiple use and sustained yield mandate.

RESOURCE MANAGEMENT PLAN AMENDMENT AND ENVIRONMENTAL IMPACT STATEMENT  
Changes to Public Draft RMPA/EIS**

<b>Cmt #</b>	<b>Page #</b>	<b>Cmt #</b>	<b>Reviewer Name/ Program</b>	<b>Change to document</b>	<b>Remarks / How Resolved</b>
6.		IDMTSG-14-0049-10	Porter-minerals-range of alts	add definition of VER to glossary. Note- this is not an easily definable term! I couldn't find a definition in Black's Law Dictionary, but did find a Solicitor's Opinion that provides context: M-36910 (Supp.) 88 I.D. 909, 912 (1981). Here are some excerpts: VER are those rights short of vested rights that are immune from denial or extinguishment by the exercise of Secretarial discretion. They may arise from two situations: a statute may prescribe a series of requirements which, if satisfied, create rights in the claimant by the claimant's actions under the statute without an intervening discretionary act; or, a VER may be created as a result of the exercise of Secretarial discretion. VERs are not absolute- the nature and extent of the rights are defined either by the statute creating the rights or by the manner in which the Secretary chose to exercise his discretion. VERs that include the right to develop may not be regulated to the point where the regulation unreasonably interferes with enjoyment of the benefit of the right.	Change made. Incorporated definition from NV/CA and UT plans to be consistent.
7.		IDMTSG-14-0049-27	Porter-minerals-range of alts	While Alt. D of the DEIS would have applied seasonal restrictions to lands with moderate to high potential for the occurrence of a fluid mineral, BLM's preferred management action has been changed in the FEIS to applying a year-round No Surface Occupancy stipulation in PHMA and IHMA. CSU, seasonal timing restrictions, buffers, and standard stipulations would be applied in GHMA.	Addressed in Proposed Plan
8.		IDMTSG-14-0049-9	Porter-minerals-range of alts	BLM's preferred management action for future oil and gas leasing has been changed in the FEIS to applying a year-round NSO stipulation in PMMA and PPMA. This will exclude all development on leases in these areas.	Addressed in Proposed Plan
9.		IDMTSG-14-0153-28	Porter-minerals-range of alts	BLM's preferred alternative for future leases has been changed in the FEIS to impose an NSO in all PPMA and PMMA habitat, and to impose a lek buffer in PGMA. What is the lek buffer for PGMA in FEIS?	Addressed in Proposed Plan

**IDMT GREATER SAGE-GROUSE  
RESOURCE MANAGEMENT PLAN AMENDMENT AND ENVIRONMENTAL IMPACT STATEMENT  
Changes to Public Draft RMPA/EIS**

<b>Cmt #</b>	<b>Page #</b>	<b>Cmt #</b>	<b>Reviewer Name/ Program</b>	<b>Change to document</b>	<b>Remarks / How Resolved</b>
10.		IDMTSG-14-0212-11	Porter-minerals-range of alts	There may be mineral leases in the ACECs proposed in Alts. C and F- that information will be included in the FEIS, as well as a discussion of mineral potential in the proposed ACECs Determine whether there are mineral leases in the ACECs proposed by Alts C and F. Determine mineral potential in ACECs proposed by Alts. C and F.	BLM: GIS analysis Katie work with Karen
11.		IDMTSG-14-0182-6	Porter-minerals-baseline data	BLM's preferred management action has been changed in the FEIS to applying a year-round No Surface Occupancy stipulation in PPMA and PMMA. Seasonal restrictions would be applied in PGMA. Lands outside of sage grouse habitat would not be subject to stipulations developed in this EIS.	Addressed in Proposed Plan
12.		IDMTSG-14-0180-43	Porter-minerals-impact analysis	The section describing the impacts from leasable minerals management for Alt E is not correct and needs major revision. See my comments on pg 4-61-63.	Katie work with Karen
13.		IDMTSG-14-0212-30	Porter-minerals-impact analysis	The impacts of Alts F and B will be analyzed in more detail in the FEIS, specifically with respect to disturbance caps. Distinguish between Impacts from Alts F and B. Note: This is a disturbance cap question.	Katie work with Karen
14.		IDMTSG-14-0212-29	Porter-minerals-impact analysis	Include a discussion of the effects of phosphate management actions to socio-economics in Ch 4. Also, references to section 4.11.2 should be corrected and should refer to section 4.12.2.	ICF Katie – correct references; check comment for context.
15.		IDMTSG-14-0131-13	Porter-minerals-cumulative analysis	Cumulative effects across state lines will be considered in the FEIS.	BLM review: Cumulative effects will be across state lines for GRSG, but not for minerals. Does this response need to be revised?

RESOURCE MANAGEMENT PLAN AMENDMENT AND ENVIRONMENTAL IMPACT STATEMENT  
Changes to Public Draft RMPA/EIS**

<b>Cmt #</b>	<b>Page #</b>	<b>Cmt #</b>	<b>Reviewer Name/ Program</b>	<b>Change to document</b>	<b>Remarks / How Resolved</b>
16.		IDMTSG-14-0131-20	Porter-minerals-cumulative analysis	Analysis of impacts in the DEIS doesn't make sense. Table 4-64 (and subsequent tables in the section) is full of errors. None of Idaho's Phosphate leases are subject to NSO, CSU, or TL stips. Also I question the figures identified as unleased KPLAs closed to leasing (3720 acres) and subject to NSO (620 acres). I recommend doing away with the following columns in Table 4-64: Closed, NSO, CSU and TL. Here are actual numbers from LR2000: There are a total of 80,168 acres designated as KPLA. Currently, there are 31,670 acres of KPLA leased (48,498 acres of unleased KPLA). There are 12,904 acres of leased land outside of KPLAs. None of the leases are covered by NSO, CSU, or TL stips.	BLM: GIS analysis Katie work with Karen
17.		IDMTSG-14-0131-30	Porter-minerals-cumulative analysis	Socio-economic impacts resulting from the loss of availability of phosphate resources in each of the alternatives will be discussed in greater depth in the FEIS. Add impacts from loss of phosphate resources to socio-economic section	Addressed with ICF revisions.
18.		IDMTSG-14-0212-31	Porter-minerals-cumulative analysis	Additional analysis is required. Reasonably foreseeable actions, and the impacts of proposed conservation measures, will be discussed in the FEIS. Additional analysis required. Discuss reasonably foreseeable actions and impacts of proposed conservation measures in FEIS.	Katie – work with Karen, cumulative impacts
19.		IDMTSG-14-0212-5	Porter-minerals-cumulative analysis	Add discussion of economic and social impacts of restricting phosphate mining and imposing conservation measures.	Addressed with ICF revisions.
20.		IDMTSG-14-0166-7	Porter-minerals-mitigation measures	The RDFs were adopted from BMPs in Appendix D of the NTT report. In that appendix, it states that "BMPs are continuously improving as new science and technology become available and therefore are subject to change. Include from the following BMPs those that are appropriate to mitigate effects from the approved action." Add wording to the FEIS from the NTT report in discussion of RDFs.	Yes we can add: "BMPs are continuously improving as new science and technology become available and therefore are subject to change. "

RESOURCE MANAGEMENT PLAN AMENDMENT AND ENVIRONMENTAL IMPACT STATEMENT  
Changes to Public Draft RMPA/EIS**

<b>Cmt #</b>	<b>Page #</b>	<b>Cmt #</b>	<b>Reviewer Name/ Program</b>	<b>Change to document</b>	<b>Remarks / How Resolved</b>
21.		IDMTSG-14-0149-15	Makela- 7.3	Clarify in FEIS the validity of NTT, COT, BER relative to “establish standards of scientific integrity under the ESA, the Data Quality Act, and the Presidential and DOI memoranda and orders.”	Ask Jon – I don’t think this requires a change in the document. This is addressed in the comment response report. Agree No change needed in document
22.		IDMTSG-14-0151-29	Makela- 7.3	Ensure FEIS clarifies how PACs were delineated (IDFG delineated based on Core and Important zones, and provided to FWS).	MZ: Add to Chapter I  Makela-2/23/15. Needs to be incorporated where FEIS talks about PACs. Easy fix, but need to know where to insert it. Basically IDFG developed PACs based on merging of Core and Important designations from Governor’s Alt. E map. CONFIRMED WITH D. KEMNER 2/24/2015. Proposed Plan shows some additional areas of IHMA (and small areas of PHMA) outside PACs based on analyses subsequent to the delineation of PACs but this is ok as provides additional conservative landscape protections above and beyond the PACs. (This needs to be added the first time we introduce pacs in the document).
23.		IDMTSG-14-0151-39	Makela- 7.3	Clarify in FEIS: Sage-grouse MZs were an attempt by WAFWA to delineate GRSG habitat range wide into more discrete areas for broad scale planning. Population monitoring is still done at finer scales such as State, local working group, Conservation Area or similar.	MZ: Add to Chapter I after first use of “management zone”  Makela-2/23/15. This was a WWP comment. See below. Need to add wording into FEIS that describes intent of the GRSG Mgt Zones. The 2006 Rangewide Cons. Strategy page I.6, (Stiver et al. 2006) delineated 7 GRSG management zones based on 41 sage-grouse populations and 7 floristic provinces to “guide conservation goals and rangewide management”. The intent was not to portray GRSG habitat quality but rather an attempt to compartmentalize the range of grsg so we

**IDMT GREATER SAGE-GROUSE

Changes to Public Draft RMPA/EIS**

Cmt #	Page #	Cmt #	Reviewer Name/ Program	Change to document	Remarks / How Resolved
					<p>could better focus efforts and monitoring in a biologically meaningful way transcending jurisdictions.</p> <p>Add wording, “ Stiver et al. (2006) delineated seven GRSG Management Zones, based on the distribution of 41 sage-grouse populations and 7 floristic provinces to guide general conservation goals and rangewide management within the range of the species. More detailed site-specific data, such as for seasonal habitats, vegetation characteristics, and related factors are more appropriately addressed in finer scale planning efforts or activities.”</p> <p>Comment Number: IDMTSG-14-0151-39 Organization1:Western Watersheds Project Commenter1:Katie Fite</p> <p>Comment Excerpt Text: The COT perpetuated the WAFWA categorization of sagebrush habitat that has been used to mask concerns about loss of increasingly isolated populations and openly track declines – the Management Zones. Grouse populations were lumped in SMZs – based on generalized vegetation communities. But the vegetation communities of the contrived MZs have no real relation to the health/condition of sage- grouse habitat, or the viability of the species. Sage-grouse can survive just fine in sagebrush vegetation in any of the SMZs – and can move between some of the SMZs. The use of this SMZ category allows agencies to overlook sharp declines (or the disappearance/extirpation) of entire populations (the Weiser population in ID or the Quinn PMU in NV for example), or overlook very low numbers until it is too late) The MZs typically lump several</p>

<b>Cmt #</b>	<b>Page #</b>	<b>Cmt #</b>	<b>Reviewer Name/ Program</b>	<b>Change to document</b>	<b>Remarks / How Resolved</b>
					smaller or isolated populations in with a couple of larger ones in the 7 vegetation-based SMZs.  Stiver et al. 2006: Page 1.6
24.		IDMTSG-14-0049-32	Makela- 7.5	Ensure Proposed Plan has appropriate provisions/ clarity for actions in General management areas. Needs additional discussion.	Addressed in Proposed Plan.
25.		IDMTSG-14-0056-17	Makela- 7.5	<b>Commenter states:</b> There is no published research that supports restricting or closing grazing, in areas adjacent to burns, in order to compensate for loss of habitat attributable to wildfire. (DESR- 5, page 2-134). <b>Response:</b> Clarify this measure further in FEIS. The MA says to consider such action. The need for it, therefore, would depend on the site specific situation such as if a burn were adjacent to remaining limited/fragmented habitat or other circumstances	BLM: Jon discuss with Paul. Provide change to EMPSi.  Makela note. BLM currently restricts grazing in the burned area to allow for recovery. So the idea for this additional measure is to provide an opportunity for closing or more conservative use of unburned areas near or adjacent to burned areas, as another tool in the toolbox, in the event such an option is needed. May want to clarify about the need to consider the site specific situation, such as where local GRSG population trends are declining, or if the fire occurred in already limited sagebrush habitats, necessitating a more conservative/ restrictive approach to the management of remaining, unburned habitat.

**IDMT GREATER SAGE-GROUSE  
RESOURCE MANAGEMENT PLAN AMENDMENT AND ENVIRONMENTAL IMPACT STATEMENT  
Changes to Public Draft RMPA/EIS**

<b>Cmt #</b>	<b>Page #</b>	<b>Cmt #</b>	<b>Reviewer Name/ Program</b>	<b>Change to document</b>	<b>Remarks / How Resolved</b>
26.		IDMTSG-14-0056-9	Makela- 7.5	<b>Commenter (0056-9 and similar comment for 0105-13) states:</b> Alternative E includes the requirement for any assessment to determine whether or not a given area has the ability to provide sage grouse habitat (See Appendix D, page D-36). This is critical because as the maps are difficult to decipher on the large scale and personal knowledge of the area reflects that some areas identified as within PPGH or Core habitat do not have the ability to provide for sage grouse needs. <b>Response:</b> Build a mechanism into the Proposed Plan that allows for evaluation of circumstances on case by case basis at the site specific scale. Maybe add wording that such would be addressed via subsequent project level NEPA analysis?	Addressed in Proposed Plan.
27.		IDMTSG-14-0105-13	Makela- 7.5	<b>Comment:</b> how would population triggers be applied if there is no definition for “population areas”? <b>Response:</b> Clarify discussion of habitat and population triggers for any relevant alternatives (D, E, Proposed Plan...).	Addressed in Proposed Plan
28.		IDMTSG-14-0153-26	Makela- 7.5	Project leads should discuss how to consistently address impacts from military flights and firm up discussion at 4-15. Consider adding additional detail from Mt. Home AFB Integrated Resource Mgt. Plan.	Liza: work with Paul, Chapter 4, this may have been resolved. Discussed week of 2/23. Issue is outside the scope of this Amendment/ FEIS.
29.		IDMTSG-14-0166-8	Makela- 7.5	Confirm that Alt F incorporates recommendations as noted (Sage-Grouse Recovery Alternative did not faithfully follow the original proposed alt)...BLM/FS believe that the Proposed Plan accommodates GRSG conservation without the need for additional broad land designations.	No change to Alternative F. Alternative F was developed based on their recommendations but was not taken verbatim and did not have to be.
30.		IDMTSG-14-0178-6	Makela- 7.5	Firm up discussion of existing policy/mechanisms in Alt A.	Liza: work with Paul, Chapter 4.  The existing policy was not adequate that's why we are doing the plan amendment.

Cmt #	Page #	Cmt #	Reviewer Name/ Program	Change to document	Remarks / How Resolved
31.		IDMTSG-14-0180-48	Makela- 7.5	Need to confirm where, in Alt D, we refer to 80% relative to brood habitat	<p>BLM: Review. I believe the 80% is in Alternative E. Adaptive management triggers were revised in the Proposed Plan.</p> <p>This was a State of Idaho comment: Moreover, Connelly et al. (2000) indicated that productive brood rearing or summer habitats are usually characterized by the area having over 40% sagebrush cover, not 80% as suggested in Alternative D.” Actually, I find no reference to the “80%” figure relative to late brood habitat since we focused on nest/winter. First sentence below may have been interpreted by the state that we were including late brood habitat in the 80%. In discussing Alt D (page 2.73 in DEIS) we said:</p> <p>Habitat Triggers: In Guidelines to Manage Sage-grouse Populations and Their Habitat, Connelly et al. (2000) suggested at least 80 percent of a seasonal habitat’s breeding or winter habitat areas should reflect rangeland characteristics indicative of productive GRSG habitat as noted in the Guidelines. In the case of sagebrush, this suggests that at least 80 percent of nesting habitat should be in the range of 15 to 25 percent sagebrush canopy cover. Similarly, at least 80 percent of winter habitat should be between 10 to 30 percent canopy cover. The NTT Report (NTT 2011, pg. 6) suggested that a minimum range of 50 to 70 percent of priority habitat should be in sagebrush cover. For establishing a habitat loss trigger for adaptive management, an assumption was made that an overall loss of 20 percent of the sagebrush landscape within a population area was consistent with the published literature, and sufficiently conservative to allow for a management response. A loss of 10 percent of nesting or winter habitat were also selected as triggers, since these are especially important for population maintenance.</p>

RESOURCE MANAGEMENT PLAN AMENDMENT AND ENVIRONMENTAL IMPACT STATEMENT  
Changes to Public Draft RMPA/EIS**

<b>Cmt #</b>	<b>Page #</b>	<b>Cmt #</b>	<b>Reviewer Name/ Program</b>	<b>Change to document</b>	<b>Remarks / How Resolved</b>
32.		IDMTSG-14-0206-1	Makela- 7.5	Commenter states: We worry that this language could be read to suggest that the State's objective is to protect just the CHZ with 65% of the leks in Idaho and that a population decline in the IHZ would be consistent with this objective. This could lead state and federal agencies to "manage down" to a lower population level... Response: Clarify the 65 % rationale for Alt E.	BLM: JB discuss with PM  Proposed plan has a pop trigger for both PHMA and IHMA within Cons Areas so this concern has been addressed. See latest Prop Plan page 2-14.
33.		IDMTSG-14-0212-1	Makela- 7.1 (moved to leasable minerals?)	Suggest looking more closely at this issue to ensure it has been adequately analyzed and address (economic issues vs. GRSG population impacts, etc). According to the commenter the core of this issue is that nearly 11 million acres of public land will be closed to phosphate development with this decision and that this is more restrictive than would be done under ESA if the species were listed. Under ESA, each individual project could be evaluated on a site-specific basis and mitigation strategies could be included.	Addressed with ICF revisions.
34.		IDMTSG-14-0212-27	Makela- 7.1 (moved to leasable minerals)	Is there an adequate baseline description for leasable minerals?	BLM: KP to provide changes to Chapter 3
35.		IDMTSG-14-0242-12	Makela- 7.1	Comment: Habitat monitoring discussed in Alternative D (Chapter 2) is significantly different than the Monitoring Framework Plan discussed in Appendix E. While we support the habitat characteristics identified in Alternative E, a more robust description of the habitat monitoring program should be provided. Response: Ensure we clarify habitat monitoring and mapping processes.	Description of monitoring has been expanded in the FEIS.
36.		IDMTSG-14-0242-19	Makela- 7.1	Verify that the habitat categories, Core, Important and General have been adequately defined and that they are tied to percentages of the population that they represent.	Addressed in Proposed Plan.

Changes to Public Draft RMPA/EIS**

<b>Cmt #</b>	<b>Page #</b>	<b>Cmt #</b>	<b>Reviewer Name/ Program</b>	<b>Change to document</b>	<b>Remarks / How Resolved</b>
37.		IDMTSG-14-0046-6	Makela- 7.6	Describe or confirm in section how GRSG populations have changed over time.	<p><b>BLM: PM to provide changes to Chapter 3</b></p> <p>DEIS page 3-5 cites Garton et al projections for declines for 2007-2037 for MZ IV and MZ II but nothing about past declines. Add to end of 1<sup>st</sup> para in sec 3.2.1 or insert a table based on FRN Table 5 on page 13922.</p> <p>Insert in section 3.2.1 following the first paragraph:</p> <p>“Periods of decline in GRSG populations rangewide have occurred since the late 1800s (FWS FRN 2010 Finding pg. 13921). More recently Connelly et al. (2004) reported long term declines (1965-2004) for GRSG in MZs II and IV; WAFWA (2008) reported declines in MZs II and IV from 1965-2007 of -2.7 and -3.8% respectively; Garton et al. (2011) reported annual rates of decline of -3.5% and -4% for MZs II and IV.”</p>
38.		IDMTSG-14-0053-10	Makela- 7.6	<p>Commenter states No population number has been suggested as the lowest recoverable figure by the USFWS or anyone else.</p> <p>Response: A population target has not been established. Clarify in FEIS what proportion of GRSG leks/numbers are captured by the management areas.</p>	Addressed in Proposed Plan
39.		IDMTSG-14-0056-9	Makela- 7.6	Add component in FEIS/Plan that describes fine/site scale review process.	Addressed in Proposed Plan
40.		IDMTSG-14-0105-7	Makela- 7.6	Ensure protocols and data needs for population and habitat monitoring, and relevant triggers are described. Reference 2014 HAF, IDFG lek route protocol etc.	Addressed in Proposed Plan and Monitoring Framework

**IDMT GREATER SAGE-GROUSE  
RESOURCE MANAGEMENT PLAN AMENDMENT AND ENVIRONMENTAL IMPACT STATEMENT  
Changes to Public Draft RMPA/EIS**

<b>Cmt #</b>	<b>Page #</b>	<b>Cmt #</b>	<b>Reviewer Name/ Program</b>	<b>Change to document</b>	<b>Remarks / How Resolved</b>
41.		IDMTSG-14-0108-6	Makela- 7.6	Confirm need to clarify discussion of current status of populations; effects of alts on GRSG.	BLM: PM to review, confirm, provide revision. See above. FEIS (and DEIS) analyzes Alts for various programs, using number of occupied leks affected by closures etc. and VDDT models address how much veg we need to treat. Adequate?
42.		IDMTSG-14-0151-106	Makela- 7.6	Clarify how population and habitat triggers will be used and how vegetation treatments factor in to the triggers.	BLM: JB/PM – are vegetation treatments addressed?  We would not do a veg treatment in sagebrush to the extent it would trip a trigger (Our disturbance cap guidance does not allow this).
43.		IDMTSG-14-0151-16	Makela- 7.6	Commenter states The DEIS has virtually no information whatsoever regarding current conditions of sage- grouse habitat at the allotment level.  Response: Clarify that function of LUPs is to address broader issues, not site/allotment scale. May need to clarify this in FEIS.	This is included in the comment response report and is not needed for the FEIS.
44.		IDMTSG-14-0151-31	Makela- 7.6	Clarify how EIS boundaries relate to GRSG populations. [Overall, ensure we clarify relation between final map, populations, Management Areas, COT PACs etc.]	BLM: PM – was this done in the Proposed Plan? Page 3-5 of DEIS talks about the WAFWA zones and that the majority of the IDSWMT is in MZ IV , with a small portion in MZ II. Should be sufficient.
45.		IDMTSG-14-0151-44	Makela- 7.6	Commenter states The indirect and cumulative effects analysis must extend beyond state lines.  Response: Clarify that cumulative effects analysis per NOC will be done by GRSG Management Zone	Addressed by CEA.
46.		IDMTSG-14-0151-45	Makela- 7.6	Ensure that FEIS clarifies focus of amendment on BLM and FS lands. Also that BER and disturbance calcs, triggers etc. will incorporate all lands to extent data are available.	BLM: Unsure if or where any changes need to be made.  Trigger info has been clarified, and FEIS should say up front that decisions apply to BLM.

Changes to Public Draft RMPA/EIS**

<b>Cmt #</b>	<b>Page #</b>	<b>Cmt #</b>	<b>Reviewer Name/ Program</b>	<b>Change to document</b>	<b>Remarks / How Resolved</b>
51.		IDMTSG-14-0153-59	Makela- 7.6	Commenter states: Please provide documentation, preferably in the form of scientific studies, that demonstrate that adding new transmission lines to existing powerline corridors has no significant impact on grouse populations and habitat use, in order to fulfill NEPA's hard look requirements. Response: Not aware of such literature. Will review additional lit suggested. Clustering of infrastructure is assumed to be more desirable than creating new infrastructure in undisturbed areas.	Liza: work with Paul; Chapter 4  ???
52.		IDMTSG-14-0153-7	Makela- 7.6	Comment: Please document any and all scientific studies that conclude that compensatory mitigation efforts have yielded an increase in sage grouse populations for the area to which mitigation efforts apply. We are unaware of any cases in which a compensatory mitigation program has resulted in a significant increase in sage grouse compared to an untreated landscape. Response: Mitigation section will be revised for FEIS.	Mitigation Framework has been revised in the FEIS.
53.		IDMTSG-14-0157-9	Makela- 7.6	Include additional information for West Nile virus in Idaho.	BLM: PM to provide changes to Chapter 3  Management actions were included in the RDFs to address west nile for water developments.  Makala looking for language written by IDFG.
54.		IDMTSG-14-0168-27	Makela- 7.6	Commenter states: Quoting Connelly's quotes of other authors violates the Information Quality Act of 2001 (Section 515 of Public Law 106-554). Response: Confirm/clarify use of citations.	This is OK?
55.		IDMTSG-14-0169-41	Makela- 7.6	Consider incorp of available modeled nesting and winter habitat in FEIS.	Addressed in Proposed Plan

**IDMT GREATER SAGE-GROUSE  
RESOURCE MANAGEMENT PLAN AMENDMENT AND ENVIRONMENTAL IMPACT STATEMENT  
Changes to Public Draft RMPA/EIS**

<b>Cmt #</b>	<b>Page #</b>	<b>Cmt #</b>	<b>Reviewer Name/ Program</b>	<b>Change to document</b>	<b>Remarks / How Resolved</b>
56.		IDMTSG-14-0183-3	Makela- 7.6	Add wording in infrastructure discussion (and new lit) regarding uncertainty of some of the science, but also re-affirm/strengthen discussion of how FWS Warranted finding partly based on infrastructure as a threat.	Liza: Work with Paul and Ethan, Chapter 4
57.		IDMTSG-14-0204-1	Makela- 7.6	Clarify in FEIS the broad nature of the LUP amendment/FEIS and that seasonal habitat maps are more appropriately developed at the local scale. Also consider showing modeled nest and winter habitat map for Idaho (Montana if avail.).	Addressed in Proposed Plan and comment response report
58.		IDMTSG-14-0206-25	Makela- 7.6	Comment: A Literature Review of Transmission Line Effect Distances Response: Consider incorporation of this information into FEIS.	Liza: Work with Paul, Chapter 4  We are using the USGS data for buffers
59.		IDMTSG-14-0209-1	Makela- 7.6	Comment: We wish to add our completed Local Working Group Conservation Plan to the reference record for the EIS. It can be found at the Idaho Fish and Game's website at: <a href="http://fishandgame.idaho.gov/public/wildlife/sageGrouse/?getPage=174">http://fishandgame.idaho.gov/public/wildlife/sageGrouse/?getPage=174</a> under North Magic Valley Conservation Plan. Response: Reference completed LWG plans.	Liza: Work with Paul, Chapter 3  OK we can put this in the record because it is already cited in Chapter 1 (See 1.7.2 )
60.		IDMTSG-14-0212-3	Makela- 7.6	Discuss process for consideration of site scale discrepancies (e.g., if a portion of Core, Imp or Gen'l is not "habitat" at site scale, such as conifer, etc. Consider coordinated review/approval between local BLM, FS, IDFG.	Addressed in Proposed Plan
61.		IDMTSG-14-0031-5	Makela- 7.7	Discuss recomm. For managing lek viewing. Consult 2006 ID GRSG plan for wording.	BLM: Paul to provide changes, if any  IDFG Manages the wildlife. If it is not a permitted activity that we can restrict.
62.		IDMTSG-14-0046-4	Makela- 7.7	Clarify Alt A and mosaic discussion.	Liza: Work with Paul, Chapter 4, see comment for context.  We strive to meet objectives as we implement the plan. Management actions are designed to move an area toward meeting an objective. The effects analysis is based on Management Actions not objectives.

76.		IDMTSG-14-0212-16	Makela- 7.9	Revising RDFs/buffers for FEIS. Clarify limits to such for mining.	BLM: Has this been addressed?  Have USGS buffers and Locatable mineral direction form WO changes the Proposed Plan
77.		IDMTSG-14-0212-17	Makela- 7.9	Comment: To incentivize immediate conservation efforts while ensuring realistic opportunities for development, the Agencies' Final LUP Amendment provisions should provide a clearer, more robust, mitigation credit program. The elements of the mitigation program should include, at a minimum, the ability of federal project proponents to pursue, and receive mitigation credits for, mitigation projects on private or state lands to offset future federal project impacts. Mitigation credit opportunities also should not be limited to traditional habitat improvement and protection activities. The Agencies should work with project proponents to develop alternative mitigation actions that could be used to offset project impacts.... Response: Discuss/consider this w/respect to mining which has little option for "NSO" type of buffers, especially for locatables under 3809.	Mitigation Plan has been revised in the FEIS.
78.			ICF- socio	See document from ICF titled "IDMT_Report_Section 22_ICF Expected revisions_042514.docx". This document contains revisions that ICF expects to make to the FEIS in response to public comments on the DEIS.	EMPSi see document to incorporate revisions
79.			Ralston- edits	You indicated in Appendix H-4 that if an area met the relevance criteria and were in PPH, they were determined to have importance because of being a national priority for BLM. Table 3-45 has 67 Existing ACECs. Why the difference in numbers? Response: Change made	Change made

86.			Ralston- edits	It needs to be kept in mind that this EIS will amend local agency land use plans and as such will be interpreted and implemented at a local level. Accordingly, any ambiguity will be multiplied by the number of affected local agency offices. There are a number of places in the EIS where definitions are necessary in order to understand the application of an Alternative e.g. "Population Area". The clarifications are also needed to assure that the final decision can be consistently applied among local administrative units and by constantly changing agency personnel over time. Response: The BLM and Forest Service are clarifying direction proposed in the Final EIS.	The BLM and Forest Service have clarified direction proposed in the Final EIS.
87.			Ralston- edits	Map Errors: Fig. 2-46 and others font heading erroneous- in hard copies, check CD versions too Response: GIS staff and EMPSi are developing maps that will show the appropriate title.	GIS staff and EMPSi are developing maps that will show the appropriate title.
88.			Ralston- edits	MOU is included in Chapter I and has been incorporated in the development of the Proposed Plan.	MOU is included in Chapter I and has been incorporated in the development of the Proposed Plan.

Cmt #	Page #	Cmt #	Reviewer Name/ Program	Change to document	Remarks / How Resolved
89.			Ralston- edits	<p>As noted in the introductory comments, Y -3 II straddles the Idaho and Nevada border and operates a single ranching entity to coordinate grazing on BLM allotments in both states. BLM, however, states in the Nevada DEIS that planning for the land use plans covering this part of both Idaho and Nevada will occur through the Nevada FEIS and Record of Decision but will be implemented and administered through the Jarbidge and Burley FEIS and Record of Decision. See Nevada DEIS Section ES.2. Additionally, the decisions and analyses for that portion of Y-3 II's allotments in Nevada will occur through the Nevada DEIS and will end at the Nevada state line apparently leaving decisions and analysis for Y-3 II's ranch operations north of the Nevada border to the Idaho DEIS. Id. This is confusing because just a few sentences earlier it is stated that planning for both Idaho and Nevada land use plans will occur through the Nevada DEIS. Id. Thus, within a few short sentences it is unclear how the lands utilized by Y-3 II in Nevada and Idaho are being analyzed, decided, implemented, and administered. If read correctly, it appears that actual management decisions are being made in each state's DEIS, but that Idaho will administer both Idaho's management decisions and Nevada's management decisions as they relate to Y -3 II. Consequently, Y -3 II must analyze and comment on both the Nevada and Idaho DEISs. Y -3 II also notes that this bifurcation of planning and management processes, while at least addressed by the Nevada DEIS, is not addressed in the Idaho DEIS as it should be.</p> <p>Response: Brent to convene a bi-state group to discuss this specific issue with Jarbidge, Burley, Bruneau and Elko Field Offices</p>	<p>BLM: work with NV. Has this been done?</p>

<b>Cmt #</b>	<b>Page #</b>	<b>Cmt #</b>	<b>Reviewer Name/ Program</b>	<b>Change to document</b>	<b>Remarks / How Resolved</b>
90.			Ralston- edits	<p>The DEIS is also internally inconsistent, as to what BLM is proposing. In one place it states that it relates only to Forest Service decision making (implying BLM is not proposing any specific plan amendments) (DEIS at 5), and in another stating that “the BLM is proposing to amend the Battle Mountain/Tonopah Resource Management Plan (RMP) and the Carson City Field Office Consolidated RMP by adding to or changing some of the regulatory mechanisms to reduce, eliminate, or minimize threats to the Bi-state sage-grouse habitat on Federal lands administered under those plans” (DEIS at 1). This fundamental inconsistency also renders the DEIS inadequate as an informational document.</p> <p>Response: In the preparation of the Final EIS any internal inconsistencies that have been identified are being corrected. This particular inconsistency does not apply to the Idaho and Southwestern Montana Draft EIS.</p>	In the preparation of the Final EIS any internal inconsistencies that have been identified are being corrected. 91.			Ralston- edits Appendix A	<p>A-1S "The County Plan encourages the federal agencies (BLM and Forest Service) to coordinate and maintain communication with the county and the counties' Natural Resource Advisory Committee. As part of this coordination the county requests documentation and research be available to support management decisions."</p> <p>This statement should be corrected. The County Plan "requires" the federal agencies to coordinate its plans and policies as directed under the appropriate federal statutes. The Plan requires coordination with the Board of Commissioners. The Natural Resource Advisory Committee's purpose is to advise the Commissioners. All official communication should be with the Commissioners. The County Plan does more than request documentation and research, but requires that all policies of the federal and state agencies be coordinated with the County for the purpose of ensuring a comprehensive approach to greater sage-grouse management Response: This has been changed in Appendix A.</p>	This has been changed in Appendix A.
92.			Ralston- edits	<p>2-18 "These plans were based largely on the existing LWG GRSB Plans (Custer county 2006, Owyhee County 2013), which were considered during the initial development of the range of alternatives considered in detail." This statement is false as it relates to the Custer County Sage Grouse Comprehensive Plan, which is the Counties primary planning device for Sage-Grouse in Custer County, and should be clarified. The Custer County plan was developed and approved in 2013, and while the Local Working Group plan was consulted during the development of the County's Sage Grouse Plan, it was only one of several grouse plans consulted. Response: Change made in FEIS.</p>	Change made

<b>Cmt #</b>	<b>Page #</b>	<b>Cmt #</b>	<b>Reviewer Name/ Program</b>	<b>Change to document</b>	<b>Remarks / How Resolved</b>
93.			Ralston- NEPA range of alts	<p>Alternative A is excluded from the discussion of "Elements Common to Alternatives B, C, D, E, and F," which implies that these elements are not present in the no action alternative. This misleads the public. For instance, one of the elements common to all but Alternative A is "adaptive management." This element is clearly part of the current management framework as is noted in Appendix A, page 21. In answering whether the Challis RMP Complies with the Custer County Sage-Grouse Management principle that includes the use of adaptive management, the document affirms that the Challis RMP is compliant with a clear "Yes." However, in this same discussion, under "inclusion in Amendment EIS" the document only refers to Alternatives B-F as having an adaptive management component. Either Alternative A does use the adaptive management principle and it should state this, or it does not and compliance with Custer County Plan should be noted as a "NO."</p> <p>Response: Further description of adaptive management principles and strategies as described in each alternative has been included.</p>	Further description of adaptive management principles and strategies as described in each alternative has been included.
94.			Ralston- FLPMA consistency with other plans	<p>NEPA requires a discussion of "Possible conflicts between the proposed action and the objectives of Federal, regional, State and local land use plans, polices and controls for the area concerned." (40 CFR I 502.1 6(c)) It is the clear policy as stated in numerous County plans that the lands within the political boundaries of the county be maintained to ensure a vibrant local economy that is built on the historic use of and right to the productive use of these lands.</p> <p>Restricting and in some alternatives, eliminating these uses conflicts with the Counties policies. These conflicts have not been identified, analyzed or resolved in the DEIS.</p> <p>Response: As a result of the Preliminary Proposed Plan review any inconsistencies with local plans will be noted by those entities and will be addressed accordingly.</p>	As a result of the Preliminary Proposed Plan review any inconsistencies with local plans will be noted by those entities and will be addressed accordingly.

<b>Cmt #</b>	<b>Page #</b>	<b>Cmt #</b>	<b>Reviewer Name/ Program</b>	<b>Change to document</b>	<b>Remarks / How Resolved</b>
1.			Jackovac – 14.1	Response: LR-19 and LR-21 do not specifically state whether or not lands identified for disposal in the LUPs would still be available for disposal. BLM needs to clarify this in the document.	BLM: What are the changes and to which alternative?
2.		IDMTSG-14-0105-15,	Burkhardt	Vol 2, Page 2-83: Regarding Alternative E -Fire Suppression Table 2-11 mentions Rangeland Fire Protection Associations. These have proven extremely effective in wildfire response and suppression. However, it should be kept in mind that the ranchers involved are there because they are able to maintain viable ranching operations and thus are not only present but have a vested interest in assuring that wildfire effects are minimized. The recent grazing permit renewals in the Owyhee Field Office have the potential to substantially alter the number of such ranch operations that will remain viable and present. The wide spread public benefit of Rangeland Fire Protection Association activity and their benefit to preservation of GRSG habitat should be considered in the evaluation of Alternative impacts on grazing opportunity. Response: Address in Socio-economics section or in future plan amendments if this occurs?	Addressed with ICF revisions.

3.		IDMTSG-14-0130-16,	Burkhardt	<p>Natural fire return intervals in Wyoming big sagebrush average 100-240 years (Baker 2007). Wyoming big sagebrush recovers slowly after fires, which typically result in 100% sagebrush mortality; recovery to pre-fire canopy cover takes over 100 years (Cooper et al. 2007). The Idaho Southwest Montana DEIS mischaracterizes this as 15 to 30 years, citing Manier et al. (2013:133-134). DEIS at 4-69. Manier et al. (2013) repeatedly reference the very slow recovery times of sagebrush following fire, and the closest that they come to supporting the DEIS characterization is to note that in mountain big sagebrush habitats (as opposed to the drier Wyoming big sagebrush communities that dominate the planning area) with ideal soil and climate parameters, recovery can be as little as 20 years (at p. 79). However, even mountain big sagebrush can take 75 years or more to recover in certain circumstances (Baker 2011). Please rectify this apparent hard-look failure in the impacts analysis</p> <p>Response: Add to research cited portion of document.</p>	<a href="#">Liza: Chapter 4</a>

<b>Cmt #</b>	<b>Page #</b>	<b>Cmt #</b>	<b>Reviewer Name/ Program</b>	<b>Change to document</b>	<b>Remarks / How Resolved</b>
4.		IDMTSG-14-0131-8	Porter-minerals-range of alts	A more complete analysis of the effects of imposing restrictions on phosphate activities will be included in the FEIS. Section 4.12 and Tables 4-64 to 4-67 have been revised in the FEIS to more accurately reflect the impacts to non-energy leasable minerals from various alternatives. Stipulations applicable to fluid mineral leasing, such as NSO and TL, are generally not appropriate for open-pit phosphate mine development. Clarify in FEIS the BMPs/RDFs that would apply to existing phosphate leases in sg habitat. While the RDFs listed in Appendix C of the DEIS do not mention phosphate mining, the RDFs for locatable minerals would be used for phosphate mine proposals. Under all alternatives, including the No Action Alternative (A), RDFs can be applied as Conditions of Approval to post-lease actions, so long as they do not affect lessee's valid existing rights. Only those RDFs that are appropriate for the action being proposed would be applied. RDFs are appropriate for exploration activities and early mine site development, however, once mining commences, many of the RDFs would no longer be practical and there could be a loss of habitat. Should this occur, offset mitigation would be required, as described in Appendix F of the DEIS. None of the RDFs would have a significant impact to phosphate exploration activities or early mine development stages. Also clarify compensatory mitigation requirements. Consistent with Appendix F. See notes for IDMTSG-14-0131-20 (row 22, below)	Katie: Work with Karen to make change, Chapter 4  BLM: Has this been incorporated into Proposed Plan/RDFs?
5.		IDMTSG-14-0049-10	Porter-minerals-range of alts	While Alt. D of the DEIS did propose closing all PPMA and PMMA habitat in areas with no to low potential for the occurrence of a fluid mineral to future leasing, that management action has been changed in the FEIS to leave all lands open to future leasing, subject to a No Surface Occupancy stipulation in PPMA and PMMA.	Addressed in Proposed Plan.

<b>Cmt #</b>	<b>Page #</b>	<b>Cmt #</b>	<b>Reviewer Name/ Program</b>	<b>Change to document</b>	<b>Remarks / How Resolved</b>
6.		IDMTSG-14-0049-10	Porter-minerals-range of alts	add definition of VER to glossary. Note- this is not an easily definable term! I couldn't find a definition in Black's Law Dictionary, but did find a Solicitor's Opinion that provides context: M-36910 (Supp.) 88 I.D. 909, 912 (1981). Here are some excerpts: VER are those rights short of vested rights that are immune from denial or extinguishment by the exercise of Secretarial discretion. They may arise from two situations: a statute may prescribe a series of requirements which, if satisfied, create rights in the claimant by the claimant's actions under the statute without an intervening discretionary act; or, a VER may be created as a result of the exercise of Secretarial discretion. VERs are not absolute- the nature and extent of the rights are defined either by the statute creating the rights or by the manner in which the Secretary chose to exercise his discretion. VERs that include the right to develop may not be regulated to the point where the regulation unreasonably interferes with enjoyment of the benefit of the right.	Change made. Incorporated definition from NV/CA and UT plans to be consistent.
7.		IDMTSG-14-0049-27	Porter-minerals-range of alts	While Alt. D of the DEIS would have applied seasonal restrictions to lands with moderate to high potential for the occurrence of a fluid mineral, BLM's preferred management action has been changed in the FEIS to applying a year-round No Surface Occupancy stipulation in PHMA and IHMA. CSU, seasonal timing restrictions, buffers, and standard stipulations would be applied in GHMA.	Addressed in Proposed Plan
8.		IDMTSG-14-0049-9	Porter-minerals-range of alts	BLM's preferred management action for future oil and gas leasing has been changed in the FEIS to applying a year-round NSO stipulation in PMMA and PPMA. This will exclude all development on leases in these areas.	Addressed in Proposed Plan
9.		IDMTSG-14-0153-28	Porter-minerals-range of alts	BLM's preferred alternative for future leases has been changed in the FEIS to impose an NSO in all PPMA and PMMA habitat, and to impose a lek buffer in PGMA. What is the lek buffer for PGMA in FEIS?	Addressed in Proposed Plan

12.		IDMTSG-14-0180-43	Porter-minerals-impact analysis	<p>The section describing the impacts from leasable minerals management for Alt E is not correct and needs major revision. See my comments on pg 4-61-63.</p> <ul style="list-style-type: none"> <li>- Alt E should be described as open to leasing subject to NSO in PHMA and IHMA, not CSU and TL, as stated in the first paragraph “Impacts from Leasable Mins Mngt” in DEIS (pg 4-61).</li> <li>- Wording in first paragraph describing State Director authorizing or allowing development should be replaced with wording describing criteria for SD waiving the stipulation (2 sentences). That might help to clarify the sentence questioning “the policy” (see pg 4-61).</li> <li>- Second paragraph- Alt E does not close any additional acres to leasing. Lands would remain open to leasing, subject to NSO.</li> <li>- Table 4-35 is confusing and contradicts Alt A closure values (table 4-9). Alt E does not close additional lands, so acreages and % should be the same as in Table 4-9. Recommend changing the title to delete “Closure” and replace with “Proposed NSO stipulation.”. That way you could show closures the same as 4-9, and additional NSO acreages for each population area.</li> <li>- The purpose of the Occupied Leks count in Table 4-35 is unclear.</li> <li>- Pg 4-63. Alt E impacts from Geothermal Energy should have similar analysis as O&amp;G. Alt E is Open with NSO</li> </ul>	Katie work with Karen

RESOURCE MANAGEMENT PLAN AMENDMENT AND ENVIRONMENTAL IMPACT STATEMENT  
Changes to Public Draft RMPA/EIS**

<b>Cmt #</b>	<b>Page #</b>	<b>Cmt #</b>	<b>Reviewer Name/ Program</b>	<b>Change to document</b>	<b>Remarks / How Resolved</b>
13.		IDMTSG-14-0212-30	Porter-minerals-impact analysis	<p>The impacts of Alts F and B will be analyzed in more detail in the FEIS, specifically with respect to disturbance caps. Distinguish between Impacts from Alts F and B. Note: This is a disturbance cap question. Alt F says close PPMA to future leasing and manage PGMA and PRMA the same as Alt A (i.e. stipulations including TLs and buffers). This is the same as Alt B.</p> <p>According to Table 2-8, MLS-5 for Alt B includes a 3% disturbance cap on existing leases in PHMA. Alt F says “same as Alt B.” I see no differences.</p>	Katie work with Karen
14.		IDMTSG-14-0212-29	Porter-minerals-impact analysis	<p>Include a discussion of the effects of phosphate management actions to socio-economics in Ch 4. Phosphate is discussed on Pg 4-230, but it is under the locatable and salable heading. Separate out phosphate from this section and place it under a heading “Impacts from Management Actions Affecting Phosphate leasing and development.” Phosphate is not a locatable or salable mineral. Also, references to section 4.10 should be for locatable mins, while section 4.11 is for salable mins. I provided additional info to the economist on 3-6-15, but it should be mentioned in this section that there is very little sage grouse habitat in the part of the study area where phosphate resources occur. The Blackfoot Bridge (not Ridge) Mine Plan has been approved and is currently in full production. Reference to it in this section should be deleted. As for unmined existing phosphate leases in sage grouse habitat, only the Trail Creek and Caldwell Canyon leases, held by Monsanto, are expected to be mined in the next 15 years. These leases have some General Habitat, and therefore would be expected to encounter potential impacts from sage grouse management actions.</p>	ICF Katie – correct references; check comment for context.

15.		IDMTSG-14-0131-13	Porter-minerals-cumulative analysis	Cumulative effects across state lines will not be considered for minerals in the FEIS.	BLM review: Cumulative effects will be across state lines for GRSG, but not for minerals. Does this response need to be revised?
16.		IDMTSG-14-0131-20	Porter-minerals-cumulative analysis	Analysis of impacts in the DEIS doesn't make sense. Table 4-64 (and subsequent tables in the section) is full of errors. None of Idaho's Phosphate leases are subject to NSO, CSU, or TL stips. Also I question the figures identified as unleased KPLAs closed to leasing (3720 acres) and subject to NSO (620 acres). I recommend doing away with the following columns in Table 4-64: Closed, NSO, CSU and TL. Here are actual numbers from LR2000: There are a total of 80,168 acres designated as KPLA. Currently, there are 31,670 acres of KPLA leased (48,498 acres of unleased KPLA). There are 12,904 acres of leased land outside of KPLAs. None of the leases are covered by NSO, CSU, or TL stips.	BLM: GIS analysis Katie work with Karen
17.		IDMTSG-14-0131-30	Porter-minerals-cumulative analysis	Socio-economic impacts resulting from the loss of availability of phosphate resources in each of the alternatives will be discussed in greater depth in the FEIS. Add impacts from loss of phosphate resources to socio-economic section Phosphate and sage grouse habitat (other than general) don't overlap except in the Paris-Bloomington KPLA. BLM foresees no significant impacts to either resource (phosphate or SG) from implementation of any of the alternatives.	Addressed with ICF revisions.

Changes to Public Draft RMPA/EIS**

<b>Cmt #</b>	<b>Page #</b>	<b>Cmt #</b>	<b>Reviewer Name/ Program</b>	<b>Change to document</b>	<b>Remarks / How Resolved</b>
19.		IDMTSG-14-0212-5	Porter-minerals-cumulative analysis	Add discussion of economic and social impacts of restricting phosphate mining and imposing conservation measures.	Addressed with ICF revisions.
20.		IDMTSG-14-0166-7	Porter-minerals-mitigation measures	The RDFs were adopted from BMPs in Appendix D of the NTT report. In that appendix, it states that "BMPs are continuously improving as new science and technology become available and therefore are subject to change. Include from the following BMPs those that are appropriate to mitigate effects from the approved action." Add wording to the FEIS from the NTT report in discussion of RDFs.	Ask Jon if he concurs, could add to intro paragraph in the RDF appendix
21.		IDMTSG-14-0149-15	Makela- 7.3	Clarify in FEIS the validity of NTT, COT, BER relative to "establish standards of scientific integrity under the ESA, the Data Quality Act, and the Presidential and DOI memoranda and orders."	Ask Jon – I don't think this requires a change in the document. This is addressed in the comment response report.
22.		IDMTSG-14-0151-29	Makela- 7.3	Ensure FEIS clarifies how PACs were delineated (IDFG delineated based on Core and Important zones, and provided to FWS).	MZ: Add to Chapter I
23.		IDMTSG-14-0151-39	Makela- 7.3	Clarify in FEIS: Sage-grouse MZs were an attempt by WAFWA to delineate GRSG habitat range wide into more discrete areas for broad scale planning. Population monitoring is still done at finer scales such as State, local working group, Conservation Area or similar.	MZ: Add to Chapter I after first use of "management zone"
24.		IDMTSG-14-0049-32	Makela- 7.5	Ensure Proposed Plan has appropriate provisions/ clarity for actions in General management areas. Needs additional discussion.	Addressed in Proposed Plan.
25.		IDMTSG-14-0056-17	Makela- 7.5	<b>Commenter states:</b> There is no published research that supports restricting or closing grazing, in areas adjacent to burns, in order to compensate for loss of habitat attributable to wildfire. (DESR- 5, page 2-134). <b>Response:</b> Clarify this measure further in FEIS. The MA says to consider such action. The need for it, therefore, would depend on the site specific situation such as if a burn were adjacent to remaining limited/fragmented habitat or other circumstances	BLM: Jon discuss with Paul. Provide change to EMPSi.

**IDMT GREATER SAGE-GROUSE  
RESOURCE MANAGEMENT PLAN AMENDMENT AND ENVIRONMENTAL IMPACT STATEMENT  
Changes to Public Draft RMPA/EIS**

<b>Cmt #</b>	<b>Page #</b>	<b>Cmt #</b>	<b>Reviewer Name/ Program</b>	<b>Change to document</b>	<b>Remarks / How Resolved</b>
26.		IDMTSG-14-0056-9	Makela- 7.5	<b>Commenter (0056-9 and similar comment for 0105-13) states:</b> Alternative E includes the requirement for any assessment to determine whether or not a given area has the ability to provide sage grouse habitat (See Appendix D, page D-36). This is critical because as the maps are difficult to decipher on the large scale and personal knowledge of the area reflects that some areas identified as within PPGH or Core habitat do not have the ability to provide for sage grouse needs. <b>Response:</b> Build a mechanism into the Proposed Plan that allows for evaluation of circumstances on case by case basis at the site specific scale. Maybe add wording that such would be addressed via subsequent project level NEPA analysis?	Addressed in Proposed Plan.
27.		IDMTSG-14-0105-13	Makela- 7.5	<b>Comment:</b> how would population triggers be applied if there is no definition for "population areas"? <b>Response:</b> Clarify discussion of habitat and population triggers for any relevant alternatives (D, E, Proposed Plan...).	Addressed in Proposed Plan
28.		IDMTSG-14-0153-26	Makela- 7.5	Project leads should discuss how to consistently address impacts from military flights and firm up discussion at 4-15. Consider adding additional detail from Mt. Home AFB Integrated Resource Mgt. Plan.	Liza: work with Paul, Chapter 4, this may have been resolved.
29.		IDMTSG-14-0166-8	Makela- 7.5	Confirm that Alt F incorporates recommendations as noted (Sage-Grouse Recovery Alternative did not faithfully follow the original proposed alt)...BLM/FS believe that the Proposed Plan accommodates GRSG conservation without the need for additional broad land designations.	No change to Alternative F. Alternative F was developed based on their recommendations but was not taken verbatim and did not have to be.
30.		IDMTSG-14-0178-6	Makela- 7.5	Firm up discussion of existing policy/mechanisms in Alt A.	Liza: work with Paul, Chapter 4.
31.		IDMTSG-14-0180-48	Makela- 7.5	Need to confirm where, in Alt D, we refer to 80% relative to brood habitat	BLM: Review. I believe the 80% is in Alternative E. Adaptive management triggers were revised in the Proposed Plan.

RESOURCE MANAGEMENT PLAN AMENDMENT AND ENVIRONMENTAL IMPACT STATEMENT  
Changes to Public Draft RMPA/EIS**

<b>Cmt #</b>	<b>Page #</b>	<b>Cmt #</b>	<b>Reviewer Name/ Program</b>	<b>Change to document</b>	<b>Remarks / How Resolved</b>
32.		IDMTSG-14-0206-1	Makela- 7.5	Commenter states: We worry that this language could be read to suggest that the State's objective is to protect just the CHZ with 65% of the leks in Idaho and that a population decline in the IHZ would be consistent with this objective. This could lead state and federal agencies to "manage down" to a lower population level... Response: Clarify the 65 % rationale for Alt E.	BLM: JB discuss with PM
33.		IDMTSG-14-0212-1	Makela- 7.1 (moved to leasable minerals?)	Suggest looking more closely at this issue to ensure it has been adequately analyzed and address (economic issues vs. GRSG population impacts, etc). According to the commenter the core of this issue is that nearly 11 million acres of public land will be closed to phosphate development with this decision and that this is more restrictive than would be done under ESA if the species were listed. Under ESA, each individual project could be evaluated on a site-specific basis and mitigation strategies could be included.	Addressed with ICF revisions.

**IDMT GREATER SAGE-GROUSE  
RESOURCE MANAGEMENT PLAN AMENDMENT AND ENVIRONMENTAL IMPACT STATEMENT  
Changes to Public Draft RMPA/EIS**

Cmt #	Page #	Cmt #	Reviewer Name/ Program	Change to document	Remarks / How Resolved
34.		IDMTSG-14-0212-27	Makela- 7.1 (moved to leasable minerals)	<p>Is there an adequate baseline description for leasable minerals?</p> <p>See 3.12.1 (pg 3-102) for O&amp;G. UPDATE- BLM now has two O&amp;G leases vs. 4 when DEIS was written. The two leases on the Bear Lake Plateau have terminated, so only the Grays Lake leases remain. Those leases total approx.. 4000 acres, of which 40 acres is BLM surface (the rest is split estate). Don't know if Dillons O&amp;G leasing numbers need to be updated.</p> <p>Pg 3-103 Geothermal update- there are now 19 geothermal leases in Idaho, totaling approx.. 48,000 acres. Several leases at Raft River and both the leases at Magic Reservoir have terminated. Thirteen of 19 leases are within habitat. First bullet on pg 3-103 should be changed from nine leases to seven. The last bullet on pg 3-105 can be deleted.</p> <p>Re-write of pg 3-114 in DEIS (section 3.12, NON-ENERGY SOLID LEASABLE MINERALS</p> <p>As with fluid minerals, the right to develop non-energy solid leasable mineral resources, such as phosphate, on federal lands may only be acquired through a mineral lease, offered and administered by the BLM in accordance with the Mineral Leasing Act of 1920, as amended and supplemented (30 U.S.C. 181 et seq.). Lands that are known to have a valuable phosphate resource have been designated by the U.S. Geological Survey as Known Phosphate Leasing Areas, or KPLAs, and are leased through a competitive leasing process. Lands outside a KPLA may also be leased, however the existence of a valuable phosphate resource must be proven first, through an activity referred to as "prospecting." Idaho has 8 KPLAs, totaling 80,168 acres. Idaho BLM has 48 existing leases in KPLAs, totaling 31,670 acres. Therefore there are 48,498 acres of unleased KPLA in Idaho. There are 12,904 acres leased outside of KPLAs (38 leases).</p> <p>The Pocatello Field Office in southeast Idaho has a large non-energy solid leasable mineral program, as the phosphate resource in that field office is significant. The Middle Permian Phosphoria formation comprises one of the largest resources of phosphate rock in the world, with the richest phosphorite accumulations being found in</p>	BLM: KP to provide changes to Chapter 3

35.		IDMTSG-14-0242-12	Makela- 7.1	Comment: Habitat monitoring discussed in Alternative D (Chapter 2) is significantly different than the Monitoring Framework Plan discussed in Appendix E. While we support the habitat characteristics identified in Alternative E, a more robust description of the habitat monitoring program should be provided. Response: Ensure we clarify habitat monitoring and mapping processes.	Description of monitoring has been expanded in the FEIS.
36.		IDMTSG-14-0242-19	Makela- 7.1	Verify that the habitat categories, Core, Important and General have been adequately defined and that they are tied to percentages of the population that they represent.	Addressed in Proposed Plan.
37.		IDMTSG-14-0046-6	Makela- 7.6	Describe or confirm in section how GRSG populations have changed over time.	<b>BLM: PM to provide changes to Chapter 3</b>
38.		IDMTSG-14-0053-10	Makela- 7.6	Commenter states No population number has been suggested as the lowest recoverable figure by the USFWS or anyone else.  Response: A population target has not been established. Clarify in FEIS what proportion of GRSG leks/numbers are captured by the management areas.	Addressed in Proposed Plan
39.		IDMTSG-14-0056-9	Makela- 7.6	Add component in FEIS/Plan that describes fine/site scale review process.	Addressed in Proposed Plan
40.		IDMTSG-14-0105-7	Makela- 7.6	Ensure protocols and data needs for population and habitat monitoring, and relevant triggers are described. Reference 2014 HAF, IDFG lek route protocol etc.	Addressed in Proposed Plan and Monitoring Framework
41.		IDMTSG-14-0108-6	Makela- 7.6	Confirm need to clarify discussion of current status of populations; effects of alts on GRSG.	<b>BLM: PM to review, confirm, provide revision.</b>
42.		IDMTSG-14-0151-106	Makela- 7.6	Clarify how population and habitat triggers will be used and how vegetation treatments factor in to the triggers.	<b>BLM: JB/PM – are vegetation treatments addressed?</b>
43.		IDMTSG-14-0151-16	Makela- 7.6	Commenter states The DEIS has virtually no information whatsoever regarding current conditions of sage- grouse habitat at the allotment level.  Response: Clarify that function of LUPs is to address broader issues, not site/allotment scale. May need to clarify this in FEIS.	This is included in the comment response report and is not needed for the FEIS.

89.			Ralston- edits	<p>As noted in the introductory comments, Y -3 II straddles the Idaho and Nevada border and operates a single ranching entity to coordinate grazing on BLM allotments in both states. BLM, however, states in the Nevada DEIS that planning for the land use plans covering this part of both Idaho and Nevada will occur through the Nevada FEIS and Record of Decision but will be implemented and administered through the Jarbidge and Burley FEIS and Record of Decision. See Nevada DEIS Section ES.2. Additionally, the decisions and analyses for that portion of Y-3 II's allotments in Nevada will occur through the Nevada DEIS and will end at the Nevada state line apparently leaving decisions and analysis for Y-3 II's ranch operations north of the Nevada border to the Idaho DEIS. Id. This is confusing because just a few sentences earlier it is stated that planning for both Idaho and Nevada land use plans will occur through the Nevada DEIS. Id. Thus, within a few short sentences it is unclear how the lands utilized by Y-3 II in Nevada and Idaho are being analyzed, decided, implemented, and administered. If read correctly, it appears that actual management decisions are being made in each state's DEIS, but that Idaho will administer both Idaho's management decisions and Nevada's management decisions as they relate to Y -3 II. Consequently, Y -3 II must analyze and comment on both the Nevada and Idaho DEISs. Y -3 II also notes that this bifurcation of planning and management processes, while at least addressed by the Nevada DEIS, is not addressed in the Idaho DEIS as it should be.</p> <p>Response: Brent to convene a bi-state group to discuss this specific issue with Jarbidge, Burley, Bruneau and Elko Field Offices</p>	<p>BLM: work with NV. Has this been done?</p>

<b>Cmt #</b>	<b>Page #</b>	<b>Cmt #</b>	<b>Reviewer Name/ Program</b>	<b>Change to document</b>	<b>Remarks / How Resolved</b>
93.			Ralston- NEPA range of alts	<p>Alternative A is excluded from the discussion of "Elements Common to Alternatives B, C, D, E, and F," which implies that these elements are not present in the no action alternative. This misleads the public. For instance, one of the elements common to all but Alternative A is "adaptive management." This element is clearly part of the current management framework as is noted in Appendix A, page 21. In answering whether the Challis RMP Complies with the Custer County Sage-Grouse Management principle that includes the use of adaptive management, the document affirms that the Challis RMP is compliant with a clear "Yes." However, in this same discussion, under "inclusion in Amendment EIS" the document only refers to Alternatives B-F as having an adaptive management component. Either Alternative A does use the adaptive management principle and it should state this, or it does not and compliance with Custer County Plan should be noted as a "NO."</p> <p>Response: Further description of adaptive management principles and strategies as described in each alternative has been included.</p>	Further description of adaptive management principles and strategies as described in each alternative has been included.
94.			Ralston- FLPMA consistency with other plans	<p>NEPA requires a discussion of "Possible conflicts between the proposed action and the objectives of Federal, regional, State and local land use plans, polices and controls for the area concerned." (40 CFR I 502.1 6(c)) It is the clear policy as stated in numerous County plans that the lands within the political boundaries of the county be maintained to ensure a vibrant local economy that is built on the historic use of and right to the productive use of these lands.</p> <p>Restricting and in some alternatives, eliminating these uses conflicts with the Counties policies. These conflicts have not been identified, analyzed or resolved in the DEIS.</p> <p>Response: As a result of the Preliminary Proposed Plan review any inconsistencies with local plans will be noted by those entities and will be addressed accordingly.</p>	As a result of the Preliminary Proposed Plan review any inconsistencies with local plans will be noted by those entities and will be addressed accordingly.

116.		Section 4.5	Response	NOTE TO BLM: Need to respond to the last comment related to consistency across state boundaries for our mapping efforts. There is no national response for this issue.	BLM: Jon, Paul, and GIS
117.		Section 5.2		Need to update Section 1.7 with any inconsistencies with other plans (including county GRSg plans)	BLM to provide consistency text. Also need to update comment report
118.		Section 5.4		Note from solicitor asking for more information in the response.	Need input from Brent for this response
119.				Sections 7.1; 7.5; 7.6; 7.8; 7.9; 8.1; 12.2; 12.3; 14.3; 16.1; 16.2; 22.3; 24.3; 26.1; 26.2; 26.3; 27.1; 30; 30.1; 30.2; 32.3; Response includes a reference to another section – need to update these once the sections are re-numbered.	EMPSi
120.		Section 7.1		Note in the response to clarify in the FEIS the policy requirements for Administrative Procedure Act (APA), NEPA relative to IM, and NTT and clarify the NTT process and FACA in the FEIS.	Brent to do
121.		Section 7.1		Note: ask for national justification of why the NTT was appropriate	Need to elevate this question. Applicable to all subregions.
122.		Section 7.3		Response suggests clarifications to the FEIS to incorporate	Brent
123.		Section 7.5		Need to include reference to section in FEIS that discusses lek buffers once known	EMPSi
124.		Section 7.5		Ensure 6840 manual and relevant FS policy are discussed in Alternative A	Brent
125.		Section 7.5		Review summary/response – is no net unmitigated loss still in the ADPP?	BLM: Jon & Paul
126.		Section 8.1		Review EIS/LUPA for consistent representation of proposed ACECs under Alternatives C and F	EMPSi and BLM
127.		Section 10.4		Need to add analysis of climate change on GRSg (cumulative?). Also add suggested statement to assumptions, Section 4.1 of FEIS.	Would like BLM input or higher level discussion
128.		Section 12		Should review all responses to determine if FIAT should be included to a greater extent	BLM/ Drew
129.		Section 12.2		Need to update FEIS regarding fuel breaks and relationship between livestock grazing and fire. (or change the response for this section)	Drew

154.		Section 32.1		Need to update GRSG impact analysis to describe how actions could affect habitat and indirectly the effects of predation.	Liza/Paul
155.		Section 32.2		Add Blickley et al. 2012 data and citation regarding noise impacts to GRSG impacts section	Liza

**Continuation of response to comment #34, pg 14**

The thickest, richest accumulations of phosphate occur in southeast Idaho, centered around the Soda Springs area. BLM manages these resources on behalf of the Federal Government. The goal in the Pocatello RMP is to manage the Federal mineral estate while minimizing adverse impacts to resource values. The 2012 Pocatello RMP does not have any stipulations or minerals guidance for non-energy leasable minerals which specifically address sage grouse.

**Existing Condition:**

Phosphate has been mined commercially in southeast Idaho for over one hundred years. Most of the mining has occurred east of Soda Springs, an area that has relatively little sage grouse habitat. Of the 86 existing Federal phosphate leases that BLM administers in Idaho, only 10 are located in sage grouse habitat. Nine of these leases are located north and west of Blackfoot Reservoir and Soda Springs, in or near General GRSG habitat. None of those leases have had active mining operations on them, nor is any mining planned on the leases in the next 5 to 10 years. Most of the leased acreage around Blackfoot Reservoir is split estate (privately-owned or state-owned surface with federal minerals). The Trail Creek and Caldwell Canyon leases, located in general GRSG habitat east of Conda Mountain, are currently undergoing drilling. One additional lease is located in priority GRSG habitat northwest of Bear Lake near Paris, Idaho. Exploration drilling was conducted in 2012 on the lease, and on the private lands and unleased split estate lands surrounding the small lease. Timing restrictions for sage grouse were applied to the approval for the drilling. If developed, this property would likely be developed as an underground mine, due to geologic factors.

In total, approximately half of the Federal leases in Idaho have been mined, are currently being mined, or are proposed to be mined in the next 5 to 10 years. The remaining unmined leases have been held for many years and are subject to valid existing rights. The Dillon Field Office has one non-energy solid leasable lease, for phosphate. It is not located in sage grouse habitat, and is undeveloped.

Figure 3-13, Unleased Known Phosphate Leasing Areas, shows phosphate potential within the planning area.

On page 3-119, the following sentence should be added as a new paragraph at the end of the non-energy solid leasable minerals section:

**BLM has not offered a competitive phosphate lease since 2000 and does not currently have any pending requests for competitive leasing. As the remaining existing leases are developed however, demand for leasing, particularly in the unleased portions of KPLAs, is expected to increase.**

**Ch. 4**

The title of Section 4.9 should be “Fluid Leasable Minerals (Leased and Unleased), including Oil and Gas and Geothermal” (this section in the DEIS didn’t have nonenergy solids in it. They are in Section 4.12). Section 4.9.1 should be Oil and Gas (since section 4.9.2 is geothermal).

**IDMT GREATER SAGE-GROUSE  
RESOURCE MANAGEMENT PLAN AMENDMENT AND ENVIRONMENTAL IMPACT STATEMENT  
Changes to Public Draft RMPA/EIS**

4.12 Nonenergy Solid Leasable Minerals

Notes for consideration:

Describe areas with high phosphate development potential as “unmined leases”

Describe areas with medium phosphate development potential as “unleased KPLAs”

Describe areas with low phosphate development potential as “unleased lands outside KPLAs”

The first indicator would be more meaningful if it were changed to “the amount of land within unleased KPLAs proposed to be closed to nonenergy solid mineral leasing.”

The third indicator would be better to say “Application of RDFs that can be placed on existing phosphate leases”

In the last sentence of both the second and third assumptions on page 4-202, the term “mineral material” is used. The word “material” should be deleted in both instances.

On pg 4-202, the first sentence under Nature and Type of Effects (4.12.2) should be revised, by replacing the term “potential” with “opportunity”. In the next sentence, which begins “Mining operations may move to nearby private or state lands” the remainder of the sentence should be revised by deleting what’s now there and saying “but only if geologic conditions are favorable.” In areas open to leasing, applying stipulations (...) would be effective in mitigating impacts from some exploratory and early mine development activities, but once mineral production begins, such stipulations would no longer be applicable.

Tables 4-64 to 4-67 don’t make a lot of sense. First, no phosphate leases in Idaho are subject to NSO, CSU, or TL stipulations, nor do any of the alternatives propose such stipulations. The management actions for phosphate are to either close some acreage to future leasing, or to apply RDFs to existing leases, to the extent practicable. Perhaps a table comparing alternatives, like:

	Alt A	Alt B	Alt C	Alt D	Alt E	Alt F	Alt G
Acres of Unleased KPLAs to be closed to phosph Leasing							
Acres of Unleased KPLAs open to leasing							
Acres of Unmined Leases to be subject to RDFs							
Acres of unmined							

**IDMT GREATER SAGE-GROUSE  
RESOURCE MANAGEMENT PLAN AMENDMENT AND ENVIRONMENTAL IMPACT STATEMENT  
Changes to Public Draft RMPA/EIS**

leases not subject to GRSG RDFs							
Acres in Decision area to be closed to leasing							
Acres in Decision area open to leasing

Hello all,

I am reviewing the public comment response report and trying to finish addressing our revisions and responses by next **Tuesday, April 21**. This will give us time to get the report in the document for our Washington Office review deliverable next Friday. Attached are the outstanding items that I would like BLM input to address. Some of these are to help refine the responses to the comments in the comment summary report, while others are more EIS-specific, identifying changes needed in certain areas of the EIS. Please search for your name highlighted in green. I'm free to discuss if needed.

Thanks,

Meredith

1.		IDMTSG-14-0212-11	Porter-minerals-range of alts	There may be mineral leases in the ACECs proposed in Alts. C and F- that information will be included in the FEIS, as well as a discussion of mineral potential in the proposed ACECs Determine whether there are mineral leases in the ACECs proposed by Alts C and F. Determine mineral potential in ACECs proposed by Alts. C and F.	Diane and Karen: GIS analysis. Please overlay mineral leases and mineral potential with proposed ACECs in Alternatives C and F. I think this would apply to both fluid and nonenergy leasables, but please work with Karen to determine. Katie will make revision in Chapter 4
2.		IDMTSG-14-0212-27	Makela- 7.1 (moved to leasable minerals)	Is there an adequate baseline description for leasable minerals? Comment states: To determine the effects of a proposed action on the environment, an EIS must first disclose the baseline conditions of the affected environment. See 40 C.F.R. § 1502.15. The affected environment includes biological, physical, social and economic elements of the environment. See BLM NEPA Handbook, at 53. Although the Agencies proposed to close large areas to phosphate leases to protect the sage-grouse or its habitat, the Agencies provided little, if any, explanation of impacts that phosphate mining has had on the species in past, particularly the near past. Our understanding is that the impacts on sage-grouse from phosphate mining in Idaho has been limited, particularly within the last decade, where no new mines have been started in high-value sage-grouse habitat or impacted significant amounts of the bird's habitat. Because the Agencies failed to provide the environmental baseline information regarding past impacts of phosphate mining, the Agencies' analysis is flawed	Karen: Please review Chapter 3 for sufficiency. If there are any revisions necessary, please provide to EMPSi.

3.		IDMTSG-14-0157-9	Makela- 7.6	Include additional information for West Nile virus in Idaho.	<p>Management actions were included in the RDFs to address west nile for water developments.</p> <p>Paul: Note saying that Paul is looking for language written by IDFG.</p> <p>Makela note 4/16/2015: Comment 14-157-9 asked for more info about WNV effects in Idaho, as there was an outbreak in 2006 and IDFG changed hunting season. I recommend adding the wording below, to Sec 3.2.2 Line 19 following first mention of WNV. Also, appended at the end this document-- if we need more info- is wording we developed here about WNV for another EA:</p> <p>West Nile virus has acted as an important source of mortality for sage-grouse and the virus was an important new source of mortality in low and mid-elevation Greater sage-grouse populations range-wide from 2003–2007 (Walker and Naugle 2011). The highest confirmed elevation at which Greater Sage-Grouse have been infected with WNV is ~2,300 m (7,500 feet) in the Lyon-Mono population of eastern California (Naugle et al. 2005). Individual sage-grouse in populations exposed to the virus during July–August 2003 were 3.3 times more likely to die than birds in uninfected populations (Naugle et al. 2004). WNV mortality of sage-grouse has been documented as ranging from 5 to 44 percent with most mortality occurring in July and August (Walker and Naugle 2011, Kaczor, 2008). WNV has been documented in sage-grouse in Idaho and in 2006, the sage-grouse hunting season was closed in western Owyhee County due to concerns of West Nile virus impacts (Idaho Sage-grouse Advisory Committee, 2008).</p>

Cmt #	Page #	Cmt #	Reviewer Name/ Program	Change to document	Remarks / How Resolved
4.			Ralston- edits	<p>As noted in the introductory comments, Y -3 II straddles the Idaho and Nevada border and operates a single ranching entity to coordinate grazing on BLM allotments in both states. BLM, however, states in the Nevada DEIS that planning for the land use plans covering this part of both Idaho and Nevada will occur through the Nevada FEIS and Record of Decision but will be implemented and administered through the Jarbidge and Burley FEIS and Record of Decision. See Nevada DEIS Section ES.2. Additionally, the decisions and analyses for that portion of Y-3 II's allotments in Nevada will occur through the Nevada DEIS and will end at the Nevada state line apparently leaving decisions and analysis for Y-3 II's ranch operations north of the Nevada border to the Idaho DEIS. Id. This is confusing because just a few sentences earlier it is stated that planning for both Idaho and Nevada land use plans will occur through the Nevada DEIS. Id. Thus, within a few short sentences it is unclear how the lands utilized by Y-3 II in Nevada and Idaho are being analyzed, decided, implemented, and administered. If read correctly, it appears that actual management decisions are being made in each state's DEIS, but that Idaho will administer both Idaho's management decisions and Nevada's management decisions as they relate to Y -3 II. Consequently, Y -3 II must analyze and comment on both the Nevada and Idaho DEISs. Y -3 II also notes that this bifurcation of planning and management processes, while at least addressed by the Nevada DEIS, is not addressed in the Idaho DEIS as it should be.</p> <p>Response: Brent to convene a bi-state group to discuss this specific issue with Jarbidge, Burley, Bruneau and Elko Field Offices</p>	Jon: Do you know if this has been done?

RESOURCE MANAGEMENT PLAN AMENDMENT AND ENVIRONMENTAL IMPACT STATEMENT  
Changes to Public Draft RMPA/EIS**

<b>Cmt #</b>	<b>Page #</b>	<b>Cmt #</b>	<b>Reviewer Name/ Program</b>	<b>Change to document</b>	<b>Remarks / How Resolved</b>
5.		26-9	Cooper	We will need to make sure it is clear that lands currently identified for “disposal”, will be changed to “retain.”	Jon and Natalie: Please review Suggest change to: <b>D-LR-19: PHMA:</b> Acquire habitat when possible and retain ownership of habitat, including lands identified for disposal in in current land use plans, except if a disposal would allow for additional or more contiguous federal ownership patterns within PHMA.
6.		210-7	Cooper	We may want to reference APLIC standards. Comment: Rather than call for the use of perch discouragers, NorthWestern Energy recommends the BLM reference the BMPs (see below) for power lines in sage-grouse habitat they are currently helping develop. Likewise, current APLIC guidance should be applied to minimize avian electrocution and collision risks.	Jon and Natalie: Please review. Suggest change to: <b>D-LR-18: PHMA:</b> Design structures and facilities to reduce perching and nesting opportunities for avian predators. Follow APLIC guidelines to minimize electrocution and collision risks.
7.		212-6	Cooper	Need to ask Karen Porter about lease development and what is authorized. Do they contain a valid existing right to roads...? Comment states: For any management action that potentially would interfere with the exercise of valid existing rights, the Final LUP Amendment should provide flexibility for case-by-case exceptions to protect such rights without the need to amend the LUP. For example, the Final LUP Amendment should recognize that, if a BLM right-of-way through sage-grouse habitat is required to access an existing phosphate lease, the right-of-way exclusion area provisions of the LUP or other restrictions on rights-of-way will not be applied in a manner so as to make accessing the lease area unreasonable or unduly uneconomical—e.g., by requiring a 25-mile road detour around sage-grouse habitat where two miles of road would provide proper access—and without considering possible mitigation. With respect to future phosphate mining opportunities, the Final LUP Amendment should similarly allow sufficient flexibility for mineral development to coexist with sage-grouse conservation	Jon and Karen: Please review. I believe the response to this comment is that valid existing rights would be recognized under all alternatives and thus management actions would not interfere with exercising these rights.

8.		Section 4.5	Response	NOTE TO BLM: Need to respond to the last comment related to consistency across state boundaries for our mapping efforts. There is no national response for this issue.	Jon: Please review. I changed the response to state: Between the Draft and Final EIS, the BLM and Forest Service worked closely to resolve differences between GRSG habitats across state boundaries. These refinements are reflected in the Final EIS maps and GIS calculations
9.		Section 5.2		Need to update Section 1.7 with any inconsistencies with other plans (including county GRSG plans)	Jon: Are we including this in the FEIS?
10.		Section 10.4		Need to add analysis of climate change on GRSG (cumulative?). Also add suggested statement to assumptions, Section 4.1 of FEIS. Suggested statement: It is speculative to attempt to predict the specific nature or magnitude of such changes	Jon and Paul: We do not really have an in-depth analysis of climate change in the document. [Makela note 4/16/2015—Climate change is mentioned throughout, and there is an entire section on it on page 3-171 of Chapter 3 latest version. There is also a reasonable presentation of assumptions in section 4.1, 4.2.1 and 4.2.1, and we cite the N. Great Basin REA. My only edit/suggestion is to change the bullet at Sec 4.1 lines 26-30 to read (add bold) “In the future, as tools for predicting climate changes in a management area improve and climate change affects resources and necessitates changes in how resources are managed, the BLM and Forest Service may be required to reevaluate direction provided as part of this planning process and adjust management accordingly. It is speculative at this time to attempt to predict the specific nature or magnitude of such changes.”

Changes to Public Draft RMPA/EIS**

<b>Cmt #</b>	<b>Page #</b>	<b>Cmt #</b>	<b>Reviewer Name/ Program</b>	<b>Change to document</b>	<b>Remarks / How Resolved</b>
11.		Section 14.1		<p>Correct the contradiction for geothermal development between D-LR-3 and D-MLM-1</p> <p><b>D-LR-3: PHMA:</b> Designate PHMA as ROW Avoidance areas and exclusion areas for wind and solar development (see <b>Table 2-9</b>). New authorizations for the following uses are not allowed: Transmission facilities (greater than 50kV in size), wind energy testing and development, commercial solar development, commercial geothermal development, nuclear development, oil and gas development, mineral development, airports, and ancillary facilities associated with any of the aforementioned development; paved roads and graded gravel roads, landfills, airports, and hydroelectric projects. Communication sites would be allowed.</p> <p><b>D-MLM-1: PHMA:</b> Lands would remain open to locatable mineral entry (see <b>Table 2-9</b>).</p>	<p>Jon, Natalie, and Karen: please review. Suggested change:</p> <p><b>D-LR-3: PHMA:</b> Designate PHMA as ROW Avoidance areas and exclusion areas for wind and solar development (see <b>Table 2-9</b>). New authorizations for the following uses are not allowed: Transmission facilities (greater than 50kV in size), wind energy testing and development, commercial solar development, commercial geothermal development, nuclear development, oil and gas development, mineral development (except locatable mineral entry), airports, and ancillary facilities associated with any of the aforementioned development; paved roads and graded gravel roads, landfills, airports, and hydroelectric projects. Communication sites would be allowed.</p>
12.		Section 24.2		Add current CTTM area designation acres to Chapter 3	Get acres from GIS if available
13.		Section 29.3		<p>Need input from BLM for response – no response currently exists, only questions for BLM</p> <p>Summary of comment: The EIS fails to address impacts on the soil and watershed conditions resulting from grazing-sourced manure, soil erosion and pathogen contamination under each alternative and to provide appropriate mitigation measures. Such an analysis should include a list of impaired waters and the sources of contamination for those waters. The EIS also fails to address the negative impact on GRSG of restricting or removing water developments under Alternative D.</p>	<p>Jon: Please review. Proposed response: During preparation of the EIS, it was determined that impacts on soil and water from management actions would be negligible or beneficial and thus did not warrant an extensive analysis in Chapter 4. Analysis of impacts on soil and water would be conducted during the NEPA review of implementation-level projects. Section 4.2.2 has been revised to include impacts from restriction/removal of water developments.</p>
14.		New section # 12.4		Summary states: The DLUPA/DEIS fails to adequately analyze the cumulative impact of locatable mineral withdrawals across the GRSG range	<p>Jon and Karen review. Proposed response: The cumulative impact of locatable mineral withdrawals has been analyzed independently under each sub-regional EIS and is not analyzed rangewide in this effort.</p>

RESOURCE MANAGEMENT PLAN AMENDMENT AND ENVIRONMENTAL IMPACT STATEMENT  
Changes to Public Draft RMPA/EIS**

Wording about West Nile Virus for Comment Response 3 above regarding Comment 14-0157-9.

Note to Meredith: As a minimum add the highlighted paragraph to 3.2.2 line 19 as I mentioned in the table above. I don't think we necessarily need the full discussion of the other paragraphs or citations below, but I included them here in case we need to discuss further. Make sure the citations in the yellow section are added to the Lit Cited in the FEIS if not already there. The full citations are at the end.

**West Nile Virus (WNV).** West Nile virus has acted as an important source of mortality for sage-grouse and the virus was an important new source of mortality in low and mid-elevation Greater sage-grouse populations range-wide from 2003–2007 (Walker and Naugle 2011). The highest confirmed elevation at which Greater Sage-Grouse have been infected with WNV is ~2,300 m (7,500 feet) in the Lyon-Mono population of eastern California (Naugle et al. 2005). Individual sage-grouse in populations exposed to the virus during July–August 2003 were 3.3 times more likely to die than birds in uninfected populations (Naugle et al. 2004). WNV mortality of sage-grouse has been documented as ranging from 5 to 44 percent with most mortality occurring in July and August (Walker and Naugle 2011, Kaczor, 2008). WNV has been documented in sage-grouse in Idaho and in 2006, the sage-grouse hunting season was closed in western Owyhee County due to concerns of West Nile virus impacts (Idaho Sage-grouse Advisory Committee, 2008).

The long-term response of different sage-grouse populations to WNV is expected to vary markedly depending on factors that influence susceptibility including: (1) annual and seasonal temperature-precipitation profiles, (2) land uses that influence the distribution of surface water, (3) population size, (4) genetic diversity, and (5) connectivity with other populations. Small, isolated, or genetically depauperate populations and those on the fringe of the species' range as in eastern California, Washington, North and South Dakota, Alberta, and Saskatchewan, are likely at higher risk. WNV outbreaks in small populations are more likely to reduce population size below a threshold from which recovery is unlikely and the likelihood of demographic or genetic rescue by adjacent populations is low (Morris and Doak 2002). Large, intact, low- to mid-elevation populations affected annually by WNV in northern Nevada, southeastern Idaho, central Montana, may absorb impacts of WNV if the quality and extent of available habitat still supports positive population growth (Walker and Naugle 2011).

WNV infection has been documented in several genera of mosquitoes (*Culex*, *Aedes*, *Ochlerotatus*, *Culiseta*; (Goddard et al. 2002, Doherty 2007) and at least one other biting midge (*Culicoides sonorensis*) (Naugle et al. 2004), in sagebrush habitats of western North America. However, *Culex tarsalis* is the dominant vector of WNV in sagebrush habitats (Goddard et al. 2002, Naugle et al. 2004, Doherty 2007). This species of mosquito prefers sites with submerged vegetation on which to oviposit (deposit eggs) and warm, standing water that promotes rapid larval development, including ephemeral puddles, vegetated pond edges, and water-filled hoof prints (Milby and Meyer 1986, Buth et al. 1990, Doherty 2007). Dense stands of emergent plants physically obstruct access to mosquitoes (larvae and pupae) by predators and hinder mosquito control efforts (Knight et al. 2003). Open water areas provide unsuitable habitats for mosquito larvae and pupae due to increased wave action and increased vulnerability to predation by native predators of mosquitoes (Laird 1988).

**IDMT GREATER SAGE-GROUSE  
RESOURCE MANAGEMENT PLAN AMENDMENT AND ENVIRONMENTAL IMPACT STATEMENT  
Changes to Public Draft RMPA/EIS**

West Nile virus transmission is also regulated by environmental factors, including temperature, precipitation, and distribution of anthropogenic water sources that support breeding mosquito vectors (Brust 1991, Dohm et al. 2002, Reisen et al. 2006a, Zou et al. 2006a, b). It has been suggested in ecosystems other than sagebrush that high temperatures associated with drought conditions increases West Nile virus transmission (Epstein and Defilippo 2001, Shaman et al. 2005). Higher temperatures facilitate greater nocturnal host-seeking activity by mosquitoes, more rapid larval development, and shorter extrinsic incubation periods for the virus—the time it takes for the virus to replicate inside the mosquito and invade its salivary glands (Reisen et al. 2006a).

Man-made water sources may also facilitate the spread of WNV within sage-grouse habitats (Zou et al. 2006b, Doherty 2007, Walker et al. 2007).

Man-made water sources known to support breeding *Culex tarsalis* in sage-grouse habitat include overflowing stock tanks, stock ponds, seep and overflow areas below earthen dams, irrigated agricultural fields, and ponds constructed for coal-bed natural gas development (Zou et al. 2006b, Doherty 2007). Also, habitat or range improvement projects that create mesic zones around stock tanks or ponds may inadvertently contribute to the WNV problem, because *Culex tarsalis* readily takes advantage of water-filled hoof prints around tanks and ponds for breeding (Doherty 2007). Managing the production of mosquito vectors from man-made water sources, reducing the distribution of man-made mosquito breeding habitats in sage-grouse habitat, or both, are potential options for reducing impacts of WNV. Suggestions include (Doherty 2007 and Knight et al. 2003):

1. Overbuild the size of ponds to accommodate a greater volume of water than is discharged. This will result in un-vegetated and muddy shorelines that breeding *Cx. tarsalis* avoid (De Szalay and Resh 2000). This modification may reduce *Cx. tarsalis* habitat but could create larval habitat for *Culicoides sonorensis*, a vector for blue tongue disease, and should be used sparingly (Schmidtman et al. 2000). Steep shorelines should be used in combination with this technique whenever possible (Knight et al. 2003).
2. Build steep shorelines to reduce shallow water (>60 cm) and aquatic vegetation around the perimeter of impoundments (Knight et al. 2003). Construction of steep shorelines also will increase wave action that deters mosquito production, and create more permanent ponds that are a deterrent to colonizing mosquito species like *Cx. tarsalis* which prefer newly flooded sites with high primary productivity (Knight et al. 2003).
3. Maintain the water level below that of rooted vegetation for a muddy shoreline that is unfavorable habitat for mosquito larvae. Rooted vegetation includes both aquatic and upland vegetative types. Avoid flooding terrestrial vegetation in flat terrain or low lying areas. Aquatic habitats with a vegetated inflow and outflow separated by open water produce 5 -10 fold less *Culex* mosquitoes than completely vegetated wetlands (Walton and Workman 1998). Wetlands with open water also had significantly less stage III and IV larval instars which may be attributed to increased predator abundances in open water habitats (Walton and Workman 1998).

**IDMT GREATER SAGE-GROUSE  
RESOURCE MANAGEMENT PLAN AMENDMENT AND ENVIRONMENTAL IMPACT STATEMENT  
Changes to Public Draft RMPA/EIS**

4. Construct dams or impoundments that restrict down slope seepage or overflow by digging ponds in flat areas rather than damming natural draws for affluent water storage, or lining constructed ponds in areas where seepage is anticipated (Knight et al. 2003). Seepage and overflow results in down-grade accumulation of vegetated shallow water areas that support breeding mosquitoes.
5. Line the channel where discharge water flows into the pond with crushed rock, or use a horizontal pipe to discharge inflow directly into existing open water, thus precluding shallow surface inflow and accumulation of sediment that promotes aquatic vegetation.
6. Line the overflow spillway with crushed rock, and construct the spillway with steep sides to preclude the accumulation of shallow water and vegetation.
7. Fence pond site to restrict access by livestock and other wild ungulates that trample and disturb shorelines, enrich sediments with manure and create hoof print pockets of water that are attractive to breeding mosquitoes.
8. Channelization to increase the water flow, to steepen banks and provide access to predators of mosquitoes that reduce the likelihood of isolated pools and marshy areas favorable for mosquito development (Knight et al. 2003).

Commenter Name	Page Number	Paragraph/Line Number	Comment	ID/SW MT Response
G. Lampman (planning)		All references are line numbers		
	General	General	In general, the ROD needs to be a lot clearer than this EIS. I do not think that a Forest can read this EIS and figure out what it needs to do. The ROD will need to provide the clarity for the Forest and the publics.  I look at processes such as calculations of disturbance caps (App G) and hope that someone is figuring out how to help the Forests do all of this. I foresee project planning is going to come to a standstill, either through specialists not having the time, knowledge, or information to figure out how to design projects or through numerous objections on multiple points as the public challenges us on how we think we're supposed to design projects.	No change
	1-1	8	I didn't see the SFAs discussed in section 1.1.2.	No change
	1-4	10	"The planning strategy will . . .": The document needs to be edited for tense, but this phrase is particularly bad, because it sounds as though after the amendment there will still be implementation of a "strategy."	No change
	1-8	22-23	"The Forest Service has partnered with the BLM to help complete the LUPAs and EISs to implement the Strategy.": This is phrased as if the Strategy, which hasn't undergone public disclosure or NEPA, is governing the amendment. As written, this would be a NEPA problem, if not a planning problem. If this "planning strategy" is the same one mentioned on page 1-4, line 10, then it's more or less a process outline and not a NEPA or planning problem, but it's not really clear if it's the same thing. Suggest just deleting the line. The previous paragraph says the FS is a cooperating agency. That should suffice.	revise
	1-9	21	"planning decisions analyzed in the LUP/EISs": They're not "decisions" until the ROD. What's analyzed are proposed amendments, or in EIS lingo, the LUPAs and alternatives.	revise
	1-12	11-12	The Challis and Salmon are one administrative unit, Salmon-Challis National Forest. The Caribou, Targhee, and Curlew are one administrative unit, the Caribou-Targhee National Forest. (The plans are separate, as provided in Table 1-2.)	revise
	1-12	28-29	"Idaho and Southwestern Montana Sub-region BLM and Forest Service offices": Change Forest Service offices to National Forest System lands. Habitat is not in	revise

Comment Form for FS WO Reviewers  
April 2015**

	1-27	9-10	“a proposed action that may result in a change in the scope of resource uses, or a change in the standards and guidelines of the approved plan”: I think this whole part of the sentence relates to amendments needed such that projects are consistent with the forest plan. If so, as written it sounds as though a project approval automatically means an amendment, whereas the opposite is true, and the forest plan rules. If the amendment is not done, the project is not approved. If I’m reading it correctly, rephrase to “. . . because approval of a project or activity is dependent on a change in the forest plan such that the approved project or activity is consistent with the forest plan.”	consider
	1-27	15	Replace “For this amendment . . . “ with “If this were an effort undertaken solely by the Forest Service, this amendment. . . “ Otherwise it’s confusing to lay out the process then say it’s not going to be followed. Also, note, the list only has 6 steps, as outlined, not 8.	No change
	1-27	footnote	Make the correction on line 15, per above, and turn the footnote into a paragraph right after the list.	No change
	1-28	1-4 and footnote	Delete the paragraph and associated footnote. It’s confusing, if not also incorrect. Decisions on leasing availability and leasing stipulations could have been made outside of the revision or original planning processes; however, they are not always “independent of the LRMP,” as stated in the footnote. The decisions for some have been approval of plan amendments that make lands available or provide the leasing stipulations. As such, they are part of the forest plan and could be changed by this amendment.  There are two different concepts being presented. One has to do with activity- or project-related plan amendments. Those plan amendments, not necessarily the activity, are part of the forest plan and could be amended by the proposals. The other concept is about activities and projects that are currently in progress. This proposal should make statement that such activities or projects would be changed, under appropriate processes, to be consistent with the approved plan amendment.	No change
	1-41	3	Replace “determine” with “inform.” BASI is only one part of the picture. It is not necessarily the determining factor (36 CFR 219.3).	revise
	1-41	9-44	These bullets are about project and activity implementation and, thus, are not “planning criteria.” They are not about plan amendment development. Only FSM 1920 and FSH 1909.12 provide direction for forest planning.	No change
	1-42	30-34	The 368 Energy Corridor decision was a plan amendment, which means it’s part of the affected plans. It’s not planning criteria, and it’s possible that the 368 Energy Corridor amendment could itself be amended. I do not know enough about the	No change

**Idaho/SW Montana Sub-regional FEIS – Sage Grouse  
Comment Form for FS WO Reviewers  
April 2015**

			geothermal leasing “amendment” mentioned in the next bullet. If it was a forest plan amendment, it, too, would not be planning criteria and could be subject to amendment.	
	2-1	37	<p>“Allocation” is troublesome from a FS perspective, especially with the polygons being named “... management areas.” We allocate acres to management areas, which have specific direction in forest plans. There is no creation of management areas per FS planning associated with this amendment, and there is no change in allocations of acres by management area or management prescription category being made by this amendment. There has been no analysis for effects of such changes in forest plan allocations. A better phrase for the FS would be something like “acres managed as PHMA...”</p> <p>Note: I dislike “..MA” because of its inconsistency with forest planning terminology.</p>	No change
	2-2	6	Change “proposed plan” to “proposed amendment” or “proposed LUPA.” This error occurs in multiple locations. Do a global search and change where needed. This is not an EIS for a revision, which would be a plan, only an amendment.	consider
	2-2	25ff	Sagebrush Focal Areas: I’ll start with stating that my preference would be for PHMA and GHMA to drop the MA, because they are not “management areas” per forest planning. Given that such argument is going nowhere and the “MA” is being kept for those polygons, I suggest the SFA be called “Sagebrush Focus Management Areas” to keep in line with the misnomer MAs for the others and not to cause confusion with possible creation of special “designated areas” per forest planning. “Designated areas” have their own set of regs and directives, including for forest planning, that are not completely covered by the EIS, i.e. designated area-specific analysis of effects and direction.	No change
	2-4	35ff	<p>Adaptive Management: The concept of putting “adaptive management” in as standards is inconsistent with FS planning.</p> <ol style="list-style-type: none"> <li>1) S&amp;Gs are design criteria for projects or activities implemented under the plan. In short, one looks at S&amp;Gs when designing projects. As such there is no applicability for “trigger is reached.”</li> <li>2) These “triggers” are identified during monitoring; however, FS monitoring programs do not have “triggers.” Per the 2012 rule, results of monitoring under the plan monitoring program are required to be evaluated biennially. No “triggers” are involved.</li> </ol> <p>Also see comment on p 2-75, line 38ff, Section 2.7</p>	No change

**Idaho/SW Montana Sub-regional FEIS – Sage Grouse  
Comment Form for FS WO Reviewers  
April 2015**

	2-5	19	Forest plans do not “implement” anything. Replace “implement” with “incorporate.”	No change
	2-67	Section 2.7	<p>The whole section is inconsistent with FS planning regulation and direction.</p> <p>The FS should not be associated with any sentences relating to “triggers.”</p> <p>“Adaptive management” as described in this section is inconsistent with “adaptive management” as used in the planning rule or planning directives.</p> <p>This section is mostly written with just BLM mentioned, but at times the FS is mentioned. Does it all apply to the FS? Or just where FS is mentioned?</p> <p>The development of the monitoring plan (as stated in App C) should not be part of the “amendment,” because the FS does not plan to plan. “Implementation” monitoring, as described in the appendix C, is inconsistent with the monitoring program as set forth in the planning rule. Plan monitoring programs are for determinations of movement toward desired conditions and objectives.</p> <p>If there is no way to exclude this “adaptive management” piece from the document or decision, then make it a part of the decision that is separate from the amendment. The overall decision would be about this GSG programmatic strategy, of which one part is the plan amendment, a different part is this adaptive management piece, and yet another part are those actions or procedures that the responsible official commits to that are not part of forest plans (because forest plans do not commit to actions and they do not include procedures).</p> <p>Some specifics. . .</p> <p>Page 2-642, line 15: What is meant by “apply to”? The adaptive management and monitoring as described are not forest plan material. The decision could include the actions described, but they would be separate from the amendment itself.</p> <p>Page 2-62, line 26: “Decisions” that involve FS actions require NEPA for site-specific, activity-specific, project-specific analysis.</p> <p>Page 2-63, line 7ff: This second sentence of the paragraph is about the only statement that is correct for the FS. Monitoring should provide us with the</p>	No change

**Idaho/SW Montana Sub-regional FEIS – Sage Grouse  
Comment Form for FS WO Reviewers  
April 2015**

			information to determine if the direction in the plan is sufficient enough for projects and activities implemented under the direction result in progress toward, or at least not prohibiting movement toward, desired conditions and objectives. The appendix, however, only states that a monitoring plan will be developed after the decision.	
	2-64	Section 2.7.2	See comments on Appendix E.	No change
	2-65	Section 2.7.3	As with the adaptive management piece, this “mitigation” section does not belong with the plan amendment. If desired to be included in the decision, it should not be part of the amendment, just the decision as one of those separate actions.  Establishing a team is definitely not part of plan direction. Developing a strategy is planning to plan, not something we should be doing. Procedures, e.g. include in NEPA analysis, are not plan direction.	No change
	2-89	Section 2.10	This seems more pertinent to the BLM and not the FS. As such, references to the FS should be removed. If this is supposed to be for the FS as well, “Management actions” is a confusing phrase for the FS, because plan amendments do not have “actions.” Some of the “actions” are design criteria and, thus, could be transformed into standards or guidelines. Some are “actions,” like “designate. . .” and would not be plan amendment material. Most of the “actions” are actions and not plan amendment material. This information is more in line with “for the purpose of this analysis for effects to other programs or meeting the purpose and need, these are assumptions about actions that may be taken to meet objectives and DCs.” It is not a commitment to such actions, unless there’s intent to make such a decision, in addition to but separate from the amendment.	No change.
	App E	General	In general, how does a Forest read this and know what it needs to do? A lot of the appendix seems to be background material with nothing relating to what the Forests need to know to ensure they are conducting project planning and management consistent with the plan amendment.	No change
	App E, page 3	Par 1, sentence 2	This sentence is incorrect and should be deleted for the FS. There is no 36 CFR 209. This was probably meant to be Part 219, FS planning regulations. Part 219 does NOT require “intervals and standards, as appropriate for monitoring and evaluations based on the sensitivity of the resource to the decisions involved.” The monitoring requirement in 219.12 involves biennial evaluation, no choice in setting intervals. There are no “standards” for monitoring. The plan monitoring program must have questions and indicators addressing 8 specified topics.	Delete “and the Forest Service (36 CFR part 209, July 1, 2010). Delete “Therefore,” from next sentence.
	App E, page 3	Par 1, sentence 4	What is meant by a monitoring plan “specific to the Environmental Impact Statement”?	No change

**Idaho/SW Montana Sub-regional FEIS – Sage Grouse  
 Comment Form for FS WO Reviewers  
 April 2015**

	App E, page 3	Par 2, sentence 1	“Implementation” monitoring is not the focus or purpose of plan monitoring programs under the current planning rule. Monitoring programs are to determine progress toward desired conditions or objectives.	No change
	App E, page 7	Section A	Has anyone thought about how this will be done? “Implementation” monitoring of activities was part of the PACFISH/INFISH BO terms and conditions. Establishing a way to do this that did not overburden Forest personnel and had some form of consistency and quality control were a nightmare, and that was just for livestock grazing.	No change
	App E, page 30	1.b	“What is the existing amount of sagebrush on the landscape and the change in the amount relative to the pre-EuroAmerican historical distribution of sagebrush (BpS)?”: I didn’t see pre-EuroAmerican conditions as part of the purpose and need or desired conditions. Why would we have this as a monitoring question? Also, it seems like a point in time, whereas per the planning rule we aim ecological conditions for ecosystem integrity relative to natural range of variability.	No change

“...to improve conditions on the range.”

January 28, 2014

BLM-Greater Sage Grouse EIS  
1387 S. Vinnell Way  
Boise, ID 83709

The members of the 71 Livestock Association respectfully encourage the BLM to adopt the Governor’s Sage Grouse Alternative (Alternative E). The 71 Livestock Association represents ranchers in the Jarbidge Resource Area and for the past 97 years our mission has been “to improve conditions on the range.” We have done this by working with federal, state, and local governmental entities in a collaborative effort to fulfill our mission. In our opinion, the Governor’s Sage Grouse Alternative (Alternative E) was created in a manner that is consistent with our philosophy of collaboration and provides the greatest localized flexibility that will enable our organization to continue to fulfill our mission.

The US Fish and Wildlife Service (USFWS) identified fragmentation due to wildfire and invasive species as a primary threat to sage grouse. Alternative E recognizes livestock grazing as an effective and inexpensive tool for fuels reduction. Alternative E recognizes the importance of Rangeland Fire Protection Associations (RFPAs) in initial attack of wildfire and that important role in curtailing massive wildfires. In the Jarbidge Resource Area, two RFPAs were formed (the Saylor Creek RFPA and the Three Creek RFPA) and the first year results were remarkable. They tell a tale of cooperative success between state, federal, and local firefighters which had tangible results on the ground of smaller, less intense fires. If given a chance, the combination of reduced fuels and initial attack will greatly minimize wildfire as a

threat to sage grouse.

The USFWS also identified infrastructure and energy developments as primary threats to the species. Alternative E helps to better define the infrastructure problem as “large-scale infrastructure.” This is an important distinction because some groups and even some agencies have categorized small-scale range improvements as infrastructure. Fences that provide for better grazing management and water systems that better distribute livestock and relieve pressure from critical sage grouse areas are not a hindrance to sage grouse. The distinction between small-scale range improvements and large-scale infrastructure should be recognized in any plan that is adopted. Alternative E minimizes the threat of large-scale infrastructure development by locating these developments in less critical sage grouse habitat. This system will work best if the BLM and USFWS recognize that mitigation is not a payoff to some third party, but instead mitigation is the increased cost of locating large-scale infrastructure projects outside of the Core Habitat Zone (CHZ).

Finally, Alternative E places secondary threats in an appropriate context. The USFWS has identified improperly managed livestock grazing as a threat to sage grouse. We contend that properly managed livestock grazing can actually be beneficial to sage grouse. Alternative E provides the flexibility in management that will maintain sage grouse habitat and also maintain the viability of the livestock operation. Our organization is comfortable with the Idaho Rangeland Health Standards and the adaptive management involved in meeting these standards. Alternative E only requires habitat characteristics be achieved where sage grouse habitat actually exists. This provides predictability for livestock producers who operate in sage grouse habitat.

The 71 Livestock Association has a 97-year history of collaborating with federal, state and local governmental entities to improve conditions on the range. We strongly believe in the philosophy of multiple-use on our rangelands. We contend the Governor’s Sage Grouse Alternative (Alternative E) allows us to meet our mission of improving conditions on the range. We also believe the Governor’s Sage Grouse Alternative (Alternative E) best conforms to our philosophy of multiple-use. Therefore, we encourage the BLM to adopt the Governor’s Sage Grouse Alternative (Alternative E) as the sole final alternative for managing sage grouse in the state of Idaho.

We thank you for the careful consideration of our comments.

Sincerely,

The 71 Livestock Association

Keith Severe, President

Gus Brackett, Sec./Tres.

American Bird Conservancy Form Letter Master

Subject: Please Ensure Sustainable Management for Greater Sage-Grouse

Dear Bureau of Land Management officials:

I am pleased that BLM is leading the effort to conserve the Greater Sage-Grouse, one of the most iconic and imperiled bird species of the American West. However, I am concerned that BLM's draft preferred alternatives do not comply with the best available science or with standards necessary to stabilize and recover grouse populations. I encourage BLM to adopt the conservation alternative to ensure sustainable management to conserve the species. These include science-based recommendations to limit future development and to create protected areas.

Conserving the Greater Sage-Grouse will require both protecting large areas of habitat and making significant changes in land management to reverse population declines of this wide-ranging species. Most priority sage-grouse habitat is already heavily degraded and grouse are only persisting in large, relatively undisturbed blocks of habitat. For years, fossil fuels production and other commercial uses have dominated public land management across sagebrush habitats, resulting in significant impacts to wildlife, public recreation, and air and water quality.

Protecting large expanses of important sage-grouse habitat—as outlined in the conservation alternative—will help stem the decline of many species of wildlife across the American West. The conservation alternative will begin restoring balance to an iconic American landscape by identifying areas most appropriate for development and those that need to be protected.

Thank you for considering these comments.

Reducing livestock grazing is not a good tool

In managing sage grouse habitat, fires - It will only  
hurt sage grouse numbers + Increase fires

Grazing helps reduce fires, Improves forages, Removes  
Invasive species + Benefits Sage grouse habitat

The BLM + USFS should NOT <sup>only</sup> adopt Alternative E  
for grazing mgmt. because it is the best option  
for conserving habitat for Sage Grouse

The Idaho Chapter of Backcountry Hunters and Anglers would like to go on record as supporting the BLM sage grouse DEIS. While not perfect, we feel the federal land management agency is best suited to oversee habitat on large swaths of land.

---

 1.29.2014 Letter to BLM GRSG EIS.pdf  
391K

January 29, 2014

Dear Sirs:

Thank you for the opportunity to respond to your BLM/USFS Draft LUP Amendment and EIS dated October 2013 concerning Greater Sage-Grouse (GRSG). I am responding as an individual, representing just myself and my personal views. My views come from my education, life experiences and employment with BLM concluding with approximately 35 years. Currently I am a retired and my last position was being a District Manager in Idaho.

Alternative A is No Action. This alternative is required and provides a baseline but is not realistic in making a good decision to support the GRGS. Therefore, my discussion will end on Alternative A at this time.

Alternative B emphasizes restrictions on resource uses. While very realistic in terms of the fiscal capabilities of the federal agencies in the long-term, it is not much better than Alternative A in terms of supporting the GRGS. Therefore, my discussion will end on Alternative B at this time.

Alternative C was driven by individuals and conservation groups. It appears it is the same as always, remove grazing and life will be grand. They also want more ACECs that continue to not stand up to a true test of the required relevance and importance analysis. This alternative appears totally without concern of the top five threats as listed in Table 2-1 that have real impacts to the GRGS. I believe it is to meet their interests in removing livestock grazing from all federal lands at all costs and with every opportunity they are presented with. They also appear to lack a true concern of the health of the public lands since they started down this road in the past, are on it now and will continue this approach into the future.

Alternative D was driven by addressing conservation measures, while balancing resources with their uses. It is similar to Alternative B but would emphasize improving the success of rehabilitation efforts and planning for wildfire suppression. I will add to this alternative in my comments later.

Alternative E is the Governor of Idaho's Alternative. I understand they own and manage the wildlife within the state and the federal agencies manage the habitat. I will add to this alternative in my comments later.

Alternative F is another alternative that was driven by individuals and conservation groups. This alternative has more restrictions and less flexibility and has proposed even more ACECs. This is also not a new approach to resource management by some individuals or groups. Without adaptive management and with the unknowns of climate change will lead to failure in your decision process if you select any portion of this alternative. Individuals and groups have tried this process with proposed ACECs in the past and by the time BLM makes an analysis of the relevance and importance, BLM could not justify further levels of management as ACECs. When you review past attempts and conclude your analysis, I believe you should come to the same conclusions again. BLM does not need additional management direction beyond these LUP amendments and this EIS to address the GRSG. The costs of

this additional level of management will not be justifiable for the protection GRGS and their habitat needs. In addition, the funds and resources required to do this unjustified level of management need to be spent on the top threats of this issue.

I commend your incorporation of Adaptive Management and its components. However, as time goes by, I would hope we can use Adaptive Management in response to good results that will be achieved. As written, it appears to only be responsive to negative results, which leads me to believe, we can't use Adaptive Management to diminish hard decisions being made now. In the future, when science indicates threats are being reduced or eliminated as a result of everyone's hard work, adaptive management needs to give credit where credit is due.

On page 2-21, you stated: "There are currently no science –based studies that demonstrate that increased livestock grazing on public lands would enhance or restore GRSG habitat or maintain or increase GRSG abundance and distribution." In general, I believe individuals and groups have been funding and supporting studies for decades to support their views that livestock are bad in every circumstance. Whereas, for the same timeframe, the federal government has not consistently encouraged science –based studies to see how best to use livestock as tools and as part of their obligation. There have been some studies on the fringes of this question, but not enough to support their multiple-use mandates. I believe livestock are still the best low-cost alternative in vegetation management you have in your tool box. So I hope as we proceed that these science-based studies are completed to address this on-going question.

I am concerned about your statement on Table 2-3, Alternative D. You indicate developing a fuel management strategy. You have had various strategies for nearly 20 years now. When it was first initiated in the mid-late 1990's BLM successfully completed 100's of thousands of acres in high quality fuel reduction and restoration projects. My team even received national recognition for what we accomplished. Then as funding started to drop and competition for the funds increased, it was reduced to a mere nothing as compared to the beginning due to budget constraints. History will repeat itself and I believe this process will continue, even though you will make promises in this process that can't be achieved over the life of this plan. You also indicate as a priority you want to use native fire resistant species. That is admirable. But again as history will repeat itself, those species may or may not be available in the quantities you need and as your fire rehabilitation funds have diminished, so has your ability to purchase even small amounts of these expensive species. I remember BLM staff indicating they would rather not do rehabilitation efforts if native species were not available versus the use of more typical species that were readily available and affordable. That mindset will not help the GRSG or the general health of the lands you administer into the future. Will you readily demand offices use non-native species to save SRSG habitat? Another point is that 20 years ago BLM basically had the funding to do all the fire rehabilitation that was required. Now with those funds both reduced and required to suppress more and more fires, many fires are receiving no funds to complete the needed rehabilitation and monitoring. How will that change through this effort and during the life of this EIS?

I am also concerned about your statement on Table 2-3, Alternative D and strategically "placing treatments on a landscape scale to prevent fires from spreading onto PPMA or WUI." The federal,

state and local agencies have been great in their education and information in trying to change what has occurred from past social, planning and zoning practices. This more typically was called the fire-wise and WUI programs. However, as well as the federal agencies have educated the private landowners on what to do on their private land, the agencies have not practiced what they preached on the lands they administer. For example, if BLM would have done more WUI work, then they would not be asked to support a rural fire department to protect life and property from fires originating on public lands they administer. That being said, I remember being questioned internally in BLM why we moved aircraft support from sage grouse habitat to a housing community. The answer was because of priorities for life and property are higher than for sage grouse habitat and because a rural fire chief requested our assistance. What is expected to happen in the future on this same scenario? Will you turn your back on your partners the rural fire chiefs? If you are able to make all of these landscape scale fixes and they work, what is your interim plan going to be? Between funding and legal challenges of local project proposals, I do not believe this will occur enough over the life of this plan to be effective. Do you?

We know as long as ongoing wildfires do not exceed the capacity of the available resources, normally the wildfires do not pose catastrophic levels of safety or damage. However, as soon as the wildfires, either in numbers, size or intensity exceeds the resource capability, the threats to life and property increase dramatically. We also know that with climate change, we all see less snow packs, more spring rains and longer fire seasons than just a few years and decades ago. I believe this lower snow pack in historic places like GRS habitat is leading to stress of the shrub species that need deep watering that is provided by slow snow melt. Without this snow pack and higher summer temperatures, I believe this situation will ultimately lead to their demise as individuals' and plant communities. Thus that means your habitat is in trouble even without this EIS and the follow-up actions you propose. For example, it is admirable that BLM plants sagebrush in their rehabilitation and restoration projects. It has quite often been very successful. However, under this scenario will they survive until they reach maturity and produce seed themselves? Or will they die from a lack of moisture and un-natural fire regimes that exist? We all know fire regimes will not change in at least the next twenty years, even if you have projects already approved and on the shelf ready to go. You can potentially reduce fire size and intensity over the life of this EIS, but not the number of fires or the regimes that require a long-term transformation. We also have seen with spring rains, the grasses flourish making either forage for wildlife and livestock or fuel for wildfires. How will your adaptive management meet this scenario? How will you be able to meet the challenges of removing this fuel load between the rains in April and May and the fires starting in late June the same year? We all have witnessed that the fire seasons have been getting longer and will undoubtedly keep getting longer. It is your responsibility to address this situation in this document and into the future. How will your adaptive management strategy be able to respond to this significant issue in a timely manner and on a yearly basis? I believe local planning project requirements and on-going litigation will stop you in your tracks before you get started. Then what are you going to do?

Your alternatives address weed management actions for noxious and invasive species. Your funding has never been adequate to support either issue. Because of this they are both expanding. Funding after fires, if provided at all is not long enough to adequately address these issues. Then your neighbors

commonly do not have adequate funds. Therefore, to be effective, you will need to take the lead in supporting this effort across all lands in providing funds and coordination. Where will the funds come from? Where will your long-term commitment come from?

You then go on to a monitoring program. In the early 1980's BLM moved from one-point-in-time inventories and went to on-going monitoring to address the requirements of FLPMA in knowing the condition of land and other issues. One of the first things that get cut in budget reductions is the staffing to do adequate monitoring of all types. What assurances are you going to give to do this monitoring? What priority order are you going to use and what monitoring efforts are you going to forego to do what you are promising or will be required here?

I am afraid of the restrictions of Alternative D in terms of new authorizations of transmission lines greater than 50kV. I believe this is a perfect example that your adaptive management needs to allow transmission lines greater than 50kV when and if science-based studies support it. Selecting this LUP decision as written is too restrictive without the flexibility I mentioned above.

As I read more about strategic wildfire suppression planning I recall many of those in the past. BLM at all levels was great in telling everyone, including Congress, what they were going to do and had coordination meetings and training sessions every spring in preparation of an on-going or a new strategy. However, when the season hits and is larger than BLM had capability to address it was for not. A typical strategy is to pre-position fire suppression resources and confront the first fires that start. You also never totally left an on-going fire to go to another, no matter how important the resources are in the new fire. That being said, the later fires were unattended for some period of time and the early ones may lose capability as I described earlier. Therefore, all the strategies I have been part of in the past looked great on paper, but had huge limitations in real life. How will you assure a different result this time? Remember, Einstein said something to the effect; a definition of insanity is when we keep doing the same basic work and expect different results.

Before I go any further, I will explain your highly flawed ACEC process. Your entire write-up for ACECs in Chapter 3 is only eight pages long for 59 existing ACECs. You indicated in Appendix H-4 that if an area met the relevance criteria and were in PPH, they were determined to have importance because of being a national priority for BLM. Table 3-45 has 67 Existing ACECs. Why the difference in numbers? On page 3-120 you indicated that both the identified relevance and importance values are listed for each ACEC. As we all know when you go through the ACEC evaluation process all relevant values are not also importance values. You made no attempt in distinguishing that fact in this document. The only rationale you provided why these were now for GRSG is a national priority for BLM. That is not rationale to require additional management above the areas immediately adjacent to them. The other big piece of missing information is the list of management prescription(s) necessary to maintain and protect each relevant and important value. Again, without this list why are these existing ACEC requiring additional management not required on the adjacent lands you administer. You have provided no science-based rationale for you proposed decisions.

Appendix H supporting your ACEC evaluations is only ten pages long and most of that are maps and tables. According to the Map H.1 four new ACEC are being proposed in Alternative C, Map H.2 has 16 proposed for Alternative F, Map H.3 has 18 proposed in Alternative F, and then Table H.1 has 39 listed. As I wrote in the paragraph above, where as a reader are we to see your evaluation, analysis and rationale for each of these? As a simple example of how you should have presented this whole part of this EIS can be found in a document you have. That is the Draft Amendments to Shoshone Field Office Land Use Plans of June 2002. You will see the appropriate method of displaying to the reader the relevance, importance, management prescriptions and rationale for each nomination so we have the opportunity to review your work.

Why have you either hidden this information so deep into this document I can't find it or have never completed your work on this important aspect to begin with? Your statement of "protection of GRSG is a national priority for BLM" therefore, they require additional protection is without merit and as I referenced in the June 2002 document on pages 128 is not the appropriate to make this decision. How can you make this pre-EIS decisional decision at this time? This is especially true without any supporting justification in your current documentation. I believe you need to present this evidence to the public in a timely fashion to keep this EIS on track.

In my thirty-five year career, I am not aware of one LUP ever being fully implemented and not one BLM Manager held accountable for not fully implementing it. I see this effort following the same path. I also witnessed that not all federal employees are concerned about how their decisions would impact their neighbors, communities or the State where they lived and worked in. I believe it was even worse when they lived in one state and made decisions affecting another. I also believe as some moved to new offices and moved up in the ranks they became even less engaged with local people and local issues and therefore, the impacts they create. That being said, and knowing no federal employee will be held accountable for the outcomes of their actions or lack of actions in this endeavor, I believe the best alternative is Alternative E. The Governor and the citizens of Idaho have the greatest obligation to see the protection of GRSG while meeting requirements of their State. Also, since they own the wildlife in the state they have more ownership in this important endeavor. They should have the greatest responsibilities and they should receive the greatest rewards for their efforts. Therefore, they need the opportunity for more freedom through positive adaptive management implementation.

I read while selecting Alternative E for Idaho, lands in Montana would be managed under Alternative A. I believe that is inappropriate as I stated above about Alternative A and similar LUP decisions I addressed above need to be made for Montana also.

Sincerely,

Bill Baker

RE: Idaho and Southwestern Montana Sage Grouse Draft Land Use Plan Amendment and Environmental Impact Statement

To Whom it May Concern,

As an Idaho rancher, I submit the following comments on the BLM/Forest Service sage grouse management proposals. My livelihood depends on my ability to graze livestock on public and private lands. As such, it is in my best interest that the lands are managed to optimum condition, which is both ecologically and economically beneficial. I am concerned that the pending effort to significantly amend the land use plans has the potential to create unnecessary restrictions on my ability to graze livestock and will result in unintended consequences that will be more harmful than helpful to sage grouse.

I would like to call to your attention the situation in the 1990's with the spotted owl. Closing down the timber industry devastated rural economies and communities. Now western forests are overgrown which has led to the huge devastation of forest fires and the loss of lives, some human and much wildlife. The spotted owl debate is an example of how extreme measures just don't work for the pretty bird in question and the surrounding economies.

We need balance to manage the sage grouse. We need to be able to limit the predators that kill them. Keep in mind that wolves have been recently added to the already existing coyote population in the region. Another predator that has a huge impact on the sage grouse is the hawk. At this time, it is unlawful to hunt hawks. If their numbers were reduced slightly, the sage grouse would have a much better chance of survival.

Many ranchers are working to improve the sage grouse habitat with the juniper encroachment project. They are opening up areas by removing the trees which give hawks a bird's eye view of their victims. This tactic alone is going to make a tremendous difference in the population of the sage grouse.

For these reasons, I encourage the BLM and Forest Service to adopt Alternative E, the Idaho Governor's Alternative as the sole final alternative for managing sage grouse within the state of Idaho. Alternative E offers the best option for conserving sage grouse and its habitat and achieving the goal of avoiding an unnecessary federal listing of the species, while protecting and maintaining land-use activities in the state and preserving Idaho's way of life.

Sincerely,

Cody & Polly Baldwin

Mustangs and burros are federally protected.

They are few compared to the massive numbers of cattle and sheep grazing on BLM lands.

You cannot use the sage grouse as an excuse to get rid of or reduce wild horses and burros in Utah and Idaho!

Enclosed herewith is our comments on the SAge Grouse draft LUP and EIS.

While the co-preferred alternatives, D & E, are similar in nature as to development of Management AReas or Conservation Zones, three types of habitat, and triggers to measure the impacts on the habitat and population, they differ greatly in regards to the implementation. Alternative E employs a robust 'site-specific' adaptive management strategy to direct resources to the relevant urgent threats within the distinct MA/CZ. Additionally, Alt E provides a more detailed framework that includes a broad scope of participants within the MA/CZ. The success of the program requires the involvement of all parties, agencies, IDF&G, permittees and users, private landowners, LWG, conservation groups, etc. The implementation of a 'one size fits all' agency approach dictates an inflexible approach without considering the conditions on the ground. Furthermore, it will be difficult for the agencies to develop new LUP while addressing the 'inconsistencies' with local LUPs. Implementing Alt E provides a framework to address threats within the MA/CZ through the inclusion of local partners. {Alternative E employs the use of conservation partners, yet to be defined, governed by a region wide board.}

Furthermore the adoption of the alternatives, other than perhaps E, do not meet the requirements of NEPA (40 CFR 1500-1508) pthat requires a consideration of the impact on the 'human enviornment' as the result of any action. The socio-economic analysis within the EIS provides only a macro analysis. With the adoption of Alternative D {B, C, F} there will be a reduction in grazing permits as well as other multiple uses [mining & recreation] within the Intermountain MA/CZ. The impact on the social, cultural, and economic environment of the communities will be significant, and require further analysis than included therein.

Subject: LUP Amendment & EIS comments

Enclosed herewith is our comments on the SAge Grouse draft LUP and EIS.

While the co-preferred alternatives, D & E, are similar in nature as to development of Management Areas or Conservation Zones, three types of habitat, and triggers to measure the impacts on the habitat and population, they differ greatly in regards to the implementation. Alternative E employs a robust 'site-specific' adaptive management strategy to direct resources to the relevant urgent threats within the distinct MA/CZ. Additionally, Alt E provides a more detailed framework that includes a broad scope of participants within the MA/CZ. The success of the program requires the involvement of all parties, agencies, IDF&G, permittees and users, private landowners, LWG, conservation groups, etc. The implementation of a 'one size fits all' agency approach dictates an inflexible approach without considering the conditions on the ground. Furthermore, it will be difficult for the agencies to develop new LUP while addressing the 'inconsistencies' with local LUPs.

Implementing Alt E provides a framework to address threats within the MA/CZ through the inclusion of local partners. {Alternative E employs the use of conservation partners, yet to be defined, governed by a region wide board.}

Furthermore the adoption of the alternatives, other than perhaps E, do not meet the requirements of NEPA (40 CFR 1500-1508) that requires a consideration of the impact on the 'human environment' as the result of any action. The socio-economic analysis within the EIS provides only a macro analysis. With the adoption of Alternative D {B, C, F} there will be a reduction in grazing permits as well as other multiple uses [mining & recreation] within the Intermountain MA/CZ. The impact on the social, cultural, and economic environment of the communities will be significant, and require further analysis than included therein.

RE: ID & SW Mt Sub-regional Sage Grouse EIS

The comments contained herein are directed towards the Preferred Alternative as outlined in 2.5.2, "...Alternatives D and E...co-Preferred Alternatives..." and addresses the features of each that provide the flexibility to address the various distinct threats affecting GRSG habit and populations within the various Management Areas/ Habitat Zones (MA/HZ). Comments herein concern the southern Lemhi and Custer county area within the Mountain Zone as it relates to Livestock Grazing.

While "*These alternatives each have different strengths that reduce, eliminate or minimize threats to GRSG and their habitat...*" Alternative E provides a process that will address "*...deficiencies in existing management, exploring opportunities for enhanced management, and addressing issues identified through internal assessment...*" (2.6.5) tailored to the local implementation. While the two alternatives are similar in approach it is in the implementation where the two diverge in effectiveness. The status of the GRSG and the threats within each CA are uniquely distinct and must address LUP accordingly. This response will address the features of Alternative E that provide the 'site specific' locally directed adaptive management strategy.

### **DEVELOPMENT and INCLUSION**

Alternative E provides a more inclusive list of contributors establishing 'buy-in' of various diverse groups ultimately responsible for addressing LUP issues. The regulatory result of an Alternative will impact all resource users in various degrees and will require cooperation from all groups and require them to mitigate against actions on the ground. "*The task force was a diverse group of*

*stakeholders comprised of representatives from local Sage-Grouse working groups, conservation interests, state and local officials, and industry.”* Alternative E allows each user to address their impacts or lose the use of the resource. While it is recognized that not all MA/HZ’s have active LWG, within the Mountain Zone there is an active LWG working in concert with agencies, industry, and Permittee. Alternative E provides a more effective implementation process leading to immediate ‘on the ground’ results.

Alternative D is directed more towards a sub-regional response without considering the distinct differences in threats, topography and local management practices. Once the alternative is implemented it must allow local land management agencies in concert with State wildlife managers to specifically address actions that are affecting the GRSG. The approach in one MA/HZ may be radically different from another and alternative D is directed “...to respond to sub-regional conditions and management in order to meet the needs of ongoing programs and land uses.” (2.6.4) The consideration for the Preferred Alternative is to “...offer a range of discrete strategies for resolving deficiencies in existing management, exploring opportunities for enhanced management, and addressing issues ... related to maintaining or increasing GRSG abundance and distribution on BLM- and Forest Service-administered lands.” (2.5.1)

Either alternative is significantly above the other alternatives and provide a regulatory basis for managing habitat and populations of GRSG, Alternative E addresses not only the issues sub-regional wide but meets the requirements of FLMPA by involving local government entities, industry, local conservation agencies [LWG], resource users and especially Permittee in the Mountain CA/HZ where Primary threats are not an issue.

### **GRSG MAPPING and HABITAT DESIGNATION**

Key to either alternative is the ‘base line’ determination of habitat and populations. The BLM assembled the preliminary data at the broad and mid scales using LANDFIRE. They also are tasked to provide Key Habitat Map updates to be solicited “...from partners in GRSG conservation...” considering factors such as “Habitat mapping errors or omissions that have been identified in the most current Sage-Grouse Habitat Planning Map and other edits recommended by Sage-Grouse conservation partners...(2.6.4) There needs to be precise language within the document that identifies the ‘conservation partners’. There are major differences in the mapping of the NTT and that provided by the Challis LWG. Even with updates to reflect resource assessments and bird counts by IDF&G, the two are radically different.

As both alternatives (D&E) rely on a base line to measure [monitor] the affects on GRSG by various resource actions, and considering the Mountain MA/HZ threat is ‘Improper Livestock Grazing’, it is essential that the framework is in place to

identify the condition of the habitat and population densities by Record of Decision.

Thus while the habitat mapping applied to either Alternative D or E will be broadly encompassing, it is critical that local GRSG conservation partners provide the parameters to manage the habitat and populations and apply 'adaptive management' guidelines or BMPs specific to the 'fine and Site Scales, defining "...physical and geographic area within home ranges. At this level, maps of seasonal habitats (breeding, summer, and winter) and the connectivity between these seasonal use areas can be examined to determine limiting factors for populations, subpopulations, and PACs." (E.2) Additionally habitat determination must be based on "...physical conditions and the geographic area within seasonal ranges to meet life requisite needs (e.g., nesting and brood rearing)." (E.2) The Plan needs to have the flexibility of local input to address the nature and potential of the habitat. Alternative E provides greater local input and tailors its monitoring and implementation accordingly.

Within the Challis area the soils varies greatly affecting the sagebrush canopy and types of forbes. Within the SCNF GRSG habitat there is even more radical changes in topography given the rapid elevation changes. Additionally the FS doesn't have soil sampling. Thus applying a standard criteria for Habitat Characteristics my not be reasonable [Table 2-8, page 2-71] within a framework that addresses GRSG from a sub-regional basis. With variation in 'habitat Characteristics' between CA/HZ, especially in the Mountain, there needs to be flexible solutions addressed by local 'conservation partners'. Alternative E provides this framework.

### **HABITAT CHARACTERISTICS**

The habitat Characteristics for Alternative D, set forth in tables 2-7 through 2-10 are not applicable in large areas of S. Lemhi and Custer County. As such this places an unrealistic burden on local land management agencies in evaluating resource status or potential during the LUP process. In fact the SCNF is using the criteria set forth in table 2-8 'Perennial Grass and Forb Heights' as their criteria in current LUP efforts for livestock grazing while recognizing it is an unrealistic, but it is the framework set forth.

Compare this to Alternative E, tables 2-14 through 2-16, which is more habitat dependent. This places the impetus on the management practices that are not meeting Rangeland Standards and health especially within critical GRSG habitat.

### **ADAPTIVE MANAGEMENT**

*"Both Alternatives D and E contain some specific details with regard to the adaptive management process that are further explained within those alternative discussions (see **Sections 2.6.4 and 2.6.5**, respectively)." As a part of the*

process the alternatives rely on science based soft and hard adaptive management triggers, based on habitat and population assessments.

The method employed by Alternative E focuses on a set of primary threats of wildfire, invasive species, and large infrastructure projects, and secondarily on improper livestock grazing management and related infrastructure. Activities not addressed by E will be "...guided by the 2006 State Plan, LWG plans, or relevant federal resource management plans." (page 2-76) This alternative provides for BMPs to 'site specifically' address issues. In the case of Livestock grazing "*This alternative emphasizes the need for livestock permittees to achieve the Idaho Rangeland Health Standards while also achieving flexibility and management predictability through the use of the state's adaptive construct, which respond to the COT Report*" (page 2-77) thus drawing together land managers, conservation partners, and resource users in a Cooperative Arrangement'. In order for the Sage Grouse Management Process to be successful it must provide 'buy-in' by the private landowner, the largest resource user, through a local based initiative as opposed to a 'top down approach'.

*Alternative D would encompass the consideration of changes or trends in habitat and population indices" evaluated by a collaboration of TAT & IDF&G. Recommendations are sent to the BLM and FS supervisor to be implemented in accordance with adaptive management triggers. (page 2-72) Monitoring will be used to determine whether trends and generally doesn't require 'fine and site-scale specific habitat monitoring which depends on "...on proposed projects, existing conditions, habitat variability, threats, and land health. However the metrics for quantifying the indicators can be adjusted for local conditions." (page E-8) This doesn't provide the criteria or basis from which to evaluate and respond to site-specific conditions and sets the basis for managing GRSG with a sub-regional approach. Furthermore this plan is yet to be identified while Alternative E has the framework in place. "This draft monitoring framework was developed for draft environmental impact statements to describe the proposed monitoring activities for this plan. The BLM and USFS will consider public comments and collaborate with other agencies to finalize the Idaho and Southwestern Montana Sub-Region Sage-grouse Monitoring Plan." (E.3, page E-8)*

## **LIVESTOCK GRAZING IMPACTS**

Improper Livestock Grazing, a secondary threat, is the largest single threat within the S. Lemhi and Custer County GRSG area. This area also has a stable viable population as such the habitat mapping and assessment process, monitoring and implementation, and ability for site-specific mitigation is critical, especially when the majority of the area is defined as PPMA or CHZ. While there are some differences between the area of designation and monitoring basis of Alternatives D & E the approach to the designation of the habitat type and potential, monitoring, and mitigation are significant.

Alternative E provides action to address 'site specific' habitat or populations declines where Alternative D is done on a sub-regional basis. *"Most management actions and related impacts on grazing would be applied across all three habitat types, so they would be similar to those discussed in Alternative B but increased in intensity. (PG 4-148) There would be prioritized implementation of grazing systems or permit modifications to meet habitat objectives in areas that are not meeting these objectives. This would result in a moderate decline in permitted grazing over time as permits are modified to incorporate GRSG objectives at renewal. (PG 4-149)"* It is recognized that there will be some modification in grazing allotments, this will also require flexibility in management and utilization of other allotments. Yet Alternative D proposes, *"Retiring grazing permits, as described under Alternative B, would be considered where grazing privileges are relinquished or the allotment is vacant in all GRSG habitat types. As a result, total areas open to grazing may be reduced in the long term."* It would be more beneficial to adjust grazing, utilizing available allotments for responsible permittees as a part of a 'Cooperative Framework'.

Alternative E 'site specific' approach places priority *"...on allotment renewal in CHZ and IHZ where populations are declining. Management changes, if required, would be tailored to specifically address habitat objectives that need improvement, and the impacts on other resources or resource uses, such as wildland fire management, would be examined. As a result, impacts on livestock management may be limited, compared to other action alternatives, due to the increased flexibility to address site-specific needs."* (4.6.8, pg 4-150) The renewal process is directed towards *"...where populations of GRSG are. Changes to grazing management and associated impacts are most likely to occur in these areas."* (pg 4-151) This provides prioritizes efforts towards addressing GRSG concerns utilizing limited agency resources which already are overburdened, and applying efforts that will provide immediate remediation where needed.

Alternative E would have the least 'socio-economic' impact on Livestock grazing. *"Existing grazing management would be maintained unless the current grazing system does not meet GRSG habitat objectives and there is compelling information that changing the system would enhance habitat. Specifically, management actions in this alternative state that where population and habitat triggers are being maintained within a Conservation Area, this shows that the current grazing system is adequate to maintain viable GRSG populations and therefore absent compelling information, no further changes to BLM grazing systems would be required pursuant to Standard 8."* Should adjustments be required to Grazing Management plans these *"...would be applied at a site-specific level and specifically tailored to achieve objectives. (pg 4-151) Under Alternative E, some additional limitations would apply to structural range improvements, as compared to Alternative A. This could increase the time or costs for construction and maintenance of improvements or could impact the*

*ability to distribute livestock. These restrictions are more flexible than those under other action alternatives.”*

### **SOCIO-ECONOMIC IMPACTS**

While the EIS addresses Macro Social and Economic Impacts it doesn't meet NEPA requirements with regards to considering Micro Social Economic Impacts. Specifically *““The council on Environmental Quality's (CEQ's) Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act (40 CFR 1500-1508) point-out that the "human environment" is to be "interpreted comprehensively" to include "the natural and physical environment and the relationship of people with that environment" (40 CFR 1508.14). Agencies need to assess not only so-called, "direct" effects, but also "aesthetic, historic, cultural, economic, social, or health" effects, "whether direct, indirect, or cumulative" (40 CFR 1508.8). Furthermore, the Act stipulates "... when an EIS is prepared "and economic or social and natural or physical environmental effects are interrelated, then the environmental impact statement will discuss all of these effects on the human environment" (40 CFR 1508.14). The EIS's are thus intended to provide a kind of full-disclosure procedure for federal decision-makers, who are then expected to consider the negative as well as the positive implications of potential courses of action, and the unintended as well as the intended consequences, before they proceed.”*

The main economic basis in Custer County is mining and then agriculture/ranching. A reduction or major modification to livestock grazing permits would impact the viability of the ranches within the area. While there has been some transition from family owned ranches to corporate/investor owned, local business is heavily dependent on the ranching community and the associated grazing permits. Any implementation of a Sage Grouse Management Plan that would have major changes in the grazing would severely impact the historical cultural economic affect on the community. As such the implementation of Alternative D [B, C, or F] must consider the direct, indirect, or cumulative impacts as set forth in 40 CFR 1508.8, of which the EIS does not.

Mon, Jan 27, 2014 at 7:42 AM

To whom it may concern;

I wholeheartedly endorse plans related to sage grouse that allow the continued use of public land for the public. Any limitation for public access and use would directly and adversely affect my business and my ability to provide a living for my family. This would not only affect me but most of the families in my community. Further restrictions on our way of life and business interests would make us the endangered species. Most of the proposed alternatives, if not all, do not address the real culprits to sage grouse which are predators.

I endorse the Idaho Governor's Alternative as the best option because it provides for continued, measurable use based on science, not an unproven dislike for any one industry. Thank you.

Von Bean

BLM – Greater Sage-Grouse EIS  
1387 S. Vinnell Way  
Boise, Idaho 83709

RE: Draft – Idaho and Southwestern Montana Greater Sage-Grouse Land Use Plan  
Amendment and Environmental Impact Statement.

The Beaverhead County Commissioners support No Action – Alternative A for  
southwestern Montana.

The Commissioners feel that the second paragraph on Page 4-293, Environmental  
Consequences Idaho and Southwestern Montana Greater Sage-Grouse Land Use Plan  
Amendment and Environmental Impact Statement, Volume II B summarizes our area and is  
extremely important. This paragraph is as follows:

### Southwestern Montana

The southwestern Montana population occurs in Beaverhead and Madison  
Counties, in the vicinity of Dillon, MT. Segments of this population make  
seasonal migrations into Idaho. Priority areas for conservation encompass 80  
percent of this area, divided into four sub-populations, and were identified by the  
relatively high density of GRSG and the genetic connectivity between this area  
and Idaho. Habitat threats are generally improper grazing management, isolated  
sagebrush control efforts, and expansion of conifers in Sage-Grouse habitat.  
Habitat conversion on the Idaho side of the MZ may also affect this population to  
some extent. Given this population's size, limited habitat threats, and  
connections to Idaho, the southwestern Montana population is considered low  
risk (USFWS 2013).

Thank you for this opportunity to comment.

Sincerely,

C. Thomas Rice  
Chairman

Garth L. Haugland  
Commissioner

Michael J. McGinley  
Commissioner

28 January 2014

RE: Idaho and Southwestern Montana Greater Sage-Grouse Draft Land Use Plan Amendment and Environmental Impact Statement.

To Whom It May Concern;

The members of the Beaverhead Outdoors Association respectfully request the BLM and the Forest Service accept this comment letter regarding the Idaho and Southwestern Montana Greater Sage-Grouse Draft Land Use Plan Amendment and Environmental Impact Statement (Sage-Grouse Plan or Plan).

The Beaverhead Outdoors Association is a group of approximately one hundred thirty (130) hunters, fishermen and women, ranchers, farmers and those that enjoy recreating on public lands. We live in a county comprised of nearly sixty-nine percent (69%) public land. Of this fifty-nine percent (59%) is under federal management and ten percent (10%) is state land. Our members are significantly impacted by any changes to land management policy. Some of our comments are of an overall general nature while some are specific to the Plan.

When discussing the “Endangered Species Act” there are several deficiencies contained in the Act. We would hope that everyone concerned with wildlife preservation consider utilizing the “Top Ten Ways to Improve the Endangered Species Act” (Range Magazine \* Summer-2013 \* page 71). These suggestions are not law, however should be. We will leave these ideas as food for thought during your sage-grouse strategy development.

1. Reward private landowners who chose to participate in saving species

instead of punishing them through regulatory confiscation for having those species on their land.

2. All agency actions in the listing process must be judicially reviewable.
3. There must be more realistic timelines for determinations. (Rule is 90 days)
4. The data used must be reliable, replicable and verifiable.
5. The ESA must not focus on single species management.
6. Replace coercive incentive programs with truly incentive-based compensatory programs.
7. The cost of the ESA and its implementation should be borne by the general public and fully accountable on an annual basis.
8. Species which are listed and afforded the protections of the ESA should be limited to those species with a majority range within the borders of the United States.
9. Ambiguous and subjective language must be eliminated.
10. Efforts must be more focused on those species that are in most danger of extinction due to the direct measurable effects of human activity, and only when the modification of those activities will have significant measureable effect on species survival.

Keeping these ten ways of improving the Endangered Species Act in your thoughts should help produce an intelligent plan that the landowner and citizen in general can accept and live with.

The first general comment has to do with the title of the Plan, “Idaho and Southwestern Montana Greater Sage-Grouse Draft Land Use Plan Amendment and Environmental Impact Statement”. This leaves the reader with the impression that “Land Use” or habitat is the only focus of the Plan. The members of the BOA oppose management plans that focus on only one aspect of a single species management. This includes the application of the Endangered Species Act as well as land management policies. When all species including livestock are included in habitat management decisions, all will thrive. Grazing by bison and then livestock has been historically shown to be beneficial to all wildlife.

The second general comment is the federal government’s dysfunctional approach to land management in general and sage-grouse management in particular. The Montana Fish, Wildlife and Parks has been tasked with trying to improve

habitat for a sage-grouse population, that is not in trouble within Montana. The first thing the BLM and Forest Service did was to divide the state of Montana into five (5) districts that overlapped Idaho, Wyoming, Utah, Nevada, North and South Dakota. Each state must be allowed to develop their own strategy to keep the sage-grouse from being listed as endangered in their own state. Federal plans to aid the recovery of one species generally causes the extinction of another species. Ravens are a protected species that has been proven to be the greatest predator of sage-grouse. Research by the USGS, Idaho State University and the Nevada Department of Wildlife has documented this finding.

The third general comment deals with the “Numbers Game”. The deception concerning wolf numbers and what is recovered and how often the goal posts were moved by the U.S. Fish and Wildlife Service, The Montana Fish Wildlife and Parks and the numerous Federal Judges involved has left a sour taste in the mouths of our members.

The first determination must be: “How are sage-grouse numbers to be determined?” Are lek locations and bird counts to be made on the ground or at thirty thousand (30,000) feet or higher? What methodology of counting sage-grouse will be used? The Montana FWP plan calls for a count of displaying males at each lek in a range of between 6.98 and 18.71 males and that the number used will be determined at a later date. Without knowing the specific range number goal before the counting begins will lead to goal posts being moved to insure the removal of man from the landscape and an end of intelligent land management. The U. S. Fish and Wildlife Service, 50CFR Part 17 requires that the rangewide population of sage-grouse fall below five thousand (5,000) mature birds to legally qualify for listing as threatened or endangered. The population of the range must be geographically connected. Without on the ground counts by wildlife biologists of not only birds but active leks and their location, there will be a continual debate over estimated numbers. The methodology of initial counting, frequency of count updates and the goal count must be agreed upon by all parties and approved by the courts before a plan can be established.

The second determination must be: “What was the original range of the Greater Sage-Grouse?” Have there been careful analysis of the Journals of Lewis and Clark, Peter Skene Ogden, Fremont and Workman Expeditions to determine the frequency of encounter as well as the “original” historic range. Were sage-

grouse noted in large numbers before European expansion into the West? Where were sage-grouse encountered? Are the baseline numbers and range to be those of the 1804-1830 time of original exploration or the 1870-1900 timeframe of westward expansion and livestock grazing? What scientific studies in each region have been completed and verified to establish the range and population size of the sage-grouse. Once an accurate on the ground count within each state is completed and verified, the U.S. Fish and Wildlife Service must return to the court, present the verifiable data, correct the misinformation in the “Species Assessment and Listing Priority Assignment Form” and request an end to litigation by environmental groups. We prefer verifiable scientific studies to anecdotal journals, letters and stories. Once the courts have approved the methodology of counting and accepted the resulting counts, a control group in each state must be established. We would prefer private lands be managed by the land owner as they deem appropriate without interference by the courts and other agencies. Federal lands managed by the BLM and Forest Service would be managed by the plan created by this EIS process. Scientific review on an ongoing and replicable basis would compare the results achieved by the varied plans for production capability and all wildlife health. Only with analysis of differing management approaches can the value or deficiency of each management plan be determined. Each plan can then be modified to utilize the most effective aspects of the competing plans and discard what isn't working.

The forth general comment is in regard to the voluminous quantity of un-useable maps. Seventy (70) pages of blurry, over marked maps that are way too small for the citizen to determine where their favorite recreation area is let alone determine the plan's intent is a waste. Magnifying the map CD to 300% still leaves the observer with no detailed idea of exactly what the BLM is trying to show. Way too much information on a map that is way too small to determine detail. EIS Volume I, page ES-13 Delineated GRSG Management Areas states: “Due to differences in state-level mapping efforts in Idaho and Montana, there is currently no consistent designation of specific GRSG seasonal habitat or vegetation across the sub-region.” How can you produce maps and designate habitat when there are “differences” in mapping efforts?

Our final general comment concerns the cost of producing the five (5) volume “Sage-Grouse Plan” for Southwestern Montana and Idaho. This appears to be an extravagant expenditure of taxpayer monies that could have been better spent

hiring the best lawyers to press the case to the Federal Judiciary that the sage-grouse is not threatened in most of the United States. Currently it appears that the U. S. Forest Service and the Bureau of Land Management are budgeting more and more resources on administrative appeasement of radical environmentalist organizations than on the ground locally developed improvements to the land. Locking man out of public lands and removal of multiple-use strategies does more harm to wildlife habitat than federal agencies will admit. A fundamental change in how the agencies spend their limited resources must be developed before public lands are lost forever.

In the introductory letter dated November 1, 2013 on page one of EIS Volume I paragraph one states “This document has been prepared in consultation with cooperating agencies and in accordance with the National Environmental Policy Act of 1969,…” This is a gross misstatement. The U.S. Fish and Wildlife Service created an inaccurate, incomplete and flawed Species Assessment and Listing Priority Assignment Form and ran. Until such time as the Service is forced to join in the development of the plan and defend the listing of avian predators that are creating suspected declines in sage-grouse numbers, this plan will be a sham designed to remove man from public lands. If there is truly a problem with sage-grouse numbers then all contributors to the decline, including ESA listed species, in those purported numbers must be addressed.

Again from the introductory letter dated November 1, 2013 paragraph two concludes with the statement: “All actions analyzed in this Draft LUPA/EIS would apply to the lands and resources managed by the BLM and US Forest Service.”

An open house scoping meeting was held at the beginning of this process in January 2012 at the National Guard Armory in Dillon, MT. The handout, National Greater Sage-Grouse Planning Strategy: Purpose and Need states: “Amending the existing LUPs will provide long-term consistency and an adequate approach toward managing greater sage-grouse habitat on BLM-and Forest Service-administered lands in the affected states, as well as habitat administered by other agencies and privately owned habitat.” The BLM representative conducting the sage-grouse open house in Dillon on 9 January 2014 stated that the handout was simply a “poorly worded statement” and I “misinterpreted” the meaning of the statement on the 2012 handout. “The agencies involved would never interfere in private property rights.” Past actions by the federal government has shown contempt for private property

rights and a willingness to circumvent the Constitution. This over reaching mentality of the Federal government must be ended and any federal employee trying to impose his/her Big Brother Plan on private property must be terminated.

The Montana “Draft Greater Sage-Grouse Habitat Conservation Strategy” speaks of land and habitat without any de-lineation between federal, state or private property. This is problematic from many perspectives. Now there are three documents with three perspectives of what sage-grouse habitat is and how it is to be managed. The BOA is adamantly opposed to any infringement on private property rights. The overreach of the federal government into the operations of farmers and ranchers that are feeding our nation must be removed from any plans. As mentioned in the “Ten Ways to Improve the Endangered Species Act” incentive based co-operation with landowners is preferable to rules and regulations.

Volume II A, Table 1-5, page 1-39: County Land Use and Sage-Grouse Management Plans lists Growth Policy dated June 20, 2005 as the reference for Beaverhead County, Montana. Our perspective would have indicated information on county land use policy for Beaverhead County, Montana would be found in the “Beaverhead County Public Lands Resource Use Policy and Plan”

Table ES-2, Identified Threats to Greater Sage-Grouse, the USFWS lists invasive species as the number one threat to sage-grouse while both Montana and Idaho list fire/wildfire as number one. Conifer encroachment is listed as number nine. Isn't conifer encroachment an invasive species along with juniper? These two could be combined into one comprehensive plan although conifer encroachment requires a chain saw and invasive grasses requires better fire management (number 3). Have the courts rejected environmental litigation in favor of logging contracts to reduce conifer encroachment? Has the Forest Service and BLM used the habitat restoration for Endangered Species Act purposes argument in court to allow timber harvest for the purpose of reduction of conifer encroachment?

Fire and invasive species are also interconnected. For ten thousand (10,000) years the Native American peoples have used fire as a management tool (References on the American Indian Use of Fire in Ecosystems, Gerald W. Williams, PhD.). “Generally, the American Indians burned parts of the ecosystems in which they lived to promote a diversity of habitats, especially increasing the “edge effect”, which gave the Indians greater security and stability to their lives.” Through scheduled and purposeful low intensity fire application to the ecosystem

the Native Indian Tribes maintained a vibrant ecosystem.

Current fuel loads on both forested and grasslands are at a critical point in the West. When a fire occurs today the result is far too often an intense conflagration that consumes everything, wildlife and livestock, public grasslands and hay meadows. This is the result of management by environmental litigation and court edict. The Federal managers should look to the private property land managers to see what works and defend them in court as policies that work. The “control group” in the scientific habitat management experiment previously suggested. The agencies should reject all wilderness (no management) legislation and support forest fuel load reduction (HR 1526) to improve habitat for all species. The best tool to reduce wildfire is prevention. Prevention requires logging, removal of overgrown sagebrush stands, and most important prescribed fire on a regular basis to prevent catastrophic fire that sterilizes the soil. Only invasive species seem to thrive in habitats burned by intense fires.

Some fires (low intensity) should be allowed to burn to remove fuel load and prevent intense, catastrophic fires. When fires require response the use of retardants becomes a problem. Have all fire retardants been thoroughly tested and found to be environmentally safe? Under court order the U.S. Forest Service issued the December 2011 “Nationwide Aerial Application of Fire Retardant on Forest System Land” Record of Decision. Page 2, Decision:” “Aerial retardant drops are not allowed in mapped avoidance areas for threatened, endangered, proposed, candidate or sensitive (TEPCS) species or in waterways.” Will this determination by the Forest Service preclude the use of fire retardants on all other public lands? The BLM representative conducting the 9 January 2014 Open House in Dillon informed me that the Retardant ROD only applied to Forest Service Waterways. That is NOT what the ROD says. Mapped areas of critical habitat for threatened or endangered species are also included. Once the Preliminary Priority and Preliminary General Management Areas become final and “Mapped” are they automatically added to the map contained within the ROD? Will the court add the BLM lands to this ROD during the next round of litigation that is assured to occur? Is the Forest Service required to amend the ROD to include new “mapped” areas of concern? We are currently “amending” multiple Land Use Plans (LUP) to accommodate perceived sage-grouse declines. When will scientific all encompassing land management be returned to public lands?

Climate change discussion in a scientific document can only reflect the fact that the earth's climate has been changing continually since creation. The earth has gone through heating (Jurassic) and cooling (Ice Age) for millions of years without man's influence. The current revelations of data manipulation by certain scientists working for the IPCC casts a large shadow on any data from this organization. Current independent temperature data in fact shows some cooling taking place. All references to manmade climate change and any management decisions formulated by this manipulated data must be removed from this plan.

Cattle and sheep grazing have been targeted as the villain causing all of the problems on public land. The opposite in fact is the truth. Grazing promotes wildlife habitat health. The rangelands of the West have simply changed one of the grazing species. At the time of westward expansion American Bison numbered in the tens of millions (est. 30-50 million) and roamed the Great Plains grazing where the pastures were the greenest. Replacing the tens of millions of bison with a few million cattle and fewer sheep reflects the need for increases in grazing. Fire has been listed as the third most important factor in sage-grouse decline. Invasive species are listed as the number one threat to sage-grouse habitat. Grazing reduces fuel loads in sage brush steppes while fertilizing the same area. When properly utilized in large enough numbers, sheep and cattle grazing improves habitat in a similar manner as the millions of bison that once covered the West.

In conclusion the Beaverhead Outdoors Association recommends Alternative A, No Action. We would further suggest a more active fuel reduction policy combined with defending that policy in court with determination. Presenting the theory, in court, that fuel reduction protects endangered species will deflate the no management preference of the environmental community.

A one size fits all plan must be replaced by local plans that fit the conditions within the local community. Logging, grazing and reductions in invasive species (conifers and cheat grass) should be coordinated to produce range lands that will support all species.

Re: DLUPA/EIS -Idaho and Southwestern Montana Greater Region

Dear BLM Planning Team:

This correspondence will act as the official comments of the Blue Ribbon Coalition (BRC), a national trail-based recreation group, regarding the Idaho and Southwestern Montana Greater Sage-Grouse Draft LUP Amendments/Draft EIS.

This document shall not supplant the rights of other BRC agents and organizational or individual members from submitting their own comments and the agency should consider and appropriately respond to all comments received. For purposes of this comment document, the Greater Sage-Grouse will be referred to hereafter as the Grouse.

In our March 20, 2012 scoping comment letter (see attached), BRC urged a “common sense” approach to management. BRC believes local land managers at the Resource Area/Field Office or Forest/District level should be heavily involved with the motorized public to establish achievable goals for protection of the Grouse (lek /nest disturbance, wintering areas and sagebrush steppe habitat degradation) and to mitigate potential affects upon recreation through designation and active management of existing and inventoried routes.

Blanket closures should always be viewed as the most extreme measure to undertake after all other management techniques and measures have failed. BRC believes that sound, proven OHV management techniques can allow the agency to protect the Grouse and habitat and to provide for all forms of responsible, family oriented OHV/ORV recreation.

BRC concluded the Grouse has been intensively studied for the last 60 years and there are a number of factors that have been identified as major contributors to the decline of the species. These include but are not limited to:

- Habitat destruction/modification thru urbanization/fragmentation
- Introduction and dominance of invasive annual grasses and noxious weeds
- Intrusion of Juniper ecotype
- Wildfire and fire management including prescribed burns
- Predation
- Fragmentation from fences, power-lines, roads and other infrastructure
- Hard and liquid mineral leases and development
- Livestock and wildlife grazing
- Wild horse/burro management
- Disease (including West Nile Virus)

In reviewing the available literature and studies as noted in our March 20, 2012 letter, BRC noted there is little to no information suggesting that motorized/mechanized access on designated routes is causally related to Grouse decline or habitat destruction, and there are no definitive studies to that effect cited anywhere in the database. Particularly considering the intense scrutiny and collective scientific energy expended on this species, BRC concludes that motorized/mechanized recreation in any of its forms does not have a significant impact on the Grouse. The USFWS listing petition decision supports this as well. Motorized recreation and/or OHV/ORV are barely mentioned and the limited references are anecdotal in nature. However, BRC does understand that OHV-related site-specific research may be needed to fine tune vehicle-based recreation on roads, trails, and areas so that future Grouse-friendly motorized access is assured.

## **IMPLICATIONS FOR VEHICULAR RECREATION**

In response to the listing decision and as the lead agency, the BLM, where most of the Grouse habitat is located, issued its National Greater Sage-Grouse Planning Strategy (Charter) and subsequent Instruction Memorandums (IM), along with various FAQ sheets, range maps and other incidental publications.

The production of National Environmental Policy Act (NEPA) documents such as this Draft LUPA when completed, will guide future management decisions for the Grouse and associated sagebrush steppe habitat. Because of the size of the landmass involving current Grouse habitat and distribution, BRC considers the production of this NEPA document to be a major landscape level decision. The Final LUPA/EIS and Record of Decision (ROD) will affect motorized recreation.

BRC is remains concerned this process has the potential to greatly affect/impact all aspects of motorized/mechanized recreation, from traditional camping, hunting and fishing access to access for photography, bird watching, mountain biking, boating, cross country skiing and wilderness areas. Most of all, this proposal could have a serious negative impact on casual OHV use and permitted special events such as enduros, trials, hare-scrambles and dual sport rides. All forms and aspects of motorized recreation --off-highway/off road motorcycle, dual sport/adventure sport motorcycle, ATV, SBS, OSV, 4WD and even all street legal vehicles -- could be adversely yet unjustifiably impacted, should the agency craft a "one size fits all" decision.

This has occurred in the past when elements of the motorized recreation community were not sufficient engaged in the planning process. OHV was not included in many of the stakeholder planning and political efforts associated with the Northern Spotted Owl because the issue was cast primarily as a “resource industry” problem. Recreation, including OHV use, was hardly mentioned.

Because of that lesson, BRC has been engaged from the beginning of the Grouse issue. That involvement has included submitting scoping comments in the very early stages of this issue and by submitting comments on subsequent DEIS plans. BRC has also been urging its members and land use partners to attend public meetings and to also submit comments.

As BRC has noted, Grouse leks are concise, well-established, historic areas that are used and usually identified for decades. Since leks are mostly in use for strutting/mating during crepuscular hours and motorized recreation is generally NOT undertaken during those hours the two can be successfully separated.

BRC also notes the BLM, like the Forest Service, state, county, local and tribal land management agencies are moving towards a mostly “designated route” planning effort for use of roads and trails that are compatible for motorized recreation use and we support that concept. On Forest Service lands the designation of routes are being driven by the 2005 Travel Management Rule Plans and in BLM planning efforts that have been developed or revised in 2008 and later where travel has been changed in most areas from “Open” designation to “Limited” per agency policy established in 2007.

While BRC supports OHV use limited to existing or designated routes, BRC also believes that an “open” to cross-country travel designation is an important recreational opportunity and is appropriate at some units. “Open” areas are often active sand dunes or associated staging areas that have minimal, if any, areas of even possible Grouse habitat.

Except for OSV winter use, where snowpack allows, BRC recognizes that unauthorized/unmanaged cross country travel can impact both wildlife and habitat.

BRC believes the preferred Alternatives D/E recognized the local Ranger District and Field Office level recreation planners and managers are the best suited to work with the motorized stakeholders to establish a manageable, designated, user- and nature-friendly route network for motorized access. This includes access roadways away from paved highways, high clearance routes for pickups, jeeps and other 4WD vehicles that can be shared under combined use by other OHV/ORV categories such as trail bikes, ATV/SBS and or OSV in the winter. Lesser used but just as important to the motorized community are rural 2 track routes, ATV width trails and trail bike single track width routes. Routes that are duplicitous, fill no need or are illegally established may often be properly considered for closure and/or rehabilitation. The desired condition is an adequate system/mixture of routes of suitable length and skill levels that follow Best Management Practices (BMP) established by Best Available Science (BAS).

BRC commends the agency for embracing the concept of limiting OHV use to existing and/or designated roads and trails as a primary strategy to help protect Grouse habitat. BRC believes this is the appropriate method by which to “minimize” impacts and otherwise comply with applicable law.

BRC supports the LUPA revision/amendment process, travel and transportation area decisions (open, limited, or closed) would be revisited at the local level based on existing inventory information associated with a myriad of resources and resource uses.

The local Forest/District or Field Office level comprehensive review of the recreation activities that occur in the amendment areas is important. Throughout most of the planning area recreational activities are mostly dispersed and do not rely on developed facilities and use is year-round and consists of varied activities including hiking, mountain biking, OHV riding, camping, hunting, and scenic touring. Day use is high, and there are very few developed facilities. Areas of concentrated use occur at popular destinations. There could be many motorized special events, mostly in late Spring, that could be adversely impacted by Alt. D/E. BLM permitted events include competitive motorcycle races, OHV and other vehicle races, competitive horse endurance rides, organized camping events, and competitive mountain bike races. These types of events and use patterns need to be understood and addressed at the site-specific level as opposed to being painted over by some generic, one-size-fits-all management direction.

The agency should allow SRPs and Forest Service Recreation Special Use Authorization (RSUA) in PPMAs and PGMAs that have neutral or beneficial effects on Grouse.

BRC support agency direction in Alternatives (D/E) that empowers local land managers the ability to grant special recreation permits. Depending on need and other factors, mitigation or restrictive measures could be placed on types, locations, and timing of activities to ensure consistency with the related management objectives. Group events could be subject to seasonal or timing prescriptions, which could limit the ability of some participants to attend. For example, many recreation events for which permits are issued on public land take place in June. In June the grouse are on nests and brood rearing. If the proposed activity poses a threat, the event may be moved or timing changed in order to reduce impacts during this period. It is possible that organizers may decide not to hold their event if they cannot hold the event at a particular time. This would represent a reduction in opportunity for participants who would otherwise have been attending such events each year. Regardless, it is essential that these factors be evaluated and decisions ultimately made at a site-specific level, and not through some broad criteria that cover all public lands.

BRC believes Alternatives D/E will enhance critical habitat, inhibit degradation, and avoid unwarranted impacts to historic OHV recreation including permitted events in proposed unit lands, BRC is recommending the agency review – and adopt as appropriate - the following (and proven) OHV management prescriptions into the Final LUPA/EIS and Record of Decision.

### **OHV Management Prescriptions**

**OHV Management Guideline One:** Limit Use to Existing and/or Designated Roads and Trails

**Overview:** On Forest Service lands, no off-road driving is allowed; the BLM does allow some cross-country travel in “Open” areas. Existing travel routes on BLM have not been completely evaluated through a travel management planning process and have not been completely “designated.” The current OHV designation for much of the BLM managed land in the amendment area is “open” to unrestricted cross-country travel.

“Open” to cross-country travel is an important recreational opportunity and is appropriate at designated sites.

**Prescription:** Except where “Open” OHV use is appropriate (i.e. sand dunes, specific geographic locations, designated/destination OHV areas, etc.), prohibit cross-country travel as the agency’s primary OHV management tool. Limit OHV use to existing use where travel plans have not yet been completed and restrict OHV use to designated roads and trails where travel plans have been completed. Casual driving and use of existing or designated trails should be considered a diffuse disturbance with no long-term effects.

#### **OHV Management Guideline Two** – Limited Operating Period for OHV Permitted Events

**Overview:** There are many motorized special events in the planning area, mostly in June. These include competitive motorcycle races, OHV and other vehicle races, competitive horse endurance rides, organized camping events, and competitive mountain bike races. Lekking occurs between March 1 and May 15.

**Prescription:** Between March 1 and May 15, prohibit OHV events from using routes that pass through an active lek. Impose a time of day restriction (after 10 a.m.) for routes that pass within ¼ mile of an active lek. Consider a reroute around the active lek site as preferable to a seasonal restriction or closure on said route.

#### **OHV Management Guideline Three** – OHV Sound Restriction

**Overview:** Although there are not studies specifically focused on the noise effects of OHV use on the Grouse, there are OHV noise studies related to the Northern Spotted Owl (specifically OHV events) and other wildlife. At least one project shows that noise levels could affect the breeding success of the owl. BRC believes that noise impacts to wildlife must be addressed when managing routes for OHV use. Land managers in states that do not have any statewide OHV sound laws should consider adopting sound laws for special management areas or units that have been designated as critical habitat. (40 CFR, Chapter 1, Section 201.158)

**Prescription:** Adopt a defensible standard OHV sound regulation for grouse mitigation. Consider Idaho’s OHV Sound Law – A muffler and Forest Service approved spark arrestor. Your muffler must be at or below 96dB at the half-meter test, SAE J1287. IC 67-7125

#### **OHV Management Guideline Four** – Invasive Species

**Overview:** Cheatgrass and Medusahead wildrye have become the most problematic of the exotic annual grasses within the Sage-grouse Conservation Area” (Miller et al. 2011) OHVs can inadvertently spread invasive/noxious weeds including cheatgrass and medusahead. It is important that vehicles be weed-free before travelling off-highway. Thoroughly washing the OHVs will ensure that the seeds are removed and will help mitigate the spread of noxious weeds.

**Prescription:** Adopt and promote an invasive species related prevention/education program based on the tenets at - <http://playcleango.org/>

**Conclusion:**

BRC strongly feels that the right blend of Alternatives D/E could allow the agency to meet its goals and objectives to protect the Grouse and its habitat without unnecessarily or unjustifiably restricting responsible, managed motorized recreation. Thank you for this chance to comment and we look forward to assisting in the NEPA planning process as it moves forward.

Sincerely yours,

*Don*

Dear Bureau of Land Management officials:

I am an active birder in Michigan and enjoy traveling around the states to see birds. I have birded CA, AZ, TX, AK, NV, and MO so far. One year I will take a vacation in hopes of seeing a Greater Sage Grouse.

Please take all actions available to save critical breeding habitat for this bird. Birding, Eco tourism, and Eco photography have an economic benefit to those in the area where people want to visit. It is incumbent on the BLM to protect that land so people want to visit an area. Not only to protect Eco tourism, but to protect a species that cannot protect itself from man's decisions.

Thank you for considering these comments.

Bortz, D (Dennis) <Dennis.Bortz@raboag.com>

Wed, Jan 29, 2014 at 10:30 AM

To: "blm\_id\_swmt\_sagegrouse\_eis@blm.gov" <blm\_id\_swmt\_sagegrouse\_eis@blm.gov>

Good Morning,

I would like to take a few minutes to voice my support for Governor Otter's Alternative "E" as the final management plan for managing sage grouse in Southern Idaho.

As a cattle producer, I take very seriously the stewardship of the rangeland I use. I think we can all relate to the pride we feel when we leave something better than when we "found" it. The same goes for our rangelands - both public and private. We have a civic duty to manage those lands in such a way to safely produce protein for human consumption; improve and maintain habitat for the wildlife that share those lands; and to preserve and maintain the recreational opportunities that our region offers. This stewardship needs to be driven by sound science and not ulterior agendas that are often "cloaked with the welfare of habitat or wildlife".

I believe the Governor's alternative "E" provides a plan for that type of stewardship.

Dennis R. Bortz, ARA

## Sage Grouse EIS

1 message

---

Nancy Brackett <nancyb660@gmail.com>  
To: blm\_id\_swmt\_sagegrouse\_eis@blm.gov

Mon, Jan 27, 2014 at 12:50 PM

To Whom It May Concern:

I submit the following comments on the BLM and Forest Service sage grouse management proposals. Idaho's Governor's Alternative E should be the sole final alternative for managing sage grouse within the state of Idaho.

Alternative E is based upon already existing Idaho Rangeland Health Standards and upon the premise that any management changes should be linked to the population status of the bird which must be conducted on a site-specific basis.

If the sage grouse populations are stable, there should be no need to trigger additional management measures. If the species population is threatened for any specific area, changes to grazing management will not be made unless it can be proven that improperly-managed grazing is the casual factor and will be weighed against the habitat capabilities.

Livestock grazing provides an effective line of defense against fire and noxious weeds.

Wildfire is the greatest threat to destroying sage grouse habitat. Livestock grazing should be used to reduce the risk of catastrophic wildfires, improve forage, and remove invasive species, and provide open space.

Alternative E has an aggressive approach to fire and fuels management. It incorporates livestock grazing as a mechanism for fuels reduction. It also highlights the significance of Rural Fire Protection Association in the Sage Grouse Management Area.

Also, to be considered are the impacts to our human environment and economy, including grazing, mining, oil and gas, and other multiple-use industries. If grazing permits are reduced as a result of this effort, the negative economic impact to rural communities would be significant. The final EIS should acknowledge the human circumstances and the consequences to the economy.

Alternative E offers the best option for conserving sage grouse and its habitat and achieving the goal of avoiding an unnecessary federal listing of the species, while protection and maintaining land-use activities in the state and preserving Idaho's way of life.

Sincerely,  
Nancy Brackett

The BLM & USFS should adopt Alternative E, the  
Federal Government's Alternative as the sole or final  
alternative for managing sage grouse within the state  
of Idaho. Alternative E centers around meeting  
the Idaho Rangeland Health Standards (IRHS).  
The Alternative E strategy includes habitat  
characteristics to be incorporated into relevant  
grazing permits or guidelines upon permit  
renewal, as well as adaptive management process  
to adjust grazing outside of the normal schedule  
permit renewal process if grazing is determined  
to be a causal factor in GRSB population or  
habitat decline. This component also  
provides much much needed predictability for  
livestock producers who operate in GRSB habitat.

Feral horses and burros are not native species.

They were introduced by man.

Sage Grouse are native species and should be protected.

Cattle and sheep are not native species and should not be considered superior to the native species.

To: "blm\_id\_swmt\_sagegrouse\_eis@blm.gov" <blm\_id\_swmt\_sagegrouse\_eis@blm.gov>

January 27, 2014

To Whom It May Concern,

As an Idaho rancher, I submit the following comments on the BLM /Forest Service sage grouse management proposals. My Livelihood depends on my ability to graze livestock on public and private lands. As such, it is in my best interest that the lands are managed to optimum condition, which is both ecologically and economically beneficial. I am concerned that the pending effort to significantly amend the land use plans has the potential to create unnecessary restrictions on my ability to graze livestock and will result in unintended consequences that will be more harmful than helpful to sage grouse.

For these reasons, I encourage the BLM and Forest Service to adopt Alternative E, the Idaho Governor's Alternative, as the sole final alternative for managing sage grouse within the state of Idaho. Alternative E. offers the best option for conserving sage grouse and its habitat and achieving the goal of avoiding an unnecessary federal listing of the species, while protecting and maintaining land-use activities in the state and preserving Idaho's way of Life.

Sincerely,

Randy Brown  
Rexburg, Idaho

# Idaho and Southwestern Montana Sage Grouse Draft Land Use Plan Amendment and Environmental Impact Statement Comment Form

Send by Jan. 29th to:

BLM-Greater Sage Grouse EIS  
1387 S. Vinnell Way  
Boise ID 83709

Or, e-mail comments to:  
blm\_id\_swmt\_sagegrouse\_eis@blm.gov

Date:	Jan 14, 2014
Name:	Art Butler
Address:	269 Spring Creek Rd Bliss ID 83314

As an Idaho Rancher I fully support  
and encourage the BLM and USFS to adopt  
Alternative E of the sage grouse management  
plan. This plan recognizes the #1 threat  
to grouse is fire and a good, effective &  
economical tool for fire control or suppression  
is livestock grazing. This alternative  
would result in the best chance for  
sage grouse and the the most beneficial  
to Idaho communities and least harm  
to ranchers who depend on public lands  
for our livelihood.

Sincerely  
Art Butler

4

Dillon

I would like to thank you for the opportunity to give testimony tonight.

Wayne J. Butts the chairman of the  
My name is Wayne J. Butts and I am a Custer County Commissioner in Custer County with Challis being our county seat. We have over 3 mil acres of State & Federal owned land with only 158,000 acres of taxable land. Custer County, located in central Idaho contains just over 982,000 acres. Your area has

acres of sagebrush uplands, many of which are home to the Greater Sage Grouse. Within Custer County 236,379 acres of Sage Grouse preliminary priority habitat and 1,213,677 acres of Sage Grouse preliminary general habitat have been identified.

Although Sage Grouse populations are thought to be suppressed from historic levels, the population within Custer County is widely dispersed and currently has adequate surplus to allow for a limited, regulated harvest under the management of the Idaho Department of Fish & Game.

2

Although Custer County does not agree with the Governor's plan because of it's lack of good scientific data. If that is what it takes to keep our permittees on their allotments, then we support our permittees.

The Custer County Commissioners are proposing a Coordinated Initiative involving representation from the following:

Custer County Commissioners

US Fish & Wildlife

BLM

Forest Service

Idaho Department of Fish & Game

Office of Species Conservation

Challis Local Working Group

Natural resource Advisory Committee

*unsuccessful with the Tribes*

13

These departments will, through the Intense Sage-Grouse Predator Control Study Area, ensure that the lands within Custer County are managed to provide for viable population of Greater Sage Grouse dispersed across suitable habitat such that sustainability concerns are addressed today and into the future. Our study group will put together a ten year program to collect scientific data of what we feel is the true threat to Sage Grouse habitat and what will need to

be done to protect or enhance it. We truly feel that predation is the top priority not fire. The one size fits all party has does not work for Custer County. Our local working group has decades of quality Scientific data which

includes collaring and Lek studies. This information is available in layers that we can build on.

The Governor's plan certainly fits the needs of the Treasurer Valley. which burns EVERY year,

We too deserve a study for our area and areas like ours. So we have taken the lead in the state of Idaho to address predation

Thank you

Wayne J. Butts  
Custer County Commissioner

To whom it may concern:

Cassia County Commissioners support: (ES.6.6 Alternative E)

Alternative E focuses primarily on management for the threats of wildfire, invasive species, and large infrastructure projects, and secondarily on management for the threats of improper livestock grazing management and related infrastructure, West Nile Virus, and recreation. It recommends use of an adaptive management approach and implementation of triggers or thresholds that adjust zone criteria. There would be a 5 percent disturbance cap associated with fluid mineral development under Alternative E.

We feel that Alternative E would cause less of an economic impact to Cassia County.

Board of Cassia County Commissioners:

DENNIS D. CRANE, Commissioner Chair

PAUL CHRISTENSEN, Commissioner

**To: Bureau of Land Management – Greater Sage Grouse Planning leaders**

**Subject: Comments on Public Meeting of Greater Sage Grouse Planning Efforts**

I have questions on why reduction in livestock grazing is being considered in an effort to restore sage grouse?

In an effort to fully understand the situation I have researched various reports and data from the Idaho Fish and Game, BLM and other sources. Looking at this data one of the only negative comment on grazing impact to sage grouse is referenced in the 1997 Fish & Game recovery plan tied directly to comments that some of the public feel strongly that grazing and hunting have caused declines and demand that these two activities cease.

Sage grouse and related species population west of the Rocky Mountains varied greatly in the last 200 years depending on climate conditions ("little ice age" of 1815, winter of 1886, droughts of 1864, 1895 and 1935) understanding during this time period different versions are passed down by various people. From sources I have researched sage grouse reached their peak after WWII in about 1946 to 1950.

Utilizing the US Department of Interior BLM grazing data use on USDI-BLM lands 1953 to 1998 shows:

- Approximately 18 million AUM in 1953
- Approximately 17 million AUM in 1960
- Approximately 14 million AUM in 1980
- Approximately 12 million AUM in 1998

Specifically looking at sheep the US Department of Agriculture data shows that in 1946 approximately 56 million sheep grazed in the Western US compared to approximately 5 million in 2010 or a reduction of 91%.

From the 1997 Idaho Fish & Game plan it reported during the 1960's and 1970's large numbers of sage grouse and livestock were compatible resulting in good ecological conditions providing acceptable nesting, chick rearing and winter habitat. It was also noted that common concerns today with fire can be minimized with grazing practices.

Negatives about grazing in riparian areas has also been mentioned. I would like to note that the vast majority, estimated at over 90% of riparian habitat in Lemhi County Idaho is held by private landowners. If grazing is reduced on public lands and shifting those animals to private land it will have a negative impact on all fish, wildlife and birds in the riparian areas. Further negative impact may occur if grazing changes impact economic conditions and ranchers sell more ranch land is subdivided. In 2010 the American Farm Land Trust reported 40% of farm and ranch land was converted to other uses between 1960 and 2010. By 2020 it estimates 11% more will be lost.

The economic impact to the area is also a concern. The biggest income and tax base in Lemhi County is ranching operations and cattle sales. In an area such as Lemhi county that is suffering a loss of jobs, outdated and underfunded schools and a challenging business environment we must be thoughtful on the negative impact of reducing the most significant income and tax producer. As an example in Lincoln County Montana (Libby), it went from having on the highest income levels in all the state to having the greatest percentage of people on public assistance as a result of logging and fish restrictions in the 1980's that failed to help any endangered species.

If we are looking at opportunities to increase sage grouse numbers, is predator control being considered? Depredation by prey species has an significant impact on sage grouse (predators such as coyotes and fox as well as raptors such as hawks, eagles and ravens). In 1997 Tim Craig a local wildlife biologist conducted a sage grouse study for the Salmon Fish & Game. Grouse were study through radio telemetry and other field studies. In the Leadore area were ten sage hens were collared and tracked, over the winter 7 of the 10 were killed by coyotes.

Looking at the current conditions sage grouse continue to decline.

- If over 50% of sage grouse are being lost to predators
- If private land habitat continues to be reduced and turned into subdivisions
- If public land habitat is further reduced through road and energy development in other regions and states
- And all while grazing has been significantly reduced

Wouldn't we want to try and keep as much open space land available (ie ranching) and return to the conditions of 1950 to 1980? Understanding public land has many stakeholders, but it is the time to use facts and not make politically correct decisions on strong feelings of an unformed public.

Respectfully,

Joe R Caywood

Attached please find the comments of the Central Idaho Rangelands Network (CIRN) regarding the "Idaho and Southwestern Montana Sub-Regional Greater Sage-Grouse Draft Environmental Impact Statement." CIRN recognizes the critical role that sage grouse play in the rangeland ecosystem of Idaho. As land owners and ranch operators, we are intimately involved in the stewardship of our range resources and formed the Network to ensure that we share the best information and management practices available to support that stewardship.

Tom & Seth McFarland  
Carmen Creek Ranch  
Salmon, ID

Tom Page  
Big Creek Ranches  
May, ID

CIRN is comprised of ten ranches with over 80,000 acres of private land and more than 1.5 million acres of federal and state grazing permits spread across South Eastern and Central Idaho from Salmon to Richfield. Much of this landscape, both public and private, is core sage grouse habitat or Preliminary Primary Habitat (PPH). Supporting sage grouse is consistent with our mission to foster innovative approaches to grazing, land and water management that sustain and enhance the natural and community values of our region. Managing our public land allotments in support of sage grouse populations is a vital part of this objective.

1. We support, in general, projects that work on long-term habitat enhancement for security, chick nutrition, moisture retention, and infrastructure removal and mitigation. With that in mind, we support Alternative D's broad-based approach to habitat recovery. The focus on conifer removal emphasized by Alternative E is too narrow. Conifer encroachment, particularly into aspen groves at higher altitudes, needs to be addressed on some of our allotments but only within the context of the larger landscape and overall habitat recovery planning.
2. The mapping efforts of the Challis Local Working Group have been solid, and the Alt E map for the Mountain Valleys region is more accurate than the map from Alternative D. As our Local Working Group maps are an accurate reflection of sage grouse and their habitat here, we would like to see the map designations for Alternative E be selected for use in the final alternative.
3. We support the need for better wildfire suppression and response efforts as proposed. We believe that rangelands need added emphasis on research into invasive and noxious weed species, such as cheatgrass, as well as the expanded control and suppression efforts represented in both Alternatives D and E. We would like to see the targeted grazing methods outlined in Alternative E included in the final alternative as we believe this is a vital tool for both vegetation management and wildfire suppression.
4. Regarding Rights of Way (RoW), we would support the compromise designation of "avoidance with limited exclusion" for RoWs, as suggested in Alternative D, as opposed to the less-stringent emphasis in Alt E, or the "exclusion with limited exceptions" as proposed in Alternative F. Regions such as the Upper Pahsimeroi are candidates for evaluation as an area of exclusion as there is currently no infrastructure in that area.
5. To reduce weed spread, fire risk and general disturbance, we support Alternative D with respect to ORV travel areas, where all travel within ID is limited to roads and designated trails; rather than Alternative E, which allows unrestricted ORV travel in many places.
6. We are concerned that under Alternative E, our Mountain Valleys region will become responsible for the maintenance of sage grouse populations over time. The restrictions needed to maintain 65% of the birds, as proposed by the Idaho Office of Species Conservation may well fall to our region as we have reduced levels of many primary threats to sage grouse populations such as wildfire, habitat fragmentation, cheatgrass, energy and human infrastructures that the other regions have. If this population trigger is maintained will the remainder of the region look to us to maintain dwindling sage grouse populations? Under such an outcome, none of the Alternatives offer a specific remedy for us as ranchers. In such a case, one alternative is a third-party voluntary and permanent buyout of permits. Another is the compensation of ranchers for supplying and improving habitat on allotments. Each of these is preferable to having the value of the permit fall to nothing due to restrictions or further AUM cuts and the fragmentation of land ownership into smaller parcels with uncertain management goals. We would like to see language supporting future agency and Congressional language legalizing such options for BLM permits included in the final decision.

Vincent Guyer  
BLM - Salmon Field Office  
208-756-5403

---

 Comments to dEIS.docx  
25K

The Challis Sage-Grouse Local Working Group would like to submit the following comments to the Bureau of Land Management concerning the Idaho and Southwestern Montana Greater Sage-Grouse Draft Land Use Plan & Environmental Impact Statement.

- 1) It would be helpful if the final document is easier to understand. In the Draft, the reader has to flip between volumes within the document to find management details. For instance, Table 2-18 refers the reader to Appendix D often and it would be helpful to have page numbers in parentheses to locate the information more quickly.
- 2) Under Alternative E we want to make sure the language from Appendix D is incorporated into the Alternative in regards to Conservation Areas. Current language in Chapter 2, including Table 2-18, does not have the level of detail that the Appendix has on how the Conservation Areas work. For example, under the alternative description, it should state that there are four Conservation Areas. It should clearly state that if a trigger is reached in one Conservation Area, the adaptive management then only applies to that Conservation Area and not to the other three areas.
- 3) We suggest the portion of the Mountain Valley Conservation Area that is adjacent to the Desert Conservation Area between the Wood River and Mountain Home be included with the Desert Conservation Area. We feel that the issues are more similar with that conservation area then with Mountain Valleys.
- 4) The Areas of Critical Environmental Concern (ACEC) details need to be corrected. Two of the maps did not say which Alternative they represented. On page 2-65 under Alternative C the BLM will designate 39 new ACECs, but elsewhere the number 4 is used, including on Figure 2-44.
- 5) For Livestock Grazing/Range Management (LG/RM)-1 we do not agree with annual changes to grazing management. If changes are made every year managers and permittees would have difficulty knowing what is working and what is not working. We prefer the Alternative E approach of making changes after three years if data shows a decline in habitat or population. The Alternative E approach would provide more stability for permittees.
- 6) LG/RM-2 and RM-4 state that priorities for land health evaluations and permit renewals should be based on sage-grouse population and habitat information, but the BLM and USFS manage other listed T&E species concurrently. The alternative should use the terminology “*consider sage-grouse population and habitat*” rather than “*based on sage-grouse population and habitat*” in setting priorities.
- 7) LG/RM-2 discussed grazing management measures and habitat objectives under Alternative D. The discussion should include language such as “*not meeting one indicator or characteristic does not necessarily mean an area is not providing suitable sage-grouse habitat*”. This is important because site potential and capability need to be taken into account and Land Managers need to have the ability to adjust objectives based on principals of adaptive management. .
- 8) Alternative E/LG/RM-2 discusses adaptive regulatory triggers. These triggers should be defined and the subsequent changes to grazing permits should be transparent. (*i.e.* through an assessment and a grazing decision or through some other mechanism)
- 9) LG/RM-9 Alternative E: Instead of: “*Manage allotments only for the primary seasonal habitat that it has the potential to support.*” We would prefer, “*Manage allotments for seasonal habitat that it has the potential to support.*” Because in many areas seasonal

habitats overlap and we are managing for spring breeding/brood rearing, summer, and winter habitats in these areas.

- 10) Alternative E talks about an Implementation Team. We would like to see more detail on who the team is and when they become involved. What is their role?
- 11) For LG/RM-21 we support Alternative E. Flexibility is crucial for adaptive management.
- 12) We were unclear on how existing lands identified for disposal under current Land Use Plans would be affected under Alternative D. Would they still be available for disposal?
- 13) When avoidance areas and exclusion areas are discussed we were not sure if it applies to all rights-of-way (ROWs) or just those listed in Alternative D-Lands and Realty (LR)-3. We feel that there are some types of ROWs that would still be appropriate, for instance fish screens to promote listed fish recovery.
- 14) Under Alternative E there is also language about an Implementation Commission. We would like more clarification on what their role is and who they are.
- 15) We feel it is important to remember the budget cycles of the BLM and USFS when talking about adaptive management under Alternative E. For instance, if a threshold is crossed in spring or early summer, the agencies may not have the budget to change from managing an area as Important to Core until some funds can be appropriated in the next fiscal year.
- 16) We want to make sure that more precise habitat information can be used at the local level. For instance, there will be areas within mapped core habitat that are non-habitat but due to scale are included in the EIS maps.
- 17) We support the Alternative E map for habitat (Figure 2-5) with the exception of the Challis LWG Hat Creek Priority Area that we have mapped in our local plan. We would like to have that added to Core Habitat.
- 18) We want to emphasize cheatgrass control efforts in the EIS. As well as further research on new and improved control methods.
- 19) We want to emphasize the importance of all restoration of habitat in areas that have missing components for sage-grouse. While wildfire, invasive species and juniper encroachment are big issues in southern Idaho the Mountain Valleys area is more intact and the threats are less. We still feel it is important to also focus restoration and protection in this area to protect and enhance our habitat.
- 20) We would like the EIS to acknowledge the impacts of grazing management changes on livestock operations. It would be good to look at options like grass banks and AUM buy outs by third parties if grazing becomes unviable on an allotment.
- 21) The LUP amendment needs to have realistic agency monitoring requirements under Alternative D and E and have contingencies and/or actions listed if the agencies cannot fulfill the monitoring requirements.

## Sage grouse impact state ment com ments

1 message

---

Kirk Chandler <kchandler@co.washington.id.us>

Tue, Jan 28, 2014 at 10:08 PM

To: "blm\_id\_swmt\_sagegrouse\_eis@blm.gov" <blm\_id\_swmt\_sagegrouse\_eis@blm.gov>

Kirk Chandler Private Rancher in Washington county, Idaho

I would like to comment on the draft that is being proposed for the sage grouse. I have been to a couple of the meetings about this and I find it interesting that we are concerned about the sage grouse and there has been little done by the BLM and FS to do anything about the concerns except for planning. It was brought to our attention at the meetings that wildfire is the number one problem on the list because of habitat loss. When I asked what was being done I was told that very little is being done. The main things that seem to be in progress are taking the cattle off the land and restricting any kind of growth or development. I think that taking the cattle off the land is doing more harm to the habitat. Back in the day when it is referred to that the sage grouse were so plentiful there were hundreds of thousands of cattle and sheep on the ranges. How could that be if they damage the habitat the way they are being accused. There have been no studies on the relationship between cattle, sheep and sage grouse. I think that sage grouse like cattle and sheep. The lek areas were pobably old salt licks that the cattle used. The more you take cattle and sheep off the range the lower the sage grouse numbers drop. The grass grows up and drys and then we have these huge uncontrolable fires that we have been seeing more of. The grazing of animals is the cheapest and best way to slow down and control fires. The suggestions in the meetings for controlling the burnable fuels were to plant green strips and locate fire crews closer to the possible fire starts. These are very expensive and less that adequate solutions. The rancher would create fire breaks and pasture off invasive species for free and do a much better job than your agencies could ever do. The thing that is interesting is that these solutions have not been even considered and yet they are very simple. I would hope that you could use a little common sense in you jobs and look at some of the simple solutions that have already been used and found to work through history. Another issue is the predator loss in the sage grouse. Because of regulations that have been put in to law over the years it is promoting the growth and population of predators to sage grouse. The ravens, eagles, hawks, badgers, foxes, coyotes, snakes, magpies and many more all prey on sage grouse, their chicks and the eggs. The more habitat you provide the better eating it is for these predators. This just goes around and around. It seems that the more you agencies work at this the worse it gets. The ranchers and people who have used these lands through out history are being blamed and are losing their livelihoods because of the regulations that you impose. I realize that it is not your falt. If you weren't getting taken to court all the time by groups that have only an interest in the money form the Equal Access to Justice Fund you would be able to manage the land better. So please take some of these ideas into consideration and keep doing the best you can. Thank-you Kirk Chandler

I would like to comment on your sage grouse alternative management plans. I am 62 years of age, a native Idahoan and have hunted sage grouse in Idaho since I was 15 years old, hunting mainly in the desert near Blackfoot, the Owyhee desert, south of Twin Falls and north of Shoshone. I remember huge flocks of sage hen (200 +) in Owyhee County in the Battle Cr., Jacks Cr. and Blue Cr. areas, this in the late 60s and mid-70s. The flocks of birds could be seen in the evenings flying from their roosts on the hilltops to the small reservoirs in Owyhee Co. There were also substantial numbers of sage hen in the South Hills, south of Twin Falls and north of Shoshone in the Magic Dam and Richfield Canal areas as well as the desert areas near Dietrich. Grazing has always been allowed in these areas and the sage grouse numbers did not seem to be affected by grazing. Sage grouse decline was very noticeable in all of these areas, especially Owyhee Co., Magic Dam and the Dietrich areas after fires devastated their habitat. I am not talking about the fires that have occurred in the last few years, but the fires that occurred sometime in the 70s, 80s or 90s. These fires destroyed a huge amount of sage grouse habitat, virtually reducing the populations by the thousands. The birds have never fully recovered from the fires and loss of habitat. I see the alternative management plans discuss making large areas roadless, limiting power line installation, mining, grazing, etc. but from my experience and observations of the fate of Idaho's sage grouse, I believe that immediate suppression of range fires, no matter the cost (slurry planes must be used liberally to do this), re-establishment of habitat and predator control is of utmost importance. Protecting the leks should be a priority also. Making more roadless areas in the state does not seem to be an answer but a way of shutting the general public out from "multiple use" public land. More aggressive fire control, habitat restoration and predator control will bring back this great bird. The sage grouse thrived in the past alongside grazing cattle, power lines, desert roads used by ranchers, BLM and the Forest Service, and the general public. They cannot thrive on downy brome covered range. A major effort to restore habitat and suppress fires should be the mainstay of any plan. Oh, did I mention that I was, in the early late 70s and early 80s, a Forest Service firefighter on a Helitak Crew located at Price Valley (near New Meadows). I was on initial attack on a lightning caused forest fire, flown to the site via helicopter, immediately called in a slurry drop, the first load did not put the fire out but the second drop I requested did. All that was left was mop up for a small crew. Was reprimanded by supervisor for spending too much money (calling in the second drop). I hope the BLM and Forest Service are not still operating with that mentality. If not for that second drop the fire would have progressed into a major forest fire destroying thousands of acres in the Payette National Forest and costing the taxpayer millions of dollars.

Thank You

Jim Childs

NEPA Coordinator  
BLM Greater Sage-Grouse EIS  
1387 S. Vinnell Way  
Boise, ID 83709

Submitted by Email to [blm\\_id\\_swmt\\_sagegrouse\\_eis@blm.gov](mailto:blm_id_swmt_sagegrouse_eis@blm.gov)

Dear NEPA Coordinator:

I am writing in response to the Idaho and Southwestern Montana Sage-Grouse Draft Land Use Plan Amendment and Environmental Impact Statement. We have an opportunity to get this right the first time. The National Technical Team (NTT) report represents a good basis on which to create the foundation for Greater Sage-Grouse recovery. Unfortunately, most of the recommendations of the report do not appear to be included in the preferred alternatives D&E in their current form. If D or E were adopted they would do little to improve the habitat and long term survival of the Greater- Sage Grouse. In particular:

**The Final draft strategy should include adequate buffers to occupied leks in order to conserve the species.** The proposed 1-mile no surface occupancy buffer is not large enough to encourage the use of leks. (Strategy 14) 1 mile is too close to encourage breeding. According to the (NTT) report a buffer of 4 miles is necessary to provide adequate protection from surface disturbance. Four miles should be the surface disturbance buffer for surface disturbance of leks.

The NTT report recommends limiting surface disturbance to no more than 3 percent per section (SGNTT 2011:8) Knick (2013) found that 99 percent of active Greater Sage-Grouse leks are in landscapes with less than 3 percent disturbance within 5km of the lek. D has no limits (ES.6.5) and the E alternative recommends a 5% limit (ES.6.6). These alternatives allow for too great of disturbance levels and will lead to a further decline in Greater Sage-Grouse numbers.

Alternative D is does not meet even the minimum level of protection for Greater Sage -Grouse as suggested in the National Technical Team Report. Please consider the recommendations of the NTT report and include them in any draft that the BLM comes up with. **Not** doing so will ensure the further demise of the Greater Sage-Grouse.

**Alternative D allows further declines in rangeland health.** Alternative D emphasizes the need for livestock permittees to achieve the Idaho Rangelands Health Standards. This clearly does not work. Currently 61 allotments in Idaho are not meeting rangeland health standards. (DEIS at 3-73) Allotments that are not meeting Rangeland Health Standards should to be closed to grazing until they can meet the standards.

**Overall, the best choice for the long term viability of the Greater Sage Grouse is Alternative F. It appears to include most of the recommendations of the NTT report and if implemented would provide for a scientific approach to Sage Grouse recovery.**

Thank you for taking the time to put together this ground breaking plan. Please consider the comments and suggestions I have made to ensure the long term survival of the Greater Sage-Grouse.

BLM-Greater Sage-Grouse EIS  
1387 S. Vinnell Way  
Boise, ID 83709.

RE: Comments for the Idaho-Montana Sage Grouse Plan EIS

Dear Sir/Madam,

We have assembled the following information and issues from our members and other motorized recreationists for the project record. We appreciate the opportunity to provide our comments for the Idaho-Montana Sage Grouse Plan EIS. We enjoy riding our OHVs on primitive trails and roads on public land managed by the BLM and National Forest. All multiple-use land managed by the Bureau of Land Management and Forest Service provides a significant source of these OHV recreational opportunities. We feel strongly about OHV recreation for the following reasons:

## **Enjoyment and Rewards of OHV Recreation**

- Opportunity for a recreational experience for all types of people.
- Opportunity to strengthen family relationships.
- Opportunity to experience and respect the natural environment.
- Opportunity to participate in a healthy and enjoyable sport.
- Opportunity to experience a variety of opportunities and challenges.
- Camaraderie and exchange of experiences.
- For the adventure of it.

## **Acknowledged Responsibilities of Motorized Visitors**

- Responsibility to respect and preserve the natural environment. We are practical environmentalists who believe in a reasonable balance between the protection of the natural environment and the human environment.
- Responsibility to respect all visitors.
- Responsibility to use vehicles in a proper manner and in designated places.
- Responsibility to work with land, resource, and recreation managers. We are committed to resolving issues through problem solving and not closures.
- Responsibility to educate the public on the responsible use of motorized vehicles on public lands.

We feel that we are representative of the needs of the majority of visitors who recreate on public lands but are not organized with a collective voice to comment on their needs during the public

*We are a locally supported association whose purpose is to preserve trails for all recreationists through responsible environmental protection and education.*

*Page 1 of 7*

IDMT\_0077376

input process. These independent multiple-use recreationists include visitors who use motorized routes for weekend drives, mountain biking, sightseeing, exploring, picnicking, hiking, ranching, rock climbing, skiing, camping, hunting, RVs, shooting targets, timber harvesting, fishing, viewing wildlife, snowmobiling, accessing patented mining claims, and collecting firewood, natural foods, rocks, etc. Mountain bikers seem to prefer OHV trails because we clear and maintain them and they have a desirable surface for biking. Multiple-use visitors also include physically challenged visitors who must use wheeled vehicles to visit public lands. All of these multiple-use visitors use roads and motorized trails for their recreational purposes and the decision must take into account motorized designations serve many recreation activities, not just recreational trail riding. We have observed that 97% of the visitors to this area are there to enjoy motorized access and motorized recreation.

Issue:

Adequate recreational opportunity for all visitors is the supreme issue that must be addressed by this action. The relative importance of recreation on a national basis is demonstrated by the Bureau of Economic Analysis statistics for spending on recreation. In 1979 the index for recreation spending was 32.537 (year 2000 = 100, <http://www.bea.gov/national/nipaweb/TablePrint.asp?FirstYear=1979&LastYear=2004&Freq=Year&SelectedTable=33&ViewSeries=NO&Java=no&MaxValue=155.606&MaxChars=7&Request3Place=N&3Place=N&FromView=YES&Legal=Y&Land=>). In 2004, the index was 113.695 for an increase of 349%. No other sector has increased this dramatically. Clearly, the public wants and needs adequate recreational opportunity and this should be the over-arching theme of this evaluation and decision.

Issue:

Many federal actions have led to the continual closure of motorized recreational opportunities and access and at the same time the number of OHV recreationists has grown to 50 million and at the same time other outdoor activities have declined 18 to 25% (Journal of Environmental Management 80 (2006) 387–393, <http://www.redrockinstitute.org/uploads/PNAS.pdf> and <http://www.msnbc.msn.com/id/22998037/>). Multiple uses of our public lands are marginalized every time a forest plan or resource management plan or travel management plan comes up for action. The motorized closure trend has created significant cumulative effects and has reached the point where it is causing severe public distress. Reasonable alternatives to motorized closures must be pursued. The continual loss of motorized recreational opportunities is our primary concern. Because of the significant cumulative effect of motorized closures at this point in time, we feel strongly that there can be “no net loss” of motorized recreational opportunities with the Sage Grouse Plan.

Issue:

The project area with its current level of motorized access and recreation is where residents from nearly all western states go to enjoy motorized recreation. The project area is where we go and what we do to create those memories of fun times with family and friends. Management of these lands for multiple-uses including reasonable motorized use allows the greatest enjoyment of these lands by the widest cross-section of the public to continue. These lands are designated as multiple-use lands. We ask that management for sharing of these lands for continued multiple-use be selected as the preferred alternative.

Issue:

*We are a locally supported association whose purpose is to preserve trails for all recreationists through responsible environmental protection and education.*

Every BLM and Forest Service planning action has resulted in less motorized access and motorized trails. Motorized recreationists have become extremely frustrated with this disconnect between their needs and Forest Service actions. We often hear others say that the BLM and Forest Service are going to close our roads and trails regardless of what we say or do. Another common comment is “Why are motorized recreationists the only ones to lose in every action?” We are very concerned about the perception of a federal agencies with a stated commitment to equal program delivery. We urge the BLM and Forest Service to address this significant issue by developing a preferred alternative based on no impacts to motorized access and motorized recreation.

Issue:

Northeast Montana has the healthiest, most diverse grassland ecosystem in the world. We have so many sage grouse that the Montana Department of Fish, Wildlife & Parks is transplanting some of them to Canada. This region’s sage grouse production is in good shape due to decades of cooperation between ranchers and the BLM. The EIS must adequately acknowledge this condition.

Issue:

The EIS should include an analysis of the importance of this public-private partnership to the sage grouse. Please explore things the FS and BLM can do to strengthen this partnership by keeping ranches economically viable. When amending the RMPs, please protect northeast Montana from any changes in land management. Instead, this region’s land use traditions should be used as a model for sage grouse conservation and restoration elsewhere.

Issue:

Motorized recreationists see the sage grouse as another potential mechanism used by the Forest Service and Bureau of Land Management to close public lands to motorized access and motorized recreation without any real basis for assumed impacts and conditions. To avoid this serious issue, the EIS must be based on site-specific information and data. The EIS and decision must be based on site specific data prepared by licensed biologists and peer reviewed by independent licensed biologists in all impact areas where significance is claimed.

Issue:

The 3-State OHV decision and National OHV rule require site-specific data and analysis to be used in any actions that could affect OHV recreation.

Issue:

Wildlife populations are significantly affected by hunting regulations. This fact must be acknowledged in the analysis and development of alternatives. In a letter from Montana Fish, Wildlife and Parks to Lori Wood, Helena National Forest dated October 31, 2011 stated the following facts:

“To infer elk numbers have increased in spite of low values of hiding cover is not the case and doesn’t recognize the primary mechanism of population management in regards to big game. Populations of most big game species are managed through hunting regulations and specifically by manipulation of permits/licenses to control harvest. The value of adequate hiding cover or security is to reduce vulnerability of wildlife during the hunting season and during other times of the year. Keeping vulnerability at desired levels has been instrumental in Montana being able to maintain a 5-week general hunting season and also in being able to have relatively liberal hunting regulations on most species.” More sage grouse can be protected by banning sage grouse hunting and eliminating

*We are a locally supported association whose purpose is to preserve trails for all recreationists through responsible environmental protection and education.*

predators than all of the proposed actions. This is a reasonable alternative that must be evaluated and selected.

Issue:

Next in line affecting sage grouse populations are natural conditions including weather and fires and induced conditions such as wolves. Sage grouse populations are significantly impacted by natural conditions including drought. The benchmark for evaluation of impacts on sage grouse by OHV recreation should be established by comparison to these natural conditions and hunting regulations. The evaluation and subsequent decision-making must be based on comparison to these real world conditions.

Issue:

The preparation of the document must work hard to avoid “confirmation bias. Confirmation bias is a tendency to favor information that confirms an individual’s or group think preconceptions or hypotheses regardless of whether the information is true ([http://en.wikipedia.org/wiki/Confirmation\\_bias](http://en.wikipedia.org/wiki/Confirmation_bias) ). Only studies with negative motorized conclusions have been cited. The evaluation should have included a broad screening of issues, information, data, opinions, and needs so that it is not based on confirmation bias and meets NEPA procedural requirements. One important component required to avoid confirmation bias is the inclusion of OHV and other motorized recreationists on the inter-disciplinary team. OHV recreationists must be included on the inter-disciplinary team to help avoid confirmation bias.

Issue:

An adequate sense of magnitude must be employed within the analysis and decision-making. For example, the total naturally occurring loss of soil from the Cibola National Forest is estimated to be on the order of 1,577 acre-feet per year (1,892,000 acres total forest area times a depth of 0.008 feet of soil loss per year). The loss associated with OHV use is on the order of 52 acre-feet (5,200 acres of roads and trails times a depth of 0.01 feet of soil loss per year). Therefore, the soil erosion associated with OHV recreation is relatively insignificant compared to the naturally occurring erosion rate and acceptable for multiple-use lands. Moreover, there are many mitigation measures that can be employed to reduce soil erosion on roads and trails while still allowing the public to enjoy them. Other examples that should be part of the evaluation include the naturally occurring mortality rate of sage grouse compared to the mortality rate associated with OHV recreation. The evaluation and disclosure to the public must include the analysis and a comparison of the magnitude of OHV impacts to naturally occurring impacts for all resource areas used to assess impacts based on site-specific data. Lack of the comparison of impacts to naturally occurring levels combined with the lack of site-specific data could allow inaccurate statements and opinions due to the lack of an adequate sense of magnitude.

Issue:

The EIS must evaluate and acknowledge that close range viewing of sage grouse leks produces significantly more impacts on sage grouse than motorized recreation which is located some distance away. The EIS must include an accurate inventory of all viewing activity in order to reasonably assess this activity and its impact. Examples of the popularity and magnitude of the lek viewing activity include:

- [BLM Buffalo Field Office Hosts Sage-grouse Lek Viewing Trip](#)

Issue:

If a motorized route is within a distance of a lek that might cause some disturbance, then a reasonable alternative that can be easily implemented is to relocate the motorized route as opposed to closing that route.

Issue:

According to available literature and studies there is little information related to the effects of motorized recreation on the Grouse. Based on current science it appears that motorized recreation in, any of its forms, does not have a significant impact on the Grouse.

Issue:

We strongly oppose components of the 2010 Conservation Measures that lack the flexibility to adapt to local management issues. The plan amendments should avoid inflexible management standards. Rather than impose an inflexible, broad-brush management prescription for the Grouse, we suggest the BLM adopts a "landscape specific" approach to minimize the impacts on both the Grouse and the recreating public.

For example, we oppose the provision mandating that any "anthropogenic disturbances" cover less than 3% of the total sage grouse habitat. Without any flexibility, the implementation of this standard on the ground will be extremely difficult. Indeed, the agencies may be forced to restrict activities that have been found to have little to no impact on the grouse.

Issue:

Regarding recreation, the plan amendments should direct local land managers to cooperate and coordinate with local governments and affected stakeholders to establish achievable goals for protection of the Grouse (lek /nest disturbance, wintering areas and sage habitat degradation) and to mitigate potential affects upon recreation through closure of existing, inventoried and managed routes.

Issue:

The amendments should recognize that local agency recreation planners and managers are the best suited to work with motorized stakeholders to establish a manageable, designated, user and nature friendly route network for motorized access. This includes access roadways away from paved

highways; high clearance routes for pickups, jeeps and other 4WD vehicles; that can be shared under mixed-use by other OHV categories such as trail bikes, ATV/UTV and/or OSV in the winter. Just as important to the motorized community are rural 2 track routes, ATV width trails, and trail bike single-track width routes.

Issue:

Any plan amendment should include adequate site-specific analysis on anticipated impacts of motorized and non-motorized recreational activities, which often have little to no impact on wildlife. The impacts of motorized and mountain bike routes that are primarily used for recreation should not be "lumped in" with highways and other high-speed access roads.

Issue:

The analysis should also disclose impacts of the hunting of the Grouse, which is still allowed in at least 8 of the 11 states where it is found. Importantly, Sage Grouse conservation efforts such as seasonal restrictions and bag limits have been quite successful in maintaining healthy populations. The same has been shown for motorized access and use. For example, Grouse leks are concise, well-established, historic areas that can last for decades. Add to this that leks are mostly in use for strutting/mating during crepuscular hours and that motorized recreation is generally NOT undertaken during those hours...the two can be successfully separated.

Issue:

The analysis should include the fact that the BLM, Forest Service, state, county, local and tribal land management agencies are moving towards a "limited to designated route" paradigm. This process should prioritize areas where such planning has not yet occurred. We strongly believe that the goals, objectives and new paradigm can be met without severely limiting or restricting responsible, managed motorized recreation uses within the planning area.

Issue:

This strategy "in no way expands the review authority of any state agency". Significant new requirements will be required before projects are approved and no timelines are given to these agencies. Timelines for review need to be clearly established and followed if this document is to be accepted. This document seems to have expanded authority in order to accomplish its directive. We oppose any expansion of that authority.

Issue:

A contractor bidding work would have no idea of the amount of mitigation required by the permitting agency. We would like some more definition of ratios of mitigation to be in this document. Who would take responsibility for the mitigation and/or set a directive on how the mitigation should be done. For example, with our OHV group, we are not wildlife biologists. The responsibility should not be placed on groups such as ours.

Issue:

These seasonal use and timing restrictions are problematic for public access to public lands. Do the agencies anticipate creating special stipulations for OHV and public access?

Issue:

Permits will include requirements for mitigation that promote genetic diversity, critical connectivity, and population viability. This is new language for industry. What agency would come up with these requirements and when would we see them?

Issue

The timing restrictions and the buffer around leks are problematic. These time frames cover most of the recreation season and the distance is excessive.

Issue:

Permitting- The agency has a role of consultation, recommendation and facilitation. Reasonable timelines need to be established for completion of these functions.

Issue: Implementation - The formation of Sage Grouse Oversight Team is concerning since we aren't sure if a balance of competing interests will serve on the team. The make-up of the team needs to include a process where it will fairly include all interests.

Issue:

The evaluation does not adequately consider that humans are part of the environment and the impact on the human environment of the proposed regulations and restrictions.

We appreciate your consideration of our comments for the project record.

RE: Comments for the Idaho-Montana Sage Grouse Plan EIS

Dear Sir/Madam,

We have assembled the following information and issues from our members and other motorized recreationists for the project record. We appreciate the opportunity to provide our comments for the Idaho-Montana Sage Grouse Plan EIS. We enjoy riding our OHVs on primitive trails and roads on public land managed by the BLM and National Forest. All multiple-use land managed by the Bureau of Land Management and Forest Service provides a significant source of these OHV recreational opportunities.

Issues:

1. Motorized recreationists endorsed and accepted millions of acres of area restriction under the Off-Highway Vehicle Environmental Impact Statement and Proposed Plan Amendment for Montana, North Dakota and South Dakota (3-State OHV) decision (<http://www.mt.blm.gov/ea/ohv/FSROD.pdf>) and the Travel Management; Designated Routes and Areas for Motor Vehicle Use, Final Rule (<http://www.fs.fed.us/recreation/programs/ohv/final.pdf>) as a positive action to control environmental impacts. We accepted area restriction and not area closure. Area closure is permanent. Area restriction allows flexibility as needed to address site specific conditions. Each motorized road and trail exists because it serves some multiple-use need. Every road and trail is important to some individual for some purpose. Each motorized road and trail must have adequate site-specific analysis to determine all of its values including motorized recreational value.
2. Motorized recreationists gave up 97% of the area historically available to them under both the 3-State ROD and the National Route Designation rule as the ultimate act of mitigation so that we would continue to have use of existing motorized routes that cover or provide access to an area estimated at less than 3% of the total area. Now motorized recreationists have been given almost no credit for our cooperation during that action and we have only been penalized for our past cooperation by current route designations, resource management plans, forest plans and travel plans that seek to close 50% to 75% of the existing motorized routes. This outcome was not part of the 3-State OHV and National Route Designation agreement and this level of closure is not acceptable to us for that reason. The 3-State OHV and National Route Designation agreements

*We are a locally supported association whose purpose is to preserve trails for all recreationists through responsible environmental protection and education.*

*Page 1 of 2*

IDMT\_0077385

were not made with the intention of massive closures beyond that agreement. We ask that all BLM and Forest Service actions include proper recognition of the agreement behind the 3-State OHV and National Route Designation decisions which allow continued use of the existing networks of motorized roads and trails without massive motorized closures.

3. The final 3-States OHV Rule (<http://www.fs.fed.us/recreation/programs/ohv/final.pdf>) included graphic examples of motorized and OHV routes that must be adequately identified and addressed by a site specific analysis. We request that all motorized routes currently in use be adequately evaluated by a site specific analysis demonstrating with scientific evidence the claimed impact on sage grouse.

We appreciate your consideration of our comments for the project record.

Sincerely,

/s/ Action Committee on behalf of our members

It's ridiculous to blame wild horses for damaging greater sage grouse habitat when the number of wild horses is dwarfed by the number of livestock [cattle & sheep] being allowed to graze on federally protected land instead of federally protected wild horses. Reduce the freeloading cattle and sheep, leave the wild horses where they are and save us all some money while preserving what needs to be preserved for all.

## It is Important to Do More to Ensure Sustainable Management for Greater Sage-Grouse

Dear Bureau of Land Management officials:

Although it appears that the BLM is making an effort to conserve the Greater Sage-Grouse, one of the most iconic and imperiled bird species of the American West, we are concerned that BLM's draft preferred alternatives do not comply with the best available science or with standards necessary to stabilize and recover grouse populations.

BLM should therefore adopt the conservation alternative to ensure sustainable management to conserve the species. These include science-based recommendations to limit future development and to create protected areas.

Conserving the Greater Sage-Grouse will require both protecting large areas of habitat and making significant changes in land management to reverse population declines of this wide-ranging species. Most priority sage-grouse habitat is already heavily degraded and grouse are only persisting in large, relatively undisturbed blocks of habitat. For years, fossil fuels production and other commercial uses have dominated public land management across sagebrush habitats, resulting in significant impacts to wildlife, public recreation, and air and water quality. Protecting large expanses of important sage-grouse habitat—as outlined in the conservation alternative—will help stem the decline of many species of wildlife across the American West. The conservation alternative will begin restoring balance to an iconic American landscape by identifying areas most appropriate for development and those that need to be protected.

Thank you for considering our comments.

To whom it may concern,

Please leave the wild horses and burrow alone. They were their before you were. God has a plan for us all, he created the horse and the burrow and put them there. You have no authority to kill them or move them. There is enough land for us all. The freedom of the wild horse give us hope, that the U.S.A. as bad as it is now, that we still might have faith and hope in our fellow man . God gave us animals to love and to take care of, there are ways to work this out not just for man and his greed, but for the good of all. Look at our Government , man has messed that up and if you start messing with Gods creations it will be on you're hands. What if the Government says that a race of people are not needed does that give you the right to kill them too. This is Gods world not mans, in his hunger to change everything man is the worst of all creations, we are sinful. Animals have no sin, they are pure, what gives you the right to kill what God has made. Has man not done enough already to make the world a worst place to live than better. Instead of Land Management it should be, Man Management of his on sins.

Ranchers are the stewards of sage grouse habitat on both the private & public land they use. Without ranchers, who provide an effective line of defence against fire & noxious weeds who manage forage for optimum production and who are the primary protectors of open space in the private land of the west, large areas of sage grouse habitat would be in jeopardy. The benefits by ranching relate directly to several identified threats to greater sage-grouse habitat, include wildfire, invasive plants and urbanization & development.

RE: Sage Grouse EIS Comment

Dear Mr. Bahr, Bureau of Land Management, and Forest Service:

I am writing on behalf of the DreamCatcher Wild Horse and Burro Sanctuary to give feedback regarding the Sage Grouse Environmental Impact Statement. This document/work is vitally important and will impact significant portions of public lands for many years. Of particular interest to me is the impact it can have on the remaining wild horse and burro populations legally living on their Herd Management Areas (HMAs).

These animals are historically removed as the first order of business; i.e., before cattle grazing is reduced or other restrictions put in place, the wild horses and burros usually are the first to be displaced whenever competition for public lands heats up. And once again, this EIS fails to protect the interests of the wild horses and burros as the law demands, i.e., treating them as "an integral part of the natural system of the public lands."

For starters, the impacts of these proposals to wild horses are not adequately analyzed. None of the alternatives analyzed adequately protects wild horses and burros.

Specifically, our federally-protected wild horses and burros are not livestock; they are a wildlife species with their own Act unanimously passed by Congress to protect them. Yet this EIS fails to distinguish the wild horses and burros from livestock.

Alternatives described would allow the BLM too much discretion in forage allocations to private livestock and wild horses. It would allow BLM to decrease AUMS (Animal Unit Months), their forage allocations, and AUMS (Allowable Management Levels) for wild horses and burros even though these federally-protected species are vastly outnumbered by livestock in the planning area, including within their federally designated habitat areas, the HMAs.

A gross inequity long present in BLM's lack of management strategy for the wild horses would continue

as, outrageously, in some alternatives, reductions in forage allocations would be borne equally by livestock and wild horses even though livestock vastly outnumber wild horses and burros.

CASE IN POINT: livestock vastly outnumber wild horses in terms of:

- 1) land impacted (66% of BLM land nationally used for livestock vs. 12% of BLM land used for wild horses);
- 2) forage allocated within wild horse Herd Management Areas (82+% for private livestock vs. 18% for federally-protected wild horses);
- 3) population numbers (livestock outnumber wild horses by at least 50 to 1 on BLM land); and
- 4) presence in critical sage grouse habitat (just 8-11% for wild horses vs. extensive presence by livestock).

Finally, the EIS fails to consider the significant differences in range impacts caused by livestock vs. wild horses.

Bearing these facts in mind, will you please tell us in what way this EIS meets the federal government's obligation, i.e. BLM's and Forest Service's obligation, to consider these animals as integral parts of the natural system of the public lands? Where does it state that about livestock? Yes, FLPMA and PRIA have impacted the 1971 Act, but that mandate expressed in the first paragraph of the Act continues.

## SUMMARY

To meet its legal and ethical obligations, the final EIS must include the following:

1. Language that clearly distinguishes between federally protected wild horses and burros from livestock.
2. Language that acknowledges and numbers that reflect the BLM's legal mandate (requirement under the law which is not optional) to protect wild horses under federal law as well as sage grouse, vs. its discretion to authorize livestock grazing
3. A clear directive to all BLM districts to preserve wild horses and burros above a level that allows for adequate genetic diversity. Genetic diversity must be specifically defined in the final EIS.
4. Directives that prohibit the reductions of current Animal Unit Months (AUMS) of forage allocated for wild horses and burros. The EIS must outline a reduction, and if necessary elimination of livestock grazing, before any reduction of AUMs for wild horses and/or burros could occur. Discretionary livestock grazing occurs on a drastically larger scale in critical sage grouse habitats than wild horse and/or burro usage.
5. Provisions to allow for increases in wild horse and burro Appropriate Management Levels and for restoration of zeroed out (Herd Area) habitat where appropriate.
6. Requirement that any land use policy changes resulting from the sage grouse plan be in conformance with the National Academy of Sciences' 2013 recommendations for reform of federal wild horse management program. BLM commissioned this report and has thus far chosen to studiously ignore it since it confirms many of the advocates points regarding mismanagement and the inadvisability of continuing BLM's failed, outlandishly expensive "just round them up" strategy.
7. Recognition of the current scientific consensus that the wild horse is a native, reintroduced North American wildlife species that co-exists with sage grouse in the high desert sagebrush ecosystems in the North American West.
8. A truly competent EIS which meets its legal intent and requirement must include detailed and comprehensive information on the following:
  - a. Vitally important Maps which set forth distinctly all HMAs and which distinguish the HMAs from the Herd Areas (HAs), with accompanying data on:

i) number of horses estimated within each area along with the number of livestock within each area;

ii) AUM allocations for wild horses and/or burros COMPARED with livestock AUMs usage, i.e., set forth AUMs for each.

b. All information describing and documenting the differences between wild horse and burro and livestock range impacts;

c. All genetic reports and documentation of genetic viability status of all wild horse and burro herds within the planning area.

These are reasonable, realistic, and do-able expectations. Providing secure protections for viable numbers of wild horses and burros falls within the scope of this EIS since it is analyzing a plan that in all likelihood will significantly impact wild horse and burro management, wild species Congress and the American people continue to cherish and prioritize. These are populations capable of reproducing themselves without human interference and have the resources available to sustain that population, and this EIS cannot appropriately simply include them as another form of livestock, nor cause them to bear an equal burden with the livestock that so greatly outnumbers them, in reducing impacts to the ranges or Sage Grouse Habitat.

In summary, the EIS is analyzing an inclusive management plan that will significantly impact protected wild horses and burros; thus, it is expected that all of these issues will be addressed in the final EIS.

Respectfully submitted,

Barbara Clarke, Director

DreamCatcher Wild Horse and Burro Sanctuary

RE: Sage Grouse EIS Comment

Dear Mr. Bahr, Bureau of Land Management, and Forest Service:

I am writing on behalf of the DreamCatcher Wild Horse and Burro Sanctuary to give feedback regarding the Sage Grouse Environmental Impact Statement. This document/work is vitally important and will impact significant portions of public lands for many years. Of particular interest to me is the impact it can have on the remaining wild horse and burro populations legally living on their Herd Management Areas (HMAs).

These animals are historically removed as the first order of business; i.e., before cattle grazing is reduced or other restrictions put in place, the wild horses and burros usually are the first to be displaced whenever competition for public lands heats up. And once again, this EIS fails to protect the interests of the wild horses and burros as the law demands, *i.e., treating them as "an integral part of the natural system of the public lands."*

For starters, the impacts of these proposals to wild horses are not adequately analyzed. None of the alternatives analyzed adequately protects wild horses and burros.

Specifically, our federally-protected wild horses and burros are not livestock; they are a wildlife species with their own Act unanimously passed by Congress to protect them. Yet this EIS fails to distinguish the wild horses and burros from livestock.

Alternatives described would allow the BLM too much discretion in forage allocations to private livestock and wild horses. It would allow BLM to decrease AUMS (Animal Unit Months), their forage allocations, and AUMS (Allowable Management Levels) for wild horses and burros even though these federally-protected species are vastly outnumbered by livestock in the planning area, including within their federally designated habitat areas, the HMAs.

**A gross inequity long present in BLM's lack of management strategy for the wild horses would continue** as, outrageously, in some alternatives, reductions in forage allocations would be borne equally by livestock and wild horses even though livestock vastly outnumber wild horses and burros.

CASE IN POINT: livestock vastly outnumber wild horses in terms of:

1) land impacted (**66% of BLM land nationally used for livestock vs. 12% of BLM land used for wild horses**);

2) forage allocated within wild horse Herd Management Areas (**82+% for private livestock vs. 18% for federally-protected wild horses**);

3) population numbers (**livestock outnumber wild horses by at least 50 to 1 on BLM land**); and

4) presence in critical sage grouse habitat (**just 8-11% for wild horses vs. extensive presence by livestock**).

Finally, the EIS fails to consider the significant differences in range impacts caused by livestock vs. wild horses. Bearing these facts in mind, will you please tell us in what way this EIS meets the federal government's obligation, i.e. BLM's and Forest Service's obligation, to consider these animals as integral parts of the natural system of the public lands? Where does it state that about livestock? Yes, FLPMA and PRIA have impacted the 1971 Act, but that mandate expressed in the first paragraph of the Act continues.

## SUMMARY

To meet its legal and ethical obligations, the final EIS must include the following:

1. Language that clearly distinguishes between federally protected wild horses and burros from livestock.
2. **Language that acknowledges and numbers that reflect the BLM's legal mandate (requirement under the law which is not optional) to protect wild horses under federal law as well as sage grouse, vs. its *discretion* to authorize livestock grazing**
3. A clear directive to all BLM districts to preserve wild horses and burros above a level that allows for adequate genetic diversity. Genetic diversity must be specifically defined in the final EIS.
4. Directives that prohibit the reductions of current Animal Unit Months (AUMS) of forage allocated for wild horses and burros. The EIS must outline a reduction, and if necessary elimination of livestock grazing, before any reduction of AUMs for wild horses and/or burros could occur. Discretionary livestock grazing occurs on a drastically larger scale in critical sage grouse habitats than wild horse and/or burro usage.
5. Provisions to allow for increases in wild horse and burro Appropriate Management Levels and for restoration of zeroed out (Herd Area) habitat where appropriate.
6. Requirement that any land use policy changes resulting from the sage grouse plan be in conformance with the National Academy of Sciences' 2013 recommendations for reform of federal wild horse management program. BLM commissioned this report and has thus far chosen to studiously ignore it since it confirms many of the advocates points regarding mismanagement and the inadvisability of continuing BLM's failed, outlandishly expensive "just round them up" strategy.

7. Recognition of the current scientific consensus that the wild horse is a native, reintroduced North American wildlife species that co-exists with sage grouse in the high desert sagebrush ecosystems in the North American West.

8. A truly competent EIS which meets its legal intent and requirement must include detailed and comprehensive information on the following:

a. Vitaly important Maps which set forth distinctly all HMAs and which distinguish the HMAs from the Herd Areas (HAs), with accompanying data on:

i) number of horses estimated within each area along with the number of livestock within each area;

ii) AUM allocations for wild horses and/or burros COMPARED with livestock AUMs usage, i.e., set forth AUMs for each.

b. All information describing and documenting the differences between wild horse and burro and livestock range impacts;

c. All genetic reports and documentation of genetic viability status of all wild horse and burro herds within the planning area.

**These are reasonable, realistic, and do-able expectations.** Providing secure protections for viable numbers of wild horses and burros falls within the scope of this EIS since it is analyzing a plan that in all likelihood will significantly impact wild horse and burro management, wild species Congress and the American people continue to cherish and prioritize. These are populations capable of reproducing themselves without human interference and have the resources available to sustain that population, and this EIS cannot appropriately simply include them as another form of livestock, nor cause them to bear an equal burden with the livestock that so greatly outnumbers them, in reducing impacts to the ranges or Sage Grouse Habitat.

In summary, the EIS is analyzing an inclusive management plan that will significantly impact protected wild horses and burros; thus, it is expected that all of these issues will be addressed in the final EIS.

I am an Idaho Rancher & my livelihood depends completely on my ability to graze livestock on public & private lands. As such, it is in my best interest that these lands are managed to optimum condition which is both ecologically & economically beneficial. I am concerned that the pending ~~issue~~ effort to significantly amend the land use plans has the potential to affect my ability to graze livestock and will result in unintended consequences that will ~~be~~<sup>be</sup> more harmful than helpful to sage grouse.

For these reasons, I encourage the BLM & Forest Service to adopt Alternative E.

Sincerely Ken Eliason Holbrook, Id  
Eliason Livestock

Christie Finn <christieffinn@gmail.com>  
Reply-To: christieffinn@gmail.com  
To: blm\_id\_swmt\_sagegrouse\_eis@blm.gov

Tue, Jan 28, 2014 at 2:20 PM

I have serious concerns about whether either the FWS or the BLM has the ability to use science non-biased by ideology to manage any species. Based on thoughtful scientific review of the BLM's wild horse and burro program, the NAS found that science is not evidence in the program, and the program's management of the wild horses forces the horses into a constant survival mode forcing the horses to push beyond the equilibrium they could find if left alone.

Furthermore, the BLM's willingness to entertain the idea that horses are not native to North America even when research has proven that there is no genetic difference between the Old World and the New World *Equus caballus*. Furthermore, a many of the variations is size and shape in *Equus caballus* are due to the genetic variation that God equipped the horse with in order for it to adapt to the rapidly changing climate of the PLeistocene that included 16 different ice ages.

As a citizen, it concerns me that a federal agency with the primary responsibility for manage wild horses that co-evolved here in North America allows itself to remain so studiously ignorant of the truth. Anyone in the world could find the research articles and books that exist. The horse and burro are native to North America and were here for hundreds of thousands, perhaps a million or two years before the warming period in the Holocene which bright the grouse of Mongolian and a number of grouse to the American grass lands. It appears that the grouse actually diversified in the U.S. from other grouse.

One concern I found perusing research abstracts about sage grouse is that sage grouse females are polygamous and will fly away from her range to find a mate. This abstract discussed how fragmentation of the range would to greater hybridization and pointed out that eventually the genetic variation to become so low that the sage grouse may become extinct or mutate into another species. So, I recommend that before any new land management plans are put into place, find some ornithologist to see if someone can do a study of what percentage of sage grouse have already hybridized.

Furthermore, while you are learning about genetic viability of sage grouse, you should realize that the formulas for genetic viability in horses came from wildlife population biology. Therefore, what you learn from this program can transfer to others.

The West is a big place, and it is hard to imagine how there could possibly not be enough grasslands and area for wild horses, wild life, cattle and other livestock, as well as the extricable industries to exist. Maybe fewer roads or smaller roads and more of them to allow for transportation into and out of areas where wildlife, cattle, and other uses can co-exist.

The BLM is charged with protecting the wild horses and burros that belong to the American people. I don't have issues with livestock grazing or limited mining and extraction—wind mills are something else.

It is time that FWS and the BLM begin serving all the American people and making sure that all our native wild animals have the opportunity to survive in the wild. It would be tragic to destroy these wonderful resources that could return to us if every we should truly need them.

I urge you to find untained science and experts that are not preselected because they will advise you manage

land and animals according to their ideology, and not for the health of the land and the people. We need to find the balance.

Sincerely yours,

Christie Finn

## Idaho and SW MT GSG draft LUPA/EIS

1 message

---

Doris Fischer <dfischer@3rivers.net>  
To: blm\_id\_swmt\_sagegrouse\_eis@blm.gov

Wed, Jan 29, 2014 at 12:03 PM

Greetings BLM Folks,

I am offering a comment on the draft land use plan amendment for Greater Sage-Grouse in the Idaho and SW Montana sub-region.

This may not count as a "substantive" thought, but I have studied your preliminary map of priority/general habitat. I see a good deal of priority habitat on the map, and suggest that you identify those additional habitats that demonstrate good potential for being "priority", with effective land management.

This also may not count as a substantive comment, but I urge you to give strong preference to professionally collected and verified science-based information. Claims by laypersons or advocates for one "side" or another should be set aside respectfully, in favor of what the best available science points to.

I am hoping that Governor Bullock and the State of Montana's Greater Sage-Grouse Advisory Council take a similar approach, in which case the two parallel efforts should produce a set of consistent and effective land management strategies.

Thank you for the opportunity to comment on this important aspect of our natural world.

Dear Mr. Bahr, BLM, FS,

Enclosed, and below, please find my feedback regarding the Sage Grouse EIS. Please feel free to contact me with any questions or comments you may have. This is a serious matter, and I hope to see some changes to the final document as I've outlined in my letter. Thank you for your attention to these matters.

For the wild horses and their stalwart burro friends, captive and free,  
for all who came before and all those yet to be,

Elyse Gardner

RE: Sage Grouse EIS Comment

Dear Mr. Bahr, Bureau of Land Management, and Forest Service:

I am writing to give feedback regarding the Sage Grouse Environmental Impact Statement. This document/work is vitally important and will impact significant portions of public lands for many years. Of particular interest to me is the impact it can have on the remaining wild horse and burro populations legally living on their Herd Management Areas (HMAs).

These animals are historically removed as the first order of business; i.e., before cattle grazing is reduced or other restrictions put in place, the wild horses and burros usually are the first to be displaced whenever competition for public lands heats up. And once again, this EIS fails to protect the interests of the wild horses

and burros as the law demands, i.e., treating them as “an integral part of the natural system of the public lands.”

For starters, the impacts of these proposals to wild horses are not adequately analyzed. None of the alternatives analyzed adequately protects wild horses and burros.

Specifically, our federally-protected wild horses and burros are not livestock; they are a wildlife species with their own Act unanimously passed by Congress to protect them. Yet this EIS fails to distinguish the wild horses and burros from livestock.

Alternatives described would allow the BLM too much discretion in forage allocations to private livestock and wild horses. It would allow BLM to decrease AUMS (Animal Unit Months), their forage allocations, and AUMS (Allowable Management Levels) for wild horses and burros even though these federally-protected species are vastly outnumbered by livestock in the planning area, including within their federally designated habitat areas, the HMAs.

A gross inequity long present in BLM's lack of management strategy for the wild horses would continue as, outrageously, in some alternatives, reductions in forage allocations would be borne equally by livestock and wild horses even though livestock vastly outnumber wild horses and burros.

CASE IN POINT: livestock vastly outnumber wild horses in terms of:

- 1) land impacted (66% of BLM land nationally used for livestock vs. 12% of BLM land used for wild horses);
- 2) forage allocated within wild horse Herd Management Areas (82+% for private livestock vs. 18% for federally-protected wild horses);
- 3) population numbers (livestock outnumber wild horses by at least 50 to 1 on BLM land); and
- 4) presence in critical sage grouse habitat (just 8-11% for wild horses vs. extensive presence by livestock).

Finally, the EIS fails to consider the significant differences in range impacts caused by livestock vs. wild horses.

Bearing these facts in mind, will you please tell me in what way this EIS meets the federal government's obligation, i.e. BLM's and Forest Service's obligation, to consider these animals as integral parts of the natural system of the public lands? Where does it state that about livestock? Yes, FLPMA and PRIA have impacted the 1971 Act, but that mandate expressed in the first paragraph of the Act continues.

## SUMMARY

To meet its legal and ethical obligations, the final EIS must include the following:

1. Language that clearly distinguishes between federally protected wild horses and burros from livestock.
2. Language that acknowledges and numbers that reflect the BLM's legal mandate (requirement under the law which is not optional) to protect wild horses under federal law as well as sage grouse, vs. its discretion to authorize livestock grazing
3. A clear directive to all BLM districts to preserve wild horses and burros above a level that allows for adequate genetic diversity. Genetic diversity must be specifically defined in the final EIS.
4. Directives that prohibit the reductions of current Animal Unit Months (AUMS) of forage allocated for wild horses and burros. The EIS must outline a reduction, and if necessary elimination of livestock grazing, before any reduction of AUMs for wild horses and/or burros could occur. Discretionary livestock grazing occurs on a drastically larger scale in critical sage grouse habitats than wild horse and/or burro usage.
5. Provisions to allow for increases in wild horse and burro Appropriate Management Levels and for restoration of

zeroed out (Herd Area) habitat where appropriate.

6. Requirement that any land use policy changes resulting from the sage grouse plan be in conformance with the National Academy of Sciences' 2013 recommendations for reform of federal wild horse management program.

BLM commissioned this report and has thus far chosen to studiously ignore it since it confirms many of the advocates points regarding mismanagement and the inadvisability of continuing BLM's failed, outlandishly expensive "just round them up" strategy.

7. Recognition of the current scientific consensus that the wild horse is a native, reintroduced North American wildlife species that co-exists with sage grouse in the high desert sagebrush ecosystems in the North American West.

8. A truly competent EIS which meets its legal intent and requirement must include detailed and comprehensive information on the following:

a. Vitally important Maps which set forth distinctly all HMAs and which distinguish the HMAs from the Herd Areas (HAs), with accompanying data on:

i) number of horses estimated within each area along with the number of livestock within each area;

ii) AUM allocations for wild horses and/or burros COMPARED with livestock AUMs usage, i.e., set forth AUMs for each.

b. All information describing and documenting the differences between wild horse and burro and livestock range impacts;

c. All genetic reports and documentation of genetic viability status of all wild horse and burro herds within the planning area.

These are reasonable, realistic, and do-able expectations. Providing secure protections for viable numbers of wild horses and burros falls within the scope of this EIS since it is analyzing a plan that in all likelihood will significantly impact wild horse and burro management, wild species Congress and the American people continue to cherish and prioritize. These are populations capable of reproducing themselves without human interference and have the resources available to sustain that population, and this EIS cannot appropriately simply include them as another form of livestock, nor cause them to bear an equal burden with the livestock that so greatly outnumbers them, in reducing impacts to the ranges or Sage Grouse Habitat.

In summary, the EIS is analyzing an inclusive management plan that will significantly impact protected wild horses and burros; thus, it is expected that all of these issues will be addressed in the final EIS.

Respectfully submitted,

Elyse Gardner

To: BLM

Subject: Sage-Grouse Plan/DEIS for Idaho-Southwest Montana

Date: 1/15/14

Attached are my comments on the Draft Land Use Plan Amendments/Draft Environmental Impact Statement for Greater Sage Grouse for the Idaho-Southwest Montana subregion. I appreciate the opportunity to comment on this proposal that could affect my use and enjoyment of the public lands in Idaho.

Normally I would begin by stating some things I like about the proposal but, unfortunately, there is precious little I agree with in this document. So, I apologize for the negative tone of my comments, but I have little choice.

I will begin with Planning Issues and work my way through to the environmental consequences.

#### Planning Issues

I believe "natural succession" in sagebrush is a distinct threat to sage grouse. As sagebrush ages it becomes denser and forces out the grass/forb understory. Doing so eliminates the sage as grouse habitat because there is little food for hens and chicks and, in addition, chicks have a hard time negotiating the thick, gnarly old sagebrush.

To what extent can the BLM and FS set overmature sagebrush back to an early stage to intervene in the succession process to improve the grass/forb condition for hens and chicks? I believe this is the major policy decision you have to make. If succession is not identified as an issue, it will not be addressed in the alternatives, and if succession is not addressed in the alternatives it will not be addressed in the environmental consequences, and therefore will play no role in the decision making process to determine which alternative best meets the long-term survival of sage grouse. This is exactly what happened in your DEIS. Sage grouse was not identified as an issue, was not addressed in the alternatives, and was not addressed in the environmental consequences. This seems like a huge oversight since sagebrush is the primary habitat for sage grouse.

To elaborate further, on one hand sagebrush is being consumed in large fires each year that burn nearly all of the sagebrush, rendering it almost useless for sage grouse. On the other hand, suppression of fires over the years has resulted in old, overmature stands of sage that are stocked with large plants that cover 50-60% of the site, or more, with almost no undergrowth of grass and forbs, also rendering it useless for grouse. Scrunched in between these two extremes is a mixture of sage, grass, and forbs, itself moving along the succession track toward an overmature condition. What can be done to arrest this relentless march of natural succession and make the sagebrush habitat more usable for sage

grouse? I believe that is the major policy decision we face today. The proposed DEIS, however, does not address this question. That does not bode well for grouse survival because the most important question to solving preservation of grouse is not even addressed in the DEIS. How sad!

I strongly recommend that natural succession of sagebrush be added as a planning issue.

The other planning issue that is missing is predator control. Predator control is an integral part of protecting and conserving sage grouse. Studies in Idaho show predators account for 26 to 76 percent of lost sage grouse nesting sites annually. That's not one egg out of a hatch; it's the loss of the entire hatch. This is too important of a factor to ignore in the DEIS and leave to individual agency action.

I understand that your reason for not including predator control as an issue is because it is a state- and federal-related action you feel is outside the scope of the LUPA/EIS. But, as you point out, the agencies will continue to work with IDFG and MFWP on predator control problems. This is a pretty loose arrangement. With all due respect, why would you not address predator control in one document that coordinates all of the factors of sage grouse management and, instead, spread predator control over 29 independent units and 4 different agencies?

Predator control should be addressed in each alternative as part of a unified action for that alternative, and evaluated in the consequences as one unified action for each alternative, not as a separate action by four different agencies on 29 different individual FS and BLM units. Do you really want to treat predator control as a separate action outside the DEIS? I think not.

The federal and state agencies are already coordinating on predator control. I recommend you include predator control as a planning issue, and look at different alternative ways to accomplish it in the DEIS. Who knows, you might even discover a better way to get the job done, beyond a MOU.

### Alternatives

1. At least one of the alternatives ( Alt. A) talks about maintaining a mosaic of species and age classes on the landscape to protect grouse habitat, which I thought was a great idea. But when I went to the environmental consequences section of the DEIS to see what the benefits of having a mosaic are, there were none. In fact, there was no discussion of a mosaic of age classes at all. Call me crazy, but if you are going to have an alternative that strives to maintain a mosaic of species and age classes, there should be some benefit from doing that, and that benefit should show up in the consequences. The fact that you prescribe an alternative with the objective of producing a mosaic of age classes on the landscape, but that objective is never achieved, makes it appear like this is a straw man alternative designed to achieve some purpose, when in fact it does not.

My point is: management actions ( like achieve a mosaic of age classes) proposed in the alternatives should be addressed and quantified in the environmental consequences so they can be evaluated and weighed in the decision of which alternative to select. I suggest you need to either 1) remove achieving a mosaic of age classes in the alternative(s), or 2) propose some advantage to doing that (achieve a mosaic) and quantify the advantage so the decision maker can decide whether it is useful or not.

2. There is a very small range between the alternatives, except for Alternative C, which eliminates all grazing. Otherwise, the alternatives all occur in a tight band that reflects little difference between them. For instance, there is only 1.4 million acres difference in GRSG habitat between the highest and lowest alternatives, out of 11.6 million acres total. This is only a 12% difference from best to worst. I doubt if that qualifies as a reasonable range of alternatives that produce feasible, distinct and implementable management scenarios that 1) address the full range of identifiable major planning issues, 2) explore opportunities to enhance management resources, 3) resolve conflicts between resources, and 4) meet the purpose and need for the LUPA.

I suggest you expand the alternatives to achieve a greater difference between them so they 1) reflect the major planning issues and 2) resolve conflicts between resources. One way to do that would be to develop one or more alternatives that more aggressively convert the mature and overmature sagebrush to a younger age class.

I would put less emphasis on factors like mineral management, land uses and realty management, renewable energy, roads, and special designations. I suspect the 4 factors of natural selection in sagebrush, predator control, grazing and wildfire account for roughly 95% of sage grouse mortality. The other factors just detract from these 4 main factors and weaken our efforts to conserve sage grouse.

#### Affected Environment (AE)

1. There is no historical record in the affected environment to indicate how grouse populations have fluctuated over time, and what factors may have caused those shifts. It's like we suddenly discovered sage grouse in 2004 and started to develop a management plan for them.

There is a rich historical record for sage grouse, going back at least to the first European explorers that visited the west. The record indicates early explorers rarely encountered sage grouse, and this continued until the late 1880's. From the late 1880's until the 1960's there was a significant increase in the sage grouse population. Near the end of the 1960's the population started to decline, and has done so ever since.

The increase in birds after the 1880's occurred at the same time that livestock grazing and predator control began on the western ranges, and then the birds increased in tandem with the increase in the human population in the west. In 1934 the FS initiated the 10 AM policy of putting out wildfires by 10 AM of the following day, or requesting more fire fighting forces to extinguish the fire by the next burning period. As a result fewer acres burned and sagebrush increased in size and area. This continued until the 1960's when policies changed, which removed livestock from the range and reduced predator control. Finally in 1988 the rule of unintended consequences caught up with us and huge, intense wildfires burned the western landscape which was overloaded with dense overstocked sagebrush. This phenomenon continued until today. As a result, large areas of sagebrush burned and were no longer suitable for sage grouse because it no longer provided cover or food for the birds. That brings us to 2004 and is the beginning point, I believe, for the DEIS.

Much could be learned about the interrelationship between grazing, wildfire, and predator control and sage grouse response to those factors during the last 200 years. Unfortunately, we will not learn from the past because it is not discussed in the DEIS.

I recommend you include the historical record for grouse and its habitat (sagebrush) in the FEIS.

2. There is no discussion of predator control in the AE. Are there no studies of predators and their affect on sage grouse in Idaho and other parts of the country? I know this is not true because I am aware of studies in Idaho that show predators cause a 26 to 76 % loss of nesting sites. This is not a loss of 1 egg in each brood, but the loss of all eggs in the brood. Is this not an important factor to consider in the affected environment?

I recommend you include a discussion of predator control in the AE.

3. There is no discussion of natural succession in the AE. Natural succession is the most important factor in the survival of sage grouse, because it is the only factor that affects every square foot of grouse habitat, every year. Fire, predators, and grazing affect some part of the habitat every year, but only succession affects every acre. Succession should be discussed to show the progression sagebrush goes through from the seedling stage to old overmature stage, and how that progression affects sage grouse.

I recommend you include a discussion of succession in the vegetation section of the AE.

4. There is no information on the different stages of vegetation in the AE (ie, seedling, immature, mature and overmature stages), and how many acres there are of each. How are the agencies going to measure the rate of increase or decrease in the acres of each age class over time if you don't even know how many acres there are to begin with?

The AE is the basis for Alt. A, the No Action Alternative, to which all other alternatives are compared. But if you don't know what the make-up of the vegetation in Alternative A looks like, you won't be able to estimate what the affects of the different alternatives will be on sage brush, and therefore sage hen.

I don't even know what to say about this. In my experience of writing roughly 12 EA's, and participating in 2 Forest Plan EIS's, I never ran into this situation before, and I doubt that the people who wrote the NEPA instructions ever anticipated it.

This lack of specificity is akin to saying: There are 1.8 million acres of forest in a certain area. We don't know what the age class distribution is, only that it is forested. We want to make a 6 million board foot timber sale there. Since we don't know what the age classes are, we don't know where the merchantable timber is. We will play it by ear as we go. Here is the environmental document Mr. Line Officer. Please sign on the dotted line. Thank you. What do you think your chances are of getting a signature?

I suppose you could start from scratch, with zero acres of sagebrush habitat for grouse. Then add the acres burned in wildfire in the last 10 years, and assume those are seedling areas.

Then add acres to each alternative that propose some kind of vegetative action (like prescribed fire or mechanical treatment), that anticipates meeting some objective of vegetation management (like return it to a seedling stage).

At 10 years, total the result and the alternative that creates the most acres of fire and vegetation treatment that improves grouse habitat would be the alternative that best meets the needs of sage grouse.

This assumes, of course, the money to accomplish the work will be appropriated by Congress, and the work actually accomplished on the ground. Good luck with this one!

#### Environmental Consequences (EC)

1. Since the affected environment section is not quantified, neither are the environmental consequences. For instance, the EC for Alt. B, Vegetation, says Alt. B would “implement numerous conservation measures to reduce impacts from human activities, which would reduce the likelihood for vegetation removal, degradation, or fragmentation and maintain the acreage and condition of sagebrush vegetation”. Good grief! What does that mean? Or, for Livestock Grazing, Alt. C, the EC states the consequences of “beneficial or adverse impacts on range management from other resource uses (eg, ROW or fluid mineral development) would be diminished in scale and intensity because of the elimination of grazing in all allotments intersecting occupied habitat.” What! How does eliminating grazing diminish the scale and intensity of beneficial or adverse impacts on range management from other resources, and to what degree? There are many, many other examples I could cite, but I lack the strength to list them all. How do these broad, generalized, superficial, nebulous, statements help anyone decide what the preferred alternative should be? After all, that is what the environmental consequences section is for; to provide specific information to the decision makers to help them select the Preferred Alternative.

The lack of specificity in the EC makes it nearly impossible to analyze the alternatives in any useful way. If I was one of the line officers that had to decide which alternative best meets the decision criteria, and thus be the selected alternative, I would not be very happy with the environmental consequences section of this DEIS. It provides no help in making the decision.

As an aside, I was.....surprised.....by the “Nature is good, humans are bad” tone of this document. That is, anything nature does is good for sage grouse, anything humans do is bad for sage grouse. I would expect to find this attitude in an environmental preservation document, but not in a professional land management agency document. You might want to lose this attitude before you get to the FEIS. You lose credibility when you use this approach.

## New Alternative Proposal

I hereby propose a new alternative, one that is focused primarily on creating a mosaic of species and age classes on the landscape. Direction in livestock grazing, wildfire management and predator control play a supporting role in accomplishing this goal.

A landscape is defined as an area of land over 100,000 acres with similar characteristics of climate, vegetation and geologic features. So, for example, a landscape might be the upper end of the Snake River drainage that receives more than 12 inches of rain per year.

### 1. Vegetation

The objective would be to, within the larger 100,000 acre landscape, focus on creating large openings (200 to 300 acres) in mature/overmature sagebrush, with smaller patches of sagebrush scattered through the open matrix. The small leave patches would be about 4 acres (400' by 400') which occupy about 10% of the total area (so within a 200 acre treatment area there might be 5 - four acre patches; 10% x 200 acres is 20 acres; 20 acres divided by 4 acre patch = 5 patches). A large patch is needed to protect sage grouse from predators.

In addition, there would be even smaller patches of sage approximately 25' x 25' up to 50' x 50', accounting for say, another 1% of the larger 200 acre area, or some 50 of these smaller patches per treatment area. These would provide temporary protection from predators.

The rest of the sagebrush in the treatment area would be removed by mechanical treatment. If necessary, the area should be seeded with grass and forbs following treatment. Also, thick patches of slash may have to be piled and burned to remove the greater concentrations of fuel. Roughly 89% of the 200 acre treatment area would be cleared of vegetation.

Overall, 30% of the sagebrush community, on a landscape basis, should be seedling age, 40% immature sagebrush, and 30 % mature/overmature vegetation.

Remove DF and pinyon-juniper that are encroaching into sagebrush to increase the total amount of sagebrush available to sage grouse.

### 2. Wildfire

Fight all wildfire in grouse habitat as soon as it is detected in June, July and August, the hottest part of the fire season. This will preserve as much of the sagebrush as possible for sage grouse.

Use prescribed fire outside of the June – August period whenever the window of opportunity for controlled burning allows. This would occur as a general maintenance program to keep sagebrush in a usable condition for grouse. Pre-approve a number of prescribed fire projects to take advantage of short windows of opportunity to burn.

### 3. Predator Control

Use predator control while hens are sitting on eggs and until the chicks can hatch and fly; do this the season following the 200 acre treatment. This generally is a 3 to 4 week period. This gives the chicks a chance to hatch and grow to a point where they can fend for themselves. I envision 2-3 people with shotguns walking through the 200 acre area and blasting away at ravens, hawks, coyotes and anything else that might want to eat a sage grouse. It might be necessary to do this for 2 or 3 seasons following the treatment.

### 4. Grazing

Allow grazing on all occupied GRS habitat in order to remove fine fuels and keep large concentrations of fuel from accumulating in the habitat.

Also use the Alan Savory method of “stomp and poop” grazing on dry sites (and other sites where appropriate) to concentrate cattle for a brief time (3 to 20 days).” Cattle excretion inoculates the soil with key bacteria and fungi that are awakened in the soil by the influence of dung and urine. This works especially well in cheatgrass-invaded areas. Native seedlings simply wait for the cheatgrass to die in summer. The native plants then act as a water-conserving , sheltering mulch that mature on summer and fall rainfall. The following spring cheatgrass seeds (if present) do not even germinate in the presence of native perennials and their allied native bacteria and fungi” (quote from Stephen H. Rich, president of Rangeland Restoration Academy in Salt Lake City; [steve@rangelandandrestoration.com](mailto:steve@rangelandandrestoration.com)).

### 5. Invasive Species

Implement noxious weed and invasive species control using integrated weed management in cooperation with State and Federal agencies, counties, and private landowners.

### 6. Internet Grouse Site

Create a nationwide grouse.com site where agency employees can post management practices they have tried and the result they had, good or bad. Other employees could visit the site to see what is working, and what is not. A sort of clearing house, so to speak, for what other employees are experiencing with adaptive management in sage grouse management.

Bottom line, I would say this DEIS has a loooong way to go before it is ready for prime time as an FEIS!

That concludes my comments. Again, thank you for the opportunity to comment on this proposal. I hope the agencies will actually read these public comments and use them to broaden and strengthen the DEIS, and not just put them in pigeon-holes, like this comment is about vegetation and that one is about

predator control. Together there were 85 comments about vegetation and 63 about predator control. This kind of shallow analysis does no good. As a minimum the people who are preparing the FEIS should read the public comments to see what they really say. Occasionally we, the public, do come up with an idea you didn't think of.
