Under Alternative G, anthropogenic disturbance, including nonenergy leasable mineral development, would be limited to 3 percent of nesting and wintering habitat within ~~GMZs and IMZs~~ PHMAs and IHMPAs within a Conservation Area (i.e., BSUs). In BSUs where the 3 percent cap is already exceeded, new development of federal nonenergy leasable mineral resources would be prohibited until enough habitat was restored to maintain the area under the threshold. Development of federal nonenergy leasable mineral resources that would result in exceedance of the 3 percent cap in a BSU would also be prohibited. This cap could potentially impact activities on XX acres of unleased

Commented [KP1 2]: Did not change to "valid existing rights could be harmed" because lessees may just choose to prioritize other areas as they might due to changing economic conditions or other factors. Does not automatically represent harm to a valid existing right.

federal nonenergy leasable mineral estate, including XX unleased acres within KPLAs. Impacts would be greatest where these caps limited development in unleased portions of KPLAs because these areas have the highest potential for nonenergy leasable mineral development. The XX acres that would be closed to nonenergy solid mineral leasing under Alternative G would not be impacted by the disturbance cap because no new nonenergy leasable mineral development could occur in the closed areas. *[Note to BLM and Forest Service: Do we have any existing information on where BSUs stand in relation to the disturbance caps at this time?]*

Commented [KP1 3]: Kept this paragraph in because it could actually prevent issuance of new leases rather than just being considered a mitigation measure.

**Subject:** ID GRSG - livestock grazing revised draft proposed plan impacts  
**Attachments:** IDMT\_SG-FEIS\_CH4\_livestock\_20141007.docx

Hi Nika,

Hope you are doing well. I have attached a revised version of the proposed plan impacts analysis for GRGS for your review. This draft includes revisions based on comments that you and others had on the initial draft as well as some changes based on revisions to the propose plan.

There are still some gaps, notably:

- Placeholder for Forest Service impacts analysis to be inserted once completed by the Forest Service.
- Missing GIS data; I have included placeholders for if/when we get this data.

There are also a few notes remaining in place for with questions for you. Note that this document has also not undergone technical edit or formatting.

Please let me know if you have questions, and feel free to pass this along to others on the grazing team for feedback if you'd like.

Thanks,

### Zoe Ghali

# CHAPTER 4

## ENVIRONMENTAL CONSEQUENCES

---

### 4.1 LIVESTOCK GRAZING MANAGEMENT

#### 4.1.1 Methods and Assumptions

##### *Indicators*

Indicators of impacts on livestock grazing are as follows:

- Changes in permitted AUMs in areas open to livestock grazing
- Changes in the kind of livestock permitted on allotments
- Prohibitions or limitations on the construction or maintenance of structural and nonstructural range improvements
- Modifications to or removal of structural range improvements
- Closures of areas to livestock grazing for the life of the plan
- Changes to the timing, duration, intensity or frequency of permitted use, including temporary closures

##### *Assumptions*

The analysis includes the following assumptions:

- All new and renewed leases and permits would be subject to terms and conditions determined to be necessary by the authorizing officer to achieve ~~the management and~~ GRSG habitat objectives for BLM- and National Forest System lands ~~as well as~~ ~~and to~~ meet land health standards for BLM-administered lands and desired conditions on National Forest System lands (see **Tables 2-X and 2-X**).

- The construction and maintenance of range improvements would continue in the ~~decision-planning~~ area, and would vary according to the constraints imposed by each alternative. New range improvements would be subject to limitations and may require additional maintenance, as defined ~~in the plan~~ management actions and RFDs. Range improvements are generally intended to improve livestock distribution and management, which would maintain or improve rangeland health and could benefit the forage base for livestock and wildlife and GRSG habitat.
- By definition in this plan, livestock grazing is not considered a surface-disturbing activity and is not included in the calculations for the disturbance threshold under Alternatives B, C, F, and G. ~~However livestock, but it~~ could affect the surface in areas where they livestock concentrate, such as around range improvements.
- If the ability to construct range improvements is limited, livestock grazing management options would be reduced.

#### 4.1.2 Nature and Type of Effects

Impacts on livestock grazing are generally the result of activities that affect forage production, areas open to grazing, the class of livestock, the season of use and timing, the ability to construct and maintain range improvements, and impacts from human disturbance, including disruption of livestock movement or unwanted dispersal. Key types of impacts are detailed below.

Protecting GRSG habitat may directly affect livestock grazing if management requires limitations to areas open to grazing, ~~or~~ available AUMs, modification of grazing strategies, or changes to season of use. ~~Such actions~~ This could increase ~~the time and~~ costs to permittees and lessees, both in time and expenses. For example, management actions to enhance habitat for GRSG could affect livestock ~~grazing~~ by restricting grazing intensity or season of use, retiring grazing privileges in some areas, or changing livestock ~~rotation~~ grazing systems and use patterns in order to maintain residual herbaceous cover in sagebrush-grouse habitat (NTT 2011). The listed restrictions could also decrease opportunities for livestock grazing, or even impact overall grazing operation viability (e.g., if no spring grazing areas are available).

However, managing vegetation to benefit GRSG may indirectly benefit livestock grazing by increasing vegetation productivity and improving the quality of available forage in the long term. This would be the case ~~especially~~ where current conditions are not meeting land health standards, ~~or desired conditions~~ or conditions. For example, in allotments with a history of intensive grazing, transitions in the composition of sagebrush communities may have occurred that have reduced cover or forage for GRSG (Cagney et al. 2010) and forage for livestock. ~~However, when~~ grazing ~~vegetation~~ management is designed put into place to promote health and vigor of the sagebrush plant herbaceous

~~communitiescommunity for livestock, beneficial impacts could this may also result in to supply sufficient herbaceous cover to meet habitat requirements for breeding GRSG, such as those specified by Connelly et al. (2000) as well as this may also providing improved livestock forage. (2000). However, note that some areas would require additional active restoration, such as reseeding native grasses and forbs or controlling invasive species.~~

Vegetation management designed to curb the incursion or encroachment of nonnative annual grasses ~~and shrubs~~ could temporarily reduce forage availability ~~in the short term~~. However, these treatments generally enhance rangeland conditions in the long term (NTT 2011).

~~Unregimented livestock grazing can have adverse impacts on riparian ecosystems (Armour et al. 1991); therefore,~~ managing riparian habitat can directly impact livestock grazing through excluding livestock at specific sites, increasing herding requirements, adding range improvements (such as cross fences and water gaps), and adjusting season of use and livestock numbers. Managing riparian habitat to maintain PFC is required for BLM-administered lands. It benefits grazing livestock by indirectly providing cleaner and more reliable water sources and more dependable forage availability. The BLM has been managing riparian and wetland areas for these objectives since at least 1997, though additional impacts could occur as additional management needs are identified and implemented.

Protecting water quality and watershed health is a requirement of standards and guidelines as well as state and federal water quality standards. If additional management needs are identified and implemented, changes could be required in livestock management, such as deferring or shortening grazing periods, adding range improvements, excluding grazing from riparian areas, establishing riparian pastures, and increasing livestock herding. ~~Increased costs to permittees could occur in areas requiring livestock exclusion of livestock or other restrictionsrestriction on livestock management such as these limitations could increase costs to permittees and lessees if changes reduced AUMs or increased livestock management costs.~~

Recreation can affect livestock grazing directly through human disturbance and indirectly through rangeland degradation. Direct disturbance can include ~~undesired animal dispersing or trespassing due to~~ recreationists leaving gates open ~~allowing livestock to move into areas they should not be (trespass), as well as animal displacement,~~ harassment, or injury from collisions, poisoning, or shooting. ~~It also can include~~ Damage to range improvements, particularly from ~~the use of~~ recreational vehicles or from sport shooting ~~can also occur~~. Disturbance ~~to livestock~~ could occur during the hunting season due to ~~the~~ increased presence of people, vehicles, and noise. Limitations on recreation in GRSG habitat could indirectly benefit livestock by reducing direct disturbances,

but could also concentrate [recreation](#) use in grazing allotments outside GRSG habitat, leading to more conflicts in those areas.

Other direct long-term recreation impacts include disturbance caused by increased levels of human activities. The degree of impacts would vary with the intensity of recreation (that is, large numbers of people for [special recreation permits \(SRP\)](#) use would likely have a higher level of disturbance than frequent use by a small number of visitors), the timing of recreation (for example, livestock could be more susceptible to disturbance during the spring when young are present), and location of recreation in the allotment (for example, a higher level of disturbance could occur near areas frequented by livestock, such as water sources or salt licks). As stated above, limitations on recreation in GRSG habitat could indirectly benefit livestock by reducing direct disturbances. [However, disturbance to livestock grazing outside of GRSG habitat areas may be increased if recreation use is concentrated in those areas as a result of restrictions within GRSG habitat.](#)

Limits on construction or use of transportation routes may affect livestock grazing practices. Road construction may cause loss of forage, harassment, and displacement; thus, reduction of these activities may benefit livestock by reducing disturbances. Closing roads or trails not leading to range improvements would ~~slightly also~~ increase forage availability when the area is rehabilitated or when natural rehabilitation occurs. Limitations on cross-country travel may impact permittees' and lessees' ability to effectively manage livestock if exemptions are not granted for access to allotments. Travel management actions for GRSG protection generally involve increased limitations or restrictions on travel management.

Wildfire alters sagebrush habitat because sagebrush takes a long time to regenerate, ~~which may allow for~~ [in addition](#), invasive species ~~to may~~ take hold [following wildfire](#) (NTT 2011). Wildland or prescribed fire would [temporarily](#) remove vegetation and forage ~~over the short term~~; however, ~~they can increase~~ forage [could increase](#) a few years post-fire as herbaceous vegetation increases [in the absence of](#) woody vegetation ~~burned in the fire is removed or reduced~~. Impacts on livestock operations could also occur when agency policies require a rest period following rehabilitation ~~and before grazing is reestablished~~.

Changes in wildfire suppression and fuels management to protect GRSG habitat would have varying effects on livestock grazing. Measures to protect sagebrush habitat might reduce the spread of wildfire and the associated disruption to livestock management. Use of livestock to manage fuel loads may provide some increased opportunities for grazing at a site-specific scale and on a temporary basis. [If fire suppression resources are redirected to protect GRSG habitat, grazing allotments outside of the fire suppression emphasis areas may be at increased risk of wildfire.](#)

The management of ~~habitat for~~ GRSG ~~habitats~~ using natural disturbance regimes, such as fire, and using vegetative treatments to accomplish ~~biodiversity objectives to improve~~ plant community resilience could also benefit livestock ~~grazing forage quality in the long term~~ by maintaining a balance of seral stages. ~~For example~~ ~~in general~~, removing encroaching junipers ~~from GRSG habitat would~~ benefits livestock ~~grazing~~ by creating a healthier grass and forage community.

Restrictions on ROWs or land transfers may indirectly impact grazing by reducing construction impacts from ~~ROW development~~ ~~development~~ ~~in developing these ROWs (such as~~ dust, displacement, and introduction of noxious weeds). Lands and realty actions taken to protect GRSG habitat would involve avoiding or excluding ROWs (e.g., for power lines, pipelines, and other structures) or land transfers in GRSG habitat. These measures could ~~slightly~~ decrease disturbance ~~to livestock~~ in these areas. However, ~~the development of such projects areas outside of GRSG habitat to which ROWs development may be relocated to general habitat~~ ~~may or non-habit resulting in~~ ~~could see~~ an increase in construction-related effects and associated disturbance or displacement of livestock ~~in these areas~~.

Energy and mineral development could impact grazing. During the exploration and testing phase of mineral development, the footprint of disturbance is usually small and localized; therefore, minimal acres available for grazing would be directly impacted. However, during the exploration phase, impacts on livestock dispersal and trespass could occur, increasing ~~time and cost~~ ~~cost~~ to permittees and lessees. Outside of the exploration and testing phase, surface-disturbing mineral development directly affects areas of grazing ~~in the short term~~ during construction of well pads, roads, pipelines, and other facilities. ~~A potential impact is an increased potential opportunity for the introduction and proliferation of noxious weeds in areas developed for minerals and energy. Noxious weeds that lack the nutritional value needed for productive grazing practices.~~ Other potential impacts are changes in available forage, limits on livestock movement, harassment, and temporary displacement of livestock. In the long term, a smaller amount of grazing acreage ~~is permanently~~ ~~would be lost~~ ~~lost from mining following rehabilitation~~ ~~until rehabilitation post mining operations~~. Improving roads associated with mineral development could facilitate livestock management operations by maintaining or improving access to remote locations within allotments. Properly implemented BMPs and reclamation mitigation measures would likely maintain rangeland health and forage levels for livestock. Reducing mineral development in GRSG habitat could reduce potential impacts on grazing, ~~as~~ described above.

Changes in livestock grazing management could impact grazing ~~opportunities~~ in a variety of ways. For example, implementing particular livestock grazing management requirements to benefit GRSG could affect livestock grazing by increasing operators' costs or changing required management actions. Some

management requirements may result in short-term and long-term increased costs to permittees and lessees, or AUMs could decrease for some permittees and lessees due to the following:

- ~~Implementation of m~~Modification ~~or modification~~ of a grazing strategy
- Change in season-of-use or livestock class
- Construction ~~or~~ modification ~~or removal~~ of range improvements, ~~that prevent or limit livestock distribution when ability to disperse livestock is impacted~~
- ~~Viability of existing operations could be compromised if s~~Seasons ~~or areas of use are eliminated or severely restricted~~ seasons ~~or areas of use are eliminated or severely restricted~~ from grazing

These management requirements could result in economic impacts on individuals and the community at large, both ~~directly direct~~ and ~~indirectly indirect~~. For example, ~~if a management action to reduce spring grazing is implemented on a BLM or FS allotment where the permittee is a ranch were dependent on spring forage seasonally on forage on BLM and/or National Forest System lands,~~ a reduction or elimination of AUMs ~~on BLM and/or National Forest System lands~~ may affect the entire ranching operation by reducing the total amount of available forage ~~(Torell et al. 2002) needed to sustain it (Torell et al. 2002).~~

Some management changes may require a short-term output of cost for permittees and lessees and/or agencies but will result in long-term benefits. For example, construction of range improvements to improve livestock distribution and allow use of a larger portion of the rangeland would generally enhance rangeland health in the long term; however, it would have short-term costs. Constructing off-site water sources and fencing riparian and spring sources could keep livestock away from sensitive riparian areas and provide a cleaner more reliable source of water for livestock; however, it would represent an increased cost for permittees and lessees: ~~if they are responsible for construction and/or maintenance of the projects.~~ Other requirements could increase annual operating costs, such as increased time feeding animals on private land, more complex pasture rotations, ~~or~~ herding ~~of livestock requiresing requiring~~ increased labor and fuels costs ~~for moving animals~~, or annually maintaining let-down fences.

In instances where an allotment is closed to grazing or AUMs reduced for GRSG objectives, ~~the agency may have to compensate~~ the permittee or lessee ~~may be compensated~~ for the value of range improvement projects constructed under a range improvement permit or cooperative agreement, in accordance with 43 CFR 4120.3-6(c), and 36 CFR 222.6 (a).

ACECs may be designated to protect sensitive habitat for the benefit of GRSG. Grazing availability would depend on the designated ACEC management objectives. Restrictions could include reducing grazing in the ACEC and limiting

the class of livestock animal or the season of use, duration, or location that livestock are allowed to graze.

#### 4.1.3 Alternative G

Under Alternative G, the functionality and capability of GRSG habitat within the project area would be assessed during project-level NEPA analysis within the management zone designations (Core, Important, General). Project proposals and their effects would be evaluated based on the updated habitat information and values affected.

Under the Alternative G and all Alternatives, impacts from energy and mineral development would be limited. Due to a lack of leases for non-energy leasables in GRSG habitat, no impacts from management actions are anticipated. Similarly, no economically viable coal resources are found in Idaho. The Dillon RMP does not allow for coal extraction leasing~~Under the Dillon RMP, a plan amendment would be required to lease coal.~~ As a result, coal development in the project area and related impacts on livestock grazing are likely to be limited under all alternatives.

[NOTE NEED TO ADD FS ANALYSIS ONCE FS PLAN IS AVAILAIBLEFS Impacts to be Inserted]

Formatted: Font: Italic

##### **Impacts from Lands and Realty Management**

Under the Alternative G, Core and Important Management Zones would be managed as ROW avoidance areas, but would be subject to RDFS, BMPs and seasonal timing limitation, resulting in limited new development in GRSG habitat. As a result, disturbance of livestock from development activities, as discussed under *Nature and Type of Impacts*, including disturbance of forage or unwanted dispersal of livestock, would be limited in GRSG habitat. Impacts could be disproportionately concentrated in non-habitat ~~HMA allotments~~ should development shift to these areas.

##### **Impacts from Habitat Restoration and Vegetation Management**

Under the Alternative G, vegetation rehabilitation would emphasize projects in areas with potential to improve GRSG habitat. Projects to remove conifers, and improve GRGS habitat may improve forage conditions for livestock ~~in the long term.~~

In addition, grazing management changes in restoration or rehabilitation ~~areas~~~~areas~~~~areas~~ could be required to maintain or improve GRSG habitat. Changes to grazing management could be required ~~during~~~~at the renewal of~~ livestock ~~permits~~~~permit~~~~renewal~~ in order to improve GRSG habitat. The intensity of impacts would vary based on site specific vegetation conditions. ~~Outside of Core Management Zones~~~~zones~~, impacts to grazing management could also occur where habitat restoration projects in burned areas adjacent to Core or Important Management zones are proposed ~~to restore outward from~~

~~existing habitat, with priority and related impacts on areas adjacent to Core first and Important second.~~

[Once language in VEG-7 clarified need to address impacts from this management action including the potential for removal of non-native vegetation that may be used as forage.]

Commented [ZG1]: NOTE TO BLM- this mgmt. action has still not had changes implemented per our previous discussion, needs to be revised.

**Impacts from Wildland Fire Management**

~~As discussed under Nature and Type of Effects, fuels projects and fire suppression to protect sagebrush ecosystems and associated GRSG habitat would benefit livestock grazing where areas available to grazing overlap this habitat, due to a long term reduction in wildfire frequency in areas currently occupied by annual grasses. this habitat. Implementing fuels projects and enhanced fire suppression would due to a long term reductionreduction in the likelihood of high intensity wildfire. Implementation ofShortShort frequency in areas currently occupied by annual grasses. In the Sshort term-term, fuels reduction projects may result in temporary reduction in available forage for livestock on a site specific basis. Rest from grazing may be required following fuels treatments, resulting in short-term reductions in forage availability. Fuels projects that remove encroaching trees would maintain forage species in affected grazing allotments.~~

Formatted: Indent: Left: 1.5"

Under Alternative G, management actions for wildfire include an emphasis on fire suppression and reduction in fire risk in Core and Important Management Zones. ~~These actions have the, with potential tfor reduceerductionfor reduction in long term fire risk and the temporary related loss of forage in these areas. Wildland Fire and Invasive Species Assessments' identification of priority areas/treatment opportunities for fuels management, fire management, and restoration would further define areas most likely to be impacted by fire management activities. Should aAreas areas available for grazing contain high fire risk areas that are outside of the identified priority treatment areas, then these non-priority areas could be at an increased risk for wildfire, as treatment and suppression activities would be focused elsewhere. Impacts to forage or disruption of activities could occur in these areas, which include approximately XX acres available to grazing in general or non-habitat. [Include data from fire risk map/GRSG habitat/ WHB HMA overlay if available- waiting on GIS]~~

Formatted: Highlight

Formatted: Font: Italic

Formatted: Font: Italic

Targeted grazing could result in some site-specific temporary increases in available forage ~~outside of permitted allotments~~, but location and levels would be unpredictable and temporary; thus, ~~impacts overall impacts on available forage would be impacts would be site specific and varied. Impacts would be further defined in site specific NEPA. minimalminimal.~~

Under the Alternative G, GRSG habitat objectives would be incorporated into ESR/BAER plans, ~~and Livestock~~ management activities may be altered ~~so~~ to meet GRSG objectives. ~~As a result, grazing could be excluded from restoration sites until GRSG objectives were met, seeded or naturally recovering vegetation is~~

~~adequate to facilitate making progress towards those objectives following resumption of grazing including no grazing of new seedling until at least the end of the second growing season.~~

However, incorporation of objectives would be based on site potential and therefore would vary on a site specific basis; ~~required~~ site specific changes to grazing management ~~required~~ would be determined at implementation. ~~[Note: refine if more specific information on limitations on grazing post fire are included.]~~

In addition, grazing management may be adjusted on sites adjacent to burned areas to mitigate the impact of a wildfire on GRGS populations. As a result, ~~some~~ permittees may be impacted by both exclusion of livestock from a burned area and/or reduction of grazing or changes to management in adjacent allotments. Specific management changes and intensity of impacts would vary based on site specific conditions and wildfire occurrences.

#### **Impacts from Energy and Mineral Development**

Under Alternative G energy and mineral development would have additional restrictions applied to limit disturbance on GRGS habitat as compared to Alternative A. As a result the likelihood of development and associated disturbance ~~to livestock of WHB to livestock grazing~~ would be reduced in areas with potential for these resources, ~~as compared with Alternative A.~~ Due to the limited conflicts between livestock grazing management and energy development ~~under existing conditions,~~ impacts would be negligible.

#### **Impacts from Travel and Transportation Management**

Under Alternative G, motorized travel would be limited to existing roads, primitive roads, and trails. Ability of permittees to access range improvements for maintenance or to utilize motorized vehicles to gather livestock could be impacted, as exceptions for administrative access would generally be granted only at permit renewal. Once travel management planning is implemented, any seasonal restrictions on motorized use could further impact ability of permittees to access allotments for management.

Limitations on motorized travel could also reduce any conflicts between livestock and recreation, as discussed under *Nature and Type of Impacts*.

#### **Impacts from Livestock Grazing Management**

Under the Proposed plan, ~~management actions and impacts would be based focused on Core and Important Habitat Zones. Changes~~ ~~Changes~~ to grazing management and associated impacts are most likely to occur in ~~Core and Important Habitat Zones~~ ~~these areas.~~ Permit renewal and ~~rangeland health and assessments and assessment~~ would be prioritized first by Conservation Areas where adaptive management triggers have been reached or where triggers are

4. Environmental Consequences

at risk of being met. Within Conservation Areas, priority would be given to Core, followed by Important, with management changes occurring in this order.

Acres available to grazing in Core, Important and General Habitat are displayed by Conservation Area in Table 4-X, Areas available to grazing and AUMs in GRSG habitat by Conservation Area.

Table 4-X  
Areas available to grazing and AUMs in GRSG habitat by Conservation Area

Source:

Existing grazing management would be maintained unless the current grazing system does not meet GRSG habitat objectives, or desired conditions. In many cases recommended GRSG habitat objectives would be similar to those currently assessed in the Habitat Assessment Framework (HAF). Adjustments to grazing management or authorized grazing use level would be applied on a site specific basis and tailored to achieve objectives-Desired Conditions for GRSG based on GRSG seasonal habitat type in the areas assessed (i.e. breeding, nesting, wintering, ~~et cetera~~) as detailed in Table 2.X Table 3. Seasonal Habitat Desired Conditions for Greater Sage-Grouse [table to be included if GIS data is available- GIS in progress]. ~~Although~~ Site specific review of livestock grazing in of seasonal habitat types istype would be required for rangeland health land assessment and if livestock grazing is a causative factor in not meeting GRSG objectives, management adjustments would be made. E- estimated acres available to grazing by GRSG seasonal habitat type are shown in

Commented [SEA2]: I still not sure how this will work if we lose our ability to issue permits under the rider. If we lose the rider then wouldn't expired permits, regardless of where they are located, be a priority? Also, if a hard trigger is met wouldn't we modify a current permit to fix the problem asap?

ZG response- might want to address these question to Brent/mgt team as to how to clarify this info in the mgmt. direction.

Nika- do we need to add anything here about other considerations as mentioned above.

Formatted Table

Formatted Table

Formatted Table

Formatted: Font: Bold

Formatted: Font: Italic, Highlight

**Table 4-X**, Acres available to grazing by GRSG seasonal habitat type. Acres within Nesting/Early Brood Rearing habitat nesting habitat (XX estimated acres) may be more likely to require changes to grazing management, due to the desired conditions for this habitat type, including perennial grass height of at least 7 inches to allow adequate nesting cover. As a result, impacts would occur on an allotment or watershed scale as changes to land assessments, permit renewal and related management changes are/were implemented. The level and intensity of impacts would vary on a site specific basis. It should also be emphasized that seasonal habitat acres displayed in Table 4-X, represent landscape scale assessment estimates and exact acres within specific habitat types and related impacts would be defined with future site specific analysis.

Formatted: Font: Bold  
Formatted: Highlight

Under Alternative G, voluntary retirement or waiver of grazing privileges would be permitted; however, final use of the relinquished preference would be determined by the BLM or Forest Service as appropriate.

<b>Acres within Nesting Habitat</b>				
<b>Acres within Brood-Rearing/Summer *</b>				

\*Applies to all habitat outside of nesting/breeding and winter  
Source:-

~~Under Alternative G, permittees could voluntarily retire or waiver of grazing privileges, would be permitted. If the authorized officer may relinquish in whole or in part permitted AUMs. If enough AUMs are relinquished over time it could This may result in long term reduction of overall available AUMs overall. Subsequently, there could be socioeconomic on local communities depending on the extent of the reduction in AUMs, with potential for economic impacts on local communities that depend on livestock grazing. Economic impacts are further discussed in section XX, Socioeconomic impacts.~~

~~Under Alternative G, some additional limitations would apply to structural range improvements, as compared to Alternative A, including limitations on fence construction and construction of tall structuresstructuresstructure near occupied leks. These limitations are, as detailed in project Required Design Features and BMPs (Appendix X). These Restrictions could increase the time or costs for construction and maintenance of improvements, but should allow sufficientflexibility is allowed for that permittees to could utilize range improvements to effectively manage distribute livestock.~~

Formatted: Highlight

**Impacts from Special Designations Management**

No new special designation areas are proposed under the Proposed Action, therefore no impacts would occur to livestock grazing management.

**Impacts from Anthropogenic Disturbance Management, Adaptive Management, and Coordination**

Livestock grazing and related range improvements are not included as anthropogenic disturbances in calculation of the anthropogenic disturbance cap. Therefore, no direct impacts would occur to livestock grazing management as a result of the cap. Limitations of Anthropogenic disturbance would generally result in a reduction in development in GRSG habitat and a related reduction in disturbance to livestock.

If adaptive management soft triggers are met and livestock management is a causative factor in not achieving GRSG habitat objectives, then adjustment of management would be required as identified in the Adaptive Grazing Management Response, Appendix G. Individual allotments or pastures would be analyzed at fine and site scale-habitat assessments within the applicable Conservation Area. This analysis would determine the appropriate changes to grazing management required to maintain GRSG populations. Impacts from Management changes identified as necessary to meet GRSG habitat objectives would be implemented at the allotment or pasture level, and commensurate with the scope and scale of the identified management issues, as discussed under livestock grazing management impacts. While management changes would occur into allotments that do not identified to meet GRSG habitat objectives, as discussed under livestock grazing management impacts, impacts would be limited in scale to that determined necessary.

**Attachments:** IDMT\_SG-FEIS\_CH4\_template\_REV\_fire-dv.docx

Hi Everyone,

I've attached the revised Chapter 4 Wildland Fire Management impacts section for your review. During our initial review period in early August, the only requested change was to make sure the reader could find a description of FRCC; I've added a note in the first Indicator referencing Section 3.7 where FRCC is discussed in detail. I have also made a few changes in light of revisions to the Proposed RMP. Thank you,

Drew

# CHAPTER 4

## ENVIRONMENTAL CONSEQUENCES

---

### 4.1 [INSERT NAME OF RESOURCE]

#### 4.1.1 Methods and Assumptions

##### *Indicators*

Indicators of impacts on wildland fire management are as follows:

- Alteration of vegetative cover that is likely to result in a substantial shift in fire regime condition class (FRCC) across the planning area (see Section 3.7 for a description of FRCC)
- A substantial change in the likelihood or severity of wildfire, based on level of restrictions on uses that may introduce sources of ignition
- Management actions that substantially inhibit a response to wildfire or appropriate treatments to prevent wildfire

##### *Assumptions*

The analysis includes the following assumptions:

- The spread of invasive annuals (e.g., cheatgrass) has lengthened the fire season in many parts of the planning area. These species often cure sooner than native perennial species and are more prone to ignition. Therefore, actions that reduce the spread or footprint of invasive annuals or restore perennial vegetation communities would reduce the frequency and intensity of wildfires, while reducing wildfire management costs.
- Fuels treatments using chemical methods to control invasive annuals are likely to be the most effective in reducing fine fuels and fire intensity and severity.
- Fire is an important functional natural disturbance in many of the ecological systems found in the planning area.

- In many cases, a direct relationship exists between fuel loading and potential fire intensity and severity.

#### 4.1.2 Nature and Type of Effects

Impacts on wildfire management result from changes in fire frequency and intensity and the ability to employ fire-suppression methods, both of which would affect management of fire and related costs within the planning area. As discussed in **Section 3.7**, most of the lands in the decision area have moderate to high levels of departure from historic conditions and related fire risk. Actions that change condition class from highly altered ecosystems to one closer to historical conditions could reduce the risk of key ecosystem loss, as well as decrease fire risk and management costs in the long term.

Many different resource uses may introduce additional ignition sources into the planning area. This increases the probability of wildfire occurrence and the need for fire-suppression activities. Fire intensity can be affected by activities that decrease fuel loading, such as vegetation treatments and timber product harvesting, and activities that alter the composition and structure of vegetation communities. High-intensity fires generally result in a greater loss of vegetation cover, changes to soil chemistry, damage to root structures, and a greater ability for nonnative species to become established (Verma and Jayakumar 2012).

Transportation and travel management can impact fire frequency by changing the level of risk of human-caused ignitions. The risk of ignition is increased where travel is less restrictive, particularly where motorized vehicles travel cross-country. All forms of travel encourage the spread of invasive weeds, particularly cheatgrass, which can shift fire regimes and increase fire behavior potential. Conversely, if management were to restrict access, wildfire risk may decrease. In addition, transportation management may impact fire suppression; when routes are closed and rehabilitated, they become unavailable for response to wildfires, limiting access opportunities.

Similarly, the level and type of recreation permitted can impact fire risk. Increased recreation may increase the probability of unintentional fires from human-caused ignitions and the need for fire suppression. Recreation management may reduce this risk by providing targeted activities and outcomes.

Surface disturbance caused by development would generally contribute to the modification of the composition and structure of vegetation communities (including increases in noxious weed proliferation) around developed areas. This would then be more likely to fuel high-intensity fires, which could increase program costs because of the increased potential for fire.

Lands and realty actions may indirectly result in development and associated fire risk. For example, issuing ROWs can result in indirect impacts by increasing the risk of human-caused ignition should transmission lines, renewable energy projects, or other development be constructed.

Likewise, the development of energy and minerals may increase the risk of wildfires by introducing new ignition sources (Shlisky et al. 2007). Associated facilities, infrastructure, and transmission lines can increase fire and fuels program costs, while decreasing fire management flexibility to respond to sub-regional conditions with regard to suppression options. Energy development also poses hazards to firefighters, including unknown toxins, facility protection, evacuation of industry personnel, and dangerous overhead power lines. Fire programs could incur additional costs to train firefighting personnel for emergency situations associated with energy development.

Additional limitations on mineral development would have an indirect effect of decreased fire. This would be due to less development, fewer vehicles, and less construction equipment, all of which would serve to decrease the chance of human ignition. Development of federal minerals underlying nonfederal lands may impact fire management on BLM- and Forest Service-administered lands when developed. This is particularly the case when ownership is in a patchwork pattern, as fires ignited on nonfederal lands may quickly spread onto and impact BLM- and Forest Service-administered lands.

Invasive species establishment or increase may follow construction and could impact fire management actions through increased risk of fire and need for fire management. If treatments in annual infested areas use an approved herbicide, those treatments would generally experience greater levels of success.

Prioritizing fuels treatments in areas dominated by invasive species would reduce the frequency and intensity of wildfire. The spread of invasive species, which cure earlier in the spring or summer, has lengthened the fire season in many parts of the planning area. If these areas revert to a perennial dominated community, the fire season would generally be shortened by two to four months, depending on moisture, weather, and other factors.

Range grazing management can impact the ability to manage fire as a natural process through changes in fine fuels availability (e.g., grasses). Livestock grazing reduces fuel loads, so retiring allotments may increase fuels in specific sites. Conversely, increasing AUMs could reduce fuel loads.

Vegetation and weed treatments that decrease standing vegetation could decrease the intensity of wildfires and allow fires to be more easily controlled. For example, efforts to reduce incursion of nonnative annual grasses (primarily cheatgrass) and proliferation of other noxious and invasive weeds would promote healthy plant communities and an associated lower risk of high-intensity wildfire (USGS 2006). Used appropriately, prescribed fire would be compatible with noxious weed control; however, the presence of noxious weeds and the potential of weeds to spread after a prescribed fire would need to be monitored on a site-specific basis. Conversely, management actions that retain shrub and cover may increase fuel loading and the likelihood and intensity of wildfire.

Management actions that are intended to improve, create, or reestablish healthy ecological conditions in various vegetation types benefit the fire and fuels program in the long term. They do this by promoting the most efficient use of fire and fuels management program resources. Conversely, prioritizing fire suppression can limit management options and increase costs for fire management programs.

Special designations, such as ACECs and sensitive resource management, can restrict fuels treatments on a site-specific basis. For example, in areas where preservation of particular species or habitats is emphasized, management options and fuels treatments may be limited. Conversely, restrictions on resource uses, such as travel and mineral extraction, in special designations areas could reduce fire risk in these locations.

Implementing management for the following resources would have negligible or would have no impact on wildfire management; therefore they are not discussed in detail: air quality, soil resources, water resources, wild horses and burros, cultural resources, paleontological resources, visual resources, wilderness characteristics, cave and karst resources, forestry, socioeconomics, and environmental justice.

#### **4.1.3 Proposed Plan**

With an emphasis on balancing resources and resource use among competing human interests, land uses, and the conservation of natural resources, the proposed plan would reduce FRCC shift and would result in a more natural (i.e., historic) frequency and intensity of wildfire.

##### ***Impacts from Lands and Realty Management***

Certain uses would be excluded in CMZ, reducing the type of development allowed in those areas. This restriction would limit opportunities for human-caused ignitions. There would be no similar restrictions in IMZ or GMZ, meaning the reduction in ignitions would be confined to a smaller area than under other alternatives.

##### ***Impacts from Habitat Restoration and Vegetation Management***

The proposed plan uses a more defined set of tools for wildfire management than other alternatives. In most instances, the proposed plan allows for management flexibility to respond to sub-regional conditions in designing fuels treatments and response to wildfire. For example, in CMZ the use of chemical, mechanical, and seeding treatments with appropriate plant materials is emphasized to prevent the dominance of invasive weeds. This would allow a greater success of those treatments. Using mechanical and chemical treatments to prepare areas in FRCC2 and FRCC3 for prescribed fire would have a similar impact.

Strategic wildland fire planning would help return CMZ to historic FRCC and natural fire intensities and intervals. Key actions driving this impact are as follows:

- Strategically placed fire-resistant vegetation or green-strip seedings
- Strategically placed pretreated areas that reduce fine fuels by such practices as mowing vegetation along roadsides, implementing grazing strategies, and applying herbicides
- Planned wildfire suppression tactics in important GRSG habitat

Prioritizing wildfire suppression in CMZ and conducting burn-out/backfiring operations in a manner that minimizes the loss of sagebrush may have limited ability to restore historic FRCC in CMZ.

Education, inventory, prevention, control, rehabilitation, and monitoring would be emphasized for invasive species management. By limiting the spread of invasive species, more GRSG-occupied habitat would be retained as a perennial-dominated community, which has a shorter fire season than those communities characterized by invasive annuals (which cure earlier in the year and are more prone to ignition).

Avoiding prescribed fire in GRSG habitat unless there would be a net benefit for GRSG could result in a greater use of other fuels treatment methods, such as chemical, biological, and mechanical treatments. It may also increase the risk of large unplanned fires, but the BLM could mitigate this risk if prescribed fire would result in a net benefit for GRSG.

#### ***Impacts from Wildland Fire Management***

Wildland fire management under the proposed plan is similar to Alternatives B and D, with additional management flexibility and guidance incorporated to tailor management to specific vegetation communities. The BLM and Forest Service would prioritize wildfire suppression planning and would consider targeted grazing to reduce fine fuels in CMZ. As a result, FRCC shift would be reduced and the frequency and intensity of wildland fire would be more natural. This is because post-fuel, restoration, and ESR management would be designed to ensure long term persistence of seeded or pre-burn native plants.

Likewise, several actions would improve the success of fuels treatments in CMZ. Specifically, a broad set of tools, including chemical, biological, mechanical fuels treatments and pretreating areas to reduce fine fuels would dramatically improve the fuel program's ability to improve GRSG habitat conditions.

When reseeding following fire, using species varieties that are adapted to a warmer climate may, in combination with potential climate change, reduce potential for unnatural levels of fire frequency and intensity.

Stationing first response firefighting resources to higher fire occurrence areas would reduce response time.

The Fire and Invasive Annuals Team protocol would help the wildland fire management program direct its efforts and resources efficiently, especially when combined with the variety of fuels treatment options available under the proposed plan.

Rural fire protection coordination would be stronger under the proposed plan than under any other alternative. Developing and implementing Rangeland Fire Protection Associations in coordination with the state would result in a more consistent inter-agency approach to wildland fire management. As a result, each agency's fire management team would deploy resources in a consistent manner, helping the BLM's fire and fuels program operate more efficiently.

#### ***Impacts from Non-Energy Leasable Minerals Management***

Seasonal limitations and restrictions on development near leks would reduce the potential for human-caused ignitions.

#### ***Impacts from Locatable Minerals Management***

Valid claims would require additional mitigation within GRSG habitat, likely resulting in site-specific improvements to FRCC and wildfire intensity and frequency.

#### ***Impacts from Salable Minerals Management***

Restoring salable mineral pits in CMZ would result in a temporary increase in the potential for human-caused ignitions. Restoration would reduce invasive species, though. Over the long term, this would reduce the frequency and intensity of wildfire and promote the establishment of native perennial species that are less combustible.

Prohibiting mineral material sales near occupied leks would also reduce opportunities for human-caused ignitions over the long term.

#### ***Impacts from Fluid Minerals Management***

There would be several measures (e.g., TL and NSO stipulations and RDFs) restricting surface disturbance that would reduce the potential for human-caused ignitions on unleased lands that could be leased in the future.

Allowing exploration and drilling on leased areas in IMZ from July through November would increase the risk of human-caused ignitions. Off-site mitigation requirements for new developments in CMZ could encourage a return to historic FRCC in areas where mitigation is implemented.

#### ***Impacts from Travel and Transportation Management***

Compared to cross-country travel, limiting motorized travel in Idaho field offices to designated routes would reduce the opportunity for ignitions. Per

regulations at 43 CFR 8340, fire vehicles being used for emergency purposes would be exempt from these limitations, thus preserving the wildland fire management program's access to respond to unplanned ignitions.

Restricting SRPs in sensitive seasons or in PPMA could result in temporary and site-specific reductions in human-caused ignitions.

Minimizing adverse recreation effects on GRSG within recreation management areas that overlap PPMA could result in use restrictions that may reduce the risk of human-caused ignitions.

#### ***Impacts from Livestock Grazing Management***

Potential restrictions on grazing, including retiring allotments, in CMZ could increase fine fuels and thus the severity of wildfires.

Evaluating, and potentially introducing, exotic grass seedings could increase the risk of wildfire, depending on the attributes of and range where the grass species is introduced.

Limiting the types of range improvements allowed in CMZ would decrease opportunities for human-caused ignitions during construction or maintenance.

Adjusting grazing management, including resting allotments, to meet ER&R objectives would mitigate the effects of wildland fire and may reduce the risk of large, unplanned fire in the future.

#### ***Impacts from Special Designations Management***

Current impacts would continue, and there would be less management flexibility for fuels treatments and wildfire response in existing ACECs.

#### ***Impacts from Anthropogenic Disturbance Management, Adaptive Management, and Coordination***

Limiting anthropogenic disturbances in nesting and wintering habitat within CMZ and IMZ within a Conservation Area would reduce the potential for human-caused ignitions. Requiring habitat restoration for new disturbances which would otherwise exceed the disturbance cap would help encourage a return to historic FRCC in restored areas.

Should adaptive management triggers be met, potential implementation measures would be identified and could include fire and fuels treatments. Impacts on the wildland fire management program are dependent upon the nature and location of implementation actions identified. However, actions to restore habitat would generally encourage a return to historic FRCC.

By potentially streamlining approaches to landscape-level fire and fuels treatments, cooperative planning efforts with other agencies and private landowners would generally improve the wildland fire management program's

ability to maintain or improve FRCC and its ability to respond to wildfire and utilize appropriate treatments to prevent wildfire.

Zoe, here are my edits. Let me know if you have questions. Thanks!

On Mon, Oct 6, 2014 at 1:25 PM, Zoe Ghali <[zoe.ghali@empsi.com](mailto:zoe.ghali@empsi.com)> wrote:

Hi Nika,

Hope you are doing well. I have attached a revised version of the proposed plan impacts analysis for GRGS for your review. This draft includes revisions based on comments that you and others had on the initial draft as well as some changes based on revisions to the propose plan.

There are still some gaps, notably:

- Placeholder for Forest Service impacts analysis to be inserted once completed by the Forest Service.
- Missing GIS data; I have included placeholders for if/when we get this data.

There are also a few notes remaining in place for with questions for you. Note that this document has also not undergone technical edit or formatting.

Please let me know if you have questions, and feel free to pass this along to others on the grazing team for feedback if you'd like.

Thanks,

Paul,

Butte Field Office is included for effects analysis purposes only. None of the proposed decisions apply to the Butte FO and the Butte RMP is not being amended through this effort. So for impacts analysis the Butte FO would carry forward the no action alternative effects specific to those lands in all alternatives analysis. Since there are no new decisions in the Butte FO the effects analysis on those lands described in the no action alternative would carry forward to all alternatives. So for acreage calculations in GIS the analysis would report the same allocations for Butte as described in the no action. In the effects write up that EMPSi is working on it may be impossible to tease out any differences in Butte based on the area and habitat involved.

On Feb 11, 2015, at 3:35 PM, "Makela, Paul" <[pmakela@blm.gov](mailto:pmakela@blm.gov)> wrote:

Gents,

Before GIS folks do the calcs for the direct/indirect effects, I think you need to confirm or reconfirm how the Butte MT field office area is going to be handled.

For example Table 4-57 in the DEIS is titled "Oil and Gas Leasing Categories in the Decision Area, Alternatives B and F".

In the DEIS glossary, "Decision Area" is defined as "Lands and federal mineral estate within the planning area that are administered by the BLM and the Forest Service." The term "Planning Area" is not in the Glossary.

If planning area is defined by the subregion boundary it includes the Butte FO.

It has been my understanding that Butte FO was going to be part of the cumulative effects analysis but not the direct/indirect analysis since it is outside the decision space for the amendment---which is only relevant to the Dillon FO and the Beaverhead-Deerlodge NF.

I was meeting with Diane about lek issues, and noticed that when you turn on certain themes like "closed for oil/gas" some polygons in the Butte portion show up. See attached pdf and callout boxes.

So the question is do those acres in Butte FO still get rolled into Ch 4 tables for oil/gas closures, or not. If they do, they inflate the actual acres "closed" relative to the Dillon FO/BHDL NF amendment area. However, if we clip those by PHMA and GHMA designations (which only are in Dillon FO/BDHNF), or if we at least just exclude/clip out the Butte FO, then it's not an issue.

Please advise...

Memorandum

To: State Director, Idaho State Office, U.S. Bureau of Land Management, Boise, Idaho  
Regional Forester, Region 1, U.S. Forest Service, Missoula, Montana  
Regional Forester, Region 4, U.S. Forest Service, Ogden, Utah

From: *Acting* State Supervisor, Idaho Fish and Wildlife Office, U.S. Fish and Wildlife Service, Boise, Idaho *Deir Mackey*

Subject: Idaho/Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement—Multiple Counties in Idaho and Southwestern Montana and Box Elder County, Utah—Concurrence  
In Reply Refer To: 01EIFW00-2015-I-0502

This memorandum transmits the U.S. Fish and Wildlife Service's (Service) concurrence on the effects to species listed under the Endangered Species Act (Act) of 1973, as amended, from actions associated with the U.S. Bureau of Land Management's (Bureau) and U.S. Forest Service's (USFS) (collectively referred to as the action agencies) proposed Idaho/Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement (LUPA) which encompasses multiple counties in Idaho and Southwestern Montana<sup>1</sup> and Box Elder County, Utah. In a letter dated May 8, 2015, and received by the Service on May 12, the action agencies requested concurrence<sup>2</sup> with the determination, documented in the Biological Assessment (Assessment; USBLM and USFS 2015, entire), that implementation of the proposed LUPA may affect, and is not likely to adversely affect the grizzly bear (*Ursus arctos horribilis*) and *Spiranthes diluvialis* (Ute ladies'-tresses), both threatened species under the Endangered Species Act of 1973 (Act), as amended.

In addition, pursuant to the requirements of 7(a)(4) of the Act and CFR 402.10, the action agencies assessed the effects of the proposed actions and made non-jeopardy determinations for the proposed LUPA. The action agencies determined that the LUPA is not likely to jeopardize the continued existence of *Lepidium papilliferum* (slickspot peppergrass), a species currently proposed for listing as Endangered under the Act. The Bureau and USFS also determined that

<sup>1</sup> The LUPA planning area includes Ada, Blaine, Cassia, Camas, Canyon, Elmore, Gem, Gooding, Jerome, Lincoln, Minidoka, Oneida, Owyhee, Power, and Twin Falls counties in Idaho, and Beaverhead, Broadwater, Deer Lodge, Gallatin, Granite, Jefferson, Lewis & Clark, Madison, Park, Powell, and Silver Bow counties in southwestern Montana.

<sup>2</sup> Although the Bureau's memorandum was transmitted under Bureau letterhead and signature, the Bureau specifically stated that this request was also on behalf of the USFS.

the proposed LUPA is not likely to result in the destruction or adverse modification of proposed critical habitat for the slickspot peppergrass and the western yellow-billed cuckoo (*Coccyzus americanus*). Though Director (Service) concurrence is not required by 7(a)(4) or CFR 402.10, the inclusion of these determinations in the Assessment creates a need under CFR 402.12(k) for the Service's concurrence with these determinations. After reviewing the action agencies' Assessment, the Service concurs with these determinations, and pursuant to language at CFR 402.12(k), a conference is not required.

The action agencies also determined that implementation of the LUPA will have no effect on the Canada lynx (*Lynx canadensis*) and its designated critical habitat, the northern Idaho ground squirrel (*Spermophilus brunneus brunneus*), the red knot (*Calidris canutus rufa*), the western yellow-billed cuckoo, the bull trout (*Salvelinus confluentus*) and its designated critical habitat, the Banbury Springs lanx (*Lanx* spp.), the Bliss Rapids snail (*Taylorconcha serpenticola*), the Bruneau hot springsnail (*Pyrgulopsis bruneauensis*), and the Snake River physa (*Physa natricina*). The Service acknowledges these no effect determinations.

## Project Overview

The Bureau and USFS prepared amendments to their respective land use plans (LUPs) in response to the need to inform the Service's March 2010 "warranted, but precluded" listing decision for the greater sage-grouse (*Centrocercus urophasianus*, GRSG). These documents provide direction for the conservation of GRSG, and analyze the environmental effects that could result from implementing the proposed LUPA. There are two selected actions, one for the Bureau and one for the USFS. Overall, the two plans are the same, with some minor differences between the plans primarily due to agency land management planning terminology. Full details of the Bureau and the USFS proposed LUPA are provided in the Assessment (USBLM and USFS 2015, Appendices D and E).

The LUPA addresses GRSG habitat within Idaho, southwestern Montana, and that portion of the Sawtooth National Forest located within Box Elder County, Utah. The LUPA covers Bureau-administered lands in the Bruneau, Burley, Challis, Four Rivers, Jarbidge, Owyhee, Pocatello, Salmon, Shoshone, and Upper Snake Field Offices in Idaho and the Butte<sup>3</sup> and Dillon Field Offices in Montana. The LUPA covers National Forest System lands in the Boise, Caribou-Targhee, Salmon-Challis National Forests, and Curlew National Grassland in Idaho, the Beaverhead-Deerlodge National Forest in Montana, and that portion of the Sawtooth National Forest located in Utah. The Proposed LUPA focuses on addressing public comments and comments from the States of Idaho and Montana, while continuing to meet Bureau and USFS legal and regulatory mandates (USBLM and USFS 2015, pp. 7-8).

The purpose of the LUPA is to identify and incorporate appropriate conservation measures in LUPs to conserve, enhance, or restore GRSG habitat by reducing, eliminating, or minimizing threats to that habitat. The Assessment further states that changes in action agency management

---

<sup>3</sup> Butte Field Office-administered lands are not included as part of the analysis in the LUPA/EIS except as required in the GRSG cumulative effects analysis. For additional information, please see Chapter 1 of the Final Environmental Impact Statement for the LUPA.

of GRSG habitats are anticipated to have considerable benefits to present and future GRSG populations, and could reduce the need to list the GRSG as threatened or endangered under the Act (USBLM and USFS 2015, p. 8). The proposed LUPA incorporates the following GRSG goal: Conserve, enhance, and restore the sagebrush ecosystem upon which GRSG populations depend in an effort to maintain and/or increase their abundance and distribution, in cooperation with other conservation partners. GRSG habitat in Idaho is divided into three categories, listed here in order of higher to lower conservation value to GRSG: Priority Habitat Management Areas (PHMA), Important Habitat Management Areas (IHMA), and General Habitat Management Areas (GHMA). Only PHMA and GHMA are identified for GRSG in the southwestern Montana portion of this action (USBLM and USFS 2015, pp. 12-13).

The proposed action, a decision on direction for the conservation of the GRSG, is unlike a typical project in that it does not set in motion specific on the ground, environment-impacting activities. However since the LUPA does represent a final agency action, the Bureau and the USFS have reviewed the general nature of impacts that could potentially occur from the LUPA, including how they potentially affect listed species. At the LUP level, there is only sufficient information to generally evaluate the potential impacts of the LUPA on species protected under the Act and the circumstances or planning and operation constraints that may reduce those potential impacts. The same analytical constraints apply to the Assessment and to this Letter of Concurrence, especially since the LUPA does not specifically act as the decision document for site-specific future projects.

Programmatic plans are considered permissive in that they allow but do not authorize or approve any site-specific projects or actions. They are much like zoning ordinances under which future decisions are made. Decisions at the LUP level establish goals and objectives, identify the types of activities that are allowed or prohibited in specific areas, may specify management standards and minimum habitat condition goals either unit wide or for specific areas, and may establish a monitoring and evaluation program. The Assessment does not analyze site-specific actions, and specifically states that effects determinations should not be assumed to relate to site-specific projects. In the future, during project-level environmental planning and analysis, site-specific actions will continue to be analyzed to identify possible effects on listed species. Site-specific analysis of such actions may identify potential effects on listed species even when the programmatic Assessment determines no effect associated with GRSG management direction for LUP programs. As part of any future project-level environmental analysis, specific conservation measures and strategies to alleviate any potential adverse effects associated with GRSG management direction may be developed as the details of the future site-specific proposed actions become available (USBLM and USFS 2015, pp. 100-101).

The LUPA Assessment, associated section 7 consultation activities, and this Letter of Concurrence do not change the responsibility of the Bureau and the USFS to consult on site-specific projects as they are developed in the future. Even if those future actions are consistent with the LUPA, if those actions may affect any listed species, the Bureau and USFS bear the responsibility to consult with the Service under section 7 of the Act to ensure that their actions are not likely to jeopardize those species or adversely modify designated critical habitat.

This consultation on GRSG management and its LUPA direction is to be considered in the context of already existing LUPs and any consultations on those previous LUPs. This consultation does not substitute or replace any previous consultation on existing LUPs. The action agency's effects determinations and the Service concurrence have been made with this context in mind. The Service recommends that a copy of this memorandum be retained in agency overall LUP files with previously completed LUP consultations for future reference and to document that section 7 compliance for individual LUPs under the Act is complete.

## **Basis for Service Concurrence by Species**

The Bureau and USFS have determined, and the Service concurs, that the LUPA may affect, but is not likely to adversely affect two threatened species (the grizzly bear and the Ute ladies'-tresses). Service concurrence with Bureau and USFS determinations of effect for these listed species is based on the rationales highlighted below. In addition, the Bureau and USFS have determined, and the Service concurs, that the LUPA is not likely to jeopardize the continued existence of one species proposed for listing (the slickspot peppergrass) and will not destroy or adversely modify critical habitat proposed for two species (the slickspot peppergrass and the yellow-billed cuckoo) within some LUP units.

### **Grizzly Bear**

The Bureau and USFS determined that the LUPA decision and associated actions occurring on the Bureau's Bruneau, Burley, Challis, Jarbidge, Owyhee, Pocatello, Salmon, Shoshone, and Four Rivers Field Offices; the USFS's Boise, Salmon-Challis, or Sawtooth National Forests; and the USFS's Curlew National Grassland will have no effect on the grizzly bear because these field offices and national forests/grassland do not contain occupied habitat for grizzly bears. The Service acknowledges these no effect determinations for the grizzly bear.

Service concurrence with the determination that the LUPA may affect, but is not likely to adversely affect the grizzly bear within the Bureau's Upper Snake and Dillon Field Offices and the USFS's Beaverhead-Deerlodge and Caribou-Targhee National Forests, is based on the following rationales.

- Overall, a total of 173,581 acres of occupied grizzly bear habitat overlap with PHMA, 116,465 acres overlap with IHMA, and 81,673 acres of GHMA within the LUPA area (compiled from USBLM and USFS 2015, pp. 47, 50, 63, 69).
- GRSG LUPA decision goals, objectives, desired conditions, standards, and guidelines that could have any bearing on the major threats to grizzly bears—secure habitat, developed sites, food storage, livestock grazing, and four key food sources<sup>4</sup>—are expected to be neutral, result in beneficial effects, or minimal negative impacts. For example:

---

<sup>4</sup> Four seasonal foods have been identified as being important to the grizzly bear population: winter killed ungulates, spawning cutthroat trout, seeds of whitebark pine, and alpine moth aggregation sites. The LUPA action area has no overlap with habitats supporting these four seasonal foods (USBLM and USFS 2015, p. 87).

- Fuels treatments, habitat restoration, and vegetation management treatments in GRSG HMAs will maintain, improve, or restore sagebrush habitat, benefitting all species that use sagebrush habitat, including grizzly bears.
- For recreation and travel management and lands and realty and infrastructure management programs, the GRSG LUPA decision will not authorize new roads. Rather, it will limit new road construction and existing road use, which could benefit grizzly bears by increasing the available amount of secure habitat.
- There is the potential for some negative effects on listed species from direction provided within the LUPA. For example, fuels treatments using targeted grazing or plant species used for seeding proposed within occupied grizzly bear habitat have the potential to negatively impact grizzly bears. In addition, prohibiting construction of new recreation facilities or infrastructure within GRSG PHMA and IHMA could push the construction of developed sites into preferred grizzly habitat. However, site-specific analyses will determine the scope and scale of any likely impacts that may occur associated with project-level activities. Furthermore, significant effects from these site-specific projects will be highly unlikely due to avoidance or other mitigations based on current laws, agency regulations, and other conservation measures in place to protect the grizzly bear. Any possible effects from future proposed actions will be addressed in site-specific analysis at the project level when reasonably certain, explicit actions are identified and proposed. Therefore, potential effects of site-specific projects proposed under LUPA programs that may affect the grizzly bear are expected to be reduced to insignificant or discountable levels.

### **Ute ladies'-tresses**

The Bureau and USFS determined that the Idaho-Southwestern Montana LUPA decision and associated actions occurring on the Bureau's Bruneau, Burley, Challis, Four Rivers, Jarbidge, Owyhee, Salmon, and Shoshone Field Offices; the USFS's Boise and Beaverhead-Deerlodge National Forests; and the USFS's Curlew National Grassland will have no effect on the Ute ladies'-tresses as suitable habitat for the Ute ladies'-tresses is not suspected to occur in these field offices and national forests/grassland. The Service acknowledges these no effect determinations for the Ute ladies'-tresses.

Service concurrence with determination that the LUPA may affect, but is not likely to adversely affect, the Ute ladies'-tresses within the Bureau's Dillon, Pocatello, and Upper Snake Field Offices and within the USFS's Caribou-Targhee, Salmon-Challis, and Sawtooth National Forests, is based on the following rationales.

- There is no overlap between known Ute ladies'-tresses locations and GRSG HMAs. The closest known Ute ladies'-tresses location is over 0.6 mile from the IHMA located in Fremont County, Idaho.
- The areas most likely to support Ute ladies'-tresses populations (riparian areas along major river drainages) have mostly been excluded from GRSG HMAs. However, it is likely that suitable habitat for Ute ladies'-tresses is located within GRSG HMAs due to the inclusion of some wetland habitats.

- Because the proposed LUPA does not propose any specific ground-disturbing actions, no direct negative effects on Ute ladies'-tresses will occur from the LUPA action.
- Where travel management planning has not been completed or is in progress, and listed plant habitats are present, there may be a reduction of impacts from off-road vehicle use (BLM TM-1) in areas where Ute ladies'-tresses overlap with GRSG HMAs (pp. 102, 140). Restrictions for off-road vehicle use may provide a beneficial effect on listed plant species by reducing impacts from off road vehicle activities (plants crushed by tires). Thus, if any areas of occupied or suitable habitat for Ute ladies'-tresses within GRSG HMAs are currently open to off-road vehicle use, restrictions will be placed on vehicles to use only existing routes. This would provide a small and contemporaneous beneficial effect on Ute ladies'-tresses by reducing the likelihood of damage to Ute ladies'-tresses or its habitat from off-road vehicles.
- Proposed retrofitting of existing towers and structures consistent with required design features (RDFs) in the GRSG HMAs (BLM LR-12) to benefit GRSG has the potential to impact listed plants, including the Ute ladies'-tresses, if the plants are present in the right-of-way (ROW) corridors where retrofit activities are needed. Potential crushing of vegetation, including Ute ladies'-tresses, could occur due to parking vehicles off roads near each tower as well as foot traffic near the towers during retrofit activities. However, because towers, structures, and their access roads generally avoid riparian habitats, the Ute ladies'-tresses is not likely to be present on or directly adjacent to ROW roads or near existing towers. Therefore, potential effects of LUPA-related retrofitting of towers and structures on the Ute ladies'-tresses are extremely unlikely to occur, and therefore, are discountable.
- Although there is the potential for some negative effects on listed species from additional proposed actions associated with LUPA direction, significant effects will be highly unlikely due to avoidance or other mitigations based on current laws, agency regulations, and other conservation measures currently in place to protect listed plants. Any possible effects from future proposed actions will be addressed in site-specific analysis at the project level when reasonably certain, explicit actions are identified and proposed. Therefore, potential effects of site-specific projects proposed under LUPA programs that may affect the Ute ladies'-tresses are expected to be reduced to insignificant or discountable levels.

### **Slickspot Peppergrass**

The Bureau and USFS determined that the LUPA decision and associated actions occurring on the Bureau's Bruneau, Burley, Challis, Dillon, Owyhee, Pocatello, Salmon, Shoshone, or Upper Snake Field Offices, the USFS's Boise, Beaverhead-Deerlodge, Caribou-Targhee, Salmon-Challis, or Sawtooth National Forests, or the USFS's Curlew National Grassland will have no effect on the slickspot peppergrass as these field offices and national forests/grassland are not suspected to contain suitable habitats for the slickspot peppergrass. The Service acknowledges these no effect determinations for the slickspot peppergrass.

After reviewing the Bureau and USFS Assessment, the Service concurs with the Bureau and USFS determination that the LUPA is not likely to jeopardize the continued existence of the

slickspot peppergrass within the Bureau's Four Rivers and Jarbidge Field Offices. As described above, pursuant to language at CFR 402.12(k), conference is not required for this Federal action agency non-jeopardy determination.

### **Proposed Critical Habitat for the Slickspot Peppergrass**

The Bureau and USFS determined that the LUPA decision and associated actions occurring on the Bureau's Bruneau, Burley, Challis, Dillon, Owyhee, Pocatello, Salmon, Shoshone, and Upper Snake Field Offices; the USFS's Boise, Beaverhead-Deerlodge, Caribou-Targhee, Salmon-Challis, and Sawtooth National Forests; and the USFS's Curlew National Grassland will have no effect on proposed critical habitat for the slickspot peppergrass as these field offices and national forests/grassland do not contain proposed critical habitat for the species. The Service acknowledges these no effect determinations for slickspot peppergrass proposed critical habitat.

After reviewing the Bureau and USFS Assessment, the Service concurs with the Bureau and USFS determination that the LUPA is not likely to destroy or adversely modify proposed critical habitat for the slickspot peppergrass within the Bureau's Four Rivers and Jarbidge Field Offices. As described above, pursuant to language at CFR 402.12(k), conference is not required for this Federal action agency no destruction or adverse modification determination.

### **Proposed Critical Habitat for the Yellow-billed Cuckoo**

The Bureau and USFS determined that the LUPA decision and associated actions occurring on the Bureau's Bruneau, Burley, Challis, Dillon, Four Rivers, Jarbidge, Owyhee, Pocatello, Salmon, and Upper Snake Field Offices, the USFS's Boise, Caribou-Targhee, Salmon-Challis, Sawtooth, and Beaverhead-Deerlodge National Forests, and the USFS's Curlew National Grassland will have no effect on the proposed critical habitat for the western yellow-billed cuckoo because these field offices and national forests/grassland do not contain western yellow-billed cuckoo proposed critical habitat that overlaps with LUPA actions. The Service acknowledges these no effect determinations for western yellow-billed cuckoo proposed critical habitat.

After reviewing the Bureau and USFS Assessment, the Service concurs with the Bureau and USFS determination that the LUPA is not likely to destroy or adversely modify proposed critical habitat for the yellow-billed cuckoo within the Bureau's Shoshone Field Office. As described above, pursuant to language at CFR 402.12(k), conference is not required for this Federal action agency no destruction or adverse modification determination.

### **Conclusion**

This concludes informal consultation on the proposed LUPA with the Bureau and the USFS under section 7 of the Act. Reinitiation of consultation on this action may be necessary if new information reveals effects of the action that may affect listed species or designated habitat in a manner or to an extent not considered in the assessment, the action is subsequently modified in a manner that causes an effect to listed species that was not considered in the analysis, or a new species is listed or critical habitat is designated that may be affected by the proposed action (CFR 402.16).

Thank you for your continued interest in threatened and endangered species conservation. Please contact Barbara Schmidt of my staff at (208) 378-5259 if you require additional information regarding this memorandum.

## INTRODUCTION

### Background

The Bureau of Land Management (BLM) and Forest Service have prepared amendments to their respective land use plans (LUPs). These documents provide direction for the conservation of Greater Sage-Grouse (*Centrocercus urophasianus*, GRSG) and analyze the environmental effects that could result from implementing the proposed plan. This land use plan amendment (LUPA) addresses GRSG habitat within Idaho, southwestern Montana, and the Sawtooth National Forest within Utah. The LUPA covers BLM-administered lands in the Bruneau Field Office, Burley Field Office, Challis Field Office, Four Rivers Field Office, Jarbidge Field Office, Owyhee Field Office, Pocatello Field Office, Salmon Field Office, Shoshone Field Office, and Upper Snake Field Office in Idaho and the Butte Field Office<sup>1</sup> and Dillon Field Office in Montana. The LUPA covers National Forest System lands in the Boise National Forest, Caribou-Targhee National Forest, Salmon-Challis National Forest, and Curlew National Grassland in Idaho, the Beaverhead-Deerlodge National Forest (BDNF) in Montana, and the Sawtooth National Forest in Utah. The Proposed LUPA focuses on addressing public comments and comments from the States of Idaho and Montana, while continuing to meet the BLM's and Forest Service's legal and regulatory mandates.

The purpose of this biological assessment (BA) is to review the Proposed LUPA to determine the extent that implementing the LUPA may affect proposed, threatened, and endangered species and proposed or designated critical habitat in the planning area. Because the LUPA is a planning document, this BA focuses on the effects of management actions that will be implemented.

Under provisions of the Endangered Species Act (ESA) of 1973, as amended (16 [US Code] USC, Section 1531 et seq.), federal agencies are directed to conserve threatened and endangered (T&E) species and their habitats. Section 7(a)(1) states that all federal agencies should use “their authorities in furtherance of the purposes of this Act by carrying out programs for the conservation of endangered species and threatened species....” Thus, the conservation and recovery of T&E species is not simply the responsibility of the US Fish and Wildlife Service (USFWS), but of all federal agencies. To meet this requirement, the BLM and Forest Service, through their LUPs, would implement management actions, standards and guidelines, protective stipulations, conditions of approval (COAs), conservation measures, required design features (RDFs), best management practices (BMPs), mitigation, habitat restoration, and protections.

Section 7(c) of the ESA requires the BLM to complete a BA to determine the effects of implementing a resource management plan (RMP) on listed species, based on compliance with Section 102 of the National Environmental Policy Act (NEPA). Federal agencies are required to consider, avoid, or prevent adverse impacts on fish and wildlife species. The agencies are also required to ensure that actions they authorize, fund, or carry out are not likely to jeopardize the continued existence of T&E species or their critical habitat. The ESA requires action agencies, such as the BLM and Forest Service, to not only consult or confer with the USFWS when there is discretionary federal involvement or control over the action, but to ensure that resources are afforded adequate consideration and protection. Formal consultation becomes necessary when the action agency requests consultation after determining that the proposed action is likely to adversely

---

<sup>1</sup> Butte Field Office-administered lands are not included as part of the analysis in this LUPA/EIS except as required in the GRSG cumulative effects analysis. For additional information, please see Chapter 1 of the FEIS.

affect listed species or critical habitat, or the aforementioned federal agencies do not concur with the action agency's finding (USFWS 1998).

This programmatic BA provides documentation and analysis for the proposed action to meet the federal requirements and agreements set forth among the federal agencies. It addresses proposed and federally listed T&E species and proposed or designated critical habitat. It has been prepared under the 1973 ESA Section 7 regulations, as amended, in accordance with the 1998 procedures set forth by USFWS and the National Marine Fisheries Service. The BLM and Forest Service, in coordination with the USFWS, conducted an analysis of the effects of the proposed LUPA on listed species.

### **Purpose and Need for GRSG LUPA**

The BLM and Forest Service have prepared a LUPA with associated environmental impact statements (EISs) for LUPs containing GRSG habitat. This is in response to the need to inform the USFWS's March 2010 "warranted, but precluded" ESA listing decision. The inadequacy of regulatory mechanisms was identified as a significant threat in the USFWS finding on the petition to list the GRSG. The need is to ensure that the BLM and Forest Service have adequate regulatory mechanisms in the LUPs for consideration by USFWS a year in advance of its anticipated 2015 listing. The USFWS identified the principal regulatory mechanisms for the BLM and the Forest Service as conservation measures embedded in LUPs. Changes in management of GRSG habitats are necessary to avoid the continued decline of populations that are anticipated across the species' range. This LUPA will focus on areas affected by threats to GRSG habitat identified by the USFWS in the March 2010 listing decision.

The purpose of the LUPA is to identify and incorporate appropriate conservation measures in LUPs to conserve, enhance, or restore GRSG habitat by reducing, eliminating, or minimizing threats to that habitat. Changes in the BLM and Forest Service management of GRSG habitats are anticipated to have a considerable beneficial impact on present and future GRSG populations and could reduce the need to list the species as threatened or endangered under the ESA. This is because the BLM and Forest Service administer a large portion of GRSG habitat in the affected states.

### **Description of Planning Area**

The Idaho and Southwestern Montana Sub-region includes BLM-administered and National Forest System lands in Idaho and southwestern Montana, excluding the Idaho panhandle. The specific field offices and national forests included in the planning area are: Bruneau Field Office, Burley Field Office, Challis Field Office, Four Rivers Field Office, Jarbidge Field Office, Owyhee Field Office, Pocatello Field Office, Salmon Field Office, Shoshone Field Office, Upper Snake Field Office, Boise National Forest, Caribou-Targhee National Forest, Curlew National Grassland, Salmon-Challis National Forest, and Sawtooth National Forest in Idaho; Butte Field Office, Dillon Field Office, and BDNF in southwestern Montana; and the portion of the Sawtooth National Forest within Box Elder County in Utah. A map of the planning area is provided as **Figure 1**, Idaho and Southwestern Montana Greater Sage-Grouse Land Use Amendment EIS Planning Area Boundaries.

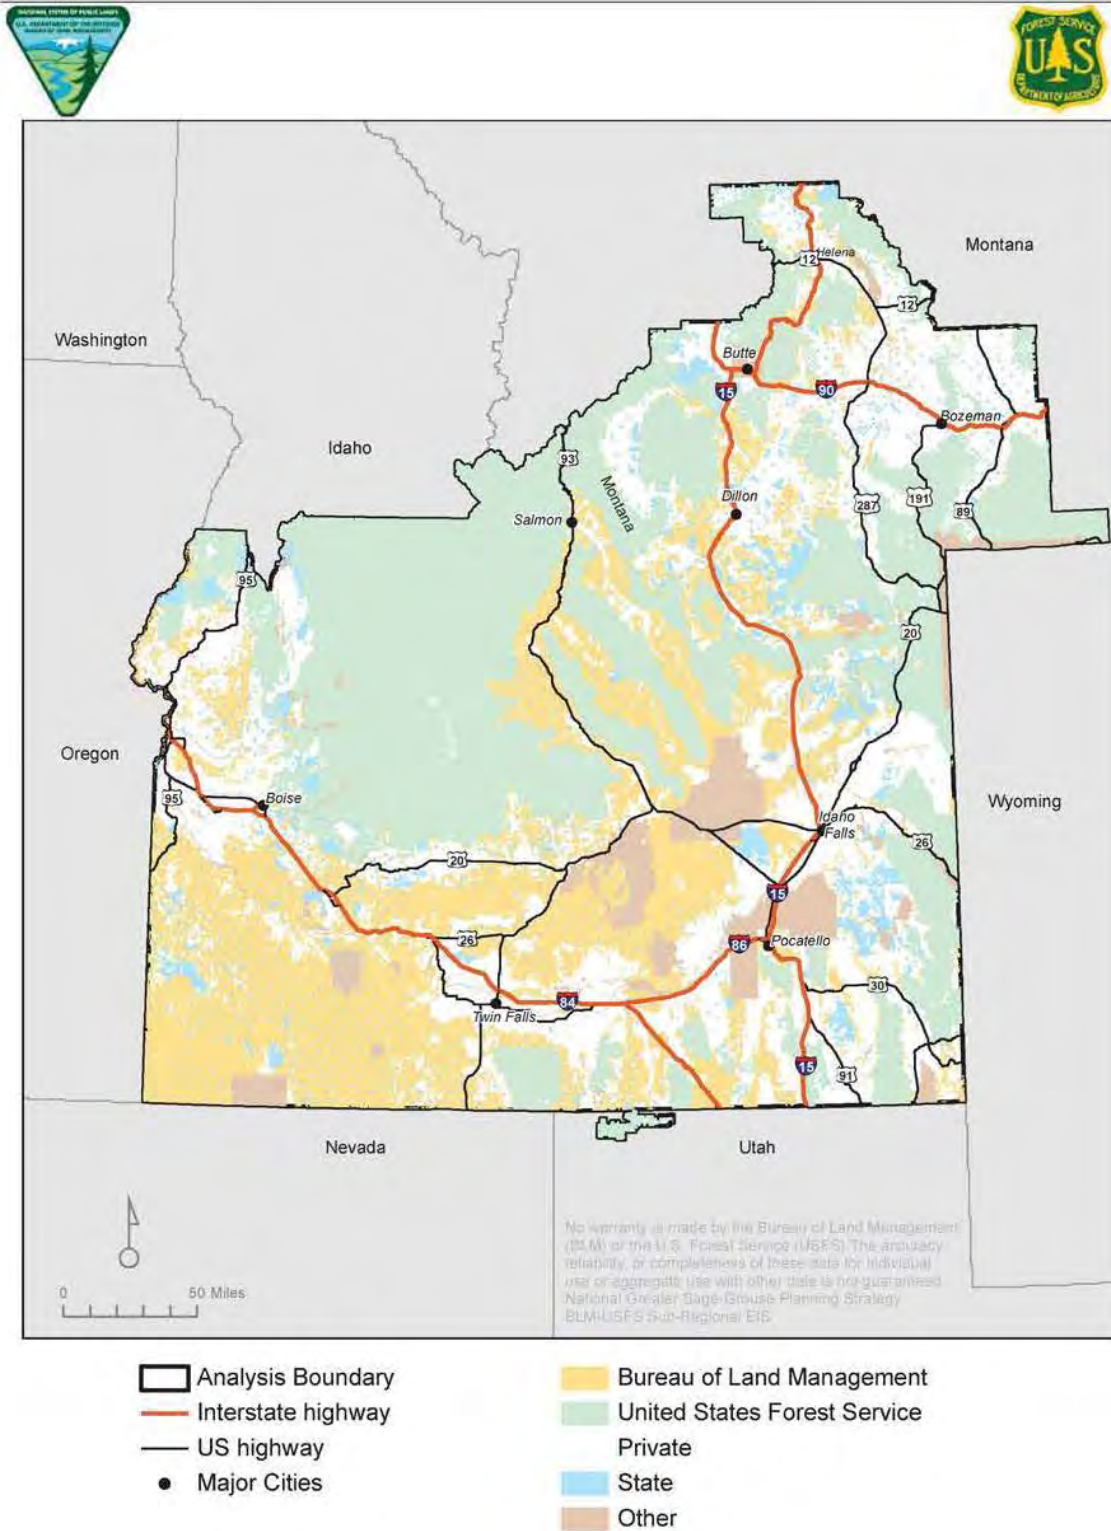

There are approximately 77,800 acres of BLM-administered lands in Elko County, Nevada, north of the Humboldt-Toiyabe National Forest and south of the Idaho-Nevada state line adjacent to the Bruneau and Jarbidge Field Offices in Idaho. For purposes of the GRSG LUPAs in Idaho and in

Biological Assessment for the Idaho and Southwestern Montana Greater Sage-Grouse  
Land Use Plan Amendment and Environmental Impact Statement

Nevada, planning for these lands will occur through the Nevada and Northeastern California Greater Sage-Grouse LUPA, and the regulatory measures and decisions that are put in place for the GRSG through the Record of Decision (ROD) will be implemented and administered by the Jarbidge and Bruneau Field Offices in Idaho. Therefore, the decision and planning areas for the Idaho and Southwestern Montana GRSG LUPA end at the Idaho/Nevada state line and will not include lands in Nevada; however, maps will continue to include these Nevada lands as part of the Idaho and Southwestern Montana Sub-region based on the recognized administrative boundary.

Range-wide, approximately 52 percent of sagebrush habitat within GRSG management zones is on BLM-administered land, and approximately 8 percent is on National Forest System land; within the Idaho and Southwestern Montana Sub-region, approximately 51 percent of sagebrush habitat is on BLM-administered land and 10 percent is on National Forest System land. The planning area for the Idaho and Southwestern Montana GRSG LUPA/EIS is composed of land administered by the BLM, the Forest Service, and state and federal agencies, as well as private lands (Table 1).

## DESCRIPTION OF THE PROPOSED ACTION

As a result of public comments, best available science, cooperating agency coordination, and internal review of the Draft LUPA/EIS, the BLM and Forest Service have developed the Proposed LUPAs/Final EISs (FEISs).

The proposed plans incorporate the following GRSG goals: Conserve, enhance, and restore the sagebrush ecosystem upon which GRSG populations depend in an effort to maintain and/or increase their abundance and distribution, in cooperation with other conservation partners. There are two selected actions, one for the BLM and one for the Forest Service. Largely, the two plans are the same. There are minor differences between the plans, primarily due to land management planning terminology. For the full details of each agency's proposed plan, please refer to Chapter 2 of the FEIS. (For purposes of USFWS review, the BLM and Forest Service plans are included as Appendices D and E, respectively.)

### *GRSG Habitat Management Area Definitions*

GRSG habitat management areas are shown in Figures 2 and 3, and are defined as follows:

- **Priority Habitat Management Areas** (PHMAs, analogous to core habitat zones)—Areas identified by the BLM and Forest Service, in coordination with respective state wildlife agencies, as having the highest conservation value to maintaining sustainable GRSG populations. These areas include breeding, late brood-rearing and winter concentration areas.
- **Important Habitat Management Areas** (IHMAs, analogous to Preliminary Medial Management Areas, Preliminary Restoration Management Areas, and Important Habitat Zones) —High value habitat and populations that provide a management buffer for the priority and sagebrush focal management areas and connect patches of priority and sagebrush focal management areas. IHMA encompass areas of generally moderate to high conservation value habitat and/or populations. In some conservation areas, they may include areas beyond those identified by USFWS as necessary to maintain redundant, representative, and resilient populations. The areas are typically adjacent to priority and sagebrush focal management areas but generally reflect somewhat lower GRSG population status or reduced habitat value due to disturbance, habitat fragmentation, or other factors. No IHMA are designated within the southwestern Montana portion of the planning area.
- **General Habitat Management Areas** (GHMAs, analogous to general habitat zones) — Areas identified by the BLM and Forest Service, in coordination with respective state wildlife agencies, as those areas outside of priority and sagebrush focal management areas and occupied by GRSG seasonally or year-round.
- **Sagebrush Focal Areas** (SFAs) —a subset of PHMA, identified by the USFWS, that are considered most vital to the species' persistence and therefore require the strongest levels of protection.

Figure 2. Idaho/Southwest Montana Greater Sage-Grouse Habitats

## Idaho / SW Montana Greater Sage-grouse EIS Habitat and Sagebrush Focal Areas

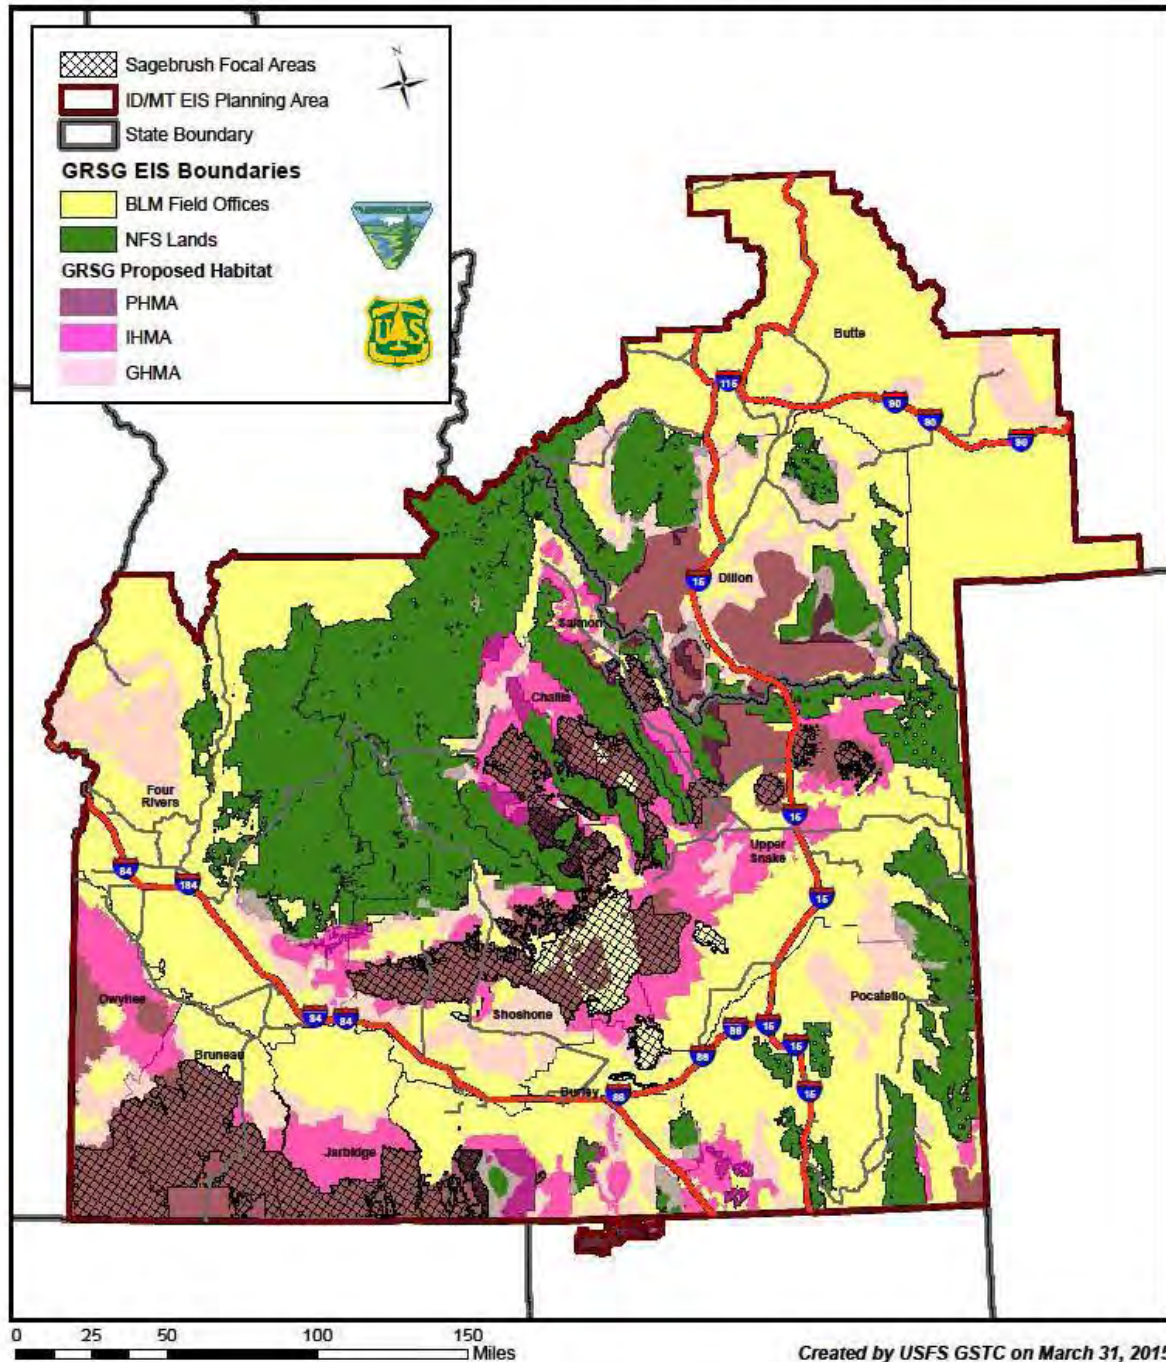

Figure 3. Idaho/Southwest Montana Greater Sage-Grouse Habitats and BLM/Forest Service Boundaries

The proposed plans seek to allocate resources among competing human interests and land uses and the conservation of natural resource values, including GRSG habitat. At the same time, they would sustain and enhance ecological integrity across the landscape, including plant, wildlife, and fish habitat. The plans incorporate adjustments made in response to public comments on the Draft LUPA, as well as cooperating agency input. Conservation measures are focused on PHMAs, IHMAs, and GHMAs as well as active leks (regardless of which type of habitat the active lek is in). Conservation measures are presented in categories of established program areas. The program areas are similar, but are not exactly the same, for each agency.

BLM program areas are:

- Special Status Species
- Vegetation
- Wildland Fire Management
- Livestock Grazing
- Wild Horses and Burros
- Lands and Realty
- Minerals
- Comprehensive Trails and Travel Management
- Recreation and Visitor Services

Forest Service program areas are:

- General Greater Sage-grouse
- Adaptive Management
- Lands and Realty
- Wind and Solar
- Greater Sage-grouse Habitat
- Livestock Grazing
- Fire Management
- Wild Horse and Burro
- Recreation
- Roads/Transportation
- Minerals

## **SPECIES CONSIDERED IN THE ANALYSIS**

This BA provides detailed analyses of all federally listed (endangered or threatened) species, proposed species, and designated or proposed critical habitat that may be affected by the actions proposed in the Idaho-Southwestern Montana Greater Sage-Grouse RMP/LMP Amendments document. Development of this BA was guided by the regulations on Interagency Cooperation (Section 7 of the ESA) in 50 Code of Federal Regulations (CFR) Part 402 and BLM Manual 6840.

The USFWS list of threatened, endangered, and proposed species is composed of plants, birds, mammals, amphibians, fish, and invertebrates. We conducted a review of those species or critical

habitat that may occur in the action area<sup>2</sup> or be affected by activities associated with the Proposed Plan in the FEIS. Occurrence and habitat information was gathered from the July 2014 Idaho Natural Heritage Program data, slickspot peppergrass habitat data from Idaho BLM, consultation with local biologists, and various planning documents and previous BAs from each of the management units involved.

Tables 2 and 3 list USFWS threatened, endangered, and proposed species that may be present or are known to be present within the planning area and designated or proposed critical habitat for those species. The species and critical habitat in Tables 2 and 3 were considered in this analysis and compared to the five criteria listed below. The criteria were used to identify species or proposed or designated critical habitat that would experience “no effect” from the implementation of the Proposed Plan and could therefore be eliminated from detailed analysis. These numerical categories below are referred to as *Evaluation Criteria* in the tables:

1. Action area is outside species’ range.
2. Potential habitat for the species does not exist within GRSG habitat (sagebrush-steppe) or is outside the elevation range of the GRSG.
3. The type or intensity of the activity in the proposed action is expected to have no impact/effect on these species or their habitat.
4. No overlap between critical habitat polygons and GRSG priority, important, or general habitat management areas (HMAs).
5. Critical habitat polygons may overlap with GRSG priority, important, or general HMAs, but primary constituent elements (PCEs) do not overlap; no “essential features” of critical habitat will be affected.

---

<sup>2</sup> Action area = BLM-administered and National Forest Service System lands within the Land Use Plan Amendment boundary.

Slickspot peppergrass (P-E) <i>Lepidium papilliferum</i>	Slickspots occur within sagebrush-steppe, characterized by a near-surface distribution of soluble sodium salts, thin vesicular surface crusts, and shallow well-developed argillic horizons or layers that are impermeable when wet. The species' range is restricted to the volcanic plains of southwest Idaho, occurring primarily in the Snake River Plain and its adjacent northern foothills, with a single disjunct population on the Owyhee Plateau. This species is present in GRSG HMAs on Jarbidge and Four Rivers Field Offices.				D							D		NA	See detailed analysis below

Slickspot peppergrass (P-E) <i>Lepidium papilliferum</i> Proposed Critical Habitat	PCEs include 1) ecologically functional “slickspots” with high sodium and clay content with a specific 3-layered horizonation, and sparse vegetation, 2) relatively intact, native Wyoming big sagebrush vegetation surrounding the slickspots, 3) a diversity of native plants appropriate for supporting slickspot peppergrass pollinators, and 4) sufficient pollinators for successful seed production, mainly wasps, flies, and bees. See the Species Information and Critical Habitat section for a more detailed PCE description. About half of the proposed critical habitat overlaps with GRSG HMAs on BLM lands, and most of the overlap is in the Jarbidge Field Office area.				D						D		NA	See detailed analysis below

Ute ladies'-tresses (T) <i>Spiranthes diluvialis</i>	Occurs in Colorado, Idaho, Montana, Nebraska, Nevada, Utah, Washington, and Wyoming. Found in moist meadows associated with perennial stream terraces, floodplains, and oxbows; seasonally flooded river terraces; sub-irrigated or spring-fed abandoned stream channels and valleys; lakeshores; and human-modified wetlands (720-7,000 feet). There are no known occurrences overlapping GRSG HMAs on BLM or Forest Service lands, but there may be suitable habitat within these action areas. However, the riparian habitat where it may occur is not likely to be affected by the proposed LUP amendments.						D			D		D	NA	See detailed analysis below

Ute ladies'-tresses (T) <i>Spiranthes diluvialis</i>	Occurs in Colorado, Idaho, Montana, Nebraska, Nevada, Utah, Washington, and Wyoming. Found in moist meadows associated with perennial stream terraces, floodplains, and oxbows; seasonally flooded river terraces; sub-irrigated or spring-fed abandoned stream channels and valleys; lakeshores; and human-modified wetlands (720-7,000 feet). There are no known occurrences overlapping GRSG HMAs on BLM or FS lands, but there may be suitable habitat within these action areas. However, the riparian habitat where it may occur is not likely to be affected by the proposed LUP amendments.		D	S	S			NA	See detailed analysis below

## SPECIES INFORMATION AND CRITICAL HABITAT

### A. Terrestrial Wildlife

#### Grizzly Bear (*Ursus arctos horribilis*)

##### *Habitat Description*

*The grizzly (or brown) bear was once found in a wide variety of habitats including open prairie, brushlands, riparian woodlands, and semidesert scrub. Most populations require vast areas of suitable habitat to prosper. They forage for wild fruits, nuts, bulbs, roots, insect larvae in logs, and carcasses of elk, deer and cattle. This species is common only in habitats where food is abundant and concentrated, including white-bark pine, berries, and salmon or cutthroat runs, and where conflicts with humans are minimal. Research indicates it is important to maintain areas where grizzly bears can forage for a 24 to 48 hour period secure from human disturbance.*

*Winter dens are dug in north-facing slopes or more often at the base of large trees in areas away from humans in late fall or winter after snow has begun to fall. (BLM 2004)*

The grizzly has a broad range of habitat tolerance. Contiguous, relatively undisturbed mountainous habitat having a high level of topographic and vegetative diversity characterizes most areas where the species remains (USFWS 1993). Secure habitat consists of areas larger than 10 acres and more than 500 meters (1,650 feet) from a motorized access route or recurring helicopter flight line (Forest Service 2006).

Throughout the year, grizzly bears occupy a mosaic of dissimilar habitat types. Seasonal use of these types depends on availability of preferred foods, which are affected by weather, elevation, topography, precipitation, and temperature. The search for energy-rich food appears to be a driving force in grizzly bear behavior, habitat selection, and intra/inter-species interactions. Upon emergence from the den, they seek lower-elevation drainage bottoms, avalanche chutes, and ungulate winter ranges where their food requirements can be met. Throughout late spring and early summer, they follow plant maturity back to higher elevation. In late summer and fall, there is a transition to fruit and nut sources, as well as other plant materials. This is a generalized pattern, however, and it should be kept in mind that bears are individuals trying to survive and will go where they can best meet their food requirements. Specific to the Greater Yellowstone Area, four seasonal foods have been identified as being important to the population: ungulates (primarily elk and bison, but also deer and moose), spawning cutthroat trout, seeds of whitebark pine, and army cutworm moths (ICST 2007).

### ***Status, Distribution, and Designated or Proposed Critical Habitat***

On July 28, 1975, the grizzly bear (*Ursus arctos horribilis*) was designated as threatened throughout its range in lower 48 states.

On March 22, 2007, the USFWS announced that the Yellowstone DPS of grizzly bears were a recovered population no longer meeting the ESA definition of threatened or endangered.

On September 21, 2009, the Federal District Court in Missoula issued an order enjoining and vacating the delisting of the Yellowstone DPS grizzly bear population.

The grizzly bear is listed as threatened throughout its range in the lower 48 states. Populations in the Yellowstone DPS and the Northern Continental Divide Ecosystem (NCDE) are increasing in size and expanding in area (Forest Service 2012).

The historic range of the grizzly bear in the continental United States extended from the central Great Plains, west to California, and south to Texas and Mexico. Between 1800 and 1975, grizzly bear populations in the lower 48 states declined from over 50,000 to less than 1,000 animals. As Euro-American settlement expanded westward, the grizzly bear was extirpated from most of its historical range.

In the lower 48 states, there are seven ecosystems recognized as grizzly bear primary conservation areas (PCAs). Five of these ecosystems are known to currently support grizzly bears: Yellowstone (northwest Wyoming, eastern Idaho, and southwest Montana), Northern Continental Divide (north-central Montana), Selkirk Mountains (northern Idaho, northeast Washington, and southeast British Columbia), Cabinet–Yaak (northwest Montana, northern Idaho), and North Cascades (north-central Washington). The two remaining ecosystems, Bitterroot (east-central Idaho, western Montana) and San Juan Mountains (Colorado), currently do not contain grizzly bears. Critical habitat has not been designated or proposed for the grizzly bear. The Idaho-Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement action area overlaps with the Yellowstone Ecosystem.

### ***Grizzly Bear General Management Direction***

#### **1993 Recovery Plan**

In 1993, the Grizzly Bear Recovery Plan (USFWS 1993) outlined a strategy to recover grizzly bears built on the concept of recovery zones. Recovery zones were established to identify areas necessary for the recovery of the species and are defined as the area in each grizzly bear ecosystem within which the population and habitat criteria for recovery are measured. Areas within the recovery zones are to be managed to conserve grizzly bear habitat and managed primarily for grizzly bear habitat. The recovery zones are areas adequate for managing and promoting the recovery and survival of these grizzly bear populations (USFWS 1993). The recovery zones contain large portions of federal lands, including wilderness and national park lands, which are protected from the influence of many types of human uses occurring on lands elsewhere. All federal lands within recovery zones, including multiple use lands, are managed

with grizzly bear recovery as a primary factor, in accordance with the Interagency Grizzly Bear Guidelines (IGBC 1986). As anticipated in the recovery plan, the Yellowstone Grizzly Bear Ecosystem (YGBE) grizzly bear population has responded favorably to these conditions.

Grizzly bears outside the recovery zones probably experience a higher level of adverse impacts due to land management actions than do grizzly bears inside recovery zones. The recovery plan outlined that such areas would not be managed primarily to provide or conserve grizzly bear habitat. Thus, we expect grizzly bears will occur at lower densities outside the recovery zones than within the recovery zones as a result of suboptimal habitat conditions, including higher road densities, fewer areas secure from motorized access, and more human presence and activity. The recovery plan anticipated that grizzly bears can and will exist outside recovery zone lines in many areas, but that the grizzly bears residing within the recovery zone were crucial to recovery goals and hence delisting. While land management direction outside of recovery zones may have adverse effects on some of the individual grizzly bears using those areas area now and into the future, land management within the recovery zones will continue to favor the needs of grizzly bears.

In 2013, the Service proposed a draft revised supplement to the 1993 Grizzly Bear Recovery Plan (USFWS 2013a). The supplement would revise the demographic recovery criteria for the Yellowstone ecosystem. Included within this draft revised supplement, a monitoring area is designated, within which all demographic criteria would be assessed. The areas within which mortalities are counted against the mortality limits for independent females and males and dependent young would be revised to be the same area where population size is estimated. Grizzly bear mortalities would no longer count against sustainable mortality limits in areas outside of this monitoring area. Conversely, grizzly bears observed outside of this monitoring area would not count toward the estimates of population size. Mortalities outside of the monitoring area would continue to be recorded and reported. Also, grizzly bear occupancy would not be actively discouraged outside of the monitoring area, but management emphasis would be on conflict response.

### 2007 Conservation Strategy

In 2007, the Final Conservation Strategy for the Grizzly Bear in the Greater Yellowstone Area (ICST 2007) was released to guide management and monitoring of the YGBE grizzly bear population and its habitat upon recovery and delisting. The Yellowstone Conservation Strategy identified a PCA, which is the same area as the YGBE Recovery Zone identified in the 1993 Grizzly Bear Recovery Plan (USFWS 1993).

Within this strategy, management direction is described for both the PCA and adjacent areas within the Greater Yellowstone Area. The habitat standards identified in the Yellowstone Conservation Strategy, including Secure Habitat<sup>7</sup>, Developed Sites<sup>8</sup>, Food Storage Order, and Livestock Allotments, would be maintained at identified levels inside the PCA. In addition,

---

<sup>7</sup> Those areas more than 500 meters (550 yards) from a motorized access route during the non-denning period. They are especially important to the survival and reproductive success of grizzly bears, especially adult females.

Biological Assessment for the Idaho and Southwestern Montana Greater Sage-Grouse  
Land Use Plan Amendment and Environmental Impact Statement

several other habitat factors, including Major Foods, would be monitored and evaluated. Habitat standards and habitat criteria monitoring focus on areas within the PCA. The goal is to maintain or improve habitat conditions existing as of 1998, as measured within each subunit within the PCA.

**Secure Habitat Standard:** The percent of secure habitat within each bear management unit (BMU) must be maintained at or above levels that existed in 1998. Permanent changes to secure habitat may occur provided that replacement secure habitat of equivalent habitat quality is provided in the same grizzly subunit. Temporary reductions in secure habitat can occur if only one project is active per grizzly subunit at any one time, total acreage within a given BMU does not exceed 1 percent of the acreage of the largest subunit within the BMU, and secure habitat is restored within one year after completion of the project.

**Developed Site Standard:** The number and capacity of developed sites within the PCA will be maintained at or below the 1998 level with the following exceptions: any proposed increase, expansion, or change of use of developed sites from the 1998 baseline in the PCA will be analyzed, and potential detrimental and positive impacts will be documented through biological evaluation or assessment by the action agency.

**Livestock Allotment Standard:** Inside the PCA, no new active commercial livestock grazing allotments will be created, and there will be no increases in permitted sheep Animal Months from the 1998 baseline. Existing sheep allotments will be monitored, evaluated, and phased out as the opportunity arises with willing permittees.

The Yellowstone Conservation Strategy states that state grizzly bear management plans, forest plans, and other appropriate planning documents will provide specific management direction for the adjacent areas outside the PCA.

The documents listed above that have been developed since the 1993 Recovery Plan are draft or in various stages of implementation. However, at this time, the Service holds that the strategies described in these documents, as updated, reflect the best available science on grizzly bear recovery (USFWS 2013b).

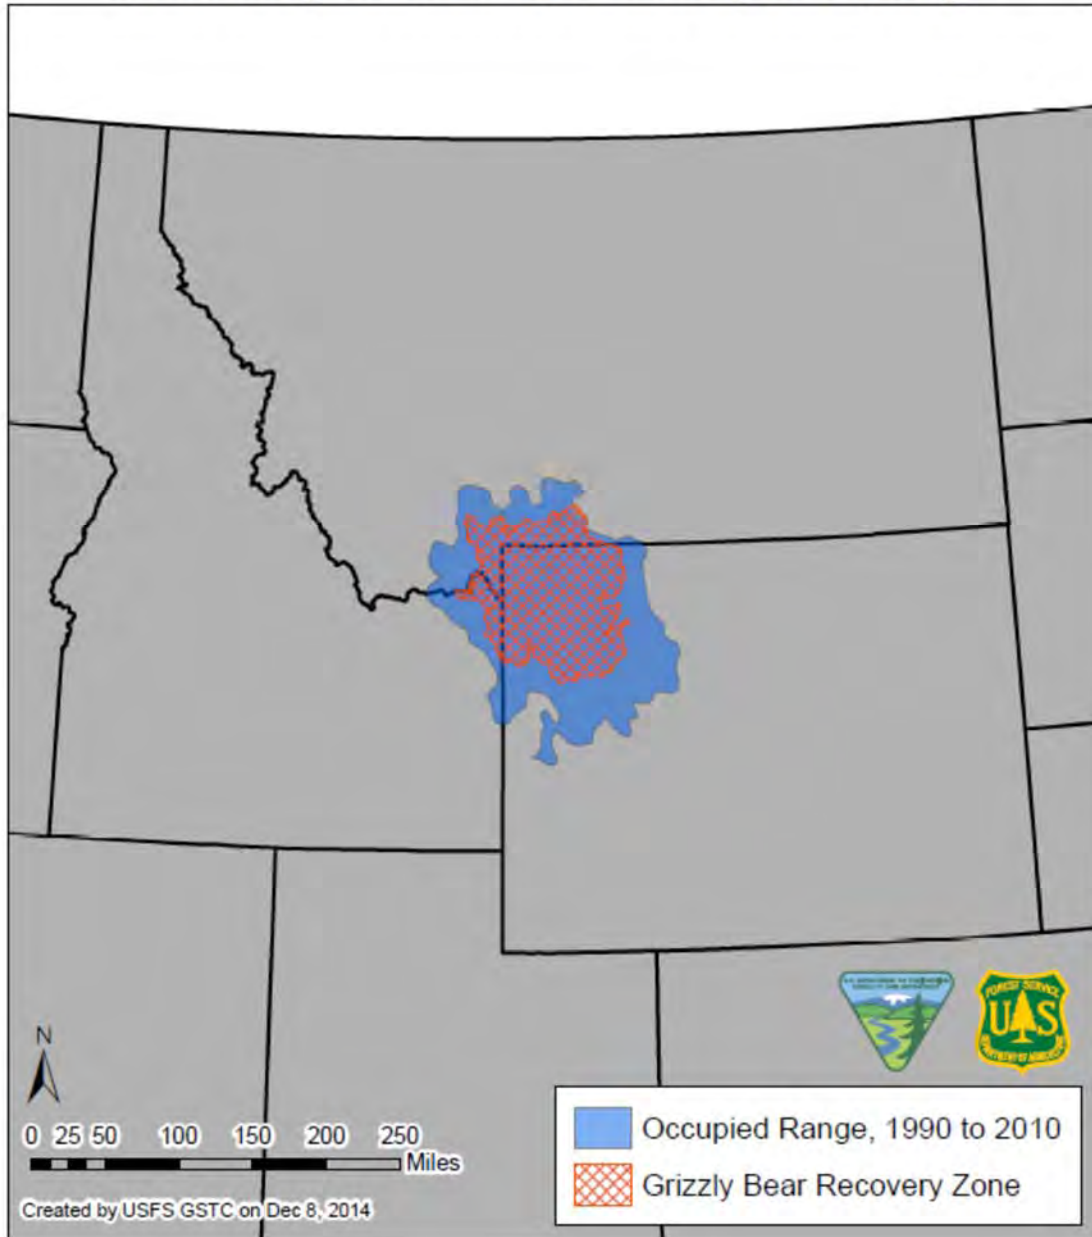

---

<sup>8</sup> Sites on public land developed or improved for human use or resource development such as campgrounds, trailheads, lodges, administrative sites, service stations, summer homes, restaurants, visitor centers, and permitted resource development sites such as oil and gas exploratory wells, production wells, plans of operation for mining activities, work camps, etc.

# Idaho / SW Montana Greater Sage-grouse EIS

## Grizzly Bear

### Recovery Zones and Occupied Range

**Figure 4. Yellowstone Grizzly Bear Ecosystem Recovery Zone (i.e., Primary Conservation Area/PCA)**

### Status of the Grizzly Bear in the YGBE<sup>9</sup>

The 9,209-square-mile YGBE recovery zone includes portions of Wyoming, Montana, and Idaho (Figure 4), portions of six National Forests (Beaverhead-Deerlodge, Bridger-Teton, Custer, Gallatin, Shoshone, and Targhee), Yellowstone and Grand Teton National Parks, John D. Rockefeller Memorial Parkway, portions of adjacent private and state lands, and lands managed by the BLM. Grizzly bears also frequently use areas outside the defined YGBE recovery zone.

Population recovery criteria are measured within the recovery zone and an adjacent 10-mile buffer. A large proportion of the Yellowstone grizzly bear population occurs within the recovery zone. A large proportion of the grizzly bears in the YGBE recovery zone occur on protected lands in Yellowstone National Park, but grizzly bears also inhabit large areas outside the park boundary. Yellowstone and Grand Teton National Parks make up 39.4 percent of the YGBE recovery zone. Private holdings and other ownership make up 2.1 percent of the recovery zone, and the remaining 58.5 percent occurs on National Forest System lands. National Park Service and National Forest System lands support roughly 89 percent of the currently known distribution of the grizzly bears in the YGBE recovery zone. Grizzly bears also frequently occur in and use areas adjacent to the recovery zone.

The YGBE recovery zone is subdivided into smaller units to facilitate both the assessment of projects and recovery objectives. Eighteen BMUs were formally delineated throughout the YGBE. BMUs were designed to:

- Assess the effects of existing and proposed activities on grizzly bear habitat without having the effects diluted by consideration of too large an area;
- Address unique habitat characteristics and grizzly bear activity and use patterns;
- Identify contiguous complexes of habitat which meet year-long needs of the grizzly bear; and
- Establish priorities for areas where land use management needs would require cumulative effects assessments.

Three demographic criteria that were formerly in the 1993 Grizzly Bear Recovery Plan (USFWS 1993) have been reevaluated and updated. The second criterion pertaining to the distribution of females with offspring remains unchanged, while the first and third criteria pertaining to the minimum allowable number of females with cubs of the year and sustainable mortality limits have been revised and updated to reflect current methods based on the best available science (USFWS 2007). The current demographic recovery criteria to be appended to the 1993 Recovery Plan include the following:

- Demographic Recovery Criterion 1 – Maintain a minimum of 48 females with cubs of the year in the Greater Yellowstone Area, as indicated by the model-averaged Chao2 estimate for that year. The number of females with cubs of the year cannot drop below 48 for any 2 consecutive years.

---

<sup>9</sup> Source: USFWS (2013a), unless otherwise noted

- Demographic Recovery Criterion 2 – Sixteen of 18 BMUs within the recovery zone must be occupied by females with young, with no two adjacent BMUs unoccupied, during a 6-year sum of observations. This criterion is important as it ensures that reproductive females occupy the majority of the recovery zone and are not concentrated in one portion of the ecosystem.
- Demographic Recovery Criterion 3 – For independent females (at least 2 years old), the current annual mortality limit not to be exceeded in 2 consecutive years and including all sources of mortality is 9 percent of the total number of independent females. For independent males (at least 2 years old), the current annual mortality limit not to be exceeded in 3 consecutive years and including all sources of mortality is 15 percent of the total number of independent males.
- For dependent young (less than 2 years old), the current annual mortality limit not to be exceeded in 3 consecutive years and including only known and probable human-caused mortalities is 9 percent of the total number of dependent young.

The first and third criteria were changed because the Service no longer considers the 1993 recovery plan criterion the best scientific method available. The Chao2 estimator is now used to calculate the total number of independent females from sightings and re-sightings of females with cubs. This allows calculation of total population size instead of the minimum population size used in the 1993 method. Also, we can now calculate unknown and unreported mortalities, which allows more conservative mortality management based on annually updated information rather than the estimate of unknown and unreported mortality used in the 1993 recovery plan. Data on the reproductive performance of Yellowstone grizzly bears, survival rates of cub and yearling Yellowstone grizzly bears, the trajectory of the Yellowstone grizzly bear population under alternate survival rates, and the impacts of spatial and environmental heterogeneity on the Yellowstone grizzly bear demographics has been improved and updated.

Based on verified sightings of females with cubs of the year during 2013 and using the Chao2 method, it was determined that the model-averaged number of females with cubs of the year was 59 (95% CI 49-72) and exceeded the demographic objective of 48 specified in the demographic criteria for the Greater Yellowstone Ecosystem (GYE). Using this number, the estimated Yellowstone grizzly bear population size for 2013 was 629 (95% CI = 566-693) based on previous demographic protocols and 741 (95% CI = 660-821) based on updated protocols. In addition to the Chao2 estimate, the number of females with cubs of the year was also estimated based on a mark-resight technique that does not include the underestimation bias of the Chao2 technique. The result of that estimate was 109, excluding observation at army cutworm moth aggregation sites; 14 additional females with cubs of the year were observed during moth site-only flights. The 3-year moving average (using 2011-2013 results) was 79 unique females with cubs of the year (95% interquartile range = 46-126) (Haroldson and Dickinson 2014).

Based upon the revised recovery criteria, independent females, males, and dependent young mortality limits were met in 2013 (IGBST 2014). Independent female and dependent young mortality limits were met in 2012, while independent male mortality limits were exceeded (IGBST 2013). The dependent young mortality limit was met in 2011, while independent female mortality was exceeded (IGBST 2012a). Independent male mortality was only fractionally

exceeded (less than one bear) in 2011. The criteria states that independent female mortality cannot be exceeded in 2 consecutive years and that independent male mortality cannot be exceeded in 3 consecutive years. Because the thresholds for dependent young has been met in each of the last three years and independent female mortality was not exceeded in 2012 or 2013, the revised demographic recovery criteria are met for dependent young and independent females. Since the thresholds for independent male mortality have been exceeded in only two of the three previous consecutive years (2011 and 2012), the revised demographic recovery criteria are also met for independent male grizzly bears. GYE grizzly bear demographic workshops have recently taken place to complete a demographic review of the GYE grizzly bear population. The objectives of the workshops were to revise current protocols for estimating population size of the GYE grizzly bear population; reevaluate current mortality limits as necessary based on a revised estimate of population size and updated demographic analyses; and discuss the possibility of zoning the ecosystem for mortality limits given the expanding population (IGBST 2012b).

Access management has long been an important tool for conserving grizzly bears and their habitat. The BMUs in the YGBE were further divided into smaller units, termed subunits. Subunits are approximately the size of an adult female grizzly bear home range and provide the basic scale for the analysis of impacts associated with access management and vegetation management projects.

Overall, conditions for grizzly bears related to access management in the YGBE are excellent (USFWS 2013b). The YGBE recovery zone, for example, contains large amounts of secure habitat and very low total and open road densities in the majority of the subunits (USFWS 2013b). In 2013, for the entire YGBE recovery zone, the mean secure habitat was 87.0 percent, the mean open motorized access route density was 9.9 percent in season one (March 1 - July 15) and 10.9 percent in season two (July 16 - November 30), and the mean total motorized access route density was 5.4 percent (USFWS 2013b).

The YGBE grizzly bear population has increased from estimates as low as 136 individuals when listed in 1975 to more than 580 animals as of 2004; this population had been increasing since the mid-1990s and was increasing at 4 to 7 percent per year. The population growth rate for the recent period is now stable to slightly increasing. The range of this population also has increased dramatically, as evidenced by the 48 percent increase in occupied habitat since the 1970s. Yellowstone grizzly bears continue to increase their range and distribution annually, and grizzly bears in the Yellowstone area now occupy habitats they have been absent from for decades. Roughly 90 percent of females with cubs occupy the PCA (i.e., recovery zone), and about 10 percent of females with cubs have expanded out beyond the PCA within the ecosystem.

The YGBE overlaps with portions of the GRSG action area on the Upper Snake and Dillon Field Offices and the Beaverhead-Deerlodge and Caribou-Targhee National Forests.

### **Status of the Grizzly Bear in the Upper Snake Field Office and Associated Management Direction**

The Upper Snake Field Office (FO) manages approximately 2,460 acres of public land within the 5,894,400-acre Greater Yellowstone PCA that encompasses northwestern Wyoming, eastern Idaho, and south-central Montana. With an increasing grizzly bear population, the area used by

Biological Assessment for the Idaho and Southwestern Montana Greater Sage-Grouse  
Land Use Plan Amendment and Environmental Impact Statement

grizzly bears is expanding outside of the recovery zone. Within areas most likely to be used by grizzly bears in the future, the Upper Snake FO manages approximately 24,710 acres of public land, which consist of small, scattered parcels interspersed with other federal, private, and state lands.

Not all of the BLM-administered land within the PCA in the Upper Snake FO is suitable habitat for grizzly bears. It consists of small, isolated parcels with existing infrastructure that is not compatible with grizzly bear occupancy. None of the BLM-administered lands within the Upper Snake FO have been identified as providing ungulates, spawning cutthroat trout, seeds of whitebark pine, or army cutworm moths for grizzly bears.

The Upper Snake FO administers about 600 acres that have been identified as secure grizzly bear habitat within the recovery zone. Approximately 2,000 acres within the recovery zone were designated as the Henry's Lake ACEC in 1997. The intent of the ACEC was to recognize and conserve rare wetland vegetation communities, special status species and their habitats, including grizzly bears, and recreational values while maintaining multiple use activities on public lands administered by the BLM.

No grizzly bears have been killed by humans, nor have any humans been killed or injured by grizzly bears, on BLM-administered lands within the Upper Snake FO. One grizzly bear/livestock incident occurred in 2011 on BLM-administered lands in the Teton Basin area outside of the recovery zone. This involved a grizzly bear eating a domestic cow carcass. It was not determined whether the grizzly bear killed the cow, and no action was taken to capture or move the bear.

Within the GRSG action area, 4,637 acres of occupied grizzly bear habitat overlap with PHMA, and 116,166 acres overlap with IHMA in the Upper Snake FO. There is no overlap between occupied grizzly bear habitat and GHMA (Figure 5). In addition, 8 acres of the recovery zone overlap with IHMA on the Upper Snake FO, and 36 acres overlap with GHMA (Figure 6).

Management direction for the Upper Snake FO is contained in the Medicine Lodge Resource Management Plan (BLM 1985).

To the extent practicable, management actions within occupied grizzly bear habitat will be consistent with the goals and objectives in the Grizzly Bear Recovery Plan [USFWS 1993] and the guidelines developed through the Interagency Wildlife Monitoring Program for mineral exploration and development (BLM 1985, page 27).

## Grizzly Bear

### Recovery Zone within GRSG Decision Space

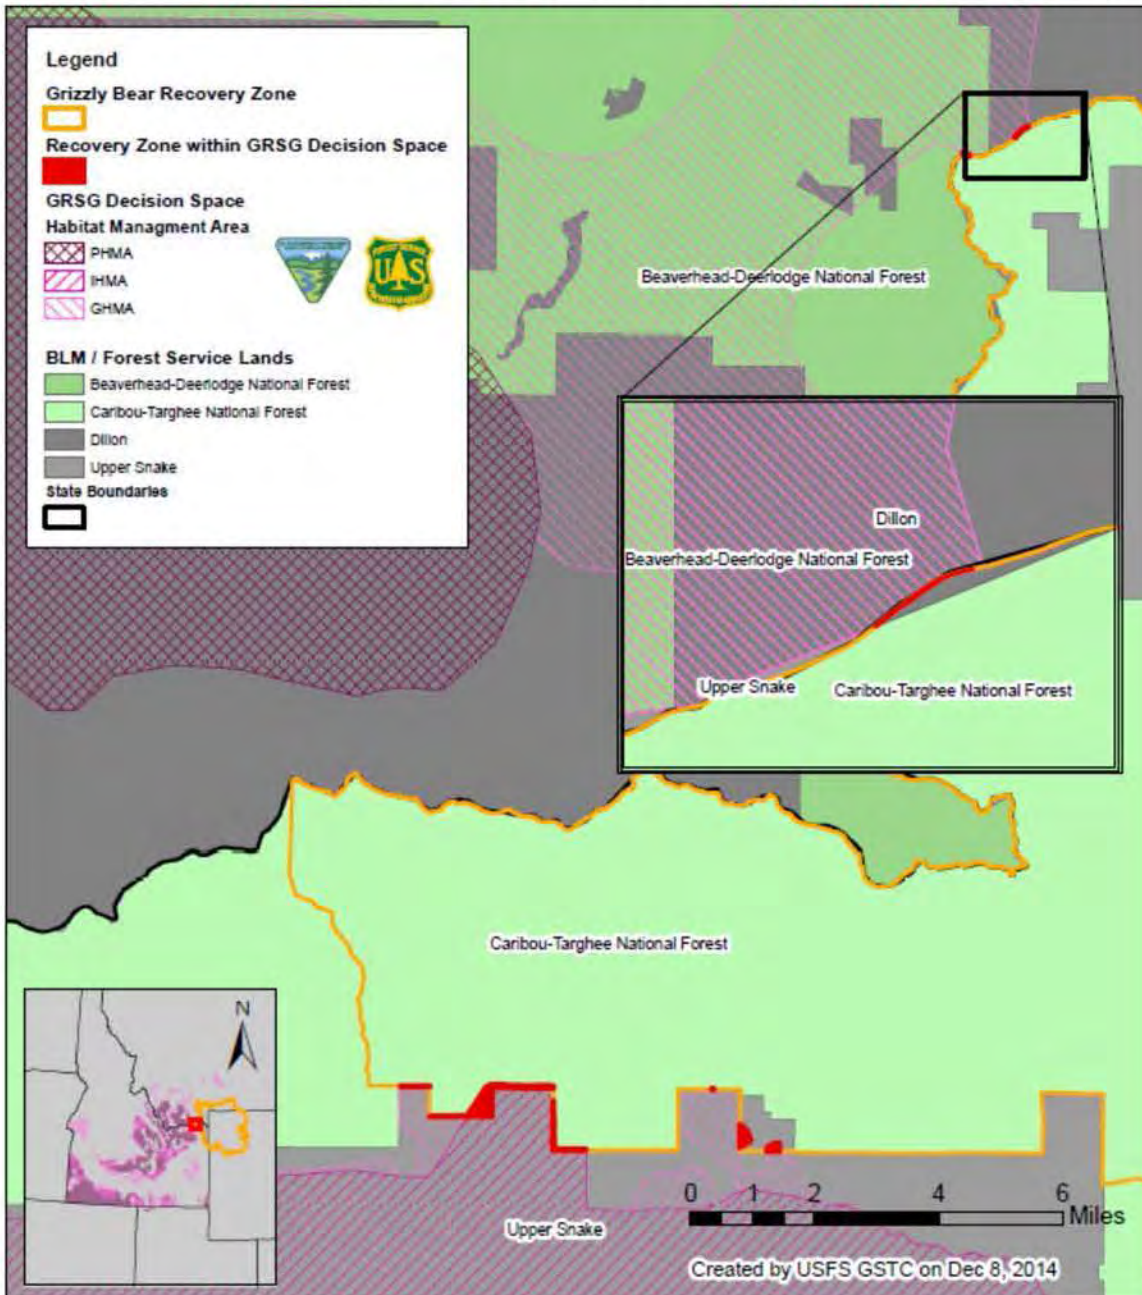

Figure 6. Grizzly bear recovery zone with respect to Idaho-Southwestern Montana Greater Sage-Grouse LUPA and EIS action area.

**Status of the Grizzly Bear in the Dillon Field Office and Associated Management Direction**

*Grizzly bear observations on public lands in the Dillon Field Office have been rare until the mid-1990s, and were confined to the Centennial Mountains and areas adjacent to the Gravelly Range. As the grizzly population in Yellowstone has increased, bears have expanded into adjoining habitat outside the Yellowstone recovery zone, or primary conservation area (PCA). The Centennial Valley and the area surrounding the Gravelly and Snowcrest Ranges are now considered as an area where grizzly bear are likely to occur as an extension of bear habitat in the Yellowstone ecosystem. Within this area, the most suitable habitat is available in BLM Wilderness Study Areas (WSAs) around Axolotl Lakes, E.F. Blacktail, and the Centennial Mountains. The Barton-Idaho area east of Ruby Reservoir provides potential habitat adjacent to occupied grizzly bear habitat on Beaverhead-Deerlodge NF lands in the Gravelly Range and Greenhorn Mountains. Other habitat along the Continental Divide, in the Tendoy Mountains including the Maiden Peak area, and the Big Hole Divide support occasional grizzly bear use. Most observations appear to be of individual animals that are simply wandering into potential habitat.*

*Distribution information about grizzly bear has been derived from interagency monitoring and conservation strategy documents, and discussions with district biologists for adjoining BD NF lands. BLM has not conducted any inventories or monitoring specifically to identify grizzly bear occurrences or map suitable habitat on public lands. (BLM 2004)*

The Dillon Field Office does not contain land within the Yellowstone Grizzly Bear Recovery Zone (USFWS 2004a). Outside of the Yellowstone PCA, grizzly bears will be allowed to expand into biologically suitable and socially acceptable areas, but these areas are not considered as essential to recovery (USFWS 2004a). The objective is to maintain existing resource management and recreational uses and to allow agencies to respond to demonstrated problems with appropriate management actions.

Within the GRSG action area, 108,059 acres of occupied grizzly bear habitat overlap with PHMA, and 71,091 acres overlap with GHMA in the Dillon Field Office; there is no overlap between occupied grizzly bear habitat and IHMA (Figure 5).

Grizzly bear management direction for the Dillon Field Office (BLM 2006) is shown in the following table:

**Table 1. Dillon Field Office Resource Management Plan Direction Specific to the Grizzly Bear and Potential for Effect**

<b>Dillon Field Office RMP Direction</b>	<b>Type/Location</b>	<b>Need for Additional Analysis (Yes/No) and Rationale</b>
Apply the following special management in	Centennial	No: There is very little

Biological Assessment for the Idaho and Southwestern Montana Greater Sage-Grouse  
Land Use Plan Amendment and Environmental Impact Statement

<b>Dillon Field Office RMP Direction</b>	<b>Type/Location</b>	<b>Need for Additional Analysis (Yes/No) and Rationale</b>
<p>the ACEC boundary to protect the habitat it contains for grizzly bear, lynx, and wolf, its use as a wildlife migration corridor, its outstanding scenic value, and the only known occurrence in Montana of Whipple’s beardtongue (in the Taylor Mountain area).</p> <p>a. Incorporate landscape design principles into vegetation treatments to maintain scenic values.</p> <p>b. Do not authorize new permanent roads within the ACEC to maintain unfragmented habitat for wildlife migration.</p> <p>c. Evaluate proposed activities, including backcountry helicopter operations and winter recreational use, for their potential to affect important and relevant values in the area and do not permit any activities that interfere with protection of those values.</p> <p>d. Allow livestock use as currently authorized. Evaluate any proposed changes in grazing, including time and intensity of use, for impacts on relevant and important values and allow if relevant and important values in the ACEC are maintained or enhanced.</p> <p>e. Do not allow conversion of grazing permits from cattle to sheep to avoid potential conflicts with grizzly bear.</p>	<p>Mountains ACEC, page 21</p>	<p>overlap of GRSG management area with the Centennial Mountains ACEC (13,073 acres of PHMA).</p> <p>a. There is nothing proposed within the GRSG LUPA decision that will prevent the incorporation of landscape design principles into vegetation treatments.</p> <p>b. The GRSG LUPA decision will not authorize new roads within GRSG habitat. Rather, it will generally limit roads or require co-location of new roads with existing infrastructure for special use authorization.</p> <p>c. GRSG LUPA decision goals, objectives, desired conditions, standards, and guidelines are not expected to negatively affect important and relevant values in the ACEC. Furthermore, grizzly habitat will be addressed at the site-specific level, and compatibility between ACEC direction, grizzly guidelines, and GRSG direction will be sought.</p> <p>d. Changes in grazing management through grazing authorization modifications may be implemented when livestock management practices are determined to not be compatible with meeting or making progress towards achievable GRSG habitat objectives.</p>

Biological Assessment for the Idaho and Southwestern Montana Greater Sage-Grouse  
Land Use Plan Amendment and Environmental Impact Statement

<b>Dillon Field Office RMP Direction</b>	<b>Type/Location</b>	<b>Need for Additional Analysis (Yes/No) and Rationale</b>
		e. Potential modifications include, but are not limited to, changes in: season or timing of use; numbers of livestock; distribution of livestock use; duration and/or level of use; kind of livestock (e.g., cattle, sheep, horses, or goats); voluntary measures such as temporary non-use; and grazing schedules. See the effects analysis section below.
19: Authorize no new domestic sheep permits or conversion of cattle permits to sheep within areas depicted on Map 33 in the RMP that contain suitable grizzly bear and wolf habitat (also known as the wildlife dispersal/migration corridors in the Centennial Mountains, Snowcrest Mountains, Gravelly Range, Greenhorn Mountains, Axolotl Lakes area, and along the Continental Divide from Monida to Lemhi Pass).	Livestock Grazing Action, page 43	Yes: Potential modifications include changes in kind of livestock. See the effects analysis section below.
20: Implement food storage strategies from the Southwest Montana State Grizzly Management Plan (MT FWP 2002) on BLM lands in the Grizzly Bear use areas outside of the Yellowstone Recovery Zone if grizzly bears are delisted. Until the grizzly bear is delisted, monitor the South Madison campground and undeveloped sites in the East Fork of the Blacktail and the Axolotl Lakes area for food storage problems related to grizzly bear use and the potential need for bear proof trash containers. Post major public land trailheads and access points in these areas and in the Centennial Mountains to advise recreationists about proper food storage to avoid back country conflict.	Recreation Action, page 54	No: GRSG LUPA decision goals, objectives, desired conditions, standards, or guidelines will not preclude the implementation of food storage strategies.
3: Consider the following habitats priority wildlife habitats: • all listed and special status species habitats, with grizzly bear and lynx receiving the most	General Wildlife and Special Status Species	No: GRSG LUPA decision goals, objectives, desired conditions, standards, or guidelines will not preclude

Biological Assessment for the Idaho and Southwestern Montana Greater Sage-Grouse  
Land Use Plan Amendment and Environmental Impact Statement

<b>Dillon Field Office RMP Direction</b>	<b>Type/Location</b>	<b>Need for Additional Analysis (Yes/No) and Rationale</b>
<p>emphasis in coniferous forest habitats, and sage-grouse receiving the most emphasis in sagebrush steppe habitats</p> <ul style="list-style-type: none"> <li>• coniferous forest and sagebrush habitats that provide important big game winter habitat</li> <li>• sagebrush habitats that provide bighorn sheep year-long or seasonal habitats</li> <li>• sagebrush habitats that provide sage-grouse breeding, early brood rearing, or winter habitat</li> <li>• mountain mahogany and sagebrush steppe habitat associations in the Lima Sweetwater Breaks key raptor management area</li> <li>• all riparian and wetland habitats</li> </ul>	<p>Actions, page 69</p>	<p>the consideration of priority wildlife habitats, and it is consistent with grizzly bear and lynx receiving the most emphasis in coniferous forest habitats, and GRSG receiving the most emphasis in sagebrush steppe habitats.</p>
<p>4: Consider the following species priority wildlife species:</p> <ul style="list-style-type: none"> <li>• all listed and special status species, with grizzly bear, lynx, and sage-grouse receiving the most emphasis</li> <li>• bighorn sheep</li> <li>• migratory birds listed on the USFWS Region 10 Birds of Conservation Concern list and in Montana Bird Conservation Plan (see Appendix R of the RMP).</li> </ul>	<p>General Wildlife and Special Status Species Actions, page 69</p>	<p>No: GRSG LUPA decision goals, objectives, desired conditions, standards, or guidelines will not preclude the consideration of priority wildlife species.</p>
<p>32: Consult with the USFWS when impacts are anticipated to threatened or endangered species or designated habitat.</p> <p>a. Use the interagency analysis screens for T&amp;E species to facilitate consistent consultation and streamline consultation on actions that have insignificant or discountable effects (see Appendix S).</p> <p>b. Use the analysis screens for bald eagle, gray wolf, and grizzly bear in Appendices S, T, and U in conjunction with the joint BLM-FS evaluation form to evaluate proposed actions and projects to determine effects and the need for additional consultation with the USFWS.</p> <p>Analysis Screen Part 1 (Appendix V, page 188). (1) The area must be in compliance with</p>	<p>General Wildlife and Special Status Species Actions, page 71</p>	<p>Yes: Analysis screen for the grizzly bear will be used in the analysis:</p> <p>Analysis Screen Part 1 (Appendix B): Grizzly bears and their habitat will be addressed, as necessary, at the site-specific level and, at this time, there is no reason to believe that GRSG LUPA decision goals, objectives, desired conditions, standards, or guidelines utilized for individual projects will preclude compliance with appropriate access management, food storage</p>

Biological Assessment for the Idaho and Southwestern Montana Greater Sage-Grouse  
Land Use Plan Amendment and Environmental Impact Statement

<b>Dillon Field Office RMP Direction</b>	<b>Type/Location</b>	<b>Need for Additional Analysis (Yes/No) and Rationale</b>
<p>the appropriate access management direction. (2) Human foods, livestock feed, garbage, and other attractants must be managed by the application of an adequate “food storage rule” similar to the NCDE or Yellowstone food storage orders. If no specific rule exists for the area, use of either the Yellowstone or NCDE order will be considered adequate. (3) Projects that involve seeding or planting of grasses, forbs, or shrubs must do so in a manner that will tend not to attract bears into areas where increased mortality risk or interaction between bears and people is likely.</p> <p>Analysis Screen Part 2 (Appendix V, pages 189-191). The Screening Criteria Table displays activities and criteria that, when met, will allow the project to meet “screening elements.” If the project does not meet the identified criteria, the project should proceed through the established consultation process.</p>		<p>order, and avoidance of human/bear interaction direction.</p> <p>Analysis Screen Part 2 (Appendix C): Based on the types of actions applicable to the GRSG LUPA decision (prescribed fire, range, roads and road maintenance, and weed control), at this time, it appears that the GRSG LUPA decision meets the screening criteria leading to a “Not Likely to Adversely Affect (NLAA) determination for the grizzly bear. Please refer to the effects analysis section below for additional discussion.</p>
<p>34: Implement the following nondiscretionary terms and conditions to ensure that actions conducted under the plan do not result in unexpected consequences that affect more grizzly bears or impart additional effects to grizzly bears than anticipated in the USFWS biological opinion of October 29, 2004 (incidental take of no more than two bears over the life of the plan as a result of habituation and/or food conditioning of grizzly bears or conflicts with livestock, an unquantifiable level of take from displacement effects of road densities and activity in project areas, and no more than one bear over the life of the plan as a result of conflicts with sheep used for BLM weed control projects):</p> <ul style="list-style-type: none"> <li>• If more than ten miles of road construction is planned or completed annually, BLM Dillon Field Office will consult with the USFWS.</li> </ul>	<p>General Wildlife and Special Status Species Actions, pages 71-72</p>	<p>No: GRSG LUPA decision goals, objectives, desired conditions, standards, or guidelines will not preclude the implementation of the nondiscretionary terms and conditions.</p>

Biological Assessment for the Idaho and Southwestern Montana Greater Sage-Grouse  
Land Use Plan Amendment and Environmental Impact Statement

<b>Dillon Field Office RMP Direction</b>	<b>Type/Location</b>	<b>Need for Additional Analysis (Yes/No) and Rationale</b>
<ul style="list-style-type: none"> <li>• Temporary roads will be closed and reclaimed within two years following the end of road use or project completion.</li> <li>• The BLM will maintain an up-to-date record of grizzly bear management actions that take place on BLM lands or as a result of activities authorized by BLM Dillon Field Office.</li> <li>• If an incident of depredation or use of improperly stored food items results in removal of a grizzly bear, BLM shall follow the Interagency Grizzly Bear Committee (IGBC) guidelines in reporting the incident to the USFWS.</li> <li>• BLM shall report any depredation or food storage incidences to the USFWS Montana Ecological Services Sub-office in Billings, or Montana Ecological Services Field Office in Helena in addition to the reporting required in the IGBC guidelines.</li> <li>• To monitor changes in road densities and potential effects on grizzly bear or their habitat, BLM will provide an annual report to the USFWS documenting:               <ul style="list-style-type: none"> <li>a. the number of miles of new road constructed</li> <li>b. the number of miles of road closed to public use and reclaimed</li> <li>c. the number of miles of temporary road on the landscape, and length of time since construction of the temporary road</li> <li>d. how open road densities may have changed relative to target densities of one mile per square mile within the analysis area for projects. (USFWS recommends the use of 6<sup>th</sup> code hydrologic units for an unbiased and consistent analysis of open road density, using the unit containing the project and the adjoining 3-6 units with similar habitat).</li> </ul> </li> </ul>		
<p>35: Require the following measures for any projects located in areas where grizzly bear use is known or likely to occur (see Map 34) where domestic sheep are used to control</p>	<p>General Wildlife and Special Status Species</p>	<p>No: GRSG LUPA decision goals, objectives, desired conditions, standards, or guidelines do not specifically</p>

Biological Assessment for the Idaho and Southwestern Montana Greater Sage-Grouse  
Land Use Plan Amendment and Environmental Impact Statement

<p>noxious weeds:</p> <ul style="list-style-type: none"> <li>• Domestic sheep grazing to control noxious weeds will not be used where previous livestock depredations have occurred from grizzly bears or wolves.</li> <li>• Domestic sheep will be removed from a project area if depredation or encounters occur from grizzly bears or wolves.</li> <li>• Any contracts or agreements to use domestic sheep grazing to control noxious weeds will specify that no control actions against grizzly bears or wolves will be requested by the contractor if depredations or encounters occur as part of the weed grazing action. Any encounters with wolves or grizzly bears will be reported to Montana Fish, Wildlife, and Parks (Montana FWP) and the United States Department of Agriculture Wildlife Services.</li> <li>• Domestic sheep will be herded, and will be attended by guard dogs at all times.</li> <li>• Temporary, predator-proof electric fencing will be used to protect night bedding areas where potential for predation by wolves and grizzly bears exists.</li> </ul>	<p>Actions, page 72</p>	<p>propose to utilize domestic sheep to control invasive species, and there are currently no site-specific proposals. In addition, grizzly habitat will be addressed at the site-specific level, and compatibility between grizzly bear actions and GRSG direction will be sought.</p>
<p>36: Implement the following conservation actions recommended by USFWS as discretionary actions to minimize or avoid adverse effects of a proposed action on listed species or critical habitat, to help implement recovery plans, or to develop information:</p> <ul style="list-style-type: none"> <li>• Participate in ongoing interagency efforts to identify, map, and manage linkage habitats essential to grizzly bear movement between ecosystems. (Contact the USFWS grizzly bear recovery coordinator office at (406) 243-4903 for more information).</li> <li>• Continue to manage road access on BLM lands to achieve lower road densities where possible.</li> <li>• Manage garbage food and livestock feed storage to prevent access to bears to benefit grizzly bears as well as black bears and other</li> </ul>	<p>General Wildlife and Special Status Species Actions, page 72</p>	<p>No: GRSG LUPA decision goals, objectives, desired conditions, standards, or guidelines will not preclude the implementation of the conservation actions recommended by USFWS as discretionary actions to minimize or avoid adverse effects of a proposed action on grizzly bears. In addition, grizzly habitat will be addressed at the site-specific level, and compatibility between grizzly bear actions and GRSG direction will be sought.</p>

Biological Assessment for the Idaho and Southwestern Montana Greater Sage-Grouse  
Land Use Plan Amendment and Environmental Impact Statement

<b>Dillon Field Office RMP Direction</b>	<b>Type/Location</b>	<b>Need for Additional Analysis (Yes/No) and Rationale</b>
<p>carnivores. Reduction in human/carnivore interactions will also increase public safety.</p> <ul style="list-style-type: none"> <li>• Where grizzly bear use is known or likely to occur and where practicable, delay disturbance activities during the spring in spring habitats to minimize displacement of grizzlies.</li> <li>• Include security cover needs for grizzly bears in timber and vegetation management activity plans to increase the utility of habitat for grizzly bears across the Dillon planning area. Specifically, adjust the size and shape of cutting and harvest units to reduce the distance to cover, adjust edges, and leave patches of trees and understory within cutting units to reduce line-of-sight distances.</li> </ul>		
<p>37: Reinitiate consultation with USFWS if:</p> <ul style="list-style-type: none"> <li>• The amount or extent of incidental take is exceeded. In instances where the amount or extent of incidental take is exceeded, any operations causing such take must cease pending reinitiation.</li> <li>• New information reveals an agency action may affect listed species or critical habitat in a manner or to an extent not considered in this opinion</li> <li>• An agency action is subsequently modified in a manner that causes an effect on the listed species or critical habitat that was not considered in the USFWS Biological Opinion on the Dillon RMP</li> <li>• A new species is listed or critical habitat designated that may be affected</li> </ul>	<p>General Wildlife and Special Status Species Actions, page 72</p>	<p>No: GRSG LUPA decision goals, objectives, desired conditions, standards, or guidelines will not preclude reinitiation of consultation with USFWS if the amount or extent of grizzly bear incidental take is exceeded or an agency action is subsequently modified in a manner that causes an effect on grizzly bears that was not considered in the USFWS Biological Opinion on the Dillon RMP. GRSG conservation measures are not expected to result in incidental take or an effect on grizzly bears beyond what was specified in the 2004 RMP BO. However, site-specific analysis will be conducted and a decision will be made at that time. Critical habitat has not been designated for the grizzly bear.</p>

Biological Assessment for the Idaho and Southwestern Montana Greater Sage-Grouse  
Land Use Plan Amendment and Environmental Impact Statement

<b>Dillon Field Office RMP Direction</b>	<b>Type/Location</b>	<b>Need for Additional Analysis (Yes/No) and Rationale</b>
<p>Management and Monitoring of Grizzly Bear/Human Conflicts: Outside the PCA, state management plans will direct the management of nuisance bears. Management of nuisance bears usually falls into one or more of the following categories:</p> <ul style="list-style-type: none"> <li>• Removing or securing the attractant</li> <li>• Deterring the bear from the site through the use of aversive conditioning techniques</li> <li>• Capturing and relocating the nuisance bear</li> <li>• Removing the bear from the wild, including lethal control</li> </ul> <p>The focus and intent of nuisance grizzly bear management inside and outside the PCA will be predicated on strategies and actions to prevent grizzly bear/human conflicts. It is recognized that active management aimed at individual nuisance bears will be required in both areas. Management actions outside the PCA will be implemented according to state management plans. These actions will be compatible with grizzly bear population management objectives for each state for the areas outside the PCA.</p> <p>In circumstances that result in a nuisance bear situation outside the PCA, more consideration will be given to existing human uses. Site-specific conflict areas within and outside the PCA will be documented and prioritized to focus proactive management actions to minimize grizzly bear/human conflicts and address existing and potential human activities that may cause future conflicts. Past conflict management has demonstrated that grizzly bears can coexist with most human activities. Management of all nuisance bear situations will emphasize resolving the human</p>	<p>Conservation Actions for Grizzly Bears (CAGB)<sup>10</sup></p>	<p>No: GRSG LUPA decision goals, objectives, desired conditions, standards, or guidelines will not preclude management and monitoring of grizzly bear/human conflicts or the use of state management plans to manage nuisance bears outside the PCA. In addition, proposed GRSG direction is not expected to result in circumstances that result in a nuisance bear situation outside the PCA.</p>

<sup>10</sup> CAGB = Conservation actions for grizzly bears. The following excerpts from the Yellowstone Conservation Strategy and Grizzly Bear Management Plan for Southwestern Montana are pertinent to grizzly bear management in the Dillon Field Office (USDI Bureau of Land Management 2006, Appendix V).

Biological Assessment for the Idaho and Southwestern Montana Greater Sage-Grouse  
Land Use Plan Amendment and Environmental Impact Statement

<b>Dillon Field Office RMP Direction</b>	<b>Type/Location</b>	<b>Need for Additional Analysis (Yes/No) and Rationale</b>
<p>cause of the conflict. Relocation and removal of grizzly bears may occur if other management actions are not successful.</p> <p>Before any removal, except in cases of human safety, management authorities will consult with each other prior to judging the adequacy of the reason for removal. Captured grizzly bears identified for removal may be given to public research institutions or public zoological parks for appropriate non-release educational or scientific purposes as per regulations of states and national parks. Grizzly bears not suitable for release, research, or educational purposes will be removed as described in appropriate state management plans or in compliance with national park management plans. All grizzly bear relocations and removals will be documented and reported annually in the Interagency Grizzly Bear Study Team Annual Report.</p>		
<p>Montana FWP will seek to maintain road densities of one mile or less per square mile of habitat as the preferred approach. This is the goal of the statewide elk management plan (including the southwestern Montana areas covered by this plan). The goal seeks to meet the needs of a variety of wildlife while maintaining reasonable public access. If additional management is needed based on knowledge gained as bears reoccupy areas, it should be developed and implemented by local groups as suggested in this plan.</p>	CAGB	<p>Yes: The GRSG LUPA decision will not authorize new roads in GRSG habitat. Rather, it will generally limit them. This may benefit grizzly bears where habitat overlaps. See the effects analysis section below.</p>
<p>1. Identify and evaluate, for each project proposal, the cumulative effects of all activities, including existing uses and other planned projects. Potential site-specific effects of the project being analyzed are a part of the cumulative effects evaluation which will apply to all lands within a designated “biological unit”. A biological unit is an area</p>	CAGB	<p>No: A cumulative effects analysis is being completed at this GRSG LUPA decision planning level and will be completed for each project occurring at the site-specific level.</p>

Biological Assessment for the Idaho and Southwestern Montana Greater Sage-Grouse  
Land Use Plan Amendment and Environmental Impact Statement

<b>Dillon Field Office RMP Direction</b>	<b>Type/Location</b>	<b>Need for Additional Analysis (Yes/No) and Rationale</b>
of land which is ecologically similar and includes all of the year-long habitat requirements for a sub-population of one or more selected wildlife species.		
2. Avoid human activities, or combinations of activities, on seasonally important wildlife habitats that may result in an adverse impact on the species or reduce long-term habitat effectiveness.	CAGB	No: GRSG LUPA decision goals, objectives, desired conditions, standards, or guidelines within sagebrush habits are not expected to negatively affect habitats seasonally important to grizzly bears.
3. Base road construction proposals on a completed transportation plan which considers important wildlife habitat components and seasonal use areas in relation to road location, construction period, road standards, seasons of heavy vehicle use, road management requirements, and more.	CAGB	Yes: The GRSG LUPA decision will not authorize new roads within GRSG habitat. Rather, it will generally limit them. This may benefit grizzly bears where habitat overlaps. See the effects analysis section below.
4. Use minimum road and site construction specifications based on projected transportation needs. Schedule construction times to avoid seasonal-use periods for wildlife as designated in species-specific guidelines.	CAGB	Yes: GRSG LUPA decision RDFs for road construction occurring within the analysis area will complement this direction which could benefit grizzly bears. See the effects analysis section below.
5. Locate roads, drill sites, landing zones, etc., to avoid important wildlife habitat components based on site-specific evaluation.	CAGB	No: GRSG LUPA decision RDFs will complement this direction.
6. Roads that are not compatible with area management objectives, and are no longer needed for the purpose for which they were built, will be closed and reclaimed. Native plant species will be used whenever possible to provide proper watershed protection on disturbed areas. Wildlife forage and/or cover species will be used in rehabilitation projects where appropriate.	CAGB	Yes: GRSG LUPA decision goals, objectives, desired conditions, standards, and guidelines will complement this direction, which could benefit grizzly bears. See the effects analysis section below.
7. Impose seasonal closures and/or vehicle restrictions based on wildlife, or other	CAGB	No: GRSG LUPA decision goals, objectives, desired

Biological Assessment for the Idaho and Southwestern Montana Greater Sage-Grouse  
Land Use Plan Amendment and Environmental Impact Statement

<b>Dillon Field Office RMP Direction</b>	<b>Type/Location</b>	<b>Need for Additional Analysis (Yes/No) and Rationale</b>
resource needs, on roads that remain open and enforce and prosecute illegal use by off-road vehicles if given authority. Montana FWP will actively work to secure authority through the appropriate process and identify funding to support enforcement efforts.		conditions, standards, guidelines, and RDFs will complement this direction.
8. Montana FWP supports the U.S. Forest Service and BLM restrictions banning all off-road/trail use.	CAGB	NA: This is a Montana FWP position statement.
9. Efforts will be directed towards improving the quality of habitat in site-specific areas of habitually high human-caused bear mortality. Increased sanitation measures, seasonal road closures, etc., could be applied.	CAGB	No: GRSG LUPA decision goals, objectives, desired conditions, standards, or guidelines will not preclude this direction.

In addition, it contains a grizzly bear screening process (BLM 2006, Appendix V, and Appendices B and C in this document) intended to facilitate ESA processing of project consultation requirements for minor projects, when a “no effect” or “not likely to adversely affect” determination is “clearly” the appropriate conclusion. Projects not meeting or included in the criteria presented must follow standard processes for conducting project analysis, BA development, and consultation. The GRSG LUPA decision has been screened (see table above) using these criteria to estimate its potential for effects on grizzly bears.

## Idaho / SW Montana Greater Sage-grouse EIS Dillon Field Office and ACEC's

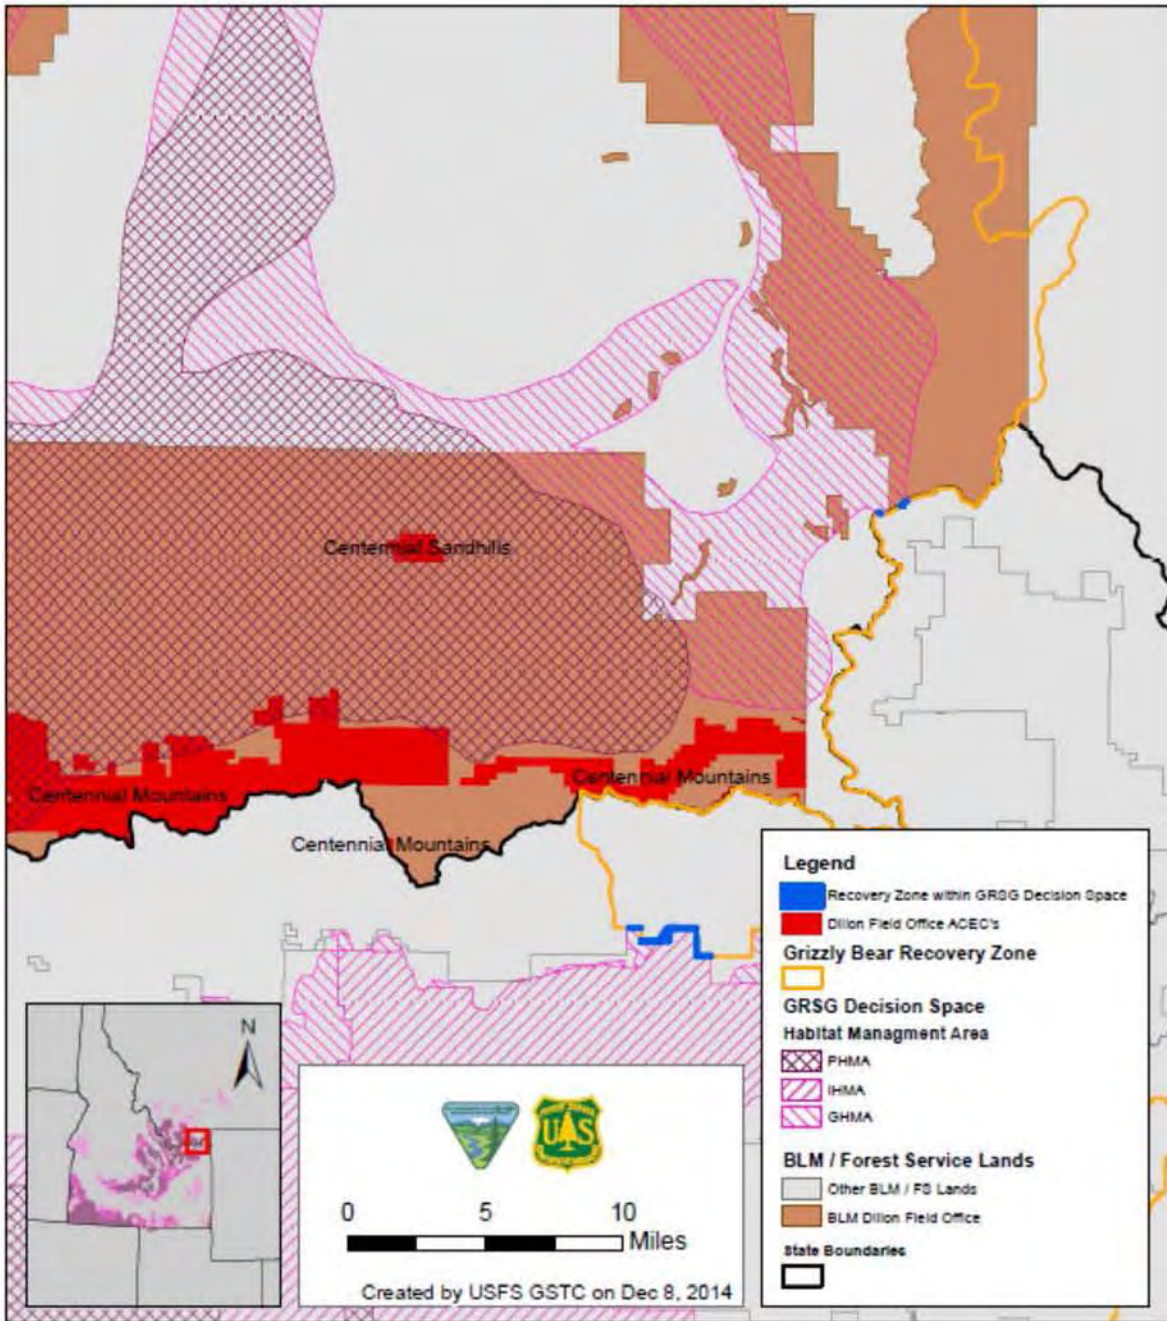

Figure 7. Centennial Mountains ACEC with respect to Idaho-Southwestern Montana Greater Sage-Grouse LUPA and EIS action area.

**Status of the Grizzly Bear on the Beaverhead-Deerlodge National Forest and Associated Management Direction**

The Forest Plan revision process occurred over an 8-year period from 2002 to 2010, with the first Record of Decision signed in January 2009, and a second Record of Decision signed in February 2010. The BDNF entered into early consultation with the Montana Field Office of the USFWS on the forest plan revision process in 2003. Consultation on the 2009 Revised Forest Plan for the Yellowstone DPS of grizzly bears was completed in August 2010.

The BDNF 2009 Revised Forest Plan incorporated the 2006 Forest Plan Amendment for Grizzly Bear Habitat Conservation for the Greater Yellowstone Area National Forests (Forest Service 2006). The 2006 Forest Plan Amendment adopted the habitat standards and other relevant provisions of the March 2003 Final Conservation Strategy for the Grizzly Bear in the Yellowstone Ecosystem (2003 Conservation Strategy). The 2006 Forest Plan Amendment encompasses the former Beaverhead National Forest, though the primary focus of the 2006 Forest Plan Amendment is on the conditions and actions that occur within the PCA of the YGBE. With the reclassification of the grizzly bear as threatened in 2009, the BDNF retained the direction of the 2006 Forest Plan Amendment and 2003 Conservation Strategy in the 2009 Revised Forest Plan. The 2006 Forest Plan Amendment and 2003 Final Conservation Strategy apply only to the area of the former Beaverhead National Forest.

Within the GRSG action area, 60,727 acres of occupied grizzly bear habitat overlap with PHMA, and 81,664 acres overlap with GHMA in the BDNF (Figure 5); there is no overlap between occupied grizzly bear habitat and IHMA on the BDNF. There is no overlap between the Grizzly Bear Recovery Zone and GRSG habitat occurring on the BDNF (Figure 6).

**Table 2. Beaverhead-Deerlodge National Forest Land and Resource Management Plan (LRMP) Grizzly Bear Habitat Conservation Goals, Standards, and Guidelines and Potential for Effect**

<b>Beaverhead-Deerlodge LRMP Direction</b>	<b>Type/Location</b>	<b>Need for Additional Analysis (Yes/No) and Rationale</b>
Manage grizzly bear habitat within the Primary Conservation Area to sustain the recovered Yellowstone grizzly bear population. Outside the Primary Conservation Area in areas identified in state management plans as biologically suitable and socially acceptable for grizzly bear occupancy, accommodate grizzly bear populations to the extent that accommodation is compatible with the goals and objectives of other uses.	Goal, Appendix G, Page 5	No: There is no overlap between the PCA (i.e., Grizzly Bear Recovery Zone) and the GRSG LUPA decision action area on the BDNF (Figure 6). In addition, GRSG LUPA goals, objectives, desired conditions, standards, or guidelines will not preclude accommodation of grizzly bear populations outside of the PCA, to the extent that accommodation is compatible with the goals and

Biological Assessment for the Idaho and Southwestern Montana Greater Sage-Grouse  
Land Use Plan Amendment and Environmental Impact Statement

<b>Beaverhead-Deerlodge LRMP Direction</b>	<b>Type/Location</b>	<b>Need for Additional Analysis (Yes/No) and Rationale</b>
		objectives of other uses.
Inside the Primary Conservation Area, maintain the percent of secure habitat in BMU subunits at or above 1998 levels. Projects that change secure habitat must follow the Application Rules.	Standard 1, Appendix G, page 5	No: There is no overlap between the PCA and the GRSG LUPA decision action area on the BDNF.
Inside the Primary Conservation Area, maintain the number and capacity of developed sites at or below 1998 levels, with the following exceptions: any proposed increase, expansion, or change of use of developed sites from the 1998 baseline in the Primary Conservation Area is analyzed and potential detrimental and positive impacts on grizzly bears are documented through a biological evaluation or assessment. Projects that change the number or capacity of developed sites must follow the Application Rules.	Standard 2 – Developed Sites, Appendix G, page 5	No: There is no overlap between the PCA and the GRSG LUPA decision action area on the BDNF.
Inside the Primary Conservation Area, do not create new active commercial livestock grazing allotments, do not increase permitted sheep animal months from the identified 1998 baseline, and phase out existing sheep allotments as opportunities arise with willing permittees.	Standard 3 – Livestock Grazing, Appendix G, page 5	No: There is no overlap between the PCA and the GRSG LUPA decision action area on the BDNF.
Coordinate with state wildlife management agencies to apply Conservation Strategy nuisance bear standards.	Standard 5 – Nuisance Bears, Appendix G, page 5	No: GRSG LUPA decision goals, objectives, desired conditions, standards, or guidelines will not preclude coordination with state wildlife management agencies to apply Conservation Strategy nuisance bear standards.
Inside the Primary Conservation Area, minimize grizzly bear/human conflicts using food storage, information and education, and other management tools.	Standard 6 – Food Storage, Appendix G, page 5	No: There is no overlap between the PCA and the GRSG LUPA decision action area on the BDNF.
Inside the Primary Conservation Area, use localized area restrictions to address conflicts with winter use activities, where conflicts	Guideline 1 – Winter Motorized	No: There is no overlap between the PCA and the GRSG LUPA decision action

Biological Assessment for the Idaho and Southwestern Montana Greater Sage-Grouse  
Land Use Plan Amendment and Environmental Impact Statement

<b>Beaverhead-Deerlodge LRMP Direction</b>	<b>Type/Location</b>	<b>Need for Additional Analysis (Yes/No) and Rationale</b>
occur during denning or after bear emergence in the spring.	Access, Appendix G, Page 5	area on the BDNF.
Inside the Primary Conservation Area, cattle allotments or portions of cattle allotments with recurring conflicts that cannot be resolved through modification of grazing practices may be retired as opportunities arise with willing permittees. Outside the Primary Conservation Area in areas identified in state management plans as biologically suitable and socially acceptable for grizzly bear occupancy, livestock allotments or portions of allotments with recurring conflicts that cannot be resolved through modification of grazing practices may be retired as opportunities arise with willing permittees.	Guideline 2 – Livestock Grazing Access, Appendix G, Page 6	<p>Inside the PCA: No. There is no overlap between the PCA and the GRSG LUPA decision action area on the BDNF.</p> <p>Outside of the PCA: Yes. GRSG LUPA decision goals, objectives, desired conditions, standards, or guidelines will not preclude retiring livestock allotments or portions of allotments outside the PCA with recurring conflicts that cannot be resolved through modification of grazing practices. In addition, GRSG LUPA decision direction that modifies livestock management practices to benefit GRSG or their habitat, including voluntary retirement of vacant allotments, could complement protection of grizzly bears and their habitat. See the effects analysis section below.</p>
Outside the Primary Conservation Area in areas identified in state management plans as biologically suitable and socially acceptable for grizzly bear occupancy, emphasize proper sanitation techniques, including food storage orders, and information and education, while working with local governments and other agencies.	Guideline 3 – Food Storage, Appendix G, Page 6	No: GRSG LUPA decision goals, objectives, desired conditions, standards, or guidelines will not preclude emphasis of proper sanitation techniques, including food storage orders, and information and education.
Inside and outside the Primary Conservation Area in areas identified in state management plans as biologically suitable and socially acceptable for grizzly bear occupancy,	Guideline 4 – Food Sources, Appendix G, Page 6	No: There is no overlap between the PCA and the GRSG LUPA decision action area on the BDNF.

Biological Assessment for the Idaho and Southwestern Montana Greater Sage-Grouse  
Land Use Plan Amendment and Environmental Impact Statement

<b>Beaverhead-Deerlodge LRMP Direction</b>	<b>Type/Location</b>	<b>Need for Additional Analysis (Yes/No) and Rationale</b>
<p>maintain the productivity, to the extent feasible, of the four key grizzly bear food sources as identified in the Conservation Strategy. Emphasize maintaining and restoring whitebark pine stands inside and outside the Primary Conservation Area.</p>		<p>The GRSG LUPA decision action area is unlikely to contain whitebark pine stands. GRSG LUPA decision goals, objectives, desired conditions, standards, or guidelines will not preclude maintenance of the productivity, to the extent feasible, of ungulates, cutthroat trout, army cutworm moths, or whitebark pine seeds.</p>

Likewise, the 2010 Biological Assessment and corresponding Biological Opinion for Effects of the Revised Land and Resource Management Plan (USFWS 2010a) for the BDNF on Grizzly Bears only applies to a portion of the BDNF. The 2010 Biological Opinion only applies to the area of the Yellowstone DPS, which encompasses the Madison, Gravelly, and Tobacco Root landscapes in their entirety and a small portion of the Jefferson River and Upper Clark Fork landscapes. The small portion of the Jefferson River and Upper Clark Fork landscapes in the Yellowstone DPS is National Forest System lands in the Highland Mountains south of and bounded by Interstate highways 15 and 90.

An additional BA was prepared in 2012 to supplement the BA prepared for the 2010 consultation on the Yellowstone DPS; new information demonstrated that grizzly bears from the NCDE and other grizzly bear ecosystems are advancing on to the northern tier of the BDNF, and the BDNF reinitiated consultation based on the new information. For purposes of reinitiation of consultation, the USFWS referred to two analysis areas on the BDNF: the Yellowstone analysis area (the area used for analysis in 2010 consultation) and the west and north analysis area (WNAA), which includes the areas of the BDNF west and north of the Yellowstone analysis area.

Grizzly bears currently occupy the southeast and northwest portions of the BDNF. The Yellowstone DPS is in the southeast portion of the BDNF, and the Madison and Gravelly mountain ranges are currently occupied by grizzly bears. To our knowledge, the Tobacco Root and Highland Mountains (also within the Yellowstone DPS) are not occupied by grizzly bears at this time (Forest Service 2012).

Grizzly bears are gradually moving south onto the BDNF from the NCDE and other grizzly bear ecosystems. At this time, it appears that grizzly bears are using the northern portions of the BDNF in the Boulder River, Clark Fork-Flints, and Upper Rock Creek landscapes (Forest Service 2012).

**The Biological Opinion (USFWS 2013b) specifies the amount or extent of take anticipated for the Yellowstone Analysis Area and WNAA of the Forest Plan:**

**First surrogate measures of incidental take - access management:**

If permanent increases in linear road density depart from conditions described in the BO (pages 79-80) over the life of the Revised Forest Plan (15 years), then the level of incidental take anticipated in the first surrogate measure of take would be exceeded, and therefore the level of take exempted would be exceeded.

GRSG LUPA decision goals, objectives, desired conditions, standards, or guidelines are not expected to result in incidental take. The decision will not authorize new roads or trails within GRSG habitat. Rather, it will generally limit them. This may benefit grizzly bears where habitat overlaps. See the effects analysis section below.

**Second surrogate measure of incidental take – temporary roads**

The Forest has estimated that 70 miles of temporary roads may be constructed across the Forest over the life of the Revised Forest Plan. If the Forest constructs more than 70 miles of temporary motorized routes over the life of the Revised Forest Plan, then the level of incidental take anticipated by the USFWS in their second surrogate measure of take would be exceeded, and the level of take exempted would be exceeded.

GRSG LUPA decision goals, objectives, desired conditions, standards, or guidelines are not expected to result in incidental take. The decision will not authorize new roads or trails within GRSG habitat. Rather, it will generally limit them. This may benefit grizzly bears where habitat overlaps. See the effects analysis section below.

**Third surrogate measure of incidental take – access management/winter motorized use**

The timeframe between the third week in March and the winter use season ending date of May 15 is the timeframe where the potential exists for interactions between snowmobiles and recently emerged female grizzly bears with cubs. This timeframe represents the third surrogate measure of incidental take anticipated as a result of the Revised Forest Plan.

GRSG LUPA decision goals, objectives, desired conditions, standards, or guidelines are not expected to result in incidental take. The decision will not authorize new roads or trails within GRSG habitat. Rather, it will generally limit them. This may benefit grizzly bears where habitat overlaps. See the effects analysis section below.

**Fourth surrogate measure of incidental take – acres of denning habitat open to snowmobiling during the life of the Revised Forest Plan**

In the Yellowstone analysis area, approximately 55,026 acres of denning habitat will be open to snowmobiling during the life of the Revised Forest Plan. In the WNAA, approximately 228,356 acres of denning habitat will be open to snowmobiling during the life of the Revised Forest Plan. These acres represent our fourth surrogate measure of the incidental take that the USFWS anticipates as a result of the Revised Forest Plan.

GRSG LUPA decision goals, objectives, desired conditions, standards, or guidelines are not expected to result in incidental take. The decision will not authorize new roads or trails within GRSG habitat. Rather, it will generally limit them. This may benefit grizzly bears where habitat overlaps. See the effects analysis section below.

**Fifth surrogate measure of incidental take - harm**

The USFWS anticipates that the fifth surrogate measures of incidental take resulting from the Revised Forest Plan in the form of harm is proportional to the number of grizzly bears that are removed or killed within the each of the analysis areas for defense of human life or property, as a result of obtaining anthropogenic food or other attractants due to inadequate storage.

GRSG LUPA decision conservation measures are not expected to result in incidental take. LUPA decision goals, objectives, desired conditions, standards, or guidelines utilized for individual projects will not preclude compliance with existing food storage order and avoidance of human/bear interaction direction.

**West and North Analysis Area (WNAA)**

Should more than one grizzly bear be killed or removed from either analysis area of the Forest at any time during for the life of the Revised Forest Plan because it has become habituated in relation to food and attractant storage, incidental take will be exceeded and the Forest must reinitiate consultation with the USFWS. Additionally, should the level of incidental take associated with food and attractant storage reach, but not exceed, the anticipated incidental take level for either area, the Forest should informally consult with the USFWS regarding the adequacy of existing mechanisms to minimize potential take.

GRSG LUPA decision conservation measures are not expected to result in incidental take. LUPA decision goals, objectives, desired conditions, standards, or guidelines used for individual projects will not preclude compliance with existing food storage order and avoidance of human/bear interaction direction.

**Sixth surrogate measure of incidental take - the number of grizzly bears that are killed within the action area as a result of livestock grazing**

The USFWS anticipates take in the form of harm to grizzly bears as a consequence of livestock grazing and the associated livestock management operation in habitats commonly used by grizzly bears. The habitat modification of adding a significant, anthropogenic food source that results in the death or injury of bears can itself be considered “take” in the form of harm. The likely depredation of some of the permitted livestock represents an impairment of natural feeding behavior that will in some cases ultimately lead to management removal or death of grizzly bears.

Should more than two grizzly bears in the Yellowstone analysis area or one grizzly bear within the WNAA be killed or removed as a result of management action related to livestock grazing within the action area during the life of the Revised Forest Plan, incidental take will be exceeded and the Forest must reinitiate consultation with the USFWS. Additionally, should the level of

incidental take associated with the Revised Forest Plan reach, but not exceed, the anticipated incidental take level, the Forest should informally consult with the USFWS regarding the adequacy of existing mechanisms to minimize potential take.

Although GRSG LUPA decision goals, objectives, desired conditions, standards, or guidelines are not expected to result in incidental take, changes in grazing management through grazing authorization modifications may be implemented when livestock management practices are determined to not be compatible with meeting or making progress towards achievable GRSG habitat objectives. Potential modifications include, but are not limited to, changes in: season or timing of use; numbers of livestock; distribution of livestock use; duration and/or level of use; kind of livestock (e.g., cattle, sheep, horses, or goats); voluntary measures such as temporary non-use; and grazing schedules. See the effects analysis section below.

### **Status of the Grizzly Bear on the Caribou-Targhee National Forest and Associated Management Direction**

Within the GRSG action area, 150 acres of occupied grizzly bear habitat overlap with IHMA on the Caribou-Targhee National Forest; there is no overlap between occupied grizzly bear habitat and PHMA or GHMA on the Caribou-Targhee National Forest (Figure 5). In addition, 92 acres of the Grizzly Recovery Zone overlap with IHMA on the Caribou-Targhee National Forest, and 2 acres of the Grizzly Recovery Zone overlap with GHMA (Figure 6).

Although portions of the Forest are within three BMUs (Henry's Lake BMU, which is divided into 2 subunits; Plateau BMU, which is divided into 2 subunits; and Bechler-Teton BMU, which is not divided into subunits), all overlap between the Caribou-Targhee National Forest, GRSG action area, and Grizzly Recovery Zone falls within the Henry's Lake BMU and Henry's Lake 1 Subunit (Figure 6).

**Targhee National Forest LRMP Direction Specific to Grizzly Bears and Potential for Effect**

<b>Targhee National Forest LRMP Direction</b>	<b>Type/Location</b>	<b>Need for Additional Analysis (Yes/No) and Rationale</b>
<b>Relevant Forestwide Standards and Guidelines - Wildlife</b>		
Problem grizzly bears will be addressed according to the IGBC nuisance bear guidelines (IGBC 1994)	General Habitat Standard, Page III-16	No: GRSG LUPA decision goals, objectives, desired conditions, standards, or guidelines will not preclude or conflict with implementation of this standard.
Habitat conditions will be sufficient to sustain a recovered population of grizzly bears	Goals – Grizzly Bear Habitat, Page III-17	Yes: There is a total of 158 acres of overlap of occupied grizzly habitat with GRSG management areas (149 acres IHMA, 9 acres GHMA) on the CTNF.
Allow for unhindered movement of bears (continuity with Yellowstone National Park and adjacent BMUs)	Goals – Grizzly Bear Habitat, Page III-17	No: There is little expected disturbance expected on the small area of overlap.
Meet recovery criteria in the current Grizzly Bear Recovery Plan	Objectives - Grizzly Bear Habitat, Page III-17	No: GRSG LUPA decision goals, objectives, desired conditions, standards, or guidelines will not conflict with meeting this objective.
Implement guidelines developed by the IGBC	Objectives - Grizzly Bear Habitat, Page III-17	No: GRSG LUPA decision goals, objectives, desired conditions, standards, or guidelines are not expected to conflict with implementation of the IGBC guidelines. Furthermore, grizzly bear habitat will be addressed at the site-specific level, and compatibility between grizzly bear guidelines and GRSG direction will be sought.
Provide safe, secure sites for nuisance bears as defined by Interagency Grizzly Bear Guidelines	Objectives - Grizzly Bear Habitat, Page III-17	No: GRSG LUPA decision goals, objectives, desired conditions, standards, or guidelines will not conflict with meeting this objective.
Achieve the road density standards in the BMUs within three years of the	Objectives - Grizzly Bear Habitat, Page III-	No: GRSG LUPA decisions will not approve new roads

activities.		
Maintain snag habitat at greater than 60 percent of the biological potential for woodpeckers.	MA 5.3.5 Ecological Processes and Patterns – Biological Elements (Wildlife) Guideline, Page III-148	No: The portion of the GRSG LUPA decision action area overlapping the Targhee NF does not include forested areas that are primary grizzly bear habitat.
Environmental analysis areas (for NEPA purposes) will be at least 7,000 acres in size.	MA 5.3.5 Ecological Processes and Patterns - Biological Elements (Wildlife) Guideline, Page III-148	No: The GRSG LUPA decision analysis area is roughly 49 million acres in size.
Long-term activities <sup>14</sup> must be concentrated in activity areas on an annual basis between April 1 and September 15. Each activity area shall not exceed 7,000 acres in size	MA 5.3.5 Ecological Processes and Patterns - Biological Elements (Wildlife) Standard, Page III-148	No: Only eighty-seven acres of important GRSG habitat and two acres of general habitat overlap with MA 5.3.5. In addition, GRSG LUPA decision timing restrictions are limited to the lekking season (March 15 – May 15), which will only slightly overlap with this direction.
Long-term activities should be concentrated in space and be of as short a duration as is practical.	MA 5.3.5 Ecological Processes and Patterns - Biological Elements (Wildlife) Guideline, Page III-148	
Long-term activity areas should generally follow ecological boundaries, watersheds, and topographic breaks. Activity areas should be distributed such that no less than 7,000 acres lie between them.	MA 5.3.5 Ecological Processes and Patterns - Biological Elements (Wildlife) Guideline, Page III-148	
Inventory, monitoring, and short-term activities <sup>15</sup> should be concentrated in time and space.	MA 5.3.5 Ecological Processes and Patterns - Biological Elements (Wildlife) Guideline, Page III-148	
Short-term management activities	MA 5.3.5 Ecological	

<sup>14</sup> Long-term activities, for purposes of this prescription, are those activities which may last more than one field season, or may be expected to recur in different areas year after year. They may occur over a larger geographic area than short-term activities. These include timber sales, firewood harvesting, prescribed burns, road reclaiming, tree thinning, and trail construction.

<sup>15</sup> Short-term activities, for purposes of this prescription, are those activities that are typically accomplished within one field season and will not necessarily recur on an annual basis. These activities generally occur over a more limited spatial extent than long-term activities. These include tree planting, trail maintenance, spraying weeds, and range maintenance activities.

Biological Assessment for the Idaho and Southwestern Montana Greater Sage-Grouse  
Land Use Plan Amendment and Environmental Impact Statement

<b>Targhee National Forest LRMP Direction</b>	<b>Type/Location</b>	<b>Need for Additional Analysis (Yes/No) and Rationale</b>
should be planned to be concentrated in one consecutive 30-day period. Exceptions should be implemented over as short a duration as is practical.	Processes and Patterns - Biological Elements (Wildlife) Guideline, Page III-149	
Management activities may take place during winter (December 15 to April 1) and shall be addressed on a case-by-case basis. The primary concern during the winter will be the changes the activity may have on habitat quality and quantity.	MA 5.3.5 Ecological Processes and Patterns - Biological Elements (Wildlife) Guideline, Page III-149	
Administrative Responsibilities - emergency cessation or modification of activities will occur when those activities are in conflict with grizzly bear management objectives. Scheduled activities will not occur during the season of bear use in areas where foraging opportunities are limited in their availability, in area, or time.	MA 5.3.5 Ecological Processes and Patterns - Biological Elements (Wildlife) Standard, Page III-149	No: Only 87 acres of IHMA and 2 acres of GHMA overlap with MA 5.3.5. Therefore, it is unlikely that GRSG LUPA decision goals, objectives, desired conditions, standards, or guidelines will conflict with grizzly bear management objectives. However, LRMP consistency will be determined and addressed for site-specific proposals.
Please refer to Table in LRMP stating season, type of access (pedestrian; horse/pack stock; mountain bike; motorized, by type), cross-country travel (yes/no/n/a), and road and trail travel (yes/no).	MA 5.3.5 Forest Use and Occupation - Access Standard. Page III-149	No: GRSG LUPA decision goals, objectives, desired conditions, standards, or guidelines will not authorize new types of access or change existing access.
New or relocated roads should meet the following guidelines: 1. Avoid high quality (such as whitebark pine habitat) grizzly bear habitat 2. Minimize sight lines on temporary roads and skid trails 3. Revegetate temporary roads following use 4. Follow minimum required construction standards	MA 5.3.5 Forest Use and Occupation – Roads Guideline. Page III-149	No: The GRSG LUPA decision will not approve new roads within GRSG habitat. Rather, it will generally limit them. In addition, the portion of the GRSG action area overlapping the Targhee NF does not include forested areas.
Motorized administrative use on restricted roads and restricted	MA 5.3.5 Forest Use and Occupation -	No: GRSG LUPA decision goals, objectives, desired

Grizzly Bear-Themed Prescriptions

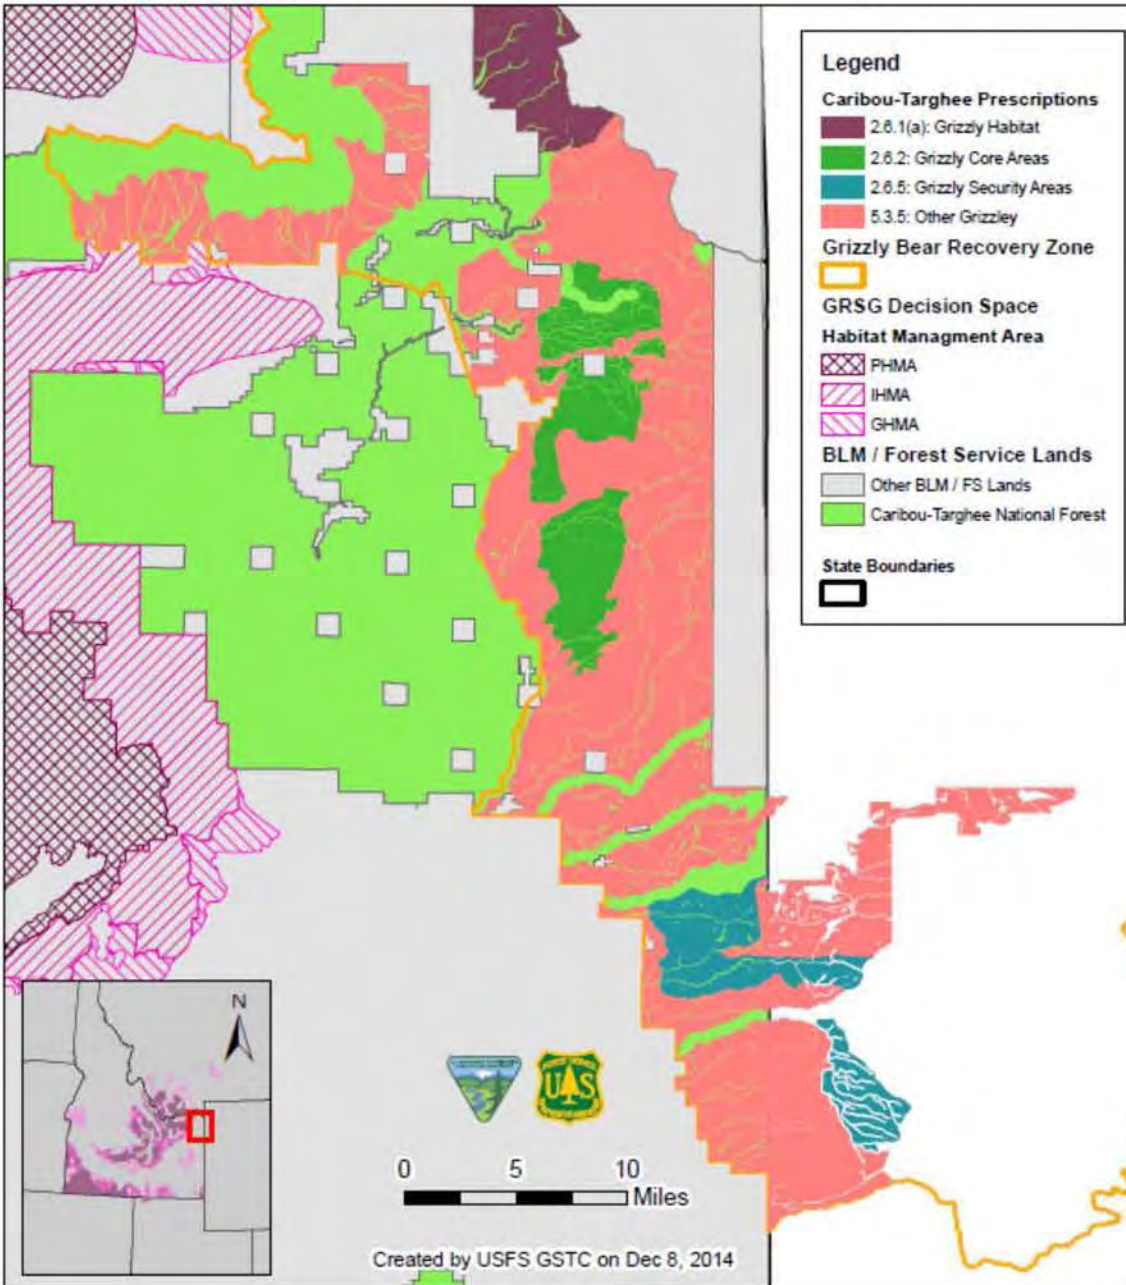

Figure 9. Caribou-Targhee National Forest LRMP grizzly bear-themed prescriptions with respect to Idaho-Southwestern Montana GRSG LUPA and EIS action area.

### **2007 Conservation Strategy Direction**

The following direction only applies to the portions of the action area within the PCA.

#### **Secure Habitat Standard**

The percent of secure habitat within each bear management subunit must be maintained at or above levels that existed in 1998. Application rules, criteria, and definitions are provided in the Conservation Strategy on pages 39-42 and will not be repeated here. According to the application rules for secure habitat, activities that do not require road construction, reconstruction, opening a permanently restricted road, or recurring helicopter flight lines at low elevation do not detract from secure habitat. Examples of such activities include thinning, tree planting, prescribed fire, trail maintenance, and administrative studies/monitoring. Activities should be concentrated in time and space to the extent feasible to minimize disturbance. There is no road construction, reconstruction, opening a permanently restricted road, or recurring helicopter flight lines at low elevation associated with this project. Therefore, this project meets all of the direction for maintaining secure habitat.

The Conservation Strategy provides the following information with regard to access conditions and secure habitat in several BMUs on the Forest: “Several other subunits were listed as needing improvement in the 2000 Draft Conservation Strategy (Plateau #1, Plateau #2, and Henry’s Lake #1). The draft stated that upon full implementation of the access management changes in the revised Targhee Forest Plan, those subunits will be acceptable for mean open motorized access route density, total motorized access route density, and secure habitat. Those access management changes have been fully implemented and those subunits are no longer identified as having potential for improvement. This is due to road decommissioning that was completed following the signing of the 1997 revised Targhee Forest Plan and the 1999 FEIS for the Targhee Travel Plan (Open Road and Open Motorized Trail Analysis (motorized road and trail travel plan).”

#### **Developed Site Standard**

The number and capacity of developed sites within the PCA will be maintained at or below the 1998 level with some following exceptions. The GRSG LUPA decision will not authorize construction of developed sites although it will place limitations on construction of new sites. Please see the effects analysis section below.

#### **Food Storage Order Standard**

GRSG LUPA decision goals, objectives, desired conditions, standards, or guidelines are not expected to preclude compliance with the food storage order; therefore, no additional analysis is necessary at this time.

### **Livestock Allotment Standard**

Inside the PCA, no new active commercial livestock grazing allotments will be created, and there will be no increases in permitted sheep Animal Months (AMs) from the identified 1998 baseline.

The GRSG LUPA decision will not authorize livestock grazing. However, changes in grazing management through grazing authorization modifications may be implemented when livestock management practices are determined to not be compatible with meeting or making progress towards achievable GRSG habitat objectives. Potential modifications include, but are not limited to, changes in season or timing of use; numbers of livestock; distribution of livestock use; duration and/or level of use; kind of livestock (e.g., cattle, sheep, horses, or goats); voluntary measures such as temporary non-use; and grazing schedules. Therefore, additional analysis is necessary and provided below.

### **Four Key Food Sources**

Four seasonal foods have been identified as being important to the grizzly bear population: winter killed ungulates, spawning cutthroat trout, seeds of whitebark pine, and alpine moth aggregation sites. The action area has none of these four seasonal foods. Therefore, the project will have no effect on these four seasonal foods, and project activities will not prevent grizzly bears from having access to these four seasonal foods that exist in other areas of the ecosystem.

### ***Life History***

Grizzly bears are in the family *Ursidae*. Grizzly bears are generally larger than black bears and can be distinguished by having longer front foot claws (2 to 4 inches), a distinctive shoulder hump, rounded ears that are proportionately smaller than the black bear, and a dished-in profile between the eyes and end of the snout. Pelage coloration is highly variable, ranging from light brown to nearly black. Guard hairs are often paled at the tips and give the bear a grizzled appearance. Spring shedding, new growth, nutrition, and climate all influence coloration.

Grizzly bears are generally larger than black bears, with longer, curved claws, distinctive humped shoulders, and a concave face. Pelage coloration is variable. In the continental US, male grizzly bears average 400 to 600 pounds and females average 250 to 300 pounds. An occasional male may attain 800 to 1,000 pounds. Adults stand 3.5 to 4.5 feet at the hump and rear up to more than 8 feet on their hind legs.

In the continental US, the average adult male grizzly bear weighs between 400 to 600 pounds, and the average female weighs between 250 to 350 pounds. Grizzly bears are long-lived, and many individuals live over 20 years. Adult bears are individualistic in behavior and normally are solitary wanderers. Females with cubs and bears defending food supplies are common causes of confrontation between humans and bears.

Home ranges of adult bears may overlap. The home ranges of adult male grizzly bears are generally two to four times larger than those of adult females. The home ranges of females are smaller while they have cubs but increase when the cubs become yearlings. Home ranges vary in

relation to food availability, weather conditions, and interactions with other bears. Home ranges are larger in the GYE compared to the more productive habitats in the northern ecosystems.

The age of first reproduction and litter size varies and may be related to the nutritional state of the female bear. The age at first reproduction averages 5.5 years and ranges from about 3.5 to 8.5 years. Reproductive intervals for females average 3 years, and litter size averages 2 cubs (1 to 4 cubs per litter). The limited reproductive capacity of grizzly bears precludes rapid increases in population. Grizzly bears have one of the lowest reproductive rates among terrestrial mammals. During a female's lifetime, if she has litters of two cubs with a 50:50 sex ratio, and a 50 percent survivorship of young to age 5.5 years, at best a breeding female can replace herself with one other breeding age female in the first decade of her life.

Adult bears are normally solitary except for breeding and while the female cares for cubs. The young will stay with the female for approximately two years. Siblings may stay together for several years after being weaned.

Grizzly bears excavate dens as early as September or prior to entry in November. Dens are usually dug on steep slopes where wind and topography cause an accumulation of deep snow and where snow is unlikely to melt during warm periods. Dens are generally found at high elevations well away from human activity and development.

Grizzly bears are opportunistic feeders and will prey or scavenge on almost any available food. Plants with high crude protein content and animal matter are the most important food items. The search for food has a prime influence on grizzly bear movements. Upon emergence from the den grizzlies move to lower elevations, drainage bottoms, avalanche chutes, and ungulate winter ranges where their food requirements can be met. Throughout spring and early summer grizzly bears follow plant phenology back to higher elevations. In late summer and fall, there is a transition to fruit and nut sources, as well as herbaceous materials. This is a generalized pattern, and it should be noted that bears will go where they can best meet their food requirements.

The grizzly bear has a broad range of habitat tolerance. Occupied habitat is generally characterized as contiguous, relatively undisturbed mountainous habitat with considerable topographic and vegetative diversity. Historical declines are related to habitat loss and human-caused mortality.

The management of human use levels through access route management is one of the most powerful tools available to balance the needs of grizzly bears with the activities of humans. Secure habitat for grizzly bears is accomplished through managing access routes at low levels.

## **Threats**

Historical declines are related to habitat loss and direct and indirect human-caused mortality (USFWS 1993). Human-caused mortality can be classified into six major categories: 1) direct human/bear confrontations (hikers, backpackers, photographers, hunters, etc.); 2) attraction of grizzly bears to improperly stored food and garbage associated with towns, subdivisions, farms, hunter camps, campers, etc.; 3) careless livestock husbandry, including the failure to dispose of dead livestock in a manner that minimizes grizzly interactions; 4) protection of livestock; 5) loss of grizzly bear habitat for economic values; and 6) lawful and illegal hunting. The first five reduce space and increase the potential for human/bear conflicts (USFWS 1993). Reducing grizzly bear/human conflicts and grizzly bear/livestock conflicts have been important management goals in the Yellowstone recovery area.

## **B. Plants**

### **Slickspot peppergrass (*Lepidium papilliferum*)**

#### ***Habitat Description***

Slickspot peppergrass occurs in close association with slickspots. These are visually distinctive openings characterized by natric soils and distinct clay layers. They tend to be highly reflective and relatively light in color, making them easy to detect on the landscape. Slickspots are distinguished from the surrounding sagebrush matrix as having the following characteristics: microsites where water pools when rain falls; sparse native vegetation, distinct soil layers with a columnar or prismatic structure, higher alkalinity and clay content, and natric properties; and reduced levels of organic matter and nutrients due to lower biomass production (Fisher et al. 2006). Slickspots have a smooth, pan-like surface that is structureless and slowly permeable when wet but moderately hard and cracked when dry (Fisher et al. 2006). Most slickspots are between 10 and 20 square feet in size. Slickspot peppergrass has infrequently been documented outside of slickspots on disturbed soils, such as along graded roadsides and badger mounds. These are rare observations, and the vast majority of plants are found within slickspots.

The native, semiarid sagebrush-steppe habitat of southwestern Idaho where slickspot peppergrass is found can be divided into two plant associations: Wyoming big sagebrush-Thurber's needlegrass and Wyoming big sagebrush-bluebunch wheatgrass habitat types (Moseley 1994). Menke and Kaye (2006) describe high-quality matrix habitat conditions for slickspot peppergrass as sagebrush-steppe habitat in late seral condition, and Fisher et al. (1996) note that "habitat with vigorous slickspot peppergrass populations has not been recently burned, is not heavily grazed, has an understory of native bunchgrasses, and a well-developed microbotic soil crust." Moseley (1994) suggests that slickspot peppergrass serves as an indicator species for the health of the sagebrush-steppe ecosystem in the western Snake River Plain.

A well-developed microbotic soil crust (also known as a biological soil crust) is one component of quality habitat for slickspot peppergrass. Such crusts are commonly found in semiarid and arid ecosystems and are formed by living organisms, primarily bryophytes, lichens, algae, and

cyanobacteria, that bind surface soil particles together (Moseley 1994). Biological soil crusts play an important role in stabilizing the soil and preventing erosion, increasing the availability of nitrogen and other nutrients, and regulating water infiltration and evaporation levels. In addition, an intact biological soil crust appears to aid in preventing the establishment of invasive plants (Brooks and Pyke 2001). These crusts are sensitive to disturbance that disrupt crust integrity, such as compression due to livestock trampling or off highway vehicle use, and are subject to damage by fire.

### *Status and Distribution*

Slickspot peppergrass was listed as a threatened species under the ESA of 1973, as amended, in October 2009 (USFWS 2009a). On August 8, 2012, the United States District Court for the District of Idaho ordered that the final rule listing slickspot peppergrass as a threatened species be vacated and remanded for further consideration consistent with the court's decision. On February 12, 2014, the USFWS published a Federal Register notice that addressed the Court's request that a specific definition of foreseeable future for slickspot peppergrass be provided. In addition, the USFWS proposed that threatened status be reinstated for slickspot peppergrass under the ESA. A final decision on the USFWS's proposal to reinstate slickspot peppergrass as threatened under the ESA is anticipated in 2015.

Slickspot peppergrass is restricted to small slickspot microsites on the Boise Foothills, Snake River Plains, and Owyhee Plateau physiographic regions, from southern Payette County, northwest of Caldwell, to near Glenn's Ferry, and southward to a disjunct population around Juniper Butte in southwestern Owyhee County. It occurs on the Four Rivers and Jarbidge Field Offices, and is not suspected to occur on any other BLM field offices or on national forests.

### *Habitat category definitions and mapped distribution*

Six slickspot peppergrass habitats are defined in the 2014 slickspot peppergrass Conservation Agreement (BLM 2014). Four of those habitat categories are used in this analysis to estimate the proportions of slickspot peppergrass and its habitats that would be affected by the proposed LUPA. The habitat category definitions are:

- Element occurrences: Areas where slickspot peppergrass exists and has been documented or identified as an element occurrence. Element occurrences are defined by grouping occupied slickspots that occur within 1 kilometer of each other; all occupied slickspots within a 1-kilometer distance of another occupied slickspot are aggregated into a single element occurrence.
- Occupied habitat: Occurrences plus the area generally within a 0.5-mile buffer around the occurrences that is important to maintain or improve habitat integrity and pollinator populations necessary for species conservation. As currently mapped, these areas may or may not contain additional slickspots, slickspot peppergrass plants, or non-habitat beyond the included occurrence areas. Further refinement of occupied habitat may be accomplished through field surveys considering existing resource conditions as well as specific habitat quality and integrity.
- Potential habitat: Areas within the known range of slickspot peppergrass that have certain general soil and elevation characteristics that indicate the potential for the area to support

slickspot peppergrass, although the presence of suitable slickspots or the plant is unknown. These currently mapped areas meet the following criteria:

- Natric and natric-like soils forming “slickspots” and associated soil series, or phases thereof, which support Loamy 7- to 10-inch and 10- to 13-inch Wyoming big sagebrush ecological sites (Major Land Resource Areas 11-Snake River Plains, and 25-Owyhee High Plateau) and have a aridic bordering on xeric soil moisture regime; and
- 2,200 to 5,400 feet elevation.
- Slickspot peppergrass habitat: Potential habitat areas with Wyoming big sagebrush ecological sites that through Stage 1 surveys have documented slickspot microsites (natric and natric-like soil types) within 2,200 feet and 5,400 feet elevation in southwest Idaho. Slickspot peppergrass habitat includes areas with slickspots of unknown occupancy and in some cases may be dominated by nonnative vegetation such as annual grasses or crested wheatgrass. In addition, to maintain ecological continuity, if there is less than 0.5 mile between areas defined as slickspot peppergrass habitat, then the entire area is considered slickspot peppergrass habitat. Surveyed potential habitat not meeting these criteria will no longer be considered habitat for slickspot peppergrass.

Initial slickspot peppergrass habitat mapping of the above categories has been done. Results of Stage 1 field surveys of modeled potential habitat in 2012 have indicated that no suitable slickspots occur on the Bruneau Field Office because the slickspots observed there have different clay layers, more rock armoring, and a flatter shape than slickspots occupied by slickspot peppergrass (BLM 2012). Slickspot peppergrass habitat has been initially evaluated in Stage 1 surveys for the Four Rivers Field Office, resulting in some areas of previously mapped slickspot peppergrass potential habitat being determined to be slickspot peppergrass habitat. There is no available information at this time on the extent of slickspot peppergrass habitat on the Jarbidge Field Office, so its potential habitat areas remain classified as slickspot peppergrass potential habitat.

Overlap between the currently known habitat categories and GRSG habitats (PHMA, IHMA, and GHMA) has been identified. Within GRSG HMAs influenced by the currently proposed LUPA (lands on which BLM or Forest Service have decision authority), there are no occurrences, critical habitat, occupied habitat, or potential habitat on Forest Service lands. Where BLM has decision authority on lands overlapping GRSG HMAs, 646 acres of element occurrences are on the Four Rivers Field Office and 614 acres of element occurrences are on the Jarbidge Field Office, but 10,428 acres (89 percent) do not overlap GRSG HMAs at all. For slickspot peppergrass occupied habitat within GRSG HMAs on BLM-administered lands, 5,568 acres are on the Four Rivers Field Office and 55,301 acres are on the Jarbidge Field Office, leaving 64,196 acres (51 percent) outside GRSG HMAs. Slickspot peppergrass potential habitat on BLM-administered lands within GRSG HMAs occurs on 250 acres on the Four Rivers Field Office and 283,717 acres on the Jarbidge Field Office, leaving 405,661 acres (59 percent) outside GRSG HMAs. Finally, the areas identified as slickspot peppergrass habitat on BLM-administered lands are all on the Four Rivers Field Office, with 40,823 acres in GRSG HMAs, leaving the remaining 190,375 acres (82 percent) outside GRSG HMAs.

### *Life History*

Slickspot peppergrass is a tap-rooted annual or biennial plant, averaging 2 to 8 inches, but occasionally reaching 16 inches high. The species flowers once and then dies. The annual form of the plant flowers, sets seed, and dies in one growing season. The biennial form initiates growth in the first year as a vegetative rosette but does not flower until the second growing season. Biennial rosettes must survive generally dry summer conditions, and consequently many die before flowering and producing seed. Although annual forms generally outnumber biennials (Moseley 1994), they produce fewer seeds than the biennials (Meyer et al. 2005). The proportion of annuals versus biennials in a population can vary greatly from year to year, as can the presence of any plants at all. Although the low permeability of slickspots appears to help hold moisture (Moseley 1994), once the thin crust dries out, slickspot peppergrass seedling survival depends on their ability to extend taproots into the argillic horizon (soil layer with high clay content) to extract moisture from the deeper natric zone.

Although slickspot peppergrass is able to self-pollinate, it is primarily an outcrossing species requiring pollen from separate plants for more successful seed production. Known slickspot peppergrass pollinators include several families of bees, beetles, flies, and other insects (Robertson and Klemash 2003).

## Idaho / SW Montana Greater Sage-grouse EIS Slickspot Peppergrass Occurrence, Proposed Critical Habitat, and Confirmed/Occupied/Potential Habitat

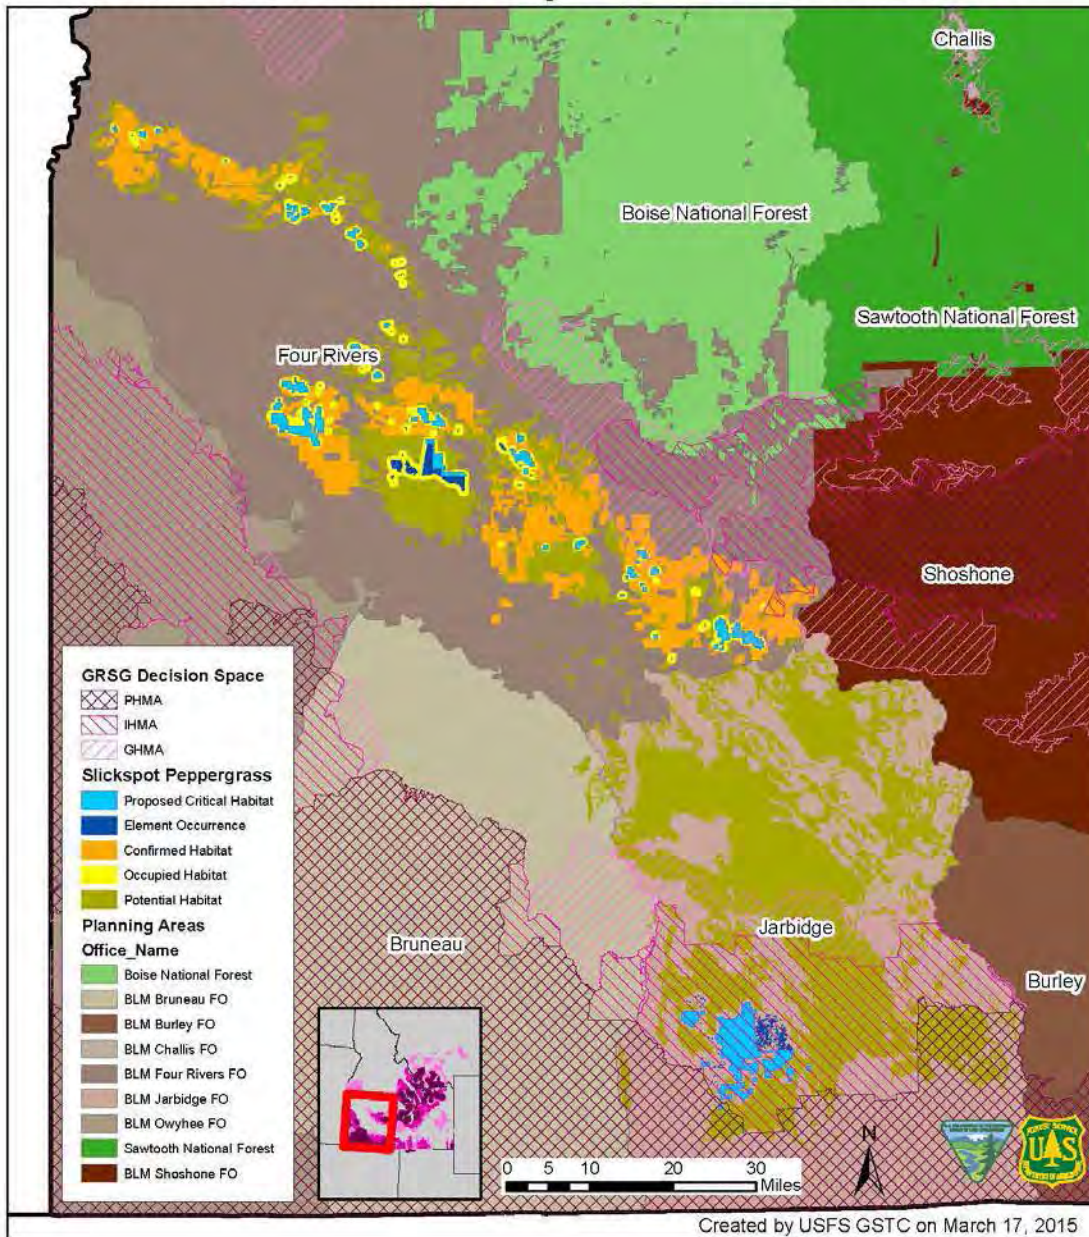

Figure 10. Slickspot peppergrass habitat categories and GRSG HMAs

### Threats

The primary threat to slickspot peppergrass is the present or threatened destruction, modification, or curtailment of its habitat and range due to the increased frequency and extent of wildfires under a fire regime modified and exacerbated by the spread of invasive plants, particularly nonnative annual grasses such as cheatgrass. Other threats include human development, potential seed predation by harvester ants, and habitat fragmentation and isolation of small populations (USFWS 2009a). The threats of urban and rural development, agriculture, and infrastructure development are more substantial in the Boise Foothills and Snake River Plains regions, while very little of this development has happened in the Owyhee Plateau region (where most of the overlap with GRSG habitat occurs). Additional impacts on slickspot peppergrass habitat can result from livestock grazing, off-highway vehicle use, and infestation of habitats by nonnative invasive species and potentially invasive plants such as intermediate wheatgrass and forage kochia, which are sometimes proposed for use in vegetated fuel breaks.

### Slickspot Peppergrass Proposed Critical Habitat

Critical habitat was proposed for the slickspot peppergrass on May 10, 2011, and the specific areas were revised in February 2014 (USFWS 2014a). The PCEs for slickspot peppergrass (USFWS 2011) include the following:

1. Ecologically functional microsites or “slickspots” that are characterized by:
  - a. A high sodium and clay content and a three-layer soil horizonation sequence, which allows for successful seed germination, seedling growth, and maintenance of the seed bank. The surface horizon consists of a thin, silty, vesicular, pored (small cavity) layer that forms a physical crust (the silt layer). The subsoil horizon is a restrictive clay layer with an abrupt boundary with the surface layer that is natric or natric-like in properties (a type of argillic (clay-based) horizon with distinct structural and chemical features) (the restrictive layer). The second argillic subsoil layer (that is less distinct than the upper argillic horizon) retains moisture through part of the year (the moist clay layer); and
  - b. Sparse vegetation with low to moderate introduced invasive, nonnative plant species cover.
2. Relatively intact, native *Artemisia tridentata* ssp. *wyomingensis* (Wyoming big sagebrush) vegetation assemblages, represented by native bunchgrasses, shrubs, and forbs, within 250 meters of *Lepidium papilliferum* element occurrences to protect slickspots and *Lepidium papilliferum* from disturbance from wildfire, slow the invasion of slickspots by nonnative species and native harvester ants, and provide the habitats needed by *L. papilliferum*'s pollinators.
3. A diversity of native plants whose blooming times overlap to provide pollinator species with sufficient flowers for foraging throughout the seasons and to provide nesting and egg-laying sites; appropriate nesting materials; and sheltered, undisturbed places for hibernation and overwintering of pollinator species. In order for genetic exchange of *Lepidium papilliferum* to occur, pollinators must be able to move freely between slickspots. Alternative pollen and nectar sources (other plant species within the surrounding sagebrush vegetation) are needed to support pollinators during times when

Biological Assessment for the Idaho and Southwestern Montana Greater Sage-Grouse  
Land Use Plan Amendment and Environmental Impact Statement

*Lepidium papilliferum* is not flowering, when distances between slickspots are large, and in years when *L. papilliferum* is not a prolific flowerer.

4. Sufficient pollinators for successful fruit and seed production, particularly pollinator species of the sphecid and vespidae wasp families, species of the bombyliid and tachinid fly families, honeybees, and halictid bee species, most of which are solitary insects that nest outside of slickspots in the surrounding sagebrush-steppe vegetation, both in the ground and within the vegetation.

The distribution of land ownership in the full extent of slickspot peppergrass proposed critical habitat is presented in the table below, and the extent of slickspot peppergrass proposed critical habitat in relation to GRSG habitats (priority, important, and general HMAs) is represented in Figure 11. About 50 percent of the proposed critical habitat (30,625 of 61,311 acres) is within GRSG habitats on BLM-administered lands. The majority of this overlap (27,523 acres IHMA and 194 acres PHMA) occurs in the Jarbidge Field Office near Juniper Butte, and the remainder of the overlap (2,908 acres GHMA) occurs in the Four Rivers Field Office between Mountain Home and Glenn's Ferry.

**Table 7. Slickspot peppergrass proposed critical habitat land ownerships**

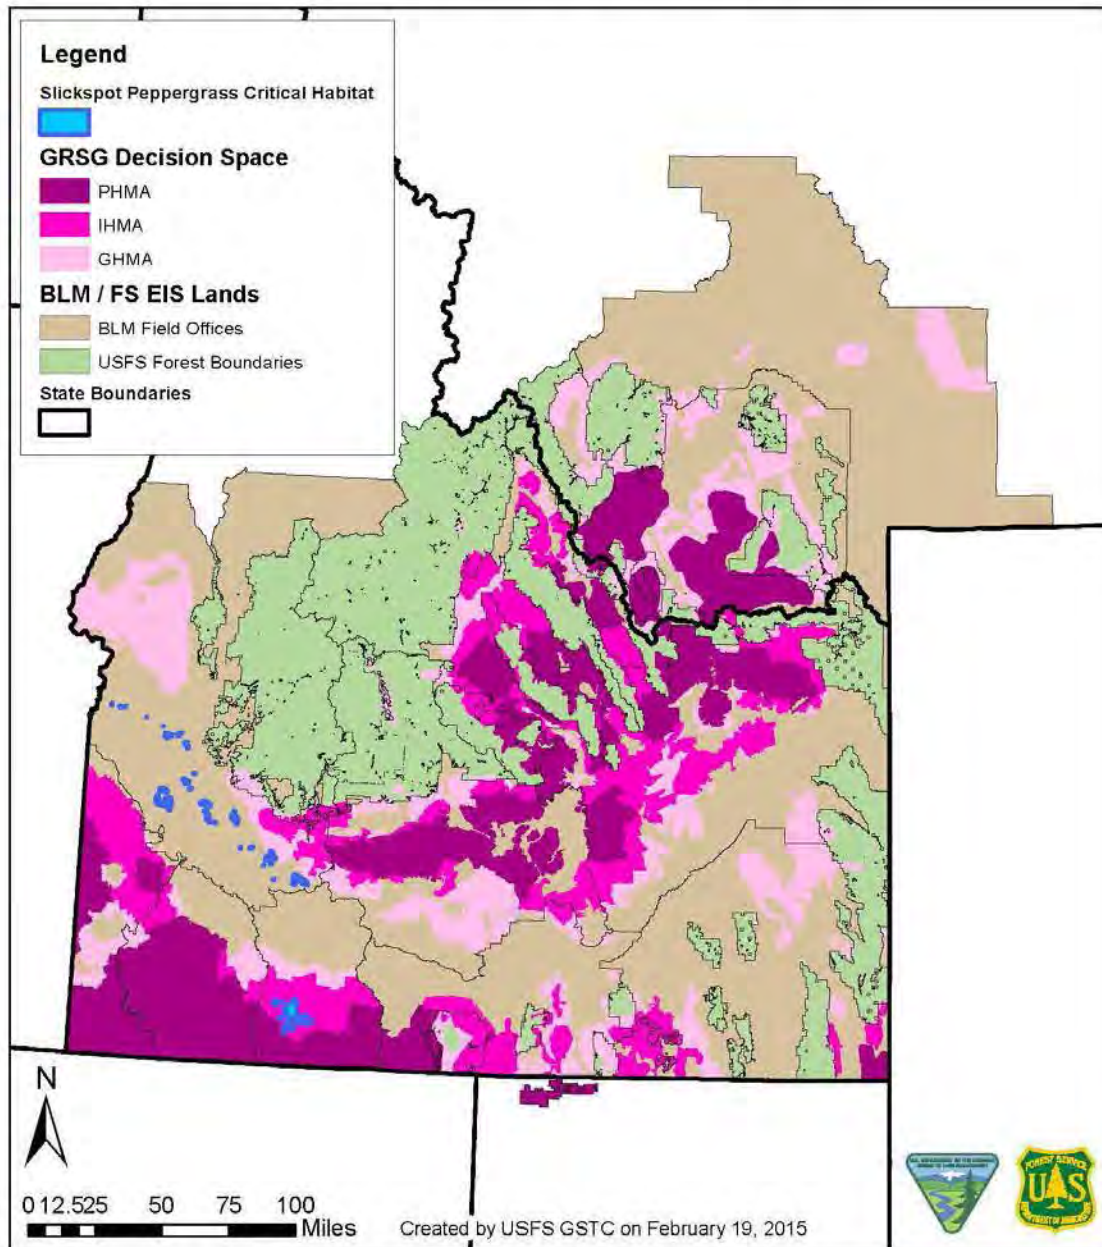

Ownership	Acres
Bureau of Land Management	52,533
Bureau of Reclamation	366
Private	3,771
State of Idaho	4,641
<b>TOTAL</b>	<b>61,311</b>

The table below displays the acreage of slickspot peppergrass proposed critical habitat in relation to GRSG HMAs.

## Idaho / SW Montana Greater Sage-grouse EIS Slickspot Peppergrass Proposed Critical Habitat

**Figure 11. Slickspot peppergrass proposed critical habitat with respect to Idaho-Southwestern Montana GRSG LUPA and EIS action area.**

## **Ute ladies'-tresses (*Spiranthes diluvialis*)**

### ***Habitat Description***

When Ute ladies'-tresses was listed in 1992, it was known primarily from moist meadows associated with perennial stream terraces, floodplains, and oxbows at elevations between 4,300 and 6,850 feet (USFWS 1992). Surveys since 1992 have expanded the number of vegetation and hydrology types occupied by Ute ladies'-tresses to include seasonally flooded river terraces, subirrigated or spring-fed abandoned stream channels and valleys, and lakeshores (USFWS 2014d). This species was originally thought to be limited to undisturbed riparian habitats but is now known to occur in agricultural lands and managed riparian systems where frequent human-influenced disturbance events such as mowing, prescribed fire, and livestock grazing can simulate natural early to mid-seral conditions (Fertig et al. 2005). Additional populations have been discovered along irrigation canals, berms, levees, irrigated meadows, excavated gravel pits, roadside barrow pits, reservoirs, and other human-modified wetlands. Currently, the known elevation range of the species is from 720 to 7,000 feet (USFWS 2014d).

### ***Status and Distribution***

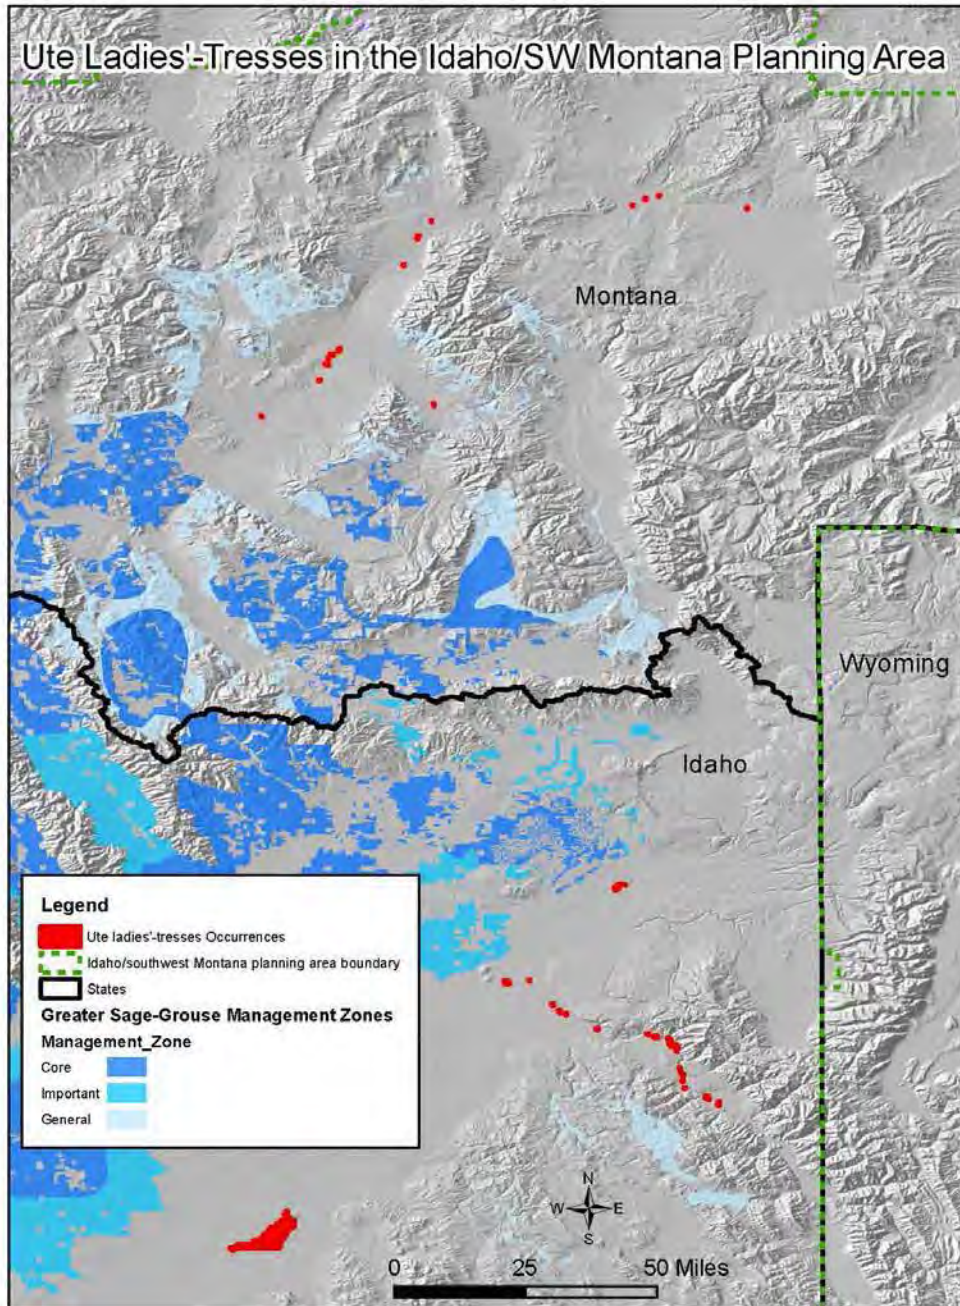

Ute ladies'-tresses was listed as threatened in 1992. In 2004, the USFWS issued a petition to delist the species and initiate a 5-year review (USFWS 2004b). The associated status review is ongoing. When first listed, the species was known only from Colorado, Nevada, and Utah, but additional populations have since been discovered in Idaho, Montana, Nebraska, Washington, and Wyoming.

### ***Populations and Habitat within the Analysis Area***

Figure 12 shows the known populations of Ute ladies'-tresses in the analysis area. In Montana, Ute ladies'-tresses grows along major river drainages on private and state lands in Beaverhead, Broadwater, Gallatin, Jefferson, and Madison Counties. The nearest occurrence to GRSG HMAs in Montana is over 2 miles from the GHMA, in Madison County.

In Idaho, this species is found along major river drainages in the eastern portion of the state (Bingham, Bonneville, Fremont, Jefferson, and Madison Counties). Some populations are found on BLM and Forest Service lands (Dillon, Pocatello, and Upper Snake Field Offices, and Caribou-Targhee National Forest), but none are within GRSG HMAs. The closest known location is over 0.6 mile from the IHMA, in Fremont County.

Although the extent and specific locations are not known, it is likely that some areas of suitable habitat for Ute ladies'-tresses do exist within GRSG HMAs because some wetland habitats are included. The areas most likely to support populations (riparian areas along major river drainages) have mostly been excluded from GRSG HMAs.

**Figure 12. Ute ladies'-tresses occurrences within the Idaho-Southwestern Montana GRSG LUPA and EIS action area.**

*Life History*

Ute ladies'-tresses is a long-lived perennial forb that probably reproduces exclusively by seed (USFWS 2014d). As with other orchid species, Ute ladies'-tresses seeds are microscopic, dust-like, and readily dispersed by wind or water. It is hypothesized that germinated seedlings must quickly establish a symbiotic relationship with mycorrhizal soil fungi in order to survive. The absence or rarity of appropriate fungal symbionts in the soil may be a major factor limiting the establishment of new Ute ladies'-tresses populations. New vegetative shoots are produced in October and persist through the winter as small rosettes. These resume growth in the spring and develop into short-stemmed, leafy, photosynthetic plants. Depending on site productivity and conditions, vegetative shoots may remain in this state all summer or develop inflorescences. Vegetative individuals die back in the winter to subterranean roots or persist as winter rosettes. Across its range, Ute ladies'-tresses blooms from early July to late October. Flowering typically occurs earlier in sites that have an open canopy and later in well-shaded sites. Bees are the primary pollinators of Ute ladies'-tresses, particularly solitary bees in the genus *Anthophora*, bumblebees (genus *Bombus*), and occasionally nonnative honeybees (*Apis mellifera*) (Sipes and Tepedino 1995). Of these species, *Anthophora terminalis* is apparently the most effective pollinator.

### **Threats**

Threats to Ute ladies'-tresses include competition from invasive species, vegetation succession, construction, hydrologic changes, grazing, recreation, urbanization, flooding, haying/mowing, natural herbivory, loss of pollinators, and drought (Fertig et al. 2005). General threats present in 1992 (habitat loss and modification, overcollection, competition from exotic weeds, and herbicides) continue to exist, but competition from invasive plants, vegetative succession, changes in hydrology (through flood control and dewatering), habitat disturbance associated with road construction, and impacts from recreation (mostly from camping and foot traffic) are now the most widespread potential threats (Fertig et al. 2005). Off-road vehicles are identified as a threat to several occurrences along the Snake River in Idaho (Fertig et al. 2005).

## **GENERAL DISCUSSION OF POTENTIAL IMPACTS AND MECHANISMS OF PROGRAM AREAS WITH RESPECT TO PLANTS**

### **Actions Evaluated and General Effects**

Because the proposed LUPAs do not propose any specific ground-disturbing actions, there would be no direct effects to any threatened, endangered, or proposed species (listed species). The environmental baseline is set by the existing conditions, including the current authorized activities and programs already analyzed and for which there has been consultation within the jurisdiction of each LUP. Various activities, including grazing, mining, recreation, travel management, invasive species control, and others, are already analyzed at the LUP level. Each activity may also have been assessed for environmental impacts through project-level, site-specific NEPA analysis. Examples of these are Allotment Management Plans, Noxious Weed Control Plans, or Travel Management Plans. All of the associated conservation measures concerning listed species would still be valid. Because existing LUP programs have already gone through Section 7 consultations, only the additional effects associated with the GRS G LUPAs are addressed in this analysis.

Programmatic plans are considered permissive in that they allow but do not authorize or approve any site-specific projects or actions. They are much like zoning ordinances under which future

decisions are made. Decisions at the LUP level establish goals and objectives, identify the types of activities that are allowed or prohibited in specific areas, may specify management standards and minimum habitat condition goals either unit wide or for specific areas, and may establish a monitoring and evaluation program. This BA does not analyze site-specific actions. Effects determinations made in this document should not be assumed to relate to site-specific projects. In the future, during project-level environmental planning and analysis, site-specific actions will continue to be analyzed to identify possible effects on listed species. Site-specific analysis of such actions may identify potential effects on listed species even when this programmatic assessment determines no effect. As part of any future project-level environmental analysis, specific conservation measures and strategies to alleviate any potential adverse effects may be developed as the details of the future proposed actions become available.

The proposed actions were evaluated for possible indirect effects on listed plants. Many of the amendment actions are restrictive of anthropogenic disturbances for the benefit of GRSG, reducing the potential impacts from various activities on GRSG and its habitat. Some examples of restrictive actions are to not construct new recreation facilities (e.g., campgrounds, trails, trailheads, staging areas) within PHMA and IHMA unless the development would have a net conservation gain to GRSG habitat (BLM REC-2 and FS GRSG-R-GL-002-Guideline), to not approve new site authorizations for salable minerals in PHMA (BLM SAL-1), to not exceed a 3 percent disturbance cap within the biologically significant unit (BLM AD-1 and FS GRSG-GEN-ST-001-Standard), and all of the energy and minerals conservation measures. No adverse effects on listed plants are expected from these types of actions because these restrictive measures would only reduce potential impacts on GRSG habitats, and these same measures may also benefit listed plants by reducing the likelihood of potential impacts in those areas. However, these possible beneficial effects would occur in the future as individual projects are proposed or leases and permits are reissued, and so the effects would not be contemporaneous with the LUPAs, and are not considered in this analysis.

Many other proposed management actions for GRSG establish guidance for resource management planning and establish priority and emphasis for sound GRSG habitat management. One example is stated in BLM WFS-6: *Suppression priorities: Firefighter and public safety followed by property are the highest priority for protection during suppression activities. Maintaining GRSG habitat will be prioritized immediately after human life and property, commensurate with threatened and endangered species habitat or other critical habitats to be protected.* This is an action that prioritizes the implementation of an existing program. T&E species already have a priority for protection in wildfire suppression below firefighter and public safety and property protection. This measure says to include GRSG (currently a candidate species) at the same priority level as T&E species.

Some proposed management actions for GRSG are more directive in nature, presenting somewhat specific actions to benefit GRSG. One such action, to “*work with ROW holders to retrofit existing towers and structures consistent with required design features (RDFs)*” (BLM LR-12) has potential to impact listed plants from personnel and vehicles accessing the towers, if the plants are present in the ROW corridors where retrofit activities are needed. This action is reasonably certain to occur, and disturbances to vegetation would be from vehicle access along

the right-of-way roads, possibly including parking the vehicles off the roads near each tower, and from foot traffic near the towers during retrofit activities. If present in these areas, listed plants may be damaged by the crushing action of vehicle tires and foot traffic. This is the one action identified as possibly having negative effects on listed plants from this programmatic decision. However, the effects from this action are discountable based on the extremely small likelihood that effects on listed plants would occur.

Restrictions for off-road vehicle use may provide a beneficial effect on listed plant species by reducing impacts from this activity. BLM TM-1 states: *Limit off-highway vehicle motorized travel within Idaho BLM Field Offices to existing roads, primitive roads, and trails in areas where travel management planning has not been completed or is in progress. This excludes areas previously designated as open through a land use plan decision or currently under review for designation as open, currently being analyzed in ongoing RMP revision efforts in the Four Rivers, Jarbidge and Upper Snake Field Offices. Upon completion of travel management plans the designation would change to limited to designated roads, primitive roads and trails.* Where travel management planning has not been completed or is in progress, and listed plant habitats are present, there may be a reduction of impacts from off-road vehicle use. Restricting motorized travel as described above would occur soon after the decision to amend LUPs, and so this possible benefit would be contemporaneous with the decision action. This is the only action identified as possibly having a contemporaneous beneficial effect on listed plants.

These actions have potential to benefit listed plants and their habitats in the future by reducing impacts from livestock grazing and invasive plants. Changes in livestock grazing may or may not occur, depending on whether current management is meeting or making progress toward GRSG habitat objectives. Both of the above measures would be implemented in the future, probably a considerable time after the decision to amend LUPs, and so any beneficial effects on listed plants would not be contemporaneous with the decision.

There is also potential for further specific actions to be proposed when implementing GRSG conservations measures. At this programmatic planning level, we are unable to effectively analyze effects from future actions not specifically identified in this programmatic decision, because the actions are unknown or too speculative to allow any meaningful analysis of their effects. Many actions are simply too vague to analyze their effects at this time. For example, BLM WFP-9 states to *implement activities identified within the FIAT [Fire and Invasive Assessment Team] Assessments*, BLM VEG-1 states to *implement habitat rehabilitation or restoration projects in areas that have potential to improve GRSG habitat using a full array of treatment activities as appropriate, including chemical, mechanical, and seeding treatments*, and BLM INV-4 says to *require project proponent to ensure that noxious weed and invasive species caused as a result of the project are treated to eliminate establishment on the disturbed project construction areas for at least 3 years and monitored and treated during the life of the project.* BLM RM-1 (and a similar measure, FS GRSG-LG-GL-001-Guideline) states that “*existing active AUMs for livestock grazing within the planning area would not be changed at the broad scale, though the number of AUMs available on an allotment may be adjusted based on site-specific conditions to meet management objectives during term permit renewals, AMP development, or other appropriate implementation planning. Additionally, temporary*

*adjustments can be made annually to livestock numbers, the number of AUMs, and season of use in accordance with applicable regulations.* Changes in livestock grazing may or may not occur, depending on whether current management is meeting or making progress toward GRSG habitat objectives. It is not known whether such actions would take place, and if so, it is not known when, where, or how the possible actions might occur. Beneficial effects, such as reduced impacts from grazing and invasive species, are possible from these actions, but the extent of benefit and likelihood of occurrence are too speculative to quantify. Although there is also potential for some negative effects on listed species from additional proposed actions, significant effects would be highly unlikely due to avoidance or other mitigations based on current laws, agency regulations, and other conservation measures in place to protect them. Any possible effects from future proposed actions would be addressed in site-specific analysis at the project level when reasonably certain, explicit actions are identified and proposed.

Sagebrush focal areas (SFA) are considered to be a subset of PHMA, and would be managed the same as PHMA with the exception of a few additional restrictions. Because the management of SFA would be the same or more restrictive than PHMA, the same effects on plant species are expected, and SFA is not evaluated separately from PHMA in the effects analysis for plants.

## **ANALYSIS OF EFFECTS OF THE PROPOSED ACTION BY SPECIES**

### **A. Terrestrial Wildlife**

#### **Grizzly Bear**

##### **Direct and Indirect Effects by Program Area**

###### ***1. Recreation/Travel***

Existing recreation uses and sites will be managed to minimize adverse effects on GRSG or their habitat through incorporation of RDFs, buffers, and seasonal restrictions. The GRSG LUPA decision will not authorize new recreation facilities; however, it will place limitations upon them. New recreation facilities (e.g., campgrounds, trails, trailheads, staging areas) will not be constructed within PHMA and IHMA unless the development would have a neutral effect or be beneficial to GRSG habitat (such as concentrating recreation, diverting use away from critical areas, etc.); or the new construction replaces existing facilities and reduces impacts from the existing facilities, or unless the development is required for visitor safety or resource protection. It is too speculative at this time to determine whether or not prohibiting construction of new recreation facilities within PHMAs and IHMAs would push the construction of developed sites into preferred grizzly habitat. However, site-specific analysis will occur for applicable projects, and a determination for grizzly bear will be made at that time.

The GRSG LUPA decision will not authorize new roads. Rather, it will limit new road construction and existing road use. Conservation measures specific to travel management would limit off-highway vehicle motorized travel within Idaho BLM Field Offices to existing roads, primitive roads, and trails in areas where travel management planning has not been completed or is in progress. This excludes areas previously designated as open through a LUP decision or

areas that are under review for designation as open, currently being analyzed in ongoing RMP revision efforts in the Four Rivers, Jarbidge, and Upper Snake Field Offices. Upon completion of travel management plans, the designation would change to limited to designated roads, primitive roads, and trails. In general, actions that limit roads or place restrictions on motorized travel have the potential to benefit grizzly bears by increasing the amount of available secure habitat.

## *2. Lands and Realty/Infrastructure*

With respect to lands and realty and infrastructure management, conservation measures that apply to developed sites or road construction would be those with potential to affect grizzly bears. The GRSG LUPA decision will not authorize new roads within GRSG habitat. Rather, it will generally limit the existing amount of roads or require collocation of new roads with existing infrastructure for special use authorization. This may benefit grizzly bears by increasing the amount of secure habitat where grizzly bear habitat overlaps with GRSG habitat. PHMA will be designated and managed as ROW avoidance areas and exclusion areas for utility-scale wind and solar testing and development and for nuclear and hydropower energy development. Developing commercial service airports and facilities or new or expanded landfills will not be allowed in PHMA. IHMA will be designated and managed as ROW, wind and solar testing and development, nuclear and hydropower development, commercial service airports and facilities, and new or expanded landfills avoidance areas. GHMA will be designated and managed as open (avoidance in Montana) to ROW development, wind and solar testing and development (avoidance in Montana), nuclear and hydropower development, commercial service airports and facilities, and new or expanded landfills with proposals subject to RDFs, buffers, and seasonal timing restrictions. In PHMA, IHMA, and GHMA and SFAs, new infrastructure will be collocated with existing infrastructure to limit disturbance to the smallest footprint, or where it best limits impacts on GRSG or its habitat.

It is too speculative at this time to determine whether or not exclusion or avoidance of new infrastructure (i.e., developed sites) within PHMA and IHMA would push the construction of developed sites into preferred grizzly habitat. However, site-specific analysis will occur for applicable projects, and a determination for grizzly bear will be made at that time.

## *3. Range*

In general, range management and livestock grazing conservation measures will be neutral to beneficial to grizzly bears because they will either maintain existing conditions or reduce the amount of livestock grazing. Generally speaking, existing areas designated as available or unavailable for livestock grazing will be maintained. Existing active AUMs for livestock grazing within the planning area will not be changed at the broad scale, though the number of AUMs available on an allotment may be adjusted based on site-specific conditions to meet management objectives during appropriate implementation planning. Additionally, temporary adjustments can be made annually to livestock numbers, the number of AUMs, and season of use in accordance with applicable regulations. Range management/livestock grazing conservation measures include conducting land health assessments and establishing forage reserves to facilitate restoration and rehabilitation efforts in GRSG habitats. When livestock management practices are determined to not be compatible with meeting or making progress towards achievable habitat objectives,

changes in grazing management may be made through grazing authorization modifications or allotment management plan implementation. Potential modifications include, but are not limited to, changes in: 1) Season or timing of use; 2) Numbers of livestock; 3) Distribution of livestock use; 4) Duration and/or level of use; 5) Kind of livestock (e.g., cattle, sheep, horses, or goats); 6) Voluntary measures such as temporary non-use; and 7) Grazing schedules (including rest or deferment).

When an allotment in either PHMA or IHMA becomes vacant or grazing preference is relinquished, the BLM will consider retiring the allotment or grazing preference in whole or in part or converting the area to a forage reserve/buffer when doing so would maintain or enhance GRSG habitat. When an allotment in GHMA becomes vacant or grazing preference is relinquished, the BLM will consider converting the allotment to a forage reserve/buffer to use during fire rehabilitation or restoration efforts when such actions will result in a net benefit to GRSG habitat and other priority resources. In particular, permit modifications resulting in reductions of numbers of livestock or retirement/conversion of allotments could benefit grizzly bears by reducing the potential for grizzly bear/livestock conflicts. However, without site-specific projects identified at this time, it is too speculative to determine the potential extent of this benefit. Although grazing authorization modifications could include proposals for changes in kind of livestock that could negatively impact grizzly bears by increasing the potential for livestock/grizzly conflicts (i.e., sheep), it is too speculative to determine whether or not these types of proposals will actually occur or where they will occur. Site-specific analysis will be conducted at the project level, and a determination of effect will be made at that time.

#### *4. Energy and Minerals*

In general, energy and minerals conservation measures are expected to be neutral to beneficial on grizzly bears because they will either maintain existing conditions or improve GRSG sagebrush habitats. Following is a summary of GRSG LUPA energy and minerals direction. In Idaho, areas within PHMA and IHMA will be open to fluid mineral leasing and development and geophysical exploration subject to no surface occupancy (NSO) with a limited exception: A lease waiver, exception, or modification to the NSO stipulation may be considered where a portion of the proposed lease is determined to be in non-GRSG habitat, the area is not used by GRSG, or the proposed lease would have no direct, indirect, or cumulative effects on GRSG or its habitat. Idaho GHMA would be open to mineral leasing and development and geophysical exploration subject to buffers, seasonal timing restrictions, and standard stipulations. In Montana, areas within PHMA will be open to leasing subject to NSO. No waivers, exceptions, or modifications would be allowed unless approved by the State Director. GHMA would be open to leasing subject to buffers, seasonal timing restrictions, and standard stipulations.

Lands will remain open (except SFA) to locatable mineral entry in all management areas. Reasonable and appropriate RDFs and BMPs will be applied as COAs to prevent unnecessary or undue degradation of GRSG habitat when a Plan of Operations is submitted for BLM or Forest Service approval.

For salable minerals, no new site authorizations will be approved in PHMA. New site authorizations could be considered in IHMA, provided the Anthropogenic Disturbance Development Criteria can be met and subject to RDFs, buffers, and seasonal timing restrictions. Sales from existing community pits within PHMA and IHMA will be subject to seasonal timing restrictions. GHMA will be open to new site authorizations subject to RDFs, buffers, and seasonal timing restrictions. Existing sites will be open to new sales subject to seasonal timing restrictions. Salable mineral pits no longer in use will be restored to meet GRSG habitat management objectives. Reclamation bonding will require restoration of GRSG habitat on new site authorizations for mineral material pits in IHMA.

For mineral split estates in which the BLM owns the mineral estate and there is a non-federal surface owner, stipulations, BLM will apply conservation measures and design features consistent with those applied to BLM- and Forest Service-administered lands in coordination with the surface owner. For mineral split estates in which the BLM owns the surface and there is a non-federal mineral estate owner, the BLM will recommend timing restrictions, COAs, and buffers around occupied leks to the state regulatory entity and mineral estate owner when concurring with the approval of authorizations for mineral-related surface disturbance on lands within GRSG habitat.

Without identified site-specific projects, it is too speculative at this time to determine the potential for or extent of any benefits on grizzly bears. However, site-specific analysis will be conducted, and a determination of effects for the grizzly bear will be made at that time.

## 5. *Fire/Fuels Management*

Fire and fuels conservation measures with potential to impact grizzly bears include prescribed fire, coordination with federal, state, and local jurisdictions on fire and litter prevention programs to reduce human caused ignitions, and fuels treatments. Prescribed fire will be restricted in GRSG wintering or breeding and nesting habitat unless it reduces the potential for wildfire. In PHMA, SFA, and GHMA, prescribed fire will only be used if it is necessary to facilitate site preparation for restoration of GRSG habitat consistent with desired condition. The associated NEPA analysis must identify how GRSG desired conditions would be met, why alternative techniques were not selected, and how potential threats to GRSG habitat would be minimized.

In PHMA, IHMA, GHMA, and SFA, fuels treatments will be designed and implemented to reduce the potential for start, spread, and intensity of wildfire in high-risk areas (i.e., areas of increased potential for ignition and in areas where there is a potential for wildfire that would be difficult for suppression resources to contain and control). Fuel treatments will be designed through an interdisciplinary process to expand, enhance, maintain, and protect GRSG habitat. This process will consider a full range of cost-effective fuel reduction techniques, including chemical, biological (including grazing and targeted grazing), mechanical, and prescribed fire treatments.

Fuel breaks would incorporate existing vegetation treatments (seedings), or they would be located adjacent to existing linear disturbance areas, where appropriate. Fuel breaks should be placed in areas with the greatest likelihood of compartmentalizing a fire and foster suppression options to protect existing intact habitat.

Targeted grazing as a fuels treatment to adjust the vegetation conditions to reduce the potential start and spread of unwanted wildfires may be implemented within existing grazing authorizations if feasible. Such authorizations include temporary nonrenewable authorizations or contracts, agreements, or other appropriate means separate from existing grazing authorizations and permits. Targeted grazing to achieve fuels management objectives should conform to the following criteria:

- Targeted grazing should be implemented strategically on the landscape and directly involve the minimum footprint and grazing intensity required to meet fuels management objectives.
- Allow conformance to the applicable Standards for Rangeland Health and Guidelines for Livestock Grazing Management (Idaho or Montana) at the assessment scale.
- Where feasible and applicable, coordinate with the grazing permittee to strategically reduce fuels through livestock management within the Mandatory Terms and Conditions of the applicable grazing authorizations.

Using native seeds for fuels management treatment will be prioritized based on availability, adaptation (site potential), and probability of success. Nonnative seeds could be used to meet GRSG habitat objectives to trend toward restoring the fire regime where probability of success or native seed availability is low or not economical. Fire-resistant native and nonnative species will be used when reseeding, as appropriate, to provide for fuel breaks.

The effectiveness of fuels projects, including fuel breaks, will be maintained to ensure long-term success, including persistence of seeded species or other treatment components, while maintaining the integrity of adjacent vegetation.

Generally speaking, fuels treatments will maintain, improve, or restore sagebrush habitat, benefitting all species that use sagebrush habitat, including grizzly bears. Targeted grazing fuels treatments will be implemented within existing grazing authorizations, when feasible. It is too speculative to know whether or not this would be proposed within occupied grizzly bear habitat and whether or not it would lead to an increase in livestock grazing that could negatively impact grizzly bears. Similarly, it is too speculative to know where fuels management treatments would occur or the types of species that would be proposed for seeding and whether or not they would be palatable forage species that could have the potential to negatively impact grizzly bears. In all instances, site-specific analysis will be conducted, and a determination of effects for the grizzly bear will be made at that time.

Coordinating with federal, state, and local jurisdictions on fire and litter prevention programs to reduce human-caused ignitions would complement existing grizzly bear food storage orders designed to prevent human/bear interactions and conflicts, thereby having the potential to benefit grizzly bears. However, because no site-specific projects have been identified, it is too speculative to determine the potential extent of this benefit.

## ***6. Habitat Restoration and Vegetation Management***

Like fire and fuels treatments, habitat restoration and vegetation management treatments will generally maintain, improve, or restore sagebrush habitat. This will benefit species that utilize sagebrush habitat, including grizzly bears. Adequate rest from livestock grazing will be provided to allow natural recovery of existing vegetation and successful establishment of seeded species. Livestock management on adjacent unburned areas will be adjusted, as appropriate, to mitigate the effect of the burn on local GRSG populations. Habitat rehabilitation or restoration projects will be implemented in areas that have the potential to improve GRSG habitat. These projects will use a full array of treatment activities, as appropriate, including chemical, mechanical, and seeding treatments. Vegetation rehabilitation or manipulation projects will be implemented to enhance sagebrush cover or to promote diverse and healthy grass and forb understory to achieve the greatest improvement in GRSG habitat. Prescribed fire may need to be used as a site preparation technique to remove annual grass residual growth prior to applying herbicides in the restoration of certain lower-elevation sites (e.g., Wyoming big sagebrush). Such efforts will be carefully planned and coordinated to minimize impacts on GRSG seasonal habitats.

Native seeds will be required for restoration based on availability, adaptation (ecological site potential), and probability of success. Nonnative seeds may be used as long as they support GRSG habitat objectives. Nonnative seeds may be used to increase probability of success, when adapted seed availability is low, or to compete with invasive species, especially on harsher sites.

Management changes in restoration and rehabilitation areas will be implemented, as necessary, to maintain suitable GRSG habitat, improve unsuitable GRSG habitat, and ensure long-term

persistence of improved GRSB habitat. Management changes could be considered during livestock grazing permit renewals, travel management planning, and renewal or reauthorization of rights-of-way.

During land health assessments, the compatibility of existing nonnative seedings for GRSB habitat will be evaluated. This evaluation will determine whether to keep nonnative seedings as a component of a grazing system, to develop a forage reserve, or to be used as a fuelbreak or during restoration development. If nonnative seedings do not contribute to a grazing system, are not suitable for a forage reserve, and are not suitable fuelbreaks, the nonnative seedings in and adjacent to PHMA will be evaluated to determine if they should be diversified or converted to native grasses, forbs, and shrubs, including sagebrush.

Using prescribed fire in GRSB habitat will be avoided unless evaluation of site-specific conditions demonstrates that there would be a net benefit for GRSB. If prescribed fire is used in GRSB habitat, the NEPA document will include an analysis that indicates how GRSB goals and objectives will be addressed and met by its use, why alternative techniques were not selected, and a risk assessment to address how potential threats to GRSB habitat would be minimized.

It is too speculative to know where habitat restoration or vegetation management treatments would occur, the types of species that would be proposed for seeding, and whether the seedings would be palatable forage species that could have the potential to negatively impact grizzly bears. In all instances, site-specific analysis will be conducted, and a determination of effects for the grizzly bear will be made at that time.

### *Cumulative Effects*

To evaluate cumulative effects, future state, tribal, local, or private actions that are reasonably certain to occur within the action area are identified, and their effects are added to the anticipated effects of the current proposal. The GRSB LUPA action area includes GRSB habitats within BLM-administered and National Forest System lands. The only state or private projects that would occur on these lands would have some type of federal nexus and would require separate Section 7 consultation. Therefore, no cumulative effects are expected as part of this project.

### *Summary and Determination of Effects on Grizzly Bear*

GRSG LUPA decision goals, objectives, desired conditions, standards, and guidelines that could have any bearing on the major threats to grizzly bears, including secure habitat, developed sites, food storage, livestock grazing, and four key food sources, are expected to be neutral, result in beneficial effects, or are too speculative in the absence of site-specific proposals to analyze at this time.

With respect to recreation and travel management and lands and realty and infrastructure management, the GRSG LUPA decision will not authorize new roads. Rather, it will limit new road construction and existing road use, which could benefit grizzly bears by increasing the available amount of secure habitat. It is too speculative to determine whether or not prohibiting construction of new recreation facilities or infrastructure within PHMA and IHMA would push the construction of developed sites into preferred grizzly habitat.

In general, range management and livestock grazing conservation measures will be neutral to beneficial to grizzly bears, because they will either maintain existing conditions or reduce the amount of livestock grazing permit modifications. This will reduce the number of livestock or retire or convert allotments, which could benefit grizzly bears by reducing the potential for grizzly bear/livestock conflicts. Without site-specific projects identified at this time, it is too speculative to determine the potential extent of this benefit. Although grazing authorization modifications could include proposals for changes in the kind of livestock and thus could negatively impact grizzly bears by increasing the potential for livestock/grizzly conflicts (i.e., sheep), it is too speculative to determine whether or not these types of proposals will actually occur or where they would occur.

In general, energy and minerals conservation measures are expected to be neutral to beneficial on grizzly bears, because they will either maintain existing conditions or improve GRSG sagebrush habitats. Without identified site-specific projects, it is too speculative to determine the potential for or extent of any benefits on grizzly bears.

Generally speaking, fuels treatments will maintain, improve, or restore sagebrush habitat, benefitting all species that use sagebrush habitat, including grizzly bears. Targeted grazing fuels treatments will be implemented within existing grazing authorizations, when feasible. It is too speculative to know whether or not this would be proposed within occupied grizzly bear habitat and whether or not it would lead to an increase in livestock grazing that could negatively impact grizzly bears. Similarly, it is too speculative to know where fuels management treatments would occur, the types of species that would be proposed for seeding, and whether or not they would be palatable forage species that could have the potential to negatively impact grizzly bears. Coordinating with federal, state, and local jurisdictions on fire and litter prevention programs to reduce human-caused ignitions would complement existing grizzly bear food storage orders that are designed to prevent human/bear interactions and conflicts, thereby having the potential to benefit grizzly bears. However, without site-specific projects identified, it is too speculative to determine the potential extent of this benefit.

Like fire and fuels treatments, habitat restoration and vegetation management treatments will generally maintain, improve, or restore sagebrush habitat, benefitting species that utilize sagebrush habitat, including grizzly bears. However, it is too speculative to know where habitat restoration or vegetation management treatments would occur, the types of species that would be proposed for seeding, and whether or not they would be palatable forage species that could have the potential to negatively impact grizzly bears.

**The Idaho-Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement decision, and associated actions occurring on the Upper Snake or Dillon Field Offices or the Beaverhead-Deerlodge or Caribou-Targhee National Forests, may affect, but are not likely to adversely affect, the grizzly bear or its habitat.**

GRSG LUPA decision goals, objectives, desired conditions, standards, and guidelines that could have any bearing on the major threats to grizzly bears, including secure habitat, developed sites, food storage, livestock grazing, and four key food sources, are expected to be neutral, result in beneficial effects, or are too speculative in the absence of site-specific proposals to analyze at this time. Furthermore, adverse effects would likely be avoided because site-specific analysis and mitigation would occur at the project level.

## **B. Plants**

### **Slickspot peppergrass (*Lepidium papilliferum*)**

#### ***Land Use Plan Consultation History***

On January 24, 2004, the USFWS published its decision to withdraw the proposal to list slickspot peppergrass as endangered in the Federal Register. The species was subsequently dropped from inclusion in BLM's efforts to consult on existing LUPs.

On August 19, 2005, the US District Court for the District of Idaho reversed the decision to withdraw the proposed rule to list slickspot peppergrass as endangered, with directions that the case be remanded to the Secretary of the Department of the Interior for reconsideration of whether a proposed rule listing the slickspot peppergrass as either threatened or endangered should be adopted.

On August 15, 2006, the BLM and USFWS entered into a consultation agreement to provide for effective and efficient Section 7 consultation for slickspot peppergrass on existing Idaho BLM LUPs, pursuant to a National Agreement regarding plan- and program-level consultations.

On August 22, 2006, the BLM and USFWS entered into a conservation agreement to implement conservation measures for slickspot peppergrass through implementation of LUPs.

On January 12, 2007, the USFWS published its decision to withdraw the proposal to list slickspot peppergrass under the ESA in the Federal Register, and efforts to complete Section 7 consultation on existing LUPs and ongoing actions for slickspot peppergrass ceased.

Biological Assessment for the Idaho and Southwestern Montana Greater Sage-Grouse  
Land Use Plan Amendment and Environmental Impact Statement

On June 4, 2008, the US District Court for the District of Idaho reversed the decision to withdraw the proposed rule, with directions that the case be remanded to the USFWS for further consideration consistent with the court's opinion.

On August 27, 2009, the BLM and USFWS entered into an updated Conservation Agreement to implement conservation measures for slickspot peppergrass through implementation of LUPs.

On October 8, 2009, the USFWS published its decision to list slickspot peppergrass as threatened under the ESA in the Federal Register.

On November 30, 2009, the USFWS completed formal consultation for the Jarbidge RMP, the Kuna Management Framework Plan, the Cascade RMP, and the Snake River Birds of Prey National Conservation Area RMP on the effects of LUP programs on slickspot peppergrass. The USFWS concurred with the BLM determination that these LUP programs may affect, and are likely to adversely affect, the species. The USFWS Biological Opinion concluded that continued implementation of the existing LUP programs with conservation measures will not jeopardize the survival and recovery of slickspot peppergrass (USFWS 2009b).

On August 8, 2012, the US District Court for the District of Idaho ordered that the final rule listing slickspot peppergrass as a threatened species be vacated and remanded for further consideration consistent with the court's decision.

On February 12, 2014, the USFWS published a Federal Register notice that addressed the US District Court for the District of Idaho's request that a specific definition of foreseeable future for slickspot peppergrass be provided. In addition, the USFWS proposed that threatened status be reinstated for slickspot peppergrass under the ESA. A final decision on the USFWS's proposal to reinstate slickspot peppergrass as threatened under the ESA is anticipated in 2015.

On September 14, 2014, a conservation agreement was signed between the Bureau of Land Management, Idaho State Office, and the USFWS, Idaho Fish and Wildlife Office, to provide for the conservation of slickspot peppergrass related to existing Idaho BLM LUPs and a subset of ongoing actions (BLM 2014).

### ***2014 Slickspot Peppergrass Conservation Agreement***

Included in the Idaho-Southwestern Montana Greater Sage-Grouse Land Use Plan Amendments and Environmental Impact Statement are RDFs. One of the RDFs mandates that the conservation agreement for slickspot peppergrass and its specific conservation measures and implementation actions be included in its entirety with the decision for the Idaho-Southwestern Montana Greater Sage-Grouse Land Use Plan Amendments. In addition, any future updates or revisions to the slickspot peppergrass conservation agreement would also be adopted as binding management direction. Particularly relevant conservation measures from the agreement pertaining to each program area are presented below within each program area heading.

On September 14, 2014, a conservation agreement was signed between the Bureau of Land Management, Idaho State Office, and the USFWS, Idaho Fish and Wildlife Office, to provide for

the conservation of slickspot peppergrass related to existing Idaho BLM LUPs and a subset of ongoing actions (BLM 2014). The conservation agreement and associated conservation measures guide the BLM management actions and serve as a basis for consultation or conference on these LUPs between the BLM and the USFWS regarding slickspot peppergrass, a species proposed for listing under the ESA, as amended.

There are three LUPs that are addressed under the scope of the conservation agreement—the 1983 Kuna Management Framework Plan, the 1987 Jarbidge RMP, and the 1988 Cascade RMP. At the time these LUPs were prepared, there was no requirement to consult with the USFWS on slickspot peppergrass. LUP revisions are in progress for the Jarbidge Field Office and the Four Rivers Field Office that will update and replace these three LUPs. The BLM and the USFWS will consult on these revised LUPs when they are at the appropriate state of development and depending on the outcome of the proposed reinstatement of slickspot peppergrass as a threatened species under the ESA. The conservation agreement also addresses ongoing actions authorized by the BLM, including livestock grazing, rights-of-way activities, and military training.

The conservation measures describe desired recovery and conservation objectives, with corresponding implementation actions. The conservation measures replace or create guidance within the LUPs regarding programmatic management direction for slickspot peppergrass. It is the intent of the BLM and the USFWS that specific conservation measures will be fully implemented, and that the conservation agreement will remain in effect and binding on both parties until such time as new LUPs or amendments are prepared, Section 7 compliance is completed, as appropriate, and Records of Decision are signed. At that time, programmatic management direction for slickspot peppergrass will be included in the new or revised LUP or amendment, and the conservation agreement, or portions thereof in the case of programmatic amendments, will no longer apply to the planning area. Programmatic planning conservation measures include those that are needed for consultation at all planning levels, including future LUPs, ongoing activities, and proposed projects. For example, the conservation agreement is not applicable to the Snake River Birds of Prey planning area, because Section 7 consultation has been completed on the 2008 Snake River Birds of Prey RMP, which contains management direction for slickspot peppergrass similar to what is found within Appendix A of the 2006 version of the conservation agreement. Additionally, the conservation measures associated with the agreement may be modified based on current USFWS analysis of new information and assessment of threats being conducted as part of the listing determination process. Any additional information that becomes available prior to completing the LUPs that may enhance conservation of the species may trigger an update of conservation measures within the agreement. Such new information may be provided when the species is listed, critical habitat is designated, and a recovery plan is completed.

While a high priority for the BLM, both the BLM and the USFWS recognize that funding constraints may affect the ability to implement specific conservation measures as planned. BLM will work to leverage stakeholder partnerships to allow for flexible cost recovery associated with conservation actions. Where funding is lacking, the BLM and the USFWS will cooperate to set priorities and adjust dates for accomplishment. In addition, minor modifications to conservation measures may be necessary as the conference process progresses. Any modification must be

agreed to by the BLM and the USFWS and shall not materially alter the meaning or intent of a conservation measure as stated at the time of signature of this agreement.

Conservation measures were developed for each LUP program and sub-program covered by the conservation agreement. Responsibilities for implementing the actions are indicated, along with time frames for implementation. Most of the conservation measures will be implemented as standard operating actions conducted during day-to-day management activities. In addition, LUP conservation measure guidance and direction will be applied to ongoing actions. However, as site-specific information will be available for the ongoing actions, additional conservation measures may be considered.

In the conservation agreement, measures common to all program areas are specified for Special Status Animal and Plant Management. These measures are summarized below:

1. BLM will cooperate with others to:
  - a. Develop and use survey protocols consistent with the USFWS Rare Plant Survey Guidelines to conduct Stage 1, 2, and 3 surveys.
  - b. Refine slickspot peppergrass habitat and potential habitat maps, and identify and map slickspot peppergrass occurrences.
  - c. Regularly monitor slickspot peppergrass population trends and land health conditions on BLM lands, and follow current monitoring protocols. Land health conditions include forb diversity to support pollinators and habitat for slickspot peppergrass.
  - d. Participate in research essential to conservation of the species.
  - e. Continue to support seed banks in a long-term seed storage facility.
  - f. Support the establishment and maintenance of new populations in habitat categories for slickspot peppergrass.
2. BLM will ensure that ongoing federal actions support or do not preclude species conservation in habitat categories for slickspot peppergrass. This includes surveying, reviewing activities, and modifying activities as necessary to avoid or minimize negative impacts and, where feasible, promote species conservation. Section 7 compliance will be completed for activities that may affect slickspot peppergrass and its habitat. Where habitat categories for slickspot peppergrass exist, BLM will conserve remaining stands of sagebrush and native vegetation in making activity plan and project-level decisions.
3. BLM will ensure that new federal actions support or do not preclude species conservation in habitat categories for slickspot peppergrass. This includes surveying as needed, modifying activities to avoid or minimize negative impacts, and, where feasible, promote species conservation. Section 7 compliance will be completed for activities that may affect slickspot peppergrass and its habitat. Where habitat categories for slickspot peppergrass exist, BLM will conserve remaining stands of sagebrush and native vegetation in making activity plan and project-level decisions.

### Direct and Indirect Effects by Program Area

The effects of current LUP programs on slickspot peppergrass have already been addressed at the LUP level in previous Section 7 consultation for the Jarbidge RMP, the Kuna Management Framework Plan, the Cascade RMP, and the Snake River Birds of Prey National Conservation

Area RMP, and it was determined that the existing LUP programs may affect, and are likely to adversely affect, slickspot peppergrass. The USFWS Biological Opinion concluded that continued implementation of the existing LUP programs with conservation measures will not jeopardize the survival and recovery of slickspot peppergrass (USFWS 2009b). The current programs are not being reevaluated with this analysis. Only the effects of the proposed LUP amendments are addressed here.

### **1. Recreation/Travel**

Off-road vehicle use is the main threat to slickspot peppergrass in this program area, as such use may directly impact individuals through mechanical damage or deep burying of a portion of the seed bank and may cause degradation of habitat by damaging the soil characteristics and biological soil crust. In addition, vehicle use on and off roads and trails is a major contributor to the spread of nonnative invasive plants, one of two primary threats identified by the USFWS to slickspot peppergrass.

Off-road vehicle impacts are mainly known to occur on the Four Rivers Field Office. Off-road vehicles are not a concern on the Jarbidge Field Office, where the majority of slickspot peppergrass populations and habitat overlap with the action area; however, off-road vehicle uses could become a concern in the future.

With this proposed action, no additional travel or vehicle uses are proposed. BLM TM-1 states: *Limit off-highway vehicle motorized travel within Idaho BLM Field Offices to existing roads, primitive roads, and trails in areas where travel management planning has not been completed or is in progress. This excludes areas previously designated as open through a land use plan decision or currently under review for designation as open, currently being analyzed in ongoing RMP revision efforts in the Four Rivers, Jarbidge and Upper Snake Field Offices. Upon completion of travel management plans the designation would change to limited to designated roads, primitive roads and trails.* Where travel management planning has not been completed or is in progress, and slickspot peppergrass habitat categories are present, there may be a reduction of impacts from off-road vehicle use. If any areas of slickspot peppergrass habitat categories within GRSG HMAs are currently open to off-road vehicle use, restrictions would be placed on vehicles to use only existing routes, becoming effective at the time of this decision. This would provide a small and contemporaneous beneficial effect on slickspot peppergrass and its habitat by reducing the likelihood of damage from off-road vehicles.

Additional beneficial effects may occur in the future as a result of restrictive or guidance conservation measures; however, the actions and resulting benefits would take place in the future, probably a considerable time after the decision to amend LUPs, and so these possible beneficial effects would not be contemporaneous with the decision. Furthermore, most actions that may result from implementing the proposed LUP amendments are highly speculative. The type of activity, locations, timing, and methods of implementation are not known, nor is whether the actions would even be needed. Examples of these speculative actions in the Recreation/Travel program area include: BLM REC-1, *manage existing recreation uses and sites to minimize adverse effects on GRSG or their habitat through incorporation of RDFs, buffers and seasonal restrictions*; BLM REC-2, *limit construction of new recreation facilities*; BLM

*TM-2, consider temporary travel closures or restrictions; and BLM TM-4, plan and design travel systems to minimize adverse effects on GRSG (including a statement to give special attention to protect endangered or threatened species and their habitats).*

There is the potential for indirect effects (effects caused by the action, but later in time) from future site-specific ground-disturbing actions relating to the recreation and travel program. However, at this programmatic planning level, these future project actions are unknown and are not reasonably certain to occur; therefore, any possible effects are too speculative to evaluate at this time. All future site-specific projects will include an environmental analysis through the NEPA process and ESA Section 7 consultation. Potential negative effects on slickspot peppergrass would be avoided, minimized, or mitigated through site-specific analysis at the project level.

The 2014 slickspot peppergrass conservation agreement, which is included in this decision as an RDF, would be followed for any proposed activities in slickspot peppergrass habitat categories. It contains additional direction to avoid or minimize impacts from developed and dispersed recreation use areas through public education or closures as needed to protect the species and its habitat. With implementation of the conservation agreement, new development of recreation facilities or expansion of existing facilities in habitat categories of slickspot peppergrass would be avoided if negative impacts are expected. Commercial and noncommercial recreation permits would also be subject to restrictions or denial of authorizations for activities if negative impacts are anticipated. Travel management activities would also be subject to restrictions to reduce ground disturbance if negative impacts on habitat categories are occurring or anticipated. In addition, compliance checks would be performed on OHV closures to protect occupied habitat.

## Recreation/Travel Summary

One conservation measure for GRSG is specific and would likely be implemented soon after the decision (BLM TM-1, restricting motorized vehicle travel to existing roads and trails). This measure would provide a contemporaneous beneficial effect on slickspot peppergrass and its habitats within affected areas of GRSG HMAs by reducing the likelihood of impacts from off-road vehicle use in areas where new vehicle restrictions overlap slickspot peppergrass habitat categories. Possible effects from the proposed conservation measures concerning other potential activities in the recreation and travel program area are not considered in this analysis and determination of effects, because specific activities are unknown and too speculative to be meaningfully addressed.

## ***2. Lands and Realty***

The lands and realty program area has potential to impact slickspot peppergrass by authorizing changes in land use (possibly resulting in infrastructure and facility development and associated loss of habitat and/or damage to individuals), by changing land ownership (possibly resulting in decreased protection of listed species), and by administering the use of rights-of-way.

The proposed conservation measures for GRSG in the Lands and Realty program area state that existing ROWs, developing new or amended ROWs, utility-scale (20 MW) wind and solar

testing and development, nuclear and hydropower energy development, developing commercial service airports and facilities, and developing new landfills would all be subject to RDFs, which includes the slickspot peppergrass conservation agreement. Retaining or acquiring federal ownership of priority or important HMAs may benefit slickspot peppergrass in the future by reducing the likelihood of its habitat being converted to agriculture, urbanization, or other uses. All but one of the actions related to the lands and realty program area are unknown or too speculative at this time to be meaningfully addressed in this programmatic analysis. Any possible effects from future proposed actions would be addressed in site-specific analyses when explicit actions are identified and proposed for implementation.

The one conservation action in the lands and realty program area that may affect slickspot peppergrass is BLM LR-12, which states to “*work with ROW holders to retrofit existing towers and structures consistent with RDFs.*” This action is reasonably certain to occur. Implementing this action would involve transporting personnel and supplies to each tower or structure needing to be retrofitted. The minimal disturbance to vegetation would be from vehicle access along the right-of-way roads, possibly including parking the vehicles off the roads near each tower, and from foot traffic near the towers during retrofit activities. There have been extremely rare instances where slickspot peppergrass plants have been found outside slickspots. Specifically, only a few individuals were documented on graded roadsides and badger mounds. These instances do not represent viable, long-term occurrences due to the lack of appropriate habitat components that would support a persistent population. If they are present along right-of-way roads or near towers, slickspot peppergrass individuals may be damaged by the crushing action of vehicle tires and foot traffic. Because of the extremely rare occurrence of slickspot peppergrass outside slickspots, it is highly unlikely that individuals would be present on or directly adjacent to right-of-way roads or near existing towers. Thus, the likelihood of damage to the plants is extremely small, and is therefore discountable. In addition, the unlikely, but possible impacts on slickspot peppergrass individuals due to this action would not significantly impact any local populations, because the adjacent core habitats would be unaffected.

The slickspot peppergrass conservation measures in the conservation agreement state that private lands containing slickspot peppergrass habitat categories would be acquired where feasible, and that occupied slickspot peppergrass habitat in federal ownership would be retained unless such a transfer would result in a net benefit to the species.

### Lands and Realty Summary

One proposed conservation measure for GRSG (BLM LR-12, retrofitting existing towers and structures) is reasonably certain to occur and may impact slickspot peppergrass plants that might occur on roadsides or near towers. It is highly unlikely that plants would occur in areas affected by vehicles accessing the sites or foot trampling near the towers; thus, the possible adverse effects are discountable. Possible negative effects from other future actions within the lands and realty program area are not considered in this analysis and determination of effects, because specific actions are undecided and too speculative to be meaningfully addressed.

### 3. Range

Livestock grazing is currently authorized in many areas affected by the proposed LUP amendments. Livestock grazing and trampling can cause degradation or loss of habitat, impact the seedbank, crush plants, introduce nonnative plant competitors, degrade the integrity of slickspots, and redistribute organic matter through deposition of feces.

Active AUMs for livestock grazing would remain the same, though the number of AUMs available on an allotment may be adjusted based on site-specific conditions to meet management objectives during term permit renewals, AMP development, or other appropriate implementation planning. Additionally, temporary adjustments can be made annually to livestock numbers, the number of AUMs, and season of use in accordance with applicable regulations (BLM RM-1). BLM RM-6 states, *When livestock management practices are determined to not be compatible with meeting or making progress towards achievable habitat objectives following appropriate consultation, cooperating and coordination, implement changes in grazing management through grazing authorization modifications, or allotment management plan implementation.* The habitat assessment framework, or other BLM or Forest Service approved methodology, would be used to determine whether vegetation structure, condition, and composition are meeting GRSG habitat objectives, including riparian and lentic areas (BLM RM-4). BLM RM-5 states, *When modifying grazing management, analyze indirect effects to habitat, including changes in fuel loading and wildfire behavior.* When GRSG habitat objectives are not being met or progress toward them is not being made, potential modifications may include changes in season or timing of use, numbers or distribution of livestock, duration and/or level of use, kind of livestock, and possible periods of rest or deferment. These possible changes may reduce the likelihood of negative impacts on slickspot peppergrass and its habitat due to potential reductions in livestock use. Possible changes in timing of use could either increase or decrease the likelihood of negative impacts on soils or slickspot peppergrass individuals. However, because potential changes to current livestock grazing are undecided and speculative at this time, the type and extent of effects on slickspot peppergrass cannot be meaningfully evaluated. Effects from these possible changes would be evaluated when the details of such actions become available. With implementation of conservation measures in the slickspot peppergrass conservation agreement as an RDF, further evaluation of effects on slickspot peppergrass would occur with the continued livestock grazing.

In addition to the slickspot peppergrass conservation measures in the conservation agreement that are common to all program areas, specific measures for livestock grazing direct the BLM to manage livestock grazing and trailing to conserve suitable habitat conditions for slickspot peppergrass while implementing rangeland health standards and guidelines, and to apply the included direction in *Implementation of Annual Grazing Adaptive Management* (an appendix to the conservation agreement) when modifying livestock grazing. Surveys in slickspot peppergrass habitat categories would be conducted as needed. More specific measures include the following actions:

- As part of range readiness assessments, delay livestock turnout when saturated soils are a negative factor in slickspot peppergrass species conservation.
- Minimize gathering livestock in element occurrences.
- Avoid impacts on element occurrences from herd movement through rested and deferred pastures.

- Trailing permits will not be authorized through element occurrences unless conducted on existing roads. In the Jarbidge Field Office of the Twin Falls District, no livestock trailing will be authorized through element occurrences, proposed critical habitat, or occupied habitat. In the Four Rivers Field Office of the Boise District, livestock trailing permits will not be authorized through element occurrences, proposed critical habitat, or occupied habitat unless conducted on existing roads or historic routes described within the Four Rivers Field Office 2012 livestock trailing consultation with USFWS.
- Sheep grazing permits will be modified to restrict bedding, trailing, or watering herds within 1/2 mile of element occurrences.
- Supplements will be placed at least 1/2 mile from element occurrences. Supplements will be placed so that livestock are drawn away from the element occurrences and avoid trailing through the element occurrences en route to the supplement or a water source.
- No new domestic horse AUMs will be authorized in pastures containing element occurrences to avoid trampling impacts.
- As part of adaptive management, the BLM will conduct scheduled compliance inspections in pastures with occupied habitat.

There is the potential for indirect effects from future site-specific ground-disturbing actions relating to the range program area, such as adjusting locations of salt placements, fences, and water developments. However, at this programmatic planning level, these future project actions are unknown and not reasonably certain to occur, and any possible effects are too speculative to evaluate at this time. All future site-specific projects will include an environmental analysis through the NEPA process and ESA Section 7 consultation. Potential negative effects on slickspot peppergrass would be avoided, minimized, or mitigated through site-specific analysis at the project level and implementation of the slickspot peppergrass conservation measures.

#### Range Summary

Possible changes to livestock grazing may reduce or increase the likelihood of negative impacts on slickspot peppergrass and its habitat due to potential reductions or changing the timing of livestock use. There is also potential for positive or negative effects from changes to locations of salt placements, fences, and water developments. However, because potential changes to current livestock grazing are undecided and speculative at this time, the type, location, timing, and extent of effects on slickspot peppergrass cannot be meaningfully evaluated at this planning level. Therefore, these potential effects are not considered in the determination of effects for this programmatic decision.

#### *4. Energy and Minerals*

The energy and minerals program may cause degradation or loss of habitat, impacts on the seedbank, crushing of slickspot peppergrass plants, and introduction of nonnative plants due to ground disturbance from mining activities, including road construction and pipelines.

Changes in current management of mineral leases would include only restrictions to these uses, and implementing all RDFs are often specified. Any unchanged management would be a continuation of current management; thus, the proposed LUP amendments would not be

authorizing an increase of these uses. Conservation measures proposed for GRSG include the following:

- BLM AD-1 limits anthropogenic disturbance to 3 percent as calculated within the biologically significant unit.
- BLM Fluid Minerals FLM-1: Idaho: Areas within PHMA and IHMA would be open to mineral leasing and development and geophysical exploration subject to NSO with a limited exception (FLM-3). GHMA would be open to mineral leasing and development and geophysical exploration subject to CSU, which includes buffers, seasonal timing restrictions, and standard stipulations.
- BLM Salable Minerals SAL-1: In PHMA, no new site authorizations would be approved. In IHMA and GHMA, new site authorizations could be considered provided the Anthropogenic Disturbance Development Criteria (AD-4) can be met, and subject to RDFs, buffers, and seasonal timing restrictions. Sales from existing community pits within PHMA and IHMA would be subject to seasonal timing restrictions. GHMA would be open to new site authorizations subject to RDFs, buffers, and seasonal timing restrictions.
- BLM Non-Energy Leasables (NEL)-1: PHMA would be closed to leasing. In IHMA and GHMA, areas within Known Phosphate Leasing Areas (KPLAs) will remain open to leasing subject to standard stipulations. PHMA outside of KPLAs are closed to leasing and prospecting. IHMA areas outside of KPLAs are open to prospecting and subsequent leasing provided the Anthropogenic Disturbance Development Criteria (AD-4) and the anthropogenic disturbance cap (AD-1) can be met. RDFs, buffers, and seasonal timing restrictions shall be applied to prospecting permits. Exceptions to closures in PHMA and IHMA may be made for lease modifications and fringe leases where valid existing rights may be affected. In GHMA, lands outside KPLAs are available for prospecting and subsequent leasing and initial mine development subject to RDFs, buffers, timing restrictions (seasonal and daily), and standard stipulations.

Since the current RDFs include implementation of the 2014 slickspot peppergrass conservation agreement, the following specific measures in that agreement would be required:

- Approve plans of operations or allow notice-level operations (for locatable minerals, saleable minerals, and leasable minerals) so as not to preclude species habitat conservation. This includes management of physical facilities, as well as disturbances to the species resulting from human uses.
  - To the extent allowed by law, modify [existing] plans of operation or notice-level operations (for locatable minerals) that may have negative impacts on the species or its habitat. For notice-level operations, notify the operator that modifications to proposed activities will be required to avoid negative impacts.
  - To the extent allowed by law, avoid approving plans of operation or notice-level operations (for locatable minerals) that may have negative impacts on the species or its habitat. For notice-level operations, notify the operator that modifications to proposed activities will be required to avoid negative impacts. If a plan of operations is to be approved in or adjacent to habitat categories for slickspot peppergrass, apply stipulations to support or to not preclude species conservation.

- Modify existing mineral leases (for salable and leasable minerals) if negative impacts are occurring.
- Avoid development of saleable or leasable minerals in or adjacent to habitat categories for slickspot peppergrass if negative impacts are expected. If a minerals lease or sale is to be issued in or adjacent to habitat, apply stipulations to support or to not preclude species conservation.

There is the potential for indirect effects from future site-specific ground-disturbing actions relating to the energy and minerals program area, such as development of extraction facilities and access roads. However, at this programmatic planning level, these future projects actions are currently unknown and not reasonably certain to occur, and any possible effects are too speculative to evaluate at this time. All future site-specific projects will include an environmental analysis through the NEPA process and ESA Section 7 consultation. Potential negative effects on slickspot peppergrass would be avoided, minimized, or mitigated through site-specific analysis at the project level and implementation of the slickspot peppergrass conservation measures.

With implementation of the proposed conservation measures, the slickspot peppergrass conservation measures, and RDFs, impacts from new and currently authorized mining activities may be reduced or prevented. However, these possible reductions or avoidance of potential impacts are unidentified at this time and would occur at some unknown time in the future; any beneficial effects would not be contemporaneous with this decision. Potential beneficial effects from the action with respect to energy and mineral development are therefore not considered for the determinations in this programmatic-level analysis but will be addressed in subsequent site-specific analyses.

### ***5. Fire/Fuels Management***

Fire is one of the two primary threats to slickspot peppergrass because it can alter soil characteristics, promote establishment and spread of invasive nonnative plants such as cheatgrass and medusahead, and negatively affect its pollinators' habitats, as well as destroy the current season's seed production. Fire suppression activities include creating fire breaks, fire camps, and staging areas, potentially causing degradation or loss of slickspot peppergrass habitat, impacts on the seedbank, crushing of plants, reduced slickspot integrity, and introduction of nonnative plants. The use of fire retardant may add nutrients to slickspot peppergrass habitat and may improve conditions for plant competitors. Fuels management activities such as prescribed fire and creating vegetated fuel breaks may also cause degradation or loss of slickspot peppergrass habitat, impacts on the seedbank, crushing of plants, reduced slickspot integrity, and introduction of nonnative plants such as forage kochia and intermediate wheatgrass as well as invasive species. In addition, wildfire restoration/rehabilitation (including Emergency Stabilization and Rehabilitation [ESR]) activities may cause degradation or loss of slickspot peppergrass habitat, impacts on the seedbank, crushing of plants, and introduction of nonnative plants. Because all of these potential fire and fuels management activities are unknown at this time, their type, location, and timing is too speculative to allow a meaningful analysis at this programmatic planning level. Potential negative effects on slickspot peppergrass would be avoided, minimized, or mitigated through site-specific analysis at the project level and implementation of the slickspot peppergrass conservation measures.

## Wildfire Management

The proposed wildfire preparedness/prevention measures do not specify any actions that would predictably affect management of slickspot peppergrass. BLM WFP-9 states to “*implement activities identified within the FIAT Assessments,*” but the potential activities are unknown at this time. Proposed wildfire suppression measures include completing FIAT Assessments to identify priority areas and establish strategies for fuels management, suppression, and restoration activities, with an analysis of response times and water capacity for suppression purposes (BLM WFS-1, WFS-2, WFS-3). During high fire danger, measures specify staging initial attack and securing additional resources closer to priority areas identified in the Wildfire and Invasive Species Assessments, based on anticipated fires and weather conditions, with particular consideration of the West Owyhee, Southern, and Desert Conservation Areas to ensure quicker response times in or near GRSG habitat (BLM WFS-4). At some unknown time in the future, the large area of disjunct occurrences of slickspot peppergrass near Juniper Butte could benefit from additional fire suppression resources providing quicker response times in the Southern Conservation Area by reducing fire impacts on occurrences and habitat categories in these areas.

The 2014 slickspot peppergrass conservation agreement contains the following applicable measures:

- Fire suppression efforts will be conducted, as possible, to protect habitat categories for slickspot peppergrass. Place a high priority on protecting habitat categories for slickspot peppergrass.
  - Fire Management Plans will include Standard Operating Procedures (SOPs) that address conservation of slickspot peppergrass.
  - BLM will provide adequate fire suppression coverage at all stations to meet management objectives with the intent to suppress 90 percent of fires to the acreages specified in the fire management plans for slickspot peppergrass. As funding allows, BLM will maintain existing remote fire guard stations easily accessible to occupied habitat (for example, Juniper Butte fire guard station) and explore opportunities to establish additional stations to provide better initial attack and reduced response times for wildfires in slickspot peppergrass habitat.
  - Apply minimum impact suppression tactics (MIST) in habitat categories for slickspot peppergrass, as appropriate. Consult with resource advisors to determine where MIST tactics should be applied to avoid or minimize negative impacts.
  - Although MIST are preferred, aggressive fire suppression tactics (e.g., blade lines, back fires, etc. in habitat) may be applied if element occurrences are threatened.
  - Do not locate fire base camps, staging areas, and fueling areas within occupied habitat.
- As needed, coordinate with appropriate agency personnel regarding fire suppression activities in or adjacent to habitat categories for slickspot peppergrass.
  - BLM and cooperators will expand on and continue to provide special status plant and habitat awareness training to fire resource advisors, Incident Commanders, Engine Operators, and Fire Operations Supervisors.

- BLM and cooperators will distribute maps and inform fire crews on locations of the element occurrences to maximize fire protection and to avoid or minimize impacts from fire suppression activities.
- When developing wildland fire use plans, do not allow wildland fire use in habitat categories for slickspot peppergrass.

Along with implementation of the 2014 slickspot peppergrass conservation agreement, the proposed management actions under the wildfire management program area could reduce negative impacts from wildfire damage and suppression activities and may benefit slickspot peppergrass and its habitats at some unknown time in the future. Because slickspot peppergrass habitat categories overlap with GRSG habitats, measures that manage wildfires and suppression activities to protect GRSG habitats may also generally benefit slickspot peppergrass habitats in these areas of overlap. However, because the potential benefits would occur at some unknown time in the future, the beneficial effect would not be contemporaneous with this decision.

### Fuels Management

For fuels management activities, the proposed LUP amendments include conservation measures that emphasize maintenance, protection, and expansion of sagebrush ecosystems, as well as reduction of wildfire threats (BLM FM-1). Fuels management strategies would be developed as part of FIAT Assessments, and fuel treatments would be designed through an interdisciplinary process to benefit GRSG habitats, including considering a full range of methods such as grazing, targeted grazing, prescribed fire, chemical, biological, and mechanical techniques (BLM FM-6). Existing and proposed linear ROWs could be considered for use and maintenance as vegetated fuel breaks in appropriate areas (BLM FM-7). Fuel breaks would incorporate existing vegetation treatments (seedings) or would be located adjacent to existing linear disturbance areas where appropriate (BLM FM-8). The use of native seeds would be prioritized for fuels management treatment based on availability, adaptation (site potential), and probability of success. Where probability of success or native seed availability is low or non-economical, nonnative seeds may be used to meet GRSG habitat objectives to trend toward restoring the fire regime. When reseeding, fire-resistant native and nonnative species would be used, as appropriate, to provide for fuel breaks (BLM FM-13).

The 2014 slickspot peppergrass conservation agreement contains the following applicable measures:

- Prescribed fire in habitat categories for slickspot peppergrass will only be used as a tool for assisting with species conservation (for example, a burn in preparation to decrease cheatgrass litter before herbicide application, or to clear fencelines of accumulated windblown weeds).
- Avoid fuels management projects in occupied and critical habitat, unless such projects would enhance species conservation or are necessary for hazardous fuels reduction near the urban interface. Implement protection measures to avoid or minimize negative impacts on the species. In critical and occupied habitat categories for slickspot peppergrass, design native seed mixes that emphasize locally adapted plant material that will promote species conservation. When appropriate, use native plant materials and seed

during project activities, and select species that benefit slickspot peppergrass insect pollinators.

- Because of potential negative impacts on habitat categories for slickspot peppergrass from linear fuel breaks, which can act as weed dispersal corridors, the following measures will be applied in habitat categories for slickspot peppergrass:
  - BLM will monitor the effectiveness of existing fuel breaks (location, dry fuel load, and weed composition) in protecting habitat categories for slickspot peppergrass.
  - BLM may create and maintain fuel breaks where frequent fires can threaten habitat categories for slickspot peppergrass. New fuel breaks in habitat categories for slickspot peppergrass will be designed to conserve and/or enhance species habitat. Where appropriate and where objectives will be met, native vegetation should be emphasized in the creation of new fuel breaks. Other fuel break methods may include mowing or brown strips. If native vegetation or seed will not meet objectives, or site disturbance or site conditions preclude their use, fuel breaks may include nonnative, noninvasive species that will not invade slickspots.
  - Potentially invasive nonnative species such as intermediate wheatgrass and forage kochia will not be used within 1.5 miles of element occurrences. When used in fuel break projects, control measures for potentially invasive nonnative species such as intermediate wheatgrass and forage kochia will be incorporated into project design features.
  - Consider actions to repair or restore fuel breaks so they function as desired.
  - In addition to the reduction in fuels associated with appropriately managed livestock grazing, BLM may create fuel breaks using techniques such as mowing or targeted grazing to strategically reduce fuel loads where frequent fires can threaten habitat categories for slickspot peppergrass if the benefit of these actions can be demonstrated to outweigh the risks to slickspot peppergrass and its habitat.

With implementation of the 2014 slickspot peppergrass conservation agreement, the proposed management actions under the fuels management program area may reduce negative impacts from fuels management activities, mainly by limiting the negative effects from potentially invasive nonnative species such as intermediate wheatgrass and forage kochia, and by preventing or reducing the likelihood of wildfires damaging slickspot peppergrass occurrences and habitat categories.

#### Wildfire Restoration/Rehabilitation – Emergency Stabilization and Rehabilitation

The proposed LUP amendments include the following conservation measures for post-wildfire activities:

- Use the findings and restoration/rehabilitation strategy developed as part of the FIAT Assessment process to determine if GRSG rehabilitation actions are needed, based on ecological potential, and direct ESR (BLM) or Burned Area Emergency Restoration (BAER) (Forest Service) actions after fire (BLM ESR-1).
- Incorporate GRSG Habitat Management Objectives into ESR/BAER plans based on site potential and in accordance with the restoration/rehabilitation strategy (BLM ESR-2).

- Provide adequate rest from livestock grazing to allow natural recovery of existing vegetation and successful establishment of seeded species within burned/ESR areas. All new seedlings of grasses and forbs should not be grazed until at least the end of the second growing season, and longer as needed to allow plants to mature and develop robust root systems, which will stabilize the site, compete effectively against cheatgrass and other invasive annuals, and remain sustainable under long-term grazing management. Adjust other management activities, as appropriate, to meet ESR objectives (BLM ESR-3).
- Adjust, as appropriate, livestock management on adjacent unburned areas to mitigate the effect of the burn on local GRSB populations (BLM ESR-4).

The 2014 slickspot peppergrass conservation agreement contains the following applicable measures:

- Implement ESR activities to consider slickspot peppergrass in and adjacent to slickspot peppergrass habitat rehabilitation.
  - Wildfires within habitat categories for slickspot peppergrass will be evaluated for ESR treatments, regardless of size, with an emphasis on retaining native plant resiliency, including early seral native grasses, forbs, and biological soil crusts.
  - As needed, protect disturbed and recovering areas using temporary closures or other measures. BLM will continue to rest areas from land use activities to meet ESR objectives as defined through ESR plans.
  - BLM ESR efforts for slickspot peppergrass, subject to funding availability, should enhance shrub establishment and forb diversity. BLM will implement the following measures during fire ESR efforts:
    - BLM will use seeding techniques that minimize soil disturbance; such techniques may include minimum-till drills and rangeland drills equipped with depth bands when ESR projects have the potential to impact occupied or proposed critical habitat categories for slickspot peppergrass.
    - BLM will use native plant materials and seed during ESR activities. BLM will include native forbs in seed mixtures that will benefit slickspot peppergrass insect pollinators commensurate with ESR program policy.
    - If native plant materials and seed are not available, or where site capability precludes the use of natives due to past disturbances, noninvasive, nonnative species may be used for stabilization activities in habitat categories for slickspot peppergrass.
    - In slickspot peppergrass habitat and potential habitat, nonnative species are acceptable for stabilization activities where site disturbances exceed the capability for extant native vegetation to regenerate. Potentially invasive nonnative species such as intermediate wheatgrass and forage kochia will not be used within 1.5 miles of element occurrences. Within slickspot peppergrass habitat and potential habitat, potentially invasive nonnative species such as intermediate wheatgrass and forage kochia may be used for stabilization activities that are specifically designed as greenstrip fuel break projects, if an environmental analysis determines that the benefits of their use outweigh the risk of invasion to slickspot

peppergrass and its habitat relative to other alternative fuel break methods. For these projects, environmental analyses will use the best available scientific and biological information, current BLM and USFWS guidance, and will incorporate a comprehensive monitoring strategy.

With implementation of the 2014 slickspot peppergrass conservation agreement, the proposed management actions under the wildfire restoration/rehabilitation – ESR program area could potentially reduce negative impacts from ESR activities, and therefore may reduce the risks to slickspot peppergrass. The main contributors to the potential reduction of negative effects would be to limit the use of potentially invasive nonnative species such as intermediate wheatgrass and forage kochia, to use seeding techniques that minimize ground disturbance, and to protect disturbed and recovering areas using temporary closures or other measures. Closures may include resting burned and adjacent areas from livestock grazing, or limiting public access. As compared with the current management direction, the proposed conservation measures for GRSG, including implementing the 2014 slickspot peppergrass conservation agreement, would provide a benefit to slickspot peppergrass and its habitat categories by reducing threats from post-wildfire management activities.

#### Fire/Fuels Management Summary

In the fire/fuels management program area, no ground-disturbing activities would be authorized by the proposed LUP amendments. These program activities may cause degradation or loss of slickspot peppergrass habitat, impacts on the seedbank, crushing of plants, reduced slickspot integrity, and introduction of nonnative plants. However, the type, location, and timing of potential activities are unknown and speculative at this time, preventing a meaningful analysis of effects at this programmatic planning level. Therefore, these potential impacts are not considered in the determination of effects. Any future project proposals, including actions involving ground disturbance, vegetation management, and seedings, would be subject to site-specific environmental analysis at the project level and Section 7 consultation as necessary. They would also be subject to the applicable conservation measures in the 2014 slickspot peppergrass conservation agreement.

Potentially beneficial effects may result from the fire/fuels management program area; however, because the potential benefits would occur at some unknown time in the future, the beneficial effects would not be contemporaneous with this decision. Proposed management actions under the wildfire management program area could reduce negative impacts from wildfire damage and suppression activities, which may benefit slickspot peppergrass and its habitats. Conservation measures for the fuels management program area may reduce negative impacts from fuels management activities, mainly by limiting the negative effects from potentially invasive nonnative species such as intermediate wheatgrass and forage kochia, and by preventing or reducing the likelihood of wildfires damaging slickspot peppergrass occurrences and habitat categories. Conservation measures for the wildfire restoration/rehabilitation – ESR program area could potentially reduce negative impacts from ESR activities by limiting the use of potentially invasive nonnative species such as intermediate wheatgrass and forage kochia, using seeding techniques that minimize ground disturbance, and protecting disturbed and recovering areas using temporary closures or other measures.

## *6. Habitat Restoration and Vegetation Management*

The proposed LUP amendments contain several conservation measures for GRSG concerning habitat restoration and vegetation management. Habitat restoration and vegetation management projects for GRSG could involve a variety of methods, including chemical, mechanical, and seeding treatments. Such activities may include herbicide application, prescribed fire, cutting of encroaching juniper, and managing native seed resources. Potential negative effects from these activities include possible damage from herbicides, degradation or loss of slickspot peppergrass habitat, impacts on the seedbank, crushing of plants, reduced slickspot integrity, and introduction of nonnative plants. Possible beneficial effects may result from general enhancement of sagebrush habitats, including possible enhancement of forb species important for slickspot peppergrass pollinators and possible reductions of invasive plant species. It is important to keep in mind that although some of the following measures may appear to be proposing specific activities, no site-specific actions are being proposed. The type, location, and timing of future habitat restoration and vegetation management activities are unknown and too speculative to allow a meaningful analysis of effects at this programmatic planning level. Further analysis of any future projects will include Section 7 consultation if necessary, and site-specific environmental analysis and determination of effects will occur when the details of such proposals become available. In addition, the 2014 slickspot peppergrass conservation agreement would be implemented, as it is included in the current proposal as an RDF.

The following conservation measures for GRSG are proposed for any future habitat restoration and vegetation management activities:

- Implement habitat rehabilitation or restoration projects in areas that have potential to improve GRSG habitat using a full array of treatment activities as appropriate, including chemical, mechanical, and seeding treatments (BLM VEG-1).
- Implement vegetation rehabilitation or manipulation projects to enhance sagebrush cover or to promote diverse and healthy grass and forb understory to achieve the greatest improvement in GRSG habitat based on FIAT Assessments, HAF assessments, other vegetative assessment data and local, site-specific factors that indicate sagebrush canopy cover or herbaceous conditions do not meet habitat management objectives (i.e., is minimal or exceeds optimal characteristics). This may necessitate the use of prescribed fire as a site preparation technique to remove annual grass residual growth prior to the use of herbicides in the restoration of certain lower-elevation sites (e.g., Wyoming big sagebrush), but such efforts will be carefully planned and coordinated to minimize impacts on GRSG seasonal habitats (BLM VEG-2).
- Require use of native seeds for restoration based on availability, adaptation (ecological site potential), and probability of success. Nonnative seeds may be used as long as they support GRSG habitat objectives to increase probability of success, when adapted seed availability is low or to compete with invasive species especially on harsher sites (BLM VEG-3).
- Implement management changes in restoration and rehabilitation areas, as necessary, to maintain suitable GRSG habitat, improve unsuitable GRSG habitat, and to ensure long-term persistence of improved GRSG habitat. Management changes could be considered

during livestock grazing permit renewals, travel management planning, and renewal or reauthorization of rights-of-way (BLM VEG-4).

- Consider establishing seed harvest areas that are managed for seed production to provide a reliable source of locally adapted seed to use during rehabilitation and restoration activities (BLM VEG-5).
- Allocate use of native seed to GRSG or ESA-listed species habitat in years when preferred native seed is in short supply. This may require reallocation of native seed from ESR (BLM) and/or BAER (Forest Service) projects outside of PHMA or IHMA to those inside it. Reestablishment of appropriate sagebrush species/subspecies and important understory plants, relative to site potential, shall be the highest priority for rehabilitation efforts (BLM VEG-6).
- During land health assessments evaluate the compatibility of existing nonnative seedings for GRSG habitat to keep as a component of a grazing system, development of a forage reserve, or to be used as a fuelbreak or during restoration/diversification for GRSG habitat improvement. Where appropriate and feasible, diversify seedings, or restore to native vegetation when potential benefits on GRSG habitat outweigh the other potential uses of the nonnative seeding, with emphasis on PHMA and IHMA. Allow recolonization of seedings by sagebrush and other native vegetation (BLM VEG-7).

These conservation measures are generally compatible with management of slickspot peppergrass habitat categories, in that they would promote healthy sagebrush communities that are important for conservation of slickspot peppergrass. Additional conservation measures in the 2014 slickspot peppergrass conservation agreement address concerns from upland vegetation management activities:

- Although non-chemical methods will be the preferred approach in occupied habitat, when appropriate, projects involving the application of pesticides (including herbicides, fungicides, and other related chemicals) in habitat categories for slickspot peppergrass that may affect the species will be analyzed at the project level and designed such that pesticide applications will support conservation and minimize risks of exposure. Site-specific stipulations will be developed locally using these criteria:
  - Evaluate the benefits and risks of vegetation treatment, including the following: application methods; pesticides, carriers, and surfactants used; needed treatment buffers; and use of non-chemical weed control (for example, biocontrols, hand pulling).
  - Apply appropriate spatial and temporal buffers to avoid species' exposure to harmful chemicals.
  - Explore opportunities to eradicate competing nonnative invasive plants in habitat categories for slickspot peppergrass where slickspots are being invaded by such plants.
  - Implement appropriate revegetation and weed control measures to reduce the risks of nonnative invasive plant infestations following ground/soil-disturbing actions in habitat categories for slickspot peppergrass.
  - BLM will provide United States Department of Agriculture APHIS with the location of habitat categories of slickspot peppergrass. Mormon cricket,

- grasshopper, or other insect control in habitat categories for slickspot peppergrass will only include those methods that minimize impacts on the plant's pollinators.
- Where needed and feasible, coordinate with adjacent land owners and local governments regarding control of noxious weeds in upland areas through cooperative weed management programs. [BLM will] take advantage of coordination opportunities as they arise.
  - BLM will promote diversity, richness, and health of native plant communities to support pollinators and habitat for slickspot peppergrass. BLM will focus slickspot peppergrass habitat conservation and restoration efforts in habitat categories for slickspot peppergrass to encourage connectivity among populations through the following measures:
    - Where habitat categories for slickspot peppergrass exist, BLM will conserve remaining stands of sagebrush and native vegetation in making activity plan and project-level decisions.
    - BLM will select and implement specific projects to restore habitat categories for slickspot peppergrass in degraded areas as funding allows, such as planting shrubs and forbs and controlling weeds, within and adjacent to occupied habitat.
    - Vegetation treatment projects undertaken in habitat categories for slickspot peppergrass will be compatible with species habitat restoration objectives.
    - When conducting vegetation treatment projects in habitat categories for slickspot peppergrass, BLM will use seeding techniques that minimize soil disturbance such as minimum-till drills and rangeland drills equipped with depth bands, use native plant materials and seed during restoration activities, and select native forbs that benefit slickspot peppergrass insect pollinators.
  - (From Wildlife and Wildlife Habitat Management program area) Any restoration efforts for wildlife within habitat categories for slickspot peppergrass will be compatible with the species' habitat requirements.

There is the potential for indirect effects from future site-specific ground-disturbing actions relating to the habitat restoration and vegetation management program area, such as prescribed fire, mechanical vegetation treatments, herbicide application, and associated vehicle access. At this programmatic planning level, these future project actions are unknown and not reasonably certain to occur, and any possible effects are too speculative to evaluate at this time. All future site-specific projects will include an environmental analysis through the NEPA process and ESA Section 7 consultation. Potential negative effects on slickspot peppergrass would be avoided, minimized, or mitigated through site-specific analysis at the project level and by implementing the slickspot peppergrass conservation measures.

Some negative impacts on slickspot peppergrass habitat categories may potentially occur with future project implementation, most likely from mechanical ground disturbance, herbicide application, use of ground-disturbing seeding or planting techniques, and competition from invasive or potentially invasive, nonnative plant species. The 2014 slickspot peppergrass conservation agreement provides direction to evaluate and weigh the benefits of these activities against the potential negative effects, and to explore less damaging methods such as biocontrol and hand-pulling. Appropriate spatial or temporal buffers would also be implemented during chemical applications to avoid or minimize exposure of slickspot peppergrass plants or seeds.

Although some localized negative effects on slickspot peppergrass and its pollinators may potentially occur from implementing habitat restoration and vegetation management projects, significant negative effects are highly unlikely. Any habitat-disturbing activities would be subject to site-specific, project-level environmental analysis (including Section 7 consultation as needed), and appropriate mitigation measures would be applied in accordance with the 2014 slickspot peppergrass conservation agreement (or updated version, as applicable). In addition, there may be long-term benefits from these activities because they would promote healthier, more resilient sagebrush communities by maintaining healthy sagebrush communities with fewer nonnative, invasive species.

### Invasive Species

Although there are many references to invasive species management in several other program areas, there are also a few conservation measures in the proposed LUP amendments specific to the invasive species topic. They include the following:

- Incorporate results of the FIAT Assessments into projects and activities addressing invasive species (BLM INV-1).
- Implement noxious weed and invasive species control using integrated weed management actions per national guidance and local weed management plans for Cooperative Weed Management Areas in cooperation with State and Federal agencies, affected counties, and adjoining private lands owners (BLM INV-2).
- Conduct integrated weed management actions for noxious and invasive weed populations that are impacting or threatening GRS habitat quality using a variety of eradication and control techniques, including chemical, mechanical, and other appropriate means (BLM INV-3).
- Require project proponent to ensure that treatments of noxious weeds and invasive species caused as a result of the project are treated to eliminate establishment on the disturbed project construction areas for at least 3 years and monitored and treated during the life of the project (BLM INV-4).

Most of the above measures are already integrated into the existing invasive species program activities. The requirement to treat noxious weeds and invasive species for at least 3 years after project disturbances further specifies a minimum time period to conduct control treatments, and thus may result in improved conditions of slickspot peppergrass habitat categories after any authorized disturbances.

Additional conservation measures in the 2014 slickspot peppergrass conservation agreement that address concerns from invasive species include measures already presented under the various program areas above. The proposed LUP amendments, in concert with the 2014 slickspot peppergrass conservation agreement as an RDF, may result in reduced impacts from invasive plant species. One particular concern, already discussed in the wildfire management, fuels management and wildfire restoration/rehabilitation - ESR program areas above, is for the intentional use of potentially invasive species such as intermediate wheatgrass and forage kochia to provide greenstrip fuel breaks. In order for potentially invasive nonnative species to be used, an environmental analysis must determine that the benefits of their use outweighs the risk of invasion to slickspot peppergrass and its habitat relative to other alternative fuel break methods.

If used, a comprehensive monitoring strategy would be implemented, and control measures for the potentially invasive species would be incorporated into project design features. Potentially invasive nonnative species would not be used within 1.5 miles of slickspot peppergrass element occurrences.

The dominance of cheatgrass in an area may also be positively related to the density of Owyhee harvester ants (*Pogonomyrmex salinus*), which represent an emerging threat to slickspot peppergrass. The replacement of sagebrush by annual grasses such as cheatgrass apparently creates conditions favorable to nesting of the native harvester ant, leading to expanded range and density of this potentially important seed predator of slickspot peppergrass (USFWS 2009a). There are potential negative consequences for plant reproduction and maintenance of the slickspot peppergrass seed bank due to Owyhee harvester ants removing mature, seed-bearing fruits from the plants or removing seeds already dropped to the ground and returning them to their nests outside the slickspot habitats.

### Habitat Restoration and Vegetation Management Summary

With this decision, no specific habitat restoration and vegetation management activities are proposed. At this programmatic planning level, future habitat restoration and vegetation management actions are unknown and not reasonably certain to occur. Any possible effects are too speculative to meaningfully evaluate at this time. All future site-specific projects will include an environmental analysis through the NEPA process and ESA Section 7 consultation.

Even though the type, location, timing, and extent of effects are not possible to analyze at this time, it is possible that some negative impacts on slickspot peppergrass habitat categories may potentially occur with future project implementation, most likely from mechanical ground disturbance, herbicide application, use of ground-disturbing seeding or planting techniques, and competition from invasive or potentially invasive, nonnative plant species. Although invasive and potentially invasive nonnative species will likely remain on the landscape and continue to impact slickspot peppergrass populations and habitat categories, their effects may possibly be reduced by the proposed increase of emphasis on invasive species control and the particular conservation measures required by the 2014 slickspot peppergrass conservation agreement. Because specific future projects are unknown, these potential effects are not considered in the determination of effects for this proposed action.

### ***Cumulative Effects***

To evaluate cumulative effects, the future state, tribal, local, or private actions that are reasonably certain to occur within the action area are identified, and their effects are added to the anticipated effects of the current proposal. The action area for the current proposal is limited to PHMA, IHMA, and GHMA occurring on BLM- and Forest Service-administered lands. No state, tribal, local, or private lands exist within the action area, and no state, tribal, local, or private actions are planned or expected to occur in the action area. Only federal actions are expected to occur in the action area; therefore, no cumulative effects are expected.

### *Summary and Determination of Effects on Slickspot Peppergrass*

The decision to adopt the proposed LUP amendments does not propose any ground-disturbing actions. Some site-specific activities in support of GRSG habitat management may be proposed that have some future potentially negative impacts on slickspot peppergrass habitat categories (e.g., establishing vegetated fuel breaks with potentially invasive plant species, using mechanical methods or chemical applications for habitat restoration and vegetation management projects, or relocating salt placements and water developments relating to livestock grazing). However, the type, location, timing, and extent of such activities are unknown at this time and are too speculative to allow a meaningful analysis of their effects. Because specific future projects are unknown, these potential effects are not considered in the determination of effects for this proposed action. All future site-specific projects will include an environmental analysis through the NEPA process and ESA Section 7 consultation. Potential negative effects on slickspot peppergrass would be avoided, minimized, or mitigated through site-specific analysis at the project level and by implementing the slickspot peppergrass conservation measures.

The 2014 slickspot peppergrass conservation agreement is included in this decision as an RDF and would be followed for any proposed activities in slickspot peppergrass habitat categories. The slickspot peppergrass conservation agreement measures common to all program areas state that surveys would be conducted, habitat categories would be mapped, and population trends would be monitored. In addition, ongoing federal actions would be reviewed and modified as necessary to avoid or minimize negative impacts, and Section 7 compliance would be completed for activities that may affect slickspot peppergrass and its habitat.

One conservation measure for GRSG is specific and would likely be implemented soon after the decision (BLM TM-1, restricting motorized vehicle travel to existing roads and trails). This measure would provide a contemporaneous beneficial effect on slickspot peppergrass and its habitats within affected areas of GRSG HMAs by reducing the likelihood of impacts from off-road vehicle use in areas where new vehicle restrictions overlap slickspot peppergrass habitat categories.

Another proposed conservation measure for GRSG (BLM LR-12, retrofitting existing towers and structures) is somewhat specific and reasonably certain to occur. This measure may impact slickspot peppergrass plants that might occur on roadsides or near towers, but it is highly unlikely that plants would occur in areas affected by vehicles accessing the sites or foot trampling near the towers. Thus, the possible adverse effects are discountable.

The remaining proposed conservation measures for GRSG that have potential to negatively affect slickspot peppergrass are not known at this time and are too speculative to allow a meaningful analysis of effects. Therefore, the following summary of such potential program area effects are described at a very general level and are not considered in the determination of effects:

- Examples of speculative actions in the recreation/travel program area include: REC-1, manage existing recreation uses and sites to minimize adverse effects on GRSG or their habitat through incorporation of RDFs, buffers, and seasonal restrictions; REC-2, limit

construction of new recreation facilities; TM-2, consider temporary travel closures or restrictions; and TM-4, plan and design travel systems to minimize adverse effects on GRSG (including a statement to give special attention to protect endangered or threatened species and their habitats). These restrictive actions could reduce the likelihood of negative impacts on slickspot peppergrass.

- Retaining or acquiring federal ownership of PHMA or IHMA lands may benefit slickspot peppergrass by reducing the likelihood of its habitat being converted to agriculture, urbanization, or other uses. Specific measures in the slickspot peppergrass conservation agreement state that private lands containing slickspot peppergrass habitat categories would be acquired where feasible and that occupied slickspot peppergrass habitat in federal ownership would be retained.
- Possible changes to livestock grazing may reduce or increase the likelihood of negative impacts on slickspot peppergrass and its habitat due to potential reductions or changing the timing of livestock use. There is also potential for positive or negative effects from the possibility of changes to locations of salt placements, fences, and water developments.
- With implementation of the proposed conservation measures for GRSG regarding the energy and minerals program area, plus the slickspot peppergrass conservation measures and other RDFs, impacts from new and currently authorized mining activities may be reduced or prevented because the measures are restrictive in nature.
- Proposed management actions under the wildfire management program area could reduce negative impacts from wildfire damage and suppression activities and may benefit slickspot peppergrass and its habitats. Conservation measures for the fuels management program area may reduce negative impacts from fuels management activities, mainly by limiting the negative effects from potentially invasive nonnative species such as intermediate wheatgrass and forage kochia, and by preventing or reducing the likelihood of wildfires damaging slickspot peppergrass occurrences and habitat categories. Conservation measures for the wildfire restoration/rehabilitation – ESR program area could potentially reduce negative impacts from ESR activities by limiting the use of potentially invasive nonnative species such as intermediate wheatgrass and forage kochia, using seeding techniques that minimize ground disturbance, and protecting disturbed and recovering areas using temporary closures or other measures.
- There is the potential for indirect effects from future site-specific ground-disturbing actions relating to the habitat restoration and vegetation management program area, such as prescribed fire, mechanical vegetation treatments, herbicide application, and associated vehicle access. Negative impacts on slickspot peppergrass habitat categories may potentially occur with future projects in the habitat restoration and vegetation management program area, most likely from mechanical ground disturbance, herbicide application, use of ground-disturbing seeding or planting techniques, and competition from invasive or potentially invasive, nonnative plant species. The effects from invasive and potentially invasive nonnative species may possibly be reduced by the proposed increase of emphasis on invasive species control and the relevant conservation measures required by the 2014 slickspot peppergrass conservation agreement.

**The Idaho-Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement is not likely to jeopardize the continued existence of slickspot peppergrass.** The estimated effects on occurrences and suitable habitat that exist in PHMA, IHMA, and GHMA in the Four Rivers and Jarbidge Field Offices would be beneficial due to the reduced impacts from off-road vehicles, and only slight indirect negative effects may result (but are highly unlikely) from existing tower retrofit activities. Further, there are no potential direct negative effects on this species from this action. In addition, any possible negative effects from future ground-disturbing actions would likely be avoided. Site-specific analysis, possible mitigation, and a further determination of effects would occur at the project level.

Because no suitable habitats for slickspot peppergrass are suspected to occur within the Bruneau, Burley, Challis, Dillon, Owyhee, Pocatello, Salmon, Shoshone, or Upper Snake Field Offices or the Boise, Beaverhead-Deerlodge, Caribou-Targhee, Salmon-Challis, or Sawtooth National Forests, or the Curlew National Grassland, there would be no effects on slickspot peppergrass in these areas.

### Slickspot Peppergrass Proposed Critical Habitat

The PCEs of slickspot peppergrass proposed critical habitat include four elements:

1. Ecologically functional microsites or “slickspots” that are characterized by:
  - a. A high sodium and clay content and a three-layer soil horizonation sequence, which allows for successful seed germination, seedling growth, and maintenance of the seed bank. The surface horizon consists of a thin, silty, vesicular, pored (small cavity) layer that forms a physical crust (the silt layer). The subsoil horizon is a restrictive clay layer with an abrupt boundary with the surface layer that is natric or natric-like in properties (a type of argillic (clay-based) horizon with distinct structural and chemical features) (the restrictive layer). The second argillic subsoil layer (that is less distinct than the upper argillic horizon) retains moisture through part of the year (the moist clay layer); and
  - b. Sparse vegetation with low to moderate introduced, invasive, nonnative plant species cover.
2. Relatively intact, native *Artemisia tridentata* ssp. *wyomingensis* (Wyoming big sagebrush) vegetation assemblages, represented by native bunchgrasses, shrubs, and forbs, within 250 meters of *Lepidium papilliferum* element occurrences to protect slickspots and *Lepidium papilliferum* from disturbance from wildfire, slow the invasion of slickspots by nonnative species and native harvester ants, and provide the habitats needed by *L. papilliferum*'s pollinators.
3. A diversity of native plants whose blooming times overlap to provide pollinator species with sufficient flowers for foraging throughout the seasons and to provide nesting and egg-laying sites; appropriate nesting materials; and sheltered, undisturbed places for hibernation and overwintering of pollinator species. In order for genetic exchange of *Lepidium papilliferum* to occur, pollinators must be able to move freely between slickspots. Alternative pollen and nectar sources (other plant species within the surrounding sagebrush vegetation) are needed to support pollinators during times when

*Lepidium papilliferum* is not flowering, when distances between slickspots are large, and in years when *L. papilliferum* is not a prolific flowerer.

4. Sufficient pollinators for successful fruit and seed production, particularly pollinator species of the sphecid and vespidae wasp families, species of the bombyliid and tachinid fly families, honeybees, and halictid bee species, most of which are solitary insects that nest outside of slickspots in the surrounding sagebrush-steppe vegetation, both in the ground and within the vegetation.

## Direct and Indirect Effects by Program Area

### 1. Recreation/Travel

Off-road vehicle use can disturb important soil horizons in slickspots, damage individuals or nests of pollinators, and contribute to the spread of nonnative invasive plants. One conservation measure for GRSG that is specific and would likely be implemented soon after the decision (BLM TM-1, restricting motorized vehicle travel to existing roads and trails) may provide a contemporaneous beneficial effect on slickspot peppergrass proposed critical habitat within affected areas of GRSG HMAs by reducing the likelihood of impacts from off-road vehicle use in areas where new vehicle restrictions overlap slickspot peppergrass proposed critical habitat. Possible effects as a result of the proposed conservation measures concerning other potential activities in the recreation and travel program area are not considered in this analysis and determination of effects, because specific activities are unknown and too speculative to be meaningfully addressed.

### 2. Lands and Realty

The lands and realty program area has potential to affect slickspot peppergrass proposed critical habitat by authorizing changes in land use (possibly resulting in infrastructure and facility development and associated loss of habitat and/or damage to individuals), by changing land ownership (possibly resulting in decreased protection of listed species), and by administering the use of rights-of-way.

All but one of the actions related to the lands and realty program area are unknown or too speculative at this time to be meaningfully addressed in this programmatic analysis. The one conservation action in the lands and realty program area that may affect slickspot peppergrass is BLM LR-12, which states to “*work with ROW holders to retrofit existing towers and structures consistent with RDFs.*” This action is reasonably certain to occur. Implementing this action would involve transporting personnel and supplies to each tower or structure needing to be retrofitted. The minimal disturbance to vegetation would be from vehicle access along the right-of-way roads, possibly including parking the vehicles off the roads near each tower, and from foot traffic near the towers during retrofit activities. Ecologically functional slickspots are not likely to be present in the areas that may be impacted by this activity (access roads and areas directly adjacent to existing towers and structures) due to the previous disturbance involved with installation of the structures and access roads. Thus, there is an extremely low likelihood of impacts on ecologically functional slickspots from tower retrofit activities, and the effect is discountable. Furthermore, the same impacts may occur from maintenance activities that are already analyzed and consultation completed in previous environment analysis. The retrofit activity would not constitute an increase in the currently authorized use of these rights-of-way.

Because the expected retrofit activities involve very little, if any, disturbance to vegetation or soils, it is also highly unlikely that the other three PCEs (relatively-intact Wyoming big sagebrush vegetation, diversity of plants for pollinators, and presence of pollinators) would be impacted.

### ***3. Range, Energy and Minerals, Fire/Fuels Management, and Habitat Restoration and Vegetation Management***

Specific activities in these remaining program areas are not identified at this time. The type, location, timing, and extent of future activities are unknown and too speculative to allow a meaningful analysis of effects at this programmatic planning level. Further analysis of any future projects will include Section 7 consultation if necessary, and site-specific environmental analysis and determination of effects will occur when the details of such proposals become available. In addition, the 2014 slickspot peppergrass conservation agreement would be implemented, as it is included in the current proposal as an RDF.

### ***Summary and Determination of Effects on Slickspot Peppergrass Proposed Critical Habitat***

**The Idaho-Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement is not likely to result in destruction or adverse modification of slickspot peppergrass proposed critical habitat.** The estimated effects on proposed critical habitat that exist in PHMA, IHMA, and GHMA in the Four Rivers and Jarbidge Field Offices would be beneficial due to the reduced impacts from off-road vehicles, and indirect negative effects may result (but are extremely unlikely) from existing tower retrofit activities. Further, there are no potential direct negative effects on slickspot peppergrass proposed critical habitat from this action. In addition, any possible negative effects from future ground-disturbing actions would likely be avoided, because site-specific analysis, possible mitigation, and a further determination of effects would occur at the project level.

Because no slickspot peppergrass proposed critical habitat exists within the Bruneau, Burley, Challis, Dillon, Owyhee, Pocatello, Salmon, Shoshone, or Upper Snake Field Offices or the Boise, Beaverhead-Deerlodge, Caribou-Targhee, Salmon-Challis, or Sawtooth National Forests, or the Curlew National Grassland, there would be no effects on slickspot peppergrass proposed critical habitat in these areas.

### ***Ute Ladies'-tresses (*Spiranthes diluvialis*)***

Ute ladies'-tresses is known to occur on the Dillon, Pocatello, and Upper Snake Field Offices and the Caribou-Targhee National Forest. None of the known populations are within PHMA, IHMA, or GHMA. The closest known location is over 0.6 mile from IMHA, in Fremont County, Idaho. It is also suspected to occur on the Salmon-Challis and Sawtooth National Forests. Although the extent and specific locations are not known, it is likely that some areas of suitable habitat for Ute ladies'-tresses do exist within GRSG HMAs because some wetland habitats are included. The areas most likely to support populations (riparian areas along major river drainages) have mostly been excluded from GRSG HMAs.

Threats to Ute ladies'-tresses include off-road vehicle use, competition with aggressive nonnative plants, alteration of hydrologic regimes through stream management, urbanization (conversion of potential habitat and increasing demands for water), drought, trampling from livestock, wild horses, and burros, and recreational use (Fertig, et. al 2005, USFWS 1995). Of these threats, effects from off-road vehicle use, competition with nonnative plants, and trampling could potentially occur from proposed actions.

### ***Direct and Indirect Effects by Program Area***

#### ***1. Recreation/Travel***

Off-road vehicle use is a threat to Ute ladies'-tresses because direct contact can damage or kill individuals. Soil disturbance as a result of off-road vehicle use can also increase erosion. In addition, recreation and vehicle uses can contribute to the spread of nonnative invasive plants. Off-road vehicle use and recreation impacts do not typically occur in Ute ladies'-tresses habitats, except for the occasional campers with such vehicles, trampling from fishing access, and possibly vehicle use associated with right-of-way maintenance.

With this action, no additional travel or vehicle uses are proposed. BLM TM-1 states: *Limit off-highway vehicle motorized travel within Idaho BLM Field Offices to existing roads, primitive roads, and trails in areas where travel management planning has not been completed or is in progress. This excludes areas previously designated as open through a land use plan decision or currently under review for designation as open and currently being analyzed in ongoing RMP revision efforts in the Four Rivers, Jarbidge, and Upper Snake Field Offices. Upon completion of travel management plans, the designation would change to limited to designated roads, primitive roads, and trails.* Where travel management planning has not been completed or is in progress, and Ute ladies'-tresses habitat is present, there may be a reduction of impacts from off-road vehicle use. Thus, if any areas of occupied or suitable habitat for Ute ladies'-tresses within GRSG HMAs are currently open to off-road vehicle use, restrictions would be placed on vehicles to use only existing routes. This would provide a small and contemporaneous beneficial effect on Ute ladies'-tresses by reducing the likelihood of damage from off-road vehicles.

#### ***2. Lands and Realty***

Only one conservation measure in the lands and realty program area may affect Ute ladies'-tresses. BLM LR-12 states to “*work with ROW holders to retrofit existing towers and structures consistent with RDFs.*” This action is reasonably certain to occur and because the level of disturbance would be minimal, it is not expected to be analyzed in future environmental analysis. Implementing this action would involve transporting personnel and supplies to each tower needing to be retrofitted. The minimal disturbance to vegetation would be from vehicle access along the right-of-way roads, possibly including parking the vehicles off the roads near each tower, and from foot traffic near the towers during retrofit activities. If present in these areas, Ute ladies'-tresses individuals may be damaged by the crushing action of vehicle tires and foot traffic. Because towers, structures, and access roads generally avoid riparian habitats, Ute ladies'-tresses is not likely to be present on or directly adjacent to right-of-way roads or near existing towers. Thus, the likelihood of damage to the plants is very small and, furthermore, the

expected magnitude of impact would be so small as to be insignificant. If any plants are affected, they would likely have survived much greater disturbances or would have become established within previously disturbed areas along the right-of-way. If individual plants are impacted by vehicles or foot traffic, aboveground portions of the plants may be damaged, but the perennial tuberous-thickened roots would not be damaged and the plants would not be killed. Seed production for the affected individuals may be lost for that growing season. In addition, the unlikely but possible impacts on Ute ladies'-tresses individuals due to this action would not significantly impact the local populations because the adjacent core habitat would be unaffected.

### *3. Range*

Livestock grazing is authorized in many areas affected by the proposed LUP amendments. Active stocking rates for livestock grazing would remain the same, though the stocking on an allotment may be adjusted based on site-specific conditions to meet management objectives during term permit renewals, allotment management plan development, or other appropriate implementation planning. Additionally, temporary adjustments can be made annually to livestock numbers and season of use in accordance with applicable regulations. Certain levels and timing of grazing are compatible maintenance of Ute ladies'-tresses habitats. For instance, winter grazing has been shown to be beneficial to Ute ladies'-tresses populations in Colorado by reducing competing vegetation and escape cover for voles (Fertig, et. al 2005). However, decreased flower and fruit production have been observed at sites that are grazed or trampled in summer (Fertig, et. al 2005).

With the proposed LUP amendments, when GRSG habitat objectives are not being met or progress toward them is not being made, potential modifications may include changes in season or timing of use, numbers or distribution of livestock, duration and/or level of use, kind of livestock, and possible periods of rest or deferment (BLM RM-6 and FS GRSG-LG-GL-001-Guideline). Changes in livestock grazing may or may not be considered as a result of the LUP amendments, and the location, timing, and type of possible change is not known at this time. This programmatic decision would not authorize changes to current range management. Because changes in livestock grazing are speculative, the effects on Ute ladies'-tresses cannot be reasonably foreseen at this time. Due to the considerable uncertainty of changes to current grazing, these effects are not addressed in this analysis. Possible beneficial effects would not be concurrent with this programmatic decision, and possible negative effects would be too speculative to allow a meaningful analysis. If changes are proposed in the future, the effects on Ute ladies'-tresses and other resources would be evaluated and analyzed through the NEPA process and ESA Section 7 consultation as needed when the site-specific actions are considered.

### *4. Energy and Minerals*

Energy and mineral development is not currently a threat identified by the USFWS for Ute ladies'-tresses. This may be due to widespread general restrictions on these activities in riparian habitats. Regardless of whether they are identified threats, the proposed action only places restrictions on these activities, which could have potential for beneficial effects. No new energy and mineral activities are proposed. Several conservation measures in the proposed action may

prevent or reduce general impacts from energy and mineral activities, but these measures would become effective in the future as the activities are proposed or parcels are leased. Therefore, any potential beneficial effects on Ute ladies'-tresses from reduced impacts of energy and mineral development would be analyzed in the future at the site-specific level and would not be contemporaneous with this decision. Potential beneficial effects from the action with respect to energy and mineral development are therefore not considered in this programmatic level analysis but will be addressed in subsequent site-specific analyses.

### ***5. Fire/Fuels Management***

The conservation measures in the fire and fuels management program area have little relevance to Ute ladies'-tresses, because generally no fire and fuels management activities are conducted in riparian habitats, and fire is not considered a threat to this species. No direct negative effects are expected because no new fire and fuels management activities are proposed. Restrictive measures in this program area may benefit this species by reducing the likelihood of impacts from the fire and fuels management program activities, but the measures would become effective in the future as specific activities are proposed. Therefore, any potential beneficial effects on Ute ladies'-tresses would not be concurrent with this decision. Furthermore, any potential effects from future activities will be addressed in subsequent site-specific analyses.

### ***6. Habitat Restoration and Vegetation Management***

Ute ladies'-tresses would not be negatively affected by conservation measures in the proposed LUP amendments for the habitat restoration and vegetation management program areas because no new activities are proposed. Vegetation management activities in riparian habitats can alter Ute ladies'-tresses habitat components (such as maintaining earlier successional conditions, or allowing successional changes to proceed), but no specific activities are proposed.

Noxious weed and invasive species treatments would be required on disturbed project construction areas for at least 3 years (BLM INV-4). This conservation measure has potential to benefit Ute ladies'-tresses by reducing the threat of increased competition from invasive species. If treatments were to occur within occupied habitats, there is a possibility of negative effects from exposure to herbicides. However, noxious weed and invasive species treatments would occur with implementation of future projects that are unknown at this time and are thus speculative and uncertain to occur. All potential effects from future activities will be addressed in subsequent site-specific analyses.

### ***Cumulative Effects***

To evaluate cumulative effects, the future state, tribal, local, or private actions that are reasonably certain to occur within the action area are identified, and their effects are added to the anticipated effects of the current proposal. The action area for the current proposal is limited to PHMA, IHMA, and GHMA occurring on BLM- and Forest Service-administered lands. No state, tribal, local, or private lands exist within the action area, and no state, tribal, local, or private actions are planned or expected to occur in the action area. Only federal actions are expected to occur in the action area; therefore, no cumulative effects are expected.

### *Summary and Determination of Effects on Ute ladies'-tresses*

Because the proposed LUP amendments do not propose any specific ground-disturbing actions, there would be no direct effects on Ute ladies'-tresses from this programmatic decision.

A potential beneficial effect on Ute ladies'-tresses may result in PHMA and GHMA from the action of restricting vehicle use to existing roads and trails (BLM TM-1, where travel planning has not previously been completed). A slight chance of damage to individuals may result from retrofitting existing towers with perch deterrents (BLM LR-12), but the likelihood of damage is very small and the expected magnitude of impact would be so small as to be insignificant.

There is potential for beneficial effects from reduced impacts from energy and minerals, fire/fuels management, habitat restoration, and vegetation management activities. Although these threats may be reduced by the proposed LUP amendments, any benefit due to restricted or prohibited actions would occur in future years, and thus the benefit would not be contemporaneous and is not considered in this analysis. All potential effects will be considered during future site-specific analyses.

There is also potential for additional indirect effects (effects caused by the action, but are later in time) from future site-specific ground-disturbing actions in many program areas. At this programmatic planning level, these future projects are unknown and not reasonably certain to occur, and any possible effects are too speculative to evaluate at this time. All future site-specific projects will include an environmental analysis through the NEPA process and ESA Section 7 consultation. Potential negative effects on Ute ladies'-tresses would be avoided, minimized, or mitigated through site-specific analysis at the project level.

**The Idaho-Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement may affect, but will not likely adversely affect, Ute ladies'-tresses.** The estimated effects on occurrences and suitable habitat that exist in PHMA, IHMA, and GHMA in the Dillon, Pocatello, and Upper Snake Field Offices and the Caribou-Targhee, Salmon-Challis, and Sawtooth National Forests would be beneficial due to the reduced impacts from off-road vehicles, and only slight indirect negative effects may result (but are highly unlikely) from existing tower retrofit activities. Further, there are no potential direct negative effects on this species from this action. In addition, any possible negative effects from future ground-disturbing actions would likely be avoided because site-specific analysis and mitigation would occur at the project level.

Because no suitable habitats for Ute ladies'-tresses are suspected to occur within the Bruneau, Burley, Challis, Four Rivers, Jarbidge, Owyhee, Salmon, or Shoshone Field Offices, or the Boise or Beaverhead-Deerlodge National Forests, or the Curlew National Grassland, there would be no effects on Ute ladies'-tresses in these areas.

## DETERMINATIONS OF EFFECTS SUMMARY BY SPECIES

Species	Status <sup>16</sup>	Determination <sup>17</sup>	Rationale
Grizzly bear <i>Ursus arctos horribilis</i>	T	NLAA	The Idaho-Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement decision and associated actions occurring on the Bruneau, Burley, Challis, Jarbidge, Owyhee, Pocatello, Salmon, Shoshone, Four Rivers Field Offices, the Boise, Salmon-Challis, or Sawtooth National Forests, and the Curlew National Grassland will not affect grizzly bears because these field offices and national forests/grassland do not contain occupied habitat for grizzly bears. Similar actions occurring within the Upper Snake or Dillon Field Offices or the Beaverhead-Deerlodge or Caribou-Targhee National Forests may affect, but are not likely to adversely affect, the grizzly bear or its habitat. GRSG LUPA decision goals, objectives, desired conditions, standards, and guidelines that could have any bearing on the major threats to grizzly bears—secure habitat, developed sites, food storage, livestock grazing, and four key food sources—are expected to be neutral, result in beneficial effects, or are too speculative in the absence of site-specific proposals to analyze at this time. Furthermore, adverse effects would likely be avoided, because site-specific analysis and mitigation would occur at the project level.
Canada lynx <i>Lynx canadensis</i>	T	NE	The Idaho-Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement decision and associated actions occurring on the Bruneau, Burley, Challis, Jarbidge, Owyhee, Pocatello, Salmon, Shoshone, Upper Snake, Four Rivers, or Dillon Field

<sup>16</sup> E = Endangered; P = Proposed Endangered; T = Threatened; P-T = Proposed Threatened

<sup>17</sup> NE = No Effect (Will not affect the species); NLJ = Not likely to jeopardize the continued existence of the species; NLAA = May affect, but is not likely to adversely affect; NLDAM = Not likely to result in destruction or adverse modification of proposed critical habitat

Biological Assessment for the Idaho and Southwestern Montana Greater Sage-Grouse  
Land Use Plan Amendment and Environmental Impact Statement

Species	Status <sup>16</sup>	Determination <sup>17</sup>	Rationale
			Offices, the Boise, Caribou-Targhee, Salmon-Challis, Sawtooth, or Beaverhead-Deerlodge National Forests, or the Curlew National Grassland will not affect Canada lynx because these field offices and national forests/grassland do not contain suitable habitat for Canada lynx.
Canada lynx critical habitat	Designated	NE	The Idaho-Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement decision and associated actions occurring on the Bruneau, Burley, Challis, Jarbidge, Owyhee, Pocatello, Salmon, Shoshone, Upper Snake, Four Rivers, or Dillon Field Offices, the Boise, Caribou-Targhee, Salmon-Challis, Sawtooth, or Beaverhead-Deerlodge National Forests, or the Curlew National Grassland will not affect Canada lynx designated critical habitat because these units do not contain Canada lynx designated critical habitat.
Northern Idaho ground squirrel <i>Spermophilus brunneus</i>	T	NE	The Idaho-Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement decision and associated actions occurring on the Bruneau, Burley, Challis, Jarbidge, Owyhee, Pocatello, Salmon, Shoshone, Upper Snake, or Dillon Field Offices, the Caribou-Targhee, Salmon-Challis, Sawtooth, or Beaverhead-Deerlodge National Forests, or the Curlew National Grassland will not affect northern Idaho ground squirrel because these field offices and national forests/grassland do not contain suitable habitat for northern Idaho ground squirrel. Similar actions occurring within the Four Rivers Field Office or Boise National Forest will not affect the northern ground squirrel or its habitat because potential habitat for northern ground squirrel within these units does not exist within sagebrush-steppe GRS habitat.
Red knot <i>Calidris canutus rufa</i>	P-T	NE	The Idaho-Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement decision and associated actions occurring on the Bruneau, Burley, Challis, Jarbidge, Owyhee, Pocatello, Salmon, Shoshone, Upper Snake, or Four Rivers Field Offices, the Boise, Caribou-Targhee, Salmon-Challis, Sawtooth, or Beaverhead-Deerlodge National Forests, or the Curlew National Grassland will not affect red knot because these field offices and national forests/grassland do

Biological Assessment for the Idaho and Southwestern Montana Greater Sage-Grouse  
Land Use Plan Amendment and Environmental Impact Statement

Species	Status <sup>16</sup>	Determination <sup>17</sup>	Rationale
			not contain suitable habitat for the red knot. Similar actions occurring within the Dillon Field Office will not affect the red knot or its habitat because there are no actions within this LUPA decision that would impact aquatic conditions that may serve as migratory stopover habitat for red knot. In addition, site-specific analysis will be conducted at the project level, and a determination of effects for the red knot will be made at that time (See Appendix A).
Western yellow-billed cuckoo <i>Coccyzus americanus</i>	T	NE	The Idaho-Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement and associated actions occurring on the Dillon Field Office, Boise National Forest, Caribou-Targhee National Forest, Salmon-Challis National Forest, Sawtooth National Forest, BDNF, or Curlew National Grassland will not affect the western yellow-billed cuckoo or its habitat because this field office and these national forests/grassland are either outside of the range of or are not known to contain suitable habitat for the western yellow-billed cuckoo. Similar actions occurring on the Bruneau, Burley, Challis, Jarbidge, Owyhee, Pocatello, Salmon, Shoshone, Upper Snake, or Four Rivers Field Offices will not affect the western yellow-billed cuckoo or its habitat because it is unlikely that western yellow-billed cuckoos are breeding within the action area and the LUPA and EIS contain no actions that would adversely impact riparian areas. Site-specific analysis will be conducted at the project level, and a determination of effects for the yellow-billed cuckoo will be made at that time.
Western yellow-billed cuckoo critical habitat	Proposed	NLDAM	The Idaho-Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement decision and associated actions occurring on the Bruneau, Burley, Challis, Dillon, Jarbidge, Owyhee, Pocatello, Salmon, Upper Snake, or Four Rivers Field Offices, the Boise, Caribou-Targhee, Salmon-Challis, Sawtooth, or Beaverhead-Deerlodge National Forests, or the Curlew National Grassland will not affect western yellow-billed cuckoo proposed critical habitat because these units do not contain yellow-billed cuckoo proposed critical habitat. Similar

Biological Assessment for the Idaho and Southwestern Montana Greater Sage-Grouse  
Land Use Plan Amendment and Environmental Impact Statement

Species	Status <sup>16</sup>	Determination <sup>17</sup>	Rationale
			actions occurring on the Shoshone Field Office are not likely to lead to the destruction or adverse modification of western yellow-billed cuckoo proposed critical habitat because the LUPA and EIS contain no actions that would adversely impact proposed critical habitat PCEs, and site-specific analysis will be conducted at the project level and a determination of effects for yellow-billed cuckoo proposed critical habitat will be made at that time.
Bull trout <i>Salvelinus confluentus</i>	T	NE	The Idaho-Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement decision and associated actions occurring on the Burley Field Office, Owyhee Field Office, Pocatello Field Office Shoshone Field Office, Dillon Field Office, the Caribou-Targhee National Forest, or the Curlew National Grassland will not affect bull trout because these field offices and national forests/grassland do not contain suitable habitat for bull trout. Similar actions occurring within the Bruneau, Challis, Jarbidge, Salmon, Upper Snake, or Four Rivers Field Offices, or the Boise, Salmon-Challis, Sawtooth, or Beaverhead-Deerlodge National Forests will not affect bull trout or its habitat because there are no actions within this LUPA decision that would impact aquatic habitat or cause water depletions in lakes, rivers, or streams occupied by bull trout (See Appendix A).
Bull trout Critical Habitat	Designated	NE	The Idaho-Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement decision and associated actions occurring on the Burley, Owyhee, Pocatello, Shoshone, or Dillon Field Offices, the Caribou-Targhee National Forest, or the Curlew National Grassland will not affect bull trout critical habitat because these field offices and national forests/grassland do not contain suitable habitat for bull trout. Similar actions occurring within the Bruneau, Challis, Jarbidge, Salmon, or Upper Snake Field Offices or the Boise, Salmon-Challis, Sawtooth, or Beaverhead-Deerlodge National Forests will not affect bull trout critical habitat because there are no actions within this LUPA decision that would impact PCE of bull trout critical habitat by altering

Biological Assessment for the Idaho and Southwestern Montana Greater Sage-Grouse  
Land Use Plan Amendment and Environmental Impact Statement

Species	Status <sup>16</sup>	Determination <sup>17</sup>	Rationale
			water quality or quantity or natural conditions. In addition, site-specific analysis will be conducted at the project level, and a determination of effects for bull trout critical habitat will be made at that time.
Chinook salmon <i>Oncorhynchus tshawytscha</i> Snake River spring/summer run	T	NE	The Idaho-Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement decision and associated actions occurring on the Bruneau, Burley, Jarbidge, Owyhee, Pocatello, Shoshone, Upper Snake, Four Rivers, or Dillon Field Offices, the Caribou-Targhee or Beaverhead-Deerlodge National Forests, or the Curlew National Grassland will not affect Chinook salmon because these field offices and national forests/grassland do not contain suitable habitat for Chinook salmon. Similar actions occurring on the Challis and Salmon Field Offices, or the Boise, Salmon-Challis, or Sawtooth National Forests will not affect Chinook salmon or its habitat because there are no actions within this LUPA decision that would impact aquatic habitat or cause water depletions to the Snake River or its tributaries (See Appendix A).
Chinook salmon Snake River critical habitat	Designated	NE	The Idaho-Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement decision and associated actions occurring on the Bruneau, Burley, Jarbidge, Owyhee, Pocatello, Upper Snake, or Dillon Field Offices, the Caribou-Targhee or Beaverhead-Deerlodge National Forests, or the Curlew National Grassland will not affect Snake River Spring/Summer Run Chinook salmon designated critical habitat because Chinook salmon critical habitat does not occur on these units. Similar actions occurring on the Challis, Salmon, Shoshone, and Four Rivers Field Offices, and the Boise, Salmon-Challis, and Sawtooth National Forests will not affect Chinook Salmon critical habitat because there is no overlap between Chinook salmon critical habitat on these units and GRSB PHMA, GHMA, or IHMA.
Sockeye salmon <i>Oncorhynchus nerka</i> Snake River	E	NE	The Idaho-Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement decision and associated actions occurring on the Bruneau, Burley, Jarbidge, Owyhee, Pocatello, Shoshone, Upper Snake, Four Rivers, or Dillon Field Offices, the Boise,

Species	Status <sup>16</sup>	Determination <sup>17</sup>	Rationale
			Sawtooth, or Beaverhead-Deerlodge National Forests, or the Curlew National Grassland will not affect Snake River Physa because these field offices and national forests/grassland do not contain suitable habitat for the species. Similar actions occurring on the Bruneau, Burley, Jarbidge, Owyhee, Shoshone, and Four Rivers Field Offices will not affect Snake River Physa or its habitat because there are no actions within this LUPA decision that would impact aquatic habitat or cause water depletions in Snake River Physa habitat. In addition, site-specific analysis will be conducted at the project level, and a determination of effects for Snake River Physa will be made at that time (See Appendix A).
Slickspot peppergrass <i>Lepidium papilliferum</i>	P-E	NLJ	<p>The Idaho-Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement is not likely to jeopardize the continued existence of slickspot peppergrass because the estimated effects on occurrences and suitable habitat that exist in PHMA, IHMA, and GHMA in the Four Rivers and Jarbidge Field Offices would be beneficial due to the reduced impacts from off-road vehicles, and only slight indirect negative effects may result (but are highly unlikely) from existing tower retrofit activities. Further, there are no potential direct negative effects on this species from this action. In addition, any possible negative effects from future ground-disturbing actions would likely be avoided because site-specific analysis, possible mitigation, and a further determination of effects would occur at the project level.</p> <p>Because no suitable habitats for slickspot peppergrass are suspected to occur within the Bruneau, Burley, Challis, Dillon, Owyhee, Pocatello, Salmon, Shoshone, or Upper Snake Field Offices, the Boise, Beaverhead-Deerlodge, Caribou-Targhee, Salmon-Challis, or Sawtooth National Forests, or the Curlew National Grassland, there would be no effects on slickspot peppergrass in these areas.</p>

## **APPENDIX A: Additional Rationale for No Effect Determinations for Select Species or Groups of Species in Tables 2 and 3**

### **Canada Lynx**

#### ***Environmental Baseline, Critical Habitat, and Threats to the Species***

Canada lynx and its habitat will not be affected by this project. In Table 2, the BLM Field Offices: Challis, Salmon, Shoshone, and Dillon indicate that Canada lynx have either been documented or suspected to occur within those units. Table 3 indicates that Canada lynx have been documented on the Boise, Caribou-Targhee, and Sawtooth National Forests. The Caribou, Beaverhead-Deerlodge, and Salmon-Challis National Forests are mapped as secondary, unoccupied habitat, while most of the Targhee National Forest is secondary habitat but is considered occupied habitat. Sagebrush habitat is not considered a primary or secondary habitat for Canada lynx in Idaho or Southwestern Montana. Therefore, there are no actions within this LUPA decision that will affect habitat quality or availability. Potential beneficial effects are possible from improved conditions of connective habitat as well as reducing or co-locating anthropogenic disturbances for Canada lynx. In addition, site-specific analyses will be conducted at the project level, and a determination of effects for Canada lynx will be made at that time. Therefore, the Idaho and Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement will not affect Canada lynx or its habitat.

#### ***Discussion and Determination***

The Idaho-Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement decision will not affect the Canada lynx or its habitat. No suitable habitat occurs within the action area. The reported sightings within the action area are located outside of PHMA, GHMA, or IHMA. There are no actions within this LUPA decision that will affect Canada lynx suitable habitat quality or availability. In addition, site-specific analyses will be conducted at the project level, and a determination of effects for Canada lynx will be made at that time.

### **Canada Lynx Designated Critical Habitat**

#### ***Environmental Baseline***

No overlap occurs between designated critical habitat and PHMA, GHMA, or IHMA. Therefore, the Idaho and Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement will not affect designated critical habitat for Canada lynx.

## Idaho / SW Montana Greater Sage-grouse EIS Canada Lynx Designated/Proposed Critical Habitat

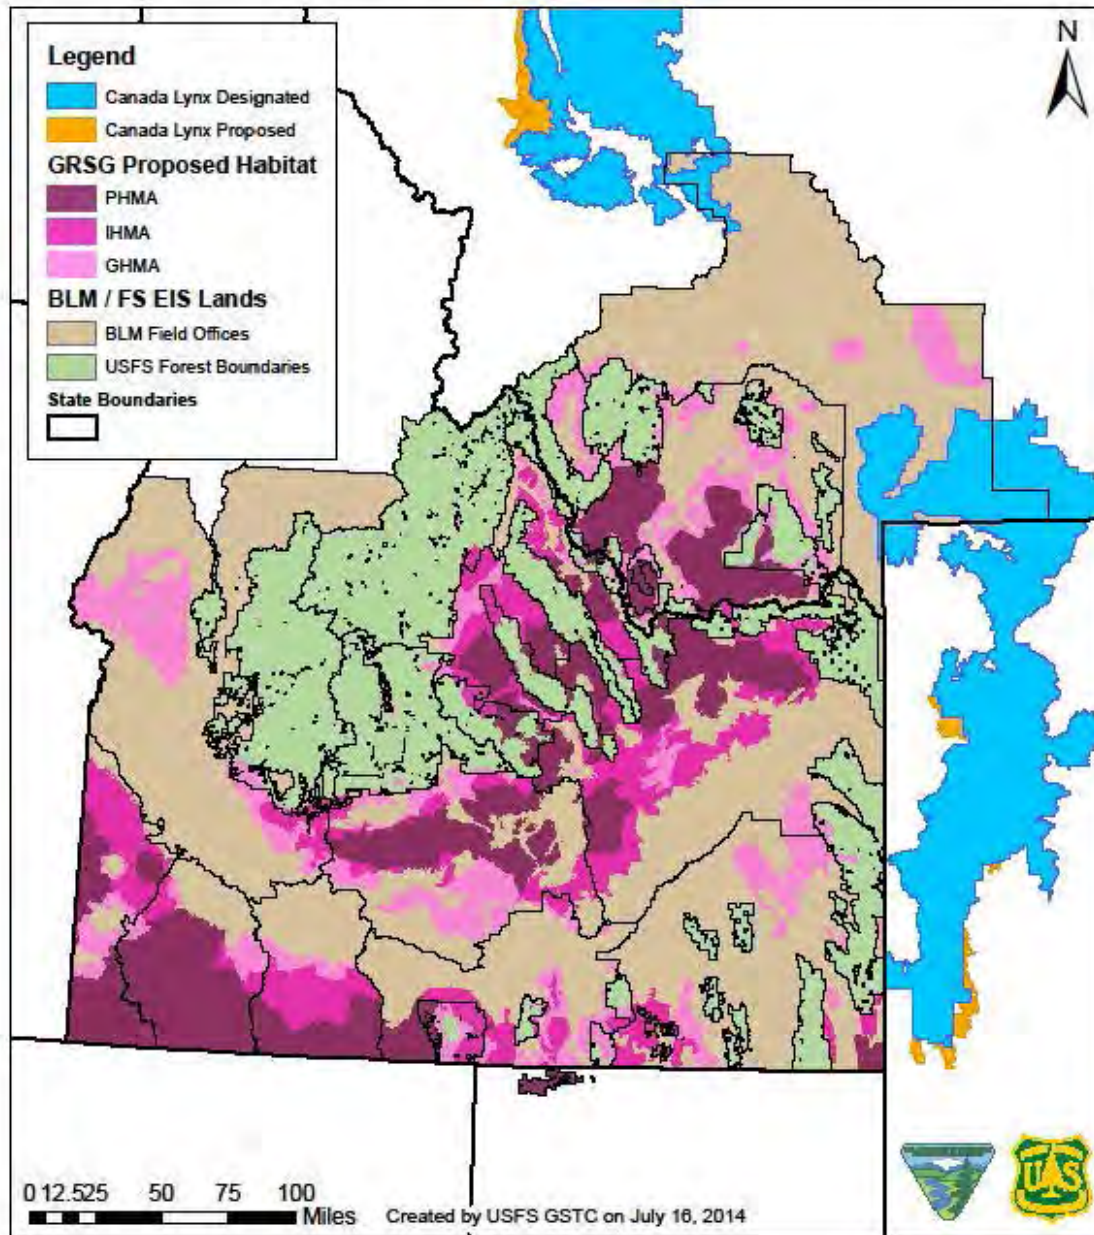

Figure 13. Canada lynx designated and proposed critical habitat with respect to Idaho-Southwestern Montana Greater Sage-Grouse LUPA and EIS action area.

### ***Discussion and Determination***

Canada lynx critical habitat will not be affected by this project. No overlap occurs between designated critical habitat and PHMA, GHMA, or IHMA. Therefore, the actions within this LUPA decision will not impact PCE of Canada lynx critical habitat by altering natural conditions. The Idaho and Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement will not affect Canada lynx critical habitat.

### **Red Knot**

#### ***Environmental Baseline, Critical Habitat, and Threats to the Species***

The red knot is a migrant shorebird that breeds in the Canadian Arctic and winters in South America. Within the action area, it is known only to occur as a rare migrant stopover in Madison County, Montana. Only one sighting has been reported within the Montana portion of the action area (Dillon Field Office), presumably during migration; the reported site location does not coincide with mapped GRSG PHMA, GHMA, or IHMA. Neither the red knot nor suitable habitat for the red knot is known or suspected to be present in the remaining units occurring within the action area: Bruneau Field Office, Burley Field Office, Challis Field Office, Jarbidge Field Office, Owyhee Field Office, Pocatello Field Office, Salmon Field Office Shoshone Field Office, Upper Snake Field Office, Four Rivers Field Office, Boise National Forest, Caribou-Targhee National Forest, Salmon-Challis National Forest, Sawtooth National Forest, or BDNF. Critical habitat has not been proposed or designated for the red knot.

### ***Discussion and Determination***

The Idaho-Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement decision will not affect the red knot or its habitat. No breeding or wintering habitat occurs within the action area. The only reported sighting within the action area was outside of PHMA, GHMA, or IHMA. There are no actions within this LUPA decision that will affect aquatic habitat quality or availability. In addition, site-specific analyses will be conducted at the project level, and a determination of effects for red knot will be made at that time.

### **Western Yellow-billed Cuckoo**

#### ***Environmental Baseline, Critical Habitat, and Threats to the Species***

The western DPS of the yellow-billed cuckoo (*Coccyzus americanus*) was federally listed as threatened by the USFWS on October 3, 2014; the ruling became effective November 3, 2014 (USFWS 2014c). The western yellow-billed cuckoo is not known or suspected to be present on the following units within the action area: Dillon Field Office, Boise National Forest, Caribou-Targhee National Forest, Salmon-Challis National Forest, Sawtooth National Forest, or BDNF. The following units either contain suitable habitat and/or documented sightings for the yellow-billed cuckoo: Bruneau Field Office, Burley Field Office, Challis Field Office, Jarbidge Field Office, Owyhee Field Office, Pocatello Field Office, Salmon Field Office Shoshone Field Office, Upper Snake Field Office, and Four Rivers Field Office. The western yellow-billed cuckoo requires large blocks of riparian woodlands within low to moderate elevation in arid to semiarid landscapes.

### ***Discussion and Determination***

The Idaho-Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement decision will not affect the yellow-billed cuckoo or its habitat; the LUPA and EIS contain no actions that will adversely impact riparian areas and, if anything, conservation measures that maintain or improve riparian habitat, such as maintaining proper functioning condition, will inadvertently benefit yellow-billed cuckoo and its habitat. In addition, site-specific analysis will be conducted at the project level, and a determination of effects for the yellow-billed cuckoo will be made at that time.

### **Western Yellow-billed Cuckoo Proposed Critical Habitat**

#### ***Environmental Baseline and Threats***

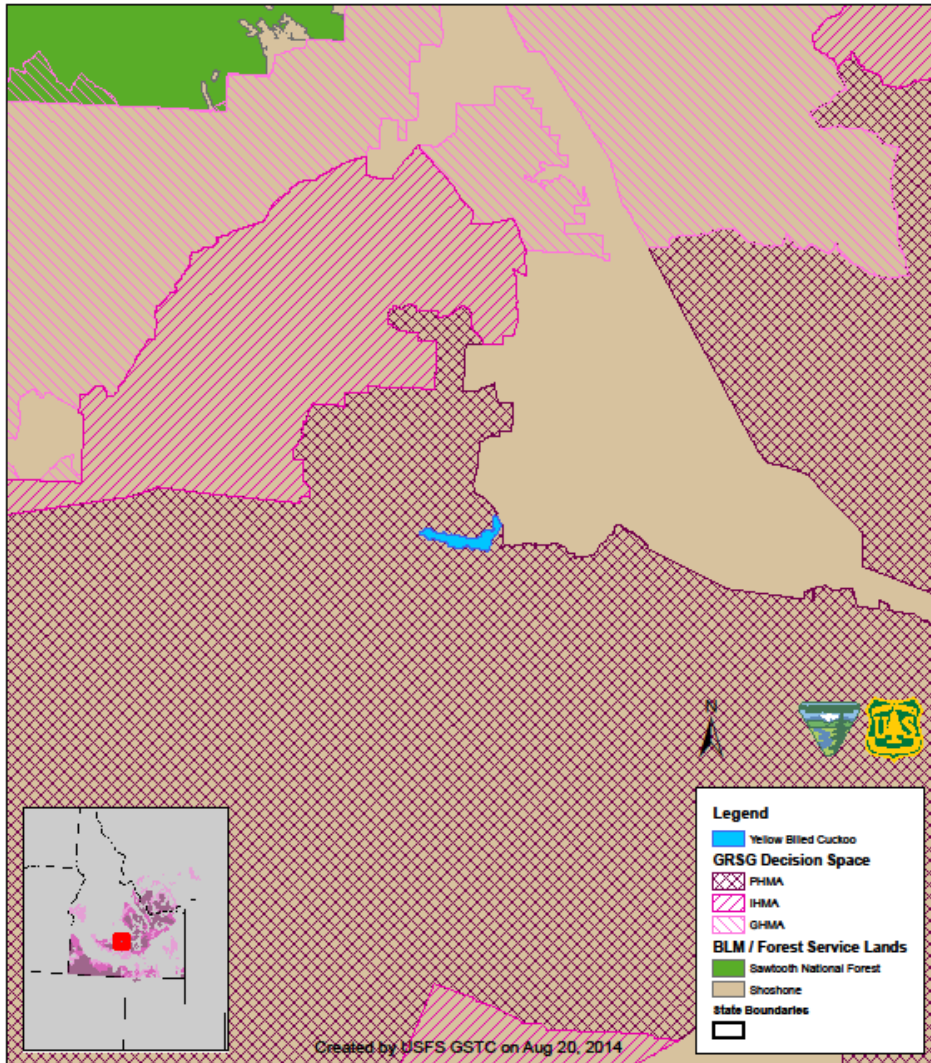

Critical habitat for the western DPS of the yellow-billed cuckoo was proposed on August 15, 2014 (USFWS 2014b). The Shoshone Field Office is the only unit within the Idaho-Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement decision action area that contains proposed critical habitat for the western yellow-billed cuckoo; 405 acres of proposed western yellow-billed cuckoo critical habitat overlap with GRSG PHMA (Figure 14).

PCEs include the following: 1) Riparian woodlands of mixed willow-cottonwood and/or mesquite-thorn patches greater than 325 feet wide and 200 acres or greater in extent; 2) Presence of a prey base consisting of large insect fauna and tree frogs in breeding areas during the nesting season and in post-breeding dispersal areas; and 3) dynamic riverine processes that allow riparian habitat to regenerate regularly, resulting in multiple age classes.

The primary threats to the yellow-billed cuckoo result from habitat destruction, modification, and degradation from dam construction and operations; water diversions; river flow management; stream channelization and stabilization; conversion to agricultural uses; urban and transportation infrastructure; and increased incidence of wildfire (USFWS 2013c).

## Idaho / SW Montana Greater Sage-grouse EIS Yellow Billed Cuckoo Proposed Critical Habitat

**Figure 14. Yellow-billed cuckoo proposed critical habitat with respect to Idaho-Southwestern Montana GRSG LUPA and EIS action area.**

### *Discussion and Determination*

The Idaho-Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement decision will not affect yellow-billed cuckoo proposed critical habitat; the LUPA and EIS contain no actions that will adversely impact proposed critical habitat PCEs and, if anything, conservation measures that maintain or improve riparian habitat, such as maintaining proper functioning condition, will inadvertently benefit western yellow-billed cuckoo proposed critical habitat. In addition, site-specific analysis will be conducted at the

project level, and a determination of effects for yellow-billed cuckoo proposed critical habitat will be made at that time.

## **Bull trout**

### ***Environmental Baseline, Critical Habitat, and Threats to the Species***

Bull trout have been documented and bull trout critical habitat is present within the following units in the action area: Bruneau Field Office, Challis Field Office, Jarbidge Field Office, Salmon Field Office, Upper Snake Field Office, Four Rivers Field Office, Boise National Forest, Salmon-Challis National Forest, Sawtooth National Forest, and BDNF. Neither bull trout nor bull trout habitat is known to be present on the Burley Field Office, Owyhee Field Office, Pocatello Field Office, Shoshone Field Office, Dillon Field Office, or Caribou-Targhee National Forest. Declines in bull trout distribution and abundance are the results of combined effects of the following: habitat degradation and fragmentation, the blockage of migratory corridors, poor water quality, angler harvest and poaching, entrainment (process by which aquatic organisms are pulled through a diversion structure or other device) into diversion channels and dams, and introduced nonnative species. Land and water management activities that continue to depress bull trout populations and degrade habitat include dams and other diversion structures, forest management practices, livestock grazing, agriculture, road construction and maintenance, mining, and urban and rural development.

### ***Discussion and Determination***

Bull trout and bull trout habitat will not be affected by this project. There are no actions within this LUPA decision that will degrade or fragment bull trout habitat, block migratory corridors, decrease water quality or availability, affect vulnerability to angler harvest or poaching, alter the distribution of nonnative fish species, or authorize livestock grazing, habitat-altering forest management practices, road construction and maintenance, mining, or development. In addition, site-specific analyses will be conducted at the project level, and a determination of effects for bull trout will be made at that time. Therefore, the Idaho and Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement will not affect bull trout or its habitat.

## **Bull Trout Designated Critical Habitat**

### ***Environmental Baseline and Threats***

Bull trout critical habitat is present within the following units in the action area: Bruneau Field Office, Challis Field Office, Jarbidge Field Office, Salmon Field Office, Upper Snake Field Office, Four Rivers Field Office, Boise National Forest, Salmon-Challis National Forest, Sawtooth National Forest, and BDNF. On the Boise National Forest, 4 miles of bull trout critical habitat overlap with GRSG GHMA and 2 miles of critical habitat overlap with GRSG IHMA. On the Bruneau Field Office, only 1 mile of critical habitat overlaps with IHMA. On the Challis National Forest, bull trout critical habitat overlaps with GRSG PHMA (33 miles), GHMA (105 miles), and IHMA (115 miles). On the Jarbidge Field Office, bull trout critical habitat overlaps with GRSG habitat by the following amounts: 31 miles (PHMA), 5 miles (GHMA), and 16 miles (IHMA). On the Salmon Field Office, bull trout critical habitat overlaps with GRSG PHMA (21 miles), GHMA (7 miles), and IHMA (6 miles). Bull trout critical habitat overlaps with GRSG

habitat on the Salmon-Challis National Forest: PHMA (11 miles), GHMA (2 miles), and IHMA (25 miles). Bull trout critical habitat overlaps with 30 miles of GHMA on the Sawtooth National Forest, 8 miles of GHMA on the Shoshone Field Office, and 10 miles of PHMA on the Upper Snake Field Office (Figure 15).

PCEs of bull trout habitat (USFWS 2010b) include:

*(1) Springs, seeps, groundwater sources, and subsurface water connectivity (hyporheic flows) to contribute to water quality and quantity and provide thermal refugia. (2) Migration habitats with minimal physical, biological, or water quality impediments between spawning, rearing, overwintering, and freshwater and marine foraging habitats, including but not limited to permanent, partial, intermittent, or seasonal barriers. (3) An abundant food base, including terrestrial organisms of riparian origin, aquatic macroinvertebrates, and forage fish. (4) Complex river, stream, lake, reservoir, and marine shoreline aquatic environments, and processes that establish and maintain these aquatic environments, with features such as large wood, side channels, pools, undercut banks and unembedded substrates, to provide a variety of depths, gradients, velocities, and structure. (5) Water temperatures ranging from 2 to 15 °C (36 to 59 °F), with adequate thermal refugia available for temperatures that exceed the upper end of this range. Specific temperatures within this range will depend on bull trout life-history stage and form; geography; elevation; diurnal and seasonal variation; shading, such as that provided by riparian habitat; streamflow; and local groundwater influence. (6) In spawning and rearing areas, substrate of sufficient amount, size, and composition to ensure success of egg and embryo overwinter survival, fry emergence, and young-of-the-year and juvenile survival. A minimal amount of fine sediment, generally ranging in size from silt to coarse sand, embedded in larger substrates, is characteristic of these conditions. The size and amounts of fine sediment suitable to bull trout will likely vary from system to system. (7) A natural hydrograph, including peak, high, low, and base flows within historic and seasonal ranges or, if flows are controlled, minimal flow departure from a natural hydrograph. (8) Sufficient water quality and quantity such that normal reproduction, growth, and survival are not inhibited. (9) Sufficiently low levels of occurrence of nonnative predatory (e.g., lake trout, walleye, northern pike, smallmouth bass); interbreeding (e.g., brook trout); or competing (e.g., brown trout) species that, if present, are adequately temporally and spatially isolated from bull trout.*

Threats to bull trout critical habitat include threats to water quality, water diversion, and reservoir development, and alterations to natural habitat conditions that increase nonnative species. Suspended sediment and environmental contaminants can increase turbidity and impact salmonids and their prey, affect swimming, feeding, or gill function by reducing visibility and ability to pursue prey, and by interrupting proper physiological gill function. Water diversion and reservoir development can reduce stream flow, reduce the amount of water available in a stream channel, change water quality, and alter groundwater regimes. These changes may collectively impact habitat and passage for bull trout, and can cause increases in water temperatures. Alterations to natural habitat conditions may also increase nonnative species predation and competition, which can significantly affect bull trout populations. Depending on local conditions,

bull trout recovery may be either reduced or precluded by the presence of nonnative and competitive species.

***Discussion and Determination***

Bull trout critical habitat will not be affected by this project. There are no actions within this LUPA decision that will impact PCEs of bull trout critical habitat by altering water quality or quantity or natural conditions. In addition, site-specific analysis will be conducted at the project level, and a determination of effects for bull trout critical habitat will be made at that time. Therefore, the Idaho and Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement will not affect bull trout critical habitat.

## Idaho / SW Montana Greater Sage-grouse EIS Bull Trout Designated Critical Habitat

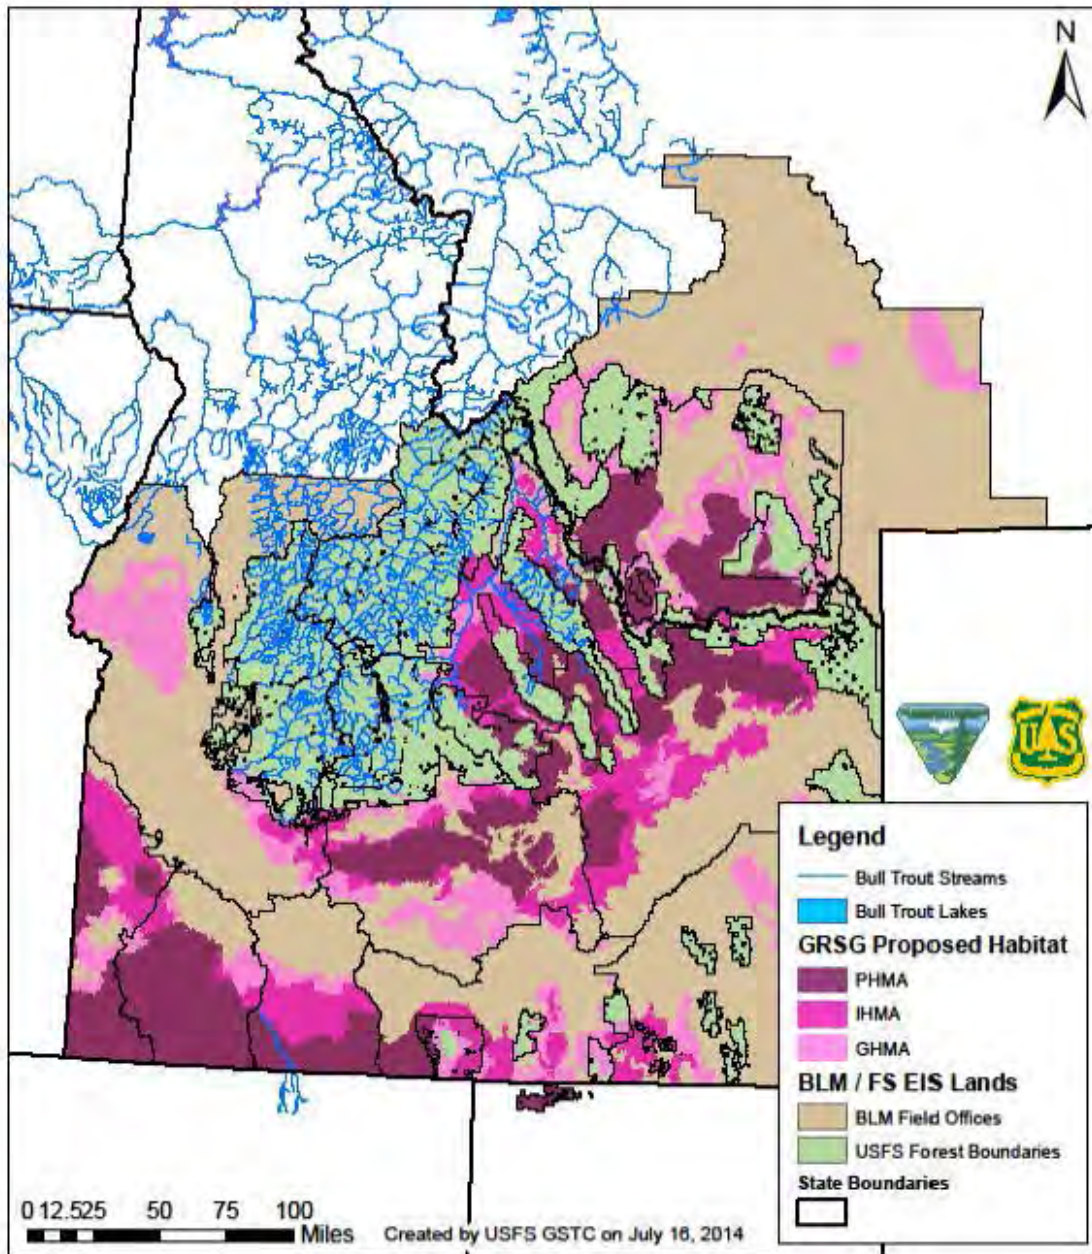

Figure 15. Bull trout designated critical habitat with respect to Idaho-Southwestern Montana GRSG LUPA and EIS action area.

## **Snake River Salmonids (Chinook salmon spring/summer run, sockeye salmon, steelhead)**

### ***Environmental Baseline, Critical Habitat, and Threats to the Species***

Snake River Spring/Summer Run Chinook salmon are known or suspected to be present on the Challis and Salmon Field Offices; they are documented to occur on the Boise, Salmon-Challis, and Sawtooth National Forests. This ESU, includes naturally spawned spring/summer-run Chinook salmon originating from the mainstem Snake River and the Tucannon River, Grande Ronde River, Imnaha River, and Salmon River subbasins. It also includes spring/summer-run Chinook salmon from 11 artificial propagation programs. Although critical habitat has been designated for this species, there is no overlap of critical habitat with the action area (see below). Critical habitat PCEs include: 1) spawning and juvenile rearing areas, 2) juvenile migration corridors, 3) areas for growth and development to adulthood, and 4) adult migration corridors.

Snake River sockeye salmon are known or suspected to be present on the Challis and Salmon Field Offices; they are documented to occur on the Salmon-Challis and Sawtooth National Forests. This ESU, includes naturally spawned anadromous and residual sockeye salmon originating from the Snake River Basin, and also sockeye salmon from one artificial propagation program. Critical habitat PCEs include: 1) spawning and juvenile rearing areas, 2) juvenile migration corridors, 3) areas for growth and development to adulthood, and 4) adult migration corridors.

Snake River Basin steelhead are known or suspected to be present on the Challis and Salmon Field Offices; they are documented to occur on the Boise, Salmon-Challis, and Sawtooth National Forests. DPS, includes naturally spawned anadromous steelhead originating below natural and manmade impassable barriers from the Snake River Basin, and also steelhead from six artificial propagation programs. Critical habitat PCEs include: 1) freshwater spawning sites, 2) freshwater rearing sites, 3) freshwater migration corridors, 4) and 5) estuarine and nearshore marine areas free of obstruction and excess predation, and 6) offshore marine areas supporting growth and maturation.

There is no single factor solely responsible for the decline of Salmonid species on the West Coast of the United States. Factors include reduction or elimination of habitat by water storage, withdrawal, conveyance, and diversions for agriculture, flood control, domestic, and hydropower purposes; modification of natural flow regimes that have increased water temperatures, changed fish community structures, depleted flows necessary for migration, spawning, rearing, flushing of sediments from spawning gravels, gravel recruitment, and transport of large woody debris; natural resource use and extraction leading to habitat modification; recreational and commercial fishing; introduction of nonnative species and modification of habitat that increase predator populations and salmonid predation in river and estuarine systems; natural environmental conditions such as flooding and persistent drought conditions that have reduced already limited spawning, rearing, and migration habitat; climatic shifts over a decadal time scale that appear to have resulted in decreased ocean productivity; and competition, genetic introgression, and disease transmission resulting from hatchery introductions (NOAA Fisheries 2014).

### ***Discussion and Determination***

Snake River endangered and threatened fish species will not be affected by this project. There are no actions within this LUPA decision that will impact aquatic habitat or cause water depletions. In addition, site-specific analysis will be conducted at the project level, and a determination of effects for federally listed Snake River salmonids will be made at that time. Therefore, the Idaho and Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement will not affect Snake River Spring/Summer Run Chinook salmon, Snake River sockeye salmon, Snake River Basin steelhead, or their habitats.

### **Snake River Salmonids (Chinook salmon spring/summer run, sockeye salmon, steelhead) Critical Habitats**

#### ***Environmental Baseline and Threats***

Although Snake River Spring/Summer Run Chinook salmon designated critical habitat occurs on the Challis, Salmon, Shoshone, and Four Rivers Field Offices and the Boise, Salmon-Challis, and Sawtooth National Forests, there is no overlap between critical habitat on these units and GRSG PHMA, GHMA, or IHMA.

Although Snake River sockeye salmon designated critical habitat occurs on the Challis, Salmon, and Shoshone Field Offices and the Salmon-Challis and Sawtooth National Forests, there is no overlap between critical habitat on these units and GRSG PHMA, GHMA, or IHMA.

Although Snake River Basin steelhead critical habitat occurs on the Challis, Salmon, Shoshone, and Four Rivers Field Offices and the Boise, Salmon-Challis, and Sawtooth National Forests, there is no overlap between critical habitat on these units and GRSG PHMA, GHMA, or IHMA.

### ***Discussion and Determination***

Critical habitat for Snake River Spring/Summer Run Chinook Salmon, Snake River Sockeye Salmon, and Snake River Basin Steelhead will not be affected by this project because the Idaho-Southwestern Montana LUPA decision action area does not overlap critical habitats for these species.

### **Middle Snake River Snails (Banbury Springs limpet, Bliss Rapids snail, Snake River Physa)**

#### ***Environmental Baseline, Critical Habitat, and Threats to the Species***

The Banbury Springs limpet is only known to occur in four isolated springs in a small area along the Middle Snake River. It inhabits spring run habitats with well oxygenated water on boulder or cobble substrates. Within the action area, it only occurs on the Shoshone Field Office.

The Bliss Rapids snail occurs on stable cobble-boulder size substrate in flowing waters of unimpounded reaches of the mainstem Snake River and in a few spring habitats in the Hagerman Valley. Within the action area, it occurs on the Bruneau Field Office, Burley Field Office, Jarbidge Field Office, Shoshone Field Office, and Four Rivers Field Office.

The Snake River Physa occurs on the undersides of gravel-to-boulder size substrate in swift current in the mainstem Snake River. Within the action area, it occurs in the following field offices: Bruneau, Burley, Jarbidge, Owyhee, Shoshone, and Four Rivers.

Critical habitat has not been proposed or designated for the Banbury Springs limpet, Bliss Rapids Snail, or Snake River Physa. Water depletions, water level fluctuations, and effects on water quality in the Middle Snake River and its tributaries are the major threats to these species.

#### ***Discussion and Determination***

Snake River endangered and threatened snails will not be affected by this project. There are no actions within this LUPA decision that will impact aquatic habitat or cause water depletions in these drainages. In addition, site-specific analysis will be conducted at the project level, and a determination of effects for federally listed snails in the Middle Snake River will be made at that time. Therefore, the Idaho and Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement will not affect the Banbury Springs limpet, Bliss Rapids snail, Snake River Physa, or their habitats.

#### **Bruneau Hot Springsnail**

##### ***Environmental Baseline, Critical Habitat, and Threats to the Species***

The Bruneau hot springsnail is found only in geothermal springs and seeps along an 8-kilometer length of the Bruneau River in Southwest Idaho. It prefers wetted rock faces of springs and flowing water, with large cobbles and boulders. Within the action area, the Bruneau hot springsnail only occurs on the Bruneau and Jarbidge Field Offices.

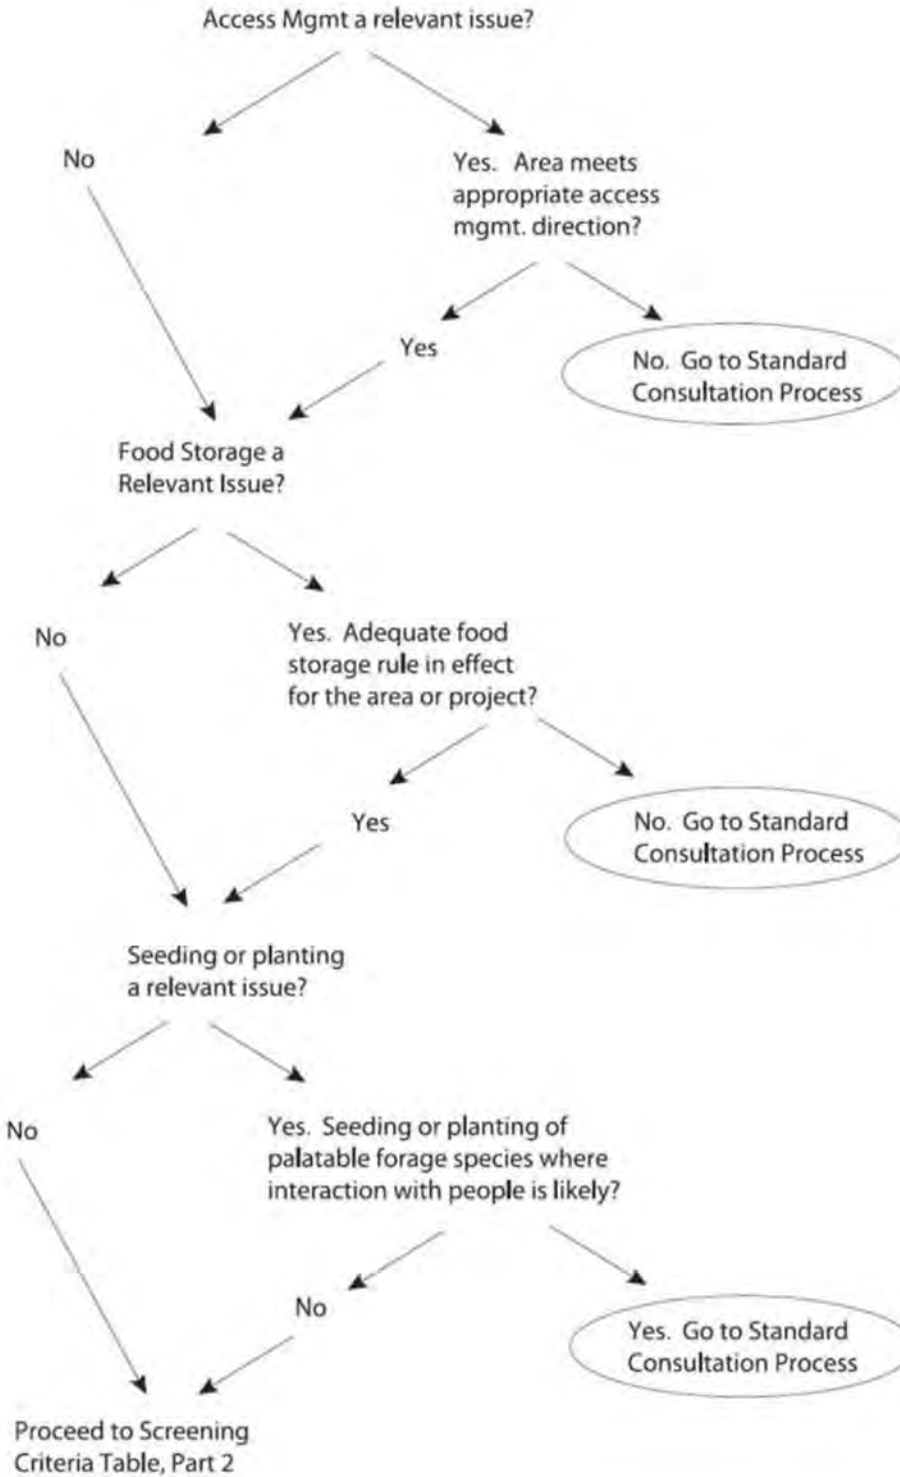

Critical habitat has not been proposed or designated for the Bruneau hot springsnail. The principal threat to this species is the reduction and/or elimination of its geothermal habitats as a result of groundwater withdrawal.

#### ***Discussion and Determination***

Bruneau hot springsnail will not be affected by this project. There are no actions within this LUPA decision that will impact aquatic habitat or cause groundwater withdrawals. In addition, site-specific analysis will be conducted at the project level, and a determination of effects for Bruneau hot springsnail will be made at that time. Therefore, the Idaho and Southwestern Montana Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement will not affect the Bruneau hot springsnail or its habitats.

## APPENDIX B: BLM Dillon Field Office RMP Grizzly Bear Analysis Screen Part 1

## APPENDIX C: BLM Dillon Field Office RMP Grizzly Bear Analysis Screen Part 2

**Part 2:** The following Screening Criteria Table displays activities and criteria, that when met, will allow the project to meet "screening elements". If the project does not meet the identified criteria, the project should proceed through the established consultation process.

#	Activity Type	Activity Component	Crew Level and Duration of Use	Screening Criteria	Determination
1	Forest Products	Personal use firewood collection, berry picking, low/incidental mushroom picking, and collection of "other forest products" (such as bear grass greens, medicinal herbs, pachistima, etc)	Day and overnight use	Does not include off road mechanical skidding. Include "bear aware" education message	NLAA
		Commercial firewood collection, berry picking, and "other forest products" (such as bear grass greens, medicinal herbs, pachistima, etc), but does not include mushrooms.	Day use only or camping of $\leq 20$ individuals and $\leq 5$ days total/analysis area	Does not include off road mechanical skidding. Enforce sanitation standards, and Include "bear aware" education message.	NLAA
2	Mechanical	Off road heavy equip operation, such as site prep, fuel piling, log yarding, etc	NA	NA	Potential LAA, go to Standard Consultation process
		Helicopter use for monitoring, prescribed fire ignition, wildlife relocations, etc	Use includes few trips and $\leq 2$ activities/year and $\leq 2$ days/activity/analysis area	NA	NLAA
3	Habitat Restoration	See timber harvest, mechanical treatments, roads, weed control, and prescribed fire. Also includes monitoring, exclosure development, fish barrier development, fish spp removal/trapping, rotenone treatment, interpretation/Con Ed, meadow restoration, riparian planting and restoration, snag creation, and water source development.	Day use only or camping of $\leq 20$ individuals and $\leq 5$ days/analysis area	Project occurs between July 1 through March 31 or completed in $\leq 1$ day in riparian areas. Project does not result in an increase in public use or user type.	NLAA
4	Prescribed Fire	General support, ignition, mop-up	Day use only or camping of $\leq 20$ individuals and $\leq 5$ days/analysis area	Does not include riparian areas	NLAA
		Fire line construction	Same as support	Fire line does not/will not function as a travel way	NLAA
		Defensible space treatments (within 100m of structure)	Same as support	Planting and/or seeding does not include palatable forage spp.	NLAA
5	Range	Infrastructure development	NA	NA	NLAA
		Grazing		Maintains or reduces existing livestock grazing or changes livestock class to a less vulnerable spp, and no history of depredation or control actions	NLAA

Biological Assessment for the Idaho and Southwestern Montana Greater Sage-Grouse  
Land Use Plan Amendment and Environmental Impact Statement

#	Activity Type	Activity Component	Crew Level and Duration of Use	Screening Criteria	Determination
		Grazing		Increases livestock grazing, introduces new grazing into areas where depredation more likely, or history of livestock depredation	Potential LAA, go to Standard Consultation process
6	Recreation	Trail maintenance or reconstruction	NA	Results in increased use or change of user type	Potential LAA, go to Standard Consultation process
		Trail maintenance or reconstruction		Does not result in increase in use or change in user type	NLAA
		New Trail construction			Potential LAA, go to Standard Consultation process
		Facility operations, including developed and dispersed camping		Educate public campers and enforce sanitation standards. Does not increase use or change user type	NLAA
		Facility operations, including developed and dispersed camping		Sanitation standards are not enforced or use is increased or user type is changed.	Potential LAA, go to Standard Consultation process
7	Roads & Road Maintenance	Opening closed road			Potential LAA, go to Standard Consultation process
		Reclaiming road outside of riparian/spring habitat		Meets administrative use levels	NLAA
		Reclaiming road in riparian spring hab		Project occurs between July 1 through March 31 or completed in $\leq 1$ day, and meets administrative use levels	NLAA
		Reclaiming road		Does not meet administrative use levels, or occurs in riparian/spring habitat and active during 4/1-6/30	Potential LAA, go to Standard Consultation process
		Road Maint: blading, culvert cleaning, brushing, etc		Road is open, or use meets administrative use criteria	NLAA
		New road construction			Potential LAA, go to Standard Consultation process

Biological Assessment for the Idaho and Southwestern Montana Greater Sage-Grouse  
Land Use Plan Amendment and Environmental Impact Statement

#	Activity Type	Activity Component	Crew Level and Duration of Use	Screening Criteria	Determination
		Bridge or stream culvert replacement		Project occurs between July 1 through March 31 or completed in $\leq 1$ day	NLAA
8	Silviculture Activities	Reforestation hand planting	Day use only or camping of $\leq 20$ individuals and $\leq 5$ days/analysis area	Does not include snow plowing for access	NLAA
		Reforestation mechanical treatments	NA	NA	Potential LAA, go to Standard Consultation process
		Insect suppression Aerial chemical application	NA	Chemicals do not effect cutworm moth or habitat	NLAA
		Insect suppression Aerial chemical application	NA	Chemicals affect cutworm moth or habitat, and in moth habitat	Potential LAA, go to Standard Consultation process
		Insect suppression ground chemical application	NA	NA	NLAA
		Insect suppression survey, fertilization, manual treatment, individual tree fire treatment, or pheromone treatment	NA	NA	NLAA
		Precommercial thinning			Potential LAA, go to Standard Consultation process
9	Timber harvest	Harvest, skidding, and/or hauling of timber products	NA	NA	Potential LAA, go to Standard Consultation process
10	Watershed restoration	Includes erosion control structures, sediment control, monitoring. Also, see reforestation, timber harvest, mechanical treatments, etc.	Day use only or camping of $\leq 20$ individuals and $\leq 5$ days/analysis area	Project occurs between July 1 through March 31 or completed in $\leq 1$ day	NLAA
11	Weed control	Chemical, aerial or ground application	NA	NA	NLAA
		Sheep or goat grazing	NA	NA	Potential LAA, go to Standard Consultation process

## APPENDIX D: BLM Proposed Plan Amendment

The Proposed Plan represents a management strategy to address GRSG, their habitat and associated threats within the Idaho and Southwestern Montana Sub-region. The Plan has been developed through a coordinated partnership of BLM, Forest Service, the States of Idaho and Montana and the USFWS.

The Plan incorporates appropriate conservation measures to conserve, enhance, and restore GRSG habitat by reducing, eliminating, or minimizing threats to that habitat. The Plan is also consistent with the objectives described in the USFWS Conservation Objectives Team Report (USFWS 2013) to: ‘Conserve sage-grouse so that it is no longer in danger of extinction or likely to become in danger of extinction in the foreseeable future...’ through ‘Maintaining viable, connected, and well-distributed populations and habitats across [the range of GRSG], through threat amelioration, conservation of key habitats, and restoration activities’.

To achieve these objectives the Plan includes a combination of: goals and objectives including vegetation/habitat management objectives to be applied during project development and implementation (FEIS Table); land allocation decisions (FEIS Table); delineation of five Conservation Areas (FEIS Figure) to support evaluation of the adaptive management strategy and 3 percent anthropogenic disturbance cap; delineation of PHMA, IHMA, and GHMA (FEIS Figure) with associated program management direction; a mitigation framework and strategy; development of Wildfire and Invasive Species Assessments; and associated monitoring to support these decisions.

The decisions described in this Plan apply to BLM lands in both Montana and Idaho unless identified differently. Several notable differences include the Adaptive Management Strategy and the Disturbance Density evaluation. In both cases Idaho and Southwestern Montana have separate approaches which are described in the applicable sections. Southwestern Montana’s approach in both cases is the same as the approaches being applied in the rest of Montana, this supports a consistent approach within the entire state that can be implemented in coordination with State and Federal partners.

The proposed plan incorporates the following GRSG goals:

- GOAL-1: Maintain and/or increase the abundance, distribution and connectivity of GRSG by conserving, enhancing and restoring GRSG habitat to maintain resilient populations by reducing, eliminating or minimizing threats to GRSG habitats.
- GOAL-2: Provide for the needs of GRSG and their habitat while also providing for resource uses in accordance with the agencies’ direction for multiple use and sustained yield as described in FLPMA and the NFMA.
- GOAL-3: Manage anthropogenic development and human disturbance to minimize the likelihood of adverse population level effects on GRSG.

**Table 2-9**  
**Idaho and Southwestern Montana GRSG EIS – Land Allocation Decisions Summary<sup>1</sup>**

PHMA	IHMA	GHMA
<b>Solar/Wind/Nuclear/Hydropower</b>		
Exclusion (LR-2)	Avoidance (LR-2)	Idaho: Open (LR-2) Montana: Avoidance
<b>Commercial Service Airports</b>		
Exclusion (LR-3)	Avoidance (LR-1)	Open (LR-1)
<b>Landfills</b>		
Exclusion (LR-4)	Avoidance (LR-1)	Open (LR-1)
<b>Utility Corridors</b>		
Existing designated corridors which are land use plan designations (and include Section 368 Corridors), will remain “open” (subject to the ongoing settlement agreement) and can provide an opportunity to be modified with mitigation. Any new disturbance within these corridors would count towards the disturbance cap. All new, modified, or deleted corridors will require a land use plan amendment. (LR-7)	Same as PHMA (LR-7)	Same as PHMA (LR-7)
<b>ROWs and Land Use Authorizations/Permits – High Voltage Transmission Lines and Large Pipelines</b>		
Avoidance (LR-1)	Avoidance (LR-1)	Idaho: Open (LR-1) Montana: Avoidance
<b>ROWs and Land Use Authorizations/Permits – Minor ROWs</b>		
Avoidance (LR-1)	Avoidance (LR-1)	Open (LR-1)
<b>Land Tenure Adjustments</b>		
Retention with exceptions for exchange; available for exchange with no net loss of GRSG Key habitat within PHMA and IHMA. Not available for disposal. (LR-14)	Same as PHMA (LR-14)	Available for exchange only
<b>Fluid Mineral Resource Allocation (Includes Geothermal)</b>		
Idaho and Montana: Open subject to No Surface Occupancy (NSO) without waiver, or	Idaho: Open subject to NSO with a limited exception. Montana: Not Applicable (FLM-1)	Idaho and Montana: Open subject to Controlled Surface Use and Timing Limitations (FLM-1)

**Table 2-9**  
**Idaho and Southwestern Montana GRSG EIS – Land Allocation Decisions Summary<sup>1</sup>**

<b>PHMA</b>	<b>IHMA</b>	<b>GHMA</b>
modification. (FLM-1)		
<b>Locatable Minerals</b>		
Areas not previously withdrawn are open.	Same as PHMA.	Same as PHMA.
<b>Non-Energy Leasables</b>		
Closed to leasing. (NEL-1) There are no Known Phosphate Leasing Areas (KPLAs) in PHMA.	KPLAs are Open subject to standard leasing stipulations. Areas outside KPLAs are Open subject to standard and GRSG stipulations (required design features, seasonal timing restrictions). (NEL-1)	Open to leasing with standard and GRSG stipulations (required design features and seasonal timing restrictions) (NEL-1)
<b>Mineral Materials (Salable Minerals)</b>		
Closed to new site authorizations. Existing sites Open to new sales subject to RDFs, buffers and seasonal timing restrictions. (SAL-1)	Open to new site authorizations subject to Anthropogenic Disturbance Criteria (AD-4). Existing sites Open to new sales subject to seasonal timing restrictions. (SAL-1)	Open to new site authorizations subject to RDFs, buffers and seasonal timing restrictions. Existing sites Open to new sales subject to seasonal timing restrictions. (SAL-1)
<b>Travel Management</b>		
BLM Idaho: Limited to Existing (TM-1) BLM Montana: Limited to Designated (Decisions described in Dillon RMP)	BLM: Limited to Existing (TM-1)	BLM: Limited to Existing (TM-1) BLM Montana: Limited to Designated (Decisions described in Dillon RMP)

- GOAL-4: Reduce the risk of West Nile Virus or other disease outbreaks from BLM and Forest Service management actions.
- GOAL-5: Conserve, enhance, and restore the sagebrush ecosystem upon which GRSG populations depend in an effort to maintain and/or increase their abundance and distribution, in cooperation with other conservation partners.

***Special Status Species***

*Objectives*

- MA-OBJ-1 (Management Area – Objective): Maintain a resilient population of GRSG in Idaho and Southwestern Montana.
- MA-OBJ-2: Designate GRSG management areas and associated management to maintain a resilient population and to designate strategically located adjacent areas to provide a buffer from unpredictable habitat loss such as wildfire to the resilient population areas.
- MA-OBJ-3: Identify and strategically protect larger intact sagebrush areas and areas of lower fragmentation to maintain GRSG population persistence.
- HM-OBJ-1 (Habitat Management): Maintain or make progress toward at least 70 percent of lands within PHMAs and IHMAs capable of producing sagebrush at 10 to 30 percent canopy cover and conifers absent to uncommon within 1.86 miles of occupied leks.
- HM-OBJ-2: Incorporate GRSG Seasonal Habitat Objectives (Table 2-3) into the design of projects or activities, as appropriate, based on site conditions and ecological potential, unless achievement of fuels management objectives require additional reduction in sagebrush cover to meet strategic protection of GRSG habitat and conserve habitat quality for the species or at least one of the following conditions can be demonstrated and documented in the NEPA analysis associated with the specific project:

- A specific objective is not applicable to the site-specific conditions of the project or activity;

- An alternative objective is determined to provide equal or better protection for GRSG or its habitat (based on appropriate scientific findings); or

- Analysis concludes that following a specific objective would provide no more protection to GRSG or its habitat than not following it, for the project being proposed.

**Table 2-10  
Seasonal Habitat Desired Conditions for GRSG**

Attribute	Indicator	Desired Condition	Reference
<b>BREEDING HABITAT (LEK AND NESTING/EARLY BROOD REARING)</b>			
<b>Breeding and Nesting (Seasonal Use Period March 1 – June 15)</b>

<b>WINTER<sup>1</sup> November-March<sup>1</sup> (Apply to areas of known or likely winter-use)</b>			
Cover and Food	Seasonal habitat extent (Percent of Seasonal Habitat Meeting Desired Condition)	>80% of the wintering habitat meets winter habitat characteristics where appropriate (relative to ecological site, etc.).	Connelly et al. 2000 <sup>8</sup>
	Sagebrush cover and height above snow	Sagebrush is at least 10 inches (25 cm) above snow and ≥10% cover <sup>16</sup>	Connelly et al. 2000 <sup>8</sup> Stiver et al. <i>in press</i> <sup>13</sup>

#### NOTES AND REFERENCES

<sup>1</sup> Seasonal dates can be adjusted by local unit according to geographic region.

<sup>2</sup> Since plant species and/or life forms may overlap, total vegetative cover, inclusive of shrubs, forbs and grasses may exceed 100%.

<sup>3</sup> Arid corresponds to the 10 – 12 inch precipitation zone; *Artemisia tridentata wyomingensis* is a common big sagebrush sub-species for this type site (Stiver et al. *In Press*).

<sup>4</sup> Mesic corresponds to the ≥12 inch precipitation zone; *Artemisia tridentata vaseyana* is a common big sagebrush sub-species for this type site (Stiver et al. *In Press*).

<sup>5</sup> Collectively the indicators for sagebrush (cover, height, and shape), perennial grass and perennial forb (cover, height and/or availability) represent the desired condition range for nesting/early brood rearing habitat characteristics, consistent with the breeding habitat suitability matrix identified in Stiver et al. *In Press*.

Sagebrush plants that are more tree or columnar-shaped provide less protective cover near the ground than sagebrush plants with a spreading shape (Stiver et al. *In Press*). Some sagebrush plants are naturally columnar (e.g., Great Basin big sagebrush), and a natural part of the plant community. However, a predominance of columnar shape arising from animal impacts may warrant management investigation or adjustments at site specific scales.

<sup>6</sup> Preferred forbs are listed in Stiver et al. *In press*. Overall total forb cover may be greater than that of preferred forb cover since not all forb species are listed as preferred.

<sup>14</sup> Connelly, J.W., A. Moser, and D. Kemner. 2013. Greater Sage-Grouse breeding habitats: Landscape-based comparisons. *Grouse News* 45. Research Reports.

<sup>15</sup> Some late brood habitat occurs at higher elevations outside of mapped nesting habitat and some is embedded within nesting landscapes especially areas such as wet meadows, riparian areas, springs and seeps.

<sup>16</sup> Winter habitat metrics are a guideline but snow depths and habitat availability may vary widely depending on winter severity, topography and elevation.

### *Coordination*

- CC-1: Collaborate, coordinate and utilize cooperative planning efforts to implement and monitor activities to achieve desired conditions and to maximize the utilization of available funding opportunities. Coordination efforts could include: adjacent landowners, federal and state agencies, local governments, tribes, communities, other agencies, resource advisory groups, public lands permit holders and non-governmental organizations.
- CC-2: Develop a cooperative MOU between the BLM, Forest Service and State of Idaho to establish the State of Idaho as a cooperating agency during implementation of the final decision. The MOU would identify responsibilities, role and interaction of the BLM, Forest Service and State of Idaho. Montana BLM will participate as appropriate on Montana's Sage-grouse Oversight Team to facilitate coordination and implementation of BLM's final decision and Montana's Executive Order No. 10-2014.
- CC-3: The BLM and Forest Service would consider any recommendations from the Governor of Idaho as a result of evaluation completed by the Sage-Grouse Implementation Task Force.
- CC-4: Idaho: The BLM would coordinate with the State of Idaho and the Idaho Sage-Grouse Implementation Task Force regarding proposed management

changes, the implementation of conservation measures, mitigation, and site-specific monitoring, related to adaptive management, anthropogenic disturbance and livestock grazing (FEIS Appendix).

- CC-5: Montana: The BLM would coordinate with the State of Montana and the Montana Sage-grouse Oversight Team regarding proposed management changes, the implementation of conservation measures, mitigation, and site-specific monitoring, related to adaptive management and anthropogenic disturbance (FEIS Appendix).
- CC-5: Upon completion of the Record of Decision the BLM will develop an initial Implementation Guide for BLM District and Field Offices within a year of issuance of the Record of Decision. This Guide would define and describe consistent application of the allocations, management actions, required design features, and etc. that are contained within the final plan and would be updated and expanded as needed to respond to issues and concerns.
- CC-6: At the state level, BLM and Forest Service would coordinate with IDFG, MFWP, USFWS, and other conservation partners in collaborative efforts with adjacent states (Oregon, Nevada, Utah, Montana, Wyoming) in GRSG MZs IV and II to evaluate GRSG habitat and population status and trends and make appropriate regional recommendations for GRSG conservation at broader scales.
- CC-7: At the state level, BLM and Forest Service would coordinate with the appropriate WAFWA Sage-grouse Technical Committee to develop consistent population and habitat monitoring approaches that facilitate GRSG conservation at the MZ scale.
- CC-8: All prescribed burning would be coordinated with state and local air quality agencies to ensure that local air quality is not significantly impacted by BLM and Forest Service activities.

*Greater Sage-Grouse Management Areas*

MA-1 (Management Area): Designate five GRSG Conservation Areas within the sub-region to form the geographic basis for achieving population objectives; evaluating the disturbance density and adaptive regulatory triggers; and tailor adaptive management responses. These conservation areas are depicted in FEIS Figure. These areas are referred to as Mountain Valleys, Desert, West Owyhee, Southern and Southwestern Montana Conservation Areas.

Conservation Area Description:

Mountain Valleys Conservation Area – generally located north of the Snake River Plain, including GRSG habitat in the Salmon and Challis areas, and habitat in west-central population area. It extends west from Rexburg, north and west of Highway 33 to Howe, north and west of Highway 33/22 to Arco, north and west of Highway 26/20/93 to Carey, north and west of Highway 20 west to Hill City, north and west of Highway 20 to the Dylan

Karaus Road, west to Canyon Creek. Canyon Creek to the confluence with the Snake River form the western boundary.

Desert Conservation Area – located north of the Snake River and south of the Mountain Valleys Conservation Area. It extends from the confluence of Canyon Creek and the Snake River, eastward to Idaho Falls. The Snake River and Henry’s Fork form the eastern boundary.

West Owyhee Conservation Area – located south of the Snake River and west of the Bruneau River.

Southern Conservation Area – located south of the Snake River and east of the Bruneau River, including East Idaho uplands and Bear Lake Plateau, and the Utah portion of the Sawtooth National Forest in Box Elder County.

Southwestern Montana – located in southwestern Montana - encompassing the Dillon Butte BLM Field Office and Beaverhead-Deerlodge National Forest boundaries (the Butte RMP is not being amended and since there are limited GRSG federal GHMAs, management actions do not apply in the Butte Field Office).

In general, GRSG habitats in the Desert and West Owyhee CAs are relatively contiguous, while those in the Mountain Valleys and Southern CAs tend to be more fragmented due to more complex topography, and elevational differences and/or effects from wildfires, agriculture, urbanization or other factors.

MA-2:

Within each Conservation Area designate GRSG Habitat Management Areas: Priority, Important and General Habitat Management Areas (FEIS Figure). Priority Habitat Management Areas (PHMAs) focus on conserving the two key meta-populations in the sub-region. These meta-populations consist of a large aggregation of interconnected breeding subpopulations of GRSG that have the highest likelihood of long-term persistence. Specifically, these include a meta-population north of the Snake River, inclusive of the North Magic Valley, Big Desert and Basin and Range areas and another south of the Snake River comprised of south central Idaho, the upper Bruneau-Jarbidge Plateau, and the Owyhee Uplands. PHMA encompasses areas with the highest conservation value to GRSG, based on the presence of larger leks, habitat extent, important movement and connectivity corridors and winter habitat. PHMAs include adequate area to accommodate continuation of existing land uses and landowner activities. **Important Habitat Management Areas (IHMA)**s contain additional habitat and populations that provide a management buffer for the PHMA and to connect patches of PHMA. IHMA encompasses areas of generally moderate to high conservation value habitat and/or populations and in some Conservation Areas includes areas beyond those identified by USFWS as necessary to maintain redundant, representative and resilient populations (Priority Areas for Conservation (PACs)). IHMAs are typically adjacent to PHMAs but generally reflect somewhat lower GRSG population status and/or reduced habitat value due to disturbance, habitat fragmentation or other factors.

There are no IHMAs designated within the Southwestern Montana Conservation Area. **General Habitat Management Areas (GHMAs)** encompass habitat that is outside of PHMAs or IHMAs. GHMAs contain approximately 10 percent of the occupied leks that are also of relatively low male attendance compared to leks in PHMA or IHMA. GHMAs are generally characterized by lower quality disturbed or patchy habitat of low lek connectivity.

- MA-3: In Idaho, Designate PHMA and IHMA to encompass 90 percent of the breeding males in Idaho. In Montana, designate PHMA to encompass Montana Fish, Wildlife, and Parks 2009 Greater Sage Grouse Core Area designations.
- MA-4: Annually prioritize Conservation Areas at the state scale considering results of the annual adaptive regulatory trigger evaluations relative to implementation of restoration and mitigation activities.
- MA-5: Prioritize activities and mitigation to protect, enhance and restore GRSG habitats (i.e., fire suppression activities, fuels management activities, vegetation treatments, invasive species treatments etc.) first by Conservation Area, if appropriate (Conservation Area under adaptive management or at risk of engaging adaptive management), followed by PHMAs, then IHMAs then GHMAs within the Conservation Areas. Local priority areas within these areas will be further refined as a result of completing the GRSG Wildfire and Invasive Species Habitat Assessments as described in FEIS Appendix. This could include projects outside GRSG habitat when those projects would provide a benefit to GRSG habitat.
- MA-6: The management area map and Biologically Significant Unit (BSU) baseline map would be re-evaluated in conjunction with plan evaluation processes (i.e. approximately every 5 years). This re-evaluation could indicate the need to adjust PHMA, IHMA or GHMA or the habitat baseline. These adjustments could occur upon completion of the appropriate analysis (plan amendment) to review the allocation decisions based on the map. Results from the Wildfire and Invasive Species Assessments, such as identified focal or emphasis areas would also be used to help inform mapping adjustments during this evaluation.
- MA-7: GRSG habitat within the project area would be assessed during project-level NEPA analysis within the management area designations (PHMA, IHMA, GHMA). Project proposals and their effects would be evaluated based on the habitat and values affected.
- MA-8: Idaho BLM will annually update the Key Habitat map as described in FEIS Appendix, in order to reflect habitat changes resulting from wildfire, succession, and vegetation treatments that occurred or were observed since the last update. Updates to the map will also occur if it is determined that mapping errors or omissions have occurred, or that radio-telemetry studies

indicate that GRSG are consistently utilizing an area. Updates are also intended to capture recommendations by the field offices, GRSG Local Working Groups, or agency partners in GRSG conservation. Project-level evaluations of GRSG habitat during the NEPA process may also be used to inform the annual update.

- MA-9: Areas of habitat outside of delineated management areas identified during the Key habitat update process would be evaluated during site specific NEPA for project level activities and GRSG required design features (Appendix F), seasonal timing restrictions (Appendix G) and buffers (Appendix H) would be included as part of project design. These areas would be further evaluated during plan evaluation and the 5-year update to the management areas, to determine whether they should be included as PHMAs, IHMAs, or GHMAs.
- MA-10: Designate Sagebrush Focal Areas (SFA) as shown in FEIS Figure. SFAs will be managed as PHMA, with the following additional management:
- Recommended for withdrawal from the General Mining Act of 1872, as amended, subject to valid existing rights.
  - Managed as NSO, without waiver, exception, or modification, for fluid mineral leasing.
  - Prioritized for management and conservation actions in these areas, including, but not limited to review of livestock grazing permits/leases (see livestock grazing section for additional actions).

*Adaptive Management*

- AM-1 (Adaptive Management): Idaho: Use hard and soft population and habitat triggers, evaluated within a Conservation Area, to determine an appropriate management response.
- AM-2: Utilize monitoring information collected through the Monitoring Framework (FEIS Appendix) to determine when adaptive regulatory triggers have been met.
- AM-3: Idaho: BLM and Forest Service would maintain GRSG habitat information, through use of the Key Habitat map or latest sagebrush/vegetation map, which would be used to track and identify habitat changes to assess the habitat trigger in the adaptive management approach. Key habitat map updates are made each winter by BLM in coordination with the Forest Service and IDFG, using the process described in FEIS Appendix.
- AM-4: Idaho: BLM would coordinate with the IDFG regarding population information collected and maintained by the IDFG to track and identify population changes to assess the population trigger in the adaptive management approach.
- AM-5: Idaho: Twice each year the applicable monitoring information would be reviewed to determine if any adaptive management triggers have been met.

- AM-6: Idaho: Adaptive habitat regulatory triggers would be individually calculated across all ownerships within the BSUs (FEIS Appendix). The BSU is defined as the IDFG modeled nesting and wintering habitat (IDFG 2013, unpublished data) within PHMAs and IHMAs within a Conservation Area. The sagebrush component of the BSU is represented by the Key habitat within the BSU present during the 2011 baseline and as mapped during subsequent annual Key habitat map updates. Key habitat is defined as areas of generally intact sagebrush that provide GRSG habitat during some portion of the year (ISAC 2006).
- AM-7: Adaptive Regulatory Criteria for Hard Habitat Triggers are defined as:
- A 20 percent loss of Key Habitat within the BSU of the PHMA of a Conservation Area when compared to the 2011 baseline, inclusive of all land ownerships or
  - A 20 percent loss of Key Habitat within the BSU of the IHMA of a Conservation Area when compared to the 2011 baseline.
- AM-8: Adaptive Regulatory Criteria for Soft Habitat Triggers are defined as:
- A 10 percent loss of Key Habitat within the BSU of the PHMA of a Conservation Area when compared to the 2011 baseline; or
  - A 10 percent loss of Key Habitat within the BSU of the IHMA of a Conservation Area when compared to the 2011 baseline.
- AM-9: Adaptive Regulatory Criteria for Hard Population Triggers are defined as:
- A 20 percent decline in the current 3-year average of total maximum number of males counted compared to the 2011 maximum male baseline and a finite rate of change ( $\lambda$ ) significantly below 1.0 within PHMA within a Conservation Area over the same 3-year period; or
  - A 20 percent decline in the current 3-year average of total maximum number of males counted compared to the 2011 maximum male baseline and a finite rate of change ( $\lambda$ ) significantly below 1.0 within IHMA within a Conservation Area over the same 3-year period.
- Significance is defined by the 90 percent confidence interval around the current 3-year finite rate of change. If the 90 percent confidence interval is less than, and does not include 1.0, then the finite rate of change is considered significant. The finite rate of change and variance will be calculated following Garton et al. (2011).
- AM-10: Adaptive Regulatory Criteria for Soft Population Triggers are defined as:
- A 10 percent decline in the current 3-year average of total maximum number of males counted compared to the 2011 maximum male baseline and a finite rate of change ( $\lambda$ ) below 1.0 within PHMA within a Conservation Area over the same 3-year period; or

A 10 percent decline in the current 3-year average of total maximum number of males counted compared to the 2011 maximum male baseline and a finite rate of change ( $\lambda$ ) below 1.0 within IHMA within a Conservation Area over the same 3-year period.

- AM-11: When any of the Adaptive Regulatory Criteria for Soft Triggers have been met the Implementation Team would evaluate causal factors and recommend additional potential implementation level activities (FEIS Appendix).
- AM-12: When any of the Adaptive Regulatory Criteria for Hard Triggers have been met then PHMA management actions would be applied to the IHMA within that Conservation Area and the Implementation Team would evaluate causal factors and recommend additional potential implementation level activities.
- AM-13: If an adaptive regulatory trigger is tripped and livestock grazing is identified as a probable limiting factor then adjustments would follow the Adaptive Grazing Management Response described in FEIS Appendix.
- AM-14: Remove any adaptive management response when the habitat or population information shows a return to or an exceedance of the 2011 baseline values within the associated Conservation Area in accordance with the Adaptive Management Strategy.
- AM-15: Montana: Follow the NPT Adaptive Management Guidance and Sideboards. When a hard trigger is hit in a BSU, the designated response will be put in place in that BSU. Triggers and responses have been developed with local state and USFWS experts.
- AM-16: Idaho and Montana: When a hard trigger is hit in a BSU within a PAC that has multiple BSUs, including those that cross state lines, the WAFWA Management Zone Greater Sage-Grouse Conservation Team will convene to determine the causal factor, put project-level responses in place, as appropriate and discuss further appropriate actions to be applied. The team will also investigate the status of the hard triggers in other BSUs within the PAC and will invoke the appropriate plan response.

*Anthropogenic Disturbance*

AD-1 (Anthropogenic Disturbance): If the 3 percent anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSG PHMA (or IHMA in Idaho) Habitat Management Areas in any given BSU, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the General Mining Law of 1872, as amended, valid existing rights, etc.) will be permitted by BLM within GRSG PHMAs and IHMAs in any given BSU until the disturbance has been reduced to less than the cap. As measured according to the Monitoring Framework (FEIS Appendix) for the intermediate scale.

If the 3 percent disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area (FEIS Appendix) in a

PHMA (or IHMA in Idaho), then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain the area under the cap (subject to applicable laws and regulations, such as the General Mining Law of 1872, as amended, valid existing rights, etc.).

Montana will use a 3 percent disturbance cap until the state of Montana strategy, similar to WY's Core Area Strategy that uses a 5 percent disturbance cap for all lands and all disturbances, is fully implemented. If the 3 percent anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) or if anthropogenic disturbance and habitat loss associated with conversion to agricultural tillage or fire exceed 5 percent within a project analysis area, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the General Mining Law of 1872, as amended, valid existing rights, etc.) will be permitted by BLM within a project analysis area until the disturbance has been reduced to less than the cap.

For Idaho the BSU (FEIS Figure) is defined as the currently mapped nesting and wintering habitat within PHMA and IHMA within a Conservation Area, inclusive of all ownerships for evaluation. For Montana the BSU is defined as the PHMA in Montana. Anthropogenic disturbance excludes habitat disturbance from wildfire and fuels management activities and includes activities described in FEIS Table. For Idaho this disturbance is measured by direct footprint or by ROW width for linear features (powerlines, pipelines and roads). For Montana disturbance is measured similar to the Wyoming Disturbance Density Calculation Tool process described in FEIS Appendix.

- AD-2: New anthropogenic disturbances within PHMA or IHMA within a Conservation Area where the disturbance cap is already exceeded from any source or where the proposed development would result in the cap being exceeded would not be allowed in within that Conservation Area until enough habitat has been restored within that Conservation Area to maintain the area under this cap (subject to valid existing rights).
- AD-3: PHMA (Idaho only): Anthropogenic Disturbance Exception Criteria. In order to avoid surface-disturbing activities in PHMA, priority will be given to development (including ROWs, fluid minerals and other mineral resources subject to applicable stipulations) outside of PHMA. When authorizing development in PHMA, priority will be given to development in non-habitat areas first and then in the least suitable habitat for GRSG. In addition to the PHMA and IHMA Anthropogenic Disturbance Development Criteria (AD-4), the following criteria must all be met in the project screening and assessment process:
- a. The population trend for the GRSG within the associated Conservation Area is stable or increasing over a three-year period and the population levels are not currently engaging the adaptive management triggers (this applies strictly to new authorizations;

renewals and amendments of existing authorizations would not be subject to this criteria when it can be shown that long-term impacts from those renewals or amendments would be substantially the same as the existing development);

- b. The development with associated mitigation would not result in a net loss of GRSG Key habitat and mitigation would provide a net conservation benefit to the respective PHMA;
- c. The project and associated impacts would not result in a net loss of GRSG Key habitat or habitat fragmentation or other impacts causing a decline in the population of the species within the relevant Conservation Area (the project would be outside Key habitat in areas not meeting desired habitat conditions or the project would provide a benefit to habitat areas that are functioning in a limited way as habitat);
- d. Cannot be reasonably accomplished outside of the PHMA; or can be either: 1) developed pursuant to a valid existing authorization; or 2) is co-located within the footprint of existing infrastructure (proposed actions would not increase the 2011 authorized footprint and associated impacts more than 50 percent, depending on industry practice.
- e. Development could be implemented adhering to the required design features (RDF) described in Appendix F;
- f. The project would not exceed the disturbance cap (AD-1).
- g. The project has been reviewed by the State Implementation Team and recommended for consideration by the Idaho Governor.

AD-4: The following Anthropogenic Disturbance Development Criteria must be met in the screening and assessment process for proposals in PHMA and IHMA to discourage additional disturbance in PHMAs and IHMAs (as described in LR-1 and LR-2; applies to Idaho only):

- a. Through coordination with the USFWS and State of Idaho (as described in CC-1), it is determined that the project cannot be achieved, technically or economically, outside of this management area; and
- b. The project siting and/or design should best reduce cumulative impacts and/or impacts on GRSG and other high value natural, cultural, or societal resources; this may include co-location within the footprint for existing infrastructure, to the extent practicable; and
- c. The project does not result in a net loss of GRSG Key habitat or habitat fragmentation or other impacts causing a decline in the population of the species within the relevant Conservation Area; and
- d. The project design mitigates unavoidable impacts through appropriate compensatory mitigation; and

- e. Development could be implemented adhering to the RDFs described in Appendix F.
  - f. The project would not exceed the disturbance cap (AD-1).
- AD-5: In Montana, the BLM would apply the project/action screen and mitigation process (FEIS Appendix).
- AD-5: Co-locating new infrastructure within existing ROWs and maintaining and upgrading ROWs is preferred over the creation of new ROWs or the construction of new facilities in all management area. Colocation for various activities is defined as:
- Communication Sites – The installation of new equipment/facilities on or within or adjacent to existing authorized equipment/facilities or within a communication site boundary as designated in the Communication Site Plan.
  - Electrical Lines – Installation of new ROWs adjacent to current ROWs boundaries, not necessarily placed on the same power poles.
  - Other Rights-of-Way – The installation of new ROWs within the existing footprint of an approved ROW boundary or adjacent to an approved ROW boundary.
  - Designated Corridors – The installation of new rights-of-way within the existing corridor or adjacent to the existing corridor.
- AD-6: Incorporate RDFs as described in Appendix F in the development of project or proposal implementation, reauthorizations or new authorizations and suppression activities, as conditions of approval (COAs) into any post-lease activities and as best management practices for locatable minerals activities, to the extent allowable by law, unless at least one of the following conditions can be demonstrated and documented in the NEPA analysis associated with the specific project:
- a. A specific RDF is not applicable to the site-specific conditions of the project or activity;
  - b. A proposed design feature or BMP is determined to provide equal or better protection for GRSG or its habitat; or
  - c. Analysis concludes that following a specific RDF would provide no more protection to GRSG or its habitat than not following it, for the project being proposed.
- AD-7: Conduct implementation and project activities, including construction and short-term anthropogenic disturbances consistent with seasonal habitat restrictions described in Appendix G.
- AD-8: RDFs and seasonal habitat restrictions would not be required for emergency or short-term activities necessary to protect and preserve human life or property.

- AD-9: In undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will apply the lek buffer-distances identified in the USGS Report Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review (Open File Report 2014-1239) in accordance with Appendix H.
- AD-10: Incorporate appropriate conservation measures for slickspot peppergrass (*Lepidium papilliferum*) as described in the 2014 Conservation Agreement (as updated, amended or reauthorized) into implementation and project design within slickspot peppergrass habitat in the Jarbidge and Four Rivers Field Offices to avoid and minimize impacts to slickspot peppergrass. The 2014 Conservation Agreement is included in FEIS Appendix.

**Table 2-11  
Anthropogenic Disturbances and Areas of Impact**

<b>Datasets as Described in the Monitoring Framework<sup>1</sup></b>
Oil and Gas Wells and Development Facilities
Coal Mines
Wind Towers
Solar Fields
Geothermal Development Facilities
Mining (Active Locatable, Leasable and Saleable Developments)
Roads
Railroads
Powerlines
Communication Towers
Other Vertical Structures
<b>Additional Local Datasets</b>
Coalbed Methane Ponds
Meteorological Towers (e.g., wind energy testing)
Nuclear Energy Facilities
Airport Facilities and Infrastructure
Military Range Facilities and Infrastructure
Hydroelectric Plants
Recreation Areas Facilities and infrastructure

Note:

Taken from Table 6 – GRSG Monitoring Framework.

*Mitigation*

- MIT-1 (Mitigation): BLM would establish an inter-agency State GRSG Conservation Team at the state level (both Idaho and Montana) to help guide conservation of GRSG through compensatory mitigation, within 90 days of the issuance of the Record of Decision.
- MIT-2: The BLM and Forest Service, in coordination with the GRSG Conservation Team would develop a Mitigation Strategy within one year of the issuance of the Record of Decision. In Idaho this strategy would be consistent with the Idaho Mitigation Framework (FEIS Appendix).

- MIT-3: In all GRSG habitat, in undertaking BLM management actions, and, consistent with valid existing rights and applicable law, in authorizing third-party actions that result in habitat loss and degradation (FEIS Appendix), the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. A net conservation benefit to GRSG would be achieved by implementing restoration conservation actions, applying a no net unmitigated loss standard for authorized uses in all GRSG habitat with PHMA, IHMA and GHMA; and strategically siting compensatory mitigation actions, consistent with the WAFWA Management Zone Regional Mitigation Strategy as part of a mitigation program in order to achieve cumulative benefits (as outlined in FEIS Appendix).
- MIT-4: Mitigate anthropogenic development (FEIS Appendix) impacts to a no net loss of Key habitat standard (FEIS Appendix) through application of appropriate mitigation in accordance with the Mitigation Framework (FEIS Appendix), referred to as no unmitigated loss. No net unmitigated loss means that impacts from implementation level actions would be fully offset to benefit the species. This would be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions.
- MIT-5: Mitigate anthropogenic development (FEIS Appendix) impacts to GRSG habitat through application of appropriate mitigation in accordance with the Mitigation Framework (FEIS Appendix).
- MIT-6: Consistent with regulations for minerals activities, require a full reclamation bond specific to the site when surface disturbing activities are proposed. Ensure reclamation bonds are sufficient to cover costs to fully rehabilitate lost GRSG habitat. Base the reclamation costs on the assumption that contractors for the BLM will perform the work. Areas are considered fully rehabilitated when they meet the conditions described in FEIS Table.
- Monitoring*
- MON-1 (Monitoring): Once FIAT Assessments are complete annually complete a review of FIAT Assessment implementation efforts within GRSG habitat with appropriate USFWS and state agency personnel.
- MON-2: Monitor the effectiveness of projects (e.g., fuel breaks, fuels treatments) until objectives have been met or until it is determined that objectives cannot be met, according to the monitoring schedule identified for project implementation.
- MON-3: Monitor invasive vegetation post vegetation management treatment
- MON-4: Monitor project construction areas for noxious weed and invasive species for at least 3 years, unless control is achieved earlier.

- MON-5: Use lek, nesting and winter habitat maps and key habitat map (updates) to annually assess GRSG population and habitat status in the context of the adaptive management triggers.
- MON-6: Continue to support updates to the Key Habitat map to track vegetation changes in relation to GRSG habitat on a yearly basis, until such a time this process is replaced. The process used to update the Key Habitat Map is described in FEIS Appendix.
- MON-7: Monitor GRSG habitat as described in the monitoring framework plan (FEIS Appendix) in coordination with IDFG and MT FWP.

**Vegetation**

*Objectives*

- VEG-OBJ-1 (Vegetation): Reconnect and expand areas of higher native plant community integrity/rangeland health to increase the extent of high quality habitat and, where possible, to accommodate the future effects of climate change.
- VEG-OBJ-2: Increase the amount and functionality of seasonal habitats by:
  - a. Increasing or enhancing canopy cover and average patch size of sagebrush.
  - b. Increasing the amount, condition and connectivity of seasonal habitats.
  - c. Protecting or improving GRSG migration/movement corridors.
  - d. Reducing conifer encroachment within GRSG seasonal habitats.
  - e. Improving understory (grass, forb) and/or riparian condition within breeding and late brood-rearing habitats.
  - f. Reducing the extent of annual grasslands within and adjacent to PHMA and IHMA.

Decadal treatment objectives by population area are identified in **Table 2-5**.

- VEG-OBJ-3: In all SFAs and PHMAs, the desired condition is to maintain a minimum of 70 percent of lands capable of producing sagebrush with 10 to 30 percent sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).

**Table 2-12**  
**Estimated Acres of Treatment Needed within a 10-Year Period to Achieve Vegetation Objectives<sup>1</sup>**

Population Area	Mechanical <sup>2</sup>	Prescribed Fire (FM-15) <sup>3</sup>	Grass Restoration (VEG-2) <sup>4</sup>
Bear Lake Plateau	1,000	0	0
East Idaho Uplands	6,000	9,000	1,000

**Table 2-12**  
**Estimated Acres of Treatment Needed within a 10-Year Period to Achieve Vegetation Objectives<sup>1</sup>**

<b>Population Area</b>	<b>Mechanical<sup>2</sup></b>	<b>Prescribed Fire (FM-15)<sup>3</sup></b>	<b>Grass Restoration (VEG-2)<sup>4</sup></b>
S Central Idaho/N Snake River and Mountain Valleys	18,000	11,000	162,000
Weiser	0	0	13,000
SW Idaho	52,000	10,000	444,000
SW Montana	0	0	0

Note:

<sup>1</sup>These are estimates of treatments required to achieve and/or maintain desired habitat conditions over a period of ten years. There are many dynamic and highly variable disturbances that may happen over that period of time that could have a significant effect on the amount, type, and timing of treatment needed. Those disturbances are factored into the ten-year simulation using stochastic, not predictive, techniques. Probabilities of events such as large wildfires are used in the model to make the simulation as realistic as possible, given empirical data about such events in the past, but the results of the simulation cannot be used to predict the future occurrence of such events, including their timing, size, or location, which are essentially random.

<sup>2</sup>Removal of conifers that have invaded sagebrush including phase one juniper that is 10 percent or less and reducing sagebrush cover in areas over 30 percent canopy cover

<sup>3</sup>Acres are those that are greater than 30 percent sagebrush canopy cover and/or invaded by 10 percent or greater conifer.

<sup>4</sup>Acres presently dominated by annual grasses that could be improved by herbicide application and seeding of perennial vegetation.

### *Vegetation Management*

VEG-1: Implement habitat rehabilitation or restoration projects in areas that have potential to improve GRSG habitat using a full array of treatment activities as appropriate, including chemical, mechanical and seeding treatments.

VEG-2: Implement vegetation rehabilitation or manipulation projects to enhance sagebrush cover or to promote diverse and healthy grass and forb understory to achieve the greatest improvement in GRSG habitat based on FIAT Assessments, HAF assessments, other vegetative assessment data and local, site specific factors that indicate sagebrush canopy cover or herbaceous conditions do not meet habitat management objectives (i.e. is minimal or exceeds optimal characteristics). This may necessitate the use of prescribed fire as a site preparation technique to remove annual grass residual growth prior to the use of herbicides in the restoration of certain lower elevation sites (e.g., Wyoming big sagebrush) but such efforts will be carefully planned and coordinated to minimize impacts to GRSG seasonal habitats.

VEG-3: Require use of native seeds for restoration based on availability, adaptation (ecological site potential), and probability of success (Richards et al. 1998). Non-native seeds may be used as long as they support GRSG habitat objectives (Pyke 2011) to increase probability of success, when adapted seed availability is low or to compete with invasive species especially on harsher sites.

- VEG-4: Implement management changes in restoration and rehabilitation areas, as necessary, to maintain suitable GRSG habitat, improve unsuitable GRSG habitat and to ensure long-term persistence of improved GRSG habitat (Eiswerth and Shonkwiler 2006). Management changes could be considered during livestock grazing permit renewals, travel management planning, and renewal or reauthorization of ROWs.
- VEG-5: Consider establishing seed harvest areas that are managed for seed production (Armstrong 2007) to provide a reliable source of locally adapted seed to use during rehabilitation and restoration activities.
- VEG-6: Allocate use of native seed to GRSG or ESA listed species habitat in years when preferred native seed is in short supply. This may require reallocation of native seed from ESR (BLM) and/or BAER (Forest Service) projects outside of PHMA or IHMA to those inside it. Where probability of success or native seed availability is low, nonnative seeds may be used as long as they meet GRSG habitat conservation objectives (Pyke 2011). Re-establishment of appropriate sagebrush species/subspecies and important understory plants, relative to site potential, shall be the highest priority for rehabilitation efforts.
- VEG-7: During land health assessments, evaluate the relative value of existing nonnative seeding within GRSG habitat as: 1) a component of a grazing system allowing improvement of adjacent native vegetation, 2) development of a forage reserve, 3) incorporation into a fuel break system (Davies et al. 2011) or 4) restoration/diversification for GRSG habitat improvement. Where appropriate and feasible, diversify seedings, or restore to native vegetation when potential benefits to GRSG habitat outweigh the other potential uses of the non-native seeding, with emphasis on PHMA and IHMA. Allow recolonization of seedings by sagebrush and other native vegetation.
- VEG-8: Remove conifers encroaching into sagebrush habitats. Prioritize treatments closest to occupied GRSG habitats and near occupied leks, and where juniper encroachment is phase 1 or phase 2. Use of site-specific analysis and tools like VDDT and the FIAT report (Chambers et. al., 2014) will help refine the location for specific areas to be treated.

*Invasive Species*

- INV-1 (Invasive Species): Incorporate results of the FIAT Assessments into projects and activities addressing invasive species.
- INV-2: Implement noxious weed and invasive species control using integrated vegetation management actions per national guidance and local weed management plans for Cooperative Weed Management Areas in cooperation with State and Federal agencies, affected counties, and adjoining private lands owners.

- INV-3: Conduct integrated weed management actions for noxious and invasive weed populations that are impacting or threatening GRSG habitat quality using a variety of eradication and control techniques including chemical, mechanical and other appropriate means.
- INV-4: Require project proponent (projects described in **Table 2-4** and which are included in the anthropogenic disturbance cap evaluation) to ensure that noxious weeds and invasive species caused as a result of the project are treated to eliminate establishment on the disturbed project construction areas for at least 3 years and monitored and treated during the life of the project.

### ***Wildland Fire Management***

#### *Objectives*

FUEL-OBJ-1: Design fuel treatments to restore, enhance, or maintain GRSG habitat.

#### *Wildfire Preparedness/Prevention*

- WFP-1 (Wildfire Preparedness): Support development and implementation of Rangeland Fire Protection Associations (RFPAs) in coordination with the State of Idaho.
- WFP-2: Develop a consistent approach to fire restrictions within GRSG habitat through the existing coordinated inter-agency approach to fire restrictions based upon National Fire Danger Rating System thresholds (fuel conditions, drought conditions, and predicted weather patterns).
- WFP-3: Annually incorporate into existing fire management plans results and updates from the Wildfire and Invasive Species Habitat Assessments (FIAT Assessments) described in FEIS Appendix, to communicate/explain the resource value of GRSG habitat, including fire prevention messages and actions to reduce human-caused ignitions.
- WFP-4: Continue to participate with the Wildland Fire Leadership Council, a cooperative, interagency organization dedicated to achieving consistent implementation of the goals, actions, and policies in the National Fire Plan and the Federal Wildland Fire Management Policy.
- WFP-5: Continue annual coordination meetings held between cooperating agencies that have fire suppression responsibilities. Incorporate Rangeland Fire Protection Associations and other stakeholders into this coordination. Discuss priority suppression areas and distribute maps showing priority suppression areas at both the Conservation Area and the local office levels as based on the adaptive management strategy and FIAT Assessments.
- WFP-6: Ensure firefighter personnel receive annual orientation regarding GRSG habitat and sagebrush management issues as related to wildfire suppression.

- WFP-7: As part of the FIAT Assessments, identify roads, trails, and recreational use areas with high frequency of human caused fires within or adjacent to the PHMA or IHMA. Consider these areas during annual fire restriction evaluations, and as appropriate, through site specific management.
- WFP-8: Coordinate with Federal, State and local jurisdictions on fire and litter prevention programs to reduce human caused ignitions.
- WFP-9: Implement activities identified within the FIAT Assessments.

*Wildfire Suppression*

- WFS-1: Complete Wildland Fire and Invasive Species Assessments (FIAT Assessments) as described within FEIS Appendix and incorporate results into appropriate Fire Management Plans as they are completed. FIAT Assessments are interdisciplinary evaluations of the threats posed by wildfire and invasive species, as well as identification of focal and emphasis habitats/treatment opportunities for fuels management, fire management, and restoration. These FIAT Assessments identify focal and emphasis habitats and describe strategies for fuels management, suppression and restoration activities. Focal and Emphasis Habitats identified through the FIAT Assessment to further refine priority areas for treatments to reduce the threats posed by wildfire, invasive annual grass and conifer expansion.
- WFS-2: As part of the FIAT Assessments incorporate a wildfire response time analysis focusing on response time to identified priority areas within PHMA and IHMA or on those fires that have the potential to impact PHMA and IHMA. Incorporate findings into Unit Initial Attack program
- WFS-3: As part of the FIAT Assessment incorporate a water capacity analysis for suppression purposes, including potential private water sources. Provide water availability to respond to fire in or threatening PHMA and IHMA during initial attack.
- WFS-4: During high fire danger conditions, stage initial attack and secure additional resources closer to priority areas identified in the FIAT Assessments, based on anticipated fires and weather conditions, with particular consideration of the West Owyhee, Southern and Desert Conservation Areas to ensure quicker response times in or near GRSG habitat after considerations and placement of resources to protect human life and property.
- WFS-5: Utilize a full range of fire management strategies and tactics through strategic wildfire suppression planning consistent with appropriate management response and within acceptable risk levels, to achieve resource objectives for GRSG habitat consistent with land use plan direction. Utilizing both direct and indirect attack as appropriate to limit the overall amount of GRSG habitat burned. This could include suppressing fires in intact sagebrush habitats; limiting fire growth in GHMA when suppression resources are

available or managing wildfire for resource benefit in areas of conifer (juniper) encroachment.

- WFS-6: Suppression priorities: Firefighter and public safety followed by property are the highest priority for protection during suppression activities. Maintaining GRSG habitat will be prioritized immediately after human life and property, commensurate with threatened and endangered species habitat or other critical habitats to be protected.
- WFS-7: Ensure close coordination with federal and state firefighters including the Rangeland Fire Protection Associations during suppression activities.

*Fuels Management*

- FM-1: Design and implement fuels treatments that would reduce the potential start and spread of unwanted wildfires and provide anchor points or control lines for the containment of wildfires during suppression activities with an emphasis on maintaining, protecting, and expanding sagebrush ecosystems and successfully rehabilitated areas and strategically and effectively reduce wildfire threats in the greatest area.
- FM-2: Enhance (or maintain/retain) sagebrush canopy cover and community structure to match expected potential for the ecological site and consistent with GRSG habitat objectives unless fuels management objectives requires additional reduction in sagebrush cover to meet strategic protection of GRSG habitat. Closely evaluate the benefits of the fuel management treatments against the additional loss of sagebrush cover on the local landscape in the NEPA process.
- FM-3: Apply appropriate seasonal restrictions for implementing vegetation and fuels management treatments according to the type of seasonal habitats present. Allow no treatments in known winter range unless the treatments are designed to strategically reduce wildfire risk around and/or in the winter range and would protect, maintain, increase, or enhance winter range habitat quality. Ensure chemical applications are utilized where they would assist in success of fuels treatments. Strategically place treatments on a landscape scale to prevent fire from spreading into PHMA or WUI.
- FM-4: Develop a fuels continuity and management strategy to expand, enhance, maintain and protect GRSG habitat informed by the FIAT Assessments completed as described in FEIS Appendix.
- FM-5: When developing the fuels management strategy as part of the FIAT Assessment described in FEIS Appendix consider up-to-date fuels profiles; land use plan direction; current and potential habitat fragmentation; sagebrush and GRSG ecological factors; active vegetation management steps to provide critical breaks in fuel continuity where appropriate; incorporate a comparative risk analysis with regard to the risk of increased habitat

fragmentation from a proposed action versus the risk of large scale fragmentation posed by wildfires if the action is not taken.

- FM-6: Fuel treatments will be designed through an interdisciplinary process to expand, enhance, maintain, and protect GRS habitat which considers a full range of cost effective fuel reduction techniques, including: chemical, biological (including grazing and targeted grazing), mechanical and prescribed fire treatments.
- FM-7: Existing and proposed linear ROWs could be considered for use and maintenance as vegetated fuel breaks in appropriate areas (this activity may or may not be part of the ROW permit or the responsibility of the permit holder, in cases where this activity is considered part of mitigation for project design then it would be appropriately included as part of the ROW permit and the responsibility of the permit holder for development and maintenance).
- FM-8: Fuel breaks would incorporate existing vegetation treatments (seedings), rocky areas or other appropriate topography or features or be located adjacent to existing linear disturbance areas where appropriate. Fuel breaks should be placed in areas with the greatest likelihood of compartmentalizing a fire and/or to foster suppression options to protect existing intact habitat.
- FM-9: Strategically pre-treat areas to reduce fine fuels consistent with areas and results identified within the Wildfire and Invasive Species Assessments.
- FM-10: Protect vegetation restoration and rehabilitation efforts/projects from subsequent fire events.
- FM-11: Targeted grazing as a fuels treatment to adjust the vegetation conditions to reduce the potential start and spread of wildfires may be implemented within existing grazing authorizations if feasible such as through temporary non-renewable authorizations, or through contracts, agreements or other appropriate means separate from existing grazing authorizations and permits.
- FM-12: Targeted grazing to achieve fuels management objectives should conform to the following criteria:
- a. Targeted grazing should be implemented strategically on the landscape, and directly involve the minimum footprint and grazing intensity required to meet fuels management objectives.
  - b. Conform to the applicable Standards for Rangeland Health and Guidelines for Livestock Grazing Management (Idaho or Montana) at the assessment scale (pasture/watershed).
  - c. Where feasible and applicable coordinate with the grazing permittee to strategically reduce fuels through livestock management within the Mandatory Terms and Conditions of the applicable grazing authorizations

- FM-13: Prioritize the use of native seeds for fuels management treatment based on availability, adaptation (site potential), and probability of success. Where probability of success or native seed availability is low or non-economical, nonnative seeds may be used to meet GRSG habitat objectives to trend toward restoring the fire regime. When reseeding, use fire resistant native and nonnative species, as appropriate, to provide for fuel breaks.
- FM-14: Maintain effectiveness of fuels projects, including fuel breaks, to ensure long-term success, including persistence of seeded species and/or other treatment components while maintaining the integrity of adjacent vegetation.
- FM-15: If prescribed fire is used in GRSG habitat, the NEPA analysis for the Burn Plan will address:
- why alternative techniques were not selected as a viable options;
  - how GRSG goals and objectives would be met by its use;
  - how the COT Report objectives would be addressed and met;
  - a risk assessment to address how potential threats to GRSG habitat would be minimized.
    - a. Prescribed fire as a vegetation or fuels treatment shall only be considered after the NEPA analysis for the Burn Plan has addressed the four bullets outlined above. Prescribed fire could be used to meet specific fuels objectives that would protect GRSG habitat in PHMAs (e.g., creation of fuel breaks that would disrupt the fuel continuity across the landscape in stands where annual invasive grasses are a minor component in the understory, burning slash piles from conifer reduction treatments, used as a component with other treatment methods to combat annual grasses and restore native plant communities).
    - b. Prescribed fire in known winter range shall only be considered after the NEPA analysis for the Burn Plan has addressed the four bullets outlined above. Any prescribed fire in winter habitat would need to be designed to strategically reduce wildfire risk around and/or in the winter range and designed to protect winter range habitat quality.

*Wildfire Restoration/Rehabilitation – Emergency Stabilization and Rehabilitation*

- ESR-1: Utilize the findings and Restoration/Rehabilitation Strategy developed as part of the FIAT Assessment process described in FEIS Appendix to determine if GRSG rehabilitation actions are needed, based on ecological potential, and direct emergency stabilization and rehabilitation (ESR) (BLM) or Burned Area Emergency Restoration (BAER) (Forest Service) actions after fire.

- ESR-2: Incorporate GRSG Habitat Management Objectives into ESR/BAER plans based on site potential and in accordance with the Restoration/Rehabilitation Strategy developed as a result of the FIAT Assessments.
- ESR-3: Provide adequate rest from livestock grazing to allow natural recovery of existing vegetation and successful establishment of seeded species within burned/ESR areas. All new seedings of grasses and forbs should not be grazed until at least the end of the second growing season, and longer as needed to allow plants to mature and develop robust root systems which will stabilize the site, compete effectively against cheatgrass and other invasive annuals, and remain sustainable under long-term grazing management. Adjust other management activities, as appropriate, to meet ESR objectives.
- ESR-4: Adjust, as appropriate, livestock management on adjacent unburned areas to mitigate the effect of the burn on local GRSG populations.
- ESR-5: Following seedling establishment, modify grazing management practices if needed to achieve long-term vegetation and habitat objectives.

***Livestock Grazing***

- RM-1 (Range Management): Maintain existing areas designated as available or unavailable for livestock grazing. Existing active AUMs for livestock grazing within the planning area would not be changed at the broad scale, though the number of AUMs available on an allotment may be adjusted based on site-specific conditions to meet management objectives during term permit renewals, AMP development, or other appropriate implementation planning. Additionally, temporary adjustments can be made annually to livestock numbers, the number of AUMs, and season of use in accordance with applicable regulations.
- RM-2: Prioritize BLM land health assessments and processing of BLM grazing permits consistent with management area prioritization (MA-4), unless other higher priority considerations exist such as threatened, endangered and proposed species habitat that livestock grazing could affect. Where possible, conduct land health assessments at the watershed, or other meaningful landscape-scale.
- RM-3: Where opportunities exist, coordinate with other land managers to encourage livestock operations that utilize mixed federal, private and/or state land to be managed at the landscape scale to benefit GRSG and their habitat across land ownerships.
- RM-4: PHMA & IHMA: During the land health assessment process, identify the type(s) of seasonal habitat the assessed areas are capable of supporting. Utilize the habitat assessment framework, (Stiver et al. 2014 as amended/replaced) or other BLM or Forest Service approved methodology, in accordance with current policy and guidance to determine whether vegetation structure, condition and composition are meeting GRSG habitat

objectives including riparian and lentic areas (HM-OBJ-2; Table 2). Use appropriate Ecological Site Descriptions, reference sheets and state and transition models to inform desired habitat conditions and expected responses to management changes for the land unit being assessed.

- RM-5: When modifying grazing management, analyze indirect effects to habitat, including changes in fuel loading and wildfire behavior.
- RM-6: When livestock management practices are determined to not be compatible with meeting or making progress towards achievable habitat objectives following appropriate consultation, cooperating and coordination, implement changes in grazing management through grazing authorization modifications, or allotment management plan implementation. Potential modifications include, but are not limited to, changes in:
- 1) Season or timing of use;
  - 2) Numbers of livestock;
  - 3) Distribution of livestock use;
  - 4) Duration and/or level of use;
  - 5) Kind of livestock (e.g., cattle, sheep, horses, or goats) (Briske et al. 2011); and
  - 6) Grazing schedules (including rest or deferment).
- RM-7: Where opportunities exist, establish forage reserves to facilitate restoration and rehabilitation efforts in GRSG habitat areas. A forage reserve is an area that is set aside for use as needed by various permittees who might be displaced by wildfire, ESR, restoration efforts, etc. rather than having a term permit issued for grazing like a regular allotment.
- RM-8: PHMA, IHMA & GHMA - When an allotment, or portion thereof, becomes vacant or grazing preference is relinquished, consider retirement of the allotment or grazing preference, or portion thereof, or converting the area to a forage reserve (a.k.a. reserve common allotment; forage reserves are areas that are set aside for use)/buffer when doing so would maintain or enhance GRSG habitat as described in subsequent site specific NEPA analysis.
- RM-9: PHMA & IHMA - Where practical, design pasture rotations to utilize non-native perennial grass seedings and/or annual grasslands, during GRSG nesting season annually or periodically.
- RM-10: Evaluate the locations where salt/supplements are placed, coordinate salt/supplements placement to reduce impacts to GRSG habitat (e.g., existing disturbed areas).
- RM-11: Incorporate RDFs into Terms and Conditions for crossing permits to limit disturbance of occupied leks when trailing livestock across BLM- and Forest Service -administered lands in the spring. Work with permittees in locating

over-nighting, watering and bedding locations to minimize impacts to seasonal habitats.

- RM-12: Design any new structural range improvements, following appropriate cooperation, consultation and coordination, to minimize and/or mitigate effects to GRSG habitat. Any new structural range improvements should be placed along existing disturbance corridors or in unsuitable habitat, to the extent practical, and are subject to RDFs (Appendix F). Structural range improvement in this context, include, but are not limited to: fences, exclosures, corrals or other livestock handling structures; pipelines, troughs, storage tanks (including moveable tanks used in livestock water hauling), windmills, ponds/reservoirs, solar panels and spring developments.
- RM-13: During the land health assessment and grazing permit renewal process, evaluate existing livestock management range improvements with respect to their effect on GRSG habitat. Consider removal of projects that are not needed for effective livestock management, are no longer in working condition, and/or negatively affect GRSG habitat, with the exception of functional projects needed for management of habitat for other threatened, endangered or proposed species or other sensitive resources.
- RM-14: Prioritize removal, modification or marking of fences or other structures in areas of high collision risk following appropriate cooperation, consultation and coordination to reduce the incidence of GRSG mortality due to fence strikes (Stevens et al. 2012).
- RM-15: In response to weather conditions (i.e. drought) adjust grazing management (i.e., delay turnout, adjust pasture rotations, adjust the amount and/or duration of grazing) as appropriate to provide for adequate food and cover for GRSG.
- RM-16: The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (ex., fire) and legal obligations.
- RM-17: The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.

- RM-18: Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.
- RM-19: At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

***Wild Horses and Burros***

- WHB-1: Manage herd management areas (HMAs) in GRSG habitat within established AML ranges to achieve and maintain GRSG habitat objectives (**Table 2-3**).
- WHB- 2: Complete rangeland health assessments for HMAs containing GRSG habitat using an interdisciplinary team of specialists (e.g. range, wildlife, and riparian). The priorities for conducting assessments are: 1) HMAs Containing SFA; 2) HMAs containing PHMA; 3) HMAs containing IHMA; 4) HMAs containing GHMA; 5) HMAs containing sagebrush habitat outside of PHMA, IHMA. and GHMA mapped habitat; 6) HMAs without GRSG Habitat.
- WHB-3: Prioritize gathers and population growth suppression techniques in HMAs in GRSG habitat, unless removals are necessary in other areas to address higher priority environmental issues, including herd health impacts. Place higher priority on Herd Areas not allocated as HMAs and occupied by wild horses and burros in SFAs followed by PHMA.
- WHB-4: In SFAs and PHMA outside of SFA, assess and adjust AMLs through the NEPA process within HMAs when wild horses or burros are identified as a significant causal factor in not meeting land health standards, even if current AML is not being exceeded.
- WHB-5: In SFAs and PHMA outside of SFA, monitor the effects of wild horse and burro use in relation to GRSG seasonal habitat objectives on an annual basis to help determine future management actions.
- WHB-6: Develop or amend herd management area plans (HMAPs) to incorporate GRSG habitat objectives and management considerations for all HMAs within GRSG habitat, with emphasis placed on SFAs and other PHMAs.
- WHB-7: Consider removals or exclusion of wild horse and burros during or immediately following emergency situations (such as fire, floods, and drought) to facilitate meeting GRSG habitat objectives where HMAs overlap with GRSG habitat.
- WHB-8: When conducting NEPA analysis for wild horse and burro management activities, water developments, or other rangeland improvements for wild

horses, address the direct and indirect effects to GRSG populations and habitat. Implement any water developments or rangeland improvements using the criteria identified for domestic livestock.

- WHB-9: Coordinate with professionals from other federal and state agencies, researchers at universities, and others to utilize and evaluate new management tools (e.g., population growth suppression, inventory techniques, and telemetry) for implementing the wild horse and burro program.

***Lands and Realty***

- LR-1 (Lands and Realty): PHMA: Designate and manage PHMA as ROW avoidance areas, consistent with AD-3 and subject to RDFs, buffers and seasonal timing restrictions (Appendices F, G, and H). IHMA: Designate and manage IHMA as ROW avoidance areas, consistent with AD-4 and subject to RDFs, buffers and seasonal timing restrictions. GHMA (Idaho and Montana): Designate and manage GHMA as open with proposals subject to RDFs, buffers and seasonal timing restrictions.
- LR-2: PHMA: Designate and manage PHMA as exclusion areas for utility scale (20 MW) wind and solar testing and development, nuclear and hydropower energy development. IHMA: Designate and manage IHMA as avoidance areas for wind and solar testing and development, nuclear and hydropower development. GHMA (Idaho): Designate and manage GHMA as open for wind and solar testing and development and nuclear and hydropower development subject to RDFs, buffers and seasonal timing restrictions. GHMA (Montana): Designate and manage GHMA as avoidance for wind and solar testing and development and nuclear and hydropower development.
- LR-3: PHMA: Development of commercial service airports and facilities (as defined by FAA 2014 – publically owned airports that have at least 2,500 passenger boardings each calendar year and receive scheduled passenger service) would not be allowed within PHMA. IHMA and GHMA are Avoidance and Open respectively for these types of ROW applications as described in LR-1.
- LR-4: PHMA: Development of new or expansion of existing landfills would not be allowed within PHMA. IHMA and GHMA are Avoidance and Open respectively for these types of ROW applications as described in LR-1.
- LR-5: Consistent with LR-2, LR-3 and LR-4, Rights-of-way for development of new or amended ROWs and land use authorizations (including permits and leases) in PHMA would only be considered when consistent with the Anthropogenic Disturbance Exception Criteria (AD-3); Rights-of-way for development of new or amended ROWs and land use authorizations (including permits and leases) in IHMA could be considered consistent with

the IHMA Anthropogenic Disturbance Development Criteria (AD-4). GHMA: New ROW and land use authorizations could be considered.

- LR-6: In PHMA, if a higher voltage transmission line is required adjacent to an existing line (i.e. the project is an incremental upgrade/capacity increase of existing development (i.e. powerline capacity upgrade):
- the existing transmission line must be removed and area rehabilitated within a specified amount of time after the new line is installed and energized; and
  - the new line must be constructed in the same alignment as the existing line unless an alternate route would benefit GRSG or GRSG habitat.
- LR-7: Existing designated corridors, including Section 368 Corridors, will remain Open in all habitat management areas (subject to the ongoing settlement agreement).
- LR-8: Process unauthorized use. If the use is subsequently authorized, it would be authorized consistent with direction for the Management Areas within which it is located and the RDFs, buffers and seasonal timing restrictions. If the use is not subsequently authorized the site would be reclaimed by removing these features and rehabilitating the habitat.
- LR-9: Land use authorizations that are temporary (less than 3 years) in nature and are not otherwise excluded or restricted would be subject to seasonal or timing restrictions and mitigation requirements regarding habitat loss as needed.
- LR-10: New ROW applications for water facilities (ditches, canals, pipelines), or amendments to existing water facilities which include additional structures to improve fish passage or benefits to fisheries (new diversions, fish screens) would be allowed on a case-by-case bases subject to RDFs to reduce impacts to GRSG habitat and mitigation requirements regarding GRSG habitat loss as needed.
- LR-11: When a ROW grant expires and is not requested to be renewed, is relinquished, or terminated, the lease holder would be required to reclaim the site by removing overhead lines and other infrastructure and to eliminate avian predator nesting opportunities provided by anthropogenic development on public lands associated with the now void ROW grant (e.g., remove powerline and communication facilities no longer in service).
- LR-12: As opportunities and priorities indicate work with existing ROW holders to retrofit existing towers and structures consistent with RDFs described in Appendix F.
- LR-13: PHMA and IHMA (Idaho and Montana), and GHMA (Montana only) are designated as avoidance areas for high voltage transmission line and large pipeline ROWs, except for the transmission projects specifically identified

below. All authorizations in these areas, other than the excepted projects, must comply with the conservation measures outlined in this proposed plan, including the RDFs and avoidance criteria presented in AD-3 and AD-4 of this document. The BLM is currently processing an application for (Gateway West and Boardman to Hemingway Transmission Projects) and the NEPA review for this project is well underway. The BLM is analyzing GRSG mitigation measures through the projects' NEPA review process.

- LR-14: Lands classified as PHMA, IHMA, and GHMA for GRSG will be retained in federal management unless: (1) the agency can demonstrate that disposal of the lands will provide a net conservation gain to the GRSG or (2) the agency can demonstrate that the disposal of the lands will have no direct or indirect adverse impact on conservation of the GRSG. Land tenure adjustments would be subject to the following disposal, exchange, and acquisition criteria, which include retaining lands with GRSG habitat. Retention of areas with GRSG would reduce the likelihood of habitat conversion to agriculture, urbanization, or other uses that would remove sagebrush habitat and potentially impact sensitive plants. Criteria:
- a. Lands within PHMA, IHMA and GHMA would only be available for disposal through exchange (FEIS Appendix).
  - b. Acquire habitat within PHMA and IHMA, when possible (i.e. willing landowner), and retain ownership of habitat within all Areas, except if a land exchange would allow for additional or more contiguous federal ownership patterns.
  - c. Lands within PHMA, IHMA and GHMA would be retained unless exchange of those lands would increase the extent or provide for connectivity of PHMA or IHMA.
  - d. Evaluate potential land exchanges containing historically low-quality GRSG habitat that may be too costly to restore in exchange for lands of higher quality habitat, lands that connect seasonal GRSG habitats or lands providing for threatened and endangered species. These potential exchanges should lead to an increase in the extent or continuity of or provide for improved connectivity of PHMA. Higher priority will be given to exchanges for those in-tact areas of sagebrush that will contribute to the expansion of sagebrush areas within PHMA currently in public ownership. Lower priority would be given to other lands that would promote enhancement in the PHMA and IHMA (i.e., areas with fragmented or less in-tact sagebrush).
  - e. Identify lands for acquisition that increase the extent of or provide for connectivity of PHMA.

***Minerals****Fluid Minerals (Oil, Gas, and Geothermal)*Objectives

- FLM-OBJ-1: Priority will be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMA, IHMA, and GHMA. When analyzing leasing and authorizing development of fluid mineral resources, including geothermal, in PHMA, IHMA, and GHMA, and subject to applicable stipulations for the conservation of GRSG, priority will be given to development in non-habitat areas first and then in the least suitable habitat for GRSG. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 USC 226(p) and 43 CFR 3162.3-1(h).
- FLM-OBJ-2: Where a proposed fluid mineral development project on an existing lease could adversely affect GRSG populations or habitat, the BLM will work with the lessees, operators, or other project proponents to avoid, reduce and mitigate adverse impacts to the extent compatible with lessees' rights to drill and produce fluid mineral resources. The BLM will work with the lessee, operator, or project proponent in developing an APD or Geothermal Drilling Permit (GDP) for the lease to avoid and minimize impacts to GRSG or its habitat and will ensure that the best information about the GRSG and its habitat informs and helps to guide development of such Federal leases.

Management

- FLM-1 (Fluid Minerals): Idaho and Montana: Areas within SFAs would be open to fluid mineral leasing and development and geophysical exploration subject to NSO without waiver, exception, or modification. Areas within PHMA and IHMA would be open to mineral leasing and development and geophysical exploration subject to NSO with a limited exception (FLM-3). GHMA would be open to mineral leasing and development and geophysical exploration subject to CSU which includes buffers, seasonal timing restrictions and standard stipulations.
- FLM-2: In Idaho, parcels nominated for lease in PHMA or IHMA would be evaluated prior to lease offering to determine if development is feasible. In GHMA, parcels that could not be developed when these buffers and restrictions are applied would not be offered for lease.
- FLM-3: PHMA: No waivers or modifications to a fluid mineral lease NSO stipulation will be granted. The Authorized Officer may grant an exception to a fluid mineral lease NSO stipulation only where the proposed action:
- i. Would not have direct, indirect, or cumulative effects on GRSG or its habitat; or,

- ii. Is proposed to be undertaken as an alternative to a similar action occurring on a nearby parcel, and would provide a clear conservation gain to GRSG.

Exceptions based on conservation gain (ii) may only be considered in (a) PHMAs of mixed ownership where federal minerals underlie less than fifty percent of the total surface, or (b) areas of the public lands where the proposed exception is an alternative to an action occurring on a nearby parcel subject to a valid Federal fluid mineral lease existing as of the date of this RMP amendment. Exceptions based on conservation gain must also include measures, such as enforceable institutional controls and buffers, sufficient to allow the BLM to conclude that such benefits will endure for the duration of the proposed action's impacts.

Any exceptions to this lease stipulation may be approved by the Authorized Officer only with the concurrence of the State Director. The Authorized Officer may not grant an exception unless the applicable state wildlife agency, the USFWS, and the BLM unanimously find that the proposed action satisfies (i) or (ii). Such finding shall initially be made by a team of one field biologist or other GRSG expert from each respective agency. In the event the initial finding is not unanimous, the finding may be elevated to the appropriate BLM State Director, USFWS State Ecological Services Director, and state wildlife agency head for final resolution. In the event their finding is not unanimous, the exception will not be granted. Approved exceptions will be made publically available at least quarterly.

Idaho IHMA: A lease waiver, exception or modification to the NSO stipulation may be considered where a portion of the proposed lease is determined to be in non-GRSG habitat, the area is not used by GRSG, or it would not have direct, indirect or cumulative effects to GRSG or its habitat. The determination would be made by a team of interagency GRSG experts, including an expert from the state wildlife agency, USFWS and the BLM. All exceptions must be approved by the State Director. In the event a waiver, exception or modification were allowed development would still be subject to CSU which includes buffers, seasonal timing restrictions and standard stipulations.

Waivers, Exceptions and Modifications (WEMs) (Source IM-2008-032):

A waiver is a permanent exemption from a lease stipulation, the stipulation would no longer apply anywhere within the lease. Waivers, by regulation, require a 30-day public review if the authorized officer has determined, prior to lease issuance, that a stipulation involves an issue of major concern to the public (43 CFR 3101.4) and are approved and signed by the State Director.

An exception is a one-time exemption for a particular site within the lease; exceptions are determined on a case-by-case basis; the stipulation continues to apply to all other sites within the lease. An exception is a limited type of waiver.

A modification is a change to the provisions of a lease stipulation, either temporarily or for the term of the lease. Depending on the specific modification, the stipulation may or may not apply to all sites within the lease to which the restrictive criteria are applied.

- FLM-4: Incorporate required design features and best management practices appropriate to the management area as COAs when post leasing activity is proposed into any post-lease authorizations.
- FLM-5: In Montana, prior to leasing conduct a Master Leasing Plan process when all four of the following criteria are met:
- A substantial portion of the area to be analyzed in the MLP is not currently leased.
  - There is a majority Federal mineral interest.
  - The oil and gas industry has expressed a specific interest in leasing, and there is a moderate or high potential for oil and gas confirmed by the discovery of oil and gas in the general area.
  - Additional analysis or information is needed to address likely resource or cumulative impacts if oil and gas development were to occur where there are:
    - multiple-use or natural/cultural resource conflicts;
    - impacts to air quality;
    - impacts on the resources or values of any unit of the National Park System, national wildlife refuge, or National Forest wilderness area, as determined after consultation or coordination with the NPS, the USFWS, or the Forest Service; or
    - impacts on other specially designated areas. – analyzing likely development scenarios and varying mitigation levels.
- FLM-5: In Idaho, complete a Master Development Plan, consistent with plan development guide on leases where a producing field is proposed to be developed.
- FLM-6: Encourage unitization when deemed necessary for proper development and operation of an area (with strong oversight and monitoring). The unitization must be designed in a manner to minimize adverse impacts on GRSG according to the Federal Lease Form, 3100-11, Sections 4 and 6.
- FLM-7: Issue Written Orders of the Authorized Officer (43 CFR 3161.2) requiring reasonable protective measures consistent with the lease terms where necessary to avoid or minimize effects to GRSG populations or habitat.

*Locatable Minerals*

- LOC-1 (Locatable Minerals): Lands would remain open to locatable mineral entry in all management areas.
- LOC-2: Apply reasonable and appropriate RDFs and BMPs as Conditions of Approval to prevent unnecessary or undue degradation of GRSG habitat when a Plan of Operations is submitted for BLM or Forest Service approval, in accordance with 43 CFR 3809.411(d)(2) (or 36 CFR 228.5(a)(3) on National Forest System lands).
- LOC-3: Recommend SFAs for withdrawal from the General Mining Act of 1872, as amended, subject to valid existing rights.

*Mineral Materials (Saleable Minerals)*

- SAL-1 (Saleable Minerals): PHMA: All PHMAs will be closed to mineral materials development. IHMA and GHMA: All IHMAs and GHMAs will be open to mineral materials development, consistent with the Idaho Anthropogenic Disturbance Criteria (AD-4), and subject to RDFs, buffers and seasonal timing restrictions. Sales from existing community pits within PHMA and IHMA would be subject to seasonal timing restrictions. GHMA: Open to new site authorizations subject to RDFs, buffers and seasonal timing restrictions. Existing sites open to new sales subject to seasonal timing restrictions.
- SAL-2: Restore salable mineral pits no longer in use to meet GRSG habitat management objectives.
- SAL-3: Require reclamation bonding that would require restoration of GRSG habitat on new site authorizations for mineral material pits in IHMA (this would not apply to free use permits issued to a government entity such as a county road district, but would apply to non-profit entities).
- SAL-4: Montana: PHMAs are closed to new mineral material sales. However, these areas remain “open” to free use permits and the expansion of existing active pits, only if the following criteria are met:

- the activity is within the BSU and project area disturbance cap;
- the activity is subject to the provisions set forth in the mitigation framework [FEIS Appendix];
- all applicable required design features are applied; and
- the activity is permissible under the Montana screening criteria

*Nonenergy Leasable Minerals*

- NEL-1 (Nonenergy Leasables): PHMAs are closed to leasing. IHMA and GHMA: Areas within Known Phosphate Leasing Areas (KPLAs) will remain open to leasing subject to standard stipulations. PHMA areas outside KPLAs are closed to leasing and prospecting. IHMA areas outside of KPLAs are open

to prospecting and subsequent leasing provided the Anthropogenic Disturbance Development Criteria (AD-4) and the anthropogenic disturbance cap (AD-1) can be met. RDFs, buffers and seasonal timing restrictions shall be applied to prospecting permits. Exceptions to closures in PHMA and IHMA may be made for lease modifications and fringe leases where valid existing rights may be affected. GHMA: Lands outside KPLAs are available for prospecting and subsequent leasing and initial mine development subject to RDFs, buffers, timing restrictions (seasonal and daily) and standard stipulations.

- NEL-2: Require seasonal and daily timing restrictions in undeveloped nonenergy mineral leases when exploration activities or initial mine development is proposed (e.g. exploration drilling, timber removal, shrub clearing, etc.) as COAs.
- NEL-3: Include RDFs as COAs to mine plans in undeveloped non-energy mineral leases for exploration activities or initial mine development.

*Mineral Split Estate*

- MSE-1 (Mineral Split Estate): BLM Owns Mineral Estate – non-federal surface owner: Where the federal government owns the mineral estate in PHMAs, IHMAs, and GHMAs, and the surface is in non-federal ownership, apply the same stipulations, COAs, and/or conservation measures and RDFs applied if the mineral estate is developed on BLM-administered lands in that management area, to the maximum extent permissible under existing authorities, and in coordination with the landowner.
- MSE-2: BLM owns surface – non-federal mineral estate owner: Where the federal government owns the surface and the mineral estate is in non-federal ownership in PHMA, IHMA, and GHMA, apply appropriate surface use COAs, stipulations, and mineral RDFs through ROW grants or other surface management instruments, to the maximum extent permissible under existing authorities, in coordination with the mineral estate owner/lessee.

***Comprehensive Trails and Travel Management***

- TM-1 (Travel Management): Limit off-highway vehicle motorized travel within Idaho BLM Field Offices to existing roads, primitive roads, and trails in areas where travel management planning has not been completed or is in progress. This excludes areas previously designated as open through a land use plan decision or currently under review for designation as open, currently being analyzed in ongoing RMP revision efforts in the Four Rivers, Jarbidge and Upper Snake Field Offices. Upon completion of travel management plans the designation would change to limited to designated roads, primitive roads and trails.

An off-highway vehicle is any motorized vehicle capable of, or designed for, travel on or immediately over land, water, or other natural terrain, excluding: (1) Any nonamphibious registered motorboat; (2) any military, fire, emergency, or law enforcement vehicle while being used for emergency

purposes; (3) any vehicle whose use is expressly authorized by the authorized officer, or otherwise officially approved; (4) Vehicles in official use where official use is use by an employee, agent, or designated representative of the Federal Government or one of its contractors, in the course of his employment, agency, or representation.; and (5) any combat or combat support vehicle when used in times of national defense emergencies (43 CFR 8340.0 5).

TM-2: In PHMA, IHMA, and GHMA, temporary closures will be considered in accordance with 43 CFR subpart 8364 (Closures and Restrictions); 43 CFR subpart 8351 (Designated National Area); 43 CFR subpart 6302 (Use of Wilderness Areas, Prohibited Acts, and Penalties); 43 CFR subpart 8341 (Conditions of Use).

Temporary closure or restriction orders under these authorities are enacted at the discretion of the authorized officer to resolve management conflicts and protect persons, property, and public lands and resources. Where an authorized officer determines that off-highway vehicles are causing or will cause considerable adverse effects upon soil, vegetation, wildlife, wildlife habitat, cultural resources, historical resources, threatened or endangered species, wilderness suitability, other authorized uses, or other resources, the affected areas shall be immediately closed to the type(s) of vehicle causing the adverse effect until the adverse effects are eliminated and measures implemented to prevent recurrence. (43 CFR 8341.2) A closure or restriction order should be considered only after other management strategies and alternatives have been explored. The duration of temporary closure or restriction orders should be limited to 24 months or less; however, certain situations may require longer closures and/or iterative temporary closures. This may include closure of routes or areas.

TM-3: Develop Travel Management Plans for each Field Office as described in the BLM Travel Management Handbook 8342.1 and according to the travel management planning guidelines (FEIS Appendix).

TM-4: During subsequent travel management planning design and designate a travel system to minimize adverse effects on GRSG. Locate areas and trails to minimize disturbance of GRSG and/or to have a neutral or positive effect on GRSG habitat and populations. Give special attention to protect endangered or threatened species and their habitats. Allow for route upgrade, closure of existing routes, timing restrictions, seasonal closures, and creation of new routes to help protect habitat and meet user group needs, thereby reducing the potential for pioneering unauthorized routes. The emphasis of the comprehensive travel and transportation planning within PHMA would be placed on having a neutral or positive effect on GRSG habitat. Individual route designations would occur during subsequent travel management planning efforts.

TM-5: Conduct road construction, upgrades, and maintenance activities to avoid disturbance during specific times at different seasons – see seasonal and timing restrictions section.

***Recreation and Visitor Services***

REC-1: Manage existing recreation uses and sites to minimize adverse effects on GRSG or their habitat through incorporation of RDFs, buffers and seasonal restrictions.

REC-2: In PHMA and IHMA, do not construct new recreation facilities (e.g., campgrounds, trails, trailheads, staging areas) unless the development would have a net conservation gain to GRSG habitat (such as concentrating recreation, diverting use away from critical areas, etc.), or unless the development is required for visitor health and safety or resource protection.

RDFs are means, measures, or practices intended to reduce or avoid adverse environmental impacts. This LUPA/EIS proposes a suite of design features that would establish the minimum specifications for water developments, certain mineral development, and fire and fuels management and would mitigate adverse impacts. These design features would be required to provide a greater level of regulatory certainty than through implementing BMPs.

In general, the design features are accepted practices that are known to be effective when implemented properly at the project level. However, their applicability and overall effectiveness cannot be fully assessed except at the project-specific level when the project location and design are known. Because of site-specific circumstances, some features may not apply to some projects (e.g., when a resource is not present on a given site) or may require slight variations from what is described in the LUPA/EIS (e.g., a larger or smaller protective area). All variations in design features would require appropriate analysis and disclosure as part of future project authorizations. Additional mitigation measures may be identified and required during individual project development and environmental review. The proposed RDFs are presented in **Appendix F**.

## APPENDIX E: Forest Service Proposed Plan Amendment

### Forest Service Plan Components

**Desired conditions** - A description of specific social, economic, and/or ecological characteristics of the plan area, or a portion of the plan area, toward which management of the land and resources should be directed. Desired conditions must be described in terms that are specific enough to allow progress toward their achievement to be determined, but do not include completion dates. (36 CFR 219.7(e)(1)(i)) FSH 1909.12, Chapter 20)

**Guideline** – A constraint on project and activity decisionmaking that allows for departure from its terms, so long as the purpose of the guideline is met. (§ 219.15(d)(3)). Guidelines are established to help achieve or maintain a desired condition or conditions, to avoid or mitigate undesirable effects, or to meet applicable legal requirements. (36 CFR 219.7(e)(1)(iv); FSH 1909.12, Chapter 20)

**Objective** - A concise, measurable, and time-specific statement of a desired rate of progress toward a desired condition or conditions. Objectives should be based on reasonably foreseeable budgets. (36 CFR 219.9(e)(1)(ii)) FSH 1909.12, Chapter 20)

**Standard** - A mandatory constraint on project and activity decisionmaking, established to help achieve or maintain the desired condition or conditions, to avoid or mitigate undesirable effects, or to meet applicable legal requirements. (36 CFR 219.7(e)(1) (iii)) FSH 1909.12, Chapter 20)

### General Greater Sage-grouse

**GRSG-GEN-DC-001-Desired Condition** – The landscape for greater sage-grouse encompasses large contiguous areas, approximately 6 to 62 square miles in area, to provide for multiple aspects of species life requirements. Within these landscapes, a variety of sagebrush-community compositions exist, with variations in subspecies composition, co-dominant vegetation, shrub cover, herbaceous cover, and stand structure, to meet seasonal requirements for food, cover, and nesting for greater sage-grouse.

**GRSG-GEN-DC-002-Desired Condition** – Anthropogenic disturbance is focused in non-habitat areas outside of priority, important, and general habitat management areas and sagebrush focal areas<sup>18</sup>. Disturbances in general habitat management areas are limited, and there is little to no disturbances in priority and important habitat management areas and sagebrush focal areas except for valid existing rights and existing authorize uses.

**GRSG-GEN-DC-003-Desired Condition** – In all seasonal habitats, 70% of lands capable of producing sagebrush have 10 to 30% sagebrush canopy cover and less than 10% conifer canopy cover. In addition, within breeding and nesting habitat, sufficient herbaceous vegetation structure and height provides

---

<sup>18</sup> Suitable greater sage-grouse habitat within polygons identified as priority or general habitat management areas. Areas of non-habitat within a polygon are not included as part of any priority or general habitat management areas. Sagebrush focal areas may include areas of non-habitat.

overhead and lateral concealment for nesting and early brood rearing life stages. Within brood rearing habitat, wet meadows and riparian areas sustain a rich diversity of perennial forb species relative to site potential. Within winter habitat, sufficient sagebrush height and density provides food and cover for greater sage-grouse during this seasonal period. Specific desired conditions for greater sage-grouse based on seasonal habitat requirements are in table 1.

**Table 1. Seasonal Habitat Desired Conditions for Greater Sage-grouse.**

ATTRIBUTE	INDICATORS	DESIRED CONDITION
<b>BREEDING AND NESTING<sup>1,2,3</sup> (Seasonal Use Period March 1-June 15) Apply 6.2 miles from active leks.<sup>4</sup></b>		
Lek Security	Proximity of trees <sup>5</sup>	Trees or other tall structures are none to uncommon within 1.86 miles of leks <sup>6,7</sup>
	Proximity of sagebrush to leks <sup>6</sup>	Adjacent protective sagebrush cover within 328 feet of lek <sup>6</sup>
Cover	Seasonal habitat extent <sup>7</sup>	>80% of the breeding and nesting habitat
	Sagebrush canopy cover <sup>6,7,8</sup>	15 to 25%
	Sagebrush height <sup>7</sup> Arid sites <sup>6,7,9</sup> Mesic sites <sup>6,7,10</sup>	12 to 32 inches 16 to 32 inches
	Predominant sagebrush shape <sup>6</sup>	>50% in spreading <sup>11</sup>
	Perennial grass canopy cover <sup>6,7</sup> Arid sites <sup>7,9</sup> Mesic sites <sup>7,10</sup>	≥10% ≥15%
	Perennial grass height <sup>6,7,8</sup>	Provide overhead and lateral concealment from predators <sup>7</sup>
	Perennial forb canopy cover <sup>6,7,8</sup> Arid sites <sup>9</sup> Mesic sites <sup>10</sup>	≥5% <sup>6,7</sup> ≥10% <sup>6,7</sup>
<b>BROOD-REARING/SUMMER<sup>1</sup> (Seasonal Use Period June 16-October 31)</b>		
Cover	Seasonal habitat extent <sup>7</sup>	>40% of the brood-rearing/summer habitat
	Sagebrush canopy cover <sup>6,7,8</sup>	10 to 25%
	Sagebrush height <sup>7,8</sup>	16 to 32 inches
	Perennial grass canopy cover and forbs <sup>7,8</sup>	>15%
	Riparian areas/mesic meadows	Proper Functioning Condition <sup>12</sup>
	Upland and riparian perennial forb availability <sup>6,7</sup>	Preferred forbs are common with several preferred species present <sup>13</sup>
<b>WINTER<sup>1</sup> (Seasonal Use Period November 1-February 28)</b>		
Cover and Food	Seasonal habitat extent <sup>6,7,8</sup>	>80% of the winter habitat
	Sagebrush canopy cover above snow <sup>6,7,8</sup>	>10%
	Sagebrush height above snow <sup>6,7,8</sup>	>10 inches <sup>14</sup>
<sup>1</sup> Seasonal dates can be adjusted; that is, start and end dates may be shifted either earlier or later, but the amount of days cannot be shortened or lengthened by the local unit. <sup>2</sup> Doherty, K. 2008. <i>Sage-grouse and Energy Development: Integrating Science with Conservation Planning to Reduce Impacts</i> . University of Montana. Missoula, MT. <sup>3</sup> Holloran and Anderson. 2005. <i>Spatial Distribution of Greater Sage-grouse nests in relatively contiguous sagebrush habitats</i> . Condor 107:742-752. <sup>4</sup> Buffer distance may be changed only if 3 out of 5 years of telemetry studies indicate the 6.2 miles is not appropriate. <sup>5</sup> Baruch-Mordo, S. J.S. Schroder. 2003. <i>Monitoring of Greater sage-grouse habitats and populations</i> . Station Bulletin 80, Contribution 979. University of Idaho, College of Natural Resources Experiment Station. Moscow, ID. <sup>9</sup> 10–12 inch precipitation zone; <i>Artemisia tridentata wyomingensis</i> is a common big sagebrush sub-species for this type site (HAF 2014). <sup>10</sup> ≥12 inch precipitation zone; <i>Artemisia tridentata vaseyana</i> is a common big sagebrush sub-species for this type site (HAF 2014). <sup>11</sup> Sagebrush plants with a spreading shape provide more protective cover than sagebrush plants that are more tree- or columnar shaped (HAF 2014).		

ATTRIBUTE	INDICATORS	DESIRED CONDITION
<p><sup>12</sup> Existing land management plan desired conditions for riparian areas/wet meadows (spring seeps) may be used in place of properly functioning conditions, if appropriate for meeting greater sage-grouse habitat requirements.</p> <p><sup>13</sup> Preferred forbs are listed in HAF Table III-2 (HAF 2014). Overall total forb cover may be greater than that of preferred forb cover since not all forb species are listed as preferred in Table III-2.</p> <p><sup>14</sup> The height of sagebrush remaining above the snow depends upon snow depth in a particular year. Intent is to manage for tall, healthy, sagebrush stands.</p>		

**GRSG-GEN-ST-001-Standard** – In priority and important habitat management areas and sagebrush focal areas, do not issue new discretionary written authorizations unless all existing discrete anthropogenic disturbances cover less than 3% of the total greater sage-grouse habitat within the Biologically Significant Unit and the proposed project analysis area, regardless of ownership, and the new use will not cause exceedance of the 3% cap (FEIS Appendix – Disturbance Cap Guidance).

**GRSG-GEN-ST-002-Standard** - In priority, sagebrush focal, and important management areas, only allow new authorized land uses if the residual impacts to greater sage-grouse or their habitats are fully offset by compensatory mitigation projects that provide a net conservation gain to the species, which will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Any compensatory mitigation will be durable, timely, and in addition to what would have resulted without the compensatory mitigation, as addressed in the Mitigation Framework (FEIS Appendix).

**GRSG-GEN-GL-001-Guideline** - During lekking (March 1 to April 30) surface disturbing and disruptive activities, including noise at 10dB above ambient (not to exceed 20-24 dB) to lekking birds should be restricted from 6 pm to 9 am at a distance of 3.1 miles from the perimeter of an occupied lek.

**GRSG-GEN-GL-002-Guideline** – During breeding and nesting (March 1 to June 15), surface disturbing and disruptive activities to nesting birds should be restricted.

**GRSG-GEN-GL-003-Guideline** - When breeding and nesting habitat overlaps with other seasonal habitats, habitat should be managed for breeding and nesting desired habitat conditions displayed in table 1.

**GRSG- GEN-GL-004-Guideline** – Development of tall structures within 2.0 miles from the perimeter of occupied leks, as determined by local conditions (such as vegetation or topography), with the potential to disrupt breeding or nesting by creating new perching/nesting opportunities avian predators or by decreasing the use of an area, should be restricted in nesting habitat.

**Adaptive Management**

**GRSG-AM-ST-001-Standard** – If a hard trigger is identified, immediate action is necessary to stop a severe deviation from greater sage-grouse conservation objectives. The hard trigger response will be an entire restrictive alternative, or one or more appropriate components of a more restrictive alternative, such as the immediate cessation of authorizing land use authorizations. An interagency team will conduct an assessment to determine the causal factor(s) and recommend corrective strategies (Appendix Z - Adaptive Management Guidance and Sideboards).

**GRSG-AM-ST-002-Standard** – If a soft trigger is identified, apply more conservative or restrictive implementation measures (e.g., extending seasonal restrictions for seasonal surface disturbing activities, modifying seasons of use for livestock grazing, and applying additional restrictions on discretionary activities) for the specific causal factor in the decline of populations and/or habitats, with consideration of local knowledge and conditions (FEIS Appendix- Adaptive Management Guidance and Sideboards).

## Lands and Realty

### Special Use Authorizations (non recreation)

**GRSG-LR-SUA-O-001-Objective** - In priority and important habitat management areas and sagebrush focal areas, retrofit existing tall structures (e.g., power poles, cellular towers) with perch deterrents or other anti-perching devices within 2 years of signing the Record of Decision.

**GRSG-LR-SUA-ST-001-Standard** – In priority habitat management areas and sagebrush focal areas, restrict issuance of new lands special use authorizations for infrastructure, such as high-voltage transmission lines, major pipelines, hydropower, distribution lines, and cellular towers. Exceptions must be limited and based on rationale (e.g., monitoring, modeling, or best available science) that explicitly demonstrates that adverse impacts to greater sage-grouse will be avoided by the exception.

**GRSG-LR-SUA-ST-002-Standard** – In general habitat management areas, new lands special use authorizations may be authorized for infrastructure, such as high-voltage transmission lines and major pipelines, if they can be located within existing designated corridors and the authorization includes stipulations to protect greater sage-grouse and their habitats.

**GRSG-LR-SUA-ST-003-Standard** – In priority and important habitat management areas and sagebrush focal areas, do not authorize temporary lands special uses (i.e., facilities or activities) that result in loss of habitat or would have long-term (greater than 5 years) negative impact on greater sage-grouse or their habitats.

**GRSG-LR-SUA-ST-004-Standard** – In priority, important, and general habitat management areas and sagebrush focal areas, require protective stipulations (e.g., noise, tall structure, guy wire removal, perch deterrent installation) when issuing new authorizations or during renewal, amendment, or reissuance of existing authorizations that authorize infrastructure (e.g., high-voltage transmission lines, major pipelines, roads, distribution lines, and cellular towers).

**GRSG-LR-SUA-ST-005-Standard** – In priority, important, and general habitat management areas and sagebrush focal areas, locate upgrades to existing transmission lines within the existing designated corridors unless an alternate route would benefit greater sage-grouse or their habitats.

**GRSG-LR-SUA-ST-006-Standard** - In priority, important, and general habitat management areas and sagebrush focal areas, when a lands special use authorization is revoked or terminated and no future use is contemplated the authorization holder must remove overhead lines and other infrastructure in compliance with 36 CFR 251.60(i).

**GRSG-LR-SUA-ST-007-Standard** - In priority, important, and general habitat management areas and sagebrush focal areas, if the potential long-term (greater than 5 years) impacts of mitigation (e.g., relocation or burying) to greater sage-grouse or their habitats are greater than the potential impacts from new lands special use authorizations, do not pursue the mitigation. If mitigation is not feasible or would result in short-term (less than 5 years) or long-term impacts, incorporate additional terms and conditions in the special use authorization for protection of greater sage-grouse or their habitats

**GRSG-LR-SUA-ST-008-Standard** – In priority, important, and general habitat management areas and sagebrush focal areas, co-locate new infrastructure (e.g., high-voltage transmission lines, major pipelines, roads, distribution lines, and cellular towers) with existing infrastructure to limit disturbance to the smallest footprint, or where it best limits impacts to greater sage-grouse or their habitats. When co-location of new infrastructure is not accomplished, locate it adjacent to existing infrastructure, roads, or already disturbed areas. Consider new communication tower sites where necessary for public safety.

**GRSG-LR-SUA-GL-001-Guideline** – In priority and sagebrush focal management areas, outside of existing designated corridors, new transmission lines and pipelines should be buried to limit disturbance to the smallest footprint unless explicit rationale is provided that the biological impacts to greater sage-grouse and its habitat are being avoided. When new transmission lines and pipelines are not buried, locate them adjacent to existing transmission lines.

### Land Ownership Adjustments

**GRSG-LR-LOA-ST-001-Standard** – In priority, important, and general habitat management areas and sagebrush focal areas, prohibit land ownership adjustments unless the action results in a net conservation gain to greater sage-grouse or it will not directly or indirectly adversely impact greater sage-grouse conservation.

**GRSG-LR-LOA-GL-001-Guideline** – In priority, important, and general habitat management areas and sagebrush focal areas with minority federal ownership, consider land ownership adjustments to achieve a landownership pattern (e.g., consolidation, reducing fragmentation) that supports improved greater sage-grouse population trends and habitats.

### Land Withdrawal

**GRSG-LR-LW-GL-001-Guideline** – In priority and important habitat management areas and sagebrush focal areas, utilize land withdrawals as a tool, where appropriate and subject to valid existing rights, to prevent activities that will be detrimental to greater sage-grouse or their habitats.

### Wind and Solar

**GRSG-WS-ST-001-Standard** – In priority and sagebrush focal management areas, prohibit new solar and wind utility-scale and/or commercial energy development except for on-site power generation associated with existing industrial infrastructure (e.g., mine site).

**GRSG-WS-GL-001-Guideline** – In important habitat management areas, new wind energy utility-scale and/or commercial development should be restricted. If development cannot be restricted due to

existing authorized use, adjacent developments, or split estate issues, then ensure that stipulations are incorporated into the authorization to protect greater sage-grouse and their habitats.

### Greater Sage-grouse Habitat

**GRSG-GRSGH-O-001-Objective** – Every 10 years for the next 50 years, improve greater sage-grouse habitat by removing invading conifers and other undesirable species in the number of acres shown in table 2.

**Table 2. Treatment Acres per Decade.<sup>1</sup>**

ACRES			
FOREST	MECHANICAL <sup>2</sup>	PRESCRIBED FIRE <sup>3</sup>	GRASS RESTORATION <sup>4</sup>
Boise	1000	2000	0
Caribou-Targhee-Curlew	3000	2000	3000
Salmon-Challis	5000	1000	0
Sawtooth	7000	1000	7000
Beaverhead-Deerlodge	0	0	0

<sup>1</sup>These are estimates of treatments required to achieve and/or maintain desired habitat conditions over a period of ten years. There are many dynamic and highly variable disturbances that may happen over that period of time that could have a significant effect on the amount, type, and timing of treatment needed. Those disturbances are factored into the ten-year simulation using stochastic, not predictive, techniques. Probabilities of events such as large wildfires are used in the model to make the simulation as realistic as possible, given empirical data about such events in the past, but the results of the simulation cannot be used to predict the future occurrence of such events, including their timing, size, or location, which are essentially random.

<sup>2</sup>Removal of conifers that have invaded sagebrush including phase one juniper that is 10% or less and reducing sagebrush cover in areas over 30% canopy cover

<sup>3</sup>Acres are those that are greater than 30% sagebrush canopy cover and/or invaded by 10% or greater conifer.

<sup>4</sup>Acres presently dominated by annual grasses that could be improved by herbicide application and seeding of perennial vegetation.

**GRSG-GRSGH-ST-001-Standard** – Design habitat restoration projects to move towards desired conditions (table 1) and incorporate the concepts outlined in FEIS Appendix - *Using resistance and resilience concepts to reduce impacts of invasive annual grasses and altered fire regimes on the sagebrush ecosystem and greater sage-grouse: A strategic multi-scale approach.*

**GRSG-GRSGH-GL-001-Guideline** – Sagebrush removal in greater sage-grouse breeding and nesting and wintering habitats should be restricted unless necessary to support attainment of desired habitat conditions (table 1).

**GRSG-GRSGH-GL-002-Guideline** – When removing conifers that are encroaching into greater sage-grouse habitat, avoid persistent woodlands (old growth relative to the site or more than 100 years old).

**GRSG-GRSGH-GL-003-Guideline** – In priority, important, and general habitat management areas and sagebrush focal areas, actions and authorizations should be designed to limit the spread and effect of non-native plant species.

**GRSG-GRSGH-GL-004-Guideline** - To facilitate safe and effective fire management actions, in priority, important, and general habitat management areas and sagebrush focal areas, fuels treatments should be designed to reduce the spread and intensity of wildfire in high-risk areas (i.e., areas of increased potential for ignition and in areas where there is a potential for wildfire that would be difficult for suppression resources to contain and control).

**GRSG-GRSGH-GL-005-Guideline** - In priority, important, and general habitat management areas and sagebrush focal areas, native plant species should be used, when possible, to restore, enhance, or maintain desired habitat conditions (table 1).

**GRSG-GRSGH-GL-006-Guideline** – In priority and important habitat management areas and sagebrush focal areas, vegetation treatment projects should only be conducted if they restore, enhance, or maintain desired habitat conditions (table 1).

**Livestock Grazing**

**GRSG-LG-DC-001-Desired Condition** – In priority and important habitat management areas and sagebrush focal areas, livestock grazing is managed to ensure adequate nesting cover and does not conflict with the attainment of other vegetative attributes (table 1).

**GRSG-LG-ST-001-Standard** – In priority and important habitat management areas and sagebrush focal areas, prohibit construction of water developments unless beneficial to greater sage-grouse habitat.

**GRSG-LG-GL-001-Guideline** - Grazing guidelines should be applied in each of the seasonal habitats in table 3. If values in table 3 guidelines cannot be achieved based upon a site-specific analysis using Ecological Site Descriptions, long-term ecological site capability analysis, or other similar analysis, adjust grazing management to move towards desired habitat conditions in table 1 consistent with the ecological site capability. Do not use drought and degraded habitat condition to adjust values. Grazing guidelines in table 3 would not apply to isolated parcels of National Forest System lands that have less than 200 acres of greater sage-grouse habitat.

**Table 3. Grazing Guidelines for Greater Sage-grouse Seasonal Habitat.**

Seasonal Habitat	Grazing Guidelines
Breeding and nesting <sup>1</sup> within 6.2 miles of occupied leks	Perennial grass height: <sup>2</sup> When grazing occurs during breeding and nesting season (March 1 to June 15) manage for upland perennial grass height of 7 inches <sup>3,4,5</sup> When grazing occurs post breeding and nesting season (June 16 to October 30) manage for 4 inches <sup>4,5,6</sup> of perennial grass height.
Brood rearing and summer <sup>1</sup>	Retain an average stubble height of 4 inches for herbaceous riparian/mesic meadow vegetation <sup>7,8</sup>
Winter <sup>1</sup>	<35% use of sagebrush

<sup>1</sup>For descriptions of Seasonal Habitat and Seasonal Periods of greater sage-grouse see table 1.

<sup>2</sup>Grass heights only apply in breeding and nesting habitat with ≥10% sagebrush cover to support nesting.

<sup>3</sup>Holloran et al. 2005. *Greater sage-grouse nesting habitat selection and success in Wyoming*.

<sup>4</sup>Average droop height, assuming current vegetation composition has the capability to achieve these heights. Heights will be measured at the end of the nesting period (Connelly, 2000).

<sup>5</sup>Hagen C., J.W. Connelly, and M.A. Schroeder. 2007. *A meta-analysis of greater sage-grouse *Centrocercus urophasianus* nesting and brood-rearing habitats*. *Wildlife Biology* 13(1): 42-50.

<sup>6</sup>Stubble height to be measured at the end of the growing season.

<sup>7</sup>Crawford et al. 2004. Ecology and Management of sage-grouse and sage-grouse habitat. “In riparian brood-rearing habitat, sage-grouse prefer the lower vegetation (5-15 cm (2-6 in) vs. 30-50 cm (12-20 in); Oakleaf 1971, Neel 1980, Klebenow 1982, Evans 1986) and succulent forb growth stimulated by moderate livestock grazing (Neel 1980, Evans 1986). “Moderate use equates to a 10-cm residual stubble height for most grasses and sedges.”

<sup>8</sup>Stubble height to be measured in the meadow areas used by greater sage-grouse for brood-rearing (not on the hydric greenline).

**GRSG-LG-GL-002-Guideline** – In priority, important, and general habitat management areas and sagebrush focal areas, consider closure of grazing allotments, pastures, or portions of pastures, or

managing the allotment as a forage reserve as opportunities arise under applicable regulations, where removal of livestock grazing would enhance the ability to achieve desired habitat conditions (table 1).

**GRSG-LG-GL-003-Guideline** – Bedding sheep and placing camps within 1.2 miles from the perimeter of a lek during lekking (March 1 to April 30) should be restricted.

**GRSG-LG-GL-004-Guideline** – During breeding and nesting season (March 1 to June 15), trailing livestock through breeding and nesting habitat should be minimized. Specific routes should be identified, existing trails should be used, and stopovers on active leks should be restricted.

**GRSG-LG-GL-005-Guideline** – Fences should not be constructed or reconstructed within 1.2 miles from the perimeter of occupied leks, unless the collision risk can be mitigated through design features or markings (e.g., mark, laydown fences, and design).

**GRSG-LG-GL-006-Guideline** – New permanent livestock facilities (e.g., windmills, corrals) should not be constructed within 1.2 miles from the perimeter of occupied leks.

## Fire Management

**GRSG-FM-ST-001-Standard** – In priority, important, and general habitat management areas and sagebrush focal areas, do not use prescribed fire, except for pile burning, in 12-inch or less precipitation zones unless necessary to facilitate site preparation for restoration of greater sage-grouse habitat consistent with desired conditions in table 1.

**GRSG-FM-ST-002-Standard** – In priority, sagebrush focal, and general management areas, if it is necessary to use prescribed fire to facilitate site preparation for restoration of greater sage-grouse habitat consistent with desired conditions in table 1, the associated NEPA analysis must identify how greater sage-grouse desired conditions would be met, why alternative techniques were not selected, and how potential threats to greater sage-grouse habitat would be minimized.

**GRSG-FM-GL-001-Guideline** – In wintering or breeding and nesting habitat, sagebrush removal or manipulation, including prescribed fire, should be restricted unless the removal strategically reduces the potential impacts from wildfire.

**GRSG-FM-GL-002-Guideline** – In priority, important, and general habitat management areas and sagebrush focal areas, when reseeding in fuel breaks, fire resistant native plant species should be used if available, or consider using fire resistant non-native to meet resource objectives.

**GRSG-FM-GL-003-Guideline** – In priority, important, and general habitat management areas and sagebrush focal areas, treatments should be designed to restore, enhance, or maintain greater sage-grouse habitat.

**GRSG-FM-GL-004-Guideline** – Locating temporary wildfire suppression facilities (e.g., incident command posts, spike camps, helibases, mobile retardant plants) in priority, sagebrush focal, and general habitat management areas should be restricted.

**GRSG-FM-GL-005-Guideline** - In priority, important, and general habitat management areas and sagebrush focal areas, cross-country vehicle travel during fire operations should be restricted whenever safe and practical to do so, as determined by fireline leadership, incident commanders, etc.

**GRSG-FM-GL-006-Guideline** – In priority, important, and general habitat management areas and sagebrush focal areas, burnout operation areas should be avoided by constructing direct fire lines, whenever safe and practical to do so, to improve suppression effectiveness and minimize loss of existing sagebrush habitat as determined by fireline leadership, incident commanders, etc.

**GRSG-FM-GL-007-Guideline** – In priority, important, and general habitat management areas and sagebrush focal areas, prescribed fire prescriptions should minimize undesirable effects on vegetation and/or soils (e.g., minimize mortality of desirable perennial plant species and reduce risk of hydrophobicity).

**GRSG-FM-GL-008-Guideline** - In priority, important, and general habitat management areas and sagebrush focal areas, roads and natural fuel breaks should be incorporated into fuel break design to improve effectiveness and minimize loss of existing sagebrush habitat.

**GRSG-FM-GL-009-Guideline** - In priority, important, and general habitat management areas and sagebrush focal areas, all fire associated vehicles and equipment should be power-washed before entering and exiting the area to minimize the introduction of undesirable invasive plant species.

**GRSG-FM-GL-010-Guideline** - Unit-specific greater sage-grouse fire management toolboxes containing maps, lists, contact information for qualified resource advisors, local guidance, and relevant information should be developed.

**GRSG-FM-GL-011-Guideline** – Localized maps of priority, important, and general habitat management areas and sagebrush focal areas should be provided to dispatch offices and extended attack incident commanders to use when prioritizing wildfire suppression resources and designing suppression tactics.

**GRSG-FM-GL-012-Guideline** - In or near priority, important, and general habitat management areas and sagebrush focal areas, a greater sage-grouse resource advisor should be assigned to all extended attack fires.

**GRSG-FM-GL-013-Guideline** – On critical fire weather days, available fire suppression resources should be pre-positioned to optimize a quick and efficient response into priority, important, and general habitat management areas and sagebrush focal areas.

**GRSG-FM-GL-014-Guideline** - During periods of multiple fires, line officers should be involved in setting priorities to help protect priority, important, and general habitat management areas and sagebrush focal areas.

**GRSG-FM-GL-015-Guideline** – In priority, important, and general habitat management areas and sagebrush focal areas, consider using fire retardant and mechanized equipment only if it is likely to result in minimizing burned acreage.

**GRSG-FM-GL-016-Guideline** – In priority, important and general habitat management areas, to minimize sagebrush loss, mop-up should be conducted where the burned areas adjoin unburned islands, doglegs, or other habitat features, as safety and available resources allows.

### Wild Horse and Burro

**GRSG-HB-GL-001-Guideline** – In priority, important, and general habitat management areas and sagebrush focal areas, wild horse and burro populations should be managed within established appropriate management levels to restore, enhance, or maintain greater sage-grouse desired habitat conditions (table 1).

**GRSG-HB-GL-002-Guideline** – In priority, important, and general habitat management areas and sagebrush focal areas, appropriate management levels should be adjusted if greater sage-grouse management standards are not met due to degradation that can be at least partially attributed to wild horse or burro populations.

### Recreation

**GRSG-R-DC-001-Desired Condition** – In priority, important, and general habitat management areas and sagebrush focal areas, existing and new recreation special use authorizations and expansion of special use authorizations restrict effects to greater sage-grouse and their habitats.

**GRSG-R-ST-001-Standard** – In priority and important habitat management areas and sagebrush focal areas, do not authorize temporary recreation uses (i.e., facilities or activities) that result in loss of habitat or would have long-term (greater than 5 years) negative impacts on greater sage-grouse or their habitats.

**GRSG-R-GL-001-Guideline** – In priority, important, and general habitat management areas and sagebrush focal areas, terms and conditions that protect and/or restore greater sage-grouse habitat within the permit area should be included in new recreation special use authorizations. During renewal, amendment, or reauthorization, terms and conditions in existing permits and operating plans should be modified to protect and/or restore greater sage-grouse habitat.

**GRSG-R-GL-002-Guideline** – In priority, sagebrush focal, and important habitat management area, new recreational facilities or expansion of existing recreational facilities (e.g., roads, trails, campgrounds), including special use authorizations for facilities and activities, should not be approved unless the development results in a net conservation gain to greater sage-grouse and/or their habitats or the development is required for visitor safety.

### Roads/Transportation

**GRSG-RT-DC-001-Desired Condition** - In priority, important, and general habitat management areas and sagebrush focal areas, within the travel management system, greater sage-grouse experience minimal

disturbance during breeding and nesting (March 1 to June 15) and wintering periods (November 1 to February 28).

**GRSG-RT-ST-001-Standard** – In priority, important, and general habitat management areas and sagebrush focal areas, prohibit new road or trail construction (does not apply to realignments for resource protection) except when necessary for administrative access, public safety, or to access valid existing rights. If necessary to construct new roads and trails for one of these purposes, construct them to the minimum standard, length, and number and avoid, minimize, and mitigate impacts

**GRSG-RT-ST-002-Standard** – Prohibit road and trail maintenance activities within 2 miles from the perimeter of active leks during lekking (March 1 to April 30) from 6 pm to 9 am.

**GRSG-RT-ST-003-Standard** – In priority and important habitat management areas and sagebrush focal areas, prohibit public access on temporary energy development roads, unless consistent with all other terms and conditions included in the land use management plan.

**GRSG-RT-GL-001-Guideline** – In priority and important habitat management areas and sagebrush focal areas, new roads and road realignments should be designed and administered to reduce collisions with greater sage-grouse.

**GRSG-RT-GL-002-Guideline** – In priority and important habitat management areas and sagebrush focal areas, road construction within riparian areas and mesic meadows should be restricted. If not possible to restrict construction within riparian areas and mesic meadows, roads should be designed and constructed at right angles to ephemeral drainages and stream crossings, unless topography prevents doing so.

**GRSG-RT-GL-003-Guideline** – In priority, important, and general habitat management areas and sagebrush focal areas, when decommissioning roads and unauthorized routes, restoration activity should be designed to move habitat towards desired conditions (table 1).

**GRSG-RT-GL-004-Guideline** – In priority, important, and general habitat management areas and sagebrush focal areas, dust abatement terms and conditions should be included in road use permits when dust has the potential to impact greater sage-grouse.

**GRSG-RT-GL-005-Guideline** - In priority, important, and general habitat management areas and sagebrush focal areas, road and road-way maintenance activities should be designed and implemented to reduce the risk of vehicle or human-caused wildfires and the spread of invasive plants.

## Minerals

### Fluid Minerals – Unleased

**GRSG-M-FMUL-ST-001-Standard** - In priority and important habitat management areas and sagebrush focal areas, any new oil and gas leases must include a no surface occupancy stipulation. There will be no waivers, exceptions, or modifications. An exception could be granted by the authorized officer with

unanimous concurrence from a team of agency greater sage-grouse experts from the Fish and Wildlife Service, Forest Service, and State wildlife agency if:

- There would be no direct, indirect, or cumulative effects to greater sage-grouse or their habitats or
- Granting the exception provides an alternative to a similar action occurring on a nearby parcel and
- The exception provides a clear net conservation gain to greater sage-grouse.

**GRSG-M-FMUL-ST-002-Standard** – In general habitat management areas, any new leases must include appropriate controlled surface use and timing limitation stipulations to protect greater sage-grouse and their habitat.

**GRSG-M-FMUL-ST-003-Standard** – In sagebrush focal habitat management areas, there will be no surface occupancy and no waivers, exceptions, or modifications for fluid mineral leasing.

**GRSG-M-FMUL-ST-004-Standard** – In priority, sagebrush focal, and general management areas, when analyzing leasing of fluid mineral resources, prioritize development in non-habitat areas first and then in the least suitable habitat for greater sage-grouse, subject to valid existing rights, law, and regulations.

### Fluid Minerals – Leased

**GRSG-M-FML-ST-001-Standard** – In priority and important habitat management areas and sagebrush focal areas, when approving the Surface Use Plan of Operation portion of the Application for Permit to Drill on existing leases that are not yet developed, require that leaseholders avoid and minimize surface disturbing and disruptive activities consistent with the rights granted in the lease.

**GRSG-M-FML-ST-002-Standard** – In priority and important habitat management areas and sagebrush focal areas, when facilities are no longer needed or leases are relinquished, require reclamation plans to include terms and conditions to restore habitat to desired conditions as described in table 1.

**GRSG-M-FML-ST-003-Standard** – In general habitat management areas, authorize new transmission line corridors, transmission line right-of-ways, transmission line construction, or transmission line-facility construction associated with fluid mineral leases with stipulations necessary to protect greater sage-grouse and their habitats, consistent with the terms and conditions of the permit.

**GRSG-M-FML-ST-004-Standard** – Locate compressor stations on portions of a lease that are non-habitat and are not used by greater sage-grouse, and if there would be no direct, indirect, or cumulative effects on sage-grouse or their habitat. If this is not possible, work with the operator to use mufflers, sound insulation, or other features to reduce noise.

**GRSG-M-FML-ST-005-Standard** – In priority, sagebrush focal, and general management areas, when authorizing development of fluid mineral resources, prioritize development in non-habitat areas first and then in the least suitable habitat for greater sage-grouse, subject to valid existing rights, law, and regulations

**GRSG-M-FML-GL-001-Guideline** – In priority, important, and general habitat management areas and sagebrush focal areas, operators should be encouraged to reduce disturbance to greater sage-grouse habitat. At the time of approval of the Surface Use Plan of Operation portion of the Application for Permit to Drill, terms and conditions should be included to reduce disturbance to greater sage-grouse habitat, where appropriate and feasible and consistent with the rights granted to the lessee.

**GRSG-M-FML-GL-002-Guideline** – On Federal leases in priority and important habitat management areas and sagebrush focal areas, when surface occupancy cannot be restricted due to valid existing rights or development requirements, disturbance and surface occupancy should be limited to areas least harmful to greater sage-grouse based on vegetation, topography, or other habitat features.

**GRSG-M-FML-GL-003-Guideline** - In priority, sagebrush focal, and general management areas, where the federal government owns the surface and the mineral estate is in non-federal ownership, coordinate with the mineral estate owner/lessee to apply appropriate stipulations, conditions of approval, conservation measures and required design features to the appropriate surface management instruments to the maximum extent permissible under existing authorities.

### Fluid Minerals – Operations

**GRSG-M-FMO-ST-001-Standard** – In priority and important habitat management areas and sagebrush focal areas, prohibit employee camps.

**GRSG-M-FMO-ST-002-Standard** – In priority and important habitat management areas and sagebrush focal areas, when feasible, do not locate tanks or other structures that may be used as raptor perches. If this is not feasible, use perch deterrents.

**GRSG-M-FMO-GL-001-Guideline** – In priority and important habitat management areas and sagebrush focal areas, closed-loop systems should be used for drilling operations with no reserve pits, where feasible.

**GRSG-M-FMO-GL-002-Guideline** – In priority, important, and general habitat management areas and sagebrush focal areas, during drilling operations, soil compaction should be reduced and soil structure should be maintained using the best available techniques to improve vegetation reestablishment.

**GRSG-M-FMO-GL-003-Guideline** – In priority, important, and general habitat management areas and sagebrush focal areas, dams, impoundments and ponds for mineral development should be constructed to reduce potential for West Nile virus. Examples of methods to accomplish this include:

- Increase the depth of ponds to accommodate a greater volume of water than is discharged.
- Build steep shorelines (greater than 2 feet) to reduce shallow water and aquatic vegetation around the perimeter of impoundments to reduce breeding habitat for mosquitoes.
- Maintain the water level below that of rooted aquatic and upland vegetation. Restrict flooding terrestrial vegetation in flat terrain or low-lying areas.
- Construct dams or impoundments that restrict down-slope seepage or overflow by digging ponds in flat areas rather than damming natural draws for effluent water storage or lining constructed ponds in areas where seepage is anticipated.

- Line the channel where discharge water flows into the pond with crushed rock or use a horizontal pipe to discharge inflow directly into existing open water.
- Line the overflow spillway with crushed rock and construct the spillway with steep sides.
- Fence pond sites to restrict access by livestock and other wild ungulates.
- Remove or re-inject produced water.
- Treat waters with larvicides to reduce mosquito production where water occurs on the surface.
- 
- **GRSG-M-FMO-GL-004-Guideline** – In priority, important, and general habitat management areas and sagebrush focal areas to keep habitat disturbance at a minimum, a phased development approach should be applied to fluid mineral operations, wherever possible, consistent with the rights granted under the lease. Disturbed areas should be reclaimed as soon as they are no longer needed for mineral operations.

### Coal Mines - Unleased

**GRSG-M-CMUL-ST-001-Standard** – In priority and important habitat management areas and sagebrush focal areas, prohibit surface disturbances (e.g., appurtenant facilities) for new underground coalmines.

### Coal Mines – Leased

**GRSG-M-CML-ST-001-Standard** – In priority and important habitat management areas and sagebrush focal areas, do not authorize new appurtenant facilities for existing underground mines unless no technically feasible alternative exists. If new appurtenant facilities associated with existing mine leases cannot be located outside of priority and important habitat management areas and sagebrush focal areas, co-locate them with any existing disturbed areas, if possible. If co-location is not possible, then construct new facilities to minimize disturbed areas while meeting mine safety standards and requirements, as identified by MSHA mine-plan approval process, and locate the facilities in an area least harmful to greater sage-grouse habitats based on vegetation, topography, or other habitat features.

**GRSG-M-CML-GL-001-Guideline** – In priority, important, and general habitat management areas and sagebrush focal areas, when coal leases are subject to readjustment, additional requirements should be included in the readjusted lease to protect and reduce threats to greater sage-grouse and their habitats to conserve, enhance, and restore habitat for long-term viability.

### Locatable Minerals

**GRSG-M-LM-ST-001-Standard** – In priority and important habitat management areas and sagebrush focal areas, approve Plans of Operation with mitigation to protect greater sage-grouse and their habitats, consistent with the rights of the mining claimant as granted by the General Mining Act of 1872, as amended.

**GRSG-M-LM-GL-001-Guideline** – In priority, important, and general habitat management areas and sagebrush focal areas to keep habitat disturbance at a minimum, a phased development approach should be applied to operations consistent with the rights granted under the General Mining Act of 1872, as amended. Disturbed areas should be reclaimed as soon as they are no longer needed for mineral operations.

**GRSG-M-LM-GL-002-Guideline** - In priority, important, and general habitat management areas and sagebrush focal areas, abandoned mine sites should be closed or mitigated, subject to valid or existing rights, to reduce predation of greater sage-grouse by eliminating tall structures that could provide nesting opportunities and perching sites for predators.

### **Non-energy Leasable Minerals**

**GRSG-M-NEL-GL-001-Guideline** – In priority, important, and general habitat management areas and sagebrush focal areas, at the time of issuance of prospecting permits, exploration licenses and leases, or readjustment of leases, the Forest Service should provide recommendations to the Bureau of Land Management for the protection of greater sage-grouse and their habitats.

**GRSG-M-NEL-GL-002-Guideline** - In priority, sagebrush focal, and general habitat management areas, the Forest Service should recommend to the Bureau of Land Management that expansion or readjustment of existing leases avoid, minimize, or mitigate the effects to greater sage-grouse and their habitat

### **Mineral Materials**

**GRSG-M-MM-ST-001-Standard** – In priority and sagebrush focal management areas, prohibit new mineral material disposal or development.

**GRSG-M-MM-ST-002-Standard** – In priority and important habitat management areas and sagebrush focal areas, free-use mineral material collection permits may be issued and expansion of existing active pits may be allowed, except from March 1 to April 30 between 6 pm and 9 am within 2 miles from the perimeter of occupied leks, if doing so is within the Biologically Significant Unit and does not exceed the disturbance cap.

**GRSG-M-MM-ST-003-Standard** - In priority, important, and general habitat management areas and sagebrush focal areas, any permit for existing mineral material operations must include appropriate requirements for operation and reclamation of the site to restore or maintain desired habitat conditions (table 1).

## Glossary of Terms as Used in this Plan

**Active lek** - Any lek that has been attended by male greater sage-grouse during the most recent strutting season.

**Adjacent** – Installation of new linear improvements parallel, near, or next to existing linear improvements.

**Administrative access** - Access for resource management and administrative purposes such as fire suppression, cadastral surveys, permit compliance, law enforcement, and military in the performance of their official duty, or other access needed to manage National Forest System lands or uses.

**Allotment management plan** - A written program of livestock grazing management, including supportive measures, if required, designed to attain specific, multiple-use management goals in a grazing allotment. The Plan is prepared in consultation with the permittee(s), lessee(s), and other affected interests. Livestock grazing is considered in relation to other uses of the range and to renewable resources, such as watershed, vegetation, and wildlife. The Plan establishes seasons of use, the number of livestock to be permitted, the range improvements needed, and the grazing system.

**Ambient (noise level)** - Sometimes called background noise level, reference sound level, or room noise level is the background sound pressure level at a given location, normally specified as a reference level to study a new intrusive sound source.

**Anthropogenic disturbances** – Human-created features including but are not limited to paved highways, graded gravel roads, transmission lines, substations, wind turbines, oil and gas wells and associated facilities, geothermal wells and associated facilities, pipelines, landfills, agricultural conversion, homes, grazing-related facilities and structures, and mines.

**Appurtenant (minerals)** - A piece of equipment (e.g., pump jack, separator, storage tank, compressor station, metering equipment) necessary for production.

**Authorized uses** - An activity (i.e., resource use) occurring on the public lands that is either explicitly or implicitly recognized and legalized by law or regulation. The term may refer to activities occurring on the public lands for which the Forest Service has issued a formal authorization document (e.g., livestock grazing permit, special use authorization, approved plan of operation, etc.). Formal authorized uses can involve both commercial and noncommercial activity, facility placement, or event. These authorized uses are often spatially or temporally limited. Unless constrained or bounded by statute, regulation, or an approved land use plan decision, legal activities involving public enjoyment and use of the public lands (e.g., hiking, camping, hunting, etc.) require no formal Forest Service authorization.

**Biologically significant unit** - A geographical/spatial area within greater sage-grouse habitat that contains relevant and important habitats that is used as the basis for comparative calculations to support evaluation of changes to habitat. A biologically significant unit or subset of the unit is used in the calculation of the anthropogenic disturbance threshold and in the adaptive management habitat trigger.

The biologically significant unit is defined as:

- Idaho: All of the modeled nesting and delineated winter habitat based on 2012 data, within priority and/or important habitat management areas within a Conservation Area.
- Montana: All of the priority and sagebrush focal management areas.

**Co-locate** - Installation of new linear improvements in or on existing linear improvements.

**Communication tower site** - Sites that include broadcast types of uses (e.g., television, AM/FM radio, cable television, broadcast translator) and non-broadcast uses (e.g., commercial or private mobile radio service, cellular telephone, microwave, local exchange network, passive reflector).

**Compensatory mitigation** – Compensating for the residual impact of a certain action or parts of an action by replacing or providing substitute resources or environments(s).

**Compensatory mitigation projects** – The restoration, creation, enhancement, and/or preservation of impacted resources, such as on-the-ground actions to improve and/or protect habitats (e.g. chemical vegetation treatments, land acquisitions, conservation easements)

**Conservation area** - Areas determined to be necessary to monitor population objectives to evaluate the disturbance density and adaptive regulatory triggers and engage adaptive management responses. Conservation Areas may contain priority, important, and general habitat management areas and sagebrush focal areas. Specifically, these areas are Mountain Valleys, Desert, West Owyhee, and Southern and Southwestern Montana.

**Disruptive activities** - Land resource uses/activities that are likely to alter the behavior, displace, or cause excessive stress to greater sage-grouse populations occurring at a specific location and/or time. Actions that alter behavior or cause the displacement of individuals such that reproductive success is negatively affected, or an individual's physiological ability to cope with environmental stress is compromised.

**Distribution line** - An electrical utility line with a capacity of less than 100kV or a natural gas, hydrogen, or water pipeline less than 24" in diameter.

**Diversity (species)** – The number, distribution, and geographic ranges of plant and animal species including focal species and species-at-risk.

**Durable (protective and ecological)** - The administrative, legal, and financial assurances that secure and protect the conservation status of a compensatory mitigation site, and the ecological benefits of a compensatory mitigation project, for at least as long as the associated impacts persist.

**Enhance** - The improvement of habitat by increasing missing or modifying unsatisfactory components and/or attributes of the habitat (e.g., road commissioning) to meet greater sage-grouse objectives.

**Exception (minerals)** - A case-by-case exemption from a lease stipulation. The stipulation continues to apply to all other sites within the leasehold to which the restrictive criteria apply. The authorized officer

(any employee of the Forest Service to whom has been delegated the authority to perform the duties described in the applicable Forest Service manual or handbook) may grant an exception if an environmental record of review determines that the action, as proposed or conditioned, would not impair the function or utility of the site for the current or subsequent seasonal habitat, life-history, or behavioral needs of greater sage-grouse.

**Feasible** – see technically/economically feasible.

**Fluid minerals** - Oil, gas, coal bed natural gas, and geothermal resources.

**General habitat management areas** - Areas identified by the Forest Service, in coordination with respective state wildlife agencies, as those areas outside of priority and sagebrush focal management areas and occupied by greater sage-grouse seasonally or year-round.

**Grazing system** - Scheduled grazing use and non-use of an allotment to reach identified goals or objectives by improving the quality and quantity of vegetation. Include, but are not limited to, developing pastures, utilization levels, grazing rotations, timing and duration of use periods, and necessary range improvements.

**Habitat** - An environment that meets a specific set of physical, biological, temporal, or spatial characteristics that satisfy the requirements of a plant or animal species or group of species for part or all of their life cycle.

**Hard triggers** - Thresholds indicating that immediate action is necessary to stop a severe deviation from sage grouse conservation objectives set forth in the land and resources management plan.

**High-voltage transmission line** – An electrical power line that is 100 kilovolts or larger.

**Holder** – An individual or entity that holds a valid special use authorization.

**Impact** - The effect, influence, alteration, or imprint caused by an action.

**Important habitat management areas** - High value habitat and populations that provide a management buffer for the priority and sagebrush focal management areas and connect patches of priority and sagebrush focal management areas. The areas encompass areas of generally moderate to high conservation value habitat and/or populations and, in some conservation areas, include areas beyond those identified by USFWS as necessary to maintain redundant, representative, and resilient populations. The areas are typically adjacent to priority and sagebrush focal management areas but generally reflect somewhat lower greater sage-grouse population status and/or reduced habitat value due to disturbance, habitat fragmentation, or other factors. No important habitat management areas are designated within the southwestern Montana conservation area.

**Indicators** - Factors that describe resource condition and change and can help the BLM and the Forest Service determine trends over time.

**Isolated parcel** - An individual parcel of land that may share a corner, but does not have a common border with another parcel.

**Invasive species (invasives plant species, invasives)** - An alien species whose introduction does or is likely to cause economic or environmental harm or harm to human health. The species must cause, or be likely to cause, harm, and be exotic to the ecosystem it has infested before considered invasive.

**Landscape** – A distinct association of land types that exhibit a unique combination of local climate, landform, topography, geomorphic process, surficial geology, soil, biota, and human influences. Landscapes are generally of a size that the eye can comprehend in a single view.

**Lease** – A type of special use authorization (usually granted for uses other than linear rights-of-way) that is used when substantial capital investment is required and when conveyance of a conditional and transferable interest in National Forest System lands is necessary or desirable to serve or facilitate authorized long-term uses, and that may be revocable and compensable according to its terms.

**Leasable minerals** - Those minerals or materials designated as leasable under the Mineral Leasing Act of 1920. These include energy-related mineral resources such as oil, natural gas, coal, and geothermal, and some non-energy minerals, such as phosphate, sodium, potassium, and sulfur. Geothermal resources are also leasable under the Geothermal Steam Act of 1970.

**Lessee** - A person or entity authorized to use and occupy National Forest System land under a specific instrument identified as a lease. Forest special use leases are limited to authorize certain wireless communication uses. Leases are also used for certain mineral leasable activities.

**Lek** - A courtship display area attended by male greater sage-grouse in or adjacent to sagebrush dominated habitat. For management purposes, leks with less than five males observed strutting should be confirmed active for 2 years to meet the definition of a lek (Connelly et al 2000, Connelly et al. 2003, 2004).

**Locatable minerals** - Mineral disposable under the General Mining Act of 1872, as amended, that was not excepted in later legislation. They include hardrock, placer, industrial minerals, and uncommon varieties of rock found on public domain lands.

**Major pipeline** – A pipeline that is 24 inches or more in outside-pipe diameter (Mineral Leasing Act of 1920 30 U.S.C. § 181; 36 CFR 251.54(f)(1)).

**Mineral** - Any naturally formed inorganic material, solid or fluid inorganic substance that can be extracted from the earth, any of various naturally occurring homogeneous substances (as stone, coal, salt, sulfur, sand, petroleum, water, or natural gas) obtained usually from the ground. Under Federal laws, considered as locatable (subject to the general mining laws), leasable (subject to the Mineral Leasing Act of 1920), and salable (subject to the Materials Act of 1947).

**Mineral materials** - Common varieties of mineral materials such as soil, sand and gravel, stone, pumice, pumicite, and clay that are not obtainable under the mining or leasing laws but that can be acquired under the Materials Act of 1947, as amended.

**Minimization mitigation** - Minimizing impacts by limiting the degree or magnitude of the action and its implementation.

**Mitigation** - Includes specific means, measures, or practices that could reduce, avoid, or eliminate adverse impacts. Mitigation can include avoiding the impact altogether by not taking a certain action or parts of an action, minimizing the impact by limiting the degree of magnitude of the action and its implementation, rectifying the impact by repairing, rehabilitation, or restoring the affected environment, reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action, and compensating for the impact by replacing or providing substitute resources or environments.

**Modification (oil and gas)** - A fundamental change to the provisions of a lease stipulation, either temporarily or for the term of the lease. A modification may include an exemption from or alteration to a stipulated requirement. Depending on the specific modification, the stipulation may or may not apply to all other sites within the leasehold to which the restrictive criteria applied.

**Native plant species** - Species that were found here before European settlement, and consequently are in balance with these ecosystems because they have well developed parasites, predators, and pollinators.

**No surface occupancy (NSO)** - Use or occupancy of the land surface for fluid mineral exploration or development prohibited to protect identified resource values. The NSO stipulation includes stipulations that may be worded as “No Surface Use/Occupancy,” “No Surface Disturbance,” “Conditional NSO,” or “Surface Disturbance or Surface Occupancy Restriction (by location).”

**Occupied Lek** - A lek that has been active during at least one strutting season within the prior 10 years.

**Opportunity (allotment closure)** - A suitable or favorable time to abolish or close an allotment because of nonuse violations, term permit waivers where the permit is waived back to the government, resource protection, or permit actions resulting in cancellation of the permit.

**Permit** — A special use authorization that provides permission, without conveying an interest in land, to occupy and use National Forest System land or facilities for specified purposes, and which is both revocable and terminable.

**Persistent woodlands** – Long-lived pinyon-juniper woodlands that typically have sparse understories and occur on poor substrates in the assessment area.

**Plan of Operation** - A Plan of Operation is required for all mining activity conducted under the General Mining Act of 1872, as amended, if the proposed operations will likely cause significant disturbance of surface resources. The Plan of Operation describes the type of operations proposed and how they would

be conducted, the type and standard of existing and proposed roads or access routes, the means of transportation to be used, the period during which the proposed activity will take place, and measures to be taken to meet the requirements for environmental protection (36 CR 228.4).

**Prescribed fire** - Any fire ignited by management actions to meet specific objectives. A written, approved prescribed fire plan must exist and NEPA requirements, where applicable, must be met before ignition.

**Priority management areas** - Areas identified by the Forest Service, in coordination with respective state wildlife agencies, as having the highest conservation value to maintaining sustainable greater sage-grouse populations. These areas include breeding, late brood-rearing and winter concentration areas.

**Prohibit** – To forbid (something) by law, rule, or other authority; no authorizations will be issued.

**Reclamation plans** – Plans that guide the suite of actions taken within an area affected by human disturbance, the outcome of which is intended to change the condition of the disturbed area to meet pre-determined objectives and/or make it acceptable for certain defined resources (e.g., wildlife habitat, grazing, ecosystem function, etc.).

**Residual impacts** - Impacts from an implementation-level decision that remain after applying avoidance and minimization mitigation; also referred to as unavoidable impacts.

**Restoration** - Implementation of a set of actions that promotes plant community diversity and structure that allows plant communities to be more resilient to disturbance and invasive species over the long term. The long-term goal is to create functional, high quality habitat that is occupied by greater sage-grouse. Short-term goal may be to restore the landform, soils and hydrology and increase the percentage of preferred vegetation, seeding of desired species, or treatment of undesired species.

**Restrict** – To put a limit on; keep under control; to limit someone’s actions or movement, or to limit the amount, size, etc., of something.

**Right-of-way** - Land authorized to be used or occupied for the construction, operation, maintenance, and termination of a project or facility passing over, upon, under or through such land.

**Road or trail** - A road or trail wholly or partly within or adjacent to and serving the National Forest System that the Forest Service determines is necessary for the protection, administration, and utilization of the National Forest System and the use and development of its resources.

**Sagebrush focal areas** – A subset of priority greater sage-grouse habitat, as identified by the U.S. Fish and Wildlife Service, which are considered most vital to the species persistence and therefore, have the strongest levels of protection.

**Soft triggers** - An intermediate threshold indicating that management changes are needed at the implementation level to address habitat or population losses.

**Special use authorization** - A written permit, term permit, lease, or easement that authorizes use or occupancy of National Forest System lands and specifies the terms and conditions under which the use or occupancy may occur.

**Stipulation (general)** - A term or condition in an agreement, contract, or written authorization.

**Stipulation (oil and gas)** - A provision that modifies standard oil and gas lease terms and conditions in order to protect other resource values or land uses and is attached to and made a part of the lease.

**Soft trigger** - An intermediate threshold indicating that management changes are needed at the implementation level to address habitat or population losses.

**Surface disturbing and disruptive activities** - Actions that alter the vegetation, surface/near surface soil resources, and/or surface geologic features, beyond natural site conditions and on a scale that affects other public land values. Examples of surface disturbing activities may include operation of heavy equipment to construct well pads, roads, pits and reservoirs; installation of pipelines and power lines; maintenance activities, and several types of vegetation treatments (e.g., prescribed fire, etc.). Surface disturbing activities may be either restricted or prohibited.

**Surface use** - Activities that may be present on the surface or near-surface (e.g., pipelines) of public lands. When administered as a use restriction (e.g., no surface occupancy), this phrase prohibits all but specified resource uses and activities in a certain area to protect particular sensitive resource values and property. This designation typically applies to small acreage sensitive resource sites (e.g., plant community study enclosure, etc.), and/or administrative sites (e.g., government ware-yard, etc.) where only authorized, agency personnel are admitted.

**Tall structures** - A wide array of infrastructures (e.g., poles that support lights, telephone and electrical distribution, communication towers, meteorological towers, high-tension transmission towers, and wind turbines) that have the potential to disrupt lekking or nesting birds by creating new perching/nesting opportunities and/or decreasing the use of an area. A determination as to whether something is considered a tall structure would be based on local conditions such as vegetation or topography.

**Technically/economically feasible** - Actions that are practical or feasible from the technical and economic standpoint and using common sense, rather than simply desirable from the standpoint of the applicant. It is the Forest Service's sole responsibility to determine what actions are technically and economically feasible. The Forest Service will consider whether implementation of the proposed action is likely given past and current practice and technology; this consideration does not necessarily require a cost-benefit analysis or speculation about an applicant's costs and profit.

**Temporary special use permit** – A type of permit that terminates within 1 year or less after the approval date. All other provisions applicable to permits apply fully to temporary permits. Temporary special use permits are issued for seasonal or short-duration uses involving minimal improvement and investment.

**Term permit** – An authorization to occupy and use National Forest System land, other than rights-of-way for a specified period that is both revocable and compensable according to its terms.

**Timely** - The conservation benefits from compensatory mitigation accruing as early as possible or before impacts have begun.

**Transmission line** - An electrical utility line with a capacity greater than or equal to 100kV or a natural gas, hydrogen, or water pipeline greater than or equal to 24" in diameter.

**Travel management system** – Planned and authorized roads, trails, and areas for motor vehicle use on National Forest System lands that are managed in a controlled, sustained manner.

**Utility-scale and/or commercial energy development** – A project that is capable of producing 20 or more megawatts of electricity for distribution to customers through the electricity-transmission-grid system.

**Valid existing rights** - Documented, legal rights, or interests in the land, which allow a person or entity to use said land for a specific purpose and that are still in effect. Such rights include but are not limited to fee title ownership, mineral rights, and easements. Such rights may have been reserved, acquired, granted or otherwise authorized under various statutes of law.

**Vegetation treatments** - Management practices that are designed to maintain current vegetation structure or change the vegetation structure to a different stage of development. Vegetation treatment methods may include managed fire, prescribed fire, chemical, mechanical, and seeding.

**Viability** - For purposes of the National Forest Management Act and its enabling regulations, viability is the availability of habitat that allows a species to persist on landscapes for long-periods (multi-generational) of time. It assumes that populations are abundant (sufficient numbers) and well-distributed (sufficient redundancy of populations) to provide for long-term population persistence on a landscape.

**Waiver (oil and gas)** - Permanent exemption from a lease stipulation. The stipulation no longer applies anywhere within the leasehold.

**West Nile virus** - A virus that is found in temperate and tropical regions of the world and most commonly transmitted by mosquitoes. West Nile virus can cause flu-like symptoms in humans and can be lethal to birds, including greater sage-grouse.

**Wildfire suppression** - An appropriate management response to wildfire, or prescribed fire that results in curtailment of fire spread and eliminates all identified threats from the particular fire.

## Appendix F – Required Design Features

The following required design features (RDFs) are included for consideration and use based upon review of current science and effects analysis (circa 2014) (Table A-1). These may be reviewed during project evaluation and updated through plan maintenance as new information and updated scientific findings become available.

The table is organized by program area grouping the RDFs most relevant to that program. All relevant RDFs, regardless of which program they are grouped under, should be considered during project evaluation and applicable RDFs should be applied during implementation, with the exception that they would be implemented as best management practices for locatable minerals activities, to the extent allowable by law. The table identifies the specific measure (numbered) and its appropriate application – as an RDF – required all the time everywhere; or as an RDF required when the applicable resources are present. In some cases the RDFs may not all be appropriate based on local conditions and would be assessed in the appropriate site specific NEPA analysis, these all should be considered and where determined to be beneficial to achieving GRS habitat objectives included as part of the site specific project. In other cases additional project design criteria or best management practices could be incorporated into project implementation to address site specific concerns not fully addressed by the RDFs described here.

Table A-1. Required Design Features

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
<b>General</b>		
Solicit and consider expertise and ideas from local landowners, working groups, and other federal, state, county, and private organizations during development of projects.		X
<b>Wildfire Suppression</b>		
Compile district-level information into state-wide sage-grouse tool boxes. Tool boxes will contain maps, listing of resource advisors, contact information, local guidance, and other relevant information for each district, which will be aggregated into a state-wide document.	X	
Provide localized maps to dispatch offices and extended attack incident commanders for use in prioritizing wildfire suppression resources and designing suppression tactics. The Fire Planning and Fuels Management Division (FA-600) hosts a webpage containing up-to-date maps, instruction memoranda, conservation measures, BMPs, and spatial data specific to fire operations and fuels management/sage-grouse interactions. These resources can be accessed at: <a href="http://web.blm.gov/internal/fire/fpfm/sg/index.html">http://web.blm.gov/internal/fire/fpfm/sg/index.html</a> . Additional BLM sage-grouse information can be found at: <a href="http://www.blm.gov/wo/st/en/prog/more/fish_wildlife_and/sage-">http://www.blm.gov/wo/st/en/prog/more/fish_wildlife_and/sage-</a>	X	

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
<a href="#">grouse-conservation.html</a> .		
Assign a resource advisor with sage-grouse expertise, or who has access to sage-grouse expertise, to all extended attack fires in or near sage-grouse habitat areas. Prior to the fire season, provide training to sage-grouse resource advisors on wildfire suppression organization, objectives, tactics, and procedures to develop a cadre of qualified individuals. Involve state wildlife agency expertise in fire operations through: instructing resource advisors during preseason trainings; qualification as resource advisors; coordination with resource advisors during fire incidents; contributing to incident planning with information such as habitat features or other key data useful in fire decision making	X	
At the onset of an emerging wildland fire the Agency Administrators and Fire Management Officers will an engage a local Resource Advisor to assess sage-grouse habitat that may be affected by the fire or suppression activities.	X	
If complexity of the wildland fire warrants the activation of an Incident Management Team, locally refined information regarding important sage-grouse habitat will be relayed during in brief and continually throughout the incident.		X
On critical fire weather days, pre-position additional fire suppression resources to optimize a quick and efficient response in sage-grouse habitat areas.		X
As appropriate, utilize existing fuel breaks, such as roads or discrete changes in fuel type, as control lines in order to minimize fire spread.		X
During periods of multiple fires, ensure line officers are involved in setting priorities.	X	
To the extent possible, locate wildfire suppression facilities (i.e., base camps, spike camps, drop points, staging areas, heli-bases, etc.) in areas where physical disturbance to sage-grouse habitat can be minimized. These include disturbed areas, grasslands, near roads/trails or in other areas where there is existing disturbance or minimal sagebrush cover.	X	
Power-wash all firefighting vehicles, to the extent possible, including engines, water tenders, personnel vehicles, and all-terrain vehicles (ATV) prior to deploying in or near sage-grouse habitat areas to minimize noxious weed spread.	X	
Minimize cross-country vehicle travel during fire operations in sage-grouse habitat.	X	
Minimize burnout operations in key sage-grouse habitat areas by constructing direct fireline whenever safe and practical to do so.	X	
Utilize retardant, mechanized equipment, and other available	X	

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
resources to minimize burned acreage during initial attack.		
As safety allows, conduct mop-up where the black adjoins unburned islands, dog legs, or other habitat features to minimize sagebrush loss.		X
Adequately document fire operation activities in sage-grouse habitat for potential follow-up coordination activities.	X	
<b>Fuels Management</b> Unless otherwise specified as part of the land use plan consider the full array of fuels management treatment types (prescribed fire, mechanical, chemical and biological) when implementing the following RDFs.		
Where applicable, design fuels treatment objectives to protect existing sagebrush ecosystems, modify fire behavior, restore native plants, and create landscape patterns which most benefit sage-grouse habitat.	X	
Provide training to fuels treatment personnel on sage-grouse biology, habitat requirements, and identification of areas utilized locally.	X	
Use burning prescriptions which minimize undesirable effects on vegetation or soils (e.g., minimize mortality of desirable perennial plant species and reduce risk of annual grass invasion).	X	
Ensure proposed sagebrush treatments are planned with full interdisciplinary input pursuant to NEPA and coordination with state fish and wildlife agencies, and that treatment acreage is conservative in the context of surrounding sage-grouse seasonal habitats and landscape.	X	
Where appropriate, ensure that treatments are configured in a manner that promotes use by sage-grouse.	X	
Where applicable, incorporate roads and natural fuel breaks into fuel break design.		X
Power-wash all vehicles and equipment involved in fuels management activities, prior to entering the area, to minimize the introduction of undesirable and/or invasive plant species.	X	
Design vegetation treatments in areas of high fire frequency which facilitate firefighter safety, reduce the potential acres burned, and reduce the fire risk to sage-grouse habitat. Additionally, develop maps for sage-grouse habitat which spatially display existing fuels treatments that can be used to assist suppression activities.	X	
Give priority for implementing specific sage-grouse habitat restoration projects in annual grasslands, first to sites which are adjacent to or surrounded by Priority Habitat Management Areas or that reestablish continuity between Priority Habitat Management Areas. Annual grasslands are a second priority for restoration when the sites are not adjacent to Priority Habitat Management Areas, but within Important Habitat Management Areas. The third priority for annual grassland habitat restoration projects are sites within General	X	

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
Habitat Management Areas. The intent is to focus restoration outward from existing, intact habitat.		
As funding and logistics permit, restore annual grasslands to a species composition characterized by perennial grasses, forbs, and shrubs or one of that referenced in land use planning documentation.	X	
Emphasize the use of native plant species, especially those from a warmer area of the species' current range, recognizing that non-native species may be necessary depending on the availability of native seed and prevailing site conditions.	X	
Remove standing and encroaching trees within at least 110 yards of occupied sage-grouse leks and other habitats (e.g., nesting, wintering and brood rearing) to reduce the availability of perch sites for avian predators, as resources permit.		X
Protect wildland areas from wildfire originating on private lands, infrastructure corridors, and recreational areas.		X
Reduce the risk of vehicle- or human-caused wildfires and the spread of invasive species by installing fuel breaks and/or planting perennial vegetation (e.g., green-strips) paralleling road rights-of-way.		X
Strategically place and maintain pre-treated strips/areas (e.g., mowing, herbicide application, etc.) to aid in controlling wildfire, should wildfire occur near PHMA or priority restoration areas (such as where investments in restoration have already been made).	X	
Design treatments to provide a break in fuel continuity in large, at-risk, expanses of continuous sagebrush. Use local knowledge of fire occurrence, spread patterns, and habitat values at risk to determine the proper placement and size of the fuel break.	X	
Use existing agreements with local, county, and state road departments to improve and maintain existing fuel breaks during routine road maintenance. Examples include: blading, mowing, disking, grading, and spraying roadside vegetation.		X
Form partnerships with linear right-of-way holders to maintain fuel breaks, which reduce fuel continuity and serve to protect at-risk landscapes.		X
Use existing NEPA documentation and authorities, where possible, when conducting road right-of-way maintenance. In many instances, existing authorizations for roads or linear rights-of-way contain provisions for maintenance activities that could be implemented and incorporated into a vegetation and habitat protection strategy without requiring additional NEPA analysis. Document this with a Determination of NEPA Adequacy (DNA).		X
Enter into agreements with road departments which may help fund the construction and maintenance of fuel breaks adjacent to roads, as funding permits.		X

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
Spatially depict the locations of existing and planned fuel breaks in a landscape fuel break map and label each vegetation polygon for reference. Offices will make these maps available to suppression resources for use in fire operations.	X	
Vegetation Treatment		
Utilize available plant species based on their adaptation to the site when developing seed mixes. (Lambert 2005; VegSpec).	X	

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
Utilizing the warmer component of a species' current range when selecting native species for restoration when available (Kramer and Havens 2009).		X
Reduce annual grass densities and competition through herbicide, targeted grazing, tillage, prescribed fire, etc. (Pyke 2011).		X
Reduce density and competition of introduced perennial grasses using appropriate techniques to accomplish this reduction (Pellant and Lysne 2005).		X
Utilize techniques to introduce desired species to the site such as drill seeding, broadcast seeding followed by a seed coverage technique, such as harrowing, churning or livestock trampling, and transplanting container or bare-root seedlings.		X
Assess existing on-site vegetation to ascertain if enough desirable perennial vegetation exists to consider techniques to increase on-site seed production to facilitate an increase in density of desired species.		X
Use site preparation techniques that retain existing desirable vegetation.	X	
Use "mother plant" techniques or planting of satellite populations of desirable plants to serve as seed sources.		X
Utilize post-treatment control of annual grass and other invasive species.	X	
Utilize new tools and use of new science and research as it becomes available.	X	
<p>Give higher priority to vegetation rehabilitation or manipulation projects that include:</p> <p>Sites where environmental variables contribute to improved chances for project success (Meinke et al. 2009).</p> <p>Areas where seasonal habitat is limiting GRSG distribution and/or abundance (wintering areas, wet meadows and riparian areas, nesting areas, leks, etc.).</p> <p>Re-establish sagebrush cover in otherwise suitable GRSG with consideration to local needs and conditions using the general priorities in the following order:</p> <ul style="list-style-type: none"> <li>Recently burned native areas</li> <li>Native grassland with suitable forb component</li> <li>Nonnative grassland with suitable forb component</li> <li>Recently converted annual grass areas</li> <li>Native grassland</li> <li>Nonnative grassland</li> </ul> <p>Where desirable perennial bunchgrasses and/or forbs are deficient in existing sagebrush stands, use appropriate mechanical, aerial or other techniques to re-establish them. Examples include but are not limited to, use of a Lawson aerator with seeding, harrow or chain with</p>	X	

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
seeding, drill seeding, hand planting plugs, aerial seeding or other appropriate technique. Cooperative efforts that may improve GRSG habitat quality over multiple ownerships. Projects that may provide connectivity between suitable habitats or expand existing good quality habitats. Projects that address conifer encroachment into important GRSG habitats. In general the priority for treatment is 1) Phase 1 (≤10% conifer cover), 2) Phase 2 (10-30%), and 3) Phase 3 (>30%). • Replacing stands of annual grasses within otherwise good quality habitats with desirable perennial species. Other factors that contribute to the importance of the restoration project in maintaining or improving GRSG habitat.		
When conducting vegetation treatments in areas inhabited or potentially inhabited by slickspot peppergrass ( <i>Lepidium papilliferum</i> ) follow the conservation measures in the applicable conservation agreement (revised August 2014).		X
Lands and Realty		
Where technically and financially feasible, bury distribution powerlines and communication lines within existing disturbance.		X
Above-ground disturbance areas would be seeded with perennial vegetation as per vegetation management.	X	
Place infrastructure in already disturbed locations where the habitat has not been fully restored.		X
Cluster disturbances, operations (fracturing stimulation, liquids gathering, etc.) and facilities as close as possible.		X
Co-locate linear facilities within one mile of existing linear facilities.		X
Micro-site linear facilities to reduce impacts to sage-grouse habitats.	X	
Locate staging areas outside the Priority Habitat Management Areas to the extent possible.	X	
Consider collocating powerlines, flowlines and pipelines under or immediately adjacent to a road or adjacent to other pipelines first, before considering co-locating with other ROW.		X
Restrict the construction of tall facilities and fences to the minimum number and amount needed.	X	
Use free standing structures where possible, to limit the use of guy wires. Where guy wires are necessary and appropriate bird collision diverters would be used, if doing so would not cause a human safety risk.	X	
Place new utility developments (power lines, pipelines, etc.) and transportation routes in existing utility or transportation corridors.		X
Construction and development activities should conform to seasonal restrictions.	X	
Fluid Mineral Leasing		

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
Use directional drilling and/or multi well-pads to reduce surface disturbance.	X	
Apply a phased development approach with concurrent reclamation.	X	
Place liquid gathering facilities outside of PHMAs. Have no tanks at well locations within PHMAs to minimize truck traffic and perching and nesting sites for ravens and raptors.	X	
Use remote monitoring techniques for production facilities and develop a plan to reduce the frequency of vehicle use (Lyon and Anderson 2003).		X
Site and/or minimize linear ROWs or SUAs to reduce disturbance to sagebrush habitats.	X	
Design or site permanent structures which create movement (e.g. pump jack) to minimize impacts to GRSG.	X	
Equip tanks and other above-ground facilities with structures or devices that discourage nesting of raptors and corvids.		X
Control the spread and effects of non-native plant species (Gelbard and Belnap 2003, Bergquist et al. 2007, Evangelista et al. 2011). (E.g. by washing vehicles and equipment.)		X
Restrict pit and impoundment construction to reduce or eliminate threats from West Nile virus (Doherty 2007).		X
<p>Remove or re-inject produced water to reduce habitat for mosquitoes that vector West Nile virus. If surface disposal of produced water continues, use the following steps for reservoir design to limit favorable mosquito habitat:</p> <p>Overbuild size of ponds for muddy and non-vegetated shorelines. Build steep shorelines to decrease vegetation and increase wave actions.</p> <p>Avoid flooding terrestrial vegetation in flat terrain or low lying areas.</p> <p>Construct dams or impoundments that restrict down slope seepage or overflow.</p> <p>Line the channel where discharge water flows into the pond with crushed rock.</p> <p>Construct spillway with steep sides and line it with crushed rock.</p> <p>Treat waters with larvicides to reduce mosquito production where water occurs on the surface</p>		X
In PHMA, limit noise from discretionary activities to not less than 10 decibels above ambient sound levels (typically 20-24 dBA) at occupied leks from 2 hours before to 2 hours after sunrise and sunset during breeding season.	X	
Require noise shields when drilling during the lek, nesting, brood-rearing, or wintering season.		X
The BLM/Forest Service would work with proponents to limit	X	

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
project related noise where it would be expected to reduce functionality of habitats in Priority and Important Habitat Management Areas.		
The BLM/Forest Service would evaluate the potential for limitation of new noise sources on a case-by-case basis as appropriate.	X	
Limit noise sources that would be expected to negatively impact populations in Priority and Important Habitat Management Areas and continue to support the establishment of ambient baseline noise levels for occupied leks in Priority Habitat Management Areas.	X	
As additional research and information emerges, specific new limitations appropriate to the type of projects being considered would be evaluated and appropriate limitations would be implemented where necessary to minimize potential for noise impacts on sage-grouse core population behavioral cycles.	X	
As new research is completed, new specific limitations would be coordinated with the IDFG and MT FWP and partners.	X	
Fit transmission towers with anti-perch devices (Lammers and Collopy 2007).		X
Require sage-grouse-safe fences.		X
Locate new compressor stations outside Priority Habitat Management Areas and design them to reduce noise that may be directed towards Priority Habitat Management Areas.	X	
Clean up refuse (Bui et al. 2011).	X	
Locate man camps outside of priority sage-grouse habitats.	X	
Consider using oak (or other material) mats for drilling activities to reduce vegetation disturbance and for roads between closely spaced wells to reduce soil compaction and maintain soil structure to increase likelihood of vegetation reestablishment following drilling.		X
Use only closed-loop systems for drilling operations and no reserve pits.	X	
Cover (e.g., fine mesh netting or use other effective techniques) all drilling and production pits and tanks regardless of size to reduce sage-grouse mortality.	X	
<b>Roads</b>		
Utilize existing roads, or realignments of existing routes to the extent possible.	X	
Design roads to an appropriate standard no higher than necessary to accommodate their intended purpose.	X	
Do not issue ROWs or SUAs to counties on newly constructed energy or mineral development roads, unless for a temporary use consistent with all other terms and conditions included in this document.	X	
Establish speed limits on BLM and FS system roads to reduce vehicle/wildlife collisions or design roads to be driven at slower		X

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
speeds.		
Coordinate road construction and use among ROW or SUA holders.	X	
Construct road crossings at right angles to ephemeral drainages and stream crossings.		X
Use dust abatement on roads and pads.	X	
Close and reclaim duplicate roads by restoring original landform and establishing desired vegetation.		X
<b>Roads Specific to Priority and Important Habitat Management Areas</b>		
Locate roads to avoid priority areas and habitats as described in the Wildfire and Invasive Species Assessments.	X	
Establish trip restrictions (Lyon and Anderson 2003) or minimization through use of telemetry and remote well control (e.g., Supervisory Control and Data Acquisition).	X	
Restrict vehicle traffic to only authorized users on newly constructed routes (using signage, gates, etc.)	X	
<b>Reclamation Activities</b>		
Include objectives for ensuring habitat restoration to meet sage-grouse habitat needs in reclamation practices/sites (Pyke 2011).	X	
Address post reclamation management in reclamation plan such that goals and objectives are to protect and improve sage-grouse habitat needs.		X
Maximize the area of interim reclamation on long-term access roads and well pads, including reshaping, topsoiling and revegetating cut-and-fill slopes.	X	
Restore disturbed areas at final reclamation to the pre-disturbance landforms and desired plant community.	X	
Irrigate interim reclamation if necessary for establishing seedlings more quickly.		X
Utilize mulching techniques to expedite reclamation and to protect soils.		X
<b>Grazing Required Design Features</b>		
Avoid building new wire fences within 2 km of occupied leks (Stevens 2011). If this is not feasible, ensure that high risk segments are marked with collision diverter devices or as latest science indicates.	X	
Place new, taller structures, including corrals, loading facilities, water storage tanks, windmills, out of line of sight or at least one kilometer (preferably 3 km) from occupied leks, where such structures would increase the risk of avian predation.	X	
Utilize temporary fencing (e.g., ESR, drop down fencing) where feasible and appropriate to meet management objectives.		X
Fence wetlands (e.g., springs, seeps, wet meadows and/or riparian areas) where appropriate, to maintain or foster progress toward Proper Functioning Condition and to facilitate management of sage-		X

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
grouse habitat objectives. Where constructing fences or enclosures to improve riparian and/or upland management, incorporate fence marking or other BMPs/RDFs as appropriate.		
During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations and March 25-May 15 in higher elevations), livestock trailing will be avoided to the extent possible within 1 km (0.62 mile) of occupied leks between 6:00 p.m. and 9:00 a.m. to avoid disturbance to lekking and roosting sage-grouse. Over-nighting, watering and sheep bedding locations on public lands must be at least 1 km from occupied leks during the lekking season to reduce disturbance from sheep, human activity and guard animals.	X	
Work with permittees in locating sheep over-nighting, watering and sheep bedding locations to minimize impacts to sage-grouse seasonal habitats.	X	
When trailing livestock during the lekking or nesting season, use roads or existing trails, to the extent possible to reduce disturbance to roosting, lekking or nesting sage-grouse.		X
Design new spring developments in GRSG habitat to maintain or enhance the free flowing characteristics of springs and wet meadows. Modify developed springs, seeps and associated pipelines to maintain the continuity of the predevelopment riparian area within priority GRSG habitat where necessary.		X
Install ramps in new and existing livestock troughs and open water storage tanks to facilitate the use of and escape from troughs by GRSG and other wildlife.		X
<b>West Nile Virus Required Design Features</b>		
Construct water return features and maintain functioning float valves to prohibit water from being spilled on the ground surrounding the trough and/or tank and return water to the original water source, to the extent practicable.	X	
Minimize the construction of new ponds or reservoirs except as needed to meet important resource management and/or restoration objectives.	X	
Develop and maintain non-pond/reservoir watering facilities, such as troughs and bottomless tanks, to provide livestock water.	X	
For most spring developments or wells, mosquito breeding habitat usually is not an issue. Flowing cold (less than 50° Fahrenheit) water and steep sides of the stock tanks are not conducive for egg laying or larvae production. If flows are low, the water is warm, or moss production is an issue in the tank, mosquito breeding habitat could exist in the tank.	X	
Maintenance of healthy wetlands at spring sources helps control mosquitoes and their larvae by providing habitat for natural predators such as birds, dragonflies and amphibians. Protecting the		X

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
wetland at the spring source with a fence is an option to consider.		
Clean and drain stock tanks before the season starts. If never cleaned or drained, many tanks will fill with silt or debris causing warmer water and heavy vegetation growth conducive to mosquito reproduction.		X
Draining tanks after the period of use is completed, particularly in warmer weather, also reduces potential habitat by eliminating stagnant standing water.		X
Maintain a properly functioning overflow to prevent water from flowing onto the pad and surrounding area, to eliminate or minimize pooling of water that is attractive to breeding mosquitoes.	X	
Clean or deepen overflow ponds to maintain colder temperatures to reduce mosquito habitat.		X
Install and maintain float valves on stock tank fill pipes to minimize overflow	X	
Harden stock tank pads to reduce tracks that can potentially hold water where mosquitoes may breed.	X	
Build ponds with steep shorelines to reduce shallow water (>60 cm) and aquatic vegetation around the perimeter of impoundments to deter colonizing by mosquitos (Knight et al. 2003, cited in NTT report page 61).	X	
Consider removing and controlling trees and shrubs to reduce shade and wind barriers on pit and reservoir shorelines if not needed for wildlife, fish, or recreational values.		X
Impoundments that remain accessible to livestock and wildlife can cause tracking and nutrient enrichment from manure which can create favorable mosquito breeding habitat. Where this is a concern, it may be desirable to fence the reservoir and pipe the water to a tank.		X
Construct dams or impoundments that minimize down-slope seepage or overflow. Seepage and overflow results in down-grade accumulation of vegetated shallow water areas that support breeding mosquitoes.		X
On ponds and reservoirs with enough depth and volume, introduce native fish species, which feed on mosquito larvae.		X
Line the overflow of a dam’s spillway with crushed rock and constructing the spillway with steep sides to preclude the accumulation of shallow water and vegetation to reduce mosquito habitat.		X
Where an existing reservoir has filled with silt, consider cleaning to reduce shallow water habitat conducive to mosquito reproduction.		X
During confirmed West Nile virus outbreaks in sage-grouse habitat, consider larvicide applications.		X
<b>Travel Management Required Design Features</b>		

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
Designate or design routes to direct use away from priority areas identified in Wildfire and Invasive Species Assessments and still provide for high-quality and sustainable travel routes and administrative access, legislatively mandated requirements, and commercial needs	X	
Recreation Required Design Features		
Direct use away from GRSG priority areas as described in the Wildfire and Invasive Species Assessments.	X	
Eliminate or minimize external food sources for corvids.		X

## **Appendix G – Seasonal Timing Restriction**

During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations and March 25-May 15 in higher elevations), project activities will be avoided to the extent possible within 1 km (0.62 mile) of occupied leks between 6:00 p.m. and 9:00 a.m. to avoid disturbance to lekking and roosting sage-grouse.

### Appendix H - Application of Buffers

Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary			
Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
Incidental disturbance to individual GRSG within all habitat types during all seasons			
	Public or administrative activities that include incidental foot, aerial, horseback, or other similar travel.	None.	Impacts from these type of activities are immeasurable and would not warrant any minimization measures.
	Livestock grazing activities (except where specifically noted below).	None.	Impacts from these type of activities are immeasurable and would not warrant any minimization measures.
	Public vehicle travel not otherwise restricted in Travel Management Plans; or administrative vehicle travel on existing routes for maintenance of existing infrastructure, facilities, or vegetation projects; or non-organized/non-permitted activities.	None.	Impacts from these type of activities are immeasurable and would not warrant any minimization measures.
Loss (i.e. death) of nests/eggs, chicks and/or adults that may occur within the nesting <sup>4</sup> habitat during the nesting season			
	Anthropogenic activities such as the use of heavy equipment <sup>2</sup> or targeted grazing in nesting habitat <sup>3</sup> for: 1) implementation of fuels/vegetation/habitat restoration management projects, 2) infrastructure construction or maintenance, 3) geophysical	BMP Priority, Important, General: Avoid these activities within nesting habitat during the nesting <sup>3</sup> season.	Application of the seasonal nesting habitat restriction would avoid and minimize the loss of nests/chicks/hens. This is a BMP since the impact is loss of individual grouse and is small scale and not population-scale. Disallowing infrastructure maintenance or

Idaho and Southwest Montana GRSB Buffers and Seasonal Restrictions Summary			
Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
	exploration activities; 4) organized motorized recreational events		construction in nesting habitat outright may not be realistic as an RDF. Impacts may be able to be offset via appropriate mitigation.
	Bedding Sheep & Associated Camps	BMP: Priority, Important, General: During the nesting season, locate bedding areas and camps outside of sagebrush areas <sup>3</sup> .	Application of the seasonal nesting habitat restriction would avoid/minimize the loss of nests/chicks by focusing bedding and camps in areas not meeting nest habitat characteristics for sagebrush cover (i.e., use areas less than 15% canopy cover).
	Fences	Existing Fences:  RDF: Priority and Important; BMP for General- Where consistent with policy, laws and/or regulations relative to Wilderness, Wilderness Study Areas and Visual Resource Management, move, modify (e.g. lay down fences) or mark existing fences to reduce collision risk within areas that have a high probability of fence strikes (per Stevens et al. 2012 model or latest science).	Application of these measures would avoid/minimize the loss of birds to fence strikes.
		New Fences:  RDF: Priority and Important; BMP for General- Do not construct new fences within areas of high collision risk unless marked or modified, consistent with policy, laws and/or regulations relative to Wilderness, Wilderness Study Areas and Visual Resource Management .	

Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary			
Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
Permanent functional or physical loss of a lek or declining attendance at lek <sup>4</sup>			
	Unleased fluid minerals	<p>Stipulation: Preiority, Important, General: Do not allow wells, pads, facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek.</p> <p>Stipulation: Priority, Important, General: Limit average well pad density to no more than 1 per 640 acres within nesting<sup>3</sup> and winter<sup>3</sup> habitat.</p>	<p>This impact may have a population level effect and trip a population trigger therefore we recommended this be an RDF. Recent literature says 0.25 mile and 0.6 mile buffers are not sufficient (Harju et al. 2010). Hess (2011 MS Thesis) found statistical evidence that oil/well pad influence extended as far as 1.6 km from grouse leks. The 1/640 density per based on consideration of 1) Harju et al. (2010) who found pad density of 1.54 pad/sq km (1 pad/247 ac ) had 13-74% lower attendance at leks and 2) Doherty (2008 page iii and 79) who noted potential impacts from oil and gas development were indiscernible at ~1 well/640 acres. IDswMT biology team recommended a more conservative approach to minimize risk of tripping a population trigger, hence the 1/640.</p>
	Commercial solar development	<p>RDF: Priority-No commercial solar development.</p> <p>RDF: Important- Do not allow new facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek<sup>4</sup>.</p> <p>BMP-General: Avoid new facilities or associated above ground</p>	<p>No specific literature available relative to solar development. Recommended buffer is based on recent literature (Harju et al 2010) that 0.6 or 0.25 mile buffers are not. The 2 mile buffer is consistent with Connelly et al. 2000 regarding energy facilities (page 978).</p>

Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary			
Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
		infrastructure within 2 miles (3.2 km) a lek <sup>4</sup> .	
	Roads	BMP: Priority, Important, General: Do not construct new paved or high volume traffic gravel roads within 0.8 mile (1.3 km) of leks <sup>4</sup> .	Patricelli et al. 2012 (Recommendations for interim protections in WY) recommended siting roads 0.7 to 0.8 miles from crucial seasonal habitat. We apply it here as a lek-centric BMP because we may need to construct a road near a lek (perhaps for fire operations/access or to allow access to private lands or per ROW need). If we buffer roads in the Priority or Important Areas via a large lek buffer, it may lead to disturbance of a much larger area of nesting habitat in the course of avoiding the lek and buffers. The BMP would at least allow for siting to avoid the lek, and reducing road noise near the lek, without compromising broader landscapes.
	Commercial/ industrial Pipelines (oil, gas, slurry, and similar)	BMP: Priority, Important, General. Minimize removal of sagebrush within 0.6 miles of leks <sup>4</sup> .	Application of this measure is designed to minimize loss of sagebrush in the vicinity of the lek. The main concern was with loss of sagebrush in vicinity of lek, that is used by GRSG for cover. The 0.6 mile buffer is based on rationale in the Colorado GRSG Conservation Plan as below:  BACKGROUND INFORMATION: From Colorado GRSG Conservation Plan Appendix B: [Lek Habitat

Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary			
Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
			<p>(March through mid-May) - The basis and rationale for the first radius, 0.6 miles from a lek (Fig. B-1), is developed by summarizing data from 5 separate studies of daytime movements of adult male sage-grouse during the breeding season (Carr 1967, Wallestad and Schladweiler 1974, Rothenmaier 1979, Emmons 1980, Schoenberg 1982), because daytime movements of adult male GRSG during the breeding season do not vary greatly. Wallestad and Schladweiler (1974) found daily movements of adult males ranged between 0.2 and 0.8 miles from leks, with a maximum cruising radius of 0.9 - 1.2 miles. Ellis et al. (1987) reported that dispersal flights of male GRSG (to day-use areas) ranged from 0.3 – 0.5 miles, with the longest flights ranging from 1.2 – 1.3 miles. Carr (1967) recorded a cruising radius for male GRSG that ranged from 0.9- 1.1 miles. Rothenmaier (1979) found that 60-80% of male GRSG locations were within 0.6 - 0.7 miles of a lek. Emmons (1980) reported that male dispersal distances to day-use areas of 0.1 miles were common and that 67% of all use areas were greater than 0.3 miles from the lek. In addition, Schoenberg (1982) found that male daily movements averaged 0.6 miles, but ranged from 0.02 - 1.5 miles.</p>

Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary			
Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
			<p>Male GRSG activity patterns during the breeding season include strutting during the early morning hours, feeding and loafing during the day, and roosting on the lek during the night. Grouse attending the lek do not always roost on the exact location where the strutting occurs the next morning. Occasionally (this is lek-dependent), grouse roost in adjacent sagebrush cover.</p> <p>Ultimately, male GRSG require an open area for strutting, and sagebrush immediately adjacent for feeding and loafing. Sagebrush adjacent to the lek is also used as escape cover from predators or other types of disturbance. Female GRSG that attend the lek also use the area in this zone in the same fashion as do males (Patterson 1952, Barnett and Crawford 1994, Coggins 1998).]</p> <p>Study locations noted above: Carr-Colorado; Wallestad and Schladweiller- Montana; Emmons-Colorado; Schoenberg- Colorado; Rothenmaier –unable to locate Univ. WY Thesis but study area not defined.</p>
	Miscellaneous anthropogenic structures/ activities (e.g., corrals, water windmills, apiaries, signs, informational kiosks, etc.)	BMP Priority, Important, General: Avoid human activities or placement of new structures as noted within 2 miles (3.2 km) mi of a lek <sup>4</sup> or ensure	This is a catch all to reduce impact of miscellaneous structures where possible (some are tall <sup>5</sup> , such as water windmill, some are small, but have

Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary			
Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
		they are out of the viewshed of the lek.	human activity- such as kiosks) or activities not otherwise addressed in this table. Based on biology team discussion and input, and Connelly et al. 2000 Guidelines that state, “avoid building powerlines and other tall structures that provide perch sites for raptors within 3 km of seasonal habitats” (page 977). Avoiding “seasonal habitats” entirely by 3 km would preclude any of these activities at all in Priority, Important or General, but siting 2 miles + from leks as a BMP would nonetheless help protect leks from disturbance. Adding the “viewshed” caveat can help with siting in cases where topography or such screens view of the activity or structure.
	Campgrounds and other developed recreation facilities (trailheads etc.)	BMP: Priority, Important, General. Avoid development of new campgrounds or recreation facilities in nesting habitat.	Biology team discussion. No literature specific to this issue. Aldrich (2012) mentions GRSG avoidance threshold 2.5 km from any single development at patch scale.
	OHV Play or Open Areas	RDF-Priority and Important; BMP for General. No new Open or Play areas.	Rationale is to reduce risk for further noise, habitat loss, fire risk in the Priority, Important and General Areas.
	Solid Minerals		These measures for solid minerals are intended to reduces noise and human disturbance to lekking birds. Siting/ avoidance buffers not realistic due to

Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary			
Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
			the nature of mineral deposits.
		Locatables-BMP Priority, Important, General: Access roads and associated infrastructure not on the mining claim-Avoid disturbance to leks <sup>4</sup> during the lekking season.	Regulations 43 CFR 3809.420 performance standards, speak to T/E, and habitat. As a BMP, it provides an opportunity to work with the developer where we can, such as routing access roads etc., siting of facilities/infrastructure etc., that are off the claim, that we have some discretion with.
		Salables- RDF: Priority: Do not construct new salable development within 0.8 mile (1.3 km) of leks <sup>4</sup> .	Salables- No literature specific to salables but buffer distance is based on the noise literature for roads. See Patricelli et al. 2012 (WY recommendations for interim noise protections) that recommended siting roads 0.7 to 0.8 miles from crucial seasonal habitat. Chose RDF for Priority and BMP in Important and General habitat since new Salable pits (e.g., gravel) may be necessary to support road maintenance or improvement for access by fire operations or for other locally important factors.
		Leasables-non-energy (e.g., phosphate)-	Leasables: None presently known in Priority based on current mapping, but

Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary			
Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
		<p>RDF-Priority and Important: New phosphate leasing is administratively unavailable.</p> <p>BMP-Priority, Important, General-On existing leases avoid disturbance to leks<sup>4</sup> during the lekking season</p>	<p>Priority RDF included in case of a trigger trip and re-delineation of IDswMT subregional management areas.</p> <p>In “Important” there is only one such area with existing lease and Known Phosphate Lease Areas (KPLAs), just west of Bear. It is Federal mineral/private surface. No interest in surface mining but there is interest by a company in underground development. Company is proposing facilities on surface, but working with IDFG locally. Lek within .3 mile.</p> <p>BMP for lek disturbance for all Management Areas in case of trigger trip and IDswMT Management Area re-delineation and since there are some KPLAs in the General Management Area. Working with proponent to reduce lek disturbance is realistic and may take on different forms, such as road access, placement of facilities, etc.. However, “exclusion” buffers are not realistic given the nature of the location of solid mineral deposits (i.e., cannot site elsewhere). For these, incorporation of appropriate mitigation, in addition to the lek BMP may need to be a primary focus.</p>
	Wind development (commercial)	RDF. Priority-No commercial wind development .	Wind: Labeau et al. (2014) stated that erecting wind turbines at least 5 km

Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary			
Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
		BMP: Important and General: Avoid wind development in nesting and/or winter habitat.	from nesting and brood rearing habitat should reduce negative impacts, at least in the short term. However putting a 5 km (3 mile) buffer around leks in Important habitat, would create a defacto closure for the most part, inconsistent with the intent of the Important designation. Hence BMP to avoid placement in nesting or winter habitat.
	Communication Towers	RDF: Priority -Do not allow communication tower construction within 3 miles (5 km) of a lek <sup>4</sup> unless needed to address public safety needs.  BMP- Important and General--Avoid communication tower construction within 3 miles (5 km) of a lek <sup>4</sup> unless needed to address public safety needs.	Johnson et al. (2011 pg. 427) noted "Analogously, across all management areas there was a steady downward pattern of trends of lek counts as the number of towers increased, either within 5 km (Fig. 21) or within 18 km (Fig. 22)."
	Transmission Lines	RDF: Priority, Important, General: Do not allow transmission line construction within 600 m of a lek.  BMP Priority, Important, General: Avoid transmission line construction within 2 miles (3.2 km) of a lek.	A 600 m GRSG avoidance zone reported per Gillan et al. (2013). No other spatial buffer supported by literature. While 600 m is a citable buffer, a 2 mile zone as BMP for Transmission is recommended as well. Based on Connelly et al. 2000 Guidelines to avoid tall structures in important seasonal habitats.
	Distribution Lines	BMP: Priority, Important and General-Avoid distribution line construction within 600 m of a lek or bury where possible	600 m, based on Gillan et al. BMP as this may not always be feasible.

Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary			
Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
Temporary functional loss of a lek <sup>4</sup> . SEASONAL RESTRICTION			
	BLM and Forest Service permitted anthropogenic activities that result in noise or visual disturbance that may lead to sustained avoidance of the lek during a particular lekking season.	RDF: Priority and Important- No repeated or sustained behavioral disturbance (e.g., visual, noise, etc.) to lekking birds from 6:00 pm to 9:00 am within 2 miles (3.2 km) of leks during the lekking season <sup>3</sup> .  BMP-General: Avoid repeated or sustained behavioral disturbance (e.g., visual, noise, etc.) to lekking birds from 6:00 pm to 9:00 am within 2 miles (3.2 km) of leks during the lekking season <sup>3</sup> .	Recent literature says 0.25 mile and 0.6 mile buffers are not sufficient (Harju et al. 2010). Hess (2011 MS Thesis) found statistical evidence that oil/well pad influence extended as far as 1.6 km (~ 1 mile) from grouse leks. IDswMT biology team recommended a more conservative approach to managing disturbance to minimize risk of disturbance.
	Sheep Bedding & Sheep Camps	BMP Priority, Important, General: Avoid bedding sheep and placing camps within 0.6 mi of a lek during the lekking season.	No literature. BMP based on biology team consensus.
	Organized Recreational Events	RDF Priority and Important-Do not schedule disruptive recreational events (e.g., motorized races) within 2.0 miles (3.2 km) of occupied leks during the lekking season.  BMP General- Do not schedule disruptive recreational events (e.g., motorized races) within 2.0 miles (3.2 km) of occupied leks during the lekking season.	Biology team consensus. No specific literature relative to buffers for recreational events but can manage this through avoiding the appropriate season. This threat (organized recreational events) is a short term, typically one-day event, with temporary disruption from noise the main issue.
Permanent functional or physical loss of nesting or winter habitat.			

Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary			
Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
	Anthropogenic development or activities that result in loss of habitat or constant or repeated noise levels or objects on the landscape that result in permanent avoidance of the habitat.	Ensure > 80% of the landscape is functionally and physically meeting GRSG habitat objectives appropriate to the seasonal habitat <sup>3</sup> .	Impacts resulting from loss of habitat vary depending on the extent of the habitat lost. Minimal loss of habitat (e.g. removal of small amounts of sagebrush cover) would not likely result in any measurable impacts to GRSG individuals or the associated populations.  More extensive loss of habitat may result in increased probability of population level impacts, and trigger trips, through the increased probability that leks will no longer persist.
	Roads	BMP: Priority, Important, General: Avoid construction of new paved or high volume traffic gravel roads within 0.8 mile (1.3 km) of nesting habitat.	See citations used for permanent loss of leks, above.
	Unleased Fluid Minerals	Stipulation: Priority, Important, General: Limit average well pad density to no more than 1/640 acres within nesting <sup>3</sup> and winter <sup>3</sup> habitat.	See citations used for permanent loss of leks, above.
	Commercial Solar	RDF: Priority-No commercial solar development.  RDF: Important: Do not allow facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek <sup>4</sup> .  BMP-Important: Avoid placing new	See citations used for permanent loss of leks, above.

Idaho and Southwest Montana GRSB Buffers and Seasonal Restrictions Summary			
Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
		facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek <sup>4</sup> .	
	Campgrounds	BMP-Priority, Important, General. Avoid development of new campgrounds or recreation facilities in nesting habitat.	See citations used for permanent loss of leks, above.
	OHV Play and Open areas	RDF-Priority and Important. No new Open or Play areas. BMP-General: Avoid new Open or Play areas	See citations used for permanent loss of leks, above.
	Wind Development (commercial)	RDF Priority - No commercial wind development .  BMP: Important: Avoid wind development in nesting habitat	See citations used for permanent loss of leks, above.
Temporary functional loss of winter habitat			
	Anthropogenic activities that result in noise or visual disturbance that may lead to avoidance of a particular wintering area during a particular wintering season.	RDF: Priority, Important- No repeated or sustained disturbance from construction activities in winter habitat during the wintering season.  BMP General: Avoid repeated or sustained disturbance from construction activities in winter habitat during the wintering season.	No known buffer. Biology team recommendation.

# Chapter 5

## Cumulative Impacts

- The cumulative impact analysis was moved from Chapter 4, Section 4.16 to Chapter 5. All subsequent chapters have been renumbered accordingly.
  - The GRSG cumulative impact analysis in the DEIS was supplemented and additional information was included regarding quantitative impacts on the WAFWA Management Zone level.
  - All sections were updated to include analysis of the Proposed Plan.
  - Table 5-1 was revised to reflect an updated list of past, present, and reasonably foreseeable future actions.
  - General corrections (e.g., typographical errors), clarifications, and acreage recalculations were included.

Administrative Draft  
Cooperating Agency Review

1           **Chapter 5.    Cumulative Impacts**

2           This section presents the likely cumulative impacts on the human and natural environment  
3           that could occur from implementing the alternatives presented in **Chapter 2**. This section is  
4           organized by topic, similar to **Chapter 3**.

5           A cumulative impact is the impact on the environment which results from the incremental  
6           impact of the action when added to other past, present, and reasonably foreseeable future  
7           actions regardless of what agency (federal or non-federal) or person undertakes such other  
8           actions. Cumulative impacts can result from individually minor but collectively significant  
9           actions taking place over a period of time. Cumulative impacts on the environment result  
10          from implementing any one of the Idaho and Southwestern Montana Greater Sage-Grouse  
11          LUPA/EIS alternatives, in combination with other federal, state, or private actions, either  
12          within or next to the planning area.

13          A cumulative impact analysis is required by CEQ regulations because environmental  
14          conditions result from many different factors that act together. The total effect of any single  
15          action cannot be determined by considering it in isolation; it must be determined by  
16          considering the likely result of that action in conjunction with many others. Evaluation of  
17          potential impacts considers incremental impacts that could occur from the proposed project,  
18          as well as impacts from past, present, and reasonably foreseeable future actions.  
19          Management actions could be influenced by activities and conditions on adjacent public and  
20          private lands beyond the planning area boundary; therefore, assessment data and information  
21          could span multiple scales, landownerships, and jurisdictions. These assessments involve  
22          determinations that often are complex and, to some degree, subjective.

23          **5.1    Greater Sage-Grouse Cumulative Effects Analysis: Idaho and Southwestern**  
24          **Montana**

25          This cumulative effects analysis (CEA) discloses the long-term effects on Greater Sage-  
26          Grouse (GRSG) from implementing each LUPA/EIS alternative, in conjunction with other  
27          past, present, and reasonably foreseeable future actions. In accordance with Council on  
28          Environmental Quality guidance, cumulative effects need to be analyzed in terms of the  
29          specific resource and ecosystem being affected (Council on Environmental Quality 1997). As  
30          discussed in **Chapter 1**, the purpose for the proposed federal action is to identify and  
31          incorporate appropriate conservation measures to conserve, enhance, and restore GRSG  
32          habitat by reducing, eliminating, or minimizing threats to GRSG habitat. The Western  
33          Association of Fish and Wildlife Agencies (WAFWA) delineated seven sage-grouse  
34          management zones based on populations within floristic provinces (Stiver et al. 2006).  
35          Therefore, the cumulative effects analysis study area for GRSG extends beyond the Idaho  
36          and Southwestern Montana Sub-region boundary and incorporates Western Association of  
37          Fish and Wildlife Agencies (WAFWA) Management Zones (MZs) IV, and II/VII.

38          MZ II and VII are combined for the purpose of characterizing GRSG habitat conditions  
39          and impacts, as was done in the Summary of Science, Activities, Programs, and Policies That  
40          Influence the Range-Wide Conservation of Greater Sage-Grouse (Manier et al. 2013).

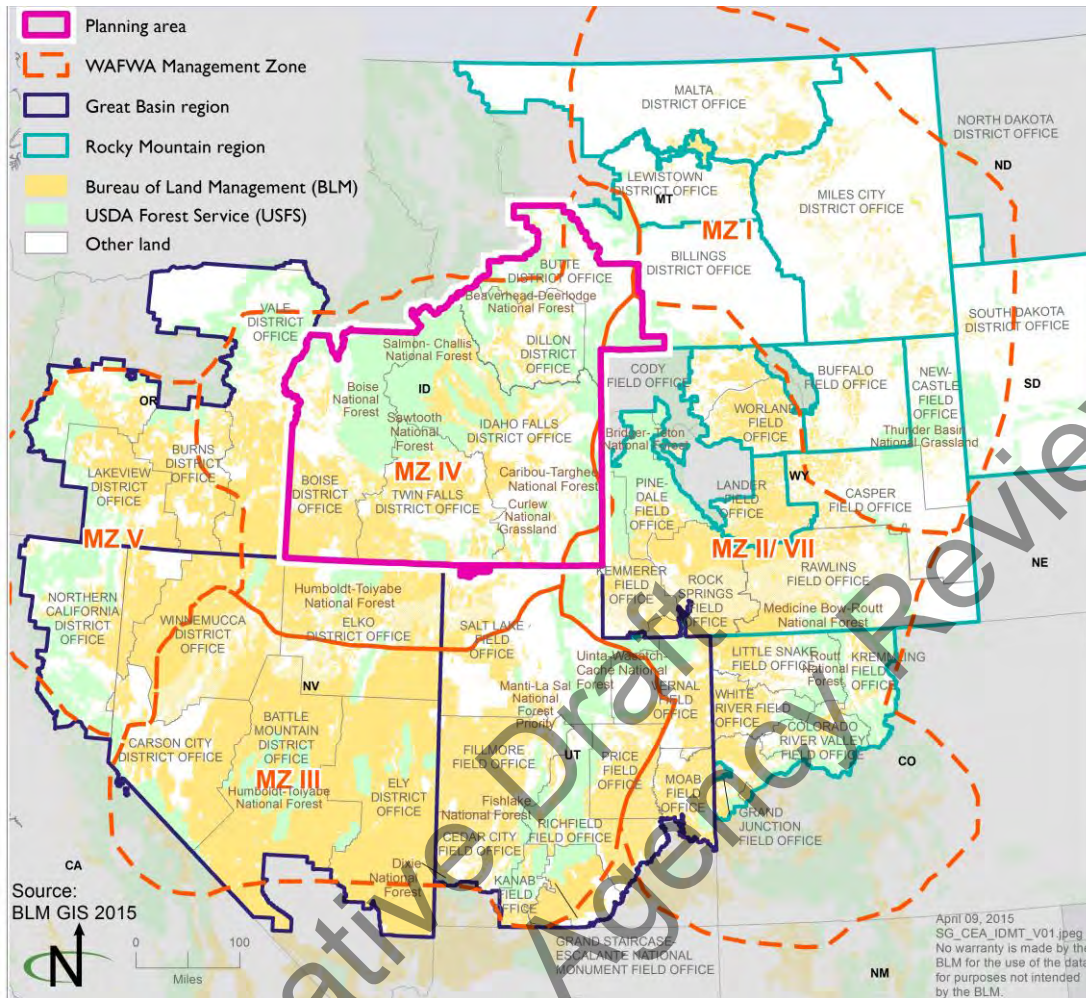

1 However, the Idaho and southwestern Montana sub-region contains a portion of MZ II and  
2 does not overlap with MZ VII. The analysis of BLM and Forest Service actions in MZs IV  
3 and II/VII is primarily based on MZ-wide datasets developed by the BLM National  
4 Operations Center (NOC).

5 As indicated in the DEIS, the CEA for the FEIS includes quantitative analysis where  
6 possible. Where quantitative data are not available, analysis is qualitative. This analysis  
7 includes past, present and reasonably foreseeable future actions for all land ownerships in  
8 the MZs, and evaluates the impacts of the Idaho and Southwestern Montana LUPA, by  
9 alternative, when added to those.

10 The analysis of nonfederal actions is more qualitative and includes a review and analysis of  
11 the following:

- 12 • State plans
- 13 • Coordination with states and agencies during consistency reviews
- 14 • Additional data from non-BLM-administered lands.

15 The following diagram shows the boundaries of the WAFWA Management Zones and the  
16 BLM and Forest Service planning areas. The Idaho and southwestern Montana sub-region  
17 contains a large proportion of MZ IV, with 11,827,900 acres of PHMA out of 22,105,600  
18 total acres in MZ IV (54 percent); and 5,635,700 acres of GHMA out of 10,128,500 total  
19 acres in MZ IV (56 percent). In contrast, the Idaho and southwestern Montana sub-region  
20 has a relatively small influence in the context of MZ II/VII, because it contains relatively  
21 few priority habitat management areas (PHMA) or general habitat management areas  
22 (GHMA): 147,100 acres of PHMA out of 14,105,000 total acres in MZs II/VII (1 percent);  
23 and 23,600 acres of GHMA out of 17,771,500 total acres in MZs II/VII (less than 1  
24 percent). As a result, actions in the Idaho and southwestern Montana LUPA/EIS may have  
25 less impact on GRSG than those in larger planning areas in MZs II/VII.

**Section 5.1.1**, Methods, provides a description of the methodology used for this cumulative effects analysis. **Section 5.1.2** lists assumptions used in the analysis. **Section 5.1.3** describes existing conditions in WAFWA MZ IV and in the Idaho and southwestern Montana sub-region. **Section 5.1.4**, provides a broad-scale description regional efforts to manage GRSG in MZ IV. **Section 5.1.5** discusses the relevant cumulative actions in MZ IV that will be analyzed in this CEA. **Section 5.1.6** analyzes threats to GRSG in MZ IV and discusses the potential cumulative effects resulting from each threat for each alternative. Section 5.1.7 describes existing conditions in WAFWA MZs II/VII. **Section 5.1.8** provides a broad-scale description regional efforts to manage GRSG in MZs II/VII. **Section 5.1.9** discusses the relevant cumulative actions in MZs II/VII that will be analyzed in this CEA. **Section 5.1.10** analyzes threats to GRSG in MZs II/VII and discusses the potential cumulative effects resulting from each threat for each alternative. **Section 5.1.11**, Conclusions, determines the cumulative effects on GRSG as a result of implementing each alternative in combination with other private, local, regional, state, and federal past, present, and reasonably foreseeable future actions in MZs IV and II/VII.

1           **5.1.1 Methods**

2           The CEA uses the following methods:

- 3           • Data from the USGS publication Summary of Science, Activities, Programs, and  
4           Policies That Influence the Range-Wide Conservation of Greater Sage-Grouse  
5           (Manier et al. 2013) establishes the reference condition against which the  
6           alternatives and other past, present, and reasonably foreseeable future actions are  
7           compared. Data from this publication are presented in terms of priority habitat  
8           and general habitat. Where Manier et al. (2013) data are used in this CEA,  
9           “priority habitat” refers to PPH and “general habitat” refers to PGH".
- 10          • The USFWS’s 12-Month Findings for Petitions to List the Greater Sage-Grouse  
11          (Centrocercus urophasianus) as Threatened or Endangered” (USFWS 2010) and  
12          the USFWS publication Conservation Objectives: Final Report (i.e., the COT  
13          report; USFWS 2013) were reviewed to identify the primary threats facing GRSG  
14          in each WAFWA MZ. Table 2 of the COT report lists threats to GRSG that are  
15          present and widespread in each population in the MZ.
- 16          • For MZ IV the list of present and widespread threats that are directly or  
17          indirectly affected by BLM and Forest Service actions are fire, spread of weeds,  
18          conifers, infrastructure, grazing/free-roaming equids, conversion to agriculture,  
19          energy development/mining, and recreation (USFWS 2013, pp. 22-24). For MZ  
20          II/VII, these threats include: energy development/mining, infrastructure,  
21          grazing, conversion to agriculture, fire, spread of weeds, recreation, and conifers  
22          (USFWS 2013, pp. 17-19, 27-28). Two other threats listed in the COT report,  
23          sagebrush eradication and isolation/small population size, affect GRSG  
24          populations in MZs IV and II/VII. While they are not addressed separately in  
25          this analysis, they are discussed as elements of other threats.
- 26          • Predation was not included as a threat in the final COT report and was not  
27          identified by USFWS as a significant threat to GRSG populations (USFWS  
28          2010). Predation is a natural occurrence that may be enhanced by human habitat  
29          modifications such as construction of infrastructure that may increase  
30          opportunities for nesting and perching or increase exposure of GRSG nests. In  
31          such altered habitats, predators may exert an undue influence on GRSG  
32          populations. Predation is discussed in this CEA in the context of these other  
33          threats.
- 34          • Sagebrush eradication and isolation/small population size are discussed as a  
35          component of other threats and in the conclusions. This is because sagebrush  
36          eradication is a component of many threats and is not addressed by any one  
37          management program. Isolation/small population size is not analyzed separately  
38          because no management actions directly address this threat. Not all the threats  
39          discussed in this section represent major threats to GRSG in each planning area  
40          in the MZs, but each poses a present and widespread threat to at least one  
41          population.

- 1 • Each threat is analyzed (quantitatively when possible), and a brief conclusion for  
2 each threat is provided.
  - 3 ○ The BLM NOC compiled MZ-wide datasets for quantifiable actions in all  
4 LUPA/EISs in MZs IV and II/VII. These datasets provide a means by  
5 which to quantify cumulative impacts from direct impacts of the threats  
6 identified in the COT report.
  - 7 ○ Data and information were gathered from other federal, state, and local  
8 agencies and tribal governments, where available, and were used to inform  
9 the analysis of cumulative impacts on GRSG from each of the threats in  
10 MZs IV and II/VII. Because of the lack of consistent non-BLM and non-  
11 Forest Service data across the MZ, this portion of the analysis is qualitative.
- 12 • A conclusion is provided for each alternative in **Section 5.1.11**. Each alternative  
13 considers the cumulative impacts on GRSG from each of the threats. It also  
14 considers whether those threats can be ameliorated by implementing that  
15 particular alternative in conjunction with non-BLM and non-Forest Service  
16 actions in MZs IV and II/VII.
- 17 • The list of relevant cumulative actions in **Sections 5.1.5** and **5.1.9** was derived  
18 from each LUPA in MZs IV and II/VII to provide an overview of the ongoing  
19 and proposed land uses there.
- 20 • Baseline data that are consistent across planning areas and that analyze  
21 cumulative effects for each alternative, including the no action alternative and  
22 Proposed Plan, are used in this analysis.
- 23 • The Idaho and southwestern Montana sub-region is located within two MZs. In  
24 this instance, the CEA analyzes threats and impacts for each MZ separately.
- 25 • Although Alternative A does not designate PHMA or GHMA, spatial GIS data  
26 was clipped to these boundaries to allow for a consistent comparison across all  
27 alternatives.
- 28 • This analysis uses the most recent information available. It assumes that the  
29 Proposed Plan will be implemented in the other BLM and Forest Service sub-  
30 regions in MZs IV and II/VII.

### 31 **5.1.2 Assumptions**

32 This cumulative analysis uses the same assumptions and indicators as those established for  
33 the analysis of direct and indirect effects on GRSG in **Section 4.4.9**. In addition, the  
34 following assumptions have been made:

- 35 • The timeframe for this analysis is 20 years.
- 36 • The CEA area extends beyond the sub-region boundary and encompasses all of  
37 WAFWA MZ IV and II/VII; the quantitative impact analysis focuses on impacts  
38 across the MZs. The MZ is the appropriate geographic scope for this analysis

1 because it encompasses areas with similar floristic conditions containing  
2 important GRSG habitat.

- 3 • The magnitude of each threat would vary geographically and may have more or  
4 less impact on GRSG in some parts of the MZs, depending on such factors as  
5 climate, land use patterns, and topography.
- 6 • A management action or alternative would contribute a net conservation gain to  
7 GRSG if there is an actual benefit or gain above baseline conditions. Baseline  
8 conditions are defined as the pre-existing condition of a defined area and/or  
9 resource that can be quantified by an appropriate metric(s). During  
10 environmental reviews, the baseline is considered the affected environment that  
11 exists at the time of the review's initiation, and is used to compare predictions of  
12 the effects of the proposed action or a reasonable range of alternatives.
- 13 • The CEA quantitatively analyzes GRSG habitat. Impacts on habitat are likely to  
14 correspond to impacts on populations within the MZs, since reductions or  
15 alterations in habitat could affect reproductive success through reductions in  
16 available forage or nest sites. Human activity could cause disturbance to the  
17 birds, preventing them from mating or successfully rearing offspring. Human  
18 activities also could increase opportunities for predation, disease, or other  
19 stressors (Connelly et al. 2004; USFWS 2010; Manier et al. 2013).
- 20 • The governor of Idaho is expected to issue an executive order providing  
21 direction for GRSG conservation in Idaho on state lands. This executive order is  
22 expected to be largely consistent with BLM and Forest Service direction, though  
23 exact details are not known at the time this FEIS is published.
- 24 • Acres presented for GHMA also include acres within Idaho Important Habitat  
25 Management Areas (IHMA).

### 26 **5.1.3 Existing Conditions in WAFWA MZ IV and the Idaho and Southwestern** 27 **Montana Sub-region**

28 This section summarizes existing conditions and past and present actions for the Idaho and  
29 southwestern Montana sub-region (provided in more detail in **Chapter 3**) and for MZ IV as  
30 a whole. Reasonably foreseeable future actions are discussed in **Section 5.1.5**.

#### 31 ***GRSG Habitats and Populations***

32 MZ IV consists of nine GRSG populations: Baker, East-Central, Southwest Montana,  
33 Snake-Salmon-Beaverhead, Belt Mountains, Weiser, Northern Great Basin, Box Elder, and  
34 Sawtooth (Garton et al. 2011). The sub-region includes seven of these populations: East-  
35 Central, Southwest Montana, Snake-Salmon-Beaverhead, Weiser, Northern Great Basin, Box  
36 Elder, and Sawtooth. This MZ represents one of the largest areas of connected GRSG  
37 habitat, as demonstrated by Knick et al. (2011), and supports the largest population of  
38 GRSG outside of the Wyoming Basin (Garton et al. 2011). MZ IV includes GRSG  
39 populations in Oregon, Idaho, Nevada, Utah and Montana.

In MZ IV, BLM-administered and other federal lands account for approximately 22,522,300 million acres of GRSG habitat (approximately 68 percent of habitat), with state and private lands accounting for over 10 million acres of GRSG habitat (approximately 31 percent of habitat) (Manier et al. 2013, p. 118). The BLM also has some management authority over split estate lands, with privately held surface and federal subsurface mineral rights. Approximately 21 percent of PHMA and 44 percent of GHMA within MZ IV are located on BLM-administered and National Forest System lands in the Idaho and southwest Montana sub-region.

**Table 5-1** provides a breakdown of landownership and acres of GRSG habitat in MZ IV. As the table shows, approximately 52 percent of priority habitat and 19 percent of general habitat is on BLM-administered lands. Approximately 7 percent of priority habitat and 5 percent of general habitat is on National Forest System lands.

**Table 5-1**  
**Management Jurisdiction in MZ IV by Acres of Priority and General Habitats**

	Total Surface Area (Acres)	Priority (Acres)	General (Acres)	Non-habitat (Acres)
<b>MZ IV</b>	78,259,200 (100%)	21,930,600 (28%)	10,958,500 (14%)	45,370,100 (58%)
BLM	26,220,300 (34%)	13,710,700 (52%)	4,928,200 (19%)	7,581,400 (29%)
Forest Service	22,291,600 (28%)	1,613,800 (7%)	1,113,500 (5%)	9,564,300 (43%)
Tribal and other federal	2,431,000 (3%)	633,600 (26%)	522,500 (21%)	1,274,900 (52%)
Private	23,150,400 (30%)	4,890,200 (21%)	3,516,700 (15%)	14,743,500 (64%)
State	3,681,000 (5%)	1,019,400 (28%)	846,200 (23%)	1,815,400 (49%)
Other	484,800 (<1%)	62,900 (13%)	31,400 (6%)	390,500 (81%)

Source: Manier et al. 2013, p. 118

***Sub-region Habitat Conditions***

Sub-regional habitat conditions and trends are presented by population area in **Table 3-4** in this EIS.

***Idaho and Southwestern Montana LUPA/EIS Alternatives***

The Idaho and Southwestern Montana LUPA and EIS evaluates the following seven alternatives:

- Alternative A, current management (the no action alternative)

- 1 • Alternative B, which was developed using GRSG conservation measures in A  
2 Report on National Greater Sage-Grouse Conservation Measures (Sage-Grouse  
3 National Technical Team 2011)
- 4 • Alternative C, which was developed based on recommendations from individuals  
5 and conservation groups for protecting and conserving GRSG and habitat  
6 rangewide
- 7 • Alternative D, which incorporates conservation measures to conserve, enhance,  
8 and restore GRSG habitat on BLM-administered and National Forest System  
9 lands, while balancing resources and resource use among competing human  
10 interests, land uses, and the conservation of natural and cultural resource values,  
11 and sustaining and enhancing ecological integrity across the landscape, including  
12 plant, wildlife, and fish habitat.
- 13 • Alternative E, which was developed from recommendations by the State of  
14 Idaho's GRSG Task Force
- 15 • Alternative F, which was derived from individual and conservation group  
16 comments. This alternative contains a mixture of management actions from A  
17 Report on National Greater Sage-Grouse Conservation Measures as well as  
18 additional restrictions on resource uses and increased resource protection; and
- 19 • Proposed Plan, which was developed through a coordinated partnership of BLM,  
20 Forest Service, the States of Idaho and Montana and the USFWS and is  
21 consistent with the objectives described in the COT report

22 MZ IV contains 4,198,900 acres of the Southern Idaho/Northern Nevada Sagebrush Focal  
23 Area (SFAs), and MZs II/VII contain 563,300 acres of the Bear River Watershed Area SFA.  
24 SFAs are a subset of PHMA and represent recognized "strongholds" for the species that  
25 have been noted and referenced by the conservation community as having the highest  
26 densities of the species and other criteria important for the persistence of the species. Those  
27 portions of SFAs on BLM-administered and National Forest System lands would be  
28 petitioned for withdrawal from mineral entry; subject to an NSO stipulation with no  
29 exceptions, modifications, or waivers (MZ IV only); and would be prioritized for  
30 management and conservation actions, including but not limited to, review of livestock  
31 grazing permits/leases. Management of SFAs would enhance protection of GRSG in these  
32 areas, providing a net conservation gain to the species in light of other past, present, and  
33 reasonably foreseeable future actions considered in this CEA.

#### 34 ***Population Trends in Management Zone IV***

35 Historic conversion of habitat to agriculture as well as fire, urbanization, and spread of  
36 weeds have resulted in a residual sagebrush landscape that is less productive and more  
37 fragmented than those prior to European colonization. As a result, more GRSG populations  
38 in the region are relatively small and/or separated from adjacent populations. Notable  
39 exceptions are the Snake-Salmon-Beaverhead and Northern Great Basin populations  
40 (Manier et al. 2013, p. 132). Garton et al. (2011) predicted a 10.5 percent chance this MZ will

1 fall below 200 males by 2037, and a 39.7 percent chance it would fall below 200 males by  
2 2107 (USFWS 2013, p. 75).

3 While population estimates and trends for the sub-region are not available, GRSG  
4 populations are described in **Section 3.2** of the EIS. The Snake-Salmon-Beaverhead and  
5 Northern Great Basin populations encompass the largest number of occupied leks in the  
6 sub-region. The Northern Great Basin population is especially important to long-term  
7 conservation of GRSG in MZ IV. This is because it comprises a substantial portion of the  
8 Great Basin core population (Connelly et al. 2004); shared with Nevada, Utah, and Oregon,  
9 this is one of the two remaining major population strongholds in the range of the species.  
10 Between 2007 and 2013, this population showed a 34 percent decline in the estimated  
11 minimum male population attending leks in the population (Garton et al. 2015, p. 35). The  
12 Snake-Salmon-Beaverhead population provides additional and substantial population  
13 contributions within Idaho. It also provides known connectivity with the Southwest  
14 Montana population area.

15 In Montana, the GRSG population changes cyclically. The GRSG population declined  
16 sharply from 1991 to 1996, before increasing through 2000 (Montana Sage Grouse Work  
17 Group 2005). The population is thought to be down 33 percent from historic levels.  
18 Between 2004 and 2013, the average number of displaying males per lek in a given year in  
19 Montana ranged from 7 to 19 (Greater Sage-Grouse Habitat Conservation Strategy 2014).

#### 20 **5.1.4 Regional Efforts to Manage Threats to GRSG in MZ IV**

21 There are several regional efforts to manage threats to GRSG in MZ IV. Because state and  
22 private lands account for approximately 10 million acres (approximately 31 percent) of  
23 GRSG habitat in MZ IV (Manier et al. 2013, p. 118) these efforts play an important role in  
24 alleviating threats to GRSG.

##### 25 ***Idaho Statewide Efforts***

26 Similar to efforts in nearby states, the governor of Idaho is expected to issue an executive  
27 order providing direction for GRSG conservation in Idaho on state lands. This executive  
28 order is expected to be largely consistent with BLM and Forest Service direction, though  
29 exact details are not known at the time this FEIS is published.

30 Idaho Department of Lands prepared the Proposed Greater Sage-Grouse Conservation Plan  
31 (IDL 2015). Released in February 2015, and complementing Idaho Governor Otter's  
32 proposed plan (Alternative E of the Draft Idaho and Southwest Montana LUPA/EIS), the  
33 draft plan focuses on three primary threats to GRSG in Idaho: wildfire, infrastructure, and  
34 invasive species. The plan outlines enforceable stipulations in leases, permits, and easements  
35 on IDL lands. Conservation measures in the plan will be used as BMPs for activities  
36 supporting fire prevention, suppression, and rehabilitation, regulating oil and gas  
37 development, some mining activities, and abandoned mine reclamation. While the plan is  
38 comprised of voluntary management guidelines, the guidelines may be utilized by state  
39 regulatory agencies for projects requiring agency review or approval.

1 The Idaho Sage-grouse Advisory Committee prepared their Conservation Plan for the  
2 Greater Sage-grouse in Idaho (Idaho Sage-grouse Advisory Committee 2006) to provide  
3 guidance, tools, and resources to GRSG Local Working Groups, and to facilitate and  
4 provide statewide consistency between Local Working Group plans. The plan identifies 19  
5 threats to GRSG and GRSG habitat and presents conservation measures to address each of  
6 those threats. Rural Fire Protection Districts have been established within the state to help  
7 suppress fires in GRSG habitat.

### 8 ***Utah State Efforts***

9 On February 25, 2015, Utah Governor Gary Herbert signed Utah Executive Order  
10 EO/2015/002. The EO directs state agencies whose actions may affect GRSG to  
11 implement Utah Division of Wildlife Resources' Conservation Plan for Greater Sage Grouse  
12 in Utah (Utah Greater Sage-Grouse Working Group 2013). The conservation plan identifies  
13 11 population areas in Utah that are the focus of GRSG conservation efforts, and helps  
14 coordinate the efforts of ten local working groups in the state and UDWR. The goal of the  
15 state plan is to protect, maintain, improve and enhance GRSG populations and habitats on  
16 public and private lands within the established management areas. It includes conservation  
17 strategies and measurable objectives regarding populations and habitat, and through the EO,  
18 provides a regulatory mechanism to preserve GRSG through specific restrictions on public  
19 or private land use.

### 20 ***Montana Statewide Efforts***

21 The Montana Department of Fish, Wildlife and Parks (MFWP) is tasked with implementing  
22 the range-wide WAFWA Sage-Grouse Strategy (Stiver et al. 2006) in Montana. The  
23 WAFWA Sage-Grouse Strategy monitors, researches, provides outreach, and funds  
24 conservation projects for GRSG. A basic premise of the WAFWA Sage-Grouse Strategy is  
25 that additional conservation capacity must be developed at all local, state, federal, and range-  
26 wide levels for both the short term (3 to 5 years) and for the long term (10 years or more) to  
27 ensure GRSG conservation.

28 In addition, the MFWP's Montana Management Plan and Conservation Strategy for Sage-  
29 Grouse was initiated in 2005 to protect, maintain, and restore GRSG habitat. The plan ranks  
30 threats to the species across the state and provides an overall strategy for public and private  
31 cooperation in conservation actions. In 2013, the governor established the Greater Sage-  
32 Grouse Habitat Conservation Advisory Council to provide recommendations on policies  
33 and actions for GRSG conservation. The council provided these recommendations in  
34 January 2014. The governor subsequently issued an executive order on September 9, 2014  
35 (State of Montana 2014), based on the council recommendations that provided the direction  
36 for GRSG conservation in Montana.

37 Montana Executive Order. The Montana governor issued an executive order on September  
38 9, 2014 (State of Montana 2014), based on the council recommendations that provided the  
39 direction for GRSG conservation in Montana. Stipulations for development in the executive  
40 order and Montana Management Plan and Conservation Strategy for Sage-Grouse include  
41 but are not limited to:

- 1 • A 0.6-mile NSO buffer around the perimeter of active leks for new activities
- 2 • Locating new overhead power lines and communication towers a minimum of
- 3 0.6-mile from the perimeter of active leks
- 4 • A minimum 2.0-mile buffer from active lek perimeters for main roads and a
- 5 minimum 0.6-mile buffer for facility site access roads
- 6 • A 5 percent limit on anthropogenic surface disturbance within the Density and
- 7 Disturbance Calculation Tool examination area (based upon suitable habitat)
- 8 • As authorized by permitting agency or agencies, activities (production,
- 9 maintenance and emergency activity exempted), will typically be prohibited from
- 10 March 15 through July 15 outside of the NSO perimeter of an active lek and
- 11 within 2 miles of that perimeter in Core Population Areas where breeding,
- 12 nesting, and early brood-rearing habitat is present

13 The approach of the Montana executive order/Montana Management Plan and  
14 Conservation Strategy for GRSG is similar to the Wyoming executive order. Montana's plan  
15 will apply a disturbance cap in core habitat and will limit well density and apply timing  
16 limitations. The 0.6-mile buffer would protect males in the vicinity of leks during the  
17 breeding season; the density limits and disturbance cap would protect GRSG during nesting,  
18 brood-rearing, and winter concentration activities. The timing restrictions would reduce the  
19 potential for displacement or disruption during the breeding season.

### 20 ***Oregon Statewide Efforts***

21 The Oregon Department of Fish and Wildlife (ODFW) has developed a strategy to promote  
22 conservation of GRSG and intact, functioning, GRSG habitats in Oregon. The Greater  
23 Sage-Grouse Conservation Assessment and Strategy for Oregon: A Plan to Maintain and  
24 Enhance Populations and Habitat (Oregon State Plan, Hagen 2011) describes the ODFW's  
25 proposed management of GRSG. It also provides guidance to public land management  
26 agencies and land managers for GRSG conservation. GRSG conservation guidelines in the  
27 State Plan are designed to maintain (at a minimum) or enhance the quality (the optimum) of  
28 current habitats. They will also assist resource managers in achieving the population and  
29 habitat objectives of the State Plan.

30 The Oregon State Plan provides biological recommendations for long-term conservation of  
31 GRSG in Oregon based on the best available science; however implementing  
32 recommendations is the responsibility of the respective land manager. Thus, the intent of the  
33 Oregon State Plan is plan is to inform decision-maker regarding the biological consequences  
34 of various actions on GRSG, but not to dictate land management decisions. Similarly, GRSG  
35 conservation proposed in the plan is voluntary on private lands (Hagen 2011, p. viii).

36 The Oregon State Plan establishes "Core Areas" to help delineate landscape planning units  
37 by distinguishing areas of high biological value to GRSG. These areas are based on the  
38 locations of breeding areas, wintering areas, and connectivity corridors and are intended to  
39 help balance GRSG habitat requirements with development outside of Core Areas, which  
40 would be subject to stipulations and regulations (Hagen 2011, p. 80). ODFW developed

1 Core Areas necessary to conserve 90 percent of Oregon's GRSG population with emphasis  
2 on highest density and important use areas which provide for breeding, wintering and  
3 connectivity corridors. BLM used the same boundaries of ODFW Core Areas to delineate  
4 PHMA.

5 While the plan is comprised of voluntary management guidelines, the guidelines may be  
6 utilized by state regulatory agencies including the Energy Facility Siting Council as conditions  
7 of approval on a case-by-case basis for certain energy projects. For example, the council has  
8 jurisdiction on wind energy projects greater than 105 MW (Dave Budeau, phone  
9 conversation with author, March 26, 2015).

10 Further, The Oregon Governor's natural resources department is currently in the process of  
11 developing regulations for GRSG conservation. The forthcoming Sage Grouse Conservation  
12 Action Plan will supplement the state plan and provide land use regulations and mitigations  
13 for Oregon core habitat areas (Dave Budeau, phone conversation with author, March 26,  
14 2015).

15 Oregon Candidate Conservation Agreements (CCA) and Candidate Conservation  
16 Agreements with Assurances (CCAA). CCAs are voluntary agreements between the USFWS  
17 and one or more parties (including federal agencies) to address the conservation needs of  
18 on-listed species at risk of being listed under the ESA. CCAAs are similar, though these  
19 voluntary agreements are made between the USFWS and non-federal landowners. One CCA  
20 and several CCAAs are currently in place or will soon be implemented that will cover the  
21 entire GRSG range in the state of Oregon. Under these agreements and the associated  
22 Enhancement of Survival permit issued under the ESA, landowners would voluntarily  
23 undertake management activities on their properties to enhance, restore, or maintain habitat  
24 benefiting GRSG, in exchange for assurances that they would not be subject to increased  
25 land use restrictions should GRSG become listed under the ESA in the future. The  
26 agreements have a term of 30 years, and can be renewed upon expiration. As of April 2015,  
27 over 2.7 million acres of GRSG habitat in Oregon are either enrolled or pending enrollment  
28 under such agreements; the amount of GRSG habitat enrolled is expected to rise as the  
29 GRSG listing decision nears. (Jeff Everett, Email to author, April 16, 2015).

30 GRSG Programmatic Candidate Conservation Agreement for Rangeland Management  
31 Practices on BLM Lands in Oregon. In cooperation with the BLM and USFWS, the Oregon  
32 Cattlemen's Association developed a Programmatic Candidate Conservation Agreement  
33 (Programmatic CCA) to reduce or eliminate negative impacts of rangeland management  
34 practices to GRSG and to maintain and support livestock grazing practices that are  
35 beneficial or neutral to GRSG on enrolled allotments administered by the BLM in Oregon.  
36 The Programmatic CCA covers approximately 10.2 million acres of GRSG habitat on BLM  
37 grazing allotments in southeast Oregon; however, not all these lands may eventually be  
38 enrolled in the programmatic CCA (USFWS 2013b). As of April 2015, BLM has received 65  
39 written requests for enrollment covering 121 allotments on more than 1.9 million acres (Jeff  
40 Everett, Email to author, April 16, 2015).

1 Harney County Programmatic CCAA. After implementation of the Programmatic CCA  
2 described above, Oregon's Harney County Soil and Water Conservation District developed a  
3 programmatic CCAA for private lands in the county (USFWS 2013c). The covered area  
4 encompasses all GRSG habitat on non-federal lands in Harney County, Oregon and on  
5 some lands immediately adjacent to but outside of Harney County, including 346,965 acres  
6 of PPH and 825,395 acres of PGH. BLM-administered grazing allotments within Harney  
7 County are still eligible for inclusion under the Programmatic CCA. Because many grazers in  
8 Oregon utilize both private lands and BLM-administered allotments, the CCAA was  
9 structured after the Programmatic CCA in part to facilitate implementation of the  
10 agreements and encourage enrollment by such grazers (Jeff Everett, phone conversation  
11 with author, April 16, 2015). As of April 2015, 54 landowners have entered lands into the  
12 CCAA totaling approximately 320,000 acres of GRSG habitat (Jeff Everett, Email to author,  
13 April 16, 2015).

14 Oregon Multi-County Soil and Water Conservation District CCAA. Following development  
15 of the Harney County Programmatic CCAA, USFWS and the Soil and Water Conservation  
16 Districts from Baker, Crook, Deschutes, Grant, Lake, Malheur, and southern Union counties  
17 developed a CCAA for over 2.3 million acres of private rangelands within these counties,  
18 which represents the range of GRSG in Oregon. Again, BLM-administered grazing  
19 allotments within the counties are still eligible for inclusion under the Programmatic CCA,  
20 and again, the CCAA was structured after the Harney County CCAA in part to facilitate  
21 implementation of the agreements and encourage enrollment by grazers who utilize both  
22 private and BLM-administered allotments. As of April 2015, 55 landowners have entered  
23 lands into the CCAA totaling approximately 466,050 acres of GRSG habitat (Jeff Everett,  
24 Email to author, April 16, 2015).

25 The Oregon Department of State Lands (DSL) CCAA. DSL is working with the USFWS to  
26 develop a CCAA for State Common School Fund Rangelands in Oregon. These lands  
27 represent the final "gaps" in land ownership throughout GRSG range in Oregon not already  
28 covered by the CCA/CCAAs described above. The CCAA covers over 633,000 acres of  
29 DSL lands, including approximately 380,700 acres of low-density habitat, and 153,100 acres  
30 of core area habitat (80 FR 9475). The required Environmental Assessment under NEPA is  
31 currently available for public comment and will be finalized in May 2015 (Jeff Everett, phone  
32 conversation with author, April 16, 2015).

### 33 ***Nevada/California State Efforts***

34 Nevada State Plan. The state of Nevada submitted a state alternative for inclusion in the  
35 Nevada and Northeast California Sub-Regional Greater Sage-Grouse Draft Land Use Plan  
36 Amendment and Environmental Impact Statement (EIS). The Nevada Greater Sage-Grouse  
37 Conservation Plan (Sagebrush Ecosystem Technical Team 2014) includes regulatory  
38 mechanisms to avoid, minimize (with the use of design features) and/or mitigate impacts  
39 through the Conservation Credit System (described in additional detail below) to protect and  
40 restore GRSG habitat. The plan defines Sage Grouse Management Areas (SGMA), and aims  
41 to reach a conservation goal of a Net Conservation Gain of GRSG habitat due to new

1 anthropogenic disturbances. The state plan identifies GRSG core, priority, and general  
2 habitat within the SGMA.

3 Under the plan, project proponents must seek to avoid GRSG habitat disturbance. If a  
4 project proponent wishes to demonstrate that avoidance cannot be reasonably  
5 accomplished, exemptions will be granted to this restriction as part of the SETT  
6 Consultation. The project proponent must demonstrate that specific criteria are met; criteria  
7 are summarized in Table 3-1 of the plan. Criteria are more stringent in Core Management  
8 Areas, and become less so as habitat quality decreases. If a project cannot avoid adverse  
9 effects (direct or indirect) to GRSG habitat, the project proponent will be required to  
10 implement design features that minimize the project's adverse effects to GRSG habitat to  
11 the extent practicable. Mitigation will be required for all anthropogenic disturbances to  
12 GRSG habitat, including those that have minimized disturbances through the process above.  
13 Mitigation requirements will be determined by the Conservation Credit System, a market-  
14 based mechanism that quantifies conservation outcomes (credits) and impacts from new  
15 anthropogenic disturbances (debits), defines standards for market transactions, and tracks  
16 conservation action implementation progress in the state.

17 GRSG habitat is determined based on the Nevada Habitat Suitability Map (described below)  
18 for GRSG habitat prepared by the state and USGS. The habitat map incorporates GRSG  
19 telemetry data along with environmental data at multiple scales, such as land cover,  
20 vegetation communities, physiographic indices and anthropogenic attributes. The habitat  
21 suitability model will be used to inform management decisions on protecting the most  
22 critical habitat and to provide strategic decision tools to identify where conservation  
23 activities will have the greatest beneficial impact on the habitat.

24 The Nevada state plan only applies to the state; it does not apply to portions of the Nevada  
25 and Northeastern California Sub-region within California.

26 Nevada State Regulations/Programs. Nevada has several state regulations and programs  
27 pertaining to GRSG. Assembly Bill 461 formally created and gave regulatory authorization  
28 for the Sagebrush Ecosystem Program. Governor Sandoval signed the bill into law in July,  
29 2013. Nevada also has a pesticide registration fee; portions of the revenue from the fee will  
30 provide funding to the state noxious weed program and GRSG habitat conservation (WGA  
31 2014). The state also has a Nevada Cheatgrass Action Team (WGA 2014), a voluntary multi-  
32 disciplinary group of individuals to assist the SETT with planning and managing projects to  
33 address cheatgrass and other invasive or noxious weeds that impact GRSG habitat.

#### 34 ***Natural Resource Conservation Service Sage Grouse Initiative***

35 The Natural Resource Conservation Service's (NRCS) Sage Grouse Initiative (SGI) is  
36 working with private landowners in 11 western states to improve habitat for GRSG (Manier  
37 et al. 2013, p. 117). With approximately 31 percent of all sagebrush habitats across the range  
38 in private ownership (Stiver 2011, p. 39), and over 25 percent in MZ IV and nearly 38  
39 percent in MZ II/VII (Manier et al. 2013, p. 118), a unique opportunity exists for the NRCS  
40 to benefit GRSG and ensure the persistence of large and intact rangelands by implementing  
41 the SGI (USFWS 2010, p.5).

1 Participation in the SGI program is voluntary, but willing participants enter into binding  
2 contracts or easements to ensure that conservation practices that enhance GRSG habitat are  
3 implemented. Participating landowners are bound by a contract (usually 3 to 5 years) to  
4 implement, in consultation with NRCS staff, conservation practices if they wish to receive  
5 the financial incentives offered by the SGI. These financial incentives generally take the form  
6 of payments to offset costs of implementing conservation practices and easements or rental  
7 payments for long-term conservation.

8 While potentially effective at conserving GRSG populations and habitat on private lands,  
9 incentive-based conservation programs that fund the SGI generally require reauthorization  
10 from Congress under subsequent farm bills. These funding streams are potentially variable as  
11 they are subject to the political process.

12 As of 2014, the most recent year for which data are available, SGI has secured conservation  
13 easements on 98,167 acres within MZ IV (NRCS 2015). On these and additional private  
14 lands, SGI has completed other GRSG conservation actions within MZ IV, including  
15 implementation of grazing systems, conifer removal, vegetation seeding, and fence marking.  
16 These conservation actions are targeted at the critical threats in each MZ, consistent with  
17 those outlined in the COT report. SGI clusters implementation to achieve landscape  
18 benefits.

#### 19 ***Other Regional Efforts***

20 As part of the Greater Sage-Grouse Rangewide Planning Effort, other BLM and Forest  
21 Service sub-regions, as explained in Chapter 1, are undergoing LUPA/EIS processes similar  
22 to this one for the Idaho and Southwestern Montana Sub-Region. The Final EIS associated  
23 with each of these efforts has identified a Proposed Plan that meets the purpose and need of  
24 conserving, enhancing, and/or restoring GRSG habitat by reducing, eliminating, or  
25 minimizing threats. The management actions from the various Proposed Plans will  
26 cumulatively decrease the threat of GRSG habitat loss and will limit fragmentation  
27 throughout the range. Key actions present in many of the Proposed Plans include an  
28 adaptive management strategy, anthropogenic disturbance cap, and lek buffers. The  
29 cumulative effect of these actions, when added to the direct and indirect effects identified  
30 above, will be a reduction in the historic rate of fragmentation and loss of GRSG habitat.

31 Tribes, counties, and local working groups are playing a critical role in promoting GRSG  
32 conservation at the local level. Individual conservation plans have been prepared by most  
33 local working groups to develop and implement strategies to improve or maintain GRSG  
34 habitat and reduce or mitigate threats on the local level. The proposed conservation actions  
35 and recommendations in these plans are voluntary actions for private landowners.

36 Local working group projects have included monitoring, research, and mapping habitat  
37 areas, as well as public outreach efforts, such as landowner education and collaboration with  
38 federal, state, and other local entities.

39 A programmatic EIS by the Western Area Power Administration (WAPA) and the USFWS  
40 for the entire upper Great Plains will focus future wind energy developments in specific

1 corridors outside of GRSG core habitat (WAPA 2013). In accordance with Section 7 of the  
2 ESA, preparation of the programmatic EIS has involved consultation between cooperating  
3 entities and the USFWS and preparation of a programmatic Biological Assessment to ensure  
4 that the action will not jeopardize the continued existence of any federally-listed species,  
5 including the federal candidate GRSG. At the time of this LUPA specific conservation  
6 measures for protecting GRSG and its habitat under the programmatic EIS are not  
7 developed.

8 Some local working group conservation plans recommend restricting resource uses as well.  
9 For example, the Big Desert Sage-Grouse Conservation Plan (Big Desert Sage-grouse Local  
10 Working Group 2010) limiting recreational OHV use to existing designated roads and trails.  
11 Local working group GRSG conservation plans in MZ IV include the following:

- 12 • North Magic Valley Conservation Plan (2011)
- 13 • West Central Conservation Plan (2010)
- 14 • East Idaho Uplands Conservation Plan (2011)
- 15 • Big Desert Conservation Plan (2010)
- 16 • Shoshone Basin Conservation Plan (2008)
- 17 • Jarbidge Conservation Plan (2007)
- 18 • Curlew Valley Conservation Plan (2004)
- 19 • Owyhee County Conservation Plan (2013)
- 20 • Upper Snake Conservation Plan (2009)
- 21 • Challis Conservation Plan (2010)

#### 22 **5.1.5 Relevant Cumulative Actions**

23 This cumulative effects analysis considers past, present, and reasonably foreseeable future  
24 actions on other federal, state, private or mixed landownership lands in MZ IV (**Section**  
25 **5.1.12**). Where these actions interface with GRSG habitat, they would cumulatively add to  
26 the impacts of BLM- and Forest Service-authorized activities.

27 The following list includes past, present, and future actions in MZ IV that could  
28 cumulatively affect GRSG (more detail is included in the table in Appendix A):

- 29 • Gateway West 230/500 Transmission Line Project, Wyoming and Idaho
- 30 • Boardman to Hemingway Transmission Line Project, Oregon and Idaho
- 31 • Fuels and vegetation treatments throughout the MZ
- 32 • Grazing permit renewals and allotment management plan updates throughout  
33 the MZ

- 1 • China Mountain Wind Project, Nevada and Idaho
- 2 • Small mining projects throughout the MZ

3 Several Native American tribal members have expressed concern about military overflights  
4 causing mortality of GRSG chicks as they incubate within their eggs. Further investigation  
5 into these impacts is needed, as effects seem to be anecdotal.

#### 6 **5.1.6 Threats to GRSG in Management Zone IV**

7 In its COT report, the USFWS identifies fire, spread of weeds, conifer encroachment,  
8 infrastructure, grazing/free-roaming equids, conversion to agriculture, energy development,  
9 and recreation as the present and widespread threats facing GRSG populations in MZ IV  
10 (USFWS 2013, pp. 22-24). These threats impact GRSG mainly by fragmenting and  
11 degrading their habitat. The loss of sagebrush steppe across the West approaches or exceeds  
12 50 percent in some areas. It is a primary factor in long-term declines in GRSG abundance  
13 across its historical range (USFWS 2010).

14 Habitat fragmentation reduces connectivity of populations and increases the likelihood of  
15 extirpation from random events, such as drought or outbreak of West Nile virus.  
16 Furthermore, climate change is predicted to affect the distribution of species through  
17 changes in annual average precipitation, greater early season plant growth, and increased  
18 frequency and severity of wildfires (BLM 2013a). Sensitive species such as GRSG, which are  
19 already stressed by declining habitat, increased development, and other factors, could  
20 experience additional pressures as a result of climate change.

21 Each COT report threat considered present and widespread in at least one population in MZ  
22 IV is discussed below. The quantitative impact analysis focuses on impacts in the MZ (sub-  
23 region percentages are provided for context).

#### 24 ***Wildfire***

25 Nature and Type of Effects. Sagebrush killed by wildfire often requires many years to  
26 recover, especially after large fires. Contiguous old-growth sagebrush sites are at high fire  
27 risk, as are large blocks of contiguous dead sagebrush and sagebrush sites with a substantial  
28 cheatgrass understory. Before recovering, these sites are of limited use to GRSG, except  
29 along the edges and in unburned islands.

30 Because of its widespread impact on habitat, fire has been identified as a primary factor  
31 associated with GRSG population declines. Depending on the species of sagebrush and the  
32 size of a burn, a return to a full pre-burn community cover can take from 25 to 120 years  
33 (Baker 2011). In addition, fires can reduce invertebrate food sources and may facilitate the  
34 spread of invasive weeds.

35 While most sagebrush subspecies are killed by fire and slow to reestablish, cheatgrass  
36 recovers within one to two years of a fire from seed in the soil. This annual recovery leads to  
37 a reoccurring fire cycle that prevents sagebrush reestablishment (USFWS 2010, p. 13932).

1 BLM management to prevent or control wildfires can also affect GRSG and habitat.  
2 Increased human activity and noise associated with fire suppression, fuels treatments, and  
3 prescribed fire in areas occupied by GRSG could affect nesting, breeding, and foraging  
4 behavior. Important habitats could be altered because of the use of heavy equipment, hand  
5 tools, and noise.

6 In addition, suppression may initially result in higher rates of conifer encroachment in some  
7 areas. In the initial stages of encroachment, fuel loadings remain consistent with the  
8 sagebrush understory. As conifer encroachment advances, fire return intervals are altered by  
9 decreasing understory abundance. The depleted understory causes the stands to become  
10 resistant to low intensity wildfires; over years, the accumulating conifer loads contribute to  
11 larger-scale wildfires and confound control efforts due to extreme fire behavior.

12 Conditions in the Sub-region and in MZ IV. Wildfire has been a primary threat to GRSG  
13 habitats and populations occurring across MZ IV, with 81 percent of priority habitat and  
14 general habitat having high risk for fire, including the Snake-Salmon-Beaverhead and  
15 Northern Great Basin population areas (Manier et al. 2013, p. 133). Since 2000, more than  
16 4.9 million acres (14 percent of priority habitat and 17 percent of general habitat) of GRSG  
17 habitats have burned in this MZ, with an average of more than 239,000 acres of priority  
18 habitats burned annually; more than 1 million acres burned in some years (Manier et al. 2013,  
19 p. 133). The Murphy Fire in Idaho and Nevada affected over 650,000 acres of habitat in this  
20 MZ in 2007 (USFWS 2013, p. 78). In 2012, the Miller Homestead and Long Draw fires in  
21 southeastern Oregon burned 160,800 and 558,200 acres, respectively, mostly on BLM-  
22 administered lands with significant losses of GRSG habitat (BLM 2013c). An additional  
23 factor in the analysis of cumulative effects of fire on GRSG is the trend of increasing fire  
24 size and frequency and severity, due to factors including exotic annual grasses, and climate  
25 change.

26 Impact Analysis. Management actions in the Idaho and southwestern Montana sub-region  
27 that emphasize wildfire suppression in GRSG habitat would benefit the species by limiting  
28 habitat loss in the event of wildfire. Under current management (Alternative A), prescribed  
29 burning may be used to achieve habitat objectives. Alternatives B through F and the  
30 Proposed Plan provide for similar protection and maintenance of sagebrush habitat in  
31 implementing prescribed burning. The action alternatives all provide sagebrush protection in  
32 fuels treatment programs and would provide superior protection for sagebrush in prescribed  
33 burning, fuels treatment and fire suppression. The inter-agency Greater Sage- Grouse  
34 Wildfire, Invasive Annual Grasses & Conifer Expansion Assessment (Fire and Invasive  
35 Assessment Tool (FIAT)) under the Proposed Plan prioritizes landscapes for wildfire  
36 prevention and suppression, fuels management, and habitat restoration and rehabilitation  
37 within key GRSG habitats based on resistance and resilience concepts in Chambers et al.  
38 (2014). These actions are in accordance with the COT report objective to retain and restore  
39 healthy native sagebrush plant communities within the range of GRSG.

40 The use of chaff and flares by the military may increase wildfire risk, but this risk is generally  
41 mitigated by release altitudes about 2,000 feet above ground level and only above 5,000 feet

1 above ground level during fire risk categories 4 and 5 (Mountain Home Air Force Base  
2 2012).

3 Recognition of the importance of sagebrush habitat during interagency wildfire response  
4 would benefit GRSG in the event of an unplanned fire. The State of Idaho, State of Nevada  
5 and State of Utah GRSG conservation plans discussed in **Section 5.1.4** would benefit  
6 GRSG habitat in the MZ. The Montana Executive Order emphasizes fire suppression in  
7 Core Population Areas, while recognizing other suppression priorities may take precedent.  
8 These programs would benefit GRSG during wildfire planning and response, particularly on  
9 lands not administered by the BLM or Forest Service.

10 On the local level, the Owyhee County Sage-Grouse Conservation Plan (2013) recommends  
11 reseeding burned areas with sagebrush and implementing sagebrush restoration projects in  
12 historical GRSG habitat where historical fires have removed sagebrush cover. However, the  
13 conservation plan does not identify a funding source for this action.

14 The Interagency Standards for Fire and Fire Aviation Operations “Red Book” includes a  
15 BMP for GRSG habitat conservation for wildlife and fuels management (BLM 2013b). This  
16 document is a supplemental policy or guidance for the BLM, the Forest Service, and the  
17 USFWS. This BMP would benefit the GRSG during interagency wildland fire operations by  
18 using spatial habitat data and predictive services to prioritize and preposition firefighting  
19 resources in critical habitat areas. In January 2015, Secretarial Order 3336 “Rangeland Fire  
20 Prevention, Management and Restoration” was signed by the Secretary of the Interior. The  
21 order sets forth enhanced policies and strategies for preventing and suppressing rangeland  
22 wildfire and for restoring sagebrush landscapes impacted by wildfire across the West. The  
23 order will improve coordination with local, state, tribal, and regional efforts to address  
24 rangeland wildfire at a landscape level.

25 Reasonably foreseeable wildland fire management efforts are projected to increase (**Section**  
26 **5.1.12**), especially through increased coordination of federal, state, and local fire prevention  
27 actions and the implementation of other BLM and Forest Service LUPAs in MZ IV. When  
28 the impacts of the Idaho and southwestern Montana LUPA are added to these actions, this  
29 would result in a net conservation gain to GRSG habitats and populations in MZ IV.

### 30 ***Spread of Invasive Plants***

31 Nature and Type of Effects. As discussed in **Section 3.3**, invasive weeds alter plant  
32 community structure and composition, productivity, nutrient cycling, and hydrology.  
33 Invasive weeds also may cause declines in native plant populations, including sagebrush  
34 habitat, through such factors as competitive exclusion and niche displacement. Invasive  
35 plants reduce and may eliminate vegetation that GRSG use for food and cover. Invasive  
36 weeds fragment existing GRSG habitat and reduce habitat quality by competitively excluding  
37 vegetation essential to GRSG. Invasive weeds can also create long-term changes in  
38 ecosystem processes, such as fire cycles and other disturbance regimes that persist even after  
39 an invasive plant is removed (Connelly et al. 2004).

1 Roads and recreation can promote the spread of invasive weeds through vehicular traffic.  
2 Weed infestations can further exacerbate the fragmentation effects of roadways. Irrigation  
3 water has also supported the conversion of native plant communities to hayfields, pasture,  
4 and cropland, thus fragmenting sagebrush habitats. Excessive grazing in these habitats can  
5 lead to the demise of the most common perennial grasses in this system and an abundance  
6 of invasive species, such as cheatgrass or Japanese brome (Reisner et al. 2013).

7 Conditions in the Sub-region and in MZ IV. By way of seeds carried by wind, humans,  
8 machinery, and animals, invasive and noxious weeds have invaded and will continue to  
9 invade many locations in MZ IV, including the sub-region. Some species, including annual  
10 bromes and Canada thistle, have become so ubiquitous throughout the sub-region that it is  
11 considered economically unfeasible to attempt to control certain areas, such as those that  
12 have crossed a threshold that precludes their returning to traditional plant community  
13 composition through normal plant succession. Such species are considered part of the  
14 vegetative landscape despite their adverse impacts on other vegetation. Canada thistle,  
15 although common throughout the sub-region, is not treated on a plant-by-plant basis; rather,  
16 it is treated when plant populations reach densities high enough to make it the majority  
17 species. Examples are when it is growing in the bottom of dry reservoirs, on recreation sites,  
18 and along established roads and undeveloped vehicle trails.

19 The BLM and Forest Service currently manage weed infestations through integrated weed  
20 management: biological, chemical, mechanical, manual, and educational methods. The BLM  
21 is guided by the 1991 and 2007 RODs for Vegetation Treatment on BLM Lands in Thirteen  
22 Western States (BLM 1991) and by the 2007 Programmatic Environmental Report (BLM  
23 2007). Weeds are managed in cooperation with county governments and represents a  
24 landscape-level approach across management jurisdictions.

25 Impact Analysis. Increased activity, such as surface disturbance, motorized transportation,  
26 and animal and human activity, would increase the chance for the establishment and spread  
27 of invasive plants.

28 Management under Alternative A would allow for the most acres of surface disturbance;  
29 therefore, the potential for invasive weed spread and establishment would be greatest under  
30 this alternative, and effects to GRSG (e.g. reduction in quality of habitat) would be more  
31 pronounced. All of the action alternatives would reduce surface disturbance and would  
32 include weed-prevention measures to some degree. Of all alternatives, the Proposed Plan  
33 would likely have the lowest potential for invasive weed spread and establishment, given the  
34 three percent anthropogenic disturbance threshold which would limit surface disturbance;  
35 extensive mitigation and monitoring plans; wildfire and invasive species assessments and  
36 subsequent prioritization; application of RDFs and BMPs; and requirement for no net loss  
37 of key GRSG habitat. The COT report objective for invasive species is to maintain and  
38 restore healthy native sagebrush plant communities.

39 Invasive species on BLM-administered and National Forest System lands would be  
40 controlled under all alternatives. This would provide a net conservation gain to GRSG by  
41 restoring degraded sagebrush habitat.

1 Relevant cumulative actions that result in surface-disturbing activities, such as ROWs and  
2 energy and mining projects, would increase the potential for the spread of invasive weeds on  
3 both federal and non-federal lands. Projects subject to the general stipulations outlined in the  
4 Montana Executive Order are required to control noxious and invasive weed species and to  
5 use native seed mixes during reclamation processes. Similarly, Utah's state plan directs land  
6 managers to aggressively respond to new infestations of invasive plants, and prioritize  
7 containment of infestations within sagebrush habitats. The Nevada state plan includes  
8 stipulations for including control of invasive plant species and use of native seed mixes  
9 during reclamation. The Nevada and Utah state plans also address invasive species in fire  
10 management. The Idaho state plan includes conservation measures to prevent invasive  
11 species spread. These stipulations would benefit GRSG habitat by limiting the spread or  
12 establishment of invasive species, particularly on lands that lack BLM and Forest Service  
13 protective regulatory mechanisms. Further, the Greater Sage-Grouse Habitat Conservation  
14 Strategy for NRCS in Idaho has identified GRSG conservation measures related to invasive  
15 weeds, such as reducing the risk and rate of fire spread, restoration and rehabilitation, and  
16 weed control. A number of projects are ongoing or in the planning phase to treat nonnative,  
17 invasive species (Appendix A). These impacts would be the same under all alternatives.

18 Reasonably foreseeable weed management efforts are projected to increase (**Section 5.1.12**),  
19 including other state and county noxious weed regulations and the implementation of other  
20 BLM and Forest Service LUPAs in MZ IV. When the impacts of the Idaho and  
21 southwestern Montana LUPA are added to these actions, this would result in a net  
22 conservation gain to GRSG habitats and populations in MZ IV. The Proposed Plan may  
23 result in the greatest net conservation gain due to its three percent anthropogenic  
24 disturbance cap that should reduce potential for the spread of weeds during the 20-year  
25 analysis period.

### 26 ***Conifer Encroachment***

27 Nature and Type of Effects. Conifer woodlands, especially juniper (*Juniperus* spp.) and in  
28 some regions pinyon pine (*Pinus edulis*), may expand into sagebrush habitat and reduce  
29 availability of habitat for GRSG. Conifer expansion may be encouraged by human activities,  
30 including fire suppression and grazing (Miller et al. 2011). If woodland development is  
31 sufficient to restrict shrub and herbaceous understory growth, habitat quality for GRSG will  
32 be reduced (Connelly et al. 2004). Mature trees offer perch sites for raptors; thus, woodland  
33 expansion may also increase the threat of predation, as with powerlines (Manier et al. 2013,  
34 p. 91). Locations within approximately 1,000 yards of current pinyon-juniper woodlands are  
35 at highest risk of expansion (Bradley 2010). Studies have shown that GRSG incur  
36 population-level impacts at very low levels of conifer encroachment (Baruch-Mordo et al.  
37 2013). In MZ IV, conifer encroachment reduces habitat quality in important seasonal ranges  
38 when woodland development is sufficient to restrict shrub and herbaceous production  
39 (Connelly and others, 2004 in Manier et al. 2013, p. 91).

40 Conditions in the Sub-region and in MZ IV. Approximately 55 percent of conifer  
41 encroachment risk in priority habitat (and 34 percent in general habitat) occur on BLM-  
42 administered lands within MZ IV (Manier et al. 2013, p. 93). In comparison, 25 percent of

1 conifer encroachment risk in priority habitat (and 32 percent in general habitat) occur on  
2 private lands and 15 percent in priority habitat occurs on National Forest System lands (25  
3 percent in general habitat). Therefore, BLM actions are likely to have a greater potential to  
4 ameliorate the effects of conifer encroachment on GRSG, particularly in priority habitat,  
5 than any other single land management entity.

6 Impact Analysis. The COT objective is to remove pinyon-juniper from areas of sagebrush  
7 that are most likely to support GRSG (post-removal) at a rate that is at least equal to the rate  
8 of pinyon-juniper incursion (USFWS 2013, p. 47). Management under Alternatives D, E, and  
9 the Proposed Plan would target conifers in GRSG habitat for removal. Treatment acres  
10 under the Proposed Plan are presented in **Table 2-5**. The Proposed Plan would also  
11 incorporate GRSG habitat objectives to guide treatments. Alternatives A, B, C, and F are  
12 largely silent on conifer removal and thus would not serve to reduce this threat on BLM-  
13 administered and National Forest System lands in the sub-region, though the cumulative  
14 impact of other past, present, and reasonably foreseeable future actions in the sub-region  
15 and larger MZ would help reduce the threat across the MZ.

16 Relevant cumulative actions on federal, private, and state lands within the MZ include  
17 several large conifer removal projects (Appendix A). Further, the NRCS carries out  
18 conservation measures to remove encroaching conifers near leks and lek seasonal habitats  
19 while minimizing disturbance to GRSG (NRCS 2012, p. 13). SGI has helped reduce the  
20 threat of early succession conifer encroachment through mechanical removal on 206,099  
21 acres of private lands within MZ IV. The majority of these efforts were located inside PACs  
22 (NRCS 2015), helping to preserve historic fire return intervals and important GRSG habitat.  
23 The Utah and Idaho state plans direct land management agencies to remove encroaching  
24 conifers and conduct restoration of sagebrush habitats to expand GRSG habitat where  
25 possible.

26 Reasonably foreseeable conifer encroachment management efforts are projected to increase  
27 (**Section 5.1.12**), including efforts on private land and implementation of other BLM and  
28 Forest Service LUPAs in MZ IV. When the impacts of the Idaho and southwestern  
29 Montana LUPA are added to these actions, this would result in a net conservation gain to  
30 GRSG habitats and populations in MZ IV. The Proposed Plan would have the greatest  
31 reduction in the threat from conifer encroachment and provide a net conservation gain to  
32 GRSG. Alternatives D and E would also reduce the threat, though to a lesser degree than  
33 the Proposed Plan because they do not specify acres for treatment or habitat objectives.

#### 34 **Infrastructure**

##### 35 *Rights-of-Way*

36 Nature and Type of Effects. As discussed in **Section 4.2**, power lines can directly affect  
37 GRSG by posing a collision and electrocution hazard. They also can indirectly decrease lek  
38 attendance and recruitment by providing perches and nesting habitat for potential avian  
39 predators, such as golden eagles and ravens (Connelly et al. 2004). In addition, power lines  
40 and pipelines often extend for many miles. The ground disturbance associated with  
41 construction, as well as vehicle and human presence on maintenance roads, may introduce or  
42 spread invasive weeds over large areas, degrading habitat. Impacts from roads may include

1 direct habitat loss from road construction and direct mortality from collisions with vehicles.  
2 Roads may also present barriers to migration corridors or seasonal habitats, facilitate  
3 predator movements, spread invasive plants, and increase human disturbance from noise and  
4 traffic (Forman and Alexander 1998).

5 Conditions in the Sub-region and in MZ IV. Infrastructure, such as ROWs and associated  
6 facilities and urbanization, is widespread throughout MZ IV. In some locations,  
7 infrastructure development has affected GRSG habitat. Development of roads, fences, and  
8 utility corridors has also contributed to habitat loss and fragmentation in portions of MZ IV.  
9 The best available estimates suggest about 25 percent of the MZ IV is within approximately  
10 4 miles of urban development (Knick et al. 2011, p. 214). Impacts of infrastructure  
11 development in MZ IV are primarily related to highways, roads, power lines, and  
12 communication towers, with 90 percent of MZ I within 4 miles of a road, 30 percent within  
13 4 miles of a power line, and 5 percent within 4 miles of a communication tower (Knick et al.  
14 2011, pp. 215-216).

15 Although not representative of all infrastructure ROWs, transmission lines greater than 115  
16 kilovolts indirectly influence 37 percent of priority habitat and 38 percent of general habitat  
17 across MZ IV. Indirect effects are assumed to occur to a radius of 4 miles (Manier et al.  
18 2013, p. 41). Approximately 62 percent of transmission lines in priority habitat and 43  
19 percent in general habitat are on BLM-administered lands across GRSG habitats in MZ IV  
20 (Manier et al. 2013, p. 41). In contrast, National Forest System lands contain 5 percent of  
21 transmission lines in priority habitat and 7 percent in general habitat. Therefore, BLM  
22 actions are likely to have a greater potential to affect transmission line ROWs in GRSG  
23 habitat than any other land management entity. Designating ROW exclusion and avoidance  
24 areas in PHMA and GHMA on BLM-administered and National Forest System lands could  
25 reduce the threat on these lands. However, in areas with scattered federal landownership,  
26 infrastructure may be routed around federal lands, often increasing its length and impact.  
27 ROW avoidance and exclusion areas on BLM-administered and National Forest System  
28 lands could increase this tendency.

29 Impact Analysis. **Table 5-2** lists the areas of ROW avoidance and exclusion in GRSG  
30 habitat by alternative. **Table 5-3** lists acres of PHMA and GHMA in existing or future utility  
31 corridors.

1

2

3

4

5

6

7

8

9

10

11

12

Alternative A (current management) has the most acres open to ROWs in PHMA. Across MZ IV, Alternative B, C, D, and F reduce the number of open acres in PHMA, with even larger reductions under Alternative E and the Proposed Plan. For GHMA, most of the action alternatives have comparable open acreage except for Alternative D, which has over a two-fold reduction. However, impacts would likely also be reduced under the Proposed Plan, which would use anthropogenic disturbance criteria to screen projects in GHMA. Alternatives B, C, and F would increase ROW exclusion areas in PHMA in MZ IV, whereas Alternatives A, E, and the Proposed Plan would have fewer acres managed as ROW exclusion in PHMA. Alternative D would have the fewest acres managed as ROW exclusion in both PHMA and GHMA. The other action alternatives would have a similar acreage managed as ROW exclusion compared to Alternative A.

13

14

15

16

17

18

19

In PHMA, Alternatives B, C, and F would not contribute acres of ROW avoidance within MZ IV, as PHMA would be managed as ROW exclusion under these alternatives. In contrast, Alternatives D, E, and the Proposed Plan manage PHMA as ROW avoidance, thereby increasing the acreage compared to Alternative A. The Proposed Plan offers additional protections due to the anthropogenic disturbance criteria, buffers, 3 percent disturbance cap, and mitigation requirements. Acres of utility corridors would be largely similar across all alternatives in both PHMA and GHMA.

20

21

Because of the additional protections under the Proposed Plan, this alternative provides the greatest net conservation gain to GRSG in the Idaho and southwestern Montana sub-region

1 and is most likely to meet the COT report objective, which is to avoid development of  
2 infrastructure in GRSG priority areas for conservation.

3 The numbers of ROW authorizations are anticipated to grow in the sub-region. Increasing  
4 populations, continued energy development, and new communication sites drive the need  
5 for new ROWs on both federal and non-federal lands. For instance, the Boardman to  
6 Hemingway and Gateway West projects would influence GRSG habitat in MZ IV. While  
7 these projects would be exempted from the conservation measures in this plan, conservation  
8 measures for GRSG will be incorporated via the site-specific NEPA process for these  
9 projects. Actual impacts and contribution to cumulative effects from these projects are  
10 unknown at this time. Impacts on GRSG habitat on state or private land could be greater  
11 due to less restrictive management on those lands.

12 New ROW authorizations that require state agency review or approval would be subject to  
13 the permitting process and stipulations for development in GRSG Core Areas (Montana and  
14 Nevada)/GRSG Management Areas (Utah) under the Montana Executive Order and the  
15 Nevada and Utah state conservation plans for GRSG. These stipulations would benefit the  
16 GRSG in these areas by encouraging ROW development outside of habitat, restricting  
17 surface occupancy within 0.6 mile of occupied leks, prohibiting power lines greater than 115  
18 kV outside of designated corridors, and locating new roads used to transport products or  
19 waste over 1.9 miles from occupied leks. The Idaho state plan also includes conservation  
20 measures to reduce the impacts from ROW development.

21 The effect of the alternatives and other conservation actions in the MZ (most notably the  
22 Montana executive order) could be synergistic. By implementing restrictions on  
23 infrastructure in PHMA and on state and private lands together, the cumulative beneficial  
24 effect on GRSG would be greater than the sum of their individual effects because  
25 protections would be applied more consistently across the landscape. This is especially  
26 important in areas of mixed land ownership patterns where complementary protections can  
27 benefit leks, early brood rearing habitat, or other important areas that do not follow  
28 geopolitical boundaries.

29 Reasonably foreseeable ROW development in MZ IV is expected to increase over the 20-  
30 year analysis period (**Section 5.1.12**), though state and private GRSG conservation efforts as  
31 well as other BLM and Forest Service proposed plans in MZ IV would reduce the threat by  
32 restricting the type and location of developments. When restrictions within the Idaho and  
33 southwestern Montana LUPA are added to these conservation actions, the impacts of future  
34 ROW developments would be further reduced. The Proposed Plan would provide the  
35 greatest net conservation gain to GRSG habitats and populations in MZ IV by providing the  
36 flexibility to site ROWs with the least impact on GRSG habitat.

37 *Renewable Energy*

38 Nature and Type of Effects. Impacts on GRSG from renewable energy development, such  
39 as that for wind and solar power, are similar to those from nonrenewable energy  
40 development. Additional concerns associated with wind energy developments are rotor blade

1 noise, structure avoidance, and mortality caused by collisions with turbines (Connelly et al.  
2 2004).

3 Conditions in the Sub-region and in MZ IV. Wind energy development is an increasing  
4 threat in some populations. Over the last six years, the BLM in Idaho has authorized and  
5 then relinquished a ROW for wind development and has two pending applications. Wind  
6 testing sites have been authorized on BLM lands in the sub-region, though no wind  
7 developments have been authorized and constructed.

8 Solar energy potential is low in MZ IV, and the BLM has not received any applications for  
9 utility-scale solar production in the sub-region, nor are there solar resources comparable to  
10 the areas where utility-scale solar production projects are being proposed or built.

11 Although not representative of all renewable energy development, wind turbines indirectly  
12 influence less than 1 percent of priority habitat and general habitat combined across MZ IV.  
13 Private lands account for 82 percent of wind turbines affecting GRSG in priority habitat  
14 (and 62 percent in general habitat) within MZ IV. Therefore, conservation actions on private  
15 land are likely to have a greater potential to ameliorate the effects of wind energy  
16 development than any other single land management entity.

17 Impact Analysis. **Table 5-4** lists areas of wind energy ROW by alternative.

Source: BLM 2015

<sup>1</sup> Includes IHMA

This table displays the acres of PHMA and GHMA within wind energy management designations in MZ IV; it also displays the percentage of those acres that are found within the sub-region.

1 In the Idaho and southwestern Montana sub-region, the alternatives do not contribute to the  
2 open acres in PHMA in MZ IV, whereas the alternatives contribute most of the open and  
3 ROW exclusion acres in GHMA. Alternatives D and E manage the greatest acreage of  
4 PHMA as ROW avoidance, while Alternatives B, C, D, F, and the Proposed Plan would  
5 have the most acres managed as ROW exclusion for wind energy. The Proposed Plan would  
6 offer additional protections for PHMA, including anthropogenic disturbance criteria, a 3  
7 percent disturbance cap, buffers, and mitigation requirements. Across MZ IV, most other  
8 sub-regions' proposed plans maintain exclusion areas in PHMA for wind energy, with the  
9 exception of Oregon which allows for avoidance in Lake, Harney, and Malheur counties.  
10 The Proposed Plan in Idaho would allow wind energy development in GHMA, subject to a  
11 screening process, whereas Montana would manage GHMA as avoidance for wind.

12 Projects that require state agency review or approval would be subject to the Montana  
13 Executive Order permitting process. This would encourage wind energy development  
14 outside of Core Areas. Similarly, in Nevada, wind energy developments would be located  
15 outside of core, priority and general habitats, or would minimize and/or mitigate for impacts  
16 if avoidance is not feasible. The Utah Executive Order directs state agencies to minimize

1 disturbance within GRSG Management Areas and maintain consistency with conservation  
2 measures in the Utah state plan. In Oregon and Idaho, wind energy projects could  
3 voluntarily site development outside of GRSG habitat, but currently no regulatory  
4 mechanisms are in place to reduce impacts to GRSG habitat from projects requiring state  
5 agency review or approval.

6 Reasonably foreseeable renewable energy development in MZ IV is expected to increase  
7 over the 20-year analysis period (**Section 5.1.12**), though state GRSG conservation efforts as  
8 well as wind energy restrictions in other BLM and Forest Service proposed plans in MZ IV  
9 would reduce the threat by implementing disturbance caps and restricting the location of  
10 developments. When restrictions in the Idaho and southwestern Montana LUPA are added  
11 to these conservation actions, this would result in a net conservation gain to GRSG habitats  
12 and populations in MZ IV.

### 13 ***Grazing/Free-Roaming Equids***

14 Nature and Type of Effects. In general, livestock can influence habitat by modifying plant  
15 biomass, plant height and cover, and plant species composition. As a result, livestock grazing  
16 could cause changes in habitat that alter species abundances and composition in GRSG  
17 insect prey. Changes in plant composition could occur in varying degrees and could change  
18 vegetative structure, affecting cover for nesting birds. Grazing could also alter fire regimes  
19 (Davies et al. 2010).

20 If not managed properly, cattle and sheep grazing can compact soil, enrich soil with  
21 nutrients, trample vegetation and nests, directly disturb GRSG and negatively affect GRSG  
22 recruitment. Cattle and sheep also can reduce invertebrate prey for GRSG or increase their  
23 exposure to predators (Beck and Mitchell 2000, pp. 998-1,000; Knick 2011; Coates 2007, pp.  
24 28-33). Grazing in riparian areas can destabilize streams and riverbanks, cause the loss of  
25 riparian shade, and increase sediment and nutrient loads in the aquatic ecosystem (George et  
26 al. 2011). Stock watering tanks can contribute to stream and aquifer dewatering and may  
27 concentrate livestock movement and congregation in sensitive areas (Vance and Stagliano  
28 2007).

29 However, grazing can reduce the spread of invasive grasses, if applied annually before the  
30 grasses have dried. It also can be used to reduce fuel load (Connelly et al. 2004, p. 7, 28-30).  
31 Light to moderate grazing does not appear to affect perennial grasses, which are important  
32 to nest cover (Strand and Launchbaugh 2013). However, excessive grazing can eliminate  
33 perennial grasses and lead to expansion of invasive species such as cheatgrass or medusahead  
34 (Reisner et al. 2013).

35 Periodic overgrazing can damage range resources over the long term. It often exacerbates  
36 drought effects when stocking levels are not quickly reduced to match the limited forage  
37 production. The degree to which grazing affects habitat depends on several factors, such as  
38 the number of animals grazing in an area, the time of grazing, and the grazing system used.

39 A well-developed understory of grass, forbs, and deciduous shrubs is critical for GRSG and  
40 other wildlife. Impacts on habitat vary with livestock densities and distribution; the more

1 evenly livestock is distributed, the lower their impact on any given area (Gillen et al.  
2 1984). However, cattle show a strong preference for certain areas, leading to high use in  
3 some areas and little to no use in others. Livestock grazing is generally limited by slopes of  
4 greater than 30 percent, dense forests and vegetation, poor or little upland forage, and lack  
5 of water.

6 Since the passage of the 1934 Taylor Grazing Act, range conditions on BLM-administered  
7 lands have improved due to improved grazing management practices and decreased livestock  
8 numbers and annual duration of grazing.

9 In addition, the BLM has applied Standards for Rangeland Health since 1997. On National  
10 Forest Systems lands, livestock grazing is administered in accordance with a number of laws  
11 and regulations, including the Multiple Use and Sustained Yield Act of 1960, Granger-Thye  
12 Act of 1950, and Organic Administration Act of 1897. The purpose of these regulations is to  
13 enhance sustainable livestock grazing and wildlife habitat, while protecting watersheds and  
14 riparian ecosystems.

15 Although livestock grazing is the most widespread land use across the sagebrush biome, it  
16 exerts a more limited influence on soils and vegetation than land uses that remove or  
17 fragment habitat (e.g., mineral extraction or infrastructure development). Thus, reducing  
18 AUMs or acres open to grazing would not necessarily restore high quality GRSG habitat.

19 Reducing grass height caused by livestock grazing in GRSG nesting and brood-rearing areas  
20 has been shown to negatively impact nesting success. This was the case when residual  
21 herbaceous cover was reduced below the approximately 7 inches needed for predator  
22 avoidance (Gregg et al. 1994). Livestock grazing could reduce the suitability of breeding and  
23 brood-rearing habitat, which would impact GRSG populations (USFWS 2010).

24 For BLM-administered and National Forest System lands, Standards for Rangeland Health  
25 require the agencies to maintain or enhance habitats that support or could support  
26 endangered, threatened, or sensitive species. The BLM Washington Office IM 2009-018  
27 requires that land health considerations, such as vegetation cover for GRSG, are  
28 considerations for prioritizing the processing of grazing authorizations.

29 Range improvements could result in livestock overusing important GRSG areas. For  
30 example, developing springs would generally change vegetative composition from a high  
31 diversity of grasses and forbs, important to broods, to one dominated by grasses; conversely,  
32 in areas where livestock use was not well managed, invasive forbs would rise in prevalence.

33 Concentrated livestock use would remove standing vegetation and subsequently reduce  
34 associated insects and forbs, both of which are important to GRSG broods. Allowing spring  
35 developments along ephemeral streams and wetlands and allowing livestock watering tanks  
36 would decrease GRSG habitat. Springs, seeps, and wetland areas are vitally important to  
37 GRSG broods; therefore, allowing spring developments under this alternative could benefit  
38 some resources but not GRSG.

1 Wild horse and burro grazing has similar impacts as livestock grazing in their effect on soils,  
2 vegetation health, species composition, water, and nutrient availability by consuming  
3 vegetation, redistributing nutrients and seeds, trampling soils and vegetation, and disrupting  
4 microbial systems (Connelly 2004).

5 Conditions in the Sub-region and in MZ IV. Livestock grazing is present and widespread on  
6 many land types, such as federal and private, across MZ IV. Rangeland health assessments  
7 have found that over 19 percent of BLM-administered grazing allotments in GRSG habitat  
8 in MZ IV are not meeting wildlife standards with grazing as a causal factor (Manier et al.  
9 2013, p. 97). Additionally, nearly 2 million acres of GRSG habitat within MZ IV is federally  
10 managed wild horse and burro range (Manier et al. 2013, p. 102).

11 Perhaps the most pervasive change associated with grazing management in GRSG habitats  
12 throughout MZ IV is the construction of fencing and water developments (Knick et al.  
13 2011, p. 224). Barbed wire fences contribute to direct mortality through fence collisions  
14 (Stevens et al. 2011); water developments may contribute to the increased occurrence of  
15 West Nile virus (Walker and Naugle 2011).

16 Additional habitat modifications associated with grazing management are mechanical and  
17 chemical treatments to increase grass production, often by removing sagebrush (Knick et al.  
18 2011). Standards for Rangeland Health protect habitat from elements detrimental to GRSG,  
19 but not all rangelands in MZ IV are in compliance with these standards.

20 Wild horses also occur within MZ IV and the sub-region; within MZ IV, 5.7 percent of  
21 priority habitat is negatively influenced by free-roaming equids (Manier et al. 2013, p. 102).  
22 Six designated herd management areas (HMAs) and nine herd areas occur on BLM-  
23 administered lands in the sub-region; no active wild horse and burro territories occur on  
24 National Forest System lands in the sub-region (**Section 3.6**). The BLM establishes an  
25 appropriate management level (AML) for each HMA, which represents the population  
26 objective.

27 Impact Analysis. On all lands in the sub-region, the BLM manages livestock grazing on  
28 12,129,800 acres, encompassing 2,654 grazing allotments, while the Forest Service manages  
29 9,646,900 acres encompassing 319 grazing allotments. **Table 5-5** lists the acres of PHMA  
30 and GHMA available and unavailable for grazing, by alternative.

Source: BLM 2015

<sup>1</sup> Includes IHMA

This table displays the acres of PHMA and GHMA available and unavailable to livestock grazing in MZ IV; it also displays the percentage of those acres that are found within the sub-region.

1 Acres available to livestock grazing in PHMA and GHMA are similar across most  
2 alternatives. Acres unavailable to livestock grazing would be greatest under Alternative C,  
3 which closes all GRSG habitat to grazing, followed by Alternative F, which would reduce  
4 grazing by 25 percent in PHMA. Such reductions and closures would benefit GRSG by  
5 maintaining nesting cover for protection and forage; however, the increased need for fencing  
6 to exclude grazing animals could also harm nesting GRSG by increasing the likelihood of  
7 predation and collision.

8 However, as discussed, moderate grazing is compatible with GRSG habitat; thus, closing  
9 acres to grazing may not itself benefit or harm GRSG. Possibly equally or more beneficial is  
10 restricting range improvements in GRSG habitat, limiting fencing, and effectively  
11 implementing range health standards on grazing allotments in GRSG habitat. Alternatives B  
12 through F and the Proposed Plan include grazing restrictions (to varying degrees) which  
13 would help protect GRSG from potential impacts such as habitat changes due to herbivory

1 and collisions with fencing. In terms of impacts on BLM-administered and National Forest  
2 System lands, Alternative A would have no GRSG-specific protective grazing restrictions,  
3 and would therefore have the greatest impacts on the species. Alternative C would have no  
4 areas available for livestock within with designated habitat, and would therefore have the  
5 fewest impacts on the species. However, as a result of restricting grazing in GRSG habitat  
6 under Alternative C, increased fencing on private lands may occur. This could result in  
7 higher cumulative effects though mortality from fencing collisions. Reduced grazing under  
8 Alternative F would have similar, but fewer impacts, compared to Alternative C.

9 The COT report objectives for livestock grazing are to manage grazing in a manner  
10 consistent with local ecological conditions. This management would maintain or restore  
11 healthy sagebrush shrub and native perennial grass and forb communities and conserve  
12 essential habitat components for GRSG. Restoration to meet these standards and adequate  
13 monitoring would be required. The COT report also states that land managers should avoid  
14 or reduce the impact of range management structures on GRSG habitat.

15 If BLM-administered and National Forest System lands were made unavailable for livestock  
16 grazing, as under Alternative C, this could increase grazing pressure on adjacent private  
17 lands. Loss of federal grazing permits would pose a threat of indirect adverse effects,  
18 including potential conversion of private grazing lands to agriculture, if the loss of federal  
19 grazing privileges made ranching less economically viable.

20 Since 2010, SGI has enhanced rangeland health through rotational grazing systems, re-  
21 vegetating former rangeland with sagebrush and perennial grasses and control of invasive  
22 weeds. On privately-owned lands, SGI has developed a prescribed grazing approach that  
23 balances forage availability with livestock demand. This system allows for adjustments to  
24 timing, frequency, and duration of grazing, ensuring rangelands are managed sustainably to  
25 provide continued ecological function of sagebrush-steppe. A primary focus of the  
26 prescribed grazing approach is maintenance of key plant species, such as deep-rooted  
27 perennial grasses that have been shown to be essential for ecological resistance to invasive  
28 annual grasses (Reisner et al. 2013, pp. 1047-1048). These actions help to alleviate the  
29 adverse impacts associated with improper grazing practices outlined above under Nature and  
30 Type of Effects. Within MZ IV, SGI has implemented 314,930 acres of prescribed grazing  
31 systems. This program is likely the largest and most impactful program on private lands  
32 within MZ IV. Because of its focus on priority areas for conservation, which often overlap  
33 PHMA, the SGI's past, present, and reasonably foreseeable work has had and likely will  
34 continue to have a cumulative beneficial impact on GRSG when considered alongside  
35 protective BLM management actions in PHMA.

36 Reasonably foreseeable livestock grazing management efforts in MZ IV are expected to  
37 increase over the analysis period (**Section 5.1.12**), through increased NRCS conservation  
38 actions under the Sage-Grouse Initiative (e.g., fence marking and conservation easements),  
39 state efforts to maintain ranchland, and the implementation of other BLM and Forest  
40 Service LUPAs in MZ IV. When grazing management within the Idaho and southwestern  
41 Montana LUPA is added to these conservation actions, this would result in a net  
42 conservation gain to GRSG habitats and populations in MZ IV.

1 Under all alternatives the BLM has the ability to adjust appropriate management levels of  
2 wild horses if resource damage occurs; however, only Alternatives B through F and the  
3 Proposed Plan provide management guidelines specific to GRSG habitat (e.g. prioritizing  
4 gathers in GRSG habitat), which would benefit the species more than Alternative A.

5 Reasonably foreseeable wild horse management efforts are projected to increase over the  
6 analysis period (**Section 5.1.12**) with implementation of other BLM and Forest Service  
7 LUPAs in MZ IV. Other past, present, and reasonably foreseeable future actions are unlikely  
8 to affect the threat from wild horses and burros, as these animals are federally-managed.  
9 When wild horse management within the Idaho and southwestern Montana LUPA is added  
10 to these conservation actions, this would result in a net conservation gain to GRSG habitats  
11 and populations in MZ IV. Impacts may be reduced to the greatest extent under the  
12 Proposed Plan, where AMLs would be evaluated with consideration of GRSG habitat  
13 objectives for BLM-administered lands.

#### 14 ***Conversion to Agriculture***

15 Nature and Type of Effects. Converting sagebrush habitat to agricultural use, commonly  
16 referred to as sodbusting, causes direct loss of habitat available for GRSG. Habitat loss also  
17 decreases the connectivity between seasonal habitats, increasing population isolation and  
18 fragmentation. Fragmentation then increases the probability for decline of the population,  
19 reduced genetic diversity, and extirpation from stochastic events (Knick and Hanser 2011).

20 In addition to reducing the land area available to support GRSG, habitat loss and  
21 fragmentation also increase the likelihood of other disturbances, such as human traffic,  
22 wildfire, and invasive plant spread.

23 Converting cropland has eliminated or fragmented sagebrush on private lands in areas with  
24 deep fertile soils or irrigation potential. Sagebrush remaining in these areas has been limited  
25 to the agricultural edge or to relatively unproductive environments.

26 Conditions in the Sub-region and in MZ IV. Regional assessments estimate that while only 1  
27 percent of priority habitat and general habitat in MZ IV are directly influenced by  
28 agricultural development, over 85 percent of these habitats are within approximately 4 miles  
29 of agricultural land (Manier et al. 2013, p. 27).

30 Impact Analysis. The BLM and Forest Service do not convert public lands to agriculture. As  
31 such, the only direct authority these agencies have over conversion to agriculture is by  
32 retaining or disposing of lands in the realty program. Lands retained under BLM and Forest  
33 Service management will not be converted to agriculture and disposing of lands could  
34 increase the likelihood they will be converted to agriculture, depending on their location and  
35 new management authority.

36 As shown below in **Table 5-6**, acres identified for retention are similar in the sub-region and  
37 in MZ IV among the alternatives. Under Alternatives B, C, D, F, and the Proposed Plan, the  
38 BLM and Forest Service would generally retain GRSG habitat, thereby eliminating the  
39 possibility that GRSG habitat would be converted to agriculture use. Alternatives A and E

1 do not specify retention of GRSG habitat, and thus there is the possibility of these lands  
 2 being disposed. Most acres within MZ IV that are identified for disposal under Alternatives  
 3 A and E are within the Idaho and southwestern Montana sub-region. However, land tenure  
 4 adjustments require site-specific NEPA analysis and land sales must meet the disposal  
 5 criteria under applicable law. BLM land tenure adjustments are not anticipated to be a  
 6 significant contributing element to the threat of agriculture conversion.

7

Table 5-6

Acres Identified for Retention and Disposal in GRSG Habitat in MZ IV

	Priority Habitat Management Areas		General Habitat Management Areas <sup>1</sup>	
	MZ IV	Percent Within Sub-Region	MZ IV	Percent Within Sub-Region
Acres Identified for Retention				
Alternative A	12,348,000	45%	4,930,000	45%
Alternative B	14,997,000	55%	4,760,000	43%
Alternative C	17,878,000	62%	2,707,000	0%
Alternative D	14,995,000	55%	5,803,000	53%
Alternative E	11,784,000	42%	5,352,000	49%
Alternative F	14,997,000	55%	5,209,000	48%
Proposed Plan	11,973,000	43%	8,628,000	69%
Acres Identified for Disposal

<sup>1</sup> Includes IHMA

This table displays the acres of PHMA and GHMA identified for retention and disposal in MZ IV; it also displays the percentage of those acres that are found within the sub-region.

1 Cumulative impacts vary relatively little across alternatives because BLM and Forest Service  
2 management have little impact on alleviating this threat. Restrictions on grazing on federal  
3 land could increase agriculture pressure on adjacent private lands. If the loss of federal  
4 grazing privileges makes ranching economically unviable, the potential conversion of private  
5 grazing lands to agriculture would increase. However, the Proposed Plan does not  
6 substantially increase acreage unavailable to grazing.

7 The COT report objectives for converting land to agriculture are to avoid further loss of  
8 sagebrush habitat for agricultural activities (both plant and animal production) and to  
9 prioritize restoration. In areas where taking agricultural lands out of production has  
10 benefited GRSG, the programs supporting these actions should be targeted and continued  
11 (USFWS 2013, p. 48). In accordance with this objective, the NRCS's SGI program focuses  
12 on maintaining rangeland that provides habitat for GRSG. This voluntary program provides  
13 private landowners with monetary incentives to protect GRSG habitat, often through  
14 conservation easements. As a result, private land containing GRSG habitat is protected from  
15 conversion to agriculture or other development for the life of the conservation agreement.  
16 The conservation easements and other conservation incentives, such as restoration of water  
17 features and fence marking, can enhance the ability of private ranchlands to support GRSG.  
18 As of 2014, SGI has secured conservation easements on 98,167 acres within MZ IV and  
19 marked or removed 95 miles of fence (NRCS 2015). This has preserved habitat and reduced  
20 the risk of direct mortality on these lands.

21 Over the analysis period, conversion to agriculture is expected to increase (**Section 5.1.12**),  
22 though state and private conservation efforts as well as other BLM and Forest Service  
23 proposed plans in MZ IV would reduce the threat. When land tenure decisions within the  
24 Idaho and southwestern Montana LUPA are added to these conservation actions, this would  
25 result in net conservation gain to GRSG habitats and populations in MZ IV.

### 26 ***Energy Development and Mining***

27 The COT report states that energy development should be designed to ensure that it will not  
28 impinge on stable or increasing GRSG population trends. For mining, the objective is to  
29 maintain stable to increasing GRSG populations and no net loss of GRSG habitats in areas  
30 affected by mining (USFWS 2013, p. 49).

31 There are approximately 1,137,700 acres of GRSG habitat in MZ IV where energy and  
32 mineral development (including geothermal, mineral materials, wind energy, and non-energy  
33 leasable minerals) is presently occurring. There are 6,553,300 acres indirectly influenced by  
34 energy development (including oil and gas, mineral materials, and wind energy; indirect  
35 effects were not quantified for geothermal and nonenergy leasable mineral developments)  
36 (Manier et al. 2013, pp. 52-71). No coal or oil and gas development is presently occurring in  
37 MZ IV.

### 38 ***Oil and Gas***

39 Nature and Type of Effects. As discussed in **Section 4.2**, oil and gas development impacts  
40 GRSG and sagebrush habitats through direct disturbance and habitat loss from well pads,  
41 access construction, seismic surveys, roads, power lines, and pipeline corridors. Indirect

1 disturbances result from noise, gaseous emissions, changes in water availability and quality,  
2 and human presence. These factors could cumulatively or individually lead to habitat  
3 fragmentation in the long term (Connelly et al. 2004; Holloran 2005).

4 Oil and gas development results in direct loss of habitat from well pad and road construction  
5 as well as indirect disturbance impacts from increased noise and vehicle traffic. Oil and gas  
6 development also directly impacts GRSG through the species' avoidance of infrastructure.  
7 This development can also impact GRSG survival or reproductive success. Indirect effects  
8 include habitat quality changes, predator communities, and disease dynamics (Naugle et al.  
9 2011).

10 Conditions in the Sub-region and in MZ IV. There is currently no oil and gas development  
11 within MZ IV (Manier et al. 2013, p. 52) and approximately 346,000 acres (1 percent) of  
12 GRSG habitat are leased but undeveloped (Manier et al. 2013, p. 55). Less than one percent  
13 of GRSG habitat in MZ IV is within 1.8 miles of oil and gas wells (Knick et al. 2011, p. 240).  
14 There are two leases in Bonneville County in the sub-region within MZ IV (**Section 3.12**).

15 Although oil and gas activities have a disproportionately greater effect on private lands,  
16 regulatory mechanisms on both federal surface and split estate lands in MZ IV are  
17 influential. Split estate lands with federal subsurface minerals may provide mitigation for  
18 impacts on GRSG habitat on private surface lands that would not be required on lands with  
19 both privately held surface and subsurface.

20 According to the RFD scenario (**Appendix O**), permanent disturbance associated with oil  
21 and gas development is projected to occur on 156 acres within the Idaho and southwestern  
22 Montana sub-region over the next 10 years, representing less than one percent of GRSG  
23 habitat within either the sub-region or MZ IV. Within MZ IV outside of the sub-region, less  
24 than 200 acres are projected by the Nevada, Oregon, and Utah sub-regional RFD scenarios.  
25 The potential for impacts would be reduced where areas are closed to fluid mineral leasing  
26 and where NSO and CSU/TL stipulations are applied. Given the small acreage and  
27 implementation of RDFs and BMPs (**Appendix B**), the likelihood for impacts on GRSG  
28 habitat on BLM-administered and National Forest System lands is anticipated to be small  
29 and localized under all alternatives.

30 Impact Analysis. **Tables 5-7** and **5-8** provide a quantitative summary of fluid mineral leasing  
31 conditions on BLM-administered and National Forest System lands across MZ IV, followed  
32 by an analysis of the Idaho and southwestern Montana sub-regional alternatives.

Source: BLM 2015

<sup>1</sup> Includes IHMA

This table displays the acres of PHMA and GHMA with NSO Stipulations and CSU/TL Stipulations in MZ IV; it also displays the percentage of those acres that are found within the sub-region.

1

2 As shown in **Tables 5-2** and **5-3**, fluid mineral closures and stipulations within the Idaho  
3 and southwestern Montana sub-region exert a fairly large influence within the broader MZ.  
4 Alternatives B, C, and F would provide the greatest protection to GRSG in the MZ by  
5 closing PHMA to new leases. This would reduce well density and impacts associated with  
6 construction and operation. Acres open and closed in GHMA would be similar across the  
7 alternatives, though the Proposed Plan would have approximately double the acreage closed  
8 in GHMA compared to the other alternatives. Acres managed as NSO would be similar  
9 across alternatives in PHMA and GHMA, with more acres managed as NSO under  
10 Alternative E and the Proposed Plan. The Proposed Plan would provide additional  
11 protections to GRSG from fluid mineral development by requiring anthropogenic  
12 disturbance criteria, a 3 percent disturbance cap, buffers, mitigation requirements, RDFs and  
13 BMPs, and by managing SFAs as NSO with no waivers, exceptions, and modifications.

14 Restoring disturbed habitats would require the reestablishment of native shrubs and forbs,  
15 including big sagebrush, which would benefit GRSG; however, restored habitats may not  
16 support GRSG for long periods following restoration (Arkle et al. 2014). For this reason,  
17 successful restoration may not be successful without a nearby source population.

1 Under the Montana Executive Order, authorizations of oil and gas development that require  
2 state agency review or approval would be subject to the GRSG permitting process. They also  
3 would be subject to stipulations for development in GRSG Core areas. Similarly,  
4 authorizations in Nevada would be subject to measures in the Nevada state plan, including  
5 avoidance, minimization, and mitigation of any unavoidable impacts to GRSG habitat. Oil  
6 and gas lease authorizations in Utah that require state agency review or approval would be  
7 subject to the Utah executive order, which directs the Utah division of Oil, Gas, and Mining  
8 to consult with UDWR on all actions within GRSG Management Areas, and incorporate  
9 conservation measures from the state's GRSG conservation plan. The Idaho state plan  
10 includes mandatory restrictions on surface use and timing on IDL lands and site reclamation  
11 requirements, as well as voluntary conservation measures that could be applied.

12 The effect of the alternatives and other conservation actions in the MZ (most notably the  
13 Nevada state plan and Montana and Utah executive order) could be synergistic. For example,  
14 applying buffers in PHMA and on state and private land would effectively conserve larger  
15 blocks of land than if these actions occurred individually. This would provide a landscape-  
16 scale net conservation benefit, especially in areas where little development has occurred to  
17 date.

18 Reasonably foreseeable oil and gas development in MZ IV is expected to increase over the  
19 20-year analysis period (**Section 5.1.12**), though state and private GRSG conservation efforts  
20 as well as other BLM and Forest Service proposed plans in MZ IV would reduce the threat  
21 by restricting the location of developments and requiring mitigation. When restrictions  
22 within the Idaho and southwestern Montana LUPA are added to these conservation actions,  
23 this would result in a net conservation gain to GRSG habitats and populations in MZ IV.

#### 24 *Geothermal*

25 Nature and Type of Effects. Impacts to GRSG from geothermal development are not well  
26 documented since geothermal development has been too recent to identify any immediate or  
27 lag effects (Knick et al. 2011 in Manier et al. 2013, p. 70). However, geothermal development  
28 is similar to fossil-fuel development and direct impacts to habitats would occur from  
29 development of power plants, access roads, pipelines and transmission lines. As a result,  
30 impacts of geothermal developments to GRSG from direct habitat loss, habitat  
31 fragmentation via roads and transmission lines, noise, and increased human presence  
32 (Connelly et al. 2004) may be similar to those discussed for nonrenewable energy  
33 development. Comparable effects on local GRSG populations are also anticipated (Manier et  
34 al. 2013, p. 70). Other concerns related to geothermal energy development include air and  
35 water pollution, disposal of hazardous waste, land subsidence, and release of toxic gases into  
36 the environment (Manier et al. 2013, p. 70).

37 Conditions in the Sub-region and MZ IV. Geothermal energy development potential is  
38 particularly high throughout MZ IV and geothermal leases directly affect 75,900 acres (less  
39 than 1 percent) of GRSG habitats in the MZ (Manier et al. 2013, p. 71). Geothermal leases  
40 in the sub-region cover 60,000 acres (**Section 3.12**).

1 The RFD scenario for the Idaho and southwestern Montana sub-region (**Appendix O**)  
2 predicts up to 410 acres of permanent disturbance associated with geothermal development  
3 over the next 10 years. The potential for impacts would be reduced where areas are closed to  
4 fluid mineral leasing and where NSO and CSU/TL stipulations are applied. Given the small  
5 acreage and implementation of RDFs and BMPs (**Appendix B**), the likelihood for impacts  
6 on GRSG habitat is anticipated to be small and localized under all alternatives.

7 Impact Analysis. The quantitative analysis of effects from geothermal leasing would be the  
8 same as described for oil and gas because allocations and past, present, and reasonably  
9 foreseeable future actions would be the same.

#### 10 *Coal*

11 Coal potential is low throughout MZ IV (Manier et al. 2013, p. 133) and there are no direct  
12 or indirect effects from surface coal leases in the MZ (Manier et al. 2013, p. 74). There is no  
13 coal development in the sub-region and lands are determined to be unsuitable for leasing;  
14 thus this threat will not be described further in this document.

#### 15 *Mineral Materials*

16 Nature and Type of Effects. Development of surface mines (for sand, gravel and other  
17 common mineral materials found in MZ IV) may negatively impact GRSG numbers and  
18 disrupt the habitat and life-cycle of the species, similar to other types of mining activities  
19 (Braun 1998; Manier et al. 2013, pp. 70-71).

20 Conditions in the Sub-region and in MZ IV. There are 652,000 acres of mining and mineral  
21 materials disposal sites (not including minerals mined as energy sources) on BLM-  
22 administered surface land on priority habitat and general habitat in MZ IV. There are  
23 1,049,600 acres across all landownership types, making BLM-administered land the largest  
24 contributor to direct effects from this threat. National Forest System lands contribute to  
25 direct effects on 170,200 acres of priority habitat and general habitat. Indirect effects are  
26 estimated to 1.5 miles out from the direct effects area (Manier et al. 2013, p. 77).

27 The mineral materials currently being developed for commercial purposes in the Idaho and  
28 southwestern Montana sub-region include stone, sand and gravel, limestone, soil, and  
29 pumice.

30 Across MZ IV, PHMA and GHMA are most affected by mining and mineral materials  
31 disposal sites on BLM-administered lands. GRSG may be directly impacted, being in the  
32 path of development; however, indirect impacts on habitat affect a much wider population  
33 of birds. In total, 61 percent of priority habitat and 48 percent of general habitat influenced  
34 by the indirect impact of mining and mineral materials disposal sites are on BLM-  
35 administered land. This does not include minerals mined as energy sources. Mining and  
36 mineral materials disposal sites on private land, by comparison, indirectly affect 26 percent  
37 of priority habitat and 34 percent of general habitat. National Forest System lands indirectly  
38 affect 10 percent of priority habitat and 13 percent of general habitat (Manier et al. 2013, p.  
39 77). As a result, management of mining and material disposal sites on BLM-administered  
40 land would have the greatest impact on GRSG habitat conditions.

1 Impact Analysis. **Table 5-9** provides a quantitative summary of acreages of BLM-  
2 administered and National Forest System lands open and closed to mineral material disposal  
3 across MZ IV.

**Table 5-9**  
**Acres Open and Closed to Mineral Material Disposal in GRSG Habitat in MZ IV**

	Priority Habitat Management Areas		General Habitat Management Areas <sup>1</sup>	
	MZ IV	Percent Within Sub-Region	MZ IV	Percent Within Sub-Region
Open to Mineral Material Disposal				
Alternative A	8,592,000	100%	6,518,000	58%
Alternative B	0	0%	5,820,000	53%
Alternative C	0	0%	2,728,000	0%
Alternative D	5,830,000	100%	5,944,000	54%
Alternative E	7,982,000	100%	6,915,000	61%
Alternative F	0	0%	6,346,000	57%
Proposed Plan	5,000	100%	8,609,000	68%
Closed to Mineral Material Disposal				
Alternative A	7,732,000	7%	677,000	25%
Alternative B	15,922,000	55%	676,000	25%
Alternative C	19,113,000	62%	505,000	0%

Alternative E	7,798,000	8%	614,000	18%
Alternative F	15,922,000	55%	690,000	27%
Proposed Plan	12,850,000	44%	1,529,000	67%

Source: BLM 2015

<sup>1</sup> Includes IHMA

<sup>2</sup> This table displays the acres of PHMA and GHMA open and closed to mineral material disposal in MZ IV; it also displays the percentage of those acres that are found within the sub-region.

4  
5 Under Alternatives B, C, F, and the Proposed Plan, all PHMA would be closed to mineral  
6 material disposal, which would constitute much of the closed acreage on BLM-administered  
7 and National Forest System lands in MZ IV. Restrictions on mineral material development  
8 in the sub-region would be applied under Alternative D, and for IHMA and GHMA under  
9 the Proposed Plan. Acres closed in GHMA would be similar across most alternatives,  
10 though Alternative E and the Proposed Plan would have the greatest acres of GHMA

1 closed. The Proposed Plan would provide additional protections to GRSG from mineral  
2 material development by requiring anthropogenic disturbance criteria, a 3 percent  
3 disturbance cap, RDFs and BMPs, buffers, and mitigation. These closures and restrictions  
4 would reduce the effect on GRSG from mineral material development on BLM-  
5 administered and National Forest System lands in MZ IV for most action alternatives,  
6 particularly the Proposed Plan and Alternative C.

7 Under the Montana Executive Order, authorizations of new mineral material disposal sites  
8 that require state agency review or approval would be subject to the GRSG permitting  
9 process. They also would be subject to stipulations for development in GRSG Core Areas.  
10 Similarly, authorizations in Nevada would be subject to measures in the Nevada state plan,  
11 including avoidance, minimization, and mitigation of any unavoidable impacts to GRSG  
12 habitat, and authorizations in GRSG Management Areas in Utah would be subject to  
13 consultation with UDWR and conservation measures. New authorizations that would occur  
14 in the majority of MZ IV within Idaho or Oregon that lack state plans containing regulatory  
15 mechanisms, may incorporate GRSG habitat recommendations from these states' plans  
16 though these would voluntary measures and not binding conditions. These stipulations  
17 would be of particular benefit on privately-owned surface and subsurface lands, where BLM  
18 and Forest Service protective regulatory mechanisms do not apply.

19 Reasonably foreseeable mineral materials development in MZ IV is expected to increase  
20 over the 20-year analysis period (**Section 5.1.12**), though state and private GRSG  
21 conservation efforts as well as other BLM and Forest Service proposed plans in MZ IV  
22 would reduce the threat by restricting the location of developments and requiring mitigation.  
23 When restrictions within the Idaho and southwestern Montana LUPA are added to these  
24 conservation actions, this would result in a net conservation gain to GRSG habitats and  
25 populations in MZ IV.

#### 26 *Locatable Minerals*

27 Nature and Type of Effects. Locatable minerals include gold, silver, uranium, and bentonite.  
28 Activities associated with locatable mineral development, such as stockpiling topsoil and  
29 extracting and transporting material, would cause mortality and nest disruption. These  
30 actions also would reduce the functionality of the surrounding habitat with noise and light  
31 disturbance, resulting in lost and degraded GRSG PHMA and GHMA.

32 As with fluid mineral development, reclamation practices may help to reduce long-term  
33 impacts on GRSG and their habitat. Although disturbed areas have not been restored to  
34 near pre-disturbance conditions in the past, recent efforts have been directed toward  
35 restoring functional habitat. Future reclamation should be focused on restoring habitats  
36 capable of supporting viable GRSG populations. Even with effective restoration, restored  
37 areas may not support GRSG populations at the same level as prior to disturbance.

38 Conditions in the Sub-region and in MZ IV. The primary locatable minerals in commercially  
39 viable quantities in the Idaho and southwestern Montana sub-region are zeolite and  
40 bentonite. Other locatable minerals are known to exist in the sub-region, but they are  
41 currently uneconomical to produce.

1 Impact Analysis. **Table 5-10** provides a quantitative summary of acreages of BLM-  
2 administered and National Forest System lands open and recommended for withdrawal from  
3 mineral entry across MZ IV.

**Table 5-10**  
**Acres Open and Recommended for Withdrawal from Mineral Entry**  
**in GRSG Habitat in MZ IV**

	Priority Habitat Management Areas		General Habitat Management Areas <sup>1</sup>	
	MZ IV	Percent Within Sub-Region	MZ IV	Percent Within Sub-Region
Open to Mineral Entry				
Alternative A	12,308,000	67%	6,390,000	51%
Alternative B	4,006,000	0%	6,140,000	49%
Alternative C	4,006,000	0%	3,108,000	0%
Alternative D	12,308,000	67%	6,390,000	51%
Alternative E	11,706,000	66%	6,780,000	54%
Alternative F	4,006,000	0%	6,625,000	53%
Proposed Plan	6,108,000	34%	9,960,000	69%
Recommended for Withdrawal from Locatable Mineral Entry				
Alternative A	3,038,000	0%	0	0%
Alternative B	11,339,000	73%	0	0%
Alternative C	14,390,000	79%	0	0%
Alternative D	3,038,000	0%	0	0%
Alternative E	3,038,000	0%	0	0%
Alternative F	11,339,000	73%	0	0%
Proposed Plan	5,974,000	49%	9,000	100%

Source: BLM 2015

<sup>1</sup> Includes IHMA

<sup>2</sup> This table displays the acres of PHMA and GHMA open to mineral entry and recommended for withdrawal from locatable mineral entry in MZ IV; it also displays the percentage of those acres that are found within the sub-region.

4  
5 Alternatives A and E would have similar acres open in PHMA and would not incorporate  
6 special mitigation measures for locatable mineral development in GRSG habitat. Locatable  
7 mineral mining would continue to affect GRSG through habitat loss and degradation. As a

1 result, Alternative E would not provide any net conservation gain to GRSG compared to  
2 Alternative A.

3 Under Alternatives B, C and F, PHMA would be recommended for withdrawal and  
4 applicable BMPs would be mandatory as COAs within PHMA. The most acreage of all the  
5 alternatives would be recommended for withdrawal in PHMA. These alternatives would  
6 restrict future locatable mineral operations on GRSG habitat more than other alternatives;  
7 thus they would provide more protections and conservation gains to GRSG habitat from  
8 locatable mineral development.

9 Under Alternatives D and the Proposed Plan, the BLM and Forest Service would apply  
10 reasonable and appropriate RDFs and BMPs as Conditions of Approval to prevent  
11 unnecessary or undue degradation of GRSG habitat. The Proposed Plan would also  
12 recommend SFAs for withdrawal. Thus, these alternatives would provide a net conservation  
13 gain to GRSG.

14 Under all alternatives, BMPs and RDFs outlined in **Appendix B** would help minimize  
15 impacts on GRSG from locatable mineral development on federal land. Clustering  
16 operations and facilities as close as possible and placing new infrastructure in already  
17 disturbed locations would reduce impacts on sagebrush habitats.

18 Authorizations of new locatable mineral sites that require state agency review or approval  
19 would be subject to either the regulatory mechanisms of the Montana, Nevada, or Utah state  
20 plans. These measures would be of particular benefit on privately-owned surface and on  
21 split-estate lands with BLM-administered federal mineral estate and other surface ownership,  
22 where BLM and Forest Service protective regulatory mechanisms do not apply.

23 Reasonably foreseeable locatable mineral development in MZ IV is expected to increase over  
24 the 20-year analysis period (**Section 5.1.12**), though state and private GRSG conservation  
25 efforts as well as other BLM and Forest Service proposed plans in MZ IV would reduce the  
26 threat by applying RDFs as Conditions of Approval. The disturbance caps in the Proposed  
27 Plans would not block locatable mineral entry projects, but any locatable mineral entry  
28 would be considered as disturbance under the cap. When restrictions within the Idaho and  
29 southwestern Montana LUPA are added to these conservation actions, this would result in a  
30 net conservation gain to GRSG habitats and populations in MZ IV.

#### 31 *Nonenergy Leasable Minerals*

32 Nonenergy leasable minerals are materials such as phosphate, sulfates, silicates, and trona  
33 (sodium carbonate). Impacts on GRSG are similar to those from other types of mining.

34 Conditions in the Sub-region and in MZ IV. Existing leases for nonenergy leasable minerals  
35 represent a relatively small threat spatially, as 12,000 acres (less than 1 percent) of GRSG  
36 habitats in MZ IV are directly affected by existing prospecting permits (Manier et al. 2013, p.  
37 71). Phosphate development is prevalent in southeastern Idaho, though acres disturbed are  
38 not known (**Section 3.12**).

1 Impact Analysis. **Table 5-11** provides a quantitative summary of acreages of BLM-  
2 administered and National Forest System lands open and closed to nonenergy leasable  
3 mineral leasing across MZ IV.

**Table 5-11**

**Acres Open and Closed to Nonenergy Leasable Mineral Leasing in GRSG Habitat in MZ IV**

	Priority Habitat Management Areas		General Habitat Management Areas <sup>1</sup>	
	MZ IV	Percent Within Sub-Region	MZ IV	Percent Within Sub-Region
Open to Nonenergy Leasing				
Alternative A	7,886,000	100%	6,006,000	54%
Alternative B	0	0%	3,815,000	28%
Alternative C	0	0%	2,755,000	0%
Alternative D	6,000	100%	6,003,000	54%
Alternative E	7,220,000	100%	6,484,000	58%
Alternative F	0	0%	3,821,000	28%
Proposed Plan	0	0%	8,391,000	67%
Closed to Nonenergy Leasing				
Alternative A	8,036,000	11%	744,000	36%
Alternative B	15,922,000	55%	716,000	33%
Alternative C	19,185,000	63%	478,000	0%
Alternative D	15,916,000	55%	744,000	36%
Alternative E	8,064,000	11%	691,000	31%
Alternative F	15,922,000	55%	746,000	36%
Proposed Plan	12,855,000	44%	1,747,000	73%

Source: BLM 2015

<sup>1</sup> Includes IHMA

<sup>2</sup> This table displays the acres of PHMA and GHMA open and closed to nonenergy leasing in MZ IV; it also displays the percentage of those acres that are found within the sub-region.

4  
5 Alternatives B, C, D, F and the Proposed Plan would increase the acreage of PHMA closed  
6 to nonenergy leasing compared to current management (Alternative A) and Alternative E.  
7 The alternatives would provide fewer protections in GHMA, though the Proposed Plan  
8 would increase the acres closed to nonenergy leasing. The Proposed Plan would provide  
9 additional protections compared to the other action alternatives by requiring anthropogenic  
10 disturbance criteria, a 3 percent disturbance cap, buffers, RDFs and BMPs, and mitigation.

1 However, under the Montana Executive Order, authorizations of new nonenergy mineral  
2 leases that require state agency review or approval would be subject to the GRSG permitting  
3 process. They also would be subject to stipulations for development in GRSG Core Areas.  
4 Similarly, authorizations in Nevada would be subject to measures in the Nevada state plan,  
5 including avoidance, minimization, and mitigation of any unavoidable impacts to GRSG  
6 habitat, and authorization in GRSG Management Areas in Utah would subject to  
7 consultation with UDWR and conservation measures. New authorizations that would occur  
8 in the majority of MZ IV within Idaho or Oregon that lack state plans containing regulatory  
9 mechanisms, may incorporate GRSG habitat recommendations from these states' plans  
10 though these would voluntary measures and not binding conditions. These stipulations  
11 would be of particular benefit on privately-owned surface and on split-estate lands with  
12 BLM-administered federal mineral estate and other surface ownership, where BLM and  
13 Forest Service protective regulatory mechanisms do not apply.

14 Reasonably foreseeable nonenergy leasable mineral development in MZ IV is expected to  
15 increase over the 20-year analysis period (**Section 5.1.12**). However, state and private GRSG  
16 conservation efforts as well as other BLM and Forest Service proposed plans in MZ IV  
17 would reduce the threat by providing additional protections such as disturbance caps, RDFs,  
18 and mitigation. When restrictions within the Idaho and southwestern Montana LUPA are  
19 added to these conservation actions, this would result in a net conservation gain to GRSG  
20 habitats and populations in MZ IV.

### 21 ***Recreation***

22 Nature and Type of Effects. Recreation, such as camping, bicycling, wildlife viewing,  
23 horseback riding, fishing, and hunting, can be dispersed; concentrated, such OHV use and  
24 developed campsites; and permitted, such as via BLM Special Recreation Permit and Forest  
25 Service Special Use Permit. The BLM also manages Special Recreation Management Areas  
26 (SRMAs) where recreation is a primary resource management consideration.

27 Recreation on federally administered lands that use the extensive network of double-track  
28 and single-track routes have an impact on sagebrush and GRSG. Ecological impacts of roads  
29 and motorized trails are mortality due to collisions; behavior modifications due to noise,  
30 activity, and habitat loss; alteration of physical environment; nutrient leaching; erosion;  
31 invasive plants spread; increased use; and alteration by humans due to accessibility (Knick et  
32 al. 2011, p. 219). Recreation activities can degrade GRSG habitat through direct impacts on  
33 vegetation and soils, introduction or spread of invasive species, and habitat fragmentation.  
34 This occurs in areas of concentrated use, trailheads, staging areas, and routes and trails.

35 Motorized activities, including OHV use, are expected to have a larger footprint on the  
36 landscape. They are anticipated to have the greatest level of impact due to noise levels,  
37 compared to nonmotorized uses, such as hiking or equestrian use. Cross-country motorized  
38 travel, which is permitted in designated areas on BLM-administered lands but not National  
39 Forest lands, would increase the potential for soil compaction, perennial grasses and forbs  
40 loss, and reduce sagebrush canopy cover. Losses in sagebrush canopy could be the result of  
41 repeated, high frequency, cross-country OHV use over long periods. In addition, the

1 chances of wildfire are increased during the summer, when fire dangers are high and  
2 recreation is at its highest.

3 Dispersed uses expand the human footprint. Closing areas to recreation and reclaiming  
4 unused, minimally used, or redundant roads in and around sagebrush habitats during  
5 seasonal use by GRSG may reduce the footprint and presumably impacts on wildlife.  
6 Restricting access to important habitat areas during seasonal use (lekking, nesting, brood-  
7 rearing, and wintering) may decrease the impacts associated with humans. However, access  
8 restriction will not eliminate other impacts, such as invasive plant spread, predator  
9 movements, cover loss, and erosion (Manier et al. 2013, p. 108).

10 Conditions in the Sub-region and in MZ IV. Human populations have increased and  
11 expanded, primarily over the past century and in the western portion of the sagebrush  
12 distribution (Knick et al. 2011, p. 212). With these expanding populations come greater  
13 human impacts (Leu et al. 2008).

14 The COT report objectives for recreation are to maintain healthy native sagebrush  
15 communities, based on local ecological conditions, and to manage direct and indirect human  
16 disturbance (including noise) to avoid interruption of normal GRSG behavior (USFWS  
17 2013, p. 49). Limits on road use under the action alternatives and limits on OHVs would  
18 help meet these objectives.

19 In the Idaho and southwestern Montana sub-region, travel management planning is  
20 underway to determine specific routes available for closure.

21 Impact Analysis. **Table 5-12** shows Acres of Travel Management Designations in GRSG  
22 Habitat in MZ IV.

**Table 5-12**

Source: BLM 2015

<sup>1</sup> Includes IHMA

This table displays the acres of PHMA and GHMA within travel management designations of open, limited and closed in MZ IV; it also displays the percentage of those acres that are found within the sub-region.

1 As shown in **Table 5-12**, there are slight variations among alternatives in acres closed and  
 2 limited to motorized vehicles in both PHMA and GHMA. However, the action alternatives  
 3 would reduce acres open in PHMA, particularly Alternatives C and the Proposed Plan, under  
 4 which no acres would be open to motorized vehicles. There would be a similar reduction in  
 5 GHMA except under Alternative E where more acres would be open compared to current  
 6 management. As a result of travel management planning, impacts on GRSG from  
 7 recreational motorized vehicle use would be greatest under Alternatives A and E; impacts  
 8 would be reduced most under Alternative C and the Proposed Plan.

9 For recreation, Alternatives B, D, and the Proposed Plan would aim to reduce impacts on  
 10 GRSG with issuance of SRPs and SUPs. Alternative F would take a similar approach, but

1 with the addition of seasonal restrictions within 4 miles of active leks. Alternatives A, C, and  
2 E would not manage recreation to reduce impacts on GRSG.

3 Reasonably foreseeable recreation in MZ IV is expected to increase over the 20-year analysis  
4 period (**Section 5.1.12**). However, state and private GRSG conservation efforts as well as  
5 other BLM and Forest Service proposed plans in MZ IV would reduce the threat by  
6 providing additional protections such as disturbance caps and limitations on National Forest  
7 System lands. When restrictions within the Idaho and southwestern Montana LUPA are  
8 added to these conservation actions, this would result in a net conservation gain to GRSG  
9 habitats and populations in MZ IV.

#### 10 **5.1.7 Existing Conditions in WAFWA MZs II/VII**

11 This section summarizes existing conditions and past and present actions for the Idaho and  
12 southwestern Montana sub-region (provided in more detail in **Chapter 3**) and for MZs  
13 II/VII as a whole. Reasonably foreseeable future actions are discussed in **Section 5.1.9**.

##### 14 ***GRSG Habitat and Populations***

15 MZs II/VII consist of eleven GRSG populations: Eagle-South Routt, Middle Park, Laramie,  
16 Jackson Hole, Wyoming Basin, Rich-Morgan-Summit, Uintah, North Park, Northwest  
17 Colorado, Parachute-Piceance-Roan Basin, and Meeker-White River (Garton et al. 2011).  
18 The sub-region includes the Wyoming Basin population. Leks in the northern portion of  
19 MZs II/VII are the most highly connected in the range (Knick and Hanser 2011);  
20 populations in southern portions of MZ II/VII (the Colorado Plateau) are less robust, with  
21 low lek connectivity and a 96 percent chance of populations declining below 200 males by  
22 2037 (Garton et al. 2011; Knick and Hanser 2011). The Wyoming Basin population showed  
23 a 63 percent decline in estimated minimum male population attending leks in the population  
24 between 2007 and 2013 (Garton et al. 2015, p. 34). MZs II/VII include GRSG populations  
25 in Idaho, Montana, Wyoming, Utah, and Colorado.

26 In MZs II/VII, BLM-administered, National Forest System and other federal lands account  
27 for over 20 million acres of GRSG habitat (approximately 58 percent of habitat), with state  
28 and private lands accounting for approximately 16 million acres of GRSG habitat  
29 (approximately 44 percent of habitat) (Manier et al. 2013, p. 118). This indicates the  
30 importance of conservation and restoration on both private and public lands.

31 **Table 5-13** provides a breakdown of landownership and acres of GRSG habitat in MZs  
32 II/VII. As the table shows, approximately 52 percent of priority habitat and 47 percent of  
33 general habitat is on BLM-administered lands. Less than one percent of priority habitat and  
34 2 percent of general habitat is on National Forest System lands. The remaining 18,028,000  
35 million acres (49 percent) of GRSG habitat in the MZs comprise private, local state, and  
36 other federal and tribal lands. Acres in these and other tables are rounded to the nearest  
37 1,000 acres. Values of less than 1,000 acres are presented as 0 acres.

Table 5-13

Management Jurisdiction in MZs II/VII by Acres of Priority and General Habitats

	Total Surface Area (Acres)	Priority (Acres)	General (Acres)	Non-habitat (Acres)
<b>MZ IV</b>	92,776,100 (100%)	17,476,000 (19%)	19,200,200 (21%)	56,099,900 (60%)
BLM	30,295,000 (33%)	9,021,200 (30%)	9,012,500 (30%)	12,261,300 (40%)
Forest Service	23,558,800 (25%)	162,000 (<1%)	452,500 (2%)	22,944,300 (97%)
Tribal and other federal	7,086,200 (8%)	784,000 (11%)	1,354,600 (19%)	4,947,600 (70%)
Private	27,405,400 (30%)	6,233,900 (23%)	7,394,800 (27%)	13,776,700 (50%)
State	4,053,900 (4%)	1,244,800 (31%)	979,800 (24%)	1,829,300 (45%)
Other	376,700 (<1%)	30,100 (8%)	6,000 (2%)	340,600 (90%)

Source: Manier et al. 2013, p. 118

A very small percentage—approximately one tenth of one percent—of PHMA and GHMA in MZs II/VII are located on BLM-administered and National Forest System lands in the Idaho and southwest Montana sub-region. As a result, BLM and Forest Service management in this sub-region would have very little influence on GRSG across the broader MZs II/VII. BLM and Forest Service management in this sub-region would be most effective at conserving a portion of the Wyoming Basin population; it would have little or no effect on other populations in the MZs. Because past, present, and reasonably foreseeable future actions do not vary by alternative, the incremental effect of implanting any of the Idaho and southwest Montana LUPA alternatives on GRSG in MZs II/VII would vary little across the range of alternatives.

**Population Trends in Management Zones II/VII**

The Wyoming Basin population within MZs II/VII is the largest population in the GRSG range with over 20,000 males attending leks annually. Although recent data suggests a population increase, long-term monitoring is trending downward and population modeling suggests this trend will continue (Garton et al. 2011). Between 2007 and 2013, this population showed a 63 percent decline in the estimated minimum male population attending leks in the population (Garton et al. 2015, p. 34).

Wyoming data suggest a cyclic pattern with population lows in 1995, 2002 and 2013 and peaks in 2000 and 2006. Actual trends are difficult to discern due to the lower survey effort prior to 2007, meaning the number and proportion of active/inactive leks is unknown. Since 2007, the number of active leks has remained stable (approximately 1,100 active leks), but the number of males/active lek has declined by more than half (from 42 to 17 males/lek).

1 The isolation of many other populations on the fringes of MZs II/VII makes them  
2 particularly vulnerable to habitat loss and fragmentation. The Wyoming Basin population  
3 within Wyoming and extending into the sub-region is at risk due to renewable and non-  
4 renewable energy development, long-term drought, and brush eradication programs  
5 (USFWS 2013, p. 68).

#### 6 **5.1.8 Regional Efforts to Manage Threats to GRSG in MZs II/VII**

7 There are several regional efforts to manage threats to GRSG in MZs II/VII. These efforts  
8 may have a strong influence in alleviating threats to GRSG than BLM and Forest Service  
9 actions alone. This is because state and private lands account for approximately 16 million  
10 acres (approximately 44 percent) of GRSG habitat in MZs II/VII (Manier et al. 2013, p.  
11 118).

##### 12 ***Idaho Statewide Efforts***

13 Idaho statewide efforts are as described in **Section 5.1.4.**

##### 14 ***Montana Statewide Efforts***

15 Montana statewide efforts are as described in **Section 5.1.4.**

##### 16 ***Natural Resource Conservation Service Sage Grouse Initiative***

17 The NRCS SGI is as described in **Section 5.1.4.** As of 2014, the most recent year for which  
18 data are available, SGI has secured conservation easements on 243,403 acres within MZs  
19 II/VII (NRCS 2015).

##### 20 ***Wyoming Statewide Efforts***

21 Wyoming has established Core Population Areas to help delineate landscape planning units  
22 by distinguishing areas of high biological value. These areas are based on the locations of  
23 breeding areas and are intended to help balance GRSG habitat requirements with demand  
24 for energy development (Doherty et al. 2011).

25 In 2000, the Wyoming Sage-Grouse Working Group (WSG WG) was formed to develop a  
26 statewide strategy for GRSG conservation. This group prepared the Wyoming GRSG  
27 Conservation Plan (WSG WG 2003) to provide coordinated management and direction  
28 across the state. In 2004, local GRSG working groups were formed to develop and  
29 implement local conservation plans. Eight local working groups around Wyoming have  
30 completed conservation plans, many of which prioritize addressing past, present, and  
31 reasonably foreseeable threats at state and local levels, and prescribe management actions for  
32 private landowners to improve GRSG conservation at the local scale, consistent with the  
33 overall Wyoming Core Area Strategy.

34 Wyoming Executive Order. Wyoming Governor Matt Mead issued an executive order on  
35 June 2, 2011, that complemented and replaced several executive orders issued by his  
36 predecessor. The 2011 Wyoming Executive Order articulates Wyoming's Core Population  
37 Area Strategy (Core Area Strategy) as an approach to balancing GRSG conservation and  
38 development. It also provides an approach to mitigating human disturbances to GRSG. The  
39 USFWS believes that Wyoming's Core Area Strategy, if extended to all landowners via

1 regulatory mechanisms, would provide adequate protection for GRSG and its habitat  
2 (USFWS 2010); however, universal implementation remains uncertain due to the variety in  
3 landownership and management (Manier et al. 2013).

4 The Wyoming Executive Order applies to state trust lands starting in 2008. These trust lands  
5 cover almost 23 percent of GRSG habitat and benefit approximately 80 percent of the  
6 estimated breeding population in the state (USFWS 2010). All proposed activities are  
7 evaluated through a density/disturbance calculation tool to determine if the project would  
8 exceed recommended density/disturbance thresholds. Additionally, the order has  
9 stipulations to be included in permits, with varying restrictions depending on whether the  
10 proposed development activity occurs within or outside delineated Core Population Areas  
11 (Wyoming Executive Order, June 2, 2011).

12 In Core Areas, there is a 0.6-mile no surface occupancy (NSO) buffer around occupied leks,  
13 density restrictions of one location per 640 acres, a disturbance cap of 5 percent, and  
14 restrictions on activities in breeding and winter concentration habitat. This buffer provides  
15 protection for males during lekking season and acts in coordination with the density  
16 disturbance cap. Large wind energy and other development projects would not be allowed  
17 within Core Areas unless they would have no adverse effects to GRSG. Such a combination  
18 of restrictions could offer GRSG considerable regulatory protection within Wyoming.

19 Statewide modeling of trends under the Core Area Strategy suggests that with effective  
20 enforcement statewide, the strategy could reduce population losses by 9 to 15 percent across  
21 Wyoming. Moreover, the number of Core Areas predicted to maintain 75 percent of their  
22 current populations could increase from 20 to 25 under long-term scenarios (Copeland et al.  
23 2013). Combining the Core Area Strategy with \$250 million in target conservation easements  
24 (provided willing landowners and funding are available) could reduce population declines by  
25 another 9 to 11 percent (Copeland et al. 2013).

26 Sweetwater River Conservancy Habitat Conservation Bank. The Sweetwater River  
27 Conservancy Habitat Conservation Bank is the first conservation bank established for  
28 GRSG. Located in central Wyoming, the bank manages habitat for GRSG allowing energy  
29 development and other activities to proceed on other lands within Wyoming. A conservation  
30 bank is a site or suite of sites established under an agreement with the USFWS, intended to  
31 protect, and improve habitat for species. Credits may be purchased which result in perpetual  
32 conservation easements and conservation projects on the land to offset impacts occurring  
33 elsewhere. The Sweetwater River Conservancy Habitat Conservation Bank launched with  
34 55,000 deeded acres of GRSG habitat, and could expand up to 700,000 acres on other lands  
35 owned by the Sweetwater River Conservancy contingent upon demand (USFWS 2015).

36 Wyoming Landscape Conservation Initiative. The Wyoming Landscape Conservation  
37 Initiative is a long-term science based effort to assess and enhance aquatic and terrestrial  
38 habitats at a landscape scale in southwest Wyoming, while facilitating responsible  
39 development through local collaboration and partnership. Collaborative efforts address  
40 multiple concerns at a scale that considers all activities on the landscape, and can leverage  
41 resources that might not be available for single agency projects. GRSG initiatives from the

1 Wyoming Landscape Conservation Initiative have included habitat enhancement efforts  
2 (e.g., invasive weed treatment, prescribed grazing strategies), and GRSG research studies  
3 (Wyoming Landscape Conservation Initiative 2013).

4 Umbrella Candidate Conservation Agreement with Assurances for Wyoming Ranch  
5 Management. Candidate Conservation Agreements with Assurances are voluntary  
6 conservation agreements between the USFWS and one or more federal or private partners  
7 (e.g., the ranchers). In return for managing lands to benefit GRSG, landowners receive  
8 assurances against additional regulatory requirements should GRSG be listed under the  
9 Endangered Species Act. Within Wyoming, the USFWS and Wyoming Governor's Office in  
10 conjunction with the BLM, Natural Resources Conservation Service, Forest Service, and  
11 other agencies, have developed an umbrella Candidate Conservation Agreement with  
12 Assurances for range management activities. Enrolled landowners are expected to comply  
13 with grazing specific conservation measures including but not limited to: avoid (or  
14 rotationally utilize) known nesting and brood-rearing habitat as a location for activities that  
15 concentrate livestock such as stock tank placement branding and roundup; place salt or  
16 mineral supplements in sites minimizing impacts to GRSG habitat; and within 24 months  
17 develop and implement a written grazing management plan to maintain or enhance the  
18 existing plant community as suitable GRSG habitat (USFWS et al. 2013).

#### 19 ***Colorado Statewide Efforts***

20 In 2008, the Colorado Division of Wildlife (now Colorado Parks and Wildlife) developed a  
21 state conservation plan, which prioritized threats and identified key issues facing  
22 conservation. The plan included issues, objectives, and strategies in detail. The strategies for  
23 conservation discussed responsible parties, lead agency, timeline, and cost associated with  
24 implementation of the strategy.

25 In 2012, a state conservation plan revision process began, and in consultation with  
26 stakeholders, a matrix summarizing implementation and effectiveness of the strategies was  
27 developed (Colorado Package), along with a subsequent Synthesis Report. The Colorado  
28 Package identified a number of conservation efforts within Colorado which have resulted in  
29 positive impacts to GRSG including acquisition of conservation easements and habitat  
30 improvement projects (Colorado Department of Natural Resources 2013). The Synthesis  
31 Report provided additional information on the effectiveness of conservation efforts such as  
32 county zoning ordinances which support protection of GRSG habitat, and measures from  
33 the Colorado State Board of Land Commissioners which will support adaptive management  
34 techniques to improve GRSG habitat (Colorado Department of Natural Resources 2014).

35 Colorado Oil and Gas Conservation Commission Rules. Oil and gas development in  
36 Colorado is governed primarily by statutory provisions of the Oil and Gas Conservation  
37 Act (Colo. Rev. Stat. § 34-60-100, et seq.) and rules developed by the Colorado Oil and Gas  
38 Conservation Commission (COGCC) (2 CCR 404-1, et seq.). The rules are intended to  
39 prevent waste and to conserve oil and gas in Colorado while protecting public health, safety,  
40 and welfare, including the environment and wildlife resources. As the state agency charged  
41 with promoting the exploration, development, and conservation of Colorado's oil and gas  
42 resources, the COGCC also handles the drilling permit process and ensures industry

1 compliance with state-wide oil and gas statutes and regulations. Operators may be subject to  
2 consultation requirements under the Colorado Oil and Gas Conservation Commission  
3 Rules, to determine if conditions of approval are necessary to minimize adverse impacts  
4 from propose oil and gas operations in sensitive wildlife habitat (e.g., GRSG PHMA).

### 5 ***Utah Statewide Efforts***

6 The Conservation Plan for Greater Sage-grouse in Utah (2013) was designed to protect,  
7 enhance, and restore GRSG habitat, in an effort to reduce the threats to the species. The  
8 plan identifies 11 GRSG management areas throughout the state (including lands within  
9 MZs II/VII), which represent areas of high habitat value. The plan calls for state and local  
10 efforts to obtain incentive-based negotiated covenants, easements, leases or other legal tools  
11 in order to protect habitat. Additionally, the plan identifies a five percent disturbance  
12 limitation of habitat on state or federally managed lands, intended to limit the effects of large  
13 scale disturbances.

### 14 ***Other Regional Efforts***

15 Other regional efforts are as described in **Section 5.1.4**.

### 16 **5.1.9 Relevant Cumulative Actions**

17 This cumulative effects analysis considers past, present, and reasonably foreseeable future  
18 actions on other federal, state, private or mixed landownership lands in MZs II/VII  
19 (**Section 5.1.12**). Where these actions interface with GRSG habitat, they would cumulatively  
20 add to the impacts of BLM- and Forest Service-authorized activities.

21 The following list includes past, present, and future actions in MZs II/VII that could  
22 cumulatively affect GRSG (more detail is included in the table in Appendix A):

- 23 • Pinedale Anticline Project, Wyoming
- 24 • LaBarge Platform Exploration and Development Project, Wyoming
- 25 • Continental Divide-Creston Natural Gas Project, Wyoming
- 26 • Moneta Divide Natural Gas and Oil Development Project, Wyoming
- 27 • Black Fork Project (Formerly Moxa Arch Area Infill), Wyoming
- 28 • Atlantic Rim Natural Gas Field Development Project, Wyoming
- 29 • Chokecherry Sierra Madre Wind Farm, Wyoming
- 30 • Hiawatha Regional Energy Development Project, Wyoming, Colorado
- 31 • Oil Shale and Tar Sands Programmatic EIS, Wyoming, Colorado, Utah
- 32 • Gateway South Transmission Project, Wyoming, Colorado, Utah
- 33 • TransWest Express Transmission Line Project, Wyoming, Colorado, Utah,  
34 Nevada

- Gateway West Transmission Line Project, Wyoming, Idaho
- Riley Ridge to Natrona Pipeline Project, Wyoming
- Invasive Plant Management EIS for the Medicine Bow-Routt National Forests and Thunder Basin National Grassland, Wyoming, Colorado

### 5.1.10 Threats to GRSG in Management Zones II/VII

In its COT report, the USFWS identifies energy development, infrastructure, grazing/free-roaming equids, conversion to agriculture, fire, spread of weeds, recreation, and conifers as the present and widespread threats facing GRSG in MZs II/VII (USFWS 2013, pp. 17-19, 27-28). Each threat is discussed below.

#### *Energy Development and Mining*

The COT report states that energy development should be designed to ensure that it will not impinge on stable or increasing GRSG population trends. For mining, the objective is to maintain stable to increasing GRSG populations and no net loss of GRSG habitats in areas affected by mining (USFWS 2013, p. 49).

There are approximately 1,144,800 acres of GRSG habitat in MZs II/VII where energy and mineral development is presently occurring. There are over 30 million acres indirectly influenced by energy development (including oil and gas, coal leasing, mineral materials, and renewables) (Manier et al. 2013, pp. 52-71). No geothermal energy development is presently occurring in MZs II/VII. Indirect influences are primarily due to oil and gas leases. Of the 80 percent of GRSG habitat in MZ II/VII indirectly influenced by oil and gas development, approximately 50 percent occurs on BLM-administered land, with most of the remainder on private lands (Manier et al. 2013, p. 52). Only 1 percent of oil and gas development affects National Forest System lands. Approximately 7 percent of federal lands are closed to oil and gas leasing, but the majority of leased lands are presently undeveloped. BLM and Forest Service regulatory actions would primarily influence unleased areas by way of attaching stipulations, conditions of approval, and other conservation measures on future leases.

#### *Oil and Gas*

Nature and Type of Effects. The impacts of oil and gas development on GRSG are described in **Section 4.2** and above in **Section 5.1.6**.

Conditions in the Sub-region and in MZs II/VII. Forty-four percent of the 39-million acre federal mineral estate in MZs I and II is leased and authorized for exploration and development (Naugle et al. 2011). The Greater Green River Basin, Uintah-Piceance Basin, and North Park Basin are all important oil and gas reserves in MZs II/VII. In Wyoming, which contains the bulk of the mineral estate, 52 percent is authorized for development (Naugle et al. 2011). There are two leases on the Bear Lake Plateau within the sub-region but there has been no oil and gas development.

Approximately 15 percent of GRSG habitat in MZs II/VII is within 1.8 miles of oil and gas wells (Knick et al. 2011, p. 240). Oil and natural gas development-related wells indirectly influence over 50 percent of priority habitat and general habitat on BLM-administered lands

1 across MZs II/VII, occurring to a distance of 12 miles from the development. There are  
2 virtually no indirect impacts on National Forest System lands. Private surface lands account  
3 for 33 percent of the indirect impact in priority habitat and 37 percent in general habitat in  
4 MZs II/VII (Manier et al. 2013, p. 52). Thus, actions on BLM-administered land are likely to  
5 have a greater potential to ameliorate the effects of oil and gas development than any other  
6 single land management entity.

7 Though the BLM and Forest Service may restrict future leasing for oil and gas on BLM-  
8 administered and National Forest System lands within GRSG habitat, existing leases remain  
9 valid with potential for development based on locations of geologic fields for traditional oil  
10 and gas distributed extensively across eastern portions of GRSG range (Manier et al. 2013, p.  
11 51). Oil and gas reserves are extensive across the Powder River Basin of northeastern  
12 Wyoming and southeastern Montana; the Wyoming Thrust Belt of extreme southwestern  
13 Wyoming, and the Southwest Wyoming Basin including portions of southwestern and  
14 central Wyoming. The Southwestern Wyoming and the Uinta–Piceance geological basins are  
15 both located partly in MZs II/VII, and coincide with high-density areas of GRSG, large  
16 numbers of leks, and the highest male attendance at leks compared with any areas in the  
17 eastern part of the range (USFWS 2010).

18 According to the RFD scenario (**Appendix O**), permanent disturbance associated with oil  
19 and gas development is projected to occur on 156 acres within the sub-region over the next  
20 10 years. The potential for impacts would be reduced where areas are closed to fluid mineral  
21 leasing and where NSO and CSU/TL stipulations are applied. Given the small acreage and  
22 implementation of RDFs and BMPs (**Appendix B**), the likelihood for impacts on GRSG  
23 habitat on BLM-administered and National Forest System lands in the sub-region is  
24 anticipated to be small and localized under all alternatives.

25 Impact Analysis. **Tables 5-14** and **5-15** provide a quantitative summary of fluid mineral  
26 leasing conditions on BLM-administered and National Forest System lands across MZs  
27 II/VII, followed by an analysis of the Idaho and southwestern Montana sub-regional  
28 alternatives.

1

2

3

4

5

6

7

8

9

10

Acres open, closed, and with stipulations for fluid mineral leasing do not vary substantially across alternatives, as the acres in **Tables 5-14** and **5-15** represent the Proposed Plans from other BLM and Forest Service sub-regions and planning areas in MZs II/VII combined with the management in the MZs II/VII portion of the Idaho and southwestern Montana sub-region. Since the Idaho and southwestern Montana sub-region has so few acres within MZs II/VII, alternatives in this sub-region would have a relatively small influence on total acres open, closed, or with stipulations. As shown in **Tables 5-14** and **5-15**, any action alternative for fluid mineral leasing in the Idaho and southwestern Montana LUPA would affect 6 percent or less of GRSG habitat within MZs II/VII.

11

12

13

14

15

16

Implementing any alternative under the Idaho and southwestern Montana LUPA/EIS would not affect pending or future oil and gas development projects outside of the sub-region. For example, numerous oil and gas development projects are proposed in Wyoming (Appendix A). However, the NSO buffer and the disturbance cap under the Wyoming Executive Order would reduce the threat to GRSG from oil and gas development on non-federal lands in MZs II/VII.

17

18

19

20

21

22

23

All BLM and Forest Service Proposed Plans within MZs II/VII include BMPs and RDFs to minimize impacts on GRSG from oil and gas development on federal lands. Examples include: locating new compressor stations outside of PHMA to reduce noise disturbance; clustering operations and facilities as closely as possible; placing infrastructure in already disturbed locations where the habitat has not been fully restored; and restoring disturbed areas at final reclamation to the pre-disturbance landforms and desired plant communities. State plans contain similar measures to reduce impacts. Together, these measures would help

1 protect unfragmented habitats, minimize habitat loss and fragmentation, and maintain  
2 conditions that meet GRSG life history needs. Recent research indicates that restored  
3 habitats lack many of the features sought by GRSG in their habitat areas, and may not  
4 support GRSG for long periods following restoration activities. In order to conserve GRSG  
5 populations on the landscape, protection of existing habitat through minimizing  
6 development, would provide the best hope for GRSG persistence (Arkle et al. 2014).

7 The effect of the Proposed Plans and other conservation actions in the MZ (most notably  
8 the Montana and Wyoming executive orders) could be synergistic. For example, applying  
9 buffers in PHMA and on state and private land would effectively conserve larger blocks of  
10 land than if these actions occurred individually. This would provide a landscape-scale net  
11 conservation benefit, especially in areas where little development has occurred to date.

12 Reasonably foreseeable oil and gas development in MZs II/VII is expected to increase over  
13 the 20-year analysis period (**Section 5.1.12**), though state and private GRSG conservation  
14 efforts as well as other BLM and Forest Service proposed plans in MZ IV would reduce the  
15 threat by restricting the location of developments, implementing disturbance caps and  
16 planned restoration activities. Together these conservation actions would result in a net  
17 conservation gain to GRSG habitats and populations in MZ IV regardless of management  
18 within the Idaho and southwestern Montana sub-region.

#### 19 *Coal*

20 While coal is the major mining activity in GRSG habitat (Braun 1998), there is no potential  
21 for coal within the sub-region. Coal mines are widespread in southern portions of MZs  
22 II/VII, and federal leases developed through surface extraction directly influence  
23 approximately 52,100 acres of these MZs. There is the potential for additional coal mining in  
24 large portions of priority habitat and general habitat in MZs I, II, and VII. Indirect effects of  
25 surface coal mines suggest influence over approximately 8 percent of priority habitat across  
26 the range of the species and approximately 5 percent of priority habitat in MZs II/VII.  
27 Approximately 36 percent of priority habitat that is indirectly influenced by coal mines  
28 across the species' range are managed by BLM. Although coal companies have demonstrated  
29 that disturbed lands can be restored to a point that supports a diversity of vegetative species,  
30 including big sagebrush, there is little evidence that GRSG populations have reoccupied  
31 habitat disturbed by coal mining, at least in terms of lek establishment (Manier et al. 2013,  
32 pp. 70-71, 74).

33 Coal development is also managed at the state level. For example, coal development that  
34 requires state agency review or approval would be subject to the permitting process and  
35 stipulations for development in GRSG Core areas under the Wyoming Executive Order.  
36 Additionally, new coal leases applications on federal lands would be subject to 43 CFR, Part  
37 3461.5, Criterion 15. This states that a lease may be issued if, after consultation with the  
38 state, the surface management agency determines that all or certain stipulated methods of  
39 coal mining would not have a significant long-term impact on the GRSG. Special conditions  
40 could be required, as identified during the leasing process, to protect GRSG habitat. The  
41 requirements of 43 CFR, Part 3461.5, Criterion 15, in combination with BLM and Forest  
42 Service planning efforts and state plans, would help reduce the threat from coal extraction

1 and would provide a net conservation gain to GRSG habitats and populations in MZs  
2 II/VII.

3 *Mineral Materials*

4 Nature and Type of Effects. The impacts of mineral material development on GRSG are  
5 described in **Section 4.2** and above in **Section 5.1.6**.

6 Conditions in the Sub-region and in MZs II/VII. There are 846,600 acres of mining and  
7 mineral materials disposal sites (not including minerals mined as energy sources) on BLM-  
8 administered surface land on priority habitat and general habitat in MZs II/VII. There are  
9 1,027,500 acres across all landownership types, making BLM-administered land the largest  
10 contributor to direct effects from this threat. National Forest System lands contribute to  
11 direct effects on 3,100 acres of priority habitat and general habitat (Manier et al. 2013, p. 77).

12 Indirect effects are estimated to 1.5 miles out from the direct effects area. In total, 65  
13 percent of priority habitat and 60 percent of general habitat influenced by the indirect impact  
14 of mining and mineral materials disposal sites are on BLM-administered land. This does not  
15 include minerals mined as energy sources. Mining and mineral materials disposal sites on  
16 private land, by comparison, indirectly affect 26 percent of priority habitat and 32 percent of  
17 general habitat. National Forest System lands have virtually no indirectly effects on priority  
18 habitat and general habitat (Manier et al. 2013, p. 77). As a result, management of mining  
19 and material disposal sites on BLM-administered land would have the greatest impact on  
20 GRSG habitat conditions.

21 Impact Analysis. Acres open and closed to mineral material disposal do not vary  
22 substantially across alternatives, as the acres in **Table 5-16** represent the Proposed Plans  
23 from other BLM and Forest Service sub-regions and planning areas in MZs II/VII  
24 combined with the management in the MZs II/VII portion of the Idaho and southwestern  
25 Montana sub-region. Since the Idaho and southwestern Montana sub-region has so few  
26 acres within MZs II/VII, alternatives in this sub-region would have a relatively small  
27 influence on total acres open or closed. As shown in **Table 5-16**, any alternative for mineral  
28 materials management in the Idaho and southwestern Montana LUPA would affect 2  
29 percent or less of GRSG habitat within MZs II/VII.

<sup>2</sup> This table displays the acres of PHMA and GHMA open and closed to mineral material disposal in MZ II/VII; it also displays the percentage of those acres that are found within the sub-region.

1

2 Reasonably foreseeable future mineral material disposals in MZs II/VII could affect GRSG  
3 through habitat disturbance, fragmentation, or behavior disruptions, depending on the  
4 location and extent of the project; however, implementation of BLM and Forest Service  
5 Proposed Plans in other areas of MZs II/VII would restrict development, thereby reducing  
6 the risk of removing or fragmenting habitat elsewhere in MZs II/VII, particularly on federal  
7 lands. There would be a net conservation gain to GRSG habitats and populations in MZs  
8 II/VII, but it would be concentrated in areas outside the Idaho and southwestern Montana  
9 sub-region.

10 Under the Wyoming and Montana Executive Orders, authorizations of new mineral material  
11 disposal sites that require state agency review or approval would be subject to the GRSG  
12 permitting process. They also would be subject to stipulations for development in GRSG  
13 Core areas. These stipulations would be of particular benefit on privately owned surface and

1 subsurface lands, where BLM and Forest Service protective regulatory mechanisms do not  
2 apply.

3 Reasonably foreseeable mineral material development in MZs II/VII is expected to increase  
4 over the 20-year analysis period (**Section 5.1.12**), though state and private GRSG  
5 conservation efforts as well as other BLM and Forest Service proposed plans in MZ IV  
6 would reduce the threat by restricting the location of developments, implementing  
7 disturbance caps and planned restoration activities. Together these conservation actions  
8 would result in a net conservation gain to GRSG habitats and populations in MZ IV  
9 regardless of management within the Idaho and southwestern Montana sub-region.

10 *Locatable Minerals*

11 Nature and Type of Effects. The impacts of locatable mineral development on GRSG are  
12 described in **Section 4.2** and above in **Section 5.1.6**.

13 Conditions in the Sub-region and in MZ II/VII. The magnitude of existing conditions in the  
14 sub-region is largely unknown, but mining of locatable federal mineral resources currently  
15 affects approximately 2.2 percent of GRSG habitat in MZs II/VII (Manier et al. 2013, p. 74).

16 Impact Analysis. Under all alternatives, BMPs and RDFs in all BLM and Forest Service  
17 Proposed Plans would help minimize the impacts on GRSG from locatable mineral  
18 development on federal land. Examples include: clustering operations and facilities as closely  
19 as possible; placing infrastructure in already disturbed locations where the habitat has not  
20 been fully restored; and restoring disturbed areas at final reclamation to the pre-disturbance  
21 landforms and desired plant communities.

22 Acres open and recommended for withdrawal from locatable mineral entry do not vary  
23 substantially across alternatives, as the acres in **Table 5-17** represent the Proposed Plans  
24 from other BLM and Forest Service sub-regions and planning areas in MZs II/VII  
25 combined with the management in the MZs II/VII portion of the Idaho and southwestern  
26 Montana sub-region. Since the Idaho and southwestern Montana sub-region has so few  
27 acres within MZs II/VII, alternatives in this sub-region would have a relatively small  
28 influence on total acres open or recommended for withdrawal. As shown in **Table 5-17**, any  
29 alternative for locatable minerals management in the Idaho and southwestern Montana  
30 LUPA would affect 7 percent or less of GRSG habitat within MZs II/VII. The greatest  
31 impacts would result under Alternatives B, C, and F, where PHMA in the Idaho and  
32 southwestern Montana sub-region would be recommended for withdrawal.

<sup>1</sup> Includes IHMA

<sup>2</sup> This table displays the acres of PHMA and GHMA open to mineral entry and recommended for withdrawal from locatable mineral entry in MZ II/VII; it also displays the percentage of those acres that are found within the sub-region.

1  
2 Under the Proposed Plans, portions of SFAs would be recommended for withdrawal. SFAs  
3 represent areas having the highest densities of GRSG and other criteria important for the  
4 persistence of the species. As such, if these areas are withdrawn, the Proposed Plan would  
5 provide a greater net conservation gain to GRSG populations by reducing disturbance to  
6 birds from mining. However due to the sub-region containing such a small percentage of  
7 GRSG habitat within the larger MZs, the impact of the sub-region would be limited.

Reasonably foreseeable locatable mineral development in MZs II/VII is expected to increase over the 20-year analysis period (**Section 5.1.12**), though state and private GRSG conservation efforts as well as other BLM and Forest Service proposed plans in MZ IV would reduce the threat. Together these conservation actions would result in a net conservation gain to GRSG habitats and populations in MZ IV regardless of management within the Idaho and southwestern Montana sub-region.

*Nonenergy Leasable Minerals*

Nature and Type of Effects. The impacts of nonenergy leasable mineral development on GRSG are described in **Section 4.2** and above in **Section 5.1.6**.

Conditions in the Sub-region and in MZs II/VII. Existing prospecting permits for nonenergy leasable minerals directly affect 935,500 acres (2.5 percent) of GRSG habitats in MZs II/VII, which is the largest proportion of GRSG habitat compared with the other MZs (Manier et al. 2013, p. 79). Phosphate development is prevalent in southeastern Idaho, though acres disturbed are not known (**Section 3.12**).

Impact Analysis. Acres open and closed to nonenergy leasable mineral leasing do not vary substantially across alternatives, as the acres in **Table 5-18** represent the Proposed Plans from other BLM and Forest Service sub-regions and planning areas in MZs II/VII combined with the management in the MZs II/VII portion of the Idaho and southwestern Montana sub-region. Since the Idaho and southwestern Montana sub-region has so few acres within MZs II/VII, alternatives in this sub-region would have a relatively small influence on total acres open or closed. As shown in **Table 5-18**, any alternative for nonenergy leasable minerals management in the Idaho and southwestern Montana LUPA would affect 2 percent or less of GRSG habitat within MZs II/VII.

<sup>1</sup> Includes IHMA

<sup>2</sup> This table displays the acres of PHMA and GHMA open and closed to nonenergy leasing in MZ II/VII; it also displays the percentage of those acres that are found within the sub-region.

Reasonably foreseeable nonenergy leasable mineral development in MZs II/VII is expected to increase over the 20-year analysis period (**Section 5.1.12**), though state and private GRSG conservation efforts as well as other BLM and Forest Service proposed plans in MZ IV would reduce the threat by restricting the location of developments, implementing disturbance caps and planned restoration activities. Together these conservation actions would result in a net conservation gain to GRSG habitats and populations in MZ IV regardless of management within the Idaho and southwestern Montana sub-region.

**Infrastructure**

*Rights-of-Way*

Nature and Type of Effects. The impacts of ROWs on GRSG are described in **Section 4.2** and above in **Section 5.1.6**.

Conditions in the Sub-region and in MZs II/VII. Infrastructure, such as ROWs and associated facilities and urbanization, is widespread throughout MZs II/VII. In some locations, infrastructure development has affected GRSG habitat. Development of roads, fences, and utility corridors has also contributed to habitat loss and fragmentation in portions of MZs II/VII. The best available estimates suggest about 25 percent of the MZs II/VII are within approximately 4 miles of urban development (Knick et al. 2011, p. 214). Impacts of infrastructure development in MZ IV are primarily related to highways, roads, power lines, and communication towers, with 90 percent of MZs II/VII within 4 miles of a road, 25 percent within 4 miles of a power line, and 5 percent within 4 miles of a communication tower (Knick et al. 2011, pp. 215-216).

1 Although not representative of all infrastructure ROWs, transmission lines greater than 115  
 2 kilovolts indirectly influence 60 percent of priority habitat and 63 percent of general habitat  
 3 across MZs II/VII. Indirect effects are assumed to occur to a radius of 4 miles (Manier et al.  
 4 2013, p. 41). Approximately 50 percent of transmission lines in priority habitat and 45  
 5 percent in general habitat are on BLM-administered lands across GRSG habitats in MZs  
 6 II/VII (Manier et al. 2013, p. 41). There is also a substantial contribution from private lands,  
 7 where 42 percent of transmission lines in priority habitat and 47 percent in general habitat  
 8 are located. In contrast, National Forest System lands contain 1 percent of transmission lines  
 9 in priority habitat and 1 percent in general habitat. Therefore, actions on BLM-administered  
 10 and private lands are likely to have the greatest potential to affect transmission line ROWs in  
 11 GRSG habitat than other land management entities. Designating ROW exclusion and  
 12 avoidance areas in PHMA and GHMA on BLM-administered and National Forest System  
 13 lands could reduce the threat on these lands. However, in areas with scattered federal  
 14 landownership, infrastructure may be routed around federal lands, often increasing its length  
 15 and impact. ROW avoidance and exclusion areas on BLM-administered and National Forest  
 16 System lands could increase this tendency.

17 Impact Analysis. Acres managed as open, exclusion, and avoidance for ROWs do not vary  
 18 substantially across alternatives, as the acres in **Table 5-19** represent the Proposed Plans  
 19 from other BLM and Forest Service sub-regions and planning areas in MZs II/VII  
 20 combined with the management in the MZs II/VII portion of the Idaho and southwestern  
 21 Montana sub-region. Since the Idaho and southwestern Montana sub-region has so few  
 22 acres within MZs II/VII, alternatives in this sub-region would have a relatively small  
 23 influence on total acres managed as open, exclusion, or avoidance. As shown in **Table 5-19**,  
 24 any action alternative for ROW management in the Idaho and southwestern Montana LUPA  
 25 would affect 8 percent or less of GRSG habitat within MZs II/VII. The greatest impacts  
 26 would result under Alternatives B, C, and F, where PHMA in the Idaho and southwestern  
 27 Montana sub-region would be managed as ROW exclusion.

<sup>1</sup> Includes IHMA

This table displays the acres of PHMA and GHMA within rights-of-way designations in MZ II/VII; it also displays the percentage of those acres that are found within the sub-region.

- 1
- 2 The numbers of ROW authorizations are anticipated to grow in the sub-region. Increasing
- 3 populations, continued energy development, and new communication sites drive the need
- 4 for new ROWs on both federal and non-federal lands.
- 5 New ROW authorizations that require state agency review or approval would be subject to
- 6 the permitting process and stipulations for development in GRSG Core areas under the
- 7 Wyoming and Montana Executive Orders. These stipulations would benefit the GRSG in
- 8 Core Areas by encouraging ROW development outside of core habitat areas, restricting

1 surface occupancy within 0.6 mile of occupied leks, prohibiting power lines greater than 115  
2 kV outside of designated corridors, and locating new roads used to transport products or  
3 waste over 1.9 miles from occupied leks.

4 Presidential Priority transmission projects which are proposed in MZs II/VII (i.e., Transwest  
5 Express and Gateway West), would not be subject to GRSG conservation requirements in  
6 BLM and Forest Service LUPAs, but would be subject to requirements in applicable state  
7 plans as well as other state and federal laws and regulations. They would also develop their  
8 own suite of protective measures analyzed in project-specific NEPA documents. Whether or  
9 not these project-specific measures would adequately protect GRSG is unknown at this  
10 point in time because the measures have not been finalized. Regardless, impacts would likely  
11 be greater in Colorado where the proposed route would impact approximately 26 miles in  
12 PACs and 57 miles in PHMA in the Little Snake and White River BLM Field Offices. This  
13 impact would be especially harmful to fringe GRSG populations in Colorado, as some are  
14 less robust than those in Wyoming and southern Montana. In Wyoming, the routes avoid  
15 Core Areas due to that state plan's requirements; this would reduce impacts in Wyoming.

16 The effect of the alternatives and other conservation actions in the MZ (most notably the  
17 Montana and Wyoming executive orders) could be synergistic. By implementing restrictions  
18 on infrastructure in PHMA and on state and private lands together, the cumulative beneficial  
19 effect on GRSG would be greater than the sum of their individual effects because  
20 protections would be applied more consistently across the landscape. This is especially  
21 important in areas of mixed land ownership patterns where complementary protections can  
22 benefit leks, early brood rearing habitat, or other important areas that do not follow  
23 geopolitical boundaries.

24 Reasonably foreseeable ROW development in MZs II/VII is expected to increase over the  
25 20-year analysis period (**Section 5.1.12**), though state and private GRSG conservation efforts  
26 as well as other BLM and Forest Service proposed plans in MZs II/VII would reduce the  
27 threat by restricting the type and location of developments. These conservation actions  
28 would provide a net conservation gain to GRSG habitats and populations in MZs II/VII  
29 regardless of management within the Idaho and southwestern Montana sub-region.

#### 30 *Renewable Energy*

31 Nature and Type of Effects. The impacts of renewable energy development on GRSG are  
32 described in **Section 4.2** and above in **Section 5.1.6**.

33 Conditions in the Sub-region and in MZs II/VII. While most federal lands are not currently  
34 leased or developed for wind or solar energy, the areas of potential development coincide  
35 closely with GRSG habitats, especially in MZs II/VII (Manier et al. 2013, p. 60).

36 Although not representative of all renewable energy development, wind turbines on BLM-  
37 administered land indirectly influence less than 1 percent of priority habitat and general  
38 habitat combined across MZs II/VII. Private lands account for 70 percent of wind turbines  
39 affecting GRSG in priority habitat (and 73 percent in general habitat) within MZs II/VII  
40 (Manier et al. 2013, p. 61). Therefore, conservation actions on private land are likely to have

1 a greater potential to ameliorate the effects of wind energy development than any other  
2 single land management entity.

3 Impact Analysis. **Table 5-20** displays acres open to wind energy ROW and wind energy  
4 exclusion and avoidance areas by alternative.

**Table 5-20**

<sup>1</sup> Includes IHMA

This table displays the acres of PHMA and GHMA within wind energy management designations in MZ II/VII; it also displays the percentage of those acres that are found within the sub-region.

1 Acres managed as open, avoidance, and exclusion for wind energy development do not vary  
 2 substantially across alternatives, as the acres in **Table 5-20** represent the Proposed Plans  
 3 from other BLM and Forest Service sub-regions and planning areas in MZs II/VII  
 4 combined with the management in the MZs II/VII portion of the Idaho and southwestern  
 5 Montana sub-region. Since the Idaho and southwestern Montana sub-region has so few  
 6 acres within MZs II/VII, alternatives in this sub-region would have a relatively small  
 7 influence on total acres managed as open, avoidance, or exclusion. As shown in **Table 5-20**,  
 8 any action alternative for wind energy management in the Idaho and southwestern Montana  
 9 LUPA would affect 1 percent or less of GRSG habitat within MZs II/VII.

10 All Proposed Plans within Wyoming in MZs II/VII rely on wind ROW avoidance  
 11 designations to protect GRSG habitat rather than wind ROW exclusion. Similar to other  
 12 ROWs, this approach preserves management flexibility in situations where landownership is  
 13 mixed. Without this flexibility, rerouting ROWs across nonfederal land may result in a longer  
 14 route, increasing disturbance of GRSG leks, nests, and brood-rearing and wintering areas  
 15 more than direct routing across federal land. Other Proposed Plans in MZs II/VII would  
 16 manage PHMA as ROW exclusion, thereby providing the greatest protection on federal  
 17 lands, but potentially increasing impacts on nonfederal lands.

18 Reasonably foreseeable future projects within MZs II/VII include renewable energy  
 19 developments, such as the Chokecherry/Sierra Madre Wind Farm in southern Wyoming.  
 20 Projects which require state agency review or approval would be subject to the Wyoming  
 21 Executive Order permitting process for development in core areas, which would encourage  
 22 ROW development outside of Core Areas and restrict surface occupancy within 0.6 miles of  
 23 occupied leks.

24 Overall, the Montana and Wyoming state actions, other BLM and Forest Service Proposed  
 25 Plans within MZs II/VII, and other past, present, and reasonably foreseeable future actions  
 26 will provide a net conservation gain to GRSG habitats and populations in MZs II/VII from  
 27 wind energy management regardless of management within the Idaho and southwestern  
 28 Montana sub-region.

Reasonably foreseeable renewable energy development in MZs II/VII is expected to increase over the 20-year analysis period (**Section 5.1.12**), though state and private GRSG conservation efforts as well as other BLM and Forest Service proposed plans in MZs II/VII would reduce the threat by restricting the location of developments. These conservation actions would provide a net conservation gain to GRSG habitats and populations in MZs II/VII regardless of management within the Idaho and southwestern Montana sub-region.

***Grazing/Free-Roaming Equids***

***Nature and Type of Effects.*** The impacts of livestock grazing and free-roaming equids on GRSG are described in **Section 4.2** and above in **Section 5.1.6**.

***Conditions in the Sub-region and in MZs II/VII.*** Livestock grazing is present and widespread on many land types, such as federal and private, across MZs II/VII. Rangeland health assessments have found that nearly 4 percent of BLM-administered grazing allotments in GRSG habitat in MZs II/VII are not meeting wildlife standards with grazing as a causal factor. Additionally, nearly 5 million acres of GRSG habitat within MZs II/VII, largely in the central portion of the area, is federally managed wild horse and burro range (Manier et al. 2013, p. 131).

***Impact Analysis.*** **Table 5-21** lists the acres of PHMA and GHMA available and unavailable for grazing by alternative.

**Table 5-21**  
**Acres Available and Unavailable to Livestock Grazing in GRSG Habitat in MZ II/VII**

	Priority Habitat Management Areas		General Habitat Management Areas

Source: BLM 2015

This table displays the acres of PHMA and GHMA available and unavailable to livestock grazing in MZ I; it also displays the percentage of those acres that are found within the sub-region.

1

2 Acres available and unavailable to livestock grazing generally do not vary substantially across  
3 alternatives, as the acres in **Table 5-21** represent the Proposed Plans from other BLM and  
4 Forest Service sub-regions and planning areas in MZs II/VII combined with the  
5 management in the MZs II/VII portion of the Idaho and southwestern Montana sub-region.  
6 Since the Idaho and southwestern Montana sub-region has so few acres within MZs II/VII,  
7 alternatives in this sub-region would have a relatively small influence on total acres available  
8 or unavailable. As shown in **Table 5-21**, most alternatives for livestock grazing management  
9 in the Idaho and southwestern Montana LUPA would affect 1 percent or less of GRSG  
10 habitat within MZs II/VII. The exception would be under Alternative C, where grazing  
11 would be removed from PHMA in the Idaho and southwestern Montana sub-region. This  
12 represents 64 percent of the total acres unavailable to grazing in MZs II/VII under this  
13 alternative. Impacts from removal of grazing under Alternative C would be as described in  
14 **Section 5.1.6**.

15 Since 2010, SGI has enhanced rangeland health through rotational grazing systems, re-  
16 vegetating former rangeland with sagebrush and perennial grasses and control of invasive  
17 weeds. On privately-owned lands, SGI has developed a prescribed grazing approach that  
18 balances forage availability with livestock demand. This system allows for adjustments to  
19 timing, frequency, and duration of grazing, ensuring rangelands are managed sustainably to  
20 provide continued ecological function of sagebrush-steppe. A primary focus of the  
21 prescribed grazing approach is maintenance of key plant species, such as deep-rooted  
22 perennial grasses that have been shown to be essential for ecological resistance to invasive  
23 annual grasses (Reisner et al. 2013, pp. 1047-1048). These actions help to alleviate the  
24 adverse impacts associated with improper grazing practices outlined above under Nature and  
25 Type of Effects. Within MZs II/VII, SGI has implemented 543,511 acres of prescribed  
26 grazing systems. This program is likely the largest and most impactful program on private  
27 lands within MZs II/VII. Because of its focus on priority areas for conservation, which  
28 often overlap PHMA, the SGI's past, present, and reasonably foreseeable work has had and  
29 likely will continue to have a cumulative beneficial impact on GRSG when considered  
30 alongside protective BLM management actions in PHMA.

1 Reasonably foreseeable livestock grazing management efforts in MZs II/VII are expected to  
2 increase over the analysis period (**Section 5.1.12**), through increased NRCS conservation  
3 actions under the Sage-Grouse Initiative (e.g., fence marking and conservation easements),  
4 state efforts to maintain ranchland, and the implementation of other BLM and Forest  
5 Service LUPAs in MZs II/VII. These conservation actions would result in a net  
6 conservation gain to GRSG habitats and populations in MZ II/VII regardless of  
7 management within the Idaho and southwestern Montana sub-region.

### 8 ***Spread of Invasive Plants***

9 ***Nature and Type of Effects.*** The impacts of weed spread on GRSG are described in **Section**  
10 **4.2** and above in **Section 5.1.6**.

11 Conditions in the Sub-region and in MZs II/VII. Cheatgrass is distributed throughout these  
12 MZs, though generally not with the same abundance observed in other areas, such as the  
13 Great Basin. Localized areas, such as southern Wyoming, are more invaded than cooler parts  
14 of the region (Manier et al. 2013, p. 131).

15 The BLM and Forest Service currently manage weed infestations through integrated weed  
16 management: biological, chemical, mechanical, manual, and educational methods. The BLM  
17 is guided by the 1991 and 2007 RODs for Vegetation Treatment on BLM Lands in Thirteen  
18 Western States (BLM 1991) and by the 2007 Programmatic Environmental Report (BLM  
19 2007). Weeds are managed in cooperation with county governments and represents a  
20 landscape-level approach across management jurisdictions.

21 Impact Analysis. Given the small acreage of the Idaho and southwestern Montana sub-  
22 region within MZs II/VII, it is unlikely that the alternatives in the Idaho and southwestern  
23 Montana LUPA would have a measurable contribution to cumulative effects from invasive  
24 weed management within MZs II/VII.

25 Invasive species on BLM-administered and National Forest System lands would be  
26 controlled under all alternatives and may be more successful given the lower extent of  
27 invasion within the MZs. This would provide a net conservation gain to GRSG by restoring  
28 degraded sagebrush habitat.

29 Relevant cumulative actions that result in surface-disturbing activities would increase the  
30 potential for the spread of invasive weeds on both federal and non-federal lands. Projects  
31 subject to the general stipulations outlined in the Montana and Wyoming Executive Orders  
32 are required to control noxious and invasive weed species and to use native seed mixes  
33 during reclamation processes. These stipulations would benefit GRSG core habitat areas.  
34 They would accomplish this by limiting the spread or establishment of invasive species,  
35 particularly on lands that lack BLM and Forest Service protective regulatory mechanisms.  
36 Further, the Greater Sage-Grouse Habitat Conservation Strategy for NRCS in Idaho has  
37 identified GRSG conservation measures related to invasive weeds, such as reducing the risk  
38 and rate of fire spread, restoration and rehabilitation, and weed control. A number of  
39 projects are ongoing or in the planning phase to treat nonnative, invasive species (Appendix  
40 A).

Reasonably foreseeable weed management efforts are projected to increase (**Section 5.1.12**), including other state and county noxious weed regulations and the implementation of other BLM and Forest Service LUPAs in MZ II/VII. These conservation actions would result in a net conservation gain to GRSG habitats and populations in MZs II/VII regardless of management within the Idaho and southwestern Montana sub-region.

***Conversion to Agriculture***

Nature and Type of Effects. The impacts of conversion to agriculture on GRSG are described in **Section 4.2** and above in **Section 5.1.6**.

Conditions in the Sub-region and in MZs II/VII. Regional assessments estimate that while only 1 percent of priority habitat and general habitat in MZs II/VII are directly influenced by agricultural development, over 80 percent of these habitats are within approximately 4 miles of agricultural land (Manier et al. 2013, p. 27).

Impact Analysis. The BLM and Forest Service do not convert public lands to agriculture. As such, the only direct authority these agencies have over conversion to agriculture is by retaining or disposing of lands in the realty program. Lands retained under BLM and Forest Service management will not be converted to agriculture and disposing of lands could increase the likelihood they will be converted to agriculture, depending on their location and the policies of the new management authority.

Acres identified for retention and disposal generally do not vary substantially across alternatives, as the acres in **Table 5-22** represent the Proposed Plans from other BLM and Forest Service sub-regions and planning areas in MZs II/VII combined with the management in the MZs II/VII portion of the Idaho and southwestern Montana sub-region. Since the Idaho and southwestern Montana sub-region has so few acres within MZs II/VII, alternatives in this sub-region would have a relatively small influence on total acres identified for retention or disposal. As shown in **Table 5-22**, most alternatives for land tenure adjustments in the Idaho and southwestern Montana LUPA would affect 4 percent or less of GRSG habitat within MZs II/VII. The exception would be under Alternatives A and E, which would identify some PHMA in the Idaho and southwestern Montana sub-region for disposal. This represents 65 and 63 percent of the total acres identified for disposal in MZs II/VII under Alternatives A and E, respectively.

Cumulative impacts vary relatively little across alternatives, and BLM and Forest Service management may have little impact on alleviating this threat. Restrictions on grazing on federal land could increase agriculture pressure on adjacent private lands. If the loss of federal grazing privileges makes ranching economically unviable, the potential conversion of private grazing lands to agriculture would increase. However, the Proposed Plan does not substantially increase acreage unavailable to grazing.

The COT report objectives for converting land to agriculture are to avoid further loss of sagebrush habitat for agricultural activities (both plant and animal production) and to prioritize restoration. In areas where taking agricultural lands out of production has benefited GRSG, the programs supporting these actions should be targeted and continued (USFWS 2013, p. 48). In accordance with this objective, the NRCS's SGI program focuses on maintaining ranchland that provides habitat for GRSG.

1 This voluntary program provides private landowners with monetary incentives to protect  
2 GRSG habitat, often through conservation easements. As a result, private land containing  
3 GRSG habitat is protected from conversion to agriculture or other development for the life  
4 of the conservation agreement. The conservation easements and other conservation  
5 incentives, such as restoration of water features and fence marking, can enhance the ability  
6 of private ranchlands to support GRSG. As of 2014, SGI has secured conservation  
7 easements on 243,403 acres within MZs II/VII and marked or removed 23 miles of fence  
8 (NRCS 2015). This has preserved habitat and reduced the risk of direct mortality on these  
9 lands.

10 Over the analysis period, conversion to agriculture is expected to increase (**Section 5.1.12**),  
11 though state and private conservation efforts as well as other BLM and Forest Service  
12 proposed plans in MZs II/VII would reduce the threat. These conservation actions would  
13 result in net conservation gain to GRSG habitats and populations in MZs II/VII regardless  
14 of management within the Idaho and southwestern Montana sub-region.

### 15 ***Wildfire***

16 Nature and Type of Effects. The impacts of fire on GRSG are described in **Section 4.2** and  
17 above in **Section 5.1.6**.

18 Conditions in the Sub-region and in MZs II/VII. Fire risk is generally low across MZs  
19 II/VII, though areas in the northern and southern portions of the MZs have a higher fire  
20 risk (Manier et al. 2013, p. 131). Within the MZs, 10 percent of priority habitat and general  
21 habitat have a high risk for fire (Manier et al. 2013, p. 85).

22 Impact Analysis. Given the small acreage of the Idaho and southwestern Montana sub-  
23 region within MZs II/VII, it is unlikely that the alternatives in the Idaho and southwestern  
24 Montana LUPA would have a measurable contribution to cumulative effects from fire  
25 management within MZs II/VII.

26 Recognition of the importance of sagebrush habitat during interagency wildfire response  
27 would benefit GRSG in the event of an unplanned fire. The Montana Executive Order  
28 emphasizes fire suppression in Core Population Areas, while recognizing other suppression  
29 priorities may take precedent. This would benefit GRSG during wildfire planning and  
30 response, particularly on lands not administered by the BLM or Forest Service.

31 The Interagency Standards for Fire and Fire Aviation Operations “Red Book” includes a  
32 BMP for GRSG habitat conservation for wildlife and fuels management (BLM 2013b). This  
33 document is a supplemental policy or guidance for the BLM, the Forest Service, and the  
34 USFWS. This BMP would benefit the GRSG during interagency wildland fire operations. It  
35 would do this by using spatial habitat data and predictive services to prioritize and  
36 preposition firefighting resources in critical habitat areas. In January 2015, Secretarial Order  
37 3336 “Rangeland Fire Prevention, Management and Restoration” was signed by the  
38 Secretary of the Interior. The order sets forth enhanced policies and strategies for preventing  
39 and suppressing rangeland wildfire and for restoring sagebrush landscapes impacted by

1 wildfire across the West. The order will improve coordination with local, state, tribal, and  
2 regional efforts to address rangeland wildfire at a landscape level.

3 Reasonably foreseeable wildland fire management efforts are projected to increase (**Section**  
4 **5.1.12**), especially through increased coordination of federal, state, and local fire prevention  
5 actions and the implementation of other BLM and Forest Service LUPAs in MZs II/VII.  
6 These conservation actions would result in a net conservation gain to GRSG habitats and  
7 populations in MZs II/VII regardless of management within the Idaho and southwestern  
8 Montana sub-region.

9 ***Recreation***

10 Nature and Type of Effects. The impacts of recreation on GRSG are described in **Section**  
11 **4.2** and above in **Section 5.1.6**.

12 Conditions in the Sub-region and in MZs II/VII. Human populations have increased and  
13 expanded, primarily over the past century and in the western portion of the sagebrush  
14 distribution. Within MZs II/VII, population densities have increased 31 percent on the  
15 Colorado Plateau and 19 percent in the Wyoming Basin (Knick et al. 2011, p. 212). With  
16 these expanding populations come greater human impacts (Leu et al. 2008).

17 The COT report objectives for recreation are to maintain healthy native sagebrush  
18 communities, based on local ecological conditions, and to manage direct and indirect human  
19 disturbance (including noise) to avoid interruption of normal GRSG behavior (USFWS  
20 2013, p. 49). Limits on road use under the action alternatives and limits on OHVs would  
21 help meet these objectives.

22 In the Idaho and southwestern Montana sub-region, travel management planning is  
23 underway to determine specific routes available for closure.

24 Impact Analysis. **Table 5-23** shows Acres of Travel Management Designations in GRSG  
25 Habitat in MZs II/VII.

**Table 5-23**

Source: BLM 2015

<sup>1</sup> Includes IHMA

This table displays the acres of PHMA and GHMA within travel management designations of open, limited and closed in MZ II/VII; it also displays the percentage of those acres that are found within the sub-region.

- 1
- 2 Acres open, closed, and limited to motorized vehicles do not vary substantially across
- 3 alternatives, as the acres in **Table 5-23** represent the Proposed Plans from other BLM and
- 4 Forest Service sub-regions and planning areas in MZs II/VII combined with the
- 5 management in the MZs II/VII portion of the Idaho and southwestern Montana sub-region.
- 6 Since the Idaho and southwestern Montana sub-region has so few acres within MZs II/VII,

1 alternatives in this sub-region would have a relatively small influence on total acres open,  
2 closed or limited. As shown in **Table 5-23**, any alternative for travel management in the  
3 Idaho and southwestern Montana LUPA would affect 1 percent or less of GRSG habitat  
4 within MZs II/VII.

5 Reasonably foreseeable recreation in MZs II/VII is expected to increase over the 20-year  
6 analysis period (**Section 5.1.12**). However, state and private GRSG conservation efforts as  
7 well as other BLM and Forest Service proposed plans in MZs II/VII would reduce the  
8 threat by providing additional protections such as disturbance caps and limitations on  
9 National Forest System lands. These conservation actions would result in a net conservation  
10 gain to GRSG habitats and populations in MZs II/VII regardless of management within the  
11 Idaho and southwestern Montana sub-region.

### 12 ***Conifer Encroachment***

13 Nature and Type of Effects. Conifer woodlands, especially juniper (*Juniperus* spp.) and in  
14 some regions pinyon pine (*Pinus edulis*), may expand into sagebrush habitat and reduce  
15 availability of habitat for GRSG. Conifer expansion may be encouraged by human activities,  
16 including fire suppression and grazing (Miller et al. 2011). If woodland development is  
17 sufficient to restrict shrub and herbaceous understory growth, habitat quality for GRSG will  
18 be reduced (Connelly et al. 2004). Mature trees offer perch sites for raptors; thus, woodland  
19 expansion may also increase the threat of predation, as with powerlines (Manier et al. 2013).  
20 Locations within approximately 1,000 yards of current pinyon-juniper woodlands are at  
21 highest risk of expansion (Bradley 2010). The greatest risks from conifer encroachment are  
22 thought to be in the Great Basin, with smaller risks (6 to 7 percent of priority and general  
23 habitat) in the Wyoming Basin (Connelly et al. 2004; Manier et al. 2013). Studies have shown  
24 that GRSG incur population-level impacts at very low levels of conifer encroachment  
25 (Baruch-Mordo et al. 2013).

26 Conditions in MZs II/VII. Approximately 46 percent of conifer encroachment risk in  
27 priority habitat (and 43 percent in general habitat) occur on BLM-administered lands within  
28 MZs II/VII (Manier et al. 2013). Therefore, BLM actions are likely to have a greater  
29 potential to ameliorate the effects of conifer encroachment on GRSG than any other single  
30 land management entity.

31 Impact Analysis. Specific required design features common to all BLM and Forest Service  
32 plans in MZs II/VII include removal of standing and encroaching trees within 100 meters of  
33 occupied leks and other habitats (e.g., nesting, wintering, and brood rearing). Additionally,  
34 reintroduction of appropriate fire regimes would limit conifer encroachment into the  
35 sagebrush plant communities. These actions would benefit GRSG by improving the quality  
36 of habitat throughout the MZ.

37 Additionally, under the Proposed Plan, conifer removal treatments would be prioritized  
38 closest to occupied GRSG habitats and near occupied leks, and where juniper encroachment  
39 is phase 1 or phase 2. This action would benefit GRSG by improving the quality of habitat  
40 and functionality.

1 In Colorado, the Colorado Parks and Wildlife has conducted conifer treatments totaling  
2 2,600 acres (Colorado Department of Natural Resources 2013). In addition, SGI has helped  
3 reduce the threat of early succession conifer encroachment through mechanical removal on  
4 10,500 acres of private lands within MZs II/VII. The majority of these efforts were located  
5 inside PACs (NRCS 2015), helping to preserve historic fire return intervals and important  
6 GRSG habitat.

7 Reasonably foreseeable conifer encroachment management efforts are projected to increase  
8 (**Section 5.1.12**), including efforts on private land and implementation of other BLM and  
9 Forest Service LUPAs in MZs II/VII. These conservation actions would result in a net  
10 conservation gain to GRSG habitats and populations in MZs II/VII regardless of  
11 management in the Idaho and southwestern Montana sub-region.

### 12 **5.1.11 Conclusions**

13 In addition to BLM and Forest Service management in the Idaho and southwestern  
14 Montana sub-region and other planning areas in MZs IV and II/VII, GRSG in these MZs  
15 will also be impacted by management and conservation at state, regional, tribal and local  
16 levels. This analysis takes into account each alternative in the Idaho and southwestern  
17 Montana LUPA in conjunction with state and private initiatives, as well as past, present, and  
18 reasonably foreseeable future actions at the federal, state, and local levels. The analysis  
19 assumes that the Proposed Plans would be implemented in the other BLM and Forest  
20 Service LUPA planning areas in MZs IV and II/VII.

21 Some of the most important past and present actions benefitting GRSG populations on  
22 private land in MZ IV and II/VII are the conservation easements coordinated by federal  
23 agencies such as BLM and the Forest Service, individual states, and by NRCS SGI with  
24 private ranchers. SGI has also worked with landowners to increase fence marking, seeding of  
25 native vegetation, and conifer removal to improve GRSG habitat quality. Future  
26 coordination of private landowners with SGI is expected to provide further benefits to  
27 GRSG habitat.

28 This coordination with private landowners enhances conservation in addition to what BLM  
29 and Forest Service management can accomplish on federal lands. Ranchers in Wyoming and  
30 Montana are also using Candidate Conservation Agreement with Assurances with the  
31 USFWS. Under these instruments, the ranchers voluntarily agree to manage lands to reduce  
32 threats to GRSG in exchange for a guarantee that they will not be subject to additional  
33 regulations should the species become listed. While ranchers have used these agreements  
34 across the GRSG range, thus far the agreements have been applied to only a small number  
35 of ranches in Wyoming and Montana.

36 As discussed in **Sections 5.1.4** and **5.1.8**, both Wyoming and Montana have adopted  
37 statewide plans to promote GRSG conservation. Both plans implement a Core Population  
38 Area Strategy with well density limitations, timing restrictions, and a uniform 5 percent  
39 disturbance cap across all landownership types. These measures would improve GRSG  
40 population levels if effectively enforced (Copeland et al. 2013) and would primarily affect

1 MZs II/VII. The limitations on timing and density of energy development along with the  
2 disturbance cap, and BLM and Forest Service management on lands with federal mineral  
3 estate, would act in concert to promote GRSG conservation and reduce the impacts from  
4 energy development on leks, breeding habitat, and wintering habitat.

5 However, a majority of MZ IV, including the states of Idaho, Oregon, Nevada, and Utah, do  
6 not have similar executive orders in place. These states do have GRSG conservation plans,  
7 but these plans generally include voluntary guidelines, not regulatory mechanisms. This could  
8 allow for more impacts on the 31 percent of GRSG habitat within the MZ that is state or  
9 privately owned. Since most GRSG habitat in MZ IV (68 percent) is under federal  
10 management, BLM and Forest Service regulatory mechanisms will have a substantial  
11 contribution to cumulative effects.

12 BLM and Forest Service restrictions on ROWs/SUAs, renewable energy, and energy  
13 development in GRSG habitat would help reduce loss and disturbance of GRSG  
14 populations. The Proposed Plan includes numerous measures to allow development while  
15 reducing the likelihood for impacts on GRSG, such as requirements for anthropogenic  
16 disturbance criteria, a 3 percent disturbance cap, buffers, mitigation, and RDFs and BMPs.

17 The more challenging threats to manage in MZ IV are fire, the spread of weeds, and conifer  
18 encroachment. Fire regimes are complex and vary tremendously across the sagebrush region  
19 and through time; furthermore, the ecological role of fire has changed dramatically since the  
20 European settlement era (circa 1850) due to changing fuel and habitat patterns (Manier et al.  
21 2013, p. 79). Fire is exacerbated by invasive weeds, particularly in Wyoming big sagebrush  
22 types, where the invasion by exotic annuals has resulted in dramatic increases in number and  
23 frequency of fires with widespread, detrimental effects on habitat conditions (Manier et al.  
24 2013, p. 88). Expansion of conifer woodlands, especially juniper (*Juniperus* spp.) do not  
25 provide suitable habitat for GRSG, and mature trees displace shrubs, grasses and forbs  
26 through direct competition (Manier et al. 2013, p. 91). These threats are at the landscape  
27 scale and are extensive throughout MZ IV; the Proposed Plans within MZ IV include a  
28 comprehensive strategy to address these threats.

#### 29 ***Alternative A: Current Management***

30 Under Alternative A, current management would continue on BLM-administered and  
31 National Forest System lands in the Idaho and southwestern Montana sub-region. Several  
32 protective measures would not be implemented; for example, the BLM and Forest Service  
33 would not designate PHMA or GHMA and would not manage any additional ROW/SUA  
34 avoidance or exclusion areas. Alternative A does not include any consistent management  
35 prescriptions to protect GRSG across the sub-region, though several individual BLM district  
36 offices and National Forests have some protections in place. Appropriate and allowable uses  
37 and restrictions with regard to such activities as mineral leasing and development, recreation,  
38 utility corridors, and livestock grazing would also remain unchanged.

39 Under current management, widespread wildfire and subsequent spread of nonnative,  
40 invasive species have destroyed and degraded PHMA and PGMA, particularly in MZ IV.  
41 This is likely to continue and reinforce the cycle of fire and weed spread. Further, the

1 expansion of conifers, particularly juniper, will continue to reduce the suitability of sagebrush  
2 habitats for GRSG.

3 In the rest of MZs IV and II/VII, other BLM and Forest Service LUPA planning efforts  
4 would implement their Proposed Plans to improve protection of GRSG and their habitat. In  
5 addition, GRSG conservation strategies would be implemented on state and private lands.  
6 As a result, the lack of protections under the Idaho and southwestern Montana LUPA  
7 Alternative A would be offset to an extent by more protective management elsewhere in the  
8 MZs, particularly within MZs II/VII. In the Idaho and southwestern Montana sub-region,  
9 though, continuation of current management would do little to reduce the major threats to  
10 GRSG in the sub-region: wildfire, invasive weeds, and conifer encroachment. Current  
11 management provides a limited number and extent of regulatory mechanisms to avoid  
12 continued degradation of GRSG habitat in MZs IV and II/VII, but it would not meet the  
13 COT report objectives for conservation of GRSG.

#### 14 ***Alternative B***

15 Under Alternative B, the BLM and Forest Service would manage lands to conserve, enhance,  
16 and restore sagebrush ecosystems. In conjunction with NRCS and state initiatives on private  
17 land, several aspects of BLM and Forest Service management under Alternative B would  
18 benefit GRSG conservation at a landscape level. These include implementation of a 3  
19 percent disturbance cap, retention of GRSG habitat, restrictions on resource uses such as  
20 managing PHMA as ROW exclusion and closed to mineral development, and prioritizing  
21 restoration in GRSG habitat. Implementing these protective measures on BLM-administered  
22 and National Forest System lands within the Idaho and southwestern Montana sub-region  
23 would help reduce damage to GRSG habitat, minimize loss of connectivity and could also  
24 minimize the spread of invasive species by limiting human activities that disturb soil or  
25 introduce seeds. However, such restrictions could also risk pushing development onto  
26 adjacent, nonfederal lands with less restrictive management. This is particularly a concern  
27 where nonfederal lands have fewer protections (e.g., most of MZ IV). In parts of MZ IV  
28 and MZs II/VII, some nonfederal lands have similarly restrictive measures such as in Core  
29 Areas in Wyoming and Montana (though Core areas do not cover all existing GRSG  
30 populations), which would reduce the likelihood for impacts.

31 In combination with other past, present, and reasonably foreseeable future actions,  
32 Alternative B would likely meet the objectives laid out in the COT report for infrastructure,  
33 grazing/free-roaming equids, conversion to agriculture, energy development, and recreation.  
34 Without a comprehensive strategy to address fire, invasive weeds, and conifer encroachment,  
35 it may not meet the COT objectives for these threats.

#### 36 ***Alternative C***

37 Under Alternative C, the BLM and Forest Service would manage lands to conserve, enhance,  
38 and restore sagebrush ecosystems and would apply management to all occupied GRSG  
39 habitats, making it the most restrictive alternative for development in GRSG habitat. In  
40 conjunction with NRCS and state initiatives on private land, several aspects of BLM and  
41 Forest Service management under Alternative C would benefit GRSG conservation at a  
42 landscape level. These include implementation of a 3 percent disturbance cap, removal of

1 livestock grazing from BLM-administered and National Forest System lands, and closure to  
2 leasable mineral development. Impacts would be similar to those described for Alternative B,  
3 but could be greater due to the larger area over which restrictions would be applied.

4 Together with other past, present, and reasonably foreseeable future actions, Alternative C  
5 would likely meet the objectives laid out in the COT report for infrastructure, conversion to  
6 agriculture, energy development, and recreation. Without a comprehensive strategy to  
7 address fire, invasive weeds, and conifer encroachment, it may not meet the COT objectives  
8 for these threats. Further, it is unknown whether removal of grazing would meet the COT  
9 objectives for range management, as analyzed above and in greater detail in **Section 4.2**.

#### 10 ***Alternative D***

11 Under Alternative D, the BLM and Forest Service would manage lands to conserve,  
12 enhance, and restore sagebrush ecosystems. Management and impacts would be similar to  
13 Alternative B, though Alternative D would incorporate more flexibility and adaptive  
14 management applied to resource uses to account for sub-regional conditions. The BLM and  
15 Forest Service would require a no net unmitigated loss of PHMA and IHMA and would  
16 implement numerous conservation measures to reduce impacts from human activities in  
17 PHMA, such as management of GRSG habitat as ROW avoidance areas and closure to  
18 some mineral development. Alternative D also includes additional measures and planning for  
19 wildfire management.

20 Under Alternative D, the BLM would increase GRSG habitat protection over current  
21 management, but with less restrictive actions than under Alternatives B or C. In conjunction  
22 with state and regional planning efforts, implementation of state disturbance caps in GRSG  
23 core areas, conservation easements on private lands, implementation of other BLM and  
24 Forest Service LUPAs in MZ IV and MZs II/VII, and other past, present, and reasonably  
25 foreseeable future actions, Alternative D would likely meet the objectives laid out in the  
26 COT report for fire, infrastructure, grazing/free-roaming equids, conversion to agriculture,  
27 energy development, and recreation. Without a comprehensive strategy to address invasive  
28 weeds and conifer encroachment, it may not meet the COT objectives for these threats.

#### 29 ***Alternative E***

30 Under Alternative E, the BLM and Forest Service would manage to maintain, conserve,  
31 enhance, and restore sagebrush ecosystems. In PHMA and IHMA, the BLM and Forest  
32 Service would incorporate management flexibility to permit high value infrastructure with  
33 appropriate mitigation and best management practices tailored for the sub-region.  
34 Management and impacts are similar to Alternative D, though Alternative E would require  
35 less stringent use restrictions and would designate the least amount of PHMA compared to  
36 the other alternatives' management area designations. Alternative E also includes additional  
37 measures and planning for wildfire management.

38 Under Alternative E, the BLM would increase GRSG habitat protection over current  
39 management, but with less restrictive actions than under Alternatives B C, or D. In  
40 conjunction with state and regional planning efforts, implementation of state disturbance  
41 caps in GRSG core areas, conservation easements on private lands, implementation of other

1 BLM and Forest Service LUPAs in MZ IV and MZs II/VII, and other past, present, and  
2 reasonably foreseeable future actions, Alternative E would likely meet the objectives laid out  
3 in the COT report for fire, infrastructure, grazing/free-roaming equids, and recreation.  
4 Alternative E imposes fewer restrictions on mining and energy development and does not  
5 provide guidance for land tenure decisions, so the alternative may not meet the COT  
6 objectives for mining, energy development, and conversion to agriculture. Without a  
7 comprehensive strategy to address invasive weeds and conifer encroachment, it also may not  
8 meet the COT objectives for these threats.

9 ***Alternative F***

10 Management under Alternative F would be largely similar to that described for Alternative B,  
11 though with more stringent guidance and restrictive management in sagebrush ecosystems.  
12 Alternative F would implement a 3 percent disturbance cap but all surface disturbances  
13 (including human disturbance and fire) would count toward this cap. In addition, grazing  
14 would be reduced by 25 percent.

15 In combination with other past, present, and reasonably foreseeable future actions,  
16 Alternative F would likely meet the objectives laid out in the COT report for infrastructure,  
17 grazing/free-roaming equids, conversion to agriculture, energy development, and recreation.  
18 Without a comprehensive strategy to address fire, invasive weeds, and conifer encroachment,  
19 it may not meet the COT objectives for these threats.

20 ***Proposed Plan***

21 Under the Proposed Plan, the BLM and Forest Service would manage lands to conserve,  
22 enhance and restore GRSG habitat and the sagebrush ecosystem upon which GRSG  
23 populations depend. Management and impacts would be similar to Alternatives D and E,  
24 though the Proposed Plan would incorporate robust strategies and approaches to GRSG  
25 management, including wildfire and invasive species management, conifer removal, adaptive  
26 management, mitigation, a 3 percent disturbance cap, anthropogenic disturbance criteria,  
27 buffers, habitat objectives and monitoring. The Proposed Plan provides vegetation treatment  
28 acres by decade sufficient to meet desired habitat conditions (70 percent of the analysis area  
29 meeting 10 to 30 percent sagebrush cover) (NTT 2011). In addition to habitat management  
30 areas, SPAs would also be managed to protect recognized the most important areas for the  
31 species.

32 The Proposed Plan would provide a higher level of GRSG habitat protection compared to  
33 current management, while allowing flexibility for resource uses when there would be no  
34 impacts to GRSG.

35 In the rest of MZs II/VII, other BLM and Forest Service LUPAs would implement their  
36 Proposed Plans to improve protection of GRSG and their habitat. In addition, other  
37 regional GRSG conservation strategies as discussed in **Section 5.1.8**, would be implemented  
38 on non-federal lands. Reasonably foreseeable future actions in MZs II/VII such as proposed  
39 oil and gas developments, interstate transmission lines, and other land disturbance projects  
40 would be subject to the requirements set forth in the BLM and Forest Service Proposed  
41 Plans which encompass MZs II/VII, where those projects occur on federal decision area

1 lands. For non-federal lands, reasonably foreseeable future projects may be subject to  
2 disturbance caps, buffer restrictions, and other requirements of GRSG state plans, as well as  
3 site specific mitigation measures.

4 In conjunction with state and regional planning efforts, implementation of state disturbance  
5 caps in GRSG core areas, conservation easements on private lands, implementation of other  
6 BLM and Forest Service LUPAs in MZ IV and MZs II/VII, and other past, present, and  
7 reasonably foreseeable future actions, the Proposed Plan would likely meet the objectives  
8 laid out in the COT report for fire, infrastructure, grazing/free-roaming equids, mining,  
9 energy development, conversion to agriculture, invasive weeds, conifer encroachment, and  
10 recreation.

### 11 **Summary**

12 Overall, GRSG populations across MZ IV and MZs II/VII face the greatest pressures from  
13 wildfire, invasive weeds, energy development, and infrastructure. BLM and Forest Service  
14 actions within the Idaho and southwestern Montana sub-region would have a limited  
15 influence on GRSG populations and habitats within MZs II/VII, but would substantially  
16 contribute to cumulative effects on populations and habitats within MZ IV.

17 Infrastructure and energy development are of particular concern in MZs II/VII because they  
18 affect the greatest amount of land. Numerous multi-state transmission lines are proposed  
19 through GRSG habitat, as are large-scale oil and gas field developments in excess of 100,000  
20 acres. Implementation of the BLM and Forest Service Proposed Plans in MZs II/VII is  
21 unlikely to preclude such projects from proceeding, especially Presidential Priority  
22 transmission line projects that are not subject to GRSG protective measures in the  
23 BLM/USFS planning efforts. The cumulative effect of reasonably foreseeable future  
24 infrastructure and energy development projects over the next 20 years, when combined with  
25 unplanned events such as wildfires, drought, or West Nile virus outbreaks, could increase the  
26 likelihood of population extirpation, particularly for the less robust populations which are  
27 considered at-risk. However, restrictions on land use in combination with project-specific  
28 BMPs and required design features, and other regional efforts will help mitigate the effects.

29 Of particular concern is that threat reduction for fire is difficult and costly. Given the  
30 intensity and widespread distribution of the threat, it may never be fully eliminated (USFWS  
31 2013, p. 40), but the comprehensive strategies under Alternatives D, E, and the Proposed  
32 Plan, may be able to reduce the threat considerably.

33 The Idaho and southwestern Montana sub-region in MZ IV contains one of the GRSG  
34 strongholds with the largest area of habitat rangewide with low similarity to extirpated  
35 portions of the range (USFWS 2013, p. 70). Both MZ IV and MZs II/VII support the two  
36 largest populations of GRSG rangewide (USFWS 2013, p. 75). As such, management within  
37 the sub-region and MZs is critical to preserving the species. All action alternatives  
38 considered in the Idaho and southwestern Montana LUPA would reduce threats to some  
39 degree and via different strategies.

1 Although small fringe populations may be extirpated in the next ten years, implementing  
 2 Alternatives B, E, F, or the Proposed Plan in combination with other regional efforts (such  
 3 as the Proposed Plans for other BLM and Forest Service planning areas; conservation  
 4 strategies in state plans; increased land protections via NRCS SGI, and local habitat  
 5 restoration efforts) would effectively conserve the region-wide population of GRSG in MZs  
 6 IV and II/VII.

7 **5.1.12 MZ-Wide Reasonably Foreseeable Future Actions Summary Tables**

8 **Tables 5-24** and **5-25** include a selection of some of the larger projects from the reasonably  
 9 foreseeable future actions tables in the RMPAs/LUPAs for MZs IV and II/VII,  
 10 respectively. The full tables can be found in each EIS within each MZ.

Table 5-24

Reasonably Foreseeable Future Actions in Management Zone IV Likely to Impact GRSG Habitat

MZ	Sub-region	Affected GRSG Population	Project Name	Project Location	Project Description	Project Status
Energy and Mining						
IV	Idaho and Southwestern Montana	Northern Great Basin	Sawtooth #4 Plan of Operation Modification	Twin Falls District, Idaho	Locatable mineral surface mining over 20 acres.	NEPA in progress.
IV	Idaho and Southwestern Montana	Northern Great Basin	Mineral Extraction	Dillon Field Office, Montana	Approximately 25 notices for locatable mineral extraction covering less than 50 acres.	Ongoing
IV	Idaho and Southwestern Montana	Northern Great Basin	Quarry Expansions	Sawtooth National Forests, Utah and Idaho	Several quarry expansions covering 40 acres total.	Planned for 2016.
IV	Idaho and Southwestern Montana	East Central	Dairy Syncline Phosphate Mine	Soda Springs, Idaho	Phosphate mine on estimated 580 acres (281 acres of open pit) within PGH/PHMA.	Planning phase
IV	Idaho and Southwestern Montana	Northern Great Basin	Oil and gas lease nominations	Rogerson-Brown's Bench, Idaho	Determine whether to offer leases on up to 90,000 acres.	Deferred, pending completion of Jarbidge RMP and GRSG EIS
IV	Idaho and Southwestern Montana	East Central	Oil and gas lease nominations	Payette-Weiser area, Idaho	Determine whether to offer oil and gas leases. Several nominations, totaling an estimated 181,000 acres.	Deferred, pending completion of Four Rivers RMP and GRSG EIS

Table 5-24

Reasonably Foreseeable Future Actions in Management Zone IV Likely to Impact GRSG Habitat

MZ	Sub-region	Affected GRSG Population	Project Name	Project Location	Project Description	Project Status
IV	Oregon	Northern Great Basin	Malheur Queen Placer Project	North-central Malheur County, Oregon	Approximately 800 acres approved for development of placer gold extraction.	Development underway
IV	Oregon	Northern Great Basin	High Bar/Upper and Lower Pine Creek Placer Mining Project	Baker County, Oregon	Up to 250 acres of activity would be disturbed for mineral extraction.	Planning phase
IV	Nevada	Northern Great Basin	Round Mountain Gold Mine			
Expansion	Nye County, Nevada	Expansion of existing facilities at the Round Mountain Mine and development of new mining and leaching facilities at the adjacent Gold Hill ore deposit.	Planning phase			
IV	Nevada	Northern Great Basin	Angel Wing Exploration Plan	60 miles northwest of West Wendover, Nevada, on the Utah/Nevada State Line	Expansion of mining exploration activities, including construction of drill pads and access roads and existing road maintenance, from a 3.3 acre Notice to 60 acres. Access to the proposed Plan is through Utah near the town of Grouse Creek.	Planning phase

Table 5-24

Reasonably Foreseeable Future Actions in Management Zone IV Likely to Impact GRSG Habitat

MZ	Sub-region	Affected GRSG Population	Project Name	Project Location	Project Description	Project Status
IV	Nevada	Northern Great Basin	Murdock Mountain Phosphate Prospecting Permit	35 miles northwest of West Wendover, Nevada, and 10 miles southwest of Montello, Nevada	Phosphate exploration drilling and trenching in the Murdock Mountain area. The operator is proposing to construct 31 drill pads with 2 drill holes per pad and 29 exploration trenches measuring 100 feet long by 5 feet wide by 5 feet deep. Exploration roads will also be constructed and existing roads will be utilized. Exploration operations are anticipated to take 200 days to complete.	Planning phase
Lands and Realty						
IV	Idaho and Southwestern Montana	Northern Great Basin; Snake-Salmon-Beaverhead	Gateway West 230/500 Transmission Line Project	Wyoming, Southern Idaho	Authorize ROW for 1,100-mile 500-kV transmission line.	Pending; Scheduled for implementation starting 2016
IV	Idaho and Southwestern Montana; Oregon	Baker; Northern Great Basin	Boardman to Hemingway Transmission Line Project	From Boardman, Oregon to Melba, Idaho	A proposal for an approximately 300-mile 500-kV transmission line.	Project under NEPA review.
IV	Oregon	Northern Great Basin	North Steens 230-kV Transmission Line Project	Harney County, Idaho	North Steens is a 29-mile 230-kV transmission line that would convey 104 MW of power generated from wind farms proposed on private land on the north side of Steens Mountain.	Project approved and ROD signed in December 2011; in litigation.
IV	Nevada	Northern Great Basin	China Mountain Wind Project	Northeastern Nevada	Utility-scale wind facility	Temporarily deferred pending NVCA GRSG EIS
IV	Idaho and Southwestern Montana	Northern Great Basin	Owyhee Land Exchange	Western Owyhee County, Idaho	Proposing to dispose of approximately 33,000 acres of non-GRSG habitat and acquiring around 38,000 acres of primarily GRSG habitat	Proposal
Fuels and Vegetation						

Table 5-24

Reasonably Foreseeable Future Actions in Management Zone IV Likely to Impact GRSG Habitat

MZ	Sub-region	Affected GRSG Population	Project Name	Project Location	Project Description	Project Status
IV	Idaho and Southwestern Montana	Northern Great Basin	Juniper Treatments in Pole Creek Allotment	Owyhee Field Office, Idaho	Juniper removal to enhance resource conditions on 24,486 acres of public, private, and state lands.	Decision issued; treatment implementation pending litigation
IV	Idaho and Southwestern Montana	Northern Great Basin	Juniper Treatment in Trout Springs Allotment	Owyhee Field Office, Idaho	Juniper removal to enhance resource conditions on 29,475 acres of public, private, and state lands.	Planning
IV	Idaho and Southwestern Montana	Northern Great Basin	Upper Castle Creek Fuels Project	Bruneau Field Office, Idaho	Juniper control project on approximately 33,000 acres. 25,000 acres implemented; anticipate 2,000-4,000 acres per year for the remaining areas.	Ongoing through 2014
IV	Idaho and Southwestern Montana	Northern Great Basin	Curlew Fuel Breaks and Juniper Reduction Project	Southeast Idaho	Compartmentalize the Curlew area using existing roads to improve wildfire suppression and reduce wildfire growth over 60,000 acres. Efforts will help to retain existing intact Wyoming sagebrush habitat. Remove encroaching junipers from within Wyoming sagebrush.	Planning; project implementation anticipated in 2017.
IV	Idaho and Southwestern Montana	Northern Great Basin	Burley Landscape Sage-Grouse Habitat Restoration	Burley Field Office, Idaho	Treat encroaching juniper on approximately 38,000 acres.	Approximately 8,500 acres already completed; implementation of remaining 29,500 acres expected over the next 7 years

Table 5-24

Reasonably Foreseeable Future Actions in Management Zone IV Likely to Impact GRSG Habitat

MZ	Sub-region	Affected GRSG Population	Project Name	Project Location	Project Description	Project Status
IV	Idaho and Southwestern Montana	Snake-Salmon-Beaverhead	Paradigm Project	Four Rivers Field Office, Idaho	Fuel break project that would create up to 294 miles of fuel breaks between 50 and 300 feet wide over a 10-year period. Fuel breaks would be associated with roads and other linear disturbances. At the maximum width of 300 feet, up to 10,690 acres would be directly affected. 2,111 acres of PPH/PHMA and 24,667 acres of PGH/GHMA in project area; fuel breaks would affect 61 acres of sagebrush in PPH/PHMA and 606 acres in PGH/GHMA.	Pending
IV	Idaho and Southwestern Montana	Northern Great Basin	South Owyhee Fuel Breaks	Boise District, Idaho	Fuel breaks over 2,000,000 acres, 850 miles.	Draft EA
IV	Idaho and Southwestern Montana	Snake-Salmon-Beaverhead	Big Desert Fuel Breaks	Idaho Falls and Twin Falls Districts, Idaho	Compartmentalize the Big Desert management area using existing roads to improve wildfire suppression and reduce wildfire growth; efforts will help to retain intact Wyoming sagebrush habitat within the northern portion of the management area. 291 miles of existing desert roads with a footprint of 10,581 acres. Upper Snake Field Office: 245 miles of roads with 8,908 footprint acres. Shoshone Field Office: 46 miles of roads with 1,673 footprint acres.	NEPA is complete and project began in 2012 within the Upper Snake Field Office; those fuel breaks identified within the Shoshone Field Office require further analysis and consultation before NEPA can be finalized.

Table 5-24

Reasonably Foreseeable Future Actions in Management Zone IV Likely to Impact GRSG Habitat

MZ	Sub-region	Affected GRSG Population	Project Name	Project Location	Project Description	Project Status
IV	Idaho and Southwestern Montana	Snake-Salmon-Beaverhead	Big Desert Noxious Weed Treatments	Idaho Falls District, Idaho	Treating noxious weeds within the Big Desert management area over 600,000 acres. Annual treatment target of 5,000 acres.	Ongoing, began in 2006.
IV	Idaho and Southwestern Montana	Snake-Salmon-Beaverhead	Cheatgrass Treatments	Idaho Falls District, Idaho	Chemically reduce cheatgrass densities over 7,000 acres to modify fire return intervals and allow for seeded native species to become established.	Planning phase
IV	Idaho and Southwestern Montana	Snake-Salmon-Beaverhead	Salmon-Challis National Forest Forest-wide Invasive Plant Treatment EIS	Salmon-Challis National Forest	Programmatic noxious weed treatment planning within the nonwilderness portion of the Salmon-Challis National Forest (3.2 million acres)	Planning phase
IV	Idaho and Southwestern Montana	Northern Great Basin	Twin Falls District Noxious Weed and Invasive Plant Treatments	Twin Falls District, Idaho	Proposed action is to use prevention, prescribed fire, herbicides, and manual, mechanical, and biological methods to treat areas dominated by annual invasive species to restore perennial grasses, forbs, and shrubs. This is a programmatic planning effort. Estimated annual restoration is 5,000-10,000 acres in Burley Field Office (FO), 10,000-15,000 acres in Shoshone FO, and 10,000-15,000 acres in Jarbidge FO. Ten-year total for each office could approach 100,000 acres in Burley FO, 150,000 acres in Shoshone FO, and 150,000 acres in Jarbidge FO.	Planning phase. Implementation is planned to cover 10 years starting in 2015.
IV	Idaho and Southwestern Montana	Northern Great Basin	Shrub Planting	Twin Falls District, Idaho	Reintroduction of shrub species through hand planting of seedlings; up to 200,000 seedlings (13,000 acres) may be planted annually.	Implementation since 2010 and expected to continue over the next 10 years.

Table 5-24

Reasonably Foreseeable Future Actions in Management Zone IV Likely to Impact GRSG Habitat

MZ	Sub-region	Affected GRSG Population	Project Name	Project Location	Project Description	Project Status
IV	Idaho and Southwestern Montana	Northern Great Basin	Twin Falls District Wildlife Tracts Restoration	Twin Falls District, Idaho	Proposed action is to use prescribed fire, chemical, drill and harrow seeding, shrub seeding, and plantings to establish perennial vegetation and restore native shrub habitat on wildlife tracts. 500-1,000 acres per year, for a cumulative total of 10,000 acres over ten years.	Implementation has been occurring since 2011 and is planned to continue over the next 8 years.
IV	Oregon	Northern Great Basin	Five Creeks Rangeland Restoration Project	Three Rivers and Andrews/Stens Resource Areas, Oregon	A landscape-scale vegetation treatment encompassing approximately 73,500 acres (approximately 26,000 acres in the CMPA) to return vegetation communities to historic compositions and reduce hazardous fuel loads. Various forms of prescribed fire and mechanical treatments have been used to reduce influence of encroaching western juniper.	Ongoing
IV	Oregon	Northern Great Basin	Multiple restoration projects	Three Rivers Resource Area, Oregon	Implementation plans include thinning, piling, pile burning, and implementing a forest underburn.	Ongoing
IV	Oregon	Northern Great Basin	District-wide noxious weed treatments	Oregon	Ongoing interagency noxious weed treatment efforts with Oregon Department of Agriculture and Oregon counties.	Ongoing
IV	Oregon	Northern Great Basin	District-wide Vegetation Management (Weed EA)	Harney County, Oregon	Use new chemicals to treat noxious and invasive species.	Planning phase
IV	Oregon	Baker; Northern Great Basin	Baker Habitat Restoration and Fuels Treatment projects	Baker County, Oregon	Multi-year phased hazardous fuels and wildlife habitat restoration project on approximately 45,000 acres.	Planning phase
IV	Utah	Box Elder	Noxious weed treatments	Utah	Treating noxious weeds	Ongoing
IV	Nevada	Northern Great Basin	Santa Rosa Fuels Project	Winnemucca District, Nevada	355,699 acre planning area to reduce fire threat and improve wildlife habitat.	Ongoing

Table 5-24

Reasonably Foreseeable Future Actions in Management Zone IV Likely to Impact GRSG Habitat

MZ	Sub-region	Affected GRSG Population	Project Name	Project Location	Project Description	Project Status
IV	Nevada	Northern Great Basin	North Tuscarora Sage-Grouse Habitat Restoration Project	Elko District Office, Nevada	Restoration of up to 10,000 acres of GRSG habitat. Treatments would improve, protect GRSG habitat, protect PPH/PHMA, protect Lahontan Cutthroat Trout Streams, improve wildlife habitat, reduce invasive weeds, and reduce hazardous fuels.	Planning phase
IV	Nevada	Northern Great Basin	Spruce Mountain Project	Elko District Office, Nevada	Spruce Mountain seeding maintenance over 700 acres. Mastication and seeding to reduce fire threat and improve wildlife habitat.	Ongoing
Livestock Grazing						
IV	Idaho and Southwestern Montana	Snake-Salmon-Beaverhead	Grazing Permit Renewals	Challis Field Office	Renewing/modifying 2 to 5 grazing permits per year for the next ten years over 770,000 acres	Project under NEPA review.
IV	Idaho and Southwestern Montana	Snake-Salmon-Beaverhead	Range NEPA for C&H allotments	Boise National Forest, Idaho	Allotments cover over 53,000 acres.	Projects under NEPA review.
IV	Idaho and Southwestern Montana	Northern Great Basin	Allotment Management Plan Updates	Sawtooth National Forest, Idaho and Utah	Cattle and sheep allotment management plan updates on over 350,000 acres.	Ongoing
IV	Idaho and Southwestern Montana	Snake-Salmon-Beaverhead	Allotment Management Plan Updates	Sawtooth National Forest, Idaho	Cattle and sheep allotment management plan updates on over 140,000 acres.	Ongoing
IV	Idaho and Southwestern Montana	Snake-Salmon-Beaverhead	Grazing Allotment Management NEPA	Salmon-Challis National Forest	Grazing allotment management NEPA on over 2 million acres.	Ongoing
IV	Idaho and Southwestern Montana	Southwest Montana	Cessation of Lima-Tendoy Sheep Grazing	Beaverhead-Deerlodge National Forest	Permittee waiving sheep permits on 11,700 acres in PPH/PHMA back to Forest Service. Allotments will be closed to future domestic sheep grazing. No new grazing permits for any livestock will be issued for the Indian Creek Allotment. Three-year trial of 100 AUMs fall cattle grazing for Bear Canyon.	Ongoing. NEPA review and new AMP after 2015 grazing season.

Table 5-24

Reasonably Foreseeable Future Actions in Management Zone IV Likely to Impact GRSG Habitat

MZ	Sub-region	Affected GRSG Population	Project Name	Project Location	Project Description	Project Status
IV	Nevada	Northern Great Basin	White Rock Mountain Aspen Exclosures	Northeastern Nevada	Place up to nine exclosures around aspen stands to protect from overgrazing by livestock.	Planning process
IV	Utah	Box Elder	Fence marking	Utah	The NRCS is planning to mark fences within 3.2 miles of leks throughout Utah on private lands.	Ongoing
Wild Horses and Burros						
IV	Idaho and Southwestern Montana	Northern Great Basin	Wild horse gathers	Owyhee Field Office, Idaho	Gather, fertility treatment, removal of excess wild horses from HMAs. Covers 128,389 acres of public and other (private and state) land.	EAs and decisions have been approved; gathers and treatment are pending due to funding and other priority treatments within the BLM wild horse program.
IV	Oregon	Northern Great Basin	Wild horse gathers	Oregon	Gather wild horses.	Ongoing
Recreation						
IV	Idaho and Southwestern Montana	Northern Great Basin	Special Recreation Permits	Owyhee Field Office, Idaho	Various motorcycle, foot, and mountain bike races, horse endurance rides, dog trials, pioneer treks, and poker runs on 260,000 acres.	Ongoing
Travel Management						
IV	Idaho and Southwestern Montana	Northern Great Basin	Curlew/Deep Creek Travel Management Plan Implementation	Idaho Falls District, Idaho	Implement Travel Management Plan on 375,000 acres; limit motorized travel to designated routes, prohibit cross-country travel	Ongoing

Table 5-24

Reasonably Foreseeable Future Actions in Management Zone IV Likely to Impact GRSG Habitat

MZ	Sub-region	Affected GRSG Population	Project Name	Project Location	Project Description	Project Status
IV	Idaho and Southwestern Montana	Snake-Salmon-Beaverhead	North Highway 20 Travel Plan	Idaho Falls District, Idaho	Designate 127 miles of existing trails; construct 52 miles of new trails, construct 3 acres of parking areas, close and rehabilitate 116 miles of existing routes.	Pending
IV	Utah	Box Elder	Motorized Travel Plan Implementation	Utah	Implementation of motorized route designation plans across the planning region.	Ongoing
Land Use Planning						
IV	Idaho and Southwestern Montana	Northern Great Basin	Jarbidge RMP	Jarbidge Field Office, Idaho	Revise the Jarbidge RMP that provides a comprehensive plan for 1,366,000 acres that further restores or maintains resource conditions and provides for the economic needs of local communities over the long term	Ongoing
IV	Idaho and Southwestern Montana	Snake-Salmon-Beaverhead	Craters LUP Amendment	Craters of the Moon National Monument and Preserve, Idaho	Analyze a range of alternatives for livestock grazing in the Craters of the Moon covering 300,000 acres (i.e., identify lands available or unavailable for grazing, identify the amount of forage available, seasons of use, range improvements)	Ongoing

This table includes a selection of some of the larger projects from the reasonably foreseeable future actions tables in the RMPAs/LUPAs for MZ IV. The full tables can be found in each EIS.

Table 5-25

Reasonably Foreseeable Future Actions in Management Zone II/VII Likely to Impact GRSG Habitat

MZ	Planning Area	Affected GRSG Population	Project Name	Project Location	Project Description, Estimated Footprint	Project Status
Energy and Mining						
II/VII	Northwest Colorado, 9-Plan	Wyoming Basin, Northwest Colorado	Hiawatha Regional Energy Development EIS	Sweetwater County, Wyoming; Moffat County, Colorado	Proposed development of up to 4,208 new natural gas wells on approximately 157,361 acres of mixed federal, state, and private lands. The project area overlaps with lands identified as GRSG Core Areas. 91% of the project area is managed by the BLM.	Proposed

Table 5-25

Reasonably Foreseeable Future Actions in Management Zone II/VII Likely to Impact GRSG Habitat

MZ	Planning Area	Affected GRSG Population	Project Name	Project Location	Project Description, Estimated Footprint	Project Status
II/ VII	9-Plan	Wyoming Basin	LaBarge Platform Exploration & Development Project	Lincoln and Sublette County, Wyoming	Proposed development of up to 838 new oil and gas wells on 218,000 acres of private, state, and federal lands. Approximately 154,000 acres of surface lands are administered by the BLM.	Proposed
II/ VII	9-Plan	Wyoming Basin	Continental Divide-Creston Natural Gas Project	Carbon and Sweetwater Counties, Wyoming	Proposed development of up to 8,950 additional natural gas wells on 1.1 million acres of land, including GRSG Core Areas. The proposed facilities would add to the existing network of wells, pipelines, access routes and electrical distribution systems. Approximately 59 percent of the project area is on federally-owned lands.	Proposed
II/ VII	Lander, 9-Plan	Wyoming Basin	Moneta Divide Natural Gas and Oil Development Project	Fremont and Natrona Counties, Wyoming	Proposed development of approximately 4,250 natural gas and oil wells on 265,000 acres of land (including approximately 169,500 acres of land administered by the BLM). The project area includes GRSG Core Areas.	Proposed
II/ VII	9-Plan	Wyoming Basin	Pinedale Anticline Project	Sublette County, Wyoming	Proposed development of natural gas resources within nearly 200,000 acres of land, of which approximately 80 percent is federal surface ownership. The project area occurs within GRSG Core Areas.	Ongoing
II/ VII	9-Plan	Wyoming Basin	Blacks Fork Project (Formerly Moxa Arch Area Infill)	Sweetwater, Uinta, and Lincoln Counties, Wyoming	Proposed infill drilling project, on approximately 7,500 hydrocarbon wells within 633,532 acres of mixed federal, state, and private lands.	Proposed
II/ VII	9-Plan, Northwest Colorado, Utah	Wyoming Basin, Northwest Colorado	Oil Shale and Tar Sands Programmatic EIS	Colorado, Utah, and Wyoming	Amendment of 10 BLM RMPs to designate certain public lands as available for application for leasing and future exploration and development of oil shale and tar sands resources. A ROD was signed in 2013 which made approximately 678,000 acres available for potential development of oil shale, and approximately 132,000 acres available for development of tar sands.	Ongoing

Table 5-25

Reasonably Foreseeable Future Actions in Management Zone II/VII Likely to Impact GRSG Habitat

MZ	Planning Area	Affected GRSG Population	Project Name	Project Location	Project Description, Estimated Footprint	Project Status
II/ VII	9-Plan	Wyoming Basin	Atlantic Rim Natural Gas Field Development Project	Carbon County, Wyoming	Ongoing development of oil gas resources on 270,080 acres of land, of which 173,672 are federal surface estate. A ROD was signed in 2007. The project area includes GRSG Core Areas.	Ongoing
II/ VII	9-Plan	Wyoming Basin	Chokecherry/Sierra Madre Wind Farm	Carbon County, Wyoming	Proposed development of approximately 1,000 wind turbines and associated ancillary facilities on 220,000 acres of land. The project area includes private, state, and federally managed lands, and overlaps with GRSG Core Areas	Proposed
II/ VII	9-Plan	Wyoming Basin	Normally-Pressured Lance Natural Gas EIS	Sublette County, Wyoming	Proposed development of approximately 3,500 natural gas wells within 141,000 acres of state, private, and BLM-administered lands.	Proposed
II/ VII	9-Plan	Wyoming Basin	Bird Canyon Field Infill Project	Sublette and Lincoln Counties, Wyoming	Proposed drilling and production of 348 new natural gas wells within 17,612 acres of BLM-administered land.	Proposed
<b>Rights-of-way</b>						
II/ VII	9-Plan, NW Colorado, Utah	Wyoming Basin, Rich-Summit-Morgan, Uintah, North Park, NWCO, Strawberry Valley, Carbon	Gateway South Transmission Line Project	17 Counties in Wyoming, Colorado, and Utah	Proposed 500 kV transmission line which would begin near Medicine Bow, Wyoming, and would extend south and west to a proposed substation near Mona, Utah. The proposed transmission line would span over 400 miles, with a 250-foot right-of-way, and would cross multiple land jurisdictions including lands administered by the BLM.	Proposed
II/ VII	9-Plan, NW Colorado, Utah	Wyoming Basin, Northwest Colorado, Sheeprock, Strawberry Valley, Carbon, Bald Hills.	TransWest Express Transmission Line Project	Wyoming, Colorado, Utah, and Nevada	Proposed 600 kV transmission line extending from south-central Wyoming to southern Nevada. The transmission line corridor would span over 700 miles and would cross private, state, and federally owned lands. The proposed route and alternative routes under consideration would cross PPH and PGH.	Proposed

Table 5-25

Reasonably Foreseeable Future Actions in Management Zone II/VII Likely to Impact GRSG Habitat

MZ	Planning Area	Affected GRSG Population	Project Name	Project Location	Project Description, Estimated Footprint	Project Status
II/ VII	9-Plan, Idaho and Southwest Montana	Wyoming Basin, East Central, Northern Great Basin, Box Elder	Gateway West Transmission Line Project	Wyoming and Idaho	Proposed 230 kV and 500 kV transmission line project between Glenrock, Wyoming, and Melba, Idaho. Approximately 1,000 miles of new high-voltage transmission lines would be constructed. The project would cross multiple land jurisdictions, including sage grouse Core Areas in Wyoming.	Proposed
II/ VII	9-Plan	Wyoming Basin	Riley Ridge to Natrona Pipeline Project	Sublette, Sweetwater, Fremont, and Natrona Counties, Wyoming	Proposed 243-mile pipeline from Riley Ridge to Big Piney, Wyoming. The pipeline would consist of a 50-foot right-of-way, and would cross GRSG Core Areas.	Proposed
II/ VII	9-Plan	Wyoming Basin	Zephyr Power Line Transmission Project	Wyoming, Colorado, Utah, and Nevada	Proposed 500 kV transmission line spanning between Chugwater, Wyoming to just south of Las Vegas, Nevada.	Proposed
<b>Weeds</b>						
II/ VII	9-Plan, Northwest Colorado	Wyoming Basin, Northwest Colorado, Powder River Basin, North Park	Invasive Plant Management EIS for the Medicine Bow - Routt National Forests, and Thunder Basin National Grassland	Wyoming and Colorado	Proposed treatment of invasive plant species using adaptive and integrated invasive plant treatment methods. These include manual, mechanical, biological, aerial, and ground herbicide applications. Potential treatment areas include GRSG Core Areas.	Proposed

**5.2 Cumulative Analysis Methodology**

The cumulative impacts discussion that follows considers the alternatives in the context of the broader human environment, specifically, actions that occur within and next to the geographic area covered by the planning area.

Because of the programmatic nature of the LUPA and cumulative assessment, the analysis of cumulative effects tends to be broad and generalized. Consequently, this assessment is primarily qualitative for most resources because of lack of detailed information that would result from project-level decisions and other activities or projects.

1 Quantitative information is used whenever available and as appropriate to portray the  
2 magnitude of an impact. The analysis assesses the magnitude of cumulative impacts by  
3 comparing the environment in its baseline condition with the expected impacts of the  
4 alternatives and other actions in the same geographic area. The magnitude of an impact is  
5 determined through a comparison of anticipated conditions against the naturally occurring  
6 baseline in the affected environment (see **Chapter 3**) or the long-term sustainability of a  
7 resource or social system.

8 The following factors were considered in this cumulative impact assessment:

- 9 • Federal, nonfederal, and private actions
- 10 • Potential for combined effects or interaction among or between effects
- 11 • Potential for effects across political and administrative boundaries
- 12 • Other spatial and temporal characteristics of each affected resource
- 13 • Comparative scale of cumulative impacts across alternatives

14 The geographic scope for the cumulative impact analysis may extend beyond the planning  
15 area boundary appropriate to the resource under consideration. For Greater Sage-Grouse  
16 (GRSG), the cumulative impact analysis includes an analysis at the WAFWA MZ level, in  
17 addition to the planning area analysis. WAFWA MZs are biologically based delineations that  
18 were determined by GRSG populations and subpopulations identified within seven floristic  
19 provinces. WAFWA MZs II and IV overlap the planning area and are included in the  
20 analysis. Analysis at this level enables the decision maker to understand the impacts on  
21 GRSG at a biologically meaningful scale.

### 22 **5.3 Past, Present, and Reasonably Foreseeable Future Actions**

23 Past, present, and reasonably foreseeable future actions are considered in the analysis to  
24 identify whether and to what extent the environment has been degraded or enhanced and  
25 whether ongoing activities are causing impacts (**Table 5-26**). Also considered are trends for  
26 activities in and impacts on the area. Projects and activities are evaluated on the basis of  
27 proximity, connection to the same environmental systems, potential for subsequent impacts  
28 or activity, similar impacts, the likelihood a project will occur, and whether the project is  
29 reasonably foreseeable.

30 Projects and activities considered in the cumulative analysis were identified by BLM and  
31 Forest Service employees with knowledge of the area. Each was asked to provide  
32 information on the most influential past, present, or reasonably foreseeable future actions.  
33 Additional information was obtained through discussions with agency officials and a review  
34 of publicly available materials and websites.

35 Effects of past actions and activities are manifested in the current condition of the resources,  
36 as described in the affected environment (**Chapter 3**). Reasonably foreseeable future actions

1 are those that have been committed to or known proposals that would take place within a  
2 20-year planning period.

3 Reasonably foreseeable future action scenarios are projections made to predict future  
4 impacts; they are not actual planning decisions or resource commitments. Projections, which  
5 have been developed for analysis only, are based on current conditions and trends and  
6 represent a best professional estimate. Unforeseen changes in such factors as economics,  
7 demand, and federal, state, and local laws and policies could result in different outcomes  
8 than those projected in this analysis.

9 Other potential future actions have been considered and eliminated from further analysis  
10 because there is a small likelihood these actions would be pursued and implemented within  
11 the life of the plan or because so little is known about the potential action that formulating  
12 an analysis of impacts is premature.

13 In addition, potential future actions protective of the environment (such as new regulations  
14 related to fugitive dust emissions) have less likelihood of creating major environmental  
15 consequences alone, or in combination with this planning effort. Federal actions such as  
16 species listing would require the BLM and Forest Service to reconsider decisions created  
17 from this action. This is because the consultations and relative impacts might no longer be  
18 appropriate. These potential future actions may have greater capacity to affect resource uses  
19 within the planning area; however, until more information is developed, no reasonable  
20 estimation of impacts could be developed.

21 Data on the precise locations and overall extent of resources within the planning area are  
22 considerable, although the information varies according to resource type and locale.  
23 Furthermore, understanding of the impacts on and the interplay among these resources is  
24 evolving. As knowledge improves, management measures (adaptive or otherwise) would be  
25 considered to reduce potential cumulative impacts, in accordance with law, regulations, and  
26 current LUPs.

27 Projects and activities identified as having the greatest likelihood to generate potential  
28 cumulative impacts when added to the Idaho and Southwestern Montana Greater Sage-  
29 Grouse EIS/Plan Amendment alternatives are displayed in **Table 5-26**.

**Table 5-26  
Past, Present, and Reasonably Foreseeable Future Actions**

Name	Description	Location	Sage-Grouse Population Area	Estimated Footprint (Acres or Miles)	Status of Action
<b>Lands and Realty</b>					
Communication sites renewal – 2	Renewal of existing sites	Owyhee Field Office	Southwest Idaho	Less than 5 acres	Pending
Communication sites renewal – 2	Renewal of existing sites	Four Rivers Field Office	Unknown	No new surface disturbance	Pending
Communication site amendment - 1	Change 199-foot tower to 699-foot tower	Owyhee Field Office	Southwest Idaho	Over 15 acres	Pending
Communication site amendment - 1	Tower replacement	Four Rivers Field Office	Unknown	Less than 1 acre	Pending
Road ROW applications – 10	Construct new roads	Owyhee Field Office	Southwest Idaho	Unknown	Pending
Road ROW applications – 4	New applications for ROW on existing roads	Bruneau Field Office	Southwest Idaho	Less than 20 acres	Pending
Road ROW application – 3	New road application on existing roads	Four Rivers Field Office	Unknown	Less than 20 acres	Pending
Road ROW – renewals – 4	Renewal of existing ROW	Owyhee Field Office	Southwest Idaho	No new surface disturbance	Pending
Road ROW renewal – 1	Renewal of existing road	Four Rivers Field Office	Unknown	No new surface disturbance	Pending
Old Highway 37 Reroute Project	Move highway out of canyon and riparian corridor 1/2-mile east onto the upland, over a 5-mile stretch	Curlew National Grassland, 8 miles NW of Holbrook, ID	South Side Snake	5 miles	EA; In the planning phase; Decision Notice FONSI expected in 2016
Oil and gas facility – 1	Expand existing facility	Owyhee Field Office	Southwest Idaho	Less than 2 acres	Pending
Oil and gas facility renewal – 1	Renewal of existing ROW	Bruneau Field Office	Southwest Idaho	No new surface disturbance	Pending
Oil and gas facility renewal – 2	Renewal of existing sites	Four Rivers Field Office	Weiser	No new surface disturbance	Pending

**Table 5-26**  
**Past, Present, and Reasonably Foreseeable Future Actions**

Name	Description	Location	Sage-Grouse Population Area	Estimated Footprint (Acres or Miles)	Status of Action
Oil and gas temporary use areas – 3	Temporary use for construction and maintenance	Four Rivers Field Office	Weiser	Less than 5 acres	Pending
Transmission line ROW application – 1	New transmission line	Bruneau Field Office	Southwest Idaho	Less than 5 acres	Pending
Transmission line ROW application – 1	New transmission line	Four Rivers Field Office	Unknown	Less than 15 acres	Pending
Hooper Springs Transmission Line	New transmission line	Soda Springs, Idaho	Southeast Idaho	No direct disturbance of PGH; if southern alternative is selected, line will be within a mile of PGH in Trail Creek/Slug Creek	FEIS 2013
Transmission line ROW renewals – 3	Renewal of existing lines	Owyhee Field Office	Southwest Idaho	No new surface disturbance	Pending
Transmission line ROW renewals – 12	Renewal of existing lines	Four Rivers Field Office	Unknown	No new surface disturbance	Pending
Transmission line ROW upgrade – 1	Add tap, upgrade line	Owyhee Field Office	Southwest Idaho	Less than 2 acres	Pending
Telephone line ROW renewals – 12	Renewal of existing ROW	Owyhee Field Office	Southwest Idaho	No new surface disturbance	Pending
Telephone line ROW renewals – 7	Renewal of existing lines	Four Rivers Field Office	Unknown	No new surface disturbance	Pending
Telephone line ROW renewal - 1	Renewal of existing ROW	Bruneau Field Office	Southwest Idaho	No new surface disturbance	Pending
Idaho Power - Smith's Prairie SUP renewal	Renewal of power line, which includes some new	Mountain Home Ranger District –	North Side Snake	5 miles	NEPA Decision in FY 2014;

*Idaho and Southwestern Montana Greater Sage-Grouse Proposed LUPA/Final EIS*  
June 2015

Past, Present, and Reasonably Foreseeable Future Actions**

Name	Description	Location	Sage-Grouse Population Area	Estimated Footprint (Acres or Miles)	Status of Action
	line and some new access roads	Boise National Forest			implementation in FY 2015
King-Moon-Wood River transmission line rebuild	Rebuild of 138 kV transmission line	Twin Falls District	North Side Snake	Unknown	Planning; projected build 2014-2016
Waterline ROW – 1	New buried water pipeline	Owyhee Field Office	Southwest Idaho	Less than 5 acres	Pending
Irrigation facility ditch ROW – 1	Renewal of existing ROW	Owyhee Field Office	Southwest Idaho	No new surface disturbance	Pending
Water facility ROW renewal – 8 (weirs)	Renewals of existing ROWs	Owyhee Field Office	Southwest Idaho	No new surface disturbance	Pending
Water facility ROW renewal – 2	Renewal of existing ROWs	Bruneau Field Office	Southwest Idaho	No new surface disturbance	Pending
Water facility ROW renewal – 1	Renewal of existing pipeline	Four Rivers Field Office	Unknown	Less than 1 acre	Pending
Water facility ROW amendment – 1	Include portions of canal on lands acquired by BLM	Four Rivers Field Office	Unknown	Less than 5 acres	Pending
Symbiotics LLC Hydro Facility	Hydro facility, including a transmission line, substation, dam, penstock, and upper reservoir	Dam located in Idaho, NE of Jackpot, Nevada, Twin Falls District	Southwest Idaho	110 acres	Feasibility study being conducted
New land use Authorizations	Approximately 40 ROW/authorizations/power lines, buried and overhead, roads, communication sites	Throughout PPH and PGH in the Dillon Field Office	Southwest Montana	Approximately 100 acres of disturbance. Associated with new ROW	Projected for 10 years based on previous last 5 years in LR2000
Leases/Permits – 3	Cabins and apiaries	Owyhee Field Office	Southwest Idaho	Less than 10 acres	Pending
Leases/Permits – 8	Agricultural and apiaries	Bruneau Field Office	Southwest Idaho	Less than 25 acres	Pending

**Table 5-26**  
**Past, Present, and Reasonably Foreseeable Future Actions**

Name	Description	Location	Sage-Grouse Population Area	Estimated Footprint (Acres or Miles)	Status of Action
Leases and Permits renewal – 3	Occupancy and Trespass Resolution	Four Rivers Field Office	Unknown	Less than 10 acres	Pending
Leases and Permits application – 8	Occupancy and Trespass Resolution	Four Rivers Field Office	Unknown	Less than 15 acres	Pending
Land Use Lease	Lease lands to resolve cabin encroachment on BLM-administered lands	Centennial Valley – PPH in the Dillon Field Office	Southwest Montana	5 acres total	Proposal stage
Owyhee land exchange	Land exchange with the state	Western portion of Owyhee County, Bruneau Field Office	Southwest Idaho	Proposing to dispose of approximately 33,000 acres of non-GRSG habitat and acquiring around 38,000 acres of primarily GRSG habitat	2015
Thompson Creek Mine land exchange	Increase public land acres through a land exchange within PPH	Challis Field Office, Idaho Falls District	Mountain Valleys	Unknown	Project under NEPA review; decision anticipated in 2014
Dairy Syncline land sale	Land sale and tailings pond construction; possible mitigation GRSG habitat land parcel in Stump Creek as exchange	Slug creek watershed, Idaho Falls District	East-Central Idaho	225 acres	Draft EIS to be released early 2015
Mackay Transfer Station land sale	Sale of land to Custer County for transfer station	T 7N, R 24E, Sec. 22, Idaho Falls District	Mountain Valleys	10 acres	Waiting for completed application from Custer County. Decision anticipated

**Table 5-26  
Past, Present, and Reasonably Foreseeable Future Actions**

					2014.
Military training	From low-level up to high-altitude flights by military aircraft; military motor vehicle access to emitter sites and use at emitter sites.	Entire Bruneau Field Office and vehicles use roads and emitter sites on the Highway 51/Rowland Road area; military withdrawal site has relatively heavy use.	Southwest Idaho	Unknown	Ongoing
F-35 A Operational Wing Bed Down EIS	Alternative in place to bed down the aircraft at the Mountain Home Air Force Base	Entire Bruneau Field Office	Southwest Idaho	Unknown	Proposed
F-35 A Training Wing Bed Down EIS	Alternative in place to bed down the aircraft at the Gowen Field Military Base	Entire Bruneau Field Office	Southwest Idaho	Unknown	Proposed
Idaho Power Integrated Resource Plan	Describes the company's projected need for additional electricity and the resources necessary to meet that need while balancing reliability, environmental responsibility, efficiency, and cost.	Entire sub-region	All GRSG population areas	None – planning effort	Completed June 2013
Rocky Mountain Power Integrated Resource Plan	Describes the company's projected need for additional electricity and	Entire sub-region	All GRSG population areas	None – planning effort	Completed April 2013

**Table 5-26  
Past, Present, and Reasonably Foreseeable Future Actions**

Name	Description	Location	Sage-Grouse Population Area	Estimated Footprint (Acres or Miles)	Status of Action
	the resources necessary to meet that need while balancing reliability, environmental responsibility, efficiency, and cost.				
<b>Major Realty Actions</b>					
Gateway West 230/500 Transmission Line project	Authorize ROW for 1,100-mile 500-KV transmission line	Wyoming, Southern Idaho, Boise District, Curlew National Grassland, Idaho Falls District	Southwest Idaho, North Side Snake	1,100 miles	Pending; final EIS 2013  Scheduled for implementation starting 2016
Boardman to Hemingway	New transmission line	Owyhee Field Office	Southwest Idaho	Unknown	Pending
<b>Fuels and Vegetation</b>					
ARS South Mountain Juniper Management Study	Determine the effects of management-driven juniper treatments on the hydrology of four watersheds in the South Mountain Area, including snowpack distribution and drifts, after altering the canopy by removing juniper from the sagebrush-steppe ecosystem. Removal would be through prescribed burning.	South Mountain (T 9S, R 5W, Sect. 2, 3, 10, 11), Owyhee Field Office	Southwest Idaho	603 acres (357 BLM; 246 private)	Scoping complete; NEPA and ROD pending

**Table 5-26**  
**Past, Present, and Reasonably Foreseeable Future Actions**

Name	Description	Location	Sage-Grouse Population Area	Estimated Footprint (Acres or Miles)	Status of Action
ARS Reynolds Creek Experimental Watershed Prescribed Fire Research Plan	Study the effects of juniper encroachment and prescribed fire on soil-water balance. Treatments occurred through prescribed burning.	Reynolds Creek Experimental Watershed, Owyhee Field Office	Southwest Idaho	5,549 acres of public and private lands; acreage broken into four treatment areas	Three of the four treatment areas have been implemented as planned. The fourth (Johnson Draw) is pending. Due to topography, the treatment area may be adjusted.
Juniper Treatments in Pole Creek Allotment	Juniper removal to enhance resource conditions	Pole Creek Allotment, Owyhee Field Office	Southwest Idaho	24,486 acres of public, private, and state land	Decision issued; treatment implementation pending litigation
Juniper Treatment in Trout Springs Allotment	Juniper removal to enhance resource conditions	Trout Springs Allotment, Owyhee Field Office	Southwest Idaho	29,475 acres of public, private, and state lands	Planning; draft EA complete
Upper Castle Creek Fuels Project	Juniper control project on approximately 33,000 acres in the northwestern portion of Upper Castle Creek	Upper Castle Creek, Bruneau Field Office	Southwest Idaho	25,000 acres implemented; of the remaining areas to treat, 2,000-4,000 acres/year	Ongoing through 2014
BOSH Sage-Grouse Juniper	Juniper thinning	Boise District, Owyhee Field Office, Boise Field Office, Owyhee County	Southwest Idaho	1,500,000 acres	Draft EA
Pixley Basin	Juniper treatments (mechanical and prescribed fire)	Boise District, Boise Field Office, Owyhee County, South	Southwest Idaho	1,933 acres	Ongoing project

**Table 5-26**

Name	Description	Location	Sage-Grouse Population Area	Estimated Footprint (Acres or Miles)	Status of Action
		Oreana			
West Antelope	Juniper thinning	Boise District, Boise Field Office, Owyhee County	Southwest Idaho	287 acres	Ongoing project
Tex Creek Aspen Health Project	Remove encroaching junipers from within historic aspen clones	Tex Creek WMA east of Idaho Falls, Idaho, Idaho Falls District	East-Central Idaho	70 acres	NEPA is complete; implementation of the project began in 2012.
Patelzik Creek Aspen Health Project	Remove encroaching conifers from within historic aspen clones and thin remaining conifer stands	Medicine lodge management area within the northern portion of the Upper Snake Field Office, Idaho Falls District	Mountain Valleys	750 acres	NEPA started; implementation slated to begin in 2014
Cedar Butte Juniper Thinning	Remove encroaching junipers from within Wyoming sagebrush and thin remaining stands of juniper	Northern portion of the Big Desert management area west of Idaho Falls, Idaho, Idaho Falls District	North Side Snake	1,000 acres	Planning phase; project implementation anticipated in 2016
Deadman Juniper Thinning	Remove encroaching junipers from within Wyoming sagebrush and thin remaining stands of juniper	Northern portion of the Big Desert management area west of Idaho Falls, Idaho, Idaho Falls District	Mountain Valleys	1,000 acres	Planning phase 1 project implementation anticipated in 2015
Samaria Mountain Fuels Reduction and Restoration Project,	Remove encroaching junipers from within Wyoming sagebrush and	Southeast Idaho, northern Utah, southwest Wyoming,	Southwest Idaho	3,000 acres	NEPA complete; approximately 1,000 acres completed,

*Idaho and Southwestern Montana Greater Sage-Grouse Proposed LUPA/Final EIS*  
June 2015

**Table 5-26  
Past, Present, and Reasonably Foreseeable Future Actions**

Name	Description	Location	Sage-Grouse Population Area	Estimated Footprint (Acres or Miles)	Status of Action
Juniper Thinning	thin remaining stands of juniper	15 miles south of Samaria, Idaho, Idaho Falls District			remaining acres to be completed over next 7 years
Soda Hills Fuels Reduction and Restoration Project, Juniper and Douglas-Fir Thinning	Remove encroaching junipers and Douglas-fir from within Wyoming sagebrush and thin remaining stands of juniper and Douglas-fir	Southeast Idaho, Soda Springs area, Idaho Falls District	East-Central Idaho	3,000 acres	NEPA complete; approximately 1,500 acres completed, remaining acres to be completed over next 5 years
Crystal Springs/Toponce Fuels Reduction and Restoration Project, Juniper and Douglas-Fir Thinning	Remove encroaching junipers and Douglas-fir from within Wyoming sagebrush and thin remaining stands of juniper and Douglas-fir	Southeast Idaho, 20 miles north of Lava Hot Springs, Blackfoot River area, Idaho Falls District	East-central Idaho	2,000 acres	Planning phase; project implementation anticipated in 2014
South Stone Juniper Thinning Project	Remove encroaching junipers from within Wyoming sagebrush	Southeast Idaho, Idaho Falls District	South Side Snake	1,700 acres	In progress; approximately 600 acres completed
Juniper Town Site Juniper Thinning Project	Remove encroaching junipers from within Wyoming sagebrush	Southeast Idaho, Idaho Falls District	South Side Snake	700 Acres	Planning phase; project implementation anticipated in 2020
Curlew Fuel Breaks and Juniper Reduction Project	Compartmentalize the Curlew area using existing roads to improve wildfire suppression and reduce wildfire growth. Efforts will help to retain existing	Southeast Idaho, north Utah, Idaho Falls District	South Side Snake	60,000 acres	Planning phase; project implementation anticipated in 2017

**Table 5-26  
Past, Present, and Reasonably Foreseeable Future Actions**

Name	Description	Location	Sage-Grouse Population Area	Estimated Footprint (Acres or Miles)	Status of Action
	intact Wyoming sagebrush habitat. Remove encroaching junipers from within Wyoming sagebrush.				
Bear Lake Fuels Reduction and Restoration Project	Remove encroaching junipers from within Wyoming sagebrush, improve and restore sagebrush habitat	Southeast Idaho, north Utah, Idaho Falls District	Bear Lake	30,000 acres	Planning phase; project implementation anticipated in 2020
Wolverine Fuels Reduction Project	Remove encroaching juniper and Douglas-fir from within Wyoming sagebrush; improve and restore sagebrush habitat	Southeast Idaho, Idaho Falls District	East-central Idaho	2,000 acres	Planning phase; project implementation anticipated in 2021
Trapper Creek Vegetation Project	Reduce conifer encroachment in riparian areas, shrublands, and grasslands; increase the aspen component; slash and jackpot burn; broadcast burn	Wise River Ranger District, Beaverhead-Deerlodge National Forest	Southwest Montana	Approximately 3,200 acres total, less than 1,100 acres in PGH	Project withdrawn per litigation; NEPA supplements underway; ROD anticipated end of 2013
Sage-Grouse Habitat Improvement	Remove conifer from Phase I-II sagebrush habitat	Minidoka Ranger District, Cassia Division, Idaho, Sawtooth National Forest	South Side Snake	800 acres	Completed

**Table 5-26  
Past, Present, and Reasonably Foreseeable Future Actions**

Name	Description	Location	Sage-Grouse Population Area	Estimated Footprint (Acres or Miles)	Status of Action
Burley Landscape Sage-Grouse Habitat Restoration	Treat encroaching juniper on approximately 38,000 acres	Various locations throughout the Burley Field Office, Twin Falls District	South Side Snake	38,000	Approximately 8,500 acres already completed; implementation of remaining 29,500 acres expected over the next 7 years
Douglas-fir removal	Mechanically remove Douglas-fir in sagebrush habitat	Throughout PPH and PGH in the Dillon Field Office	Southwest Montana	Approximately 50 acres yearly	Complies with NEPA; ongoing
Bruneau Fuel Breaks Project	Fuel breaks, in the form of greenstrips and roadside mowing, will occur in the eastern portion of the Bruneau Field Office. The projects may take 5 years to implement; maintenance is anticipated every 7-10 years.	11 allotments in Bruneau Field Office: Blackstone Center China Creek Crab Creek East Canyon View Louse Creek Miller Table Seeding Northwest Owens Table Butte West Canyon View	Southwest Idaho	Treatments along 128 miles of roads; 2,836 acres of shrub modification	Project approved; awaiting completion of appeal period before beginning implementation
Paradigm Project	Fuel break project that would create up to 294 miles of fuel breaks between 50 and 300 feet wide over a 10-year period. Fuel breaks would	Ada (eastern) and Elmore (western) Counties between Boise and Glens Ferry, between the railroad and the base	North Side Snake	2,111 acres of PPH and 24,667 acres of PGH in project area; five leks within the project boundary, two leks within 0.5	Pending

**Table 5-26**  
**Past, Present, and Reasonably Foreseeable Future Actions**

Name	Description	Location	Sage-Grouse Population Area	Estimated Footprint (Acres or Miles)	Status of Action
	be associated with roads and other linear disturbances. At the maximum width of 300 feet, up to 10,690 acres would be directly affected. Methods proposed to create fuel breaks include seeding with forage kochia or native/nonnative grass species, disking/bare ground, mechanical thinning and mowing, herbicides, targeted grazing, and prescribed burning.	of the foothills (293,891 total acres), in Four Rivers Field Office		mile, and 17 leks within 10 miles; fuel breaks in PPH would be 50 feet on either side of road and in PGH would be 100 feet on either side of road; would affect 61 acres of sagebrush in PPH and 606 acres in PGH	
Bruneau Mow	Fuel breaks	Boise District, Boise Field Office, Owyhee County, south of Bruneau	Southwest Idaho	130 miles	EA done in 2013; ready for treatments
South Owyhee Fuel Breaks	Fuel breaks	Boise District, Owyhee Field Office, Boise Field Office, Owyhee County	Southwest Idaho	2,000,000 acres, 850 miles	Draft EA
I-84	Fuel breaks	Boise District, Four Rivers Field Office, I-84 Oregon – Glens Ferry	North Side Snake	80 miles	Ongoing project

**Table 5-26  
Past, Present, and Reasonably Foreseeable Future Actions**

Name	Description	Location	Sage-Grouse Population Area	Estimated Footprint (Acres or Miles)	Status of Action
Curlew National Grassland Sagebrush Protection Project	Mechanical mowing of 314 acres of fuel breaks in strategic locations to protect existing stands of sagebrush from wildland fire	Curlew National Grassland	South Side Snake	314 acres	Decision completed; work started in 2012 and will continue through 2014 as funding allows
Curlew Sagebrush Protection Project Upgrade	Fuel break mowing	Westside Ranger District, Curlew Grasslands	South Side Snake	900 acres	Planned for 2017
Big Desert Fuel Breaks	Compartmentalize the Big Desert management area using existing roads to improve wildfire suppression and reduce wildfire growth; efforts will help to retain intact Wyoming sagebrush habitat within the northern portion of the management area	Big Desert Area in the southwest portion of the Upper Snake Field Office and the eastern portion of the Shoshone Field Office, Idaho Falls and Twin Falls Districts	North Side Snake	291 miles of existing desert roads with a footprint of 10,581 acres  Upper Snake Field Office: 245 miles of roads with 8,908 footprint acres  Shoshone Field Office: 46 miles of roads with 1,673 footprint acres	NEPA is complete and project began in 2012 within the Upper Snake Field Office; those fuel breaks identified within the Shoshone Field Office require further analysis and consultation before NEPA can be finalized.
Blackfoot River Fuel Breaks	Compartmentalize the Blackfoot River Corridor area using existing roads to improve wildfire suppression and reduce wildfire growth; efforts	Blackfoot River, 20 miles East of Blackfoot Idaho, Idaho Falls District	East-central Idaho	2,000 acres	Planning phase; project implementation anticipated in 2018

**Table 5-26  
Past, Present, and Reasonably Foreseeable Future Actions**

Name	Description	Location	Sage-Grouse Population Area	Estimated Footprint (Acres or Miles)	Status of Action
	will help to retain existing intact Wyoming sagebrush habitat				
Minidoka Fuel Break	Maintenance treatments of forage kochia fuel breaks	Minidoka desert road network approximately 30 miles northeast of Burley, Idaho, Twin Falls District	North Side Snake	100-foot fuel breaks on each side of multiple roads for 28 miles; approximately 690 acre footprint	Fuel breaks were implemented in 2010 – 2012; maintenance actions are expected within the next 10 years to improve fuel break effectiveness.
Jarbidge Fuel Breaks	Implementation of self-sustaining fuel breaks using prescribed fire, herbicide, mechanical seedbed preparation, broadcast and drill seeding methods	Multiple locations along road corridors within the Jarbidge Field Office, Twin Falls District	South Side Snake	160 miles of 550-foot-wide fuel breaks along existing roads; approximately 10,499-acre footprint	Planned ROD in 2014; implementation is planned to cover a 5- to 10-year period
Pocatello Field Office Noxious Weed Control	Apply chemical treatments for noxious weed control	BLM-administered and National Forest System lands within Bear Lake County, Idaho, Idaho Falls District	Bear Lake	300 acres per year	Ongoing
Challis Field Office weed treatments	Treating weeds across the field office with biological, chemical, and mechanical treatments	Challis Field Office	Mountain Valleys	1,000 acres per year	Ongoing
Big Desert Noxious Weed Treatments	Treating noxious weeds within the Big Desert	Big Desert Area in the southwest portion	North Side Snake	Total landmass is 600,000 acres with an	NEPA is complete; project began in 2006

**Table 5-26  
Past, Present, and Reasonably Foreseeable Future Actions**

Name	Description	Location	Sage-Grouse Population Area	Estimated Footprint (Acres or Miles)	Status of Action
	management area	of the Upper Snake Field Office, Idaho Falls District		annual treatment target of 5,000 acres	
Eastside Sheeptrail Cheatgrass Treatment	Chemically reduce cheatgrass densities to modify fire return intervals and allow for seeded native species to become established	Eastern portion of the Big Desert management area west of Blackfoot, Idaho, Idaho Falls District	North Side Snake	2,000 acres	Planning phase; project implementation anticipated in 2016
Rock Corral Cheatgrass Treatment	Chemically reduce cheatgrass densities to modify fire return intervals and allow for seeded native species to become established	Eastern portion of the Big Desert management area west of Blackfoot, Idaho, Idaho Falls District	North Side Snake	2,000 acres	Planning phase; project implementation anticipated in 2018
Stage Road Cheatgrass Treatment	Chemically reduce cheatgrass densities to modify fire return intervals and allow for seeded native species to become established	Eastern portion of the Big Desert management area west of Blackfoot, Idaho, Idaho Falls District	North Side Snake	3,000 acres	Planning phase; project implementation anticipated in 2017
Birch Willow Lost EIS Vegetation Management EIS	Vegetation management treatments to meet Forest Plan desired conditions including removing encroaching conifers in Sagebrush, Aspen, Mountain Mahogany, thinning Douglas-fir,	Dillon Ranger District Southern portion of East Pioneers	No population overlap.	Unknown at this time Possible slight overlap of PGH	EIS on hold

**Table 5-26**

Name	Description	Location	Sage-Grouse Population Area	Estimated Footprint (Acres or Miles)	Status of Action
	daylighting Whitebark Pine.				
Salmon-Challis National Forest Forest-wide Invasive Plant Treatment EIS	Programmatic Noxious Weed Management EIS and ROD	Salmon-Challis National Forest	Mountain Valleys	Project area is nonwilderness portion of the Salmon-Challis National Forest (3.2 million acres)	NEPA anticipated to be completed by September 2014
Clear Creek Restoration	Treat cheatgrass-dominated site and restore to perennial grasses and shrubs	15 miles east of Almo, Idaho, Twin Falls District	South Side Snake	1,000 acres	Planned implementation within the next 3 years
Twin Falls District Noxious Weed and Invasive Plant Treatments	Proposed action is to use prevention, prescribed fire, herbicides, and manual, mechanical, and biological methods to treat areas dominated by annual invasive species to restore perennial grasses, forbs, and shrubs.	Various locations throughout the Shoshone, Jarbidge, and Burley Field Offices, Twin Falls District	South Side Snake	This is a programmatic planning effort. Estimated annual restoration is 5,000-10,000 acres in Burley, 10,000-15,000 acres in Shoshone, and 10,000-15,000 acres in Jarbidge. Ten-year total for each office could approach 100,000 acres in Burley, 150,000 acres in Shoshone, and 150,000 acres in	Programmatic EA with planned ROD in 2014. Implementation is planned to cover 10 years starting in 2015.

**Table 5-26  
Past, Present, and Reasonably Foreseeable Future Actions**

Name	Description	Location	Sage-Grouse Population Area	Estimated Footprint (Acres or Miles)	Status of Action
				Jarbidge.	
Noxious weeds treatment	Treat noxious weeds across the Dillon Field Office	Throughout PPH and PGH in the Dillon Field Office	Southwest Montana	Approximately 1,500 acres yearly	Ongoing
Rock Creek Riparian Restoration Project	In association with the Old Highway 37 Reroute Project, once the highway is moved, remove road materials and restore hydrologic function to Rock Creek	Curlew National Grassland, 8 miles northwest of Holbrook, Idaho	South Side Snake	5 miles	In the planning phase; expected EA in 2014 once a decision is made on highway project (above)
Rock Creek Fuels EA	Fuels reduction and vegetation improvement adjacent to sagebrush communities	Minidoka Ranger District, Cassia Division, Idaho, Sawtooth NF	South Side Snake	7,959 acres	Planned for 2016
Pocatello Field Office Seedling plantings	Seedling planting of sagebrush and antelope bitterbrush	BLM-administered and National Forest System lands within Bear lake County, Idaho, Idaho Falls District	Bear Lake	20 acres per year	Ongoing, includes Fish and Game habitat restoration projects
Pocatello Field Office Curlew Seedling plantings	Seedling planting of sagebrush and antelope bitterbrush	BLM-administered and National Forest System lands within Oneida County, Idaho – Curlew and South Stone areas, Idaho Falls District	South Side Snake	20 acres per year	Ongoing, includes Fish and Game habitat restoration projects
Pahsimeroi Sagebrush	Treating sagebrush with	West River Flat	Mountain Valleys	700 acres	Project under NEPA

**Table 5-26  
Past, Present, and Reasonably Foreseeable Future Actions**

Name	Description	Location	Sage-Grouse Population Area	Estimated Footprint (Acres or Miles)	Status of Action
Restoration	Lawson aerator and seeding native herbaceous species	Pasture of the Upper Pahsimeroi Allotment, Challis Field Office, Idaho Falls District			review; decision date anticipated in 2014
Buckwalter Sage-Grouse Habitat Project	Treating sagebrush cover to increase herbaceous cover to site potential	T 8N.,R 23E., Sec. 36, Challis Field Office, Idaho Falls District	Mountain Valleys	Up to 640 acres	Project under NEPA review; decision date anticipated in 2014
Pocatello Shrub Planting Programmatic EA	Reintroduction of shrub species through hand planting of seedlings	Various locations throughout southeast Idaho, Idaho Falls District	Bear Lake, South Side Snake, east-central Idaho	Up to 500 acres annually	NEPA complete; implementation has been occurring since 2011 and is expected to continue for next 5-10 years.
Burley Shrub Planting	Reintroduction of shrub species through hand planting of seedlings; up to 150,000 seedlings may be planted annually.	Various locations throughout the Burley Field Office, Twin Falls District	South Side Snake	Up to approximately 8,000 acres annually	Implementation has been occurring since 2010 and is expected to continue over the next 7-10 years.
Jarbidge Shrub Planting	Reintroduction of shrub species through hand planting of seedlings; up to 50,000 seedlings may be planted annually.	Various locations throughout the Jarbidge Field Office, Twin Falls District	South Side Snake	Up to approximately 5,000 acres annually	Implementation has been occurring since 2012 and is expected to continue over the next 10 years.
Twin Falls District Wildlife Tracts Restoration	Proposed action is to use prescribed fire, chemical, drill and harrow seeding, shrub seeding, and	Multiple wildlife tracts throughout the Shoshone, Burley, and Jarbidge Field	South Side Snake	500-1,000 acres per year, for a cumulative total of 10,000 acres over ten years	Implementation has been occurring since 2011 and is planned to continue over the

White Knob Cattle Allotments	Grazing Allotment Management NEPA	Lost River Ranger District, Salmon-Challis National Forest	Mountain Valleys	54,997 acres	Decision possible within the reasonably foreseeable time frame (by 2023)
Little Eightmile and Grizzly Hill	Grazing Allotment Management NEPA	Leadore Ranger District, Salmon-Challis National Forest	Mountain Valleys	46,086 acres	Decision possible within the reasonably foreseeable time frame (by 2023)
Middle Fork Allotments	Grazing Allotment Management NEPA	Middle Fork Ranger District, Salmon-Challis National Forest	Mountain Valleys	52,905 acres	Decision possible within the reasonably foreseeable time frame (by 2023)
Pioneer Cattle Allotments	Grazing Allotment Management NEPA	Lost River Ranger District, Salmon-Challis National	Mountain Valleys	246,179 acres	Decision planned in 6-7 years

**Table 5-26**  
**Past, Present, and Reasonably Foreseeable Future Actions**

Name	Description	Location	Sage-Grouse Population Area	Estimated Footprint (Acres or Miles)	Status of Action
		Forest			
Lost River Allotments	Grazing Allotment Management NEPA	Lost River Ranger District, Salmon-Challis National Forest	Mountain Valleys	113,122 acres	Decision planned in 4-7 years
Lemhi/Salmon Allotments	Grazing Allotment Management NEPA	Leadore Ranger District, Salmon-Challis National Forest	Mountain Valleys	52,661 acres	Decision planned in 6-10 years
North Lost River Allotments	Grazing Allotment Management NEPA	Challis-Yankee Fork Ranger District, Salmon-Challis National Forest	Mountain Valleys	71,492 acres	Decision planned in 6-10 years
Lower Salmon/Panther Allotments	Grazing Allotment Management NEPA	Salmon-Cobalt Ranger District, Salmon-Challis National Forest	Mountain Valleys	297,730 acres	Decision planned in 8-10 years
NW Lemhi Allotments	Grazing Allotment Management NEPA	Challis-Yankee Fork Ranger District, Salmon-Challis National Forest	Mountain Valleys	57,782 acres	Decision planned in 8-10 years
Kelly Canyon-Indian Creek Grazing Analysis Project	Grazing re-authorization	Dubois Ranger District	Mountain Valleys	53,220 acres	Planned for 2018
South Soda Sheep AMP revisions	Grazing re-authorization	Soda Spring Ranger District	East-Central Idaho	132,000 acres	Planned for 2016
NW Big Hole AMP Revision	Cattle allotment management plan revision (7 cattle	Wisdom Ranger District, Beaverhead-Deerlodge National	Southwest Montana, Wisdom sub-population (P37)	4 allotments overlapping 687 acres of PGH	NEPA underway; ROD in late 2015

**Table 5-26  
Past, Present, and Reasonably Foreseeable Future Actions**

Name	Description	Location	Sage-Grouse Population Area	Estimated Footprint (Acres or Miles)	Status of Action
Cessation Lima-Tendoy Sheep Grazing	allotments)  Indian Creek and Bear Canyon Allotments	Forest  Dillon Ranger District, Beaverhead-Deerlodge National Forest	Southwest Montana, Red Rocks sub-population (P24)	11,700 acres in PPH	Permittee waiving sheep permits back to Forest Service (pending receipt of waiver of term grazing permit-2013). Allotments will be closed to future domestic sheep grazing. No new grazing permits for any livestock will be issued for Indian Creek. Three-year trial of 100 AUMs fall cattle grazing for Bear Canyon. NEPA review and new AMP after 2015 grazing season
Range Improvement Construction	Construction or maintenance of fencing (allotment boundary, pasture or enclosure fencing), water developments (water hauls, pipelines and troughs)	Owyhee Field Office jurisdiction.	Southwest Idaho	Approximately 25 miles of new fence to be constructed; approximately 5 miles of pipelines and associated troughs; approximately 30	Various; projects either waiting for available funding or in the planning stages; maintenance of existing projects is ongoing

**Table 5-26  
Past, Present, and Reasonably Foreseeable Future Actions**

Name	Description	Location	Sage-Grouse Population Area	Estimated Footprint (Acres or Miles)	Status of Action
				water haul sites	
Range Water Developments	40 new spring developments and associated pipeline and drinkers	Throughout PPH and PGH in the Dillon Field Office	Southwest Montana	20 miles of pipeline estimated 20 acres disturbance.	NEPA compliant and ongoing
Fence Removal	Removal of approximately 5 miles of old fences yearly	Throughout PPH and PGH in the Dillon Field Office	Southwest Montana	50 miles removed in next ten years	Ongoing
New Fence Construction	Approximately 5 miles of new fence construction per year	Throughout PPH and PGH in the Dillon Field Office	Southwest Montana	50 miles of new fence in the next ten years	NEPA compliant and ongoing
Pocatello Field Office – Fence Flagging	Install GRSG fence reflectors	BLM-administered and National Forest System lands throughout southeast Idaho, Pocatello Field Office	Bear Lake, South Side Snake	10 miles per year	Ongoing
Grouse Creek Fences	Construct 1 mile of fence to protect 2 springs and ½ mile of Sulphur Creek	Section 30, T13N, R23E; Section 13, T.14N., R.21E., W½SW¼, Challis Field Office, Idaho Falls District	Mountain Valleys	1 mile	NEPA completed; construction in 2014
Upper Pahsimeroi/Burnt Creek Fences	Construct 2.5 miles of fence	at T.10N., R.24E; Challis Field Office, Idaho Falls District	Mountain Valleys	2.5 miles	Project under NEPA review, decision date anticipated 2014
Rock Springs Pipeline Extension Reconstruct with Two New Troughs	Extending an existing pipeline 4 miles and adding two additional	T.13N., R.22E., Section 27 E½ and the other in T.13N.,	Mountain Valleys	4 miles, 1.4 acres of disturbance	NEPA completed; construction in 2014

	identify the amount of forage available, seasons of use, range improvements)				

Administrative Draft  
Cooperating Agency Review

1       **5.3.1 Vegetation**

2       Past, present, and reasonably foreseeable future actions and conditions that affect vegetation  
3       are vegetation and habitat management and improvement projects, noxious weed control,  
4       wildfire management, livestock grazing management, lands and realty management, mineral  
5       extraction and development, and travel management planning.

6       Sagebrush-promoting and conifer-removing vegetation and habitat treatments would retain  
7       and enhance sagebrush vegetation and overall ecosystem productivity, while reducing the  
8       distribution of invasive weeds and woody conifer species. Given the limited distribution of  
9       suitable sagebrush habitats and the cost of habitat restoration, management plans that  
10      protect intact sagebrush acreage and restore impacted areas strategically to improve habitat  
11      connectivity have the best chance of increasing the amount and quality of sagebrush cover  
12      (Manier et al. 2013).

13      An assortment of nonnative annuals and perennials and native conifers is invading sagebrush  
14      ecosystems. Many areas throughout the range of GRSG are at high risk from invasive plants;  
15      the most concentrated areas of risk include the Intermountain West and Great Basin (Manier  
16      et al. 2013). Invasive plants can alter plant community structure and composition,  
17      productivity, nutrient cycling, and hydrology and may competitively exclude native plant  
18      populations. Invasive plant spread may result in habitat loss and fragmentation and may also  
19      increase the risk of wildfire. The spread of invasive plants such as cheatgrass has increased  
20      the frequency and intensity of fires in some areas (Balch et al. 2012). Treatments designed to  
21      prevent encroachment of shrubs, nonnative species, or woody vegetation would alter the  
22      condition of native vegetation communities by changing the density, composition, and  
23      frequency of species within plant communities. The intent of these management programs is  
24      to improve rangeland condition and enhance sagebrush ecosystems.

25      Slow rates of regrowth and recovery of vegetation after disturbances (driven by low water  
26      availability and other constraints) coupled with high rates of disturbance and conversion to  
27      introduced plant cover have contributed to the accumulating displacement and degradation  
28      of the sagebrush ecosystem (Beck et al. 2009). Big sagebrush does not resprout after a fire  
29      but is replenished by wind-dispersed seed from adjacent unburned stands or seeds in the  
30      soil. Depending on the species and the size of a burn, a return to pre-burn community cover  
31      can take 13 to 100 years (Connelly et al. 2000). When management reduces wildfire  
32      frequency by suppressing natural ignitions, the indirect impact is that vegetation ages across  
33      the landscape, and early successional vegetation communities are diminished.

34      Fire suppression may preserve the condition and connectivity of some vegetation  
35      communities. This is particularly important in areas where fire frequency has increased as a  
36      result of weed invasion or where landscapes are highly fragmented. Fire suppression can also  
37      lead to increased fuel loads, which can lead to more damaging or larger fires in the long  
38      term. Fire also increases opportunities for invasive species such as cheatgrass to spread, so  
39      fire suppression can indirectly limit this expansion.

40      Controlled burning may be prescribed to treat fuel buildup and to assist in the recovery of  
41      sagebrush habitat in some vegetation types. Reseeding with native plants and long-term

1 monitoring to ensure the production of cover and forage plants would assist vegetation  
2 recovery (NTT 2011).

3 Livestock grazing may have both beneficial and detrimental aspects on rangeland vegetation,  
4 depending on site-specific management (USFWS 2010). At higher levels, grazing can lead to  
5 loss of vegetative cover, degraded riparian habitats, increases in invasive weeds, decreased  
6 plant litter, increased soil erosion, and reduced habitat quality for wildlife (Belsky et al. 1999;  
7 Reisner et al. 2013; Knick 2011; Connelly et al. 2004). However, in some habitats, targeted  
8 livestock grazing may be useful for reducing fine fuels produced by annual grasses (Boyd et  
9 al. 2014). In areas meeting BLM Idaho Standards for Rangeland Health or similar Forest  
10 Service standards, grazing practices coexist with healthy vegetation communities, providing  
11 wildlife habitat.

12 Grazing systems that aim to protect sagebrush and riparian ecosystems would allow more  
13 plant growth and reduce trampling and introduction of exotic species. Reducing or removing  
14 grazing in habitats would also reduce these effects but could have unintended consequences  
15 of increasing fuel buildup. Range improvement projects often can be used to improve  
16 livestock distribution and set aside areas for rest from grazing, which would reduce the  
17 likelihood of impacts described above.

18 As described in **Section 4.3**, Vegetation, mineral extraction and development impacts  
19 sagebrush habitats directly by disturbance and removal from well pad and access  
20 construction, seismic surveys, roads, power lines, and pipeline corridors. It impacts  
21 sagebrush habitats indirectly by gaseous emissions, changes in water availability and quality,  
22 and human disturbance. The interaction and intensity of effects could cumulatively or  
23 individually lead to habitat fragmentation in the long term (Connelly et al. 2004; Holloran  
24 2005).

25 The BLM uses travel management planning to designate and close routes and to balance the  
26 demands for motorized recreation and access with protection of sensitive resources. By  
27 planning at the landscape scale, the BLM would be able to retain large expanses of sagebrush  
28 and manage impacts on vegetation from motorized vehicles (discussed in **Section 4.3**,  
29 Vegetation) through route designations and closures.

### 30 ***Alternatives Analysis***

31 Under Alternative A, current management would continue on BLM-administered and  
32 National Forest System lands in the planning area. There would be no PHMA, IHMA or  
33 GHMA designated, and most land use plans would not implement use restrictions (e.g.,  
34 ROW exclusion and closure to mineral leasing and development) to protect GRSG habitat.  
35 Seasonal restrictions and lek buffers would continue to be applied as stipulations to oil and  
36 gas and geothermal leases, in accordance with existing land use plan direction. Grazing  
37 management would not specifically consider GRSG habitat needs, and vegetation  
38 management would not prioritize sagebrush. Prescribed fires in sagebrush communities  
39 could be harmful to sagebrush, which is slow to regrow and susceptible to weed invasion  
40 post-fire.

1 Planned ROW construction could increase fragmentation of vegetation, and new mineral  
2 extraction would increase loss of sagebrush vegetation until sites are reclaimed. However,  
3 some use restrictions would be implemented, which would protect vegetation in these areas  
4 from degradation or removal. Vegetation management and noxious weed control projects  
5 would benefit sagebrush ecosystems by removing invasive plants and promoting healthy  
6 vegetation communities. Overall, Alternative A would lack the landscape-level management  
7 tools to reduce cumulative effects from past, present, and reasonably foreseeable future  
8 actions.

9 Under Alternative B, PHMA and GHMA would be designated and ROW exclusion and  
10 avoidance areas would be established over larger areas, compared to Alternative A. Grazing  
11 management would be improved, which would reduce impacts on sagebrush vegetation. No  
12 ACECs would be established, but land disposals and acquisitions would focus on  
13 maintaining sagebrush acreage and connectivity. ROWs, access roads, and associated  
14 infrastructure planned according to **Table 5-26** would be sited outside PHMA under  
15 Alternative B. Planned mineral exploration and development would be sited outside PHMA  
16 in unleased areas, and RDFs would be applied to post-lease actions on existing leases. The  
17 vegetation management and restoration projects mentioned above would benefit the  
18 planning area in discrete locations. Prescribed fire areas would be reseeded and monitored to  
19 prevent invasive plants from becoming established. As a result, the cumulative effects from  
20 past, present, and reasonably foreseeable future actions under Alternative B would be  
21 reduced, compared to Alternative A.

22 Cumulative impacts under Alternative C are similar to those described for Alternative B,  
23 though with fewer restrictions on resource uses. Under Alternative C, grazing would be  
24 removed from occupied habitat, which would allow for greater herbaceous growth but could  
25 increase fuel loading and risk of wildfire. This could degrade vegetation quality over the long  
26 term. Given the uncertain effects of removing livestock grazing, it is not known whether  
27 cumulative effects from past, present, and reasonably foreseeable future actions would be  
28 reduced, compared to Alternative A.

29 Alternative D is intended to preserve management flexibility and provide increased  
30 implementation guidance, while protecting GRSG habitat. Management under Alternative D  
31 would increase vegetation protection, compared to current management, but with more  
32 limited actions than Alternatives B or F. Alternative D would establish ROW avoidance but  
33 not exclusion areas, thereby reducing but not eliminating impacts from ROW development.

34 Restrictions on mineral leasing and development under Alternative D would be greater than  
35 under Alternative A but less stringent than Alternatives B and F. Prescribed burning and  
36 fuels management would take sagebrush vegetation into account. As under the other  
37 alternatives, the vegetation management and weed control plans listed in **Table 5-26** would  
38 benefit vegetation health. Development restrictions in occupied habitat would retain  
39 vegetation, and rangeland improvements would improve vegetation quality on sagebrush  
40 acreage. As a result, the cumulative effects from past, present, and reasonably foreseeable  
41 future actions under Alternative D would be reduced, compared to Alternative A, but to a  
42 lesser extent than Alternatives B and F.

1 Cumulative impacts from Alternative E are similar to those described for Alternative D,  
2 though Alternative E would require less stringent use restrictions and would designate the  
3 least amount of CHZ (compared to PHMA) of all the action alternatives. As a result, the  
4 cumulative impacts from past, present, and reasonably foreseeable future actions would be  
5 reduced, compared to Alternative A, but to a lesser extent than the other action alternatives.

6 Alternative F would provide more protection to GRSB habitat on BLM-administered and  
7 National Forest System lands but would reduce management flexibility. Alternative F would  
8 establish ACECs and ZAs in occupied habitat, and occupied habitat would become ROW  
9 exclusion areas and closed to mineral development and leasing. These provisions would  
10 protect vegetation from loss, fragmentation, and disturbance associated with surface-  
11 disturbing activities. Reduced management flexibility could lead to inefficient or ineffective  
12 management at the site-specific scale, when conditions may require alterations in  
13 management. As under the other alternatives, the vegetation management and weed  
14 prevention projects listed in **Table 5-26** would benefit vegetation health.

15 Alternative F would impose the most stringent restrictions on development of GRSB  
16 habitat, potentially restricting the ROW and mineral developments in **Table 5-26** thereby  
17 retaining the greatest extent of sagebrush vegetation. Alternative F would result in the  
18 greatest reduction in cumulative effects from past, present, and reasonably foreseeable future  
19 actions, compared to all alternatives.

20 Cumulative impacts from the Proposed Plan are similar to those described for Alternative D,  
21 though the Proposed Plan would have additional measures that would afford protections to  
22 vegetation and would further reduce cumulative impacts. These include managing to attain  
23 GRSB habitat objectives; management of SFAs where restrictions on uses would be greater  
24 than in PHMA; a comprehensive mitigation strategy that would avoid, minimize and  
25 compensate for GRSB habitat impacts; and specified acres of vegetation treatments. In  
26 addition, the Fire and Invasives Assessment Tool would be implemented, which would  
27 increase the effectiveness of management activities and is anticipated to maintain and  
28 improve habitat. On National Forest System lands, grazing use guidelines would be  
29 implemented that limit the amount of allowable use on perennial grass, shrubs, upland  
30 herbaceous species, and herbaceous riparian/wet meadow vegetation. These guidelines  
31 would reduce grazing impacts on vegetation over time. Together, these would reduce  
32 cumulative effects from past, present, and reasonably foreseeable future actions compared to  
33 Alternative A, but to a lesser extent than Alternatives B and F.

### 34 **5.3.2 Wild Horses and Burros**

35 The cumulative impact analysis area used to analyze cumulative impacts on wild horse  
36 management includes the planning area. This is because impacts are expected to be limited  
37 to those actions originating within the planning area.

38 Past, present, and reasonably foreseeable actions and conditions within the cumulative  
39 impact analysis area that have affected and will likely continue to affect wild horse  
40 management are actions that change forage and water availability, access to water sources,

1 range conditions, and barriers to movement and population control (such as removing  
2 excess animals and repressing population).

3 Reasonably foreseeable projects in the project area include extensive vegetation treatment  
4 and fuels reduction projects. These could result in short-term impacts on horses, but they  
5 are likely to improve rangeland health in the long term. Population control gathers would  
6 continue in the area to keep wild horses at appropriate population levels and to support  
7 maintenance or improvement of land health in the area overall. In addition, actions that  
8 disturb wild horses are recreation and development for transmission, as well as the  
9 exploration for energy and mineral development.

10 Under all alternatives, no direct change would occur on areas allocated as HMAs for wild  
11 horses. Under Alternative A, AML would continue to be adjusted as needed, based on  
12 rangeland conditions. Populations would be controlled to support land health within the  
13 constraints of national priorities and budgets. Under Alternatives B, C, D, E, and the  
14 Proposed Plan there could be long-term reduction of AMLs. This would occur if  
15 management for wild horses conflicts with GRSG management objectives, resulting in a  
16 cumulative addition to the management needs and associated costs of wild horse and burro  
17 management in the planning area. Under Alternative F, a direct 25 percent reduction in  
18 AMLs is proposed, resulting in a cumulative addition to costs and time for management of  
19 the wild horse and burro program due to the need for increased gathers. This could strain  
20 available resources in the region.

21 In addition, should management resources be concentrated in GRSG habitat due to  
22 priorities for management under the action alternatives, HMAs outside of GRSG habitat  
23 may be allotted fewer resources. In general, actions to improve land health for GRSG are  
24 also likely to improve rangelands for wild horses, resulting in a cumulative improvement in  
25 the ability to meet AMLs.

### 26 **5.3.3 Wildland Fire**

27 Past, present, and reasonably foreseeable future actions and conditions within the cumulative  
28 impact analysis area that have affected and will likely continue to affect wildfire are fuels and  
29 vegetation management projects, ROW and energy development, projects that impact the  
30 agencies' abilities to respond to wildfire, and projects that would increase the risk of human-  
31 caused ignitions.

32 Wildfires in the planning area have been frequent in the past, with over 9,600 wildfire starts  
33 occurring on or threatening to spread to BLM and FS-administered lands in the planning  
34 area between 1980 and 2012. Approximately 54 percent of these wildfires were attributed to  
35 human-caused ignition. Wildfires are expected to increase in the future due to increasingly  
36 severe drought conditions caused in part by climate change. This could impact wildland fire  
37 management through increased personnel requirements and need for fire suppression and  
38 resultant increased costs.

1 A variety of fuels treatments, including hazardous fuels reduction, prescribed fires, chemical  
2 and mechanical treatment, and seeding, would likely continue to be used. At least 80  
3 reasonably foreseeable fuels and vegetation management projects have been identified within  
4 the planning area (see **Table 5-26**).

5 ROWs and the associated development may increase the risk of human-caused ignitions due  
6 to vehicular travel to and from the site, construction, maintenance, and operation of the  
7 facilities. The development allowed under these authorizations would result in surface  
8 disturbance, which would generally contribute to the modification of the composition and  
9 structure of vegetation communities in the vicinity of developed areas, which could then be  
10 more likely to fuel high-intensity fires.

11 Similarly, energy and mineral development has contributed to human-caused ignitions in the  
12 planning and would do so in the future.

13 As the global effects of climate change continue, the likelihood of natural unplanned  
14 ignitions and large fires within the planning area may increase due to the irregular weather  
15 patterns, increased likelihood of storms, and drought.

#### 16 ***Alternatives Analysis***

17 Under Alternative A, the trends described above would continue to affect wildland fire  
18 management in the planning area.

19 Under Alternative B, restrictions on land uses and development may reduce new sources of  
20 ignition and decrease the risk of human-caused ignitions. However, this alternative may  
21 restrict the ability of the wildland fire management program to suppress and preventatively  
22 treat fires.

23 Under Alternative C, responses to wildfire or appropriate treatments to prevent wildfire may  
24 be prohibited. As a result, there may be changes in fuel levels and management options for  
25 fuels treatments and wildfire suppression. Drought may cause vegetation to be more  
26 vulnerable to wildfires. In addition, the exclusion of livestock grazing on BLM-administered  
27 lands could increase fine fuels and associated risk of wildfire. These cumulative effects would  
28 create a need for greater flexibility in fire suppression, but stringent controls on the wildland  
29 fire management program under Alternative C would inhibit responses to and preventative  
30 treatments for wildfire.

31 Under Alternative D, the emphasis on fire risk reduction in the GRSG habitat and efforts to  
32 coordinate with local and state governments would cumulatively reduce fire risk across all  
33 landownership types in the planning area.

34 Under Alternative E, impacts in Montana are the same as under Alternative A. In Idaho,  
35 guidance to reduce wildfire response time, create fuel breaks, and improve the wildfire  
36 suppression baseline would provide the wildland fire management program with the tools  
37 necessary to manage fuel levels and decrease the risk of catastrophic wildfire in the planning  
38 area.

1 Alternative F places the greatest restrictions on land uses and development. It also includes  
2 the greatest restrictions on the wildland fire management program, limiting wildfire response  
3 options and fire and fuels treatments. As a result, there would be less risk of human-caused  
4 ignition, but the lack of proactive fire prevention activities (e.g., fuels treatments) may mean  
5 that wildfires would be more severe. Drought may cause vegetation to be more vulnerable to  
6 wildfires, exacerbating these effects. The management actions under Alternative F that  
7 inhibit responses to and preventative treatments for wildfire may be insufficient to meet the  
8 growing need for wildland fire management flexibility over the long term.

9 Under the Proposed Plan, interagency coordination and strategic deployment of resources  
10 via the GRSG Fire and Invasive Species Assessments, restrictions on anthropogenic  
11 development in GRSG habitat, and site-specific monitoring and implementation measures  
12 for fire operations and fuels management would result in improved vegetation and reduced  
13 cumulative fire risk in the sub-region.

#### 14 **5.3.4 Livestock Grazing**

15 Past, present, and reasonably foreseeable future actions and conditions that have affected  
16 and will likely continue to affect livestock grazing are those that reduce available grazing  
17 acreage and the level of forage production in those areas or that inhibit livestock  
18 improvements, such as water development or fences.

19 In the planning area, relevant past and present actions include human-caused surface  
20 disturbances, such as those associated with minerals, transmission and energy development,  
21 recreation, and current and historic grazing practices. In addition, changes in habitat due to  
22 historic fire suppression and climate change have resulted in juniper and other trees  
23 encroaching onto grasslands, decreasing available forage.

24 Reasonably foreseeable future actions affecting livestock grazing are similar to the present  
25 actions and include numerous permit/lease renewals, over 75 allotment NEPA  
26 assessments, and additional AMP reviews, as detailed in **Table 5-26**. These actions could  
27 cumulatively reduce permitted AUMs or restrict management options when allotments are  
28 found to be inconsistent with land health standards due to livestock use. Furthermore,  
29 proposed fencing projects may impact ability to distribute livestock. Conversely, the  
30 development of 40 springs and associated pipelines, as well as additional water troughs,  
31 would provide additional watering sources and may allow for better distribution of livestock,  
32 resulting in decreased time and costs for permittees to manage livestock.

33 Cumulative projects that increase human disturbance in grazing areas could also indirectly  
34 impact grazing, by increasing weeds and the spread of invasive species. As stated above,  
35 weed invasion can reduce preferred livestock and wildlife forage and increase the chance of  
36 weeds being dispersed by roaming cattle. Cumulative projects that increase human  
37 disturbance in grazing areas could also directly impact grazing by displacing, injuring, or  
38 killing animals. Such projects include drilling and road construction for mineral development  
39 operations.

1 Conversely, planned vegetation improvement and fuels reduction and restoration projects in  
2 the planning area, as described in **Table 5-26**, may exclude grazing from site-specific areas  
3 temporarily. However, these projects would generally improve rangeland conditions in the  
4 long term by reducing juniper encroaching into grasslands and, potentially, by improving  
5 vegetation condition. In addition to foreseeable actions, vegetation may change due to  
6 continued drought or climate change. While these changes are difficult to quantify, they are  
7 likely to include reduced forage availability.

### 8 ***Alternatives Analysis***

9 The contribution of the project to cumulative impacts would parallel the impacts of the  
10 alternatives, as described in **Section 4.5**, Livestock Grazing/Range Management.

11 Under Alternative A, permitted active use would likely decline to some extent over time,  
12 following observed trends. Alternative A would allow the highest level of surface disturbance  
13 of all alternatives, with the highest cumulative contribution to decrease forage availability in  
14 the planning area.

15 Under Alternative B, while no direct reduction to permitted AUMs would occur, compared  
16 to Alternative A, permitted active use would decline to a greater extent over time. This is  
17 because of the implementation of grazing management changes to meet GRSG habitat  
18 objectives. These include potential grazing management changes and restrictions on  
19 structural improvements and water developments. As a result forage availability may increase  
20 in GRSG habitat, although this forage would generally not be available for livestock use.

21 Surface-disturbing activities would be sited in lower priority habitats and mainly in  
22 nonhabitats, increasing cumulative impacts in these areas.

23 The greatest impacts on livestock grazing in the planning area would be seen under  
24 Alternative C, due to the elimination of all AUMs within occupied habitat. The elimination  
25 of grazing in occupied habitat may reduce livestock grazing overall, both inside and outside  
26 the planning area. Many livestock operations that rely on BLM-administered and National  
27 Forest System lands also incorporate private and leased lands in their operations. Grazing on  
28 private lands is often limited and may not be able to absorb the grazing use that is eliminated  
29 from BLM-administered and National Forest System lands.

30 Eliminating grazing in occupied habitat would likely result in operations going out of  
31 business. In other cases, greater reliance on private lands could also put additional pressure  
32 on forage resources and may accelerate the conversion of private native range at a local level,  
33 potentially including GRSG habitat, to agricultural or introduced grass production.

34 Cumulative impacts under Alternative D are similar to those described under Alternative B.  
35 Impacts from the project would be focused on the highest quality GRSG habitat limit any  
36 impacts of disturbance from development in these areas but may shift disturbance and  
37 related forage loss to nonhabitat on BLM-administered and other lands.

1 The contribution to cumulative impacts on grazing in Alternative E would be slightly  
2 decreased, compared to other action alternatives. This would be due to increased flexibility  
3 in application of restrictions to account for site-specific habitat needs.

4 Under Alternative F, the contribution to cumulative impacts would be similar to that  
5 described under Alternative B. In addition, prohibiting structural range improvements and  
6 new water developments under Alternative F would further decrease grazing in the area for  
7 both BLM-administered lands and in the area overall. This would increase forage availability  
8 but could lead to closures/reductions of grazing should operators go out of business.

9 Under the Proposed Plan, the contribution to cumulative impacts would be similar to that  
10 described under Alternative B and D. Changes to grazing management would be focused on  
11 PHMA, particularly in areas currently not meeting land health standards. On NFS lands  
12 implementation of the grazing use guidelines would have greater impacts to livestock  
13 management on allotments within nesting habitat. This could include the reduction of  
14 AUMs on these allotments over time. Management changes focused on achieving specific  
15 vegetation objectives based on site conditions would improve vegetation and forage  
16 conditions for livestock and wildlife in the long term within GRSG habitat. There would be  
17 potential for development and related forage loss to shift to non-GRSG habitat.

### 18 **5.3.5 Travel and Transportation**

19 Past, present and reasonably foreseeable future actions and conditions that have affected and  
20 will likely continue to affect travel and transportation are the result of management actions  
21 to obtain the following:

- 22 • Limit motorized travel to existing or designated routes
- 23 • Designate types of uses and seasonal restrictions for designated routes
- 24 • Limit the construction or expansion of roads in GRSG habitat

#### 25 ***Alternatives Analysis***

26 Under all alternatives, unauthorized cross-country motorized travel will continue to impact  
27 comprehensive travel and transportation management. Cumulative impacts from cross-  
28 country travel include the creation of new linear features and the need for additional  
29 management, such as enforcement, signs, and education. Unauthorized travel could result in  
30 seasonal or permanent closures of areas or designated routes. Staff in several BLM field  
31 offices and National Forests in the planning area are developing travel management plans to  
32 address the need for closures and designate routes. For example, the Minidoka Ranger  
33 District in the Sawtooth National Forest is decommissioning 30 miles of roads per year as  
34 part of its travel plan (see **Table 5-26**).

35 Under Alternative A, only travel management planning being carried out by BLM Field  
36 Offices and Forest Service Ranger Districts under separate planning efforts would impact  
37 travel management. Currently on National Forest System lands, travel is limited to  
38 designated roads and trails. Under Alternative B, the BLM would additionally limit

1 motorized travel to existing roads and trails in PHMAs, thereby reducing cross-country  
2 access in those areas. Reducing access would be greatest under Alternative C, due to BLM  
3 management that would prohibit new road construction within 4 miles (6.4 km) of active  
4 leks and preclude upgrading of existing routes in PHMAs. Cumulative impacts on travel and  
5 transportation management as a result of the limitations under Alternative C could include  
6 congestion on the existing travel route network in and next to the planning area, particularly  
7 where routes provide access to multiple resource uses.

8 Impacts on travel and transportation management under Alternatives D, F and the Proposed  
9 Plan are the same as under Alternative B, while impacts under Alternative E are the same as  
10 under Alternative A.

11 Reasonably foreseeable trends that would result in cumulative impacts on travel and  
12 transportation are continued growth patterns in demand for OHV recreation experiences,  
13 continued and increased visitation from a growing regional population, and increased  
14 popularity of adjacent BLM-administered and National Forest System lands.

15 The Proposed Plan, which would implement a 3 percent disturbance cap for new surface  
16 disturbing activities, would limit new route construction in a BSU where future disturbance  
17 exceeds the cap. However, proposed RDFs would enhance the long-term condition of  
18 routes available for public and/or permitted use.

### 19 **5.3.6 Lands and Realty**

20 Past, present and reasonably foreseeable future actions and conditions that have affected and  
21 will likely continue to affect lands and realty are land use authorizations, including  
22 foreseeable demand for ROWs associated with transmission lines, roads, and expanded  
23 communication infrastructure (see **Table 5-26**). They also include land tenure adjustments  
24 and withdrawals necessary to meet various public needs.

25 Land use authorizations in the planning area place the largest demand on the BLM-  
26 administered and National Forest System Lands and realty programs. Past authorizations  
27 include those for linear features, such as roads, power lines, and water canals, pipelines, and  
28 site ROW features, such as communication towers and temporary permits for oil and gas  
29 facilities. There will be a steady increase in demand for ROWs to accommodate new power,  
30 water, and telecommunication lines, roadways, pipelines, and communication sites. Two  
31 major realty actions being considered in the sub-region are the Gateway West and Boardman  
32 to Hemingway transmission line projects. These projects would add more than 1,000 miles  
33 (600 km) of new ROWs across southern Idaho. The Proposed Plan identifies the Boardman  
34 to Hemingway line as a high-priority project and considers limited exemptions to the  
35 proposed ROW for the project. Since all but 300 acres of the proposed alignment are within  
36 a designated corridor, exemption from the avoidance designation would apply only those  
37 acres. Cumulative impacts from the development of this line would include increased ability  
38 to accommodate electrical transmission infrastructure demand in the short-term. However,  
39 in the longer-term, placement of the large Boardman to Hemingway line in one of the few  
40 designated corridors managed as open, could exclude future development from occurring in

1 those corridors due to technical (i.e., spacing and design) constraints. On the other hand, if  
2 technically feasible, the developed line could provide an opportunity for the co-location of  
3 future infrastructure to accommodate longer-term demand.

4 Land tenure and landownership adjustments allow the BLM and Forest Service to effectively  
5 manage BLM-administered and National Forest System lands over time. Exchanges may  
6 consolidate BLM-administered and National Forest System lands and improve management  
7 efficiency. Land exchanges are pending in the Bruneau and Challis BLM Field Offices. In the  
8 Bruneau Field Office, the BLM would dispose of 33,000 acres of non-GRSG habitat and  
9 would acquire 38,000 acres of mostly GRSG habitat. In the BLM Idaho Falls District, there  
10 are 235 acres of pending land sales. Management prescriptions that limit land tenure  
11 adjustments could result in cumulative impacts on lands and realty and other resources and  
12 uses.

13 Land withdrawals are used to preserve sensitive environmental values, protect major federal  
14 investments in facilities, support national security, and provide for public health and safety.  
15 There are several pending land withdrawals, for which jurisdiction would be transferred to  
16 the Department of Defense for military use or to Idaho Power as part of a state-wide  
17 Integrated Resource Plan for power development.

#### 18 ***Alternatives Analysis***

19 Impacts on lands and realty across alternatives depend largely on the number of acres where  
20 the BLM or Forest Service would exclude or avoid new ROW development. A prohibition  
21 on ROW development, particularly electrical transmission lines, over a large area would  
22 prevent the BLM and Forest Service from accommodating demand for new ROWs.  
23 Potential ROW applicants could choose to develop on land not administered by the BLM or  
24 Forest Service outside the planning area. This could increase environmental impacts on  
25 sensitive lands and permitting times and decrease the overall effectiveness of the power grid,  
26 telecommunication system, or roadway network. Development on adjacent lands could also  
27 result in indirect effects on BLM-administered and National Forest System lands via  
28 increased vehicle traffic or requests for ROW authorizations for transmission lines.

29 Under Alternative A, the BLM and Forest Service would continue to authorize ROW  
30 development and temporary surface disturbance on a case-by-case basis. There would  
31 continue to be 1,010,900 acres designated as ROW exclusion and 1,903,400 as ROW  
32 avoidance. Land tenure adjustments would be subject to current LUP criteria without further  
33 limitations. As a result, cumulative impacts on lands and realty would occur as new ROWs or  
34 land tenure adjustments are proposed. Alternative A would not affect the BLM's or Forest  
35 Service's ability to accommodate new ROW development or to improve management  
36 efficiency through land tenure decisions or withdrawals.

37 Under Alternatives B, C, D, E, F and the Proposed Plan, BLM and Forest Service  
38 management would include increased levels of ROW restrictions, when compared to  
39 Alternative A. Designations of areas as avoidance or exclusion would not impact existing  
40 ROW authorizations. The ROW restrictions would, however, impact future ROW  
41 authorizations. Alternative C would restrict ROW development the most by designating

1 PHMAs and GHMAs as ROW exclusion. Alternative B would exclude ROW development  
2 in PHMAs, while Alternative D would exclude electrical transmission lines greater than  
3 50kV on 6,135,200 acres. Similar to Alternatives B, C, D, E, and F, the Proposed Plan would  
4 result in more complex project reviews and increased project costs. Management of PHMA  
5 and IHMA as avoidance, combined with GRSG net conservation gain requirements such as  
6 RDFs, buffers, and tall structure limitations, could discourage future development in PHMA  
7 and IHMA. The long-term cumulative effect would entail future ROW/SUA demand being  
8 accommodated in GHMA and non-habitat areas.

9 Limitations on land tenure adjustments, which allow the BLM and Forest Service to sell,  
10 exchange, withdraw, or acquire lands to increase effective management, would be the most  
11 restrictive under Alternative C and the least restrictive under Alternatives A, E, and F.  
12 Alternatives B and D would allow land sales under certain conditions. Under the Proposed  
13 Plan, the BLM and Forest Service could carry out land tenure actions where they would  
14 result in a cumulative net conservation gain to GRSG and its habitat. Land exchanges that  
15 result in a consolidated land ownership pattern would over time increase BLM and Forest  
16 Service management efficiency, including GRSG conservation.

17 National policies to mitigate climate change through the expansion of renewable energy  
18 production could contribute to direct and indirect long-term cumulative impacts on the  
19 lands and realty program and be affected by management under Alternatives B through F  
20 and the Proposed Plan.

21 As part of the 2013 Climate Action Plan, President Obama set a new energy goal of 10 new  
22 gigawatts of new renewable energy permitted on DOI lands by 2020 (The White House  
23 2013). Despite wind energy potential in the planning area being moderate (NREL 2009) and  
24 solar resources being moderate to low (NREL 2005), the President's plan is expected to  
25 increase the demand for renewable energy ROWs.

26 The potential for cumulative impacts on wind energy ROW development in the planning  
27 area would be greatest under Alternative C, which would restrict renewable energy ROW  
28 development in PHMAs and GHMAs. Impacts on wind and solar ROWs under Alternatives  
29 B, D, F and the Proposed Plan would be less than under Alternative C but greater than  
30 under Alternatives A and E. Alternatives A, B, C, F and the Proposed Plan would force wind  
31 energy ROWs outside GRSG habitat, thereby increasing the potential for indirect effects to  
32 wind energy development in the planning areas, such as denial of requests for new  
33 transmission line ROWs and access roads. The Proposed Plan would redirect future wind  
34 energy development outside of PHMA and restrict wind energy development in IHMA.

35 GRSG conservation measures under the Proposed Plan, such as RDFs, lek buffers, tall  
36 structure limitations, mitigation, and a disturbance cap, would cumulatively increase the  
37 project costs and complexity of project reviews. Overtime, new technology could minimize  
38 cost impacts; however, for some projects, the increased costs and mitigation requirements  
39 could preclude development. In any BSU or proposed project analysis area, where future  
40 development results in an exceedance of the disturbance cap, future disturbance, including  
41 ROW development, would be excluded from that BSU or proposed project analysis area.

**5.3.7 Leasable Minerals**

***Fluid Minerals***

Past, present and reasonably foreseeable future actions and conditions within the sub-region that have affected and will likely continue to affect fluid minerals include existing and planned oil and gas development projects on nonfederal mineral estate within the planning area.

***Alternatives Analysis***

The management actions proposed under this LUPA/EIS would cumulatively impact mineral development through surface use restrictions (e.g., closures and NSO, CSU, and TL stipulations). This ultimately would decrease the amount of oil and gas development in the planning area during the planning period. Surface use restrictions, such as NSO restrictions, could also cause an operator to move to nearby private or state land with no such restrictions.

Reasonably foreseeable oil and gas activities that are anticipated to occur in the planning area over the next 20 years include offering parcels of lands in five parts of the planning area for oil and gas leasing (**Appendix O**). Expressions of Interest have been made by the public for lands in the Four Rivers Field Office near Payette; lands near Brown’s Bench/China Mountain primarily in the Jarbidge Field Office; and lands on the Bear Lake Plateau in southeast Idaho (**Appendix O**). Also included in the RFDS analysis are lands on the Caribou National Forest and in the Dillon Field Office, because the RFDSs for those land use plans forecast oil and gas activity. **Table 5-27** shows the number of exploratory and production wells forecast over the next 20 years:

**Table 5-27 Number of Wells and Permanent Disturbance Predicted, by Alternative**

ALTERNATIVE	# Exploratory Wells predicted	# Discovery Wells	# Step-out wells	Total Permanent Disturbance
Alternative A	25 wells	4 wells	12 wells	156 acres
Alternative B	13 wells	2 wells	6 wells	73.5 acres
Alternative C	13 wells	2 wells	6 wells	73.5 acres
Alternative D	23 wells	4 wells	12 wells	156 acres
Alternative E	19 wells	4 wells	10 wells	128.5 acres
Alternative F	13 wells	2 wells	6 wells	73.5 acres
Proposed Plan	15 wells	2 wells	6 wells	63 acres

1 Under Alternative A, it is predicted that up to 25 exploratory wells would be drilled over the  
2 next 20 years in the planning area, and that four well fields would be developed. Fields  
3 would be located in the Four Rivers Field Office area (one field), the Bear Lake area (one  
4 field), and in the Dillon Field Office (two fields). Under Alternatives B, C, and F, no leasing  
5 would occur on the Bear Lake Plateau or in the Jarbidge area, so wells would not be drilled  
6 there, and only half the Dillon Field Office wells would be drilled. Under Alternative D, no  
7 leasing or development would be allowed in low potential areas, including the Jarbidge area.  
8 Under Alternative E, the same number of wells would be drilled as under Alternatives B, C,  
9 and F, but wells in Montana could be drilled. Under the Proposed Plan, only wells in the  
10 Four Rivers Field Office, Caribou National Forest, and half the wells in the Dillon Field  
11 Office would be drilled.

12 Under Alternative A, 83,650 acres with medium development potential (8 percent of the  
13 federal oil and gas estate with medium development potential) would remain closed to oil  
14 and gas leasing, and approximately 400,600 acres of federal oil and gas estate with medium  
15 development potential (41 percent of the federal oil and gas estate with medium  
16 development potential) would remain open to leasing subject to NSO stipulations.  
17 Management under Alternatives B and F would close 344,300 acres with medium potential  
18 (35 percent of the medium potential acres in the decision area), and 330,400 acres with  
19 medium potential would be subject to NSO stipulations.

20 Under Alternative C, 513,700 acres (52 percent) of minerals with medium oil and gas  
21 potential would be closed, and 222,900 acres (22 percent), would be subject to NSO  
22 stipulations. Under Alternative D, 86,000 unleased acres with medium development  
23 potential (10 percent of total unleased acres with medium development potential in the oil  
24 and gas decision area) would be closed to leasing, and 421,800 acres (47 percent) of unleased  
25 areas with medium development potential would be subject to NSO stipulations.

26 Under Alternative E, 86,000 unleased acres with medium development potential (10 percent  
27 of total unleased acres with medium development potential in the oil and gas decision area)  
28 would be closed to leasing. Approximately 550,400 acres (62 percent) of unleased areas with  
29 medium development potential would be subject to NSO stipulations.

30 Under the Proposed Plan, 264,400 acres (27 percent) of minerals with medium oil and gas  
31 potential in the planning area would be closed to leasing, and 373,800 acres (38 percent)  
32 would be subject to NSO stipulations.

33 Of all the alternatives, Alternative C would close the most acres with medium oil and gas  
34 potential to fluid mineral leasing: a 600 percent increase over Alternatives A or E.

### 35 ***Geothermal Resources***

36 Past, present and reasonably foreseeable future actions and conditions that have affected and  
37 will likely continue to affect renewable energy are the construction of existing and proposed  
38 roads and transmission lines. This would increase the routing options and possibly reduce  
39 project construction or implementation costs. GRSG conservation measures would not

1 contribute to cumulative impacts since the above-identified effects would benefit renewable  
2 energy development.

### 3 ***Alternatives Analysis***

4 The management actions proposed under this LUPA/EIS would cumulatively impact  
5 mineral development through surface use restrictions (e.g., closures and NSO, CSU, and TL  
6 stipulations). This ultimately would decrease the amount of geothermal development in the  
7 planning area during the planning period. Surface use restrictions, such as NSO restrictions,  
8 could also cause an operator to move to nearby private or state land with no such  
9 restrictions.

10 Unlike for oil and gas, there are no pending geothermal lease nominations in the planning  
11 area. All the areas discussed in the geothermal RFDS have been leased, so the forecasted  
12 number of wells and acreages disturbed are the same under all the alternatives. All existing  
13 leases in GRSG habitat have stipulations including seasonal restrictions and lek buffers.  
14 While post-lease activities are currently proposed on existing leases at Raft River, they have  
15 valid existing rights. Conditions of Approval will be attached to drilling permits when they  
16 are approved. It is highly likely that COAs that mitigate sage grouse will be included, since  
17 applying COAs to a drilling permit is not a land use planning decision.

#### 18 **5.3.8 Locatable Minerals**

19 Past, present, and reasonably foreseeable future actions and conditions within the cumulative  
20 impact analysis area that have affected and will likely continue to affect locatable minerals are  
21 existing and planned locatable mineral operations within the planning area but outside of the  
22 decision area. Locatable mineral resources are associated with the geological formations or  
23 units they are found within, which are typically localized and do not encompass large areas.  
24 Additionally, not all geological formations contain mineral resources, or mineral resources  
25 could be found only in a portion of a certain geological formation. To provide context for  
26 where interest in locatable mineral development is most likely within the planning area, the  
27 BLM has assessed the locatable mineral occurrence potential throughout the planning area  
28 (see **Section 3.12.1**, Conditions within the Planning Area, Locatable Minerals). Assessment  
29 of locatable mineral occurrence potential in the planning area allows impact analysis to focus  
30 on those areas withdrawn or recommended for withdrawal from locatable mineral entry that  
31 are actually likely to have locatable mineral resources and interest in their development.  
32 While areas outside of the Idaho and Southwestern Montana Sub-region may be  
33 recommended for withdrawal from locatable mineral entry as a result of decisions in other  
34 sub-regional LUPAs, expanding the cumulative impact analysis to include additional sub-  
35 regions would both dilute and inflate the impacts on locatable mineral development.  
36 Expansion of the cumulative impacts analysis area would dilute the impacts because the  
37 acres withdrawn or recommended for withdrawal across the GRSG range under the  
38 proposed plan would be minute compared to the total acreage of the range. On the other  
39 hand, expansion of the cumulative impacts analysis area would inflate the impacts because  
40 many of the acres withdrawn or recommended for withdrawal across the GRSG range do  
41 not actually have locatable mineral resources that would be impacted. While data on  
42 locatable mineral occurrence potential are available for the planning area, similar data are not

1 available across the GRSG range. Therefore, adding up areas withdrawn or recommended  
2 for withdrawal from locatable mineral entry beyond the planning area without accounting  
3 for where such entry is foreseeable would provide a less accurate picture of the cumulative  
4 impacts on locatable mineral development.

### 5 ***Alternatives Analysis***

6 The cumulative impacts analysis area for locatable minerals is the planning area.

7 Less than 250 acres are forecasted to be disturbed in the planning area as a result of locatable  
8 mineral development over the next 20 years. Approximately half this disturbance is predicted  
9 to occur in Cassia County, where Oakley Stone, a micaceous quartzite prized for its  
10 durability as a building stone, is mined. Most of the proposed activity involves expanding the  
11 existing quarries. Several exploratory drilling operations are anticipated in different parts of  
12 the planning area, including on the Salmon-Challis National Forest, Dillon Field Office, and  
13 in the extreme southern part of the Burley Field Office. Alternatives A, D, and E would  
14 continue to manage 5,380,200 acres, 18 percent, of locatable mineral estate in the planning  
15 area as withdrawn from locatable mineral entry. Alternative B would withdraw or  
16 recommend for withdrawal 237,400 acres (10 percent) of minerals in the planning area with  
17 a high likelihood of interest. The increase from Alternative A would represent 8 percent of  
18 the planning area. Alternative C would withdraw or recommend for withdrawal 369,600  
19 acres (16 percent) of minerals in the planning area with a high likelihood of interest. The  
20 increase from Alternative A to Alternative C would represent 14 percent of the planning  
21 area. The Proposed Plan would withdraw or recommend for withdrawal 94,600 acres (5  
22 percent) of minerals in the planning area with a high likelihood of interest. The increase  
23 from Alternative A to the Proposed Plan would represent 3 percent of the planning area.  
24 Alternative C would withdraw or recommend for withdrawal more acres than any other  
25 alternative. Since all areas (250 acres) that are forecast to be disturbed in the next 20 years are  
26 on claims with valid existing rights which are exempt from the proposed withdrawals,  
27 cumulative impacts on locatable minerals are expected to be negligible.

### 28 **5.3.9 Mineral Materials**

29 Past, present and reasonably foreseeable future actions and conditions that have affected and  
30 will likely continue to affect mineral materials include existing and planned mineral material  
31 development projects on nonfederal mineral estate within the planning area. There are five  
32 planned mineral materials projects in the planning area, all of which are on federal minerals.

### 33 ***Alternatives Analysis***

34 The cumulative impacts analysis area for mineral materials is the planning area. It covers  
35 52,000,000 acres total, regardless of surface or mineral ownership. Under Alternative A,  
36 10,707,600 acres in the planning area would remain closed to mineral material disposal (21  
37 percent of the planning area). Under Alternative B, 18,517,500 acres would be closed to  
38 mineral material disposal (36 percent of the planning area). Under Alternative C, 21,102,200  
39 acres (41 percent of the planning area); under Alternative D, 13,202,200 acres (25 percent);  
40 under Alternative E, 10,707,600 acres (21 percent); and under Alternative F, 18,517,500 acres  
41 (36 percent). Under the Proposed Plan, 15,529,000 acres in the sub-region would be closed

1 to mineral material disposal (30 percent of the planning area). Alternative C would close the  
2 most acres to mineral material disposal out of all the alternatives. The increase in closed  
3 acres from Alternative A (which would close the fewest acres) represents 20 percent of the  
4 planning area.

### 5 **5.3.10 Nonenergy Leasable Minerals**

6 Past, present and reasonably foreseeable future actions and conditions that have affected and  
7 will likely continue to affect nonenergy leasable minerals include existing and planned  
8 nonenergy leasable development projects on nonfederal mineral estate. There are three  
9 existing mines currently in operation and four proposed mines in the planning/NEPA  
10 analysis stages. Two proposed mines, at Caldwell Canyon and Trail Creek, have some  
11 GRSG habitat in the proposed disturbance area. An underground mine has been proposed  
12 a few miles west of Paris, Idaho, however the company announced in late 2014 that it was  
13 suspending its development plans for the foreseeable future.

#### 14 ***Alternatives Analysis***

15 The cumulative impacts analysis area for nonenergy leasable minerals is the planning area. It  
16 contains 34,000 acres of unleased known phosphate leasing areas (KPLAs). Since all the  
17 currently proposed mining would occur on existing federal leases, management actions  
18 proposing to close lands under the alternatives would not affect these operations, or any  
19 operations on existing leases, due to valid existing rights. BLM and the Forest Service have  
20 already begun requiring compensatory mitigation for newly proposed mines, and this trend is  
21 expected to continue. Under Alternative E 4,870 acres (14 percent) of unleased minerals in  
22 the planning area within KPLAs, would be closed to nonenergy solid mineral leasing.

23 Under Alternatives B and F, 5,350 acres (16 percent) would be closed; under Alternative C,  
24 5,870 acres (17 percent) would be closed.

25 Of all the alternatives, Alternative C represents the largest closure of unleased KPLAs.  
26 However, the increase in acres closed compared with Alternatives A, D, and E and the  
27 Proposed Plan (which would have the fewest acres closed) would make up only three  
28 percent of the total KPLAs in the planning area.

### 29 **5.3.11 Special Designations**

30 Past, present and reasonably foreseeable future actions and conditions that have affected and  
31 will likely continue to affect ACECs include any action that would impact the relevant and  
32 important values for which the ACEC is established (e.g., GRSG habitat health). Such  
33 actions include surface-disturbing activities, wildfires, increased recreation demands, and  
34 climate change.

35 Cumulative impacts on existing ACECs under the various alternatives could result from  
36 non-BLM actions and decisions on lands next to ACECs. While protections exist within the  
37 ACECs, population growth, development, and recreation throughout the planning area  
38 could, over time, encroach on these areas. This could degrade the ACEC values, such as  
39 unauthorized off-route travel and trash dumping and increased noise and air and light

1 pollution. Other impacts include species displacement, habitat fragmentation, and changes to  
2 the visual landscape that could affect resources within ACECs. Impacts are greater where  
3 recreation areas or development are next to an ACEC.

4 There are several ROW road applications and new transmission lines pending within the  
5 planning area. If these roads, transmission lines, or facilities were to run through, or be next  
6 to, any of the ACECs, this could damage the relevant and important values for which these  
7 ACECs are designated. Future road ROW applications, transmission line construction, and  
8 energy development in the planning area could cumulatively impact existing ACECs.  
9 Examples of long-term impacts on the ACEC from these activities are noise, heavy vehicle  
10 traffic, and dust.

11 Climate change could also pose a long-term threat of cumulative impacts on the relevant and  
12 important values of ACECs. Cumulative impacts on GRSG habitat and, consequently, on  
13 the ACEC from climate change are vegetation regime changes (e.g., from sagebrush to  
14 grasslands) and increased wildfire potential due to drought (Connelly et al. 2004).

### 15 ***Alternatives Analysis***

16 All action alternatives and the Proposed Plan would restrict such activities as ROW  
17 development, grazing, mineral entry, and new road construction, which could provide  
18 indirect protections to ACECs. However, existing and future ROWs, oil and gas  
19 development, and travel routes could result in cumulative impacts on ACECs.

20 ACECs for which GRSG is an important and relevant value could experience more  
21 protections and could have more restrictions on resource uses and surface-disturbing  
22 activities than ACECs that do not identify GRSG as an important and relevant value. No  
23 existing ACECs identify GRSG as an important and relevant value, and under Alternatives C  
24 and F, new ACECs (and ZAs under Alternative F) would be created for the important and  
25 relevant value of GRSG. The ACECs under Alternatives C and F (and ZAs under  
26 Alternative F) would be less likely to experience cumulative degradation to their important  
27 and relevant values due to management actions focused on GRSG conservation.

28 The BLM would adaptively manage to protect ACEC values and minimize impacts where  
29 applicable and feasible.

### 30 **5.3.12 Lands with Wilderness Characteristics**

31 Past, present, and reasonably foreseeable future actions and conditions that have affected  
32 and will likely continue to affect lands with wilderness characteristics are wildfires, wildland  
33 fire management, energy development, mining, noxious weed invasion, increased recreation  
34 demand, and road construction.

35 Many past, present, and reasonably foreseeable actions have impacted or could impact lands  
36 with wilderness characteristics. For example, continued travel management and recreation  
37 development in the planning area will likely increase visitor use on BLM-administered lands,  
38 including lands with wilderness characteristics. This could impact wilderness characteristics

1 by reducing opportunities for solitude. Development of energy and minerals resources could  
2 introduce sights, noises, and infrastructure in or next to lands with wilderness characteristics,  
3 which could impair the feeling of solitude and degrade naturalness. In addition, vegetation  
4 management on public and private lands could alter landscape appearance and setting in the  
5 short and long term, protecting or degrading wilderness characteristics, depending on the  
6 activity. Cumulative impacts on lands with wilderness characteristics would be mitigated  
7 where management actions governing other resources threaten wilderness characteristics.

### 8 ***Alternatives Analysis***

9 Cumulative impacts would be most likely to damage lands with wilderness characteristics  
10 under Alternative A. This is because the fewest restrictions on present and future resource  
11 uses are in place under this alternative. Management under the action alternatives and the  
12 Proposed Plan would protect wilderness characteristics to some degree by restricting  
13 development and land uses that could degrade the characteristics. Such restrictions would  
14 indirectly limit cumulative impacts on wilderness characteristics. Alternatives C and F place  
15 broader and more stringent restrictions on allowable uses of resources in GRSG habitat.  
16 Consequently, these alternatives would provide more indirect protections to lands with  
17 wilderness characteristics and would be less likely to have cumulative impacts that would  
18 degrade those characteristics.

### 19 **5.3.13 Social and Economic Conditions (Including Environmental Justice)**

20 The cumulative impact analysis area used to analyze potential impacts on social and  
21 economic conditions consists of the counties identified as the primary and secondary  
22 socioeconomic study area.

23 Virtually every major government action has some influence on social and economic  
24 conditions, as government actions have the power to create or alter incentives for numerous  
25 individuals and businesses that make choices that affect employment, earnings, population  
26 demographics, and other variables of concern for social and economic conditions. Past,  
27 present, and reasonably foreseeable future actions and conditions have affected and will  
28 likely continue to affect social and economic conditions, including livestock grazing,  
29 recreation, lands and realty, transportation, ROWs, renewable energy development, and  
30 mineral development. Changes to social and economic conditions result when individuals,  
31 businesses, governments, and other organizations initiate actions. Over the next several  
32 decades, millions of decisions will be made by tens of thousands of residents of the counties  
33 in the socioeconomic study area and others that will affect trends in employment, income,  
34 housing, and property.

35 Projections published by the Idaho Department of Labor and the Montana Department of  
36 Labor and Industry account for these individual decisions in the aggregate, and provide a  
37 baseline for comparing effects of alternatives in the future. The projections represent a  
38 regional forecast taking a wide range of actions into account, including management actions  
39 by the BLM and Forest Service as well as many other government entities, private citizens,  
40 and businesses. As a result, these projections incorporate the past, present, and reasonably  
41 foreseeable future projects that will form the basis of future economic and social trends in

1 the cumulative impact analysis area. Current and future trends in the cumulative impact  
2 analysis area include population growth, demographic change, changes in recreational  
3 demand and availability of recreational opportunities, renewable energy development,  
4 livestock grazing, housing development policies, mining, and other activities.

5 The Idaho Department of Labor provides employment projections from 2010 to 2020, for  
6 six regions across the state. Four overlap with the study area:

- 7 • Southwest Idaho (includes primary study area counties of Adams, Elmore, Gem,  
8 Owyhee, Payette, and Washington; secondary study area counties of Ada, Boise,  
9 and Canyon; and also Valley County) – projected increase of 18.6 percent
- 10 • South-Central Idaho (includes primary study area counties of Blaine, Camas,  
11 Cassia, Gooding, Jerome, Lincoln, Minidoka and Twin Falls, all of which are in  
12 the primary study area) – projected increase of 19.7 percent
- 13 • Southeast Idaho (includes primary study area counties of Bear Lake, Bingham,  
14 Caribou, Oneida and Power; Bannock County in the secondary study area; and  
15 also Franklin County) – projected increase of 14.4 percent
- 16 • Eastern Idaho (includes primary study area counties of Bonneville, Butte, Clark,  
17 Custer, Fremont, Jefferson, Lemhi, and Madison counties, all of which are in the  
18 primary study area, and also Teton County) – projected increase of 15.9 percent  
19 (Idaho Department of Labor, 2013)

20 Similarly, the Montana Department of Labor and Industry projects employment growth in  
21 upcoming years, with the current projections reflecting forecasted conditions in 2020, for  
22 five regions in the state. The relevant region for this EIS is the Southwest Region, which  
23 contains Beaverhead and Madison (in the primary study area), Gallatin and Silver Bow (in  
24 the secondary study area), and nine other counties: Deer Lodge, Granite, Park, Powell, Lewis  
25 and Clark, Broadwater, Sweetgrass, Meagher, and Jefferson. From 2011 to 2020, the  
26 Montana Department of Labor and Industry projected employment in that region to  
27 increase about 11 percent (Montana Department of Labor and Industry 2011).

28 To provide information about the cumulative impacts of the alternatives in this draft  
29 LUPA/EIS, the BLM compared the projected employment differences associated with the  
30 alternatives with the forecasts of the Idaho and Montana labor agencies as described above.  
31 As described in **Section 4.15**, the only employment and income effects of the management  
32 alternatives that were quantified were those on livestock grazing, where BLM and Forest  
33 Service used IMPLAN, a regional economic model, to calculate indirect and induced impacts  
34 of these actions.

35 **Table 5-28** provides an overview of how forecasted changes in employment from the  
36 alternatives would occur within the context of the ten-year trend of employment to 2020.  
37 Because Alternative A represents current management plans, employment would correspond  
38 most closely to the existing forecasts. By contrast, employment under Alternatives C and F

1 would be expected to change from the projections, based on anticipated impacts on  
 2 livestock grazing. **Table 5-28** shows the estimated change in employment for these  
 3 alternatives, based on modifying the projected future employment by the estimated changes  
 4 for the socioeconomic study area (from IMPLAN). The table focuses on the primary  
 5 socioeconomic study area because the great majority of impacts occur in that area, and  
 6 adding the secondary study area would effectively dilute the magnitude of impacts by adding  
 7 a large employment base (especially from more urban counties) without adding substantially  
 8 to the impacts.

**Table 5-28**  
**Projected Employment by Alternative for Primary Socioeconomic Study Area**

Item	Alt. A	Alt. B	Alt. C	Alt. D	Alt. E	Alt. F	Proposed Plan
Employment (2010) <sup>1</sup>	309,620	309,620	309,620	309,620	309,620	309,620	309,620
Average annual change in future employment related to livestock grazing <sup>2</sup>	N/A	0	-1,420	0	0	-310	0
Projected 2020 employment <sup>3</sup>	356,063	356,121	354,643	356,343	356,343	355,753	356,343
% change, 2010 to 2020	15.0%	15.0%	14.5%	15.1%	15.1%	14.9%	15.1%

Source: Idaho Department of Labor (2013) and Montana Department of Labor and Industry (2011) (projected employment data), modified by estimates from IMPLAN reported in **Chapter 4, Section 4.15**, Social and Economic Impacts (Including Environmental Justice). Changes related to livestock grazing include direct, indirect, and induced effects from IMPLAN; see **Appendix R**, Economic Impact Analysis Methodology, for a detailed description of this model.

N/A not applicable

<sup>1</sup> Employment in 2010 in the primary socioeconomic study area from **Chapter 3, Section 3.22**, Social and Economic Conditions (Including Environmental Justice).

<sup>2</sup> The values for livestock grazing are those shown in **Chapter 4, Section 4.15**, Social and Economic Impacts (Including Environmental Justice).

<sup>3</sup> Based on the projected employment increase for the four Idaho regions and southwest Montana, a conservative (i.e., lower range) estimate for employment growth would be about a 15 percent increase from 2010 to 2020. This results in an estimate of about 356,063 jobs (for Alternative A), which is then modified based on the results of the IMPLAN analysis for each alternative.

9  
 10 Changes in employment in Alternatives C and F, would have a measurable effect on future  
 11 employment, according to this analysis, but reductions would be relatively small given the  
 12 size of the study area and the uncertainty associated with a long-term forecast. Long-term  
 13 trends including changing market conditions, consolidation supported by economies of  
 14 scale, demographic change, and environmental concerns have resulted in increasingly  
 15 challenging economic conditions for ranch operators, especially smaller operators. Increased  
 16 costs due to restrictions on vegetation treatments, range improvements, and other  
 17 management elements could exacerbate existing trends and create additional, cumulative  
 18 impacts for the livestock grazing and ranching sector. This could have economic impacts  
 19 over and above those identified in **Table 5-28** and could also result in social impacts since  
 20 the grazing and ranching industry has been relatively influential in terms of establishing  
 21 community character, identity, and social values, particularly in certain areas within the study  
 22 area. In terms of geographic regions, the cumulative effects on livestock grazing operators

1 would occur throughout the socioeconomic study area but would be most important in  
2 Cassia, Gooding, Jerome, Lincoln, and Owyhee Counties, Idaho, based on the importance of  
3 grazing within the economy of those counties.

4 Of the effects documented in **Section 4.15**, Social and Economic Conditions (Including  
5 Environmental Justice), the impact that most exacerbates current economic challenges is the  
6 potential for several of the management alternatives to result in increased costs for livestock  
7 grazing operators. Long-term trends including changing market conditions, consolidation  
8 supported by economies of scale, demographic change, and environmental concerns have  
9 resulted in increasingly challenging economic conditions for ranch operators, especially  
10 smaller operators.

11 Increased costs due to restrictions on vegetation treatments, range improvements, OHV  
12 travel, and other management elements could exacerbate existing trends and create  
13 additional, cumulative impacts for the livestock grazing and ranching sector. This could have  
14 economic impacts over and above those identified in Error! Reference source not  
15 found. **Table 5-28** and could also result in social impacts since the grazing and ranching  
16 industry has been relatively influential in terms of establishing community character, identity,  
17 and social values, particularly in certain areas within the study area.

18 All of the alternatives would have some degree of cumulative social and economic impact  
19 related to grazing. Although AUMs would be reduced only in Alternatives C and F,  
20 Alternatives B, D and E would also entail changes to management that could increase costs  
21 or decrease the flexibility of ranchers to manage their animals.

22 In terms of geographic regions, the cumulative effects on livestock grazing operators would  
23 occur throughout the socioeconomic study area but would be most important in Cassia,  
24 Gooding, Jefferson, Lincoln, and Owyhee Counties, Idaho, based on the importance of  
25 grazing within the economy of those counties.

26 Another effect identified in **Section 4.15** that could lead to a cumulatively considerable  
27 contribution to impacts would be impacts on recreation (in Alternatives C and F), especially  
28 in counties where recreation contributes substantially to the local economy, which are  
29 identified in **Section 4.15** as Madison County in Montana and Blaine County in Idaho.

30 Other effects would not be expected to contribute to cumulative effects. From a cumulative  
31 effects standpoint the economic and social impacts of these changes would be relatively  
32 minor and do not particularly exacerbate existing trends in the study area.

# Chapter 6

## Consultation and Coordination

Administrative Draft  
Cooperating Agency Review

1 **Changes to Chapter 6 between Draft LUPA/EIS and Proposed LUPA/Final EIS**

- 2
- 3
- 4
- 5
- 6
- 7
- 8
- Chapter 5 in the DEIS was renumbered to become Chapter 6 in the Proposed LUPA/FEIS.
  - General corrections (e.g., typographical errors) and clarifications were included.
  - A summary of the public comment period and public comments on the Draft LUPA/EIS was added in **Section 6.2.5**, Public Comment on the Draft LUPA/EIS.
  - Future opportunity for public involvement was added in **Section 6.2.6**, Future Public Involvement.

Administrative Draft  
Cooperating Agency Review

1           **Chapter 6.    Consultation and Coordination**

2           **6.1     Introduction**

3           This chapter describes the efforts undertaken by the BLM and Forest Service throughout the  
4           process of developing the LUPA/EIS to ensure the process remained open and inclusive to  
5           the extent possible. This chapter also describes efforts taken to comply with legal  
6           requirements to consult and coordinate with various government agencies. These efforts  
7           include public scoping; identifying and designating cooperating agencies; consulting with  
8           state, local, and tribal governments; and determining whether the LUPA/EIS is consistent  
9           with tribal, state, local, and county plans.

10          The BLM and Forest Service land use planning activities are conducted in accordance with  
11          NEPA requirements, CEQ regulations, and US Departments of the Interior and Agriculture  
12          policies and procedures implementing NEPA, as well as specific BLM and Forest Service  
13          planning and NEPA policies. The NEPA and associated laws, regulations, and policies  
14          require the BLM and Forest Service to seek public involvement early in and throughout the  
15          planning process to develop a range of reasonable alternatives to proposed actions and to  
16          prepare environmental documents that disclose the potential impacts of proposed  
17          alternatives.

18          Public involvement and agency consultation and coordination have been at the heart of the  
19          planning process leading to this LUPA/EIS. These efforts were achieved through Federal  
20          Register notices, public and informal meetings, individual contacts, media releases, planning  
21          bulletins, and a series of GRSG planning-related Web sites. This chapter documents the  
22          outreach efforts that have occurred to date.

23          **6.2     Public Involvement**

24          In accordance with CEQ scoping guidance, the BLM and Forest Service provided  
25          opportunities for public involvement as an integral part of amending the LUPs and  
26          preparing the EIS. CEQ scoping guidance (1981) defines scoping as the process by which  
27          lead agencies solicit input from the public and interested agencies on the nature and extent  
28          of issues and impacts to be addressed and the methods by which they will be evaluated. The  
29          scoping comment summary report, which summarizes comments received during the  
30          scoping process, is available on the BLM's National GRSG Web site at  
31          [http://www.blm.gov/wo/st/en/prog/more/sagegrouse/documents\\_and\\_resources.html](http://www.blm.gov/wo/st/en/prog/more/sagegrouse/documents_and_resources.html).

32          The intent of the scoping process is to provide an opportunity for the public, tribes, other  
33          government agencies, and interest groups to learn about the project and provide input on  
34          the planning issues, impacts, and potential alternatives that will be addressed in the EIS, and  
35          the extent to which those issues will be analyzed. In general, public involvement during  
36          scoping assists the agency through the following:

- 37                   •   Broadening the information base for decision-making

- 1 • Informing the public about the EIS and proposed LUPAs and the potential  
2 impacts associated with various management decisions
- 3 • Ensuring public needs and viewpoints are brought to the attention of the agency
- 4 • Determining the scope and the significant issues to be analyzed in depth in the  
5 EIS

### 6 **6.2.1 Scoping Period**

7 The scoping period for the Idaho and Southwestern Montana Sub-region LUPA/EIS began  
8 with the publication of the NOI in the Federal Register on December 9, 2011, and ended on  
9 March 23, 2012. The scoping period provides an opportunity for the public to identify  
10 potential planning issues and concerns associated with the LUP amendments and EIS.  
11 Information obtained by the BLM and Forest Service during scoping is combined with  
12 issues identified by the agencies to form the scope of the EIS.

### 13 **6.2.2 Public Notification of Scoping**

14 A press release was made available on the national, Great Basin Region, and Rocky  
15 Mountain Region Web sites on December 8, 2011, announcing the scoping period for the  
16 EIS process. A similar press release was also sent out from the BLM Idaho State Office on  
17 January 5, 2012. The press releases provided information on the scoping open houses being  
18 held (see *Public Scoping Open Houses* below) and described the various methods for submitting  
19 comments. A second press release was posted on the project Web sites on February 7, 2012,  
20 announcing the extension of the public scoping period to March 23, 2012. A newsletter was  
21 also sent out to the mailing list as described below (see Newsletter and Mailing List).

22 In addition to news releases and other notifications from the BLM and Forest Service  
23 regarding the scoping process, some members of the public received notification from other  
24 sources. Several articles were published in local newspapers, including in the Times New on  
25 January 28, 2012, and the Idaho Mountain Express on February 29, 2012.

26 The national GRSG conservation Web site (see Web site below) provides background  
27 information on the project, a description of the scoping process and meeting locations,  
28 instructions on how to submit comments, and copies of public information documents such  
29 as the NOI. The Web site is one of the methods used to communicate project news and  
30 updates to the public. The Web site is available on the Internet at  
31 <http://www.blm.gov/sagegrouse.html>.

### 32 **6.2.3 Public Scoping Open Houses**

33 The BLM and Forest Service hosted six open houses throughout the Idaho and  
34 Southwestern Montana Sub-region to provide the public with opportunities to become  
35 involved, learn about the project and the planning process, meet the planning team  
36 members, and offer comments. Where possible, representatives from the USFWS and state  
37 fish and game agencies also attended. The open houses were advertised via press releases,  
38 the project newsletter, and the project Web sites. The locations of the open houses are  
39 provided in **Table 6-1**, Idaho and Southwestern Montana Sub-region Scoping Open Houses.

**Table 6-1**  
**Idaho and Southwestern Montana Sub-region Scoping Open Houses**

Location	Venue	Date	Number of Attendees
<b>Idaho</b>			
Boise	Red Lion Boise Hotel	January 9, 2012	110
Idaho Falls	Red Lion Hotel	January 10, 2012	63
Salmon	Salmon Valley Business & Innovation Center	January 11, 2012	63
Twin Falls	Canyon Springs Red Lion Inn	January 25, 2012	87
Pocatello	The Clarion	January 26, 2012	58
<i>Idaho Total</i>			<i>381</i>
<b>Montana</b>			
Dillon	National Guard Armory	January 12, 2012	47
<i>Montana Total</i>			<i>47</i>
<b>Idaho and Southwestern Montana Sub-region Total</b>			<b>428</b>

Scoping meetings were held in an open house format to encourage participants to discuss concerns and questions with the BLM and Forest Service and other agency staff representatives. Copies of scoping information, as well as blank scoping comment forms, were available at the sign-in station. Resource stations displayed maps to illustrate the planning area under consideration, GRSG habitat and bird densities, resource uses (e.g., rights-of-way, energy, livestock grazing, and recreation), and resource conditions (e.g., vegetation and wildland fire). At those stations, fact sheets for various topics (e.g., planning process, purpose and need, preliminary planning issues, preliminary planning criteria, GRSG conservation, biology and habitat, and threats to GRSG) provided an overview of current management practices and issues.

#### 6.2.4 Other Public Involvement

##### *Newsletter and Mailing List*

In December 2011, the BLM and Forest Service mailed a newsletter announcing the start of the public scoping period for the Great Basin EISs, including the Idaho and Southwestern Montana Sub-region, to more than 14,000 individuals from the public, agencies, and organizations who had participated in past BLM and Forest Service activities and had been included on past BLM and Forest Service distribution lists. The newsletter provided background information and an overview of the National GRSG Planning Strategy, the dates and venues for the scoping open houses (see Public Scoping Open Houses above), and the various methods for submitting comments, including dedicated email and postal addresses. In December 2012, the BLM and Forest Service mailed a postcard providing a notification of updates to the national Web site.

The BLM and Forest Service will publish future newsletters at major project milestones and will mail them to individuals and organizations that have requested to remain on or be added

1 to the project mailing list. All newsletters will be made available on the national or regional  
2 project Web sites. Participants may request to receive newsletters and other project  
3 information through electronic or postal mail.

#### 4 **Web Site**

5 The BLM launched a national GRSG conservation Web site as part of the agency's efforts to  
6 maintain and restore GRSG habitat on BLM-administered lands. The site is intended to  
7 make it easy to find out about how the BLM and Forest Service are working on maintaining  
8 and restoring GRSG habitat, and includes background information related to governmental  
9 and the BLM and Forest Service roles in GRSG conservation. The Web site is available on  
10 the Internet at <http://www.blm.gov/sagegrouse.html>.

11 The BLM has also launched a regional Web site for the Great Basin Region. This site is  
12 regularly updated to provide the public with the latest information about the EIS processes  
13 in the region. The regional Web site provides background information about the project, a  
14 public involvement timeline, maps of the planning areas, and copies of public information  
15 documents such as the newsletter and NOI. The site also provides a description of how to  
16 submit comments about the EIS process, including a link to the scoping comment email  
17 address. The dates and locations of scoping open houses were also announced on the  
18 regional Web site. The Great Basin Region Web site is available on the Internet at  
19 <http://www.blm.gov/wo/st/en/prog/more/sagegrouse/western.html>. A link to this Web  
20 site is also provided on the National Web site.

### 21 **6.2.5 Public Comment on the Draft LUPA/EIS**

#### 22 **Public Meetings**

23 A Notice of Availability (NOA) for the Draft LUPA/EIS was published in the Federal  
24 Register on November 1, 2013. The NOA initiated a 90-day public comment period, which  
25 ended on January 29, 2014. The BLM and Forest Service notified the public of open house  
26 meetings via the project Web site and a news release to various media sites including  
27 newspapers, radio, and television.

28 The BLM and Forest Service held seven public comment open houses for the Draft LUPA/EIS  
29 from January 6 through January 15, 2014:

- 30 • Murphy, ID- January 6, 2014
- 31 • Idaho Falls, ID, January 7, 2014
- 32 • Salmon, ID, January 8, 2014
- 33 • Dillon, MT, January 9, 2014
- 34 • Pocatello, ID, January 13, 2014
- 35 • Twin Falls, ID, January 14, 2014
- 36 • Boise, ID, January 15, 2014

1 All meetings were from 5:30 to 7:30 PM. The goal of the open houses was to inform the public  
2 about the Draft LUPA/EIS and to obtain further public input on the alternatives that were  
3 developed and analyzed. In addition, the BLM and Forest Service sought comments on potential  
4 impacts resulting from the six alternatives. At the open houses, displays introduced the various  
5 resource topics and presented the six alternatives for the resource topics. Other displays  
6 explained the NEPA process and the methods for submitting comments. A slide show  
7 looped throughout the open house describing the Idaho and Southwestern Montana Sub-  
8 region Greater Sage-Grouse Draft LUPA/EIS preparation process.

9 Public comments were solicited at the open houses, where comment sheets were provided.

### 10 ***Comment Analysis Methodology***

11 After publishing the Draft LUPA/EIS, the BLM and Forest Service held a 90-day public  
12 comment period to receive comments on the Draft LUPA/EIS. The BLM and Forest  
13 Service received written comments by mail, email, and submissions at the public meetings.  
14 Comments covered a wide spectrum of thoughts, opinions, ideas, and concerns. The BLM  
15 and Forest Service recognize that commenters invested considerable time and effort to  
16 submit comments on the Draft LUPA/EIS, and developed a comment analysis  
17 methodology to ensure that all comments were considered as directed by NEPA regulations.

18 According to NEPA, the BLM and Forest Service are required to identify and formally  
19 respond to all substantive public comments. The BLM and Forest Service developed a  
20 systematic process for responding to comments to ensure all substantive comments were  
21 tracked and considered. Upon receipt, each comment letter was assigned an identification  
22 number and logged into CommentWorks, a Web-based database that allowed the BLM and  
23 Forest Service to organize, categorize, and respond to comments. Substantive comments  
24 from each letter were coded to appropriate categories based on content of the comment,  
25 retaining the link to the commenter. The categories generally follow the sections presented  
26 in the Draft LUPA/EIS, though some relate to the planning process or editorial concerns.

27 Comments similar to each other were grouped under a topic heading, and the BLM and  
28 Forest Service drafted a statement summarizing the ideas contained in the comments. The  
29 responses were crafted to respond to the comments; a response indicates whether or not the  
30 commenters' points resulted in a change in the document. As a result of public comments,  
31 changes were made to the Draft LUPA/DEIS and reflect consideration given to public  
32 comments. A summary of major changes between the Draft LUPA/EIS and the Proposed  
33 LUPA/FEIS can be found prior to each Chapter in the Proposed LUPA/FEIS.

34 Although each comment letter was diligently considered, the comment analysis process  
35 involved determining whether a comment was substantive or nonsubstantive in nature. In  
36 performing this analysis, the BLM and Forest Service relied on the CEQ's regulations to  
37 determine what constituted a substantive comment.

1 A substantive comment does one or more of the following:

- 2 • Questions, with a reasonable basis, the accuracy of the information and/or  
3 analysis in the EIS
- 4 • Questions, with a reasonable basis, the adequacy of the information and/or  
5 analysis in the EIS
- 6 • Presents reasonable alternatives other than those presented in the draft EIS that  
7 meet the purpose and need of the proposed action and addresses significant  
8 issues
- 9 • Questions, with a reasonable basis, the merits of an alternative or alternatives
- 10 • Causes changes in or revisions to the proposed action
- 11 • Questions, with a reasonable basis, the adequacy of the planning process itself

12 Additionally, BLM's NEPA handbook identifies the following types of substantive  
13 comments:

- 14 • Comments on the Adequacy of the Analysis: Comments that express a  
15 professional disagreement with the conclusions of the analysis or assert that the  
16 analysis is inadequate are substantive in nature but may or may not lead to  
17 changes in the Final EIS. Interpretations of analyses should be based on  
18 professional expertise. Where there is disagreement within a professional  
19 discipline, a careful review of the various interpretations is warranted. In some  
20 cases, public comments may necessitate a reevaluation of analytical conclusions.  
21 If, after reevaluation, the manager responsible for preparing the EIS (the  
22 Authorized Officer) does not think that a change is warranted, the response  
23 should provide the rationale for that conclusion.
- 24 • Comments That Identify New Impacts, Alternatives, or Mitigation Measures:  
25 Public comments on a draft EIS that identify impacts, alternatives, or mitigation  
26 measures that were not addressed in the draft are substantive. This type of  
27 comment requires the Authorized Officer to determine whether it warrants  
28 further consideration. If it does, the Authorized Officer must determine whether  
29 the new impacts, new alternatives, or new mitigation measures should be  
30 analyzed in the Final EIS, a supplement to the Draft EIS, or a completely revised  
31 and recirculated Draft EIS.
- 32 • Disagreements with Significance Determinations: Comments that directly or  
33 indirectly question, with a reasonable basis, determinations regarding the  
34 significance or severity of impacts are substantive. A reevaluation of these  
35 determinations may be warranted and may lead to changes in the Final EIS. If,  
36 after reevaluation, the Authorized Officer does not think that a change is  
37 warranted, the response should provide the rationale for that conclusion.

38 Some submissions received contained substantive comments, but were out of the scope of  
39 this project. These included comments on subjects not related to this effort, other GRSG

1 efforts, or BLM or Forest Service laws, rules, regulations, or policy. These comments were  
2 reviewed and sent along to the appropriate party as needed, but are not included in the  
3 comment response for this effort.

4 Comments that failed to meet the above description were considered nonsubstantive. Many  
5 comments received throughout the process expressed personal opinions or preferences, had  
6 little relevance to the adequacy or accuracy of the Draft LUPA/EIS, or represented  
7 commentary regarding resource management without any real connection to the document  
8 being reviewed. These comments did not provide specific information to assist the planning  
9 team in making a change to the Preferred Alternative, did not suggest other alternatives, and  
10 did not take issue with methods used in the Draft LUPA/EIS, and are not addressed further  
11 in this document. Examples of some of these comments include the following:

- 12 • The best of the alternatives is Alternative F (or A, B, C, D or E).
- 13 • The BLM has yet to show land stewardship at or above the level currently  
14 demonstrated by the private sector.
- 15 • Your plan does not reflect balanced land management.
- 16 • Stop giving away land to the mineral companies.
- 17 • More land should be protected as wilderness.
- 18 • I want the EIS to reflect the following for this area: no grazing, no logging, no  
19 drilling, no mining, and no OHVs.
- 20 • You need to protect all ACECs/Wild and Scenic Rivers/areas with wilderness  
21 characteristics.
- 22 • Do not add any more road closures to what is now in existence.
- 23 • People need access and the roads provide revenue for local communities.
- 24 • More areas should be made available for multiple uses (drilling, OHVs, ROWs,  
25 etc.) without severe restrictions.

26 Opinions, feelings, and preferences for one element or one alternative over another, and  
27 comments of a personal and/or philosophical nature were all read, analyzed, and considered,  
28 but because such comments are not substantive in nature, the BLM and Forest Service did  
29 not respond to them. It is also important to note that, while all comments were reviewed and  
30 considered, comments were not counted as “votes.” The NEPA public comment period is  
31 neither considered an election nor does it result in a representative sampling of the  
32 population. Therefore, public comments are not appropriate to be used as a democratic  
33 decision-making tool or as a scientific sampling mechanism.

34 Comments citing editorial changes to the document were reviewed and incorporated. The  
35 Final LUPA/EIS has been extensively technically edited and revised to fix typos, missing  
36 references, definitions, and acronyms, and other clarifications as needed.

**Public Comments**

A total of 297 unique comment letters, forms, and emails were received during the 90-day public comment period. These documents resulted in 1,085 substantive comments. Out of the 297 comment letters, 193 were submitted by private individuals (65 percent); 29 by organizations, including businesses and environmental and wildlife protection groups (10 percent); 54 by associations, including user groups, recreational clubs, realty associations, industry groups, and partnerships (18 percent); 4 by federal agencies (1 percent); 3 by state governments (1 percent); 12 by local governments (4 percent); and 2 letters were submitted anonymously (1 percent). The BLM and Forest Service parsed 1,085 substantive comments from the 297 submissions. Private individuals submitted 111 of these comments (10 percent), 408 were submitted by organizations (38 percent), 382 were submitted by associations (35 percent), 59 were submitted by federal agencies (5 percent), 53 were submitted by state agencies (5 percent), 72 were submitted by local governments (7 percent), and no substantive comments came from anonymous submission (see **Table 6-2**, Number of Unique Submissions and Commenters by Affiliation).

<b>Group</b>	<b>Number of Submissions</b>	<b>Number of Comments</b>
Private individuals	193	111
Organizations (including businesses and environmental and wildlife protection groups)	29	408
Associations (user groups, recreational clubs, realty associations, industry groups, partnerships, etc.)	54	382
Federal agencies (EPA, USFWS, USFS, NPS)	4	59
State government (state agencies, Governor's Office)	3	53
Local government (county commissions and departments)	12	72
Anonymous	2	0
<b>Total</b>	<b>297</b>	<b>1,085</b>

In addition to the unique submissions discussed above, 15,646 form letters were submitted during the public comment period. Form letters are exact or very close copies of a letter that are submitted multiple times by different individuals; individuals may add additional language to the letter, but this usually does not substantially change the content of the letter. Often, form letters are created by an organization and sent to their members, who in turn submit this letter to the planning effort. For the Idaho and Southwestern Montana Draft LUPA/EIS, 6 different form letter masters were submitted: 2,930 letters from WildEarth Guardians; 2,510 letters from the American Bird Conservancy; 2,080 letters from Defenders of Wildlife; 7,660 letters from the American Wild Horse Preservation Campaign; 126 letters from local ranchers; and 5 letters from unknown organizations. One copy of each of these letters was included in the comment analysis process as a master form letter. All of the form letters were reviewed for additional substantive content; this was included in the comment analysis process when present.

1 A review of the 1,085 substantive comments received revealed a high level of interest about  
 2 the management of GRSG (346 comments, 32 percent), compliance with NEPA, FLPMA,  
 3 and other laws (NEPA: 136 comments, 13 percent; other laws: 15 comments, 1 percent; and  
 4 FLPMA: 28 comments, 3 percent), livestock grazing (120 comments, 11 percent), sagebrush  
 5 vegetation (47 comments, 4 percent), socioeconomics (39 comments, 4 percent), and lands  
 6 and realty (35 comments, 3 percent). Topics that received moderate interest were fire and  
 7 fuels (27 comments, 2 percent), leasable minerals (26 comments, 2 percent), travel  
 8 management (20 comments, 2 percent), and wild horses and burros (18 comments, 2  
 9 percent). The topics with the least amount of interest were lands with wilderness  
 10 characteristics (10 comments, 1 percent); ACECs (10 comments, 1 percent), riparian  
 11 vegetation (7 comments, 1 percent); predation (6 comments, 1 percent); climate change (5  
 12 comments, 0.5 percent); noxious and invasive weeds (4 comments, 0.4 percent); recreation,  
 13 tribal interests, and fish and wildlife (3 comments, 0.3 percent each); water resources (2  
 14 comments, 0.2 percent), and locatable minerals, noise, and soil resources (1 comment, 0.1  
 15 percent each). In addition to these topics, substantive comments were collected that  
 16 suggested editorial changes (62 comments, 6 percent), were substantive comments but  
 17 considered out of scope of this document (109 comments, 10 percent), and those that  
 18 requested an extension of the comment period (1 comments, 0.1 percent). These comments  
 19 were reviewed and considered, but not included in the formal comment responses effort. See  
 20 **Table 6-3**, Number of Comments on the Draft LUPA/EIS by Category.

**Table 6-3**  
**Number of Comments on the Draft LUPA/EIS by Category**

Topic	Number of Comments
Greater Sage-Grouse	346
NEPA	136
Livestock grazing	120
Vegetation – sagebrush	47
Socioeconomics	39
Lands and realty	35
FLPMA	28
Fire and fuels	27
Leasable minerals	26
Travel management	20
Wild horses and burros	18
Other Laws	15
Lands with wilderness characteristics	10
ACECs	10

Extension requests*	1
<b>Total</b>	<b>1,085</b>
*Comments in these categories were reviewed for their content, but not included in the comment response effort.	

1  
2 The comments received on the Draft LUPA/EIS were similar to the issues raised during  
3 public scoping. In many cases, comments expressed a desire for very specific  
4 implementation level (project level) details to be included in the LUPA. As described in  
5 Chapters 1 and 2, the LUPA/EIS provides general guidance and identifies allowable uses  
6 and allocations but is not meant to address all details about individual projects. A separate  
7 environmental review will be conducted for specific projects at the implementation level to  
8 address these details. Some comments spanned several topical areas and included a  
9 discussion about a resource use or activity and listed concerns about the resources that  
10 would be impacted by the use, or conversely, the impact that restrictions would have on  
11 resource uses or activities.

12 All substantive comments, detailed summaries, and responses organized by resource,  
13 resource use, or EIS planning regulation can be found in **Appendix T**. An overview of these  
14 summaries and responses can be found below in **Table 6-4**, Overview of Comments by  
15 Category. Comments related to editorial changes, out of scope topics, extension requests,  
16 and non-substantive comments were not included in the comment response effort.

<b>Table 6-4 Overview of Comments by Category</b>	
<i>Topic</i>	<i>Overview</i>
ACECs	Commenters noted inconsistencies in the representation of ACECs under alternatives in the DEIS, wanted to see a greater range of alternatives for ACEC locations, and emphasized that protective actions in ACECs be adequate.
Climate change	Commenters wanted to see a more thorough and rigorous analysis of the cumulative effects of climate change on GRSG or GRSG habitat.
Fire and fuels	Commenters requested clarification on the potential impacts of the plan on fuel loads and fire risk and additional analysis of fire suppression impacts, suggested potential changes to alternatives or management actions, and recommended that additional references be incorporated to support the analysis.
Fish and wildlife	Commenters stated that the BLM fails to address avoiding the potential to list the GRSG under the Endangered Species Act and that the bird does not meet the criteria to be listed under that law.
FLPMA	Commenters claimed that the Draft LUPA/EIS failed to comply with the multiple use mandate required under FLPMA and the Multiple Use Sustained Yield Act required under the Forest Service. They also noted that the plan is not consistent with state, local, and tribal plans and policies, and that there needs to be a consistency review with local plans in the document.
Greater Sage-Grouse	Commenters claimed the BER and NTT reports were inadequate to use as a primary source in the plan, found the plan to be inconsistent with COT conservation objectives, requested clarification on the range of alternatives and habitat mapping, suggested additional literature to be used for best available information on GRSG, made recommendations on how to improve the impact analysis of various resources on GRSG, found the cumulative impacts to be deficient, and requested clarification or revisions to mitigation measures.
Lands and realty	Commenters requested clarification on or recommended specific changes to proposed management, recommended additional references related to infrastructure, and found the analysis of impacts between lands and realty management and renewable energy infrastructure to be lacking.
Lands with wilderness characteristics	Commenters wanted additional lands with wilderness characteristics to be considered for the protection of GRSG, requested that these lands be analyzed more thoroughly, and requested additional baseline information be provided.
Leasable minerals	Commenters wanted certain aspects of the alternatives clarified, recommended additional literature to consider, and wanted a more complete analysis impacts and cumulative impacts,
Livestock grazing	Commenters expressed concerns regarding retirement of grazing permits, recommended expanding the range of alternatives for livestock grazing, recommended additional references to consider, and found the analysis of impacts to be inadequate.
Locatable minerals	Commenters stated that the DLUPA/DEIS failed to adequately analyze the cumulative impact of locatable mineral withdrawals across the GRSG range.
NEPA	Commenters asserted that the plan does not comply with the requirements of NEPA, did not adequately notify the public about the DEIS, did not coordinate with local agencies, did not provide a wide enough range of alternatives, did not use the best available data, and have not provided adequate cumulative impacts analysis or mitigation measures.
Noise	Commenters questioned current studies used regarding noise and wanted to see

**Table 6-4  
Overview of Comments by Category**

<i>Topic</i>	<i>Overview</i>
	additional information used to determine the impacts of noise on different parts of GRSG life cycle.
Noxious and invasive weeds	Commenters requested additional analysis be conducted, recommended literature to consider, asked for more baseline data, and suggested collaboration with private landowners.
Other laws	Commenters argued that the plan does not comply with other federal laws.
Predation	Commenters state that the BLM does not adequately address the threat of predation or fully analyze the direct, indirect, and cumulative impacts of predation on GRSG populations.
Recreation	Commenters recommended additional management actions to limit the potential for impacts on GRSG from recreation activities.
Socioeconomics	Commenters claimed the analysis used was at the wrong scale to make the information meaningful, and noted that the impacts analysis was inadequate.
Soil resources	One commenter noted that the DEIS lacked references to support discussion of macrobiotic crusts.
Travel management	Commenters stated that the DEIS failed to consider a full range of travel management alternatives and suggested additional management actions, and felt the DEIS did not adequately analyze the impacts of proposed management actions on travel management.
Tribal interests	Commenters requested the BLM consult with tribes regarding ACEC designations and stated that the BLM must ensure tribes maintain opportunities to access the public domain.
Vegetation – riparian	Commenters requested that the BLM and Forest Service consider additional management approaches for riparian vegetation, requested baseline data be provided, and suggested modification of current assessment methods to address GRSG needs,
Vegetation – sagebrush	Commenters recommended actions to include in the alternatives, provided additional literature to consider, stated that the DEIS inadequately analyzes impacts, including cumulative impacts, and requested clarification on mitigation and monitoring.
Water resources	Commenters stated that the DEIS fails to address impacts on the soil and watershed conditions and to provide appropriate mitigation measures.
Wild horses and burros	Commenters suggested changes in management actions, such as inclusion of the National Academy of Sciences’ 2013 recommendations into the plan, requested additional baseline information, and felt the impact analysis was inadequate,

Complete responses, including rationale and any associated changes made in the Proposed LUPA/FEIS, can be found in **Appendix T**. A brief overview of changes to the document is included below:

- The disturbance cap in the Proposed LUPA/FEIS was revised to provide additional detail, such as enhanced descriptions of what types of activities would count towards the disturbance totals, where disturbance activities would count against the cap, reclamation and habitat requirements for a disturbed area for both temporary and permanent disturbance, and how the cap would be implemented and monitored. **Appendix H** has also been added to the Proposed LUPA/FEIS, which contains preliminary disturbance inventory to more

1 accurately assess current disturbance levels and potential impacts across the  
2 planning area.

- 3 • A more comprehensive list of cumulative projects, past and future, has been  
4 developed, and used to support a more detailed analysis of cumulative impacts.  
5 Cumulative impacts have also been reviewed for consistency with the rest of the  
6 plan.
- 7 • Additional language has been added describing the adaptive management  
8 approach for the LUPA/EIS level.
- 9 • Mitigation and monitoring have been further defined as a Regional Mitigation  
10 Framework and National Monitoring Framework, detailed in **Appendices J and**  
11 **E**, respectively.
- 12 • Management objectives and actions in **Chapter 2** have been updated.
- 13 • Additional literature was reviewed and added to the baseline information in  
14 **Chapter 3**.
- 15 • **Chapter 4** has been updated with new information and analysis, and revised for  
16 consistency with **Chapter 3**.
- 17 • Clarifications have been added on specific topics commenters found confusing  
18 or deficiently described, including implementation level decisions.

19 All comments citing editorial changes to the document were reviewed and incorporated as  
20 appropriate. The Proposed LUPA/FEIS has been edited and revised to fix typographic  
21 errors, missing references, definitions, acronyms, calculations, and other inconsistencies.

### 22 **6.2.6 Future Public Involvement**

23 Public participation efforts will be ongoing throughout the remainder of the LUPA/EIS  
24 process.

25 An NOA will be published in the *Federal Register* to notify the public of the availability of the  
26 Proposed LUPA/Final EIS. The NOA will also outline protest procedures during the 30-  
27 calendar-day protest period. The Proposed LUPA/Final EIS will be available for downloading  
28 from the project Web site at: [http://www.blm.gov/id/st/en/prog/nepa\\_register/sage-  
29 grouse\\_rmp\\_revision.html](http://www.blm.gov/id/st/en/prog/nepa_register/sage-grouse_rmp_revision.html). The Proposed LUPA/Final EIS will also be available for review at  
30 the BLM Idaho and Montana State Offices along with the Beaverhead-Deerlodge, Boise,  
31 Caribou-Targhee, Salmon-Challis, and Sawtooth national forests. Press releases will be issued to  
32 notify the public of the Proposed LUPA/Final EIS availability. All recipients of the Draft  
33 LUPA/EIS and all parties who submitted written comments on the Draft LUPA/EIS will  
34 receive the Proposed LUPA/Final EIS in either a hard copy or CD, or they will be able to  
35 download it from the Web site. The BLM and Forest Service will notify those who previously  
36 received the Draft RMP/EIS electronically. The BLM Idaho State Office maintains the  
37 distribution list for the Proposed LUPA/EIS, which is available on request.

1 Records of Decision will be issued by the BLM and the Forest Service after the release of  
2 the Proposed LUPA/Final EIS, the Governor’s Consistency Review, and any resolution of  
3 protests received on the Proposed LUPA/Final EIS.

### 4 **6.3 Consultation and Coordination**

5 Various federal laws require the BLM to consult with Native American tribes, the State  
6 Historic Preservation Office, and USFWS, the US Environmental Protection Agency, and  
7 the US Department of Defense during the planning/NEPA decision-making process. This  
8 section documents the specific consultation and coordination efforts undertaken by the  
9 BLM throughout the process of developing the LUPA/EIS.

#### 10 **6.3.1 Cooperating Agencies**

11 A cooperating agency is any federal, state, or local government agency or Native American  
12 tribe that enters into a formal agreement with the lead federal agency to help develop an  
13 environmental analysis. Cooperating agencies and tribes “work with the BLM, sharing  
14 knowledge and resources, to achieve desired outcomes for public lands and communities  
15 within statutory and regulatory frameworks” (BLM 2005). The Forest Service defines  
16 collaboration as, “People working together to share knowledge and resources to describe  
17 and achieve desired conditions for National Forest System lands and for associated social,  
18 ecological, and economic systems in a plan area. Collaboration applies throughout the  
19 planning process, encompasses a wide range of external and internal relationships, and  
20 entails formal and informal processes” (Forest Service 2006). The benefits of enhanced  
21 collaboration among agencies in preparing NEPA analyses are:

- 22 • Disclosing relevant information early in the analytical process
- 23 • Applying available technical expertise and staff support
- 24 • Avoiding duplication with other federal, state, tribal, and local procedures
- 25 • Establishing a mechanism for addressing intergovernmental issues

26 The Idaho and Southwestern Montana Sub-region invited local, state, federal, and tribal  
27 representatives to participate as cooperating agencies for this LUPA/EIS. **Table 6-5**, Idaho  
28 and Southwestern Montana Sub-region Cooperating Agency Participation, provides the list  
29 of invited and accepted cooperating agencies for the sub-region. Agencies accepting  
30 invitations to be cooperating agencies sign an MOU with the BLM. The MOU outlines the  
31 interests, expertise, and jurisdictional responsibilities of both the agency and its cooperating  
32 agency partners and also outlines their respective roles and responsibilities in the planning  
33 and NEPA processes.

5

Cooperating agencies have been involved throughout the planning process with monthly conference calls providing project updates. In addition, cooperating agencies were given advance review of LUPA/EIS sections. Cooperating agencies will continue to be engaged throughout the planning process.

16

The BLM is aware that there are specific State laws and local plans relevant to aspects of public land management that are discrete from, and independent of, Federal law. However, BLM is bound by Federal law. As a consequence, there may be inconsistencies that cannot be reconciled. The FLPMA and its implementing regulations require that BLM's land use plans be consistent with State and local plans only if those plans are consistent with the purposes, policies, and programs of federal laws and regulations applicable to public lands. Where State and local plans conflict with the purposes, policies, and programs of Federal law there will be an inconsistency that cannot be resolved. While County and Federal planning processes, under FLPMA, are required to as integrated and consistent as practical, the Federal agency planning process is not bound by or subject to County plans, planning processes, or planning stipulations.

1           **6.3.2 USFWS Section 7 Consultation**

2           Consultation with USFWS is required under Section 7(c) of the ESA prior to initiation of  
3           any project by the BLM/Forest Service that may affect any federally listed or endangered  
4           species or its habitat. This LUPA process is considered to be a major project, and the  
5           Proposed LUPA/Final EIS defines potential impacts on threatened and endangered species  
6           as a result of management actions proposed in the alternatives. The USFWS is a cooperating  
7           agency in this planning process, and USFWS staff has participated in interdisciplinary team  
8           meetings and has been provided drafts of alternative decisions and analyses for discussion  
9           and input.

10           The BLM and Forest Service formally initiated Section 7 consultation with a letter to the  
11           USFWS on November 19, 2013, and requested concurrence on which species would require  
12           consideration during consultation. Over the ensuing months, regular meetings and  
13           coordination efforts were held to identify the species that would be analyzed in the biological  
14           assessment, address which actions could affect those species, and determine whether the  
15           implementation of the Proposed Plan “may affect” the species for which this consultation  
16           occurred.

17           In May 2015, the biological assessment was formally submitted to the USFWS for review  
18           (see **Appendix Y**, Biological Assessment). The USFWS will evaluate the biological  
19           assessment and either concur with the determination via memorandum or prepare a  
20           biological opinion. The USFWS response to this consultation process (either the  
21           memorandum or the biological opinion) will be included in the RODs.

22           **6.3.3 Native American Tribal Consultation**

23           In accordance with the National Historic Preservation Act and several other legal authorities  
24           (see BLM Manual 8120), and in recognition of the government-to-government relationship  
25           between individual tribes and the federal government, the BLM has initiated Native  
26           American consultation efforts related to preparation of this LUPA. In December 2011, the  
27           BLM sent letters to tribal governments providing initial notification of the LUPA and  
28           background information on the project, an invitation to be a cooperating agency, and  
29           notification of subsequent consultation efforts related to the planning process. These letters  
30           were sent to the following tribes located in Idaho or southwestern Montana or having  
31           cultural ties to areas with GRS habitat in the sub-region:

- 32           • Blackfoot Tribe of the Blackfoot Indian Reservation of Montana
- 33           • Coeur d’Alene Tribe
- 34           • Confederated Salish and Kootenai Tribes
- 35           • Eastern Shoshone Tribe
- 36           • Kootenai Tribe of Idaho
- 37           • Nez Perce Tribe

- 1 • Shoshone-Bannock Tribes
- 2 • Shoshone-Paiute Tribes

3 None of the tribes have agreed to become cooperating agencies. The Shoshone-Bannock  
4 and Shoshone-Paiute tribes requested regular briefings at key milestones during the planning  
5 process. Per their request, BLM staff provided early drafts of some project documents for  
6 their review and comment under the government-to-government relationship. Other tribes  
7 have requested to be kept informed as the LUPA/EIS is developed, so that they may have  
8 an opportunity to comment. The complete Proposed LUPA/FEIS was provided to the  
9 tribes concurrently with its release to the public. Government-to-government consultation  
10 will continue throughout the LUPA process to ensure that tribal groups' concerns are  
11 considered.

12 Under the proposed plan, all GRSG habitat would be retained under BLM and Forest  
13 Service management unless an exchange would result in a greater benefit to GRSG or their  
14 habitat. Lands would be available for exchange with no net loss of GRSG Key habitat within  
15 PHMA and IHMA and site-specific NEPA would be required for any future exchanges.  
16 Additional tribal consultation would occur during this site-specific NEPA to address tribal  
17 concerns and requests regarding specific parcels.

#### 18 **5.1.1 State Historic Preservation Officer Consultation**

19 As part of the NEPA scoping and consultation process, BLM and the Forest Service have  
20 notified the Idaho and Montana State Historic Preservation Officers and several Tribal  
21 Historic Preservation Officers of the proposed LUPA. However, full formal NHPA Section  
22 106 consultation is not called for at this time, as effects on historic properties cannot be  
23 determined until site-specific follow-on projects have been identified. The Section 106  
24 process will be completed at a later stage, during project proposal and design, and will  
25 include consultation with SHPOs, THPOs, Native American Tribes, and other interested  
26 parties. This process will be performed consistent with the alternative procedures BLM  
27 agreed to in a Programmatic Agreement with the Advisory Council on Historic Preservation  
28 and the National Conference of State Historic Preservation Officers. Any future actions not  
29 covered by the BLM's national Programmatic Agreement may require either (a) separate  
30 NHPA analysis, or (b) a separate Section 106 agreement.

#### 31 **5.1.2 US Environmental Protection Agency**

32 NEPA regulations require that EISs be filed with the US Environmental Protection Agency  
33 for review and comment (40 CFR 1506.9). The Idaho and Southwestern Montana Sub-  
34 region Draft LUPA/EIS was submitted to the US Environmental Protection Agency for  
35 review as required by CEQ regulations. The US Environmental Protection Agency provided  
36 comments on the Draft LUPA/EIS and rated the document Environmental Concerns –  
37 Insufficient Information (EC-2).

#### 38 **6.4 List of Preparers**

39 Table 6-6, List of Preparers, lists the name and project role of the individuals involved in the  
40 preparation of this document.

**Table 6-6  
List of Preparers**

<b>Name</b>	<b>Role/Responsibility</b>
<b>Bureau of Land Management</b>	
Brent Ralston	Idaho State Office Project Lead, special designations lead
Jon Beck	Idaho State Office Project Lead, mineral resources, special designations
John Thompson	Montana State Office Project Lead
Joe Adamski	Forestry
Kelly Bocking	GRSG, vegetation, livestock grazing, recreation and visitor services, comprehensive trail and travel management, lands and realty, mineral resources
Bryce Bohn	Air quality, soil resources, water resources
Connie Breckenridge	GIS
Brandon Brown	Wildland fire management
Glen Burkhardt	Air quality, wildland fire management
Tim Carrigan	Lands and realty
Rod Collins	GIS
Natalie Cooper	Lands and realty
Lynn Danly	Vegetation
Robin Fehlau	Visual resources, lands with wilderness characteristics, recreation and visitor services, comprehensive trail and travel management, special designations
Vince Guyer	GRSG, wild horse and burro
Kirk Halford	Cultural resources, paleontological resources
Lara Hannon	Vegetation
Jon Haupt	Livestock grazing
Sara Heide	Wildland fire management
Terry Heslin	Comprehensive trail and travel management
Scott Hoefler	Special status species, fish resources
Gloria Jakovac	Lands and Realty
Steve Jirik	Vegetation, wildland fire management
Brandon Knaption	Special status species
Kevin Knauth	Wildland fire management
Michael Kuyper	Vegetation, livestock grazing, mineral resources
Stephen Leonard	Wild horse and burro
Nika Lepak	Wild horse and burro, livestock grazing
Don Major	Vegetation, wildlife resources
Paul Makela	GRSG, special status species, wildlife resources, lands and realty
Clint McCarthy	Vegetation
Diane McConnaughey	GIS
Kelly Moore	Lands and realty
Karen Porter	Mineral resources
Kasey Prestwich	Lands and realty
Jesse Rawson	GRSG
Tom Rinkes	GRSG, wildlife resources
Chris Robbins	Livestock grazing
Bruce Schoeberl	Fish resources
Elena Shaw	Vegetation, livestock grazing

**Table 6-6  
List of Preparers**

<b>Name</b>	<b>Role/Responsibility</b>
Steve Shaw	Wildland fire management
Dick Todd	Lands and realty
Jason Wright	Vegetation, wildland fire management
Cheryle Zwang	Cultural resources
<b>Forest Service Nest Members</b>	
Rob Mickelsen	Idaho Project Lead, vegetation
Dustin Bambrough	Livestock grazing
Pam Bode	NEPA/planning
Chris Colt	Special status species, wildlife
Dale Harber	Minerals specialist
Kolleen Kralick	Cultural resources, Native American tribal interests
Tim Love	GIS
Tim Metzger	Wildland fire management
Cory Norman	Wildland fire management
David Reis	Comprehensive trails and travel management
<b>Consultant - EMPSi</b>	
Meredith Zaccherio	Project Manager, biological resources lead
Angie Adams	Special designations, wilderness characteristics
David Batts	Project Advisor
Constance Callahan	Quality Assurance, editing
Amy Cordle	Air quality
Annie Daly	Air quality, special designations, wilderness characteristics
Andrew Gentile	Soil resources, water resources
Zoe Ghali	Forestry, livestock grazing, wild horse and burro, wildland fire management
Peter Gower	Comprehensive trails and travel management, lands and realty, recreation and visitor services, visual resources
Brandon Jensen	Fish resources, wildlife resources
Matt Kluvo	Vegetation, forestry, paleontological resources
Kate Krebs	Visual resources
Laura Long	Technical editing
Carol-Anne Murray	Cultural resources, Native American tribal interests, paleontological resources
Katie Patterson	Minerals (coal, fluid minerals, locatable minerals, mineral materials, nonenergy leasable minerals)
Holly Prohaska	Livestock grazing, wild horse and burro
Marcia Rickey	GIS
Chad Ricklefs	Lands and realty
Cindy Schad	Word processing
Jordan Tucker	Soil resources, water resources
Drew Vankat	Wildland fire management, recreation and visitor services, comprehensive trails and travel management
Jennifer Whitaker	Minerals (coal, fluid minerals, locatable minerals, mineral materials, nonenergy leasable minerals)
Liza Wozniak	GRSG, special status species
<b>Consultant – ICF International</b>	

**Table 6-6**  
**List of Preparers**

<b>Name</b>	<b>Role/Responsibility</b>
Robert Fetter	Project Manager-Socioeconomics and Environmental Justice
Alex Uriarte	Socioeconomics and Environmental Justice Specialist
Elizabeth Kurz	Project Assistance
Alison Carey	Project Assistance

# Chapter 8

## Acronyms and Glossary

This Page Intentionally Blank

Administrative Draft  
Cooperating Agency Review

1 Chapter 8. Acronyms and Glossary

2 8.1 Acronyms

<u>Acronym</u>	<u>Full Phrase</u>
ACEC	area of critical environmental concern
AML	appropriate management level
AMP	allotment management plan
APD	application for permit to drill
APHIS	Animal and Plant Health Inspection Service
AQRV	air quality related values
ATV	all-terrain vehicle
AUM	animal unit-month
BAER	burn area emergency response
BDNF	Beaverhead-Deerlodge National Forest
BEA	Bureau of Economic Analysis
BER	baseline environmental report
BLM	United States Department of the Interior, Bureau of Land Management
BLS	Bureau of Labor Statistics
BMP	best management practices
BSU	Biologically Significant Unit
CA	conservation area
CEQ	Council on Environmental Quality
CFR	Code of Federal Regulations
CO	carbon monoxide
CO <sub>2</sub>	carbon dioxide
COA	condition of approval
COT	Conservation Objectives Team
CSU	controlled surface use
DFO	Dillon Field Office
DOI	United States Department of the Interior
EIS	environmental impact statement
EPA	United States Environmental Protection Agency
ESA	US Endangered Species Act of 1973
ESD	Ecological Side Description
ERMA	extensive recreation management area
ERS	USDA Economic Research Service
ESR	emergency stabilization and rehabilitation
°F	Fahrenheit degrees
FERC	Federal Energy Regulatory Commission

<u>Acronym</u>	<u>Full Phrase</u>
FLPMA	Federal Land Policy and Management Act of 1976
Forest Service	United States Department of Agriculture, Forest Service
FR	<i>Federal Register</i>
FRCC	fire regime condition class
FSH	Forest Service Handbook
FSM	Forest Service Manual
FY	fiscal year
GHMA	general habitat management area
GIS	geographic information system
GOA	goals, objectives, allocations and management actions
GPS	global positioning system
GRSG	greater sage-grouse
HA	herd area
HAF	Habitat Assessment Framework
HFC	hydroflourocarbon
HFR	hazardous fuels reduction program
HMA	herd management area
HMAP	habitat management area plan
IB	BLM Information Bulletin
IDFG	Idaho Department of Fish and Game
IHMZ	important habitat management area
IM	BLM Instruction Memorandum
IPCC	Intergovernmental Panel on Climate Change
KPLA	known phosphate leasing area
LRMP	land and resource management plan
LUP	land use plan
LUPA	land use plan amendment
LWG	local working group
MBF	thousand board feet
MFP	management framework plan
MFWP	Montana Fish, Wildlife, and Parks
MOU	memorandum of understanding
MZ	management zone
N <sub>2</sub> O	nitrous oxide
N/A	not applicable
NAAQS	National Ambient Air Quality Standards

<u>Acronym</u>	<u>Full Phrase</u>
NCA	National Conservation Area
NEPA	National Environmental Policy Act of 1969
NF	not functioning
NFMA	National Forest Management Act of 1976
NHPA	National Historic Preservation Act
NHT	National Historic Trail
NLCS	National Landscape Conservation System
NO <sub>2</sub>	nitrogen dioxide
NO <sub>x</sub>	nitrogen oxides
NOI	notice of intent
NPS	National Park Service
NRCS	United States Department of Agriculture Natural Resources Conservation Service
NREL	National Renewable Energy Laboratory
NRHP	National Register of Historic Places
NSO	no surface occupancy
NTT	Greater Sage-Grouse National Technical Team
OHV	off-highway vehicle
ONRR	Department of Interior, Office of Natural Resources Revenue
OSC	Idaho Office of Species Conservation
PAC	priority areas for conservation
PDF	preferred design feature
PECE	policy for evaluation of conservation efforts when making listing decisions
PFC	proper functioning condition
PGH	preliminary general habitat
PHMA	priority habitat management area
PILT	Payment in Lieu of Taxes
PM <sub>2.5</sub>	particulate matter with a diameter less than or equal to 2.5 microns
PM <sub>10</sub>	particulate matter with a diameter less than or equal to 10 microns
PPH	preliminary primary habitat
RDF	required design feature
RFDS	reasonable foreseeable development scenario
RFPA	Rangeland Fire Protection Association
RHMA	restoration habitat management area
RMP	resource management plan
ROD	record of decision
ROW	right-of-way
S&Gs	standards and guidelines
SDF	suggested design feature
SFA	Sagebrush Focal Area

<u>Acronym</u>	<u>Full Phrase</u>
SGMA	Sage-Grouse Management Area
SHPO	state historic preservation officer
SO <sub>2</sub>	sulfur dioxide
SRMA	special recreation management area
SRP	special recreation permit
SUA	special use authorization
TAT	technical assistance team
TCP	traditional cultural property
TL	timing limitation
TTM	travel and transportation management
UDWR	Utah Department of Wildlife Resources
US	United States
USC	United States Code
USDA	United States Department of Agriculture
USEPA	United States Environmental Protection Agency
USFWS	United States Department of the Interior, Fish and Wildlife Service
USGS	United States Geological Survey
VDDT	Vegetation Dynamics Development Tool
VOC	volatile organic compound
VRM	visual resource management
WAFWA	Western Association of Fish and Wildlife Agencies
WGFD	Wyoming Game and Fish Department
WSA	Wilderness Study Area
WUI	wildland-urban interface
ZA	zoological area

1       **8.2 Glossary**

2       **BLM and Forest Service terms will be combined as appropriate for the public FEIS**

3       **2008 WAFWA Sage-Grouse MOU:** A memorandum of understanding among Western  
4 Association of Fish and Wildlife Agencies, US Department of Agriculture, Forest Service,  
5 US Department of the Interior, Bureau of Land Management, US Department of the  
6 Interior, Fish and Wildlife Service, US Department of the Interior, Geological Survey, US  
7 Department of Agriculture, Natural Resources Conservation Service, and the US  
8 Department of Agriculture, Farm Service Agency. The purpose of the MOU is to provide  
9 for cooperation among the participating state and federal land, wildlife management and  
10 science agencies in the conservation and management of GRSG (*Centrocercus urophasianus*)  
11 sagebrush (*Artemisia* spp.) habitats and other sagebrush-dependent wildlife throughout the

1 western United States and Canada and a commitment of all agencies to implement the 2006  
2 WAFWA Conservation Strategy.

3 **2011 Partnership MOU:** An agreement among the United States Department of Agriculture  
4 Natural Resource Conservation Service, Forest Service, United State Department of the  
5 Interior, Bureau of Land Management, and Fish and Wildlife Service. This MOU is for range  
6 management, to implement NRCS practices on adjacent federal properties.

7 **Acquired lands:** Federal lands obtained by purchase, condemnation, exchange, or gift under  
8 laws other than public land laws. Legally defined as "... land obtained by the United States  
9 through purchase or transfer from a State or private individual and normally dedicated to a  
10 specific use." McKenna v. Wallis, 200 F. Supp. 468 (1961). See also Bobby Lee Moore, et al.,  
11 72 I.D. 505 (1965).

12 **Actual use:** The amount of animal unit months consumed by livestock based on the  
13 numbers of livestock and grazing dates submitted by the livestock operator and confirmed  
14 by periodic field checks by the BLM.

15 **Additionality:** The conservation benefits of compensatory mitigation are demonstrably new  
16 and would not have resulted without the compensatory mitigation project.

17 **Adjacent:** Installation of new linear improvements parallel, near, or next to existing linear  
18 improvements.

19 **Administrative access:** A term used to describe access for resource management and  
20 administrative purposes, such as fire suppression, cadastral surveys, permit compliance, law  
21 enforcement, and military in the performance of their official duty, or other access needed to  
22 administer BLM-managed or National Forest System lands or uses.

23 **Allotment management plan:** A concisely written program of livestock grazing  
24 management, including supportive measures if required, designed to attain specific, multiple-  
25 use management goals in a grazing allotment. An AMP is prepared in consultation with the  
26 permittees, lessees, and other affected interests. Livestock grazing is considered in relation to  
27 other uses of the range and to renewable resources, such as watershed, vegetation, and  
28 wildlife. An AMP establishes seasons of use, the number of livestock to be permitted, the  
29 range improvements needed, and the grazing system.

30 **Allotment:** An area of land in which one or more livestock operators graze their livestock.  
31 Allotments generally consist of BLM-administered lands but may include National Forest  
32 System lands or other federally managed, state-owned, or private lands. An allotment may  
33 include or more separate pastures. Livestock numbers and periods of use are specified for  
34 each allotment.

35 **Ambient (noise level):** Sometimes called background noise level, reference sound level, or  
36 room noise level is the background sound pressure level at a given location, normally  
37 specified as a reference level to study a new intrusive sound source.

1 **Animal unit month:** The amount of forage necessary for the sustenance of one cow or its  
2 equivalent for a period of one month (approximately 800 pounds of air-dried material per  
3 AUM).

4 **Anthropogenic disturbances:** Human-created features include paved highways, graded  
5 gravel roads, transmission lines, substations, wind turbines, oil and gas wells, geothermal  
6 wells and associated facilities, pipelines, landfills, agricultural conversion, homes, and mines.

7 **Appurtenant (minerals):** A piece of equipment (e.g., pump jack, separator, storage tank,  
8 compressor station, metering equipment) necessary for production.

9 **Area of critical environmental concern:** Special area designation established through the  
10 BLM's land use planning process (43 CFR 1610.7-2), where special management attention is  
11 needed to protect and prevent irreparable damage to important historical, cultural, or scenic  
12 values, fish and wildlife resources, or other natural systems or processes or to protect life  
13 and safety from natural hazards. The level of allowable use within an ACEC is established  
14 through the collaborative planning process. Designation of an ACEC allows for resource use  
15 limitations in order to protect identified resources or values.

16 **Associated settings:** The geographic extent of the resources, qualities, and values or  
17 landscape elements within the surrounding environment that influence the trail experience  
18 and contribute to resource protection. Settings associated with a National Scenic or Historic  
19 Trail include scenic, historic, cultural, recreation, natural (including biological, geological, and  
20 scientific), and other landscape elements (see resources, qualities, and values).

21 **Authorized/authorized use:** This is an activity (i.e., resource use) occurring on the public  
22 lands that is either explicitly or implicitly recognized and legalized by law or regulation. This  
23 term may refer to those activities occurring on the public lands for which the BLM, Forest  
24 Service, or other appropriate authority (e.g., Congress for RS 2477 rights-of-way, FERC for  
25 major interstate rights-of-way) has issued a formal authorization document (e.g., livestock  
26 grazing lease/permit, right-of-way grant, coal lease, or oil and gas permit to drill). Formally  
27 authorized uses can involve commercial and noncommercial activity, facility placement, or  
28 event. These formally authorized uses are often spatially or temporally limited. Unless  
29 constrained or bounded by statute, regulation, or an approved land use plan decision, legal  
30 activities involving public enjoyment and use of the public lands (e.g., hiking, camping, and  
31 hunting) require no formal BLM or Forest Service authorization.

32 **Avoidance/avoidance area:** These terms usually address mitigation of some activity (i.e.,  
33 resource use). Paraphrasing the CEQ Regulations (40 CFR 1508.20), avoidance means to  
34 circumvent or bypass an impact altogether by not taking a certain action, or parts of an  
35 action. Therefore, the term avoidance does not necessarily prohibit a proposed activity, but it  
36 may require the relocation of an action or the total redesign of an action to eliminate any  
37 potential impacts resulting from it.

1 **Avoidance mitigation:** Avoiding the impact altogether by not taking a certain action or  
2 parts of an action. (40 CFR 1508.20(a)) (e.g. may also include avoiding the impact by moving  
3 the proposed action to a different time or location).

4 **Baseline:** The pre-existing condition of a defined area and/or resource that can be  
5 quantified by an appropriate metric(s). During environmental reviews, the baseline is  
6 considered the affected environment that exists at the time of the review's initiation, and is  
7 used to compare predictions of the effects of the proposed action or a reasonable range of  
8 alternatives.

9 **Best management practices:** A suite of techniques that guide or may be applied to  
10 management actions to aid in achieving desired outcomes. BMPs are often developed in  
11 conjunction with land use plans, but they are not considered a planning decision unless the  
12 plans specify that they are mandatory.

13 **Biologically significant unit:** A geographical/spatial area within GRSG habitat that  
14 contains relevant and important habitats that is used as the basis for comparative calculations  
15 to support evaluation of changes to habitat. A biologically significant unit or subset of the  
16 unit is used in the calculation of the anthropogenic disturbance threshold and in the adaptive  
17 management habitat trigger.

18 The biologically significant unit is defined as:

- 19 • Idaho: All of the modeled nesting and delineated winter habitat, based on 2012 data,  
20 within priority and/or important habitat management areas within a Conservation  
21 Area.
- 22 • Montana: All of the priority and sagebrush focal management areas.

23 **Candidate species:** Species for which the US Fish and Wildlife Service has sufficient  
24 information on their status and threats to support proposing them for listing as endangered  
25 or threatened under the Endangered Species Act but for which issuance of a proposed rule  
26 is currently precluded by higher priority listing actions. Separate lists for plants, vertebrate  
27 animals, and invertebrate animals are published periodically in the *Federal Register* (from  
28 M6840, Special Status Species Manual).

29 **Casual use:** Activities ordinarily resulting in no or negligible disturbance of the public lands,  
30 resources, or improvements. For examples of rights-of-way, see 43 CFR 2801.5; for  
31 examples of locatable minerals, see 43 CFR 3809.5.

32 **Condition of approval:** Requirement under which an application for a permit to drill or  
33 sundry notice is approved.

34 **Checkerboard:** This term refers to a landownership pattern of alternating sections of  
35 federal owned lands with private or state-owned lands for 20 miles on either side of a land  
36 grant railroad (e.g., Union Pacific and Northern Pacific). On land status maps this alternating

1 ownership is either delineated by color coding or alphabetic code resulting in a checkerboard  
2 pattern.

3 **Cherry-stemmed/cherry-stemming:** This term refers to a narrow, linear, intrusion, or  
4 extrusion of a delineated block of federal lands resulting in what appears on a map as a  
5 boundary inlet or peninsula. Although this term may be used in any resource program, the  
6 most common use is in relation to dead-end road intrusions along WSA boundaries.

7 **Co-locate:** Installation of new linear improvements in or on existing linear improvements.

8 **Communication tower site:** Sites that include broadcast types of uses (e.g., television,  
9 AM/FM radio, cable television, broadcast translator) and non-broadcast uses (e.g.,  
10 commercial or private mobile radio service, cellular telephone, microwave, local exchange  
11 network, passive reflector).

12 **Compensatory mitigation:** Compensating for the residual impact of a certain action or  
13 parts of an action by replacing or providing substitute resources or environments. (40 CFR  
14 1508.20)

15 **Compensatory mitigation projects:** The restoration, creation, enhancement, and/or  
16 preservation of impacted resources (adopted and modified from 33 CFR 332), such as on-  
17 the-ground actions to improve and/or protect habitats (e.g. chemical vegetation treatments,  
18 land acquisitions, conservation easements).

19 **Compensatory mitigation sites:** The durable areas where compensatory mitigation  
20 projects will occur.

21 **Condition of approval:** A site-specific and enforceable requirement included in an  
22 approved application for permit to drill or sundry notice that may limit or amend the specific  
23 actions proposed by the operator. Conditions of approval minimize, mitigate, or prevent  
24 impacts on resource values or other uses of public lands.

25 **Conservation area:** Areas determined to be necessary to monitor population objectives to  
26 evaluate the disturbance density and adaptive regulatory triggers and engage adaptive  
27 management responses. Conservation Areas may contain priority, important, and general  
28 habitat management areas and sagebrush focal areas. Specifically, these areas are Mountain  
29 Valleys, Desert, West Owyhee, and Southern and Southwestern Montana.

30 **Conservation Plan:** The recorded decisions of a landowner or operator, cooperating with a  
31 conservation district, on how the landowner or operator plans, within practical limits, to use  
32 his or her land according to its capability and to treat it according to its needs for  
33 maintenance or improvement of the soil, water, animal, plant, and air resources.

34 **Conservation measures:** Undertakings to conserve, enhance, or restore GRSG habitat by  
35 reducing, eliminating, or minimizing threats to that habitat.

1 **Controlled surface use:** CSU is a category of moderate constraint stipulations that allows  
2 some use and occupancy of public land, while protecting identified resources or values. A  
3 CSU stipulation allows the BLM or Forest Service to require special operational constraints,  
4 or the surface-disturbing activity can be shifted to protect the specified resource or value.

5 **Cooperating agency:** Assists the lead federal agency in developing an environmental  
6 assessment or environmental impact statement. This can be any agency with jurisdiction by  
7 law or special expertise for proposals covered by NEPA (40 CFR 1501.6). Any tribe or  
8 federal, state, or local government jurisdiction with such qualifications may become a  
9 cooperating agency by agreement with the lead agency.

10 **Council on Environmental Quality:** An advisory council to the President of the United  
11 States established by the National Environmental Policy Act of 1969. It reviews federal  
12 programs to analyze and interpret environmental trends and information.

13 **Cultural resources:** Locations of human activity, occupation, or use. Cultural resources  
14 include archaeological, historic, or architectural sites, structures, or places with important  
15 public and scientific uses and locations of traditional cultural or religious importance to  
16 specified social or cultural groups.

17 **Cumulative effects:** The direct and indirect effects of a proposed project alternative's  
18 incremental impacts when they are added to other past, present, and reasonably foreseeable  
19 actions, regardless of who carries out the action.

20 **Decision area:** Lands and federal mineral estate within the planning area that are  
21 administered by the BLM and Forest Service.

22 **Deferred/deferred use:** To set-aside, or postpone, a particular resource use or activity on  
23 the public lands to a later time. Generally when this term is used, the period of the deferral is  
24 specified. Deferments sometimes follow the sequence timeframe of associated serial actions  
25 (e.g., action B will be deferred until action A is completed).

26 **Designated roads and trails:** Specific roads and trails identified by the BLM (or other  
27 agencies) where some type of motorized vehicle use is appropriate and allowed, either  
28 seasonally or year-long (H-1601-1, BLM Land Use Planning Handbook).

29 **Disruptive activities:** Land resource uses/activities that are likely to alter the behavior,  
30 displace, or cause excessive stress to GRSG populations occurring at a specific location  
31 and/or time. Actions that alter behavior or cause the displacement of individuals such that  
32 reproductive success is negatively affected, or an individual's physiological ability to cope  
33 with environmental stress is compromised.

34 **Diversity (species):** The number, distribution, and geographic ranges of plant and animal  
35 species including focal species and species-at-risk.

36 **Durable (protective and ecological) (Forest Service):** The administrative, legal, and  
37 financial assurances that secure and protect the conservation status of a compensatory

1 mitigation site, and the ecological benefits of a compensatory mitigation project, for at least  
2 as long as the associated impacts persist.

3 **Durability (protective and ecological) (BLM):** The maintenance of the effectiveness of a  
4 mitigation site and project for the duration of the associated impacts, which includes  
5 resource, administrative/legal, and financial considerations.

6 **Ecological site:** A distinctive kind of land with specific physical characteristics that differs  
7 from other kinds of land in its ability to produce a distinctive kind and amount of vegetation.

8 **Emergency Use:** These are activities occurring on the public lands outside the scope of  
9 normal resource use and operations and that require immediate attention. Emergency use  
10 activities are typically driven by imminent concerns for human health and safety or  
11 protection of property (e.g., wildfire suppression, HAZMAT response, and disease  
12 outbreaks). Emergency use is typically exempted from other land use restrictions, with the  
13 exercise of reasonable and prudent care.

14 **Endangered species:** Any species that is in danger of extinction throughout all or a  
15 significant portion of its range and is so designated by the Secretary of Interior, in  
16 accordance with the 1973 Endangered Species Act.

17 **Enhance:** The improvement of habitat by increasing missing or modifying unsatisfactory  
18 components and/or attributes of the habitat (e.g., road commissioning) to meet GRSG  
19 objectives.

20 **Environmental impact statement:** A detailed written statement required by the National  
21 Environmental Policy Act when an agency proposes a major federal action significantly  
22 affecting the quality of the human environment.

23 **Exception (minerals):** A case-by-case exemption from a lease stipulation. The stipulation  
24 continues to apply to all other sites within the leasehold to which the restrictive criteria  
25 apply. The authorized officer (e.g., any employee of the Forest Service to whom has been  
26 delegated the authority to perform the duties described in the applicable Forest Service  
27 manual or handbook) may grant an exception if an environmental record of review  
28 determines that the action, as proposed or conditioned, would not impair the function or  
29 utility of the site for the current or subsequent seasonal habitat, life-history, or behavioral  
30 needs of GRSG.

31 **Exclusion area:** An area on the public lands where a certain activity is prohibited to ensure  
32 protection of other resources on the site. The term is frequently used in reference to lands  
33 and realty actions and proposals (e.g., rights-of-way), but it is not unique to lands and realty  
34 activities. This restriction is functionally analogous to the phrase “no surface occupancy”  
35 used by the oil and gas program and is applied as an absolute condition to those affected  
36 activities. The less restrictive analogous term is avoidance area.

1 **Exploration:** Active drilling and geophysical operations to determine the presence of the  
2 mineral resource or to determine the extent of the reservoir or mineral deposit.

3 **Feasible:** See technically/economically feasible.

4 **Federal Land Policy and Management Act of 1976 (FLPMA):** Public Law 94-579, which  
5 gives the BLM legal authority to establish public land policy, to establish guidelines for  
6 administering such policy, and to provide for management, protection, development, and  
7 enhancement of the public land.

8 **Federal mineral estate:** Subsurface mineral estate owned by the United States and  
9 administered by the BLM. Federal mineral estate under BLM jurisdiction is composed of  
10 mineral estate underlying BLM-administered lands, privately owned lands, and state-owned  
11 lands

12 **Fire suppression:** All activities connected with fire extinguishing operations, beginning with  
13 discovery of a fire and continuing until the fire is completely out.

14 **Fluid minerals:** Oil, gas, coal bed natural gas, and geothermal resources.

15 **Forage:** All browse and herbaceous foods that are available to grazing animals.

16 **Forage reserve:** An area that is set aside for use as needed by various permittees who might  
17 be displaced by wildfire, ESR, restoration efforts, etc. rather than having a term permit  
18 issued for grazing like a regular allotment.

19 **Free flowing:** Existing or flowing in natural condition without impoundment, diversion,  
20 straightening, riprapping, or other modification of the waterway (Section 16[b] of the Wild  
21 and Scenic Rivers Act). Designation of a wild and scenic river does not depend on the river  
22 being “naturally flowing,” (i.e., flowing without any man-made upstream or downstream  
23 manipulation). The presence of impoundments above or below the segment (including those  
24 that may regulate flow regimes within the segment) and existing minor dams or diversion  
25 structures within the study area do not necessarily render a river segment noneligible. There  
26 are segments in the national system that are downstream from major dams or located  
27 between dams.

28 **Enhance:** The improvement of habitat by increasing missing or modifying unsatisfactory  
29 components or attributes of the plant community to meet GRSG objectives.

30 **General Habitat Management Area:** Occupied (seasonal or year-round) habitat outside of  
31 priority habitat management areas and sagebrush focal areas. It includes a few active leks and  
32 fragmented or marginal habitat, such as two isolated populations of GRSG in the East Idaho  
33 Uplands and West Central Idaho. These areas have been identified by the BLM and Forest  
34 Service in coordination with respective state wildlife agencies.

35 **Grazing system:** Scheduled grazing use and nonuse of an allotment to reach identified goals  
36 or objectives by improving the quality and quantity of vegetation. This includes, but is not

1 limited to, developing pastures, utilization levels, grazing rotations, timing and duration of  
2 use periods, and necessary range improvements.

3 **Guideline (Forest Service):** A constraint on project and activity decisionmaking that allows  
4 for departure from its terms, so long as the purpose of the guideline is met. (§ 219.15(d)(3)).  
5 Guidelines are established to help achieve or maintain a desired condition or conditions, to  
6 avoid or mitigate undesirable effects, or to meet applicable legal requirements. (36 CFR  
7 219.7(e)(1)(iv); FSH 1909.12, Chapter 20)

8 **Habitat:** An environment that meets a specific set of physical, biological, temporal, or  
9 spatial characteristics that satisfy the requirements of a plant or animal species or group of  
10 species for part or all of their life cycle.

11 **Hard triggers:** Thresholds indicating that immediate action is necessary to stop a severe  
12 deviation from GRSG conservation objectives set forth in the land and resources  
13 management plan.

14 **High-voltage transmission line:** An electrical power line that is 100 kilovolts or larger.

15 **Holder:** An individual or entity that holds a valid special use authorization.

16 **Impact:** The effect, influence, alteration, or imprint caused by an action.

17 **Important Habitat Management Area:** High value habitat and populations that provide a  
18 management buffer for the priority habitat management areas and sagebrush focal areas and  
19 connect patches of priority habitat management areas and sagebrush focal areas. The areas  
20 encompass areas of generally moderate to high conservation value habitat and/or  
21 populations and, in some conservation areas, include areas beyond those identified by  
22 USFWS as necessary to maintain redundant, representative, and resilient populations. The  
23 areas are typically adjacent to priority habitat management areas and sagebrush focal areas  
24 but generally reflect somewhat lower GRSG population status and/or reduced habitat value  
25 due to disturbance, habitat fragmentation, or other factors. No important habitat  
26 management areas are designated within the southwestern Montana conservation area.

27 **Incompatible use:** An activity that affects (hinders or obstructs) the nature and purposes of  
28 a designated National Trail (see substantial interference).

29 **Indicators:** Factors that describe resource condition and change and can help the BLM and  
30 the Forest Service determine trends over time.

31 **Integrated ranch planning:** A method for ranch planning that takes a holistic look at all  
32 elements of the ranching operations, including strategic and tactical planning, rather than  
33 approaching planning as several separate enterprises.

34 **Isolated parcel:** An individual parcel of land that may share a corner, but does not have a  
35 common border with another parcel.

1 **Invasive species (invasive plant species, invasives):** An alien species whose introduction  
2 does or is likely to cause economic or environmental harm or harm to human health. The  
3 species must cause, or be likely to cause, harm, and be exotic to the ecosystem it has infested  
4 before considered invasive.

5 **Land-locked:** This term refers to the situation when any parcel of private, state, or federal  
6 land has no legal access without crossing another ownership due to the existing land  
7 ownership pattern.

8 **Landscape:** A distinct association of land types that exhibit a unique combination of local  
9 climate, landform, topography, geomorphic process, surficial geology, soil, biota, and human  
10 influences. Landscapes are generally of a size that the eye can comprehend in a single view.

11 **Land tenure adjustment:** This term refers to a change in landownership patterns, or legal  
12 status, to improve their administrative manageability and their usefulness to the public.

13 **Late brood rearing area:** Habitat includes mesic sagebrush and mixed shrub communities,  
14 wet meadows, and riparian habitats, as well as some agricultural lands (e.g., alfalfa fields).

15 **Lease:** A type of special use authorization (usually granted for uses other than linear rights-  
16 of-way) that is used when substantial capital investment is required and when conveyance of  
17 a conditional and transferable interest in BLM-administered or National Forest System lands  
18 is necessary or desirable to serve or facilitate authorized long-term uses, and that may be  
19 revocable and compensable according to its terms.

20 **Leasable minerals:** Those minerals or materials designated as leasable under the Mineral  
21 Leasing Act of 1920. These include energy-related mineral resources such as oil, natural gas,  
22 coal, and geothermal, and some non-energy minerals, such as phosphate, sodium, potassium,  
23 and sulfur. Geothermal resources are also leasable under the Geothermal Steam Act of 1970.

24 **Lessee:** A person or entity authorized to use and occupy National Forest System land under  
25 a specific instrument identified as a lease. Forest special use leases are limited to authorize  
26 certain wireless communication uses. Leases are also used for certain mineral leasable  
27 activities.

28 **Lek:** A traditional courtship display area attended by male GRSG in or next to sagebrush-  
29 dominated habitat. A lek is designated based on observations of two or more male GRSG  
30 engaged in courtship displays. For management purposes, leks with less than five males  
31 observed strutting should be confirmed active for two years to meet the definition of a lek  
32 (Connelly et al. 2000; Connelly et al. 2003, 2004). Each state may have a slightly different  
33 definition of lek, active lek, inactive lek, occupied lek, and unoccupied leks. Regional  
34 planning will use the appropriate definition provided by the state of interest.

35 **Lek complex:** A lek or group of leks within 2.5 kilometers (1.5 miles) of each other between  
36 which male GRSG may interchange from one day to the next. Fidelity to leks has been well  
37 documented. Visits to multiple leks are most common among yearlings and less frequent for  
38 adult males, suggesting an age-related period of establishment (Connelly et al. 2004).

1       **Lek, active:** Any lek that has been attended by male GRSG during the strutting season.

2       **Lek, inactive:** Any lek where sufficient data suggests that there was no strutting activity  
3 throughout a strutting season. Absence of strutting GRSG during a single visit is insufficient  
4 documentation to establish that a lek is inactive. This designation requires documentation of  
5 one of the following scenarios:

- 6           • An absence of GRSG on the lek during at least two ground surveys separated by  
7 at least seven days. These surveys must be conducted under ideal conditions  
8 (April 1-May 7 or other appropriate date based on local conditions), no  
9 precipitation, light or no wind, half-hour before sunrise to one hour after  
10 sunrise).
- 11           • A ground check of the exact known lek site late in the strutting season (after  
12 April 15) that fails to find any sign (tracks, droppings, feathers) of strutting  
13 activity. Data collected by aerial surveys should not be used to designate inactive  
14 status as the aerial survey may actually disrupt activities.

15       **Lek, occupied:** A lek that has been active during at least one strutting season within the  
16 prior 10 years.

17       **Lek, unoccupied:** A lek that has either been destroyed or abandoned.

18       **Lek, destroyed:** A formerly active lek site and surrounding sagebrush habitat that has been  
19 destroyed and is no longer suitable for GRSG breeding.

20       **Lek, abandoned:** A lek in otherwise suitable habitat that has not been active for 10  
21 consecutive years. To be designated abandoned, a lek must be inactive (see above criteria) in  
22 at least four nonconsecutive strutting seasons spanning the 10 years. The site of an  
23 abandoned lek should be surveyed at least once every 10 years to determine whether it has  
24 been reoccupied by GRSG.

25       **Locatable minerals:** Mineral disposable under the General Mining Act of 1872, as  
26 amended, that was not excepted in later legislation. They include hardrock, placer, industrial  
27 minerals, and uncommon varieties of rock found on public domain lands.

28       **Major pipeline:** A pipeline that is 24 inches or more in outside-pipe diameter (Mineral  
29 Leasing Act of 1920 30 U.S.C. § 181; 36 CFR 251.54(f)(1)).

30       **Master development plans:** A set of information common to multiple planned wells,  
31 including drilling plans, surface use plans of operations, and plans for future production.

32       **Mineral:** Any naturally formed inorganic material, solid or fluid inorganic substance that can  
33 be extracted from the earth, any of various naturally occurring homogeneous substances (as  
34 stone, coal, salt, sulfur, sand, petroleum, water, or natural gas) obtained for human use,  
35 usually from the ground. Under federal laws, considered as locatable (subject to the general

1 mining laws), leasable (subject to the Mineral Leasing Act of 1920), and salable (subject to  
2 the Materials Act of 1947).

3 **Mineral materials (salable minerals):** Common varieties of sand, stone, pumice, gravel,  
4 and clay that are not obtainable under the mining or leasing laws but that can be acquired  
5 under the Materials Act of 1947, as amended. In accordance with regulations in 43 CFR Part  
6 3600, the BLM sells mineral materials to the public at fair market value but gives them free  
7 to states, counties, or other government entities for public projects. Disposal of mineral  
8 materials is subject to conformance with all applicable laws and BLM policy in BLM  
9 Handbook H-3600-1.

10 **Mining claim:** A parcel of land that a miner takes and holds for mining purposes, having  
11 acquired the right of possession by complying with the Mining Law and local laws and rules.  
12 A mining claim may contain as many adjoining locations as the locator may make or buy.  
13 There are four categories of mining claims: lode, placer, mill site, and tunnel site.

14 **Minimization mitigation:** Minimizing impacts by limiting the degree or magnitude of the  
15 action and its implementation. (40 CFR 1508.20 (b))

16 **Mitigation:** Includes specific means, measures, or practices that could reduce, avoid, or  
17 eliminate adverse impacts. Mitigation can include avoiding the impact altogether by not  
18 taking a certain action or parts of an action, minimizing the impact by limiting the degree of  
19 magnitude of the action and its implementation, rectifying the impact by repairing,  
20 rehabilitating, or restoring the affected environment, reducing or eliminating the impact over  
21 time by preservation and maintenance operations during the life of the action, and  
22 compensating for the impact by replacing or providing substitute resources or environments.

23 **Modification (oil and gas):** A fundamental change to the provisions of a lease stipulation,  
24 either temporarily or for the term of the lease. A modification may include an exemption  
25 from or alteration to a stipulated requirement. Depending on the specific modification, the  
26 stipulation may or may not apply to all other sites within the leasehold to which the  
27 restrictive criteria applied.

28 **Monitoring (plan monitoring):** The process of tracking the implementation of land use  
29 plan decisions and collecting and assessing data necessary to evaluate the effectiveness of  
30 land use planning decisions.

31 **National Conservation Area:** Area designated by Congress, generally to conserve, protect,  
32 enhance, and properly manage the resources and values for which it was designated for the  
33 benefit and enjoyment of present and future generations.

34 **National Historic Trail:** A congressionally designated trail that is an extended, long-  
35 distance trail, not necessarily managed as continuous, that follows as closely as possible and  
36 practicable the original trails or routes of travel of national historic significance. The purpose  
37 of a National Historic Trail is the identification and protection of the historic route and the  
38 historic remnants and artifacts for public use and enjoyment. A National Historic Trail is

1 managed in a manner to protect the nationally significant resources, qualities, values, and  
2 associated settings of the areas through which such trails may pass, including the primary use  
3 or uses of the trail (BLM Manual 6250, NHT Administration).

4 **National Monument:** Area designated by the president of the United States by  
5 proclamation, in accordance with the Antiquities Act of 1906, for the protection of objects  
6 of historical or scientific interest, or by Congress for the conservation, protection,  
7 restoration, or enhancement of the resources, objects, and values for which it was  
8 designated.

9 **Native plant species:** Species that were found here before European settlement, and  
10 consequently are in balance with these ecosystems because they have well developed  
11 parasites, predators, and pollinators.

12 **Nature and purposes:** The term used to describe the character, characteristics, and  
13 congressional intent for a designated National Trail, including the resources, qualities, values,  
14 and associated settings of the areas through which such trails may pass; the primary use or  
15 uses of a National Trail; and activities promoting the preservation of, public access to, travel  
16 within, and enjoyment and appreciation of National Trails.

17 **Net conservation gain:** The actual benefit or gain above baseline conditions.

18 **No surface occupancy:** A major constraint where use or occupancy of the land surface for  
19 fluid mineral exploration or development and surface-disturbing activities is prohibited to  
20 protect identified resource values. Areas identified as NSO are open to fluid mineral leasing,  
21 but surface-disturbing activities cannot be conducted on the surface of the land. Access to  
22 fluid mineral deposits would require directional drilling from outside the boundaries of the  
23 NSO. NSO areas are treated as avoidance areas for rights-of-way; no rights-of-way would be  
24 granted in NSO areas unless there were no feasible alternatives. The NSO stipulation  
25 includes stipulations that may be worded as “No Surface Use/Occupancy,” “No Surface  
26 Disturbance,” “Conditional NSO,” or “Surface Disturbance or Surface Occupancy  
27 Restriction (by location).”

28 **Notice-level mining activities:** To qualify for a notice the mining activity must 1)  
29 constitute exploration, 2) not involve bulk sampling of more than 1,000 tons of presumed  
30 ore, 3) must not exceed five acres of surface disturbance, and 4) must not occur in one of  
31 the special category lands listed in 43 CFR 3809.11(c). The notice is to be filed in the BLM  
32 field office with jurisdiction over the land involved. The notice does not need to be on a  
33 particular form but must contain the information required by 43 CFR 3809.301(b).

34 **Old-growth juniper:** Characterized by rounded tops and spreading canopies, often  
35 containing dead limbs and/or spike tops, large branches near the base of the tree, as well as  
36 furrowed, fibrous bark, and are typically host to arboreal lichens. Leader growth in the upper  
37 quarter of the tree is usually less than one inch. These trees are generally distributed on rock  
38 outcrop or rubble land soils, or other soils with coarse fragments in the soil-surface and/or

1 slopes over 12-25%, where juniper vegetation type is the climax plant community (Miller et  
2 al 2005; USDI and USGS 2007).

3 **Off-highway vehicle:** Any motorized vehicle capable of, or designed for, travel on or  
4 immediately over land, water, or other natural terrain, excluding (1) any nonamphibious  
5 registered motorboat, (2) any military, fire, emergency, or law enforcement vehicle while  
6 being used for emergency purposes, (3) any vehicle whose use is expressly authorized by the  
7 authorized officer or otherwise officially approved, (4) vehicles in official use, and (5) any  
8 combat or combat support vehicle when used for national defense (H-1601-1, BLM Land  
9 Use Planning Handbook).

10 **Off-site mitigation:** Compensating for resource impacts by replacing or providing  
11 substitute resources or habitat at a different location than the project area.

12 **Outstandingly remarkable values:** Values among those listed in Section 1(b) of the Wild  
13 and Scenic Rivers Act: “scenic, recreational, geological, fish and wildlife, historical, cultural,  
14 or other similar values.” Other values that may be considered include ecological, biological  
15 or botanical, paleontological, hydrological, traditional cultural uses, water quality, and  
16 scientific values. The Wild and Scenic Rivers Act does not further define outstandingly  
17 remarkable values. Agency resource professionals develop and interpret criteria in evaluating  
18 river values (unique, rare, or exemplary) based on professional judgment on a regional,  
19 physiographic, or geographic comparative basis.

20 **Patent:** A grant made to an individual or group conveying fee simple title to selected public  
21 lands.

22 **Permit:** A special use authorization that provides permission, without conveying an interest  
23 in land, to occupy and use National Forest System land or facilities for specified purposes,  
24 and which is both revocable and terminable.

25 **Permittee:** A person or company permitted to graze livestock on public land.

26 **Persistent woodlands:** Long-lived pinyon-juniper woodlands that typically have sparse  
27 understories and occur on poor substrates in the assessment area.

28 **Plan of operations:** A Plan of Operation is required for all mining activity conducted under  
29 the General Mining Act of 1872, as amended, if the proposed operations will likely cause  
30 significant disturbance of surface resources. The Plan of Operation describes the type of  
31 operations proposed and how they would be conducted, the type and standard of existing  
32 and proposed roads or access routes, the means of transportation to be used, the period  
33 during which the proposed activity will take place, and measures to be taken to meet the  
34 requirements for environmental protection (36 CR 228.4).

35 **Policy:** This is a statement of guiding principles, or procedures, designed and intended to  
36 influence planning decisions, operating actions, or other affairs of the BLM or Forest  
37 Service. Policies are established interpretations of legislation, executive orders, regulations, or  
38 other presidential, secretarial, or management directives.

1 **Prescribed fire:** Any fire ignited by management actions to meet specific objectives. A  
2 written, approved prescribed fire plan must exist and NEPA requirements, where applicable,  
3 must be met before ignition.

4 **Primary use or uses:** Authorized mode or modes of travel, or activities identified in the  
5 National Trails System Act, enabling legislation, or legislative history, through the trailwide  
6 comprehensive plan or approved resource management plan.

7 **Primitive Road (BLM definition):** A linear route managed for use by four-wheel drive or  
8 high clearance vehicles. Primitive roads do not normally meet any BLM road design  
9 standards.

10 **Priority Habitat Management Areas:** Areas that have been identified as having the  
11 highest conservation value to maintaining sustainable GRSG populations. These areas would  
12 include breeding, late brood-rearing, and winter concentration areas. The BLM and Forest  
13 Service have identified these areas in coordination with respective state wildlife agencies.

14 **Public domain:** The term applied to any or all of those areas of land ceded to the federal  
15 government by the original states and to such other lands as were later acquired by treaty,  
16 purchase, or cession and are disposed of only under the authority of Congress.

17 **Range improvement:** Any activity, structure, or program on or relating to rangelands that  
18 is designed to improve production of forage, change vegetative composition, control  
19 patterns of use, provide water, stabilize soil and water conditions, and provide habitat for  
20 livestock and wildlife. The term includes structures, treatment projects, and use of  
21 mechanical means to accomplish the desired results.

22 **Reclamation:** The suite of actions taken within an area affected by human disturbance, the  
23 outcome of which is intended to change the condition of the disturbed area to meet  
24 predetermined objectives or make it acceptable for certain defined resources (e.g., wildlife  
25 habitat, grazing, and ecosystem function).

26 **Reclamation plans:** Plans that guide the suite of actions taken within an area affected by  
27 human disturbance, the outcome of which is intended to change the condition of the  
28 disturbed area to meet pre-determined objectives and/or make it acceptable for certain  
29 defined resources (e.g., wildlife habitat, grazing, ecosystem function, etc.).

30 **Reference state:** The state where the functional capacities represented by soil/site stability,  
31 hydrologic function, and biotic integrity are performing at an optimum level under the  
32 natural disturbance regime. This state usually includes what is often referred to as the  
33 potential natural plant community.

34 **Required design features:** Required Design Features (RDFs) are required for certain  
35 activities in all GRSG habitat. RDFs establish the minimum specifications for certain  
36 activities to help mitigate adverse impacts. However, the applicability and overall  
37 effectiveness of each RDF cannot be fully assessed until the project level when the project

1 location and design are known. Because of site-specific circumstances, some RDFs may not  
2 apply to some projects (e.g., a resource is not present on a given site) and/or may require  
3 slight variations (e.g., a larger or smaller protective area). All variations in RDFs would  
4 require that at least one of the following be demonstrated in the NEPA analysis associated  
5 with the project/activity:

- 6 • A specific RDF is documented to not be applicable to the site-specific conditions of  
7 the project/activity (e.g. due to site limitations or engineering considerations).  
8 Economic considerations, such as increased costs, do not necessarily require that an  
9 RDF be varied or rendered inapplicable;
- 10 • An alternative RDF is determined to provide equal or better protection for GRSG or  
11 its habitat;
- 12 • A specific RDF will provide no additional protection to GRSG or its habitat.

13 **Residual impacts:** Impacts from an implementation-level decision that remain after  
14 applying avoidance and minimization mitigation; also referred to as unavoidable impacts.

15 **Resource management plan:** A land use plan as prescribed by the Federal Land Policy and  
16 Management Act that establishes, for a given area of land, land-use allocations, coordination  
17 guidelines for multiple-use, objectives, and actions to be achieved.

18 **Resources, qualities, and values:** The significant scenic, historic, cultural, recreation,  
19 natural (including biological, geological, and scientific), and other landscape areas through  
20 which trails may pass, as identified in the National Trails System Act (see associated settings).

21 **Restoration:** Implementation of a set of actions that promotes plant community diversity  
22 and structure that allows plant communities to be more resilient to disturbance and invasive  
23 species over the long term. The long-term goal is to create functional high quality habitat  
24 that is occupied by GRSG. The short-term goals may be to restore the landform, soils, and  
25 hydrology and to increase the percentage of preferred vegetation, seeding of desired species,  
26 or treatment of undesired species.

27 **Restriction/restricted use:** A limitation or constraint on public land uses and operations.  
28 Restrictions can be of any kind, but most commonly apply to certain types of vehicle use,  
29 temporal or spatial constraints, or certain authorizations.

30 **Right-of-way:** Land authorized to be used or occupied for the construction, operation,  
31 maintenance, and termination of a project or facility passing over, upon, under or through  
32 such land.

33 **Road (BLM definition):** A linear route declared a road by the owner, managed for use by  
34 low-clearance vehicles having four or more wheels, and maintained for regular and  
35 continuous use.

1 **Road or trail (Forest Service definition):** A road or trail wholly or partly within or  
2 adjacent to and serving the National Forest System that the Forest Service determines is  
3 necessary for the protection, administration, and utilization of the National Forest System  
4 and the use and development of its resources.

5 **Roadless area:** Designated Forest Service-administered lands with wilderness attributes.  
6 The Forest Service restricts activities, such as road construction and reconstruction, timber  
7 cutting, and mineral activities to various degrees in order to protect roadless areas.

8 **Sagebrush Focal Area:** Areas identified by the USFWS that that represent recognized  
9 “strongholds” for GRSG that have been noted and referenced by the conservation  
10 community as having the highest densities of GRSG and other criteria important for the  
11 persistence of GRSG.

12 **Season of use:** The time during which livestock grazing is permitted on a given range area,  
13 as specified in the grazing lease.

14 **Soft triggers:** An intermediate threshold indicating that management changes are needed at  
15 the implementation level to address habitat or population losses.

16 **Special recreation management area:** Administrative units where the existing or proposed  
17 recreation opportunities and recreation setting characteristics are recognized for their unique  
18 value, importance, or distinctiveness, especially compared to other areas used for recreation.

19 **Special recreation permits:** Authorizations that allow for recreation on public lands and  
20 related waters. Issued as a means to control visitor use, protect recreational and natural  
21 resources, and provide for the health and safety of visitors. Commercial special recreation  
22 permits also are issued as a mechanism to provide a fair return for the commercial use of  
23 public lands.

24 **Special status species:** Includes proposed species, listed species, and candidate species  
25 under the ESA; also, state-listed species and BLM State Director-designated sensitive species  
26 (BLM Manual 6840, Special Status Species Management).

27 **Special use authorization:** A written permit, term permit, lease, or easement that  
28 authorizes use or occupancy of National Forest System lands and specifies the terms and  
29 conditions under which the use or occupancy may occur.

30 **Split estate:** Circumstance where the surface of a particular parcel of land is owned by a  
31 different party than the minerals underlying the surface. Split estates may have any  
32 combination of surface/subsurface owners: federal/state, federal/private, state/private, or  
33 percentage ownerships. When referring to the split estate ownership on a particular parcel of  
34 land, it is generally necessary to describe the surface/subsurface ownership pattern of the  
35 parcel.

1 **Standard (Forest Service)** - A mandatory constraint on project and activity  
2 decisionmaking, established to help achieve or maintain the desired condition or conditions,  
3 to avoid or mitigate undesirable effects, or to meet applicable legal requirements. (36 CFR  
4 219.7(e)(1) (iii)) FSH 1909.12, Chapter 20)

5 **State:** A state is composed of an integrated soil and vegetation unit having one or more  
6 biological communities that occur on a particular ecological site and that are functionally  
7 similar with respect to the three attributes (soil/site stability, hydrologic function, and biotic  
8 integrity) under natural disturbance regimes.

9 **Stipulation (general):** A condition of lease issuance that provides a level of protection for  
10 other resource values or land uses by restricting lease operations during certain times or  
11 locations or to avoid unacceptable impacts, to an extent greater than standard lease terms or  
12 regulations. A stipulation is an enforceable term of the lease contract, supersedes any  
13 inconsistent provisions of the standard lease form, and is attached to and made a part of the  
14 lease. Lease stipulations further implement the BLM's regulatory authority to protect  
15 resources or resource values. Lease stipulations are developed through the land use planning  
16 process.

17 **Stipulation (oil and gas):** A provision that modifies standard oil and gas lease terms and  
18 conditions in order to protect other resource values or land uses and is attached to and made  
19 a part of the lease.

20 **Soft trigger:** An intermediate threshold indicating that management changes are needed at  
21 the implementation level to address habitat or population losses.

22 **Stochastic:** Randomly determined event, chance event, a condition determined by  
23 predictable processes and a random element.

24 **Substantial interference:** Determination that an activity or use hinders or obstructs the  
25 nature and purposes of a designated National Trail (see nature and purposes).

26 **Surface disturbance:** Suitable habitat is considered disturbed when it is removed and  
27 unavailable for immediate GRSG use.

- 28 • Long-term removal occurs when habitat is physically removed through activities  
29 that replace suitable habitat with long-term occupancy of unsuitable habitat, such  
30 as a road, power line, well pad, or active mine. Long-term removal may also  
31 result from any activities that cause soil mixing, soil removal, and exposure of the  
32 soil to erosive processes
- 33 • Short-term removal occurs when vegetation is removed in small areas but  
34 restored to suitable habitat within less than five years of disturbance, such as a  
35 successfully reclaimed pipeline or successfully reclaimed drill hole or pit
- 36 • Suitable habitat rendered unusable due to numerous anthropogenic disturbances

- Anthropogenic surface disturbance are surface disturbances meeting the above definitions and that result from human activities

**Surface-disturbing and disruptive activities:** Actions that alter the vegetation, surface/near surface soil resources, and/or surface geologic features, beyond natural site conditions and on a scale that affects other public land values. Examples of surface-disturbing activities are operation of heavy equipment to construct well pads, roads, pits and reservoirs; installation of pipelines and power lines; and the conduct of several types of vegetation treatments (e.g., prescribed fire). Surface-disturbing activities may be either authorized or prohibited.

**Surface uses:** Activities that may be present on the surface or near-surface (e.g., pipelines), of the public lands. When administered as a use restriction (e.g., no surface occupancy), this phrase prohibits all but specified resource uses and activities in a certain area to protect particular sensitive resource values and property. This designation typically applies to small acreage sensitive resource sites (e.g., plant community study enclosure), or administrative sites (e.g., government ware-yard) where only authorized agency personnel are admitted.

**Tall structures:** A wide array of infrastructures (e.g., poles that support lights, telephone and electrical distribution, communication towers, meteorological towers, high-tension transmission towers, and wind turbines) that have the potential to disrupt lekking or nesting birds by creating new perching/nesting opportunities and/or decreasing the use of an area. A determination as to whether something is considered a tall structure would be based on local conditions such as vegetation or topography.

**Technically/economically feasible:** Actions that are practical or feasible from the technical and economic standpoint and using common sense, rather than simply desirable from the standpoint of the applicant. It is the BLM's sole responsibility to determine what actions are technically and economically feasible. The BLM will consider whether implementation of the proposed action is likely given past and current practice and technology; this consideration does not necessarily require a cost-benefit analysis or speculation about an applicant's costs and profit.

**Temporary/temporary use:** The opposite of the term permanent/permanent use. It is a relative term and has to be considered in the context of the resource values affected and the nature of the resource use or activity taking place. Generally, a temporary activity is considered to be one that is not fixed in place and is of short duration.

**Temporary special use permit:** A type of permit that terminates within 1 year or less after the approval date. All other provisions applicable to permits apply fully to temporary permits. Temporary special use permits are issued for seasonal or short-duration uses involving minimal improvement and investment.

**Term permit:** An authorization to occupy and use National Forest System land, other than rights-of-way for a specified period that is both revocable and compensable according to its terms.

1 **Timeliness:** The lack of a time lag between impacts and the achievement of compensatory  
2 mitigation goals and objectives (BLM Manual Section 1794).

3 **Timely:** The conservation benefits from compensatory mitigation accruing as early as  
4 possible or before impacts have begun.

5 **Timing limitation:** Areas identified for timing limitations, a moderate constraint, are closed  
6 to fluid mineral exploration and development, surface-disturbing activities, and intensive  
7 human activity during identified time frames. This stipulation does not apply to operation  
8 and basic maintenance activities, including associated vehicle travel, unless otherwise  
9 specified. Construction, drilling, completions, and other operations considered to be  
10 intensive are not allowed. Intensive maintenance, such as workovers on wells, is not  
11 permitted. Administrative activities are allowed at the discretion of the authorized officer.  
12 TLs can overlap spatially with NSO and CSU, as well as with areas that have no other  
13 restrictions.

14 **Trail (BLM definition):** A linear route managed for human-powered, stock, or off-highway  
15 vehicle forms of transportation or for historical or heritage values. Trails are not generally  
16 managed for use by four-wheel drive or high-clearance vehicles.

17 **Transition:** A shift between two states. Transitions are not reversible by simply altering the  
18 intensity or direction of factors that produced the change. Instead, they require new inputs,  
19 such as revegetation or shrub removal. Practices such as these that accelerate succession are  
20 often expensive to apply..

21 **Travel management areas:** Polygons or delineated areas where a rational approach has  
22 been taken to classify areas as open, closed, or limited and have identified or designated a  
23 network of roads, trails, ways, and other routes that provide for public access and travel  
24 across the planning area. All designated travel routes within travel management areas should  
25 have a clearly identified need and purpose, as well as clearly defined activity types, modes of  
26 travel, and seasons or timeframes for allowable access or other limitations (BLM Manual  
27 H1601-1 Land Use Planning Handbook).

28 **Travel management system:** Planned and authorized roads, trails, and areas for motor  
29 vehicle use on National Forest System lands that are managed in a controlled, sustained  
30 manner.

31 **Unitization:** The process by which lessees may unite with each other in collectively  
32 adopting and operating under a unit plan for the development of any oil, gas, or geothermal  
33 field.

34 **Utility-scale and/or commercial energy development:** A project that is capable of  
35 producing 20 or more megawatts of electricity for distribution to customers through the  
36 electricity-transmission-grid system.

37 **Valid existing rights.** Documented, legal rights or interests in the land that allow a person  
38 or entity to use said land for a specific purpose and that are still in effect. Such rights include

1 but are not limited to fee title ownership, mineral rights, rights-of-way, easements, permits,  
2 and licenses. Such rights may have been reserved, acquired, leased, granted, permitted, or  
3 otherwise authorized under various statutes of law.

4 **Vegetation treatments:** Management practices that are designed to maintain current  
5 vegetation structure or change the vegetation structure to a different stage of development.  
6 Vegetation treatment methods may include managed fire, prescribed fire, chemical,  
7 mechanical, and seeding.

8 **Viability (Forest Service):** For purposes of the National Forest Management Act and its  
9 enabling regulations, viability is the availability of habitat that allows a species to persist on  
10 landscapes for long-periods (multi-generational) of time. It assumes that populations are  
11 abundant (sufficient numbers) and well-distributed (sufficient redundancy of populations) to  
12 provide for long-term population persistence on a landscape.

13 **Waiver (oil and gas):** Permanent exemption from a lease stipulation. The stipulation no  
14 longer applies anywhere within the leasehold.

15 **West Nile virus:** A virus that is found in temperate and tropical regions of the world and  
16 most commonly transmitted by mosquitoes. West Nile virus can cause flu-like symptoms in  
17 humans and can be lethal to birds, including GRSG.

18 **Wild and scenic study river:** Rivers identified for study by Congress under Section 5(a) of  
19 the Wild and Scenic Rivers Act or identified for study by the Secretary of Agriculture or the  
20 Secretary of the Interior under Section 5(d)(1) of the Wild and Scenic Rivers Act. These  
21 rivers will be studied under the provisions of Section 4 of the Wild and Scenic Rivers Act.

22 **Wildcat well:** An exploratory oil well drilled in land not known to be an oil field.

23 **Wilderness characteristics:** These attributes include the area's size, its apparent  
24 naturalness, and outstanding opportunities for solitude or a primitive and unconfined type of  
25 recreation. They may also include supplemental values. Lands with wilderness characteristics  
26 are those that have been inventoried and determined by the BLM to contain wilderness  
27 characteristics, as defined in Section 2(c) of the Wilderness Act.

28 **Wilderness Study Area:** Areas with wilderness characteristics identified and designated  
29 through the inventory and study processes authorized by Section 603 of FLPMA and, prior  
30 to 2003, through the planning process authorized by Section 202 of FLPMA.

31 **Wilderness:** A congressionally designated area of undeveloped federal land retaining its  
32 primeval character and influence, without permanent improvements or human habitation,  
33 that is protected and managed to preserve its natural conditions and that (1) generally  
34 appears to have been affected mainly by the forces of nature, with human imprints  
35 substantially unnoticeable; (2) has outstanding opportunities for solitude or a primitive and  
36 unconfined type of recreation; (3) has at least 5,000 acres or is large enough to make practical  
37 its preservation and use in an unimpaired condition; and (4) may also contain ecological,

1 geological, or other features of scientific, educational, scenic, or historic value. The definition  
2 is contained in Section 2(c) of the Wilderness Act of 1964 (78 Stat. 891, from H-6310-1,  
3 Wilderness Inventory and Study Procedures).

4 **Wildfire suppression:** An appropriate management response to wildfire, or prescribed fire  
5 that results in curtailment of fire spread and eliminates all identified threats from the  
6 particular fire.

7 **Wildland Fire:** Any nonstructure fire that occurs in the vegetation or natural fuels. Includes  
8 both prescribed fire and wildfire (NWCG Memo #024-2010 April 30, 2010,  
9 [www.nwcg.gov](http://www.nwcg.gov)).

10 **Wildland-urban interface:** The line, area or zone where structures and other human  
11 development meet or intermingle with undeveloped wildland or vegetative fuels.

12 **Winter concentration areas:** GRSG winter habitats that are occupied annually by GRSG  
13 and provide sufficient sagebrush cover and food to support birds throughout the entire  
14 winter (especially periods with above average snow cover). Many of these areas support  
15 several different breeding populations of GRSG. GRSG typically show high fidelity for these  
16 areas, and loss or fragmentation can result in significant population impacts.

17 **Withdrawal:** A withholding of an area of federal land from settlement, sale, location, or  
18 entry under some or all of the general land laws to achieve the following:

- 19 • Limit activity under those laws in order to maintain other public values in the  
20 area
- 21 • Reserve the area for a particular public purpose or program
- 22 • Transfer jurisdiction of the area from one federal agency to another

23 **Zoological area:** Roughly analogous to BLM area of critical environmental concern, this  
24 area preserves GRSG habitat next to potential ACECs found to have relevance and  
25 importance. This area would be managed to ensure consistent GRSG management and  
26 conservation across the landscape.

## Economic Impact Analysis Methodology

This Page Intentionally Blank

Administrative Draft  
Cooperating Agency Review

## **AA. Economic Impact Analysis Methodology**

### **AA.1 Introduction**

This appendix describes the methods and data that underlie the economic impact modeling analysis. Input-output models such as the Impact Analysis for Planning (IMPLAN) model, an economic impact analysis model, provide a quantitative representation of the production relationships between individual economic sectors. Thus, the economic modeling analysis uses information about physical production quantities and the prices and costs for goods and services. The inputs required to run the IMPLAN model are described in the following narrative and tables. The resulting estimates from the IMPLAN model, by alternative, are in **Chapter 4, Environmental Consequences, Section 4.15, Social and Economic Conditions**. The first portion of the following information describes general aspects of the IMPLAN model and how it was used to estimate economic impacts. The remaining sections provide additional detailed data used in the analysis for livestock grazing.

### **AA.2 The IMPLAN Model**

IMPLAN is a regional economic model that provides a mathematical accounting of the flow of money, goods, and services through a region's economy. The model provides estimates of how a specific economic activity translates into jobs and income for the region. It includes the ripple effect (also called the multiplier effect) of changes in economic sectors that may not be directly impacted by management actions, but are linked to industries that are directly impacted. In IMPLAN, these ripple effects are termed indirect impacts (for changes in industries that sell inputs to the industries that are directly impacted) and induced impacts (for changes in household spending as household income increases or decreases due to the changes in production).

This analysis used IMPLAN 2011; prior to running the model, cost and price data were converted to a consistent dollar year (2011) using sector-specific adjustment factors from the IMPLAN model. However, the values in this appendix are expressed in year 2010 dollars for comparability with the data provided in the socioeconomics section in chapter 3.

The current IMPLAN model has 440 economic sectors, of which 333 are represented in the Socioeconomic Study Area counties. This analysis involved direct changes in economic activity for 15 IMPLAN economic sectors, as well as changes in all other related sectors due to the ripple effect. The IMPLAN production coefficients were modified to reflect the interaction of producing sectors in the Socioeconomic Study Areas. As a result, the calibrated model does a better job of generating multipliers and the subsequent impacts that reflect the interaction between and among the sectors in the Socioeconomic Study Area compared to a model using unadjusted national coefficients. Key variables used in the IMPLAN model were filled in using data specific to the Socioeconomic Study Area, including employment estimates, labor earnings, and total industry output.

The trade data available in the current version of IMPLAN (Version 3.0) make it possible to do multi-region analysis to track how an impact on any of the IMPLAN sectors in the study area affects production in any of the sectors in any other region of the US. For this analysis, this feature allowed the estimation of how an impact in the primary study area disperses into

the secondary study area, and how these effects in the secondary study area create additional local effects in the primary study area. As a result, it was possible to estimate not only the jobs and income generation in the primary study area, but to also estimate how the economic activity in the primary study area affected jobs and income generation in the secondary study area.

### AA.3 Livestock Grazing

Economic impacts from changes to livestock grazing are a function of the amount of forage available and the economic value of forage.

Forage availability was measured in Animal Unit Months (AUMs), with one AUM defined as the amount of forage needed to feed one cow, one horse, or five sheep for one month. Data on forage availability were obtained from BLM's Rangeland Administration System (BLM 2012a) and from the Forest Service's INFRA (infrastructure) range module (Forest Service 2013). Two types of AUM measures were used: Active AUMs and Billed AUMs. Active AUMs measure the amount of forage from land available for grazing. The Forest Service designates this measure "permitted" AUMs. Billed AUMs measure the amount of forage for which the BLM and Forest Service bill annually (i.e., the amount of forage that ranchers actually use, which is typically less than the amount of forage available). The Forest Service uses the designation "authorized" AUMs.

Data for 2011 and 2013 were used for active AUMs. BLM provided data on the breakdown of active AUMs in various GRSG habitat and non-habitat classes by alternative. For billed AUMs, data for 2000 to 2011 were used to develop a 12-year average for billed AUMs on BLM-administered lands. Under current management (Alternative A), the analysis estimated 2,047,170 total active AUMs in the Socioeconomic Study Area, with 1,190,255 active AUMs in GRSG habitat (all designated habitat [ADH]) in the Socioeconomic Study Area (BLM 2012a and Forest Service 2013).<sup>12</sup> The data on active and billed AUMs were used to determine the historical ratio of billed AUMs to active AUMs for each BLM field office. The analysis assumed a billed to active ratio of 100 percent for Forest Service lands because Forest Service has historically adjusted the number of active AUMs to correspond to the number of recently billed AUMs. **Table AA-1**, Current and Historical Annual Animal Unit Months Data, presents the current and historical data used in the analysis.

**Table AA-1**  
**Current and Historical Annual Animal Unit Months Data**

	Active AUMs	Active AUMs in ADH	Billed as Share of Active
Bruneau Field Office	109,567	98,528	78%

<sup>1</sup> Because permitted AUMs include active and suspended AUMs (in BLM terminology), this comparison of total active AUMs with ADH permitted AUMs may overestimate the loss of AUMs under Alternative C.

<sup>2</sup> When a portion of an allotment was found in GRSG habitat, only the portion with GRSG was excluded from total active AUMs, under Alternatives C (not the entire allotment).

**Table AA-1**  
**Current and Historical Annual Animal Unit Months Data**

	Active AUMs	Active AUMs in ADH	Billed as Share of Active
Burley Field Office	123,505	76,765	72%
Challis Field Office	53,570	39,935	59%
Dillon Field Office	72,637	64,283	75%
Four Rivers Field Office	118,918	43,602	81%
Jarbidge Field Office	178,271	129,014	84%
Owyhee Field Office	125,140	101,029	86%
Pocatello Field Office	68,768	40,876	86%
Salmon Field Office	55,966	37,376	80%
Shoshone Field Office	196,137	182,430	61%
Upper Snake River Field Office	140,084	126,608	67%
Beaverhead-Deerlodge National Forest	154,629	42,832	100%
Boise National Forest	59,319	9,596	100%

Sources: Calculated based on data from BLM 2012a and Forest Service 2013.

ADH all designated habitat

AUM animal unit month

Forage availability was estimated for all alternatives. Alternatives A, B, D, E, and the Proposed Plan used the current data for active and billed AUMs (obtained as explained above). Alternative C discounted the current data to remove 100 percent of active and billed AUMs in ADH, as designated by the alternative. Alternative F discounted the current data to remove 25 percent of active and billed AUMs in ADH, as designated by the alternative. **Table AA-2**, Estimated Change in Annual Animal Unit Months by Alternative and Livestock Type, Low Impact Scenario, shows the resulting reductions in billed AUMs, calculated as the difference between the initial billed AUMs and the reduced billed AUMs under each alternative. AUMs are distinguished between those allocated to sheep, and those allocated to cattle and other animals, to allow different valuation of forage, as explained further below. The BLM and Forest Service consider these estimates to be a low-impact scenario because they do not account for the possibility that an initial reduction in AUMs on BLM-administered lands could lead to the loss of additional AUMs due to seasonal limitations in the availability of grazing areas. The possibility of additional losses in AUMs due to seasonal restrictions in the availability of grazing areas is considered in the high-impact scenario explained below.

Sources: Calculated based on data from BLM 2012a and Forest Service 2013.

In addition to the low-impact scenario reflected in Table R-2, the BLM and Forest Service considered the possibility that the loss of AUMs on public lands could lead to the loss of additional AUMs due to seasonal limitations of grazing areas. This would be the case if livestock operations have no reasonable alternative to seasonal grazing on public lands. Livestock grazing on federal lands often occurs during the spring and summer seasons, with other feeding alternatives (hay) being used during fall and winter. If there are no grazing alternatives to federal lands during spring and summer, farmers may need to reduce their operations and the resulting loss of output, jobs, and earnings would be larger than that otherwise estimated. Torell et al. (2014) provide estimates of the potential impacts to a model ranch in Idaho from seasonal closures of federal lands for cattle grazing. These estimates show the number of AUMs lost on and off BLM-administered lands for each AUM lost on BLM-administered lands under various scenarios. These scenarios range from a 25 percent reduction in BLM AUMs to a complete elimination of AUMs on BLM-administered lands with the livestock operation going out of business. The estimates are based on an economic model that assumes farmers respond to the loss of availability of federal lands for grazing in several ways to maximize their profits (gross margins), including reducing the size of their operations. Based on the Torell et al. (2014) estimates, BLM and Forest Service assumed that for each BLM AUM lost under Alternative C, an additional 1.01 AUMs would be lost for a total of 2.01 AUMs lost (mid-point between the scenarios of 100

percent loss of BLM AUMs with and without closure of operations).. Under Alternative F, an additional 0.47 AUM would be lost for each reduction of BLM AUMs for a total of 1.47 AUMs (scenarios of loss of 25 percent of AUMs on BLM-administered lands). These AUM adjustment factors are based on a model Idaho ranch that relies on a total of approximately 4,620 AUMs, of which 2,098 AUMs (45%) are linked to federal land. These factors were applied only to cattle AUMs, because no similar estimate was available for sheep. **Table AA-3** shows the resulting reductions in billed AUMs, calculated as the difference between the initial billed AUMs and the reduced billed AUMs under each alternative.

Sources: Calculated based on data from BLM 2012a, Forest Service 2013 and Torell 2014.

The economic value of forage is estimated based on the value of production associated with the forage. Values for cattle and sheep are estimated separately, with the value of forage for

other animals considered equivalent to the value for cattle. Due to price fluctuations, average per-AUM values for cattle and sheep are based on the 2002 to 2011 average value of production estimates from the US Department of Agriculture, Economic Research Service (2012). The value for cattle is \$50.37 per AUM, and the value for sheep is \$57.20 per AUM (in 2010 dollars). Including indirect and induced impacts, the per-AUM values are \$101.90 for cattle and \$127.54 for sheep in the primary study area and \$102.19 for cattle and \$127.89 for sheep in the primary and secondary study area (in 2010 dollars). **Table AA-2**, Assumptions for Analysis of Impacts on Output for Livestock Grazing, shows the economic impact assumptions for cattle and sheep. The direct economic impact is the estimated change in livestock output per AUM; IMPLAN generates the indirect and induced impacts.

**Table AA-2**  
**Assumptions for Analysis of Impacts on Output for Livestock Grazing**

Economic Impact	Cattle	Sheep
<b>Primary Study Area</b>		
Direct Economic Impact (\$/AUM)	\$50.37	\$57.20
Indirect Economic Impact (\$/AUM) <sup>1</sup>	\$44.69	\$59.61
Induced Economic Impact (\$/AUM) <sup>2</sup>	\$6.83	\$10.74
Total Economic Impact (\$/AUM)	\$101.90	\$127.54
Multiplier (Total Impact/Direct Impact)	2.02	2.23
<b>Primary and Secondary Study Area</b>		
Direct Economic Impact (\$/AUM)	\$50.37	\$57.20
Indirect Economic Impact (\$/AUM) <sup>1</sup>	\$44.92	\$59.86
Induced Economic Impact (\$/AUM) <sup>2</sup>	\$6.90	\$10.83
Total Economic Impact (\$/AUM)	\$102.19	\$127.89
Multiplier (Total Impact/Direct Impact)	2.03	2.24

Note: All dollar values are in 2010 dollars.

<sup>1</sup> Indirect impacts reflect increased demand in sectors that directly or indirectly provide supplies to the livestock industry.

<sup>2</sup> Induced impacts reflect increased demand in the consumer and government sectors.

**Table AA-3**, Assumptions for Analysis of Employment Impacts for Livestock Grazing, provides a summary of the employment impacts that would result, according to IMPLAN, based on unit changes in livestock AUMs.

**Table AA-3**  
**Assumptions for Analysis of Employment Impacts for Livestock Grazing**

Employment Impact	Cattle	Sheep
<b>Primary Study Area</b>		
Direct Employment (Jobs/1,000 AUMs)	0.000559	0.000980
Indirect Employment (Jobs/1,000 AUMs)	0.000338	0.000603
Induced Employment (Jobs/1,000 AUMs)	0.000067	0.000104
Total Employment (Jobs/1,000 AUMs)	0.000963	0.001688
Multiplier (Total Impact/Direct Impact)	1.72	1.72

**Table AA-3**  
**Assumptions for Analysis of Employment Impacts for Livestock Grazing**

Employment Impact	Cattle	Sheep
<b>Primary Study Area</b>		
Average Earnings per Job (2010 dollars)	\$36,839	\$22,890
<b>Primary and Secondary Study Area</b>		
Direct Employment (Jobs/1,000 AUMs)	0.000559	0.000980
Indirect Employment (Jobs/1,000 AUMs)	0.000338	0.000603
Induced Employment (Jobs/1,000 AUMs)	0.000067	0.000104
Total Employment (Jobs/1,000 AUMs)	0.000963	0.001688
Multiplier (Total Impact/Direct Impact)	1.72	1.72
Average Earnings per Job (2010 dollars)	\$36,904	\$22,934

Note: Direct, indirect, and induced employment impacts and average earnings per job are calculated using IMPLAN.

Output, labor, and earning impacts summarized in Table 4-71 in the economic impact section of the EIS are presented as lower and upper bound impacts. Estimates of lower bound impacts are equal to the 'low impact scenario' reductions in AUMs in Table R-2 multiplied by impact multipliers in Tables R-4 and R-5; calculations are performed for cattle and sheep separately and then added together. Estimates of upperbound impacts are equal to the 'high impact scenario' reductions in AUMs in Table R-3, and multiplied by multipliers in Tables R-4 and R-5 in a similar manner, noting that the high impact reductions in AUMs include the Torell et al. (2014) production adjustment factors as described earlier (similar adjustment factors are not available for sheep).

The IMPLAN sectors used to model an exogenous change in demand for livestock grazing were the following (IMPLAN sector numbers are shown in brackets): grain farming (2), all other crop farming (10), support activities for agriculture and forestry (19), residential structures maintenance and repairs (40), wholesale trade (319), truck transportation (335), banking (354), real estate (360), accounting (368), veterinary services (379), equipment repair and maintenance (417), and labor income (NA). Cattle grazing used the following additional sector: cattle ranching and farming (11). Sheep grazing used the following additional sectors: animal production except cattle and poultry and eggs (14) and retail-food and beverages (324).

Cooperating Agency Review

## Appendix B – Required Design Features

Required Design Features (RDFs) are required for certain activities in all GRSG habitat. RDFs establish the minimum specifications for certain activities to help mitigate adverse impacts. However, the applicability and overall effectiveness of each RDF cannot be fully assessed until the project level when the project location and design are known. Because of site-specific circumstances, some RDFs may not apply to some projects (e.g., a resource is not present on a given site) and/or may require slight variations (e.g., a larger or smaller protective area). RDFs are continuously improving as new science and technology become available and therefore are subject to change. All variations in RDFs would require that at least one of the following be demonstrated in the NEPA analysis associated with the project/activity:

- A specific RDF is documented to not be applicable to the site-specific conditions of the project/activity (e.g. due to site limitations or engineering considerations). Economic considerations, such as increased costs, do not necessarily require that an RDF be varied or rendered inapplicable;
- An alternative RDF is determined to provide equal or better protection for GRSG or its habitat;
- A specific RDF will provide no additional protection to GRSG or its habitat.

The following required design features (RDFs) are included for consideration and use based upon review of current science and effects analysis (circa 2014) (**Table B-1**). These may be reviewed during project evaluation and updated through plan maintenance as new information and updated scientific findings become available.

The table is organized by program area grouping the RDFs most relevant to that program. All relevant RDFs, regardless of which program they are grouped under, should be considered during project evaluation and applicable RDFs should be applied during implementation, with the exception that they would be implemented as best management practices for locatable minerals activities, to the extent allowable by law. In some cases the RDFs may not all be appropriate based on local conditions and would be assessed in the appropriate site specific NEPA analysis, these all should be considered and where determined to be beneficial to achieving GRSG habitat objectives included as part of the site specific project. In other cases additional project design criteria or best management practices could be incorporated into project implementation to address site specific concerns not fully addressed by the RDFs described here.

**Table B-1. Required Design Features**

Required Design Feature	
<b>General</b>	
1.	Solicit and consider expertise and ideas from local landowners, working groups, and other federal, state, county, and private organizations during development of projects.
2.	No repeated or sustained behavioral disturbance (e.g., visual, noise over 10 dbA at lek, etc.) to lekking birds from 6:00 pm to 9:00 am within 2 miles (3.2 km) of leks during the lekking season.
3.	Avoid mechanized anthropogenic disturbance, in nesting habitat during the nesting season when implementing: 1) fuels/vegetation/habitat restoration management projects, 2) infrastructure construction or maintenance, 3) geophysical exploration activities; 4) organized motorized recreational events.

<b>Required Design Feature</b>
4. Avoid mechanized anthropogenic disturbance during the winter, in wintering areas when implementing: 1) fuels/vegetation/habitat restoration management projects, 2) infrastructure construction or maintenance, 3) geophysical exploration activities; 4) organized motorized recreational events.
<b>Wildfire Suppression</b>
5. Compile district-level information into state-wide sage-grouse tool boxes. Tool boxes will contain maps, listing of resource advisors, contact information, local guidance, and other relevant information for each district, which will be aggregated into a state-wide document.
6. Provide localized maps to dispatch offices and extended attack incident commanders for use in prioritizing wildfire suppression resources and designing suppression tactics. The Fire Planning and Fuels Management Division (FA-600) hosts a webpage containing up-to-date maps, instruction memoranda, conservation measures, BMPs, and spatial data specific to fire operations and fuels management/sage-grouse interactions. These resources can be accessed at: <a href="http://web.blm.gov/internal/fire/fpfm/sg/index.html">http://web.blm.gov/internal/fire/fpfm/sg/index.html</a> . Additional BLM sage-grouse information can be found at: <a href="http://www.blm.gov/wo/st/en/prog/more/fish_wildlife_and/sage-grouse-conservation.html">http://www.blm.gov/wo/st/en/prog/more/fish_wildlife_and/sage-grouse-conservation.html</a>
7. Assign a resource advisor with sage-grouse expertise, or who has access to sage-grouse expertise, to all extended attack fires in or near sage-grouse habitat areas. Prior to the fire season, provide training to sage-grouse resource advisors on wildfire suppression organization, objectives, tactics, and procedures to develop a cadre of qualified individuals. Involve state wildlife agency expertise in fire operations through: <ul style="list-style-type: none"> <li>• instructing resource advisors during preseason trainings;</li> <li>• qualification as resource advisors;</li> <li>• coordination with resource advisors during fire incidents;</li> <li>• contributing to incident planning with information such as habitat features or other key data useful in fire decision making</li> </ul>
8. At the onset of an emerging wildland fire the Agency Administrators and Fire Management Officers will engage a local Resource Advisor to assess sage-grouse habitat that may be affected by the fire or suppression activities.
9. If complexity of the wildland fire warrants the activation of an Incident Management Team, locally refined information regarding important sage-grouse habitat will be relayed during in brief and continually throughout the incident.
10. On critical fire weather days, pre-position additional fire suppression resources to optimize a quick and efficient response in sage-grouse habitat areas.
11. As appropriate, utilize existing fuel breaks, such as roads or discrete changes in fuel type, as control lines in order to minimize fire spread.
12. During periods of multiple fires, ensure line officers are involved in setting priorities.
13. To the extent possible, locate wildfire suppression facilities (i.e., base camps, spike camps, drop points, staging areas, heli-bases, etc.) in areas where physical disturbance to sage-grouse habitat can be minimized. These include disturbed areas, grasslands, near roads/trails or in other areas where there is existing disturbance or minimal sagebrush cover.
14. Power-wash all firefighting vehicles, to the extent possible, including engines, water tenders, personnel vehicles, and all-terrain vehicles (ATV) prior to deploying in or near sage-grouse habitat areas to minimize noxious weed spread.
15. Minimize cross-country vehicle travel during fire operations in sage-grouse habitat.
16. Minimize burnout operations in key sage-grouse habitat areas by constructing direct fireline whenever safe and practical to do so.
17. Utilize retardant, mechanized equipment, and other available resources to minimize burned acreage during initial attack.
18. As safety allows, conduct mop-up where the black adjoins unburned islands, dog legs, or other habitat features to minimize sagebrush loss.
19. Adequately document fire operation activities in sage-grouse habitat for potential follow-up coordination activities.
<b>Fuels Management</b>

<b>Required Design Feature</b>
Unless otherwise specified as part of the land use plan consider the full array of fuels management treatment types (prescribed fire, mechanical, chemical and biological) when implementing the following RDFs.
20. Where applicable, design fuels treatment objectives to protect existing sagebrush ecosystems, modify fire behavior, restore native plants, and create landscape patterns which most benefit sage-grouse habitat.
21. Provide training to fuels treatment personnel on sage-grouse biology, habitat requirements, and identification of areas utilized locally.
22. Use burning prescriptions which minimize undesirable effects on vegetation or soils (e.g., minimize mortality of desirable perennial plant species and reduce risk of annual grass invasion).
23. Ensure proposed sagebrush treatments are planned with full interdisciplinary input pursuant to NEPA and coordination with state fish and wildlife agencies, and that treatment acreage is conservative in the context of surrounding sage-grouse seasonal habitats and landscape.
24. Where appropriate, ensure that treatments are configured in a manner that promotes use by sage-grouse.
25. Where applicable, incorporate roads and natural fuel breaks into fuel break design.
26. Power-wash all vehicles and equipment involved in fuels management activities, prior to entering the area, to minimize the introduction of undesirable and/or invasive plant species.
27. Design vegetation treatments in areas of high fire frequency which facilitate firefighter safety, reduce the potential acres burned, and reduce the fire risk to sage-grouse habitat. Additionally, develop maps for sage-grouse habitat which spatially display existing fuels treatments that can be used to assist suppression activities.
28. As funding and logistics permit, restore annual grasslands to a species composition characterized by perennial grasses, forbs, and shrubs or one of that referenced in land use planning documentation.
29. Emphasize the use of native plant species, especially those from a warmer area of the species' current range, recognizing that non-native species may be necessary depending on the availability of native seed and prevailing site conditions.
30. Remove standing and encroaching trees within at least 110 yards of occupied sage-grouse leks and other habitats (e.g., nesting, wintering and brood rearing) to reduce the availability of perch sites for avian predators, as resources permit.
31. Protect wildland areas from wildfire originating on private lands, infrastructure corridors, and recreational areas.
32. Reduce the risk of vehicle- or human-caused wildfires and the spread of invasive species by installing fuel breaks and/or planting perennial vegetation (e.g., green-strips) paralleling road rights-of-way.
33. Strategically place and maintain pre-treated strips/areas (e.g., mowing, herbicide application, etc.) to aid in controlling wildfire, should wildfire occur near PHMA or priority restoration areas (such as where investments in restoration have already been made).
34. Design treatments to provide a break in fuel continuity in large, at-risk, expanses of continuous sagebrush. Use local knowledge of fire occurrence, spread patterns, and habitat values at risk to determine the proper placement and size of the fuel break.
35. Use existing agreements with local, county, and state road departments to improve and maintain existing fuel breaks during routine road maintenance. Examples include: blading, mowing, disking, grading, and spraying roadside vegetation.
36. Form partnerships with linear right-of-way holders to maintain fuel breaks, which reduce fuel continuity and serve to protect at-risk landscapes.
37. Use existing NEPA documentation and authorities, where possible, when conducting road right-of-way maintenance. In many instances, existing authorizations for roads or linear rights-of-way contain provisions for maintenance activities that could be implemented and incorporated into a vegetation and habitat protection strategy without requiring additional NEPA analysis. Document this with a Determination of NEPA Adequacy (DNA).
38. Enter into agreements with road departments which may help fund the construction and maintenance of fuel breaks adjacent to roads, as funding permits.
39. Spatially depict the locations of existing and planned fuel breaks in a landscape fuel break map and label each vegetation polygon for reference. Offices will make these maps available to suppression resources for use in fire operations.
<b>Vegetation Treatment</b>
40. Utilize available plant species based on their adaptation to the site when developing seed mixes. (Lambert

<b>Required Design Feature</b>
2005; VegSpec).
41. Utilizing the warmer component of a species' current range when selecting native species for restoration when available (Kramer and Havens 2009).
42. Reduce annual grass densities and competition through herbicide, targeted grazing, tillage, prescribed fire, etc. (Pyke 2011).
43. Reduce density and competition of introduced perennial grasses using appropriate techniques to accomplish this reduction (Pellant and Lysne 2005).
44. Utilize techniques to introduce desired species to the site such as drill seeding, broadcast seeding followed by a seed coverage technique, such as harrowing, chaining or livestock trampling, and transplanting container or bare-root seedlings.
45. Assess existing on-site vegetation to ascertain if enough desirable perennial vegetation exists to consider techniques to increase on-site seed production to facilitate an increase in density of desired species.
46. Use site preparation techniques that retain existing desirable vegetation.
47. Use "mother plant" techniques or planting of satellite populations of desirable plants to serve as seed sources.
48. Utilize post-treatment control of annual grass and other invasive species.
49. Utilize new tools and use of new science and research as it becomes available.
50. Give higher priority to vegetation rehabilitation or manipulation projects that include: <ul style="list-style-type: none"> <li>• Sites where environmental variables contribute to improved chances for project success (Meinke et al. 2009).</li> <li>• Areas where seasonal habitat is limiting GRSG distribution and/or abundance (wintering areas, wet meadows and riparian areas, nesting areas, leks, etc.).</li> <li>• Re-establish sagebrush cover in otherwise suitable GRSG with consideration to local needs and conditions using the general priorities in the following order: <ul style="list-style-type: none"> <li>• Recently burned native areas</li> <li>• Native grassland with suitable forb component</li> <li>• Nonnative grassland with suitable forb component</li> <li>• Recently converted annual grass areas</li> <li>• Native grassland</li> <li>• Nonnative grassland</li> </ul> </li> <li>• Where desirable perennial bunchgrasses and/or forbs are deficient in existing sagebrush stands, use appropriate mechanical, aerial or other techniques to re-establish them. Examples include but are not limited to, use of a Lawson aerator with seeding, harrow or chain with seeding, drill seeding, hand planting plugs, aerial seeding or other appropriate technique.</li> <li>• Cooperative efforts that may improve GRSG habitat quality over multiple ownerships.</li> <li>• Projects that may provide connectivity between suitable habitats or expand existing good quality habitats.</li> <li>• Projects that address conifer encroachment into important GRSG habitats. In general the priority for treatment is 1) Phase 1 (<math>\leq 10\%</math> conifer cover), 2) Phase 2 (10-30%), and 3) Phase 3 (<math>&gt; 30\%</math>).</li> <li>• Replacing stands of annual grasses within otherwise good quality habitats with desirable perennial species. Other factors that contribute to the importance of the restoration project in maintaining or improving GRSG habitat.</li> </ul>
51. When conducting vegetation treatments in areas inhabited or potentially inhabited by slickspot peppergrass ( <i>Lepidium papilliferum</i> ) follow the conservation measures in the applicable conservation agreement between Idaho BLM and US Fish and Wildlife Service (most recent version dated September 2014).
<b>Lands and Realty</b>
52. Where technically and financially feasible, bury distribution powerlines and communication lines within existing disturbance.
53. Above-ground disturbance areas would be seeded with perennial vegetation as per vegetation

<b>Required Design Feature</b>
management.
54. Place infrastructure in already disturbed locations where the habitat has not been fully restored.
55. Cluster disturbances, operations (fracturing stimulation, liquids gathering, etc.) and facilities as close as possible.
56. Co-locate linear facilities within one mile of existing linear facilities.
57. Micro-site linear facilities to reduce impacts to sage-grouse habitats.
58. Locate staging areas outside the Priority Habitat Management Areas to the extent possible.
59. Consider collocating powerlines, flowlines and pipelines under or immediately adjacent to a road or adjacent to other pipelines first, before considering co-locating with other ROW.
60. Restrict the construction of tall facilities and fences to the minimum number and amount needed.
61. Use free standing structures where possible, to limit the use of guy wires. Where guy wires are necessary and appropriate bird collision diverters would be used, if doing so would not cause a human safety risk.
62. Place new utility developments (power lines, pipelines, etc.) and transportation routes in existing utility or transportation corridors.
63. Construction and development activities should conform to seasonal restrictions.
<b>Fluid Mineral Leasing</b>
64. Use directional drilling and/or multi well-pads to reduce surface disturbance.
65. Apply a phased development approach with concurrent reclamation.
66. Place liquid gathering facilities outside of PHMAs. Have no tanks at well locations within PHMAs to minimize truck traffic and perching and nesting sites for ravens and raptors.
67. Use remote monitoring techniques for production facilities and develop a plan to reduce the frequency of vehicle use (Lyon and Anderson 2003).
68. Site and/or minimize linear ROWs or SUAs to reduce disturbance to sagebrush habitats.
69. Design or site permanent structures which create movement (e.g. pump jack) to minimize impacts to GRSG.
70. Equip tanks and other above-ground facilities with structures or devices that discourage nesting of raptors and corvids.
71. Control the spread and effects of non-native plant species (Gelbard and Belnap 2003, Bergquist et al. 2007, Evangelista et al. 2011). (E.g. by washing vehicles and equipment.)
72. Restrict pit and impoundment construction to reduce or eliminate threats from West Nile virus (Doherty 2007).
73. Remove or re-inject produced water to reduce habitat for mosquitoes that vector West Nile virus. If surface disposal of produced water continues, use the following steps for reservoir design to limit favorable mosquito habitat: <ul style="list-style-type: none"> <li>• Overbuild size of ponds for muddy and non-vegetated shorelines.</li> <li>• Build steep shorelines to decrease vegetation and increase wave actions.</li> <li>• Avoid flooding terrestrial vegetation in flat terrain or low lying areas.</li> <li>• Construct dams or impoundments that restrict down slope seepage or overflow.</li> <li>• Line the channel where discharge water flows into the pond with crushed rock.</li> <li>• Construct spillway with steep sides and line it with crushed rock.</li> <li>• Treat waters with larvicides to reduce mosquito production where water occurs on the surface</li> </ul>
74. Require noise shields when drilling during the lek, nesting, brood-rearing, or wintering season.
75. The BLM/Forest Service would work with proponents to limit project related noise where it would be expected to reduce functionality of habitats in Priority and Important Habitat Management Areas.
76. The BLM/Forest Service would evaluate the potential for limitation of new noise sources on a case-by-case basis as appropriate.
77. Limit noise sources that would be expected to negatively impact populations in Priority and Important Habitat Management Areas and continue to support the establishment of ambient baseline noise levels for occupied leks in Priority Habitat Management Areas.
78. As additional research and information emerges, specific new limitations appropriate to the type of projects being considered would be evaluated and appropriate limitations would be implemented where

<b>Required Design Feature</b>
necessary to minimize potential for noise impacts on sage-grouse core population behavioral cycles.
79. As new research is completed, new specific limitations would be coordinated with the IDFG and MT FWP and partners.
80. Fit transmission towers with anti-perch devices (Lammers and Collopy 2007).
81. Require sage-grouse-safe fences.
82. Locate new compressor stations outside Priority Habitat Management Areas and design them to reduce noise that may be directed towards Priority Habitat Management Areas.
83. Clean up refuse (Bui et al. 2011).
84. Locate man camps outside of priority sage-grouse habitats.
85. Consider using oak (or other material) mats for drilling activities to reduce vegetation disturbance and for roads between closely spaced wells to reduce soil compaction and maintain soil structure to increase likelihood of vegetation reestablishment following drilling.
86. Use only closed-loop systems for drilling operations and no reserve pits.
87. Cover (e.g., fine mesh netting or use other effective techniques) all drilling and production pits and tanks regardless of size to reduce sage-grouse mortality.
<b>Roads</b>
88. Utilize existing roads, or realignments of existing routes to the extent possible.
89. Design roads to an appropriate standard no higher than necessary to accommodate their intended purpose.
90. Do not issue ROWs or SUAs to counties on newly constructed energy or mineral development roads, unless for a temporary use consistent with all other terms and conditions included in this document.
91. Establish speed limits on BLM and FS system roads to reduce vehicle/wildlife collisions or design roads to be driven at slower speeds.
92. Coordinate road construction and use among ROW or SUA holders.
93. Construct road crossings at right angles to ephemeral drainages and stream crossings.
94. Use dust abatement on roads and pads.
95. Close and reclaim duplicate roads by restoring original landform and establishing desired vegetation.
<b>Roads Specific to Priority and Important Habitat Management Areas</b>
96. Locate roads to avoid priority areas and habitats as described in the Wildfire and Invasive Species Assessments.
97. Establish trip restrictions (Lyon and Anderson 2003) or minimization through use of telemetry and remote well control (e.g., Supervisory Control and Data Acquisition).
98. Restrict vehicle traffic to only authorized users on newly constructed routes (using signage, gates, etc.)
<b>Reclamation Activities</b>
99. Include objectives for ensuring habitat restoration to meet sage-grouse habitat needs in reclamation practices/sites (Pyke 2011).
100. Address post reclamation management in reclamation plan such that goals and objectives are to protect and improve sage-grouse habitat needs.
101. Maximize the area of interim reclamation on long-term access roads and well pads, including reshaping, topsoiling and revegetating cut-and-fill slopes.
102. Restore disturbed areas at final reclamation to the pre-disturbance landforms and desired plant community.
103. Irrigate interim reclamation if necessary for establishing seedlings more quickly.
104. Utilize mulching techniques to expedite reclamation and to protect soils.
<b>Grazing</b>
105. Avoid building new wire fences within 2 km of occupied leks (Stevens 2011). If this is not feasible, ensure that high risk segments are marked with collision diverter devices or as latest science indicates.
106. Place new, taller structures, including corrals, loading facilities, water storage tanks, windmills, out of line of sight or at least one kilometer (preferably 3 km) from occupied leks, where such structures would increase the risk of avian predation.
107. Utilize temporary fencing (e.g., ESR, drop down fencing) where feasible and appropriate to meet

<b>Required Design Feature</b>
management objectives.
108. Fence wetlands (e.g., springs, seeps, wet meadows and/or riparian areas) where appropriate, to maintain or foster progress toward Proper Functioning Condition and to facilitate management of sage-grouse habitat objectives. Where constructing fences or enclosures to improve riparian and/or upland management, incorporate fence marking or other BMPs/RDFs as appropriate.
109. During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations and March 25-May 15 in higher elevations), livestock trailing will be avoided to the extent possible within 1 km (0.62 mile) of occupied leks between 6:00 p.m. and 9:00 a.m. to avoid disturbance to lekking and roosting sage-grouse. Over-nighting, watering and sheep bedding locations on public lands must be at least 1 km from occupied leks during the lekking season to reduce disturbance from sheep, human activity and guard animals.
110. Work with permittees in locating sheep over-nighting, watering and sheep bedding locations to minimize impacts to sage-grouse seasonal habitats.
111. When trailing livestock during the lekking or nesting season, use roads or existing trails, to the extent possible to reduce disturbance to roosting, lekking or nesting sage-grouse.
112. Design new spring developments in GRSG habitat to maintain or enhance the free flowing characteristics of springs and wet meadows. Modify developed springs, seeps and associated pipelines to maintain the continuity of the predevelopment riparian area within priority GRSG habitat where necessary.
113. Install ramps in new and existing livestock troughs and open water storage tanks to facilitate the use of and escape from troughs by GRSG and other wildlife.
<b>West Nile Virus</b>
114. Construct water return features and maintain functioning float valves to prohibit water from being spilled on the ground surrounding the trough and/or tank and return water to the original water source, to the extent practicable.
115. Minimize the construction of new ponds or reservoirs except as needed to meet important resource management and/or restoration objectives.
116. Develop and maintain non-pond/reservoir watering facilities, such as troughs and bottomless tanks, to provide livestock water.
117. For most spring developments or wells, mosquito breeding habitat usually is not an issue. Flowing cold (less than 50° Fahrenheit) water and steep sides of the stock tanks are not conducive for egg laying or larvae production. If flows are low, the water is warm, or moss production is an issue in the tank, mosquito breeding habitat could exist in the tank.
118. Maintenance of healthy wetlands at spring sources helps control mosquitoes and their larvae by providing habitat for natural predators such as birds, dragonflies and amphibians. Protecting the wetland at the spring source with a fence is an option to consider.
119. Clean and drain stock tanks before the season starts. If never cleaned or drained, many tanks will fill with silt or debris causing warmer water and heavy vegetation growth conducive to mosquito reproduction.
120. Draining tanks after the period of use is completed, particularly in warmer weather, also reduces potential habitat by eliminating stagnant standing water.
121. Maintain a properly functioning overflow to prevent water from flowing onto the pad and surrounding area, to eliminate or minimize pooling of water that is attractive to breeding mosquitoes.
122. Clean or deepen overflow ponds to maintain colder temperatures to reduce mosquito habitat.
123. Install and maintain float valves on stock tank fill pipes to minimize overflow
124. Harden stock tank pads to reduce tracks that can potentially hold water where mosquitoes may breed.
125. Build ponds with steep shorelines to reduce shallow water (>60 cm) and aquatic vegetation around the perimeter of impoundments to deter colonizing by mosquitos (Knight et al. 2003, cited in NIT report page 61).
126. Consider removing and controlling trees and shrubs to reduce shade and wind barriers on pit and reservoir shorelines if not needed for wildlife, fish, or recreational values.
127. Impoundments that remain accessible to livestock and wildlife can cause tracking and nutrient enrichment from manure which can create favorable mosquito breeding habitat. Where this is a concern, it may be desirable to fence the reservoir and pipe the water to a tank.
128. Construct dams or impoundments that minimize down-slope seepage or overflow. Seepage and overflow results in down-grade accumulation of vegetated shallow water areas that support breeding mosquitoes.

<b>Required Design Feature</b>
129. On ponds and reservoirs with enough depth and volume, introduce native fish species, which feed on mosquito larvae.
130. Line the overflow of a dam's spillway with crushed rock and constructing the spillway with steep sides to preclude the accumulation of shallow water and vegetation to reduce mosquito habitat.
131. Where an existing reservoir has filled with silt, consider cleaning to reduce shallow water habitat conducive to mosquito reproduction.
132. During confirmed West Nile virus outbreaks in sage-grouse habitat, consider larvicide applications.
<b>Travel Management</b>
133. Designate or design routes to direct use away from priority areas identified in Wildfire and Invasive Species Assessments and still provide for high-quality and sustainable travel routes and administrative access, legislatively mandated requirements, and commercial needs
<b>Recreation</b>
134. Direct use away from GRSG priority areas as described in the Wildfire and Invasive Species Assessments.
135. Eliminate or minimize external food sources for corvids.
136. Avoid development of new campgrounds or recreation facilities in nesting habitat.

Administrative Draft  
Cooperating Agency Review

## **BB. Non-Market Valuation Methods**

### **BB.1 Non-Market Valuation Methods**

This section addresses economic valuation of two categories of non-market resources that are present in the study area and could potentially be affected by the alternatives. These two categories of non-market value are values of GRSG to households in the intermountain west, and value of the ranching tradition to the ranchers themselves, residents, and visitors to the region..

The economic non-market values described in this appendix are not directly comparable to regional economic indicators commonly used to describe how natural resources on public lands contribute to the regional economic indicators such as output/sales, labor income, and employment. These indicators provide valuable information to the local public as well as to regional government agencies for purposes of public service and infrastructure planning. These impacts or contributions are often referred to as distributional effects as they describe the effects to the region. However, these indicators do not represent net economic value. For example, in economic terms, labor income associated with mineral production would actually be considered a cost to the producer. Similarly, expenditures by a recreation visitor associated with a visit to public lands would be viewed by the recreationist as a cost. One last example would be the total sales generated by the sale of minerals extracted from federally owned minerals: the total sales do not reflect the net economic value since the costs associated with the extraction are not accounted for (including labor income, supplies, and equipment, as well as potentially non-market costs such as those associated with pollution). This section considers the economic value of the non-market outputs, a concept described below.

#### **BB.1.1 Total Non-Market Economic Value**

Many of the multiple uses in the study area are not bought and sold in competitive markets. For instance, many recreational visitors to public lands pay no or low admission fees, and the presence of and/or ability to view scenic landscapes, unique geological features, and wild animals such as GRSG have no “market price,” yet have value to people. In some cases people gain value from using these non-market resources, such as photographing ranch houses, old barns and bridges, collecting colorful rocks, driving backcountry roads, and other recreation on public lands; in other cases, protection of some natural resources provides both a use value (e.g., viewing ranch and agricultural land scenery, historic buildings, and wildlife) as well as a non-use value (e.g., the value some people hold for knowing that a specific natural resource exists and is protected even if they never intend to “use” or visit it).

Economists call the sum of these two values Total Economic Value. Use values typically can be consumptive use (e.g., hunting) and/or non-consumptive, such as viewing or being present on site (e.g., camping and hiking). In contrast, non-use values occur off-site to people who derive enjoyment from knowing a scenic ranching community, historic mining town, natural environment, habitat or species exists in its natural state, either for themselves (existence value) and/or future generations (bequest value). Krutilla (1967) documents the

conceptual origins of these two elements of non-use value, and Freeman (2003) provides a rigorous theoretical treatment.

Non-use or existence values can potentially be enjoyed by millions if the good or service (e.g., the presence of a specific wild species such as wild salmon or rare bird species) is of widespread interest. Thus, while the non-use value per household may much lower than a value per day received by a visitor, in total, non-use values may be quite large.

### **BB.1.2 Values Associated with Greater Sage-Grouse Populations**

Economists have long recognized that wildlife species, especially rare, threatened, and endangered species, have economic values beyond just viewing. This is supported by a series of legal decisions and technical analyses. The US Court of Appeals in 1989 first clarified that the US Department of the Interior, in assessing damages in Natural Resource Damage Assessment cases, should include what it termed as “passive use values,” that is, existence values provided to non-users of the species, as a compensable value in addition to any use value. These passive use values are also included in Oil Pollution Act damage assessments as well. The term passive values is interchangeable with the term non-use values defined previously. This ruling and subsequent analysis for Natural Resource Damage Assessment and Oil Pollution Act assessments are consistent with well-established economic theory showing that people derive value from passive use or non-use as well as active uses of resources (Krutilla 1967). Economists have devoted a great deal of conceptual and empirical work to refining concepts and developing methods to measure these passive use values.

The dominant methods are “stated preference” methods, of which the most prominent is the Contingent Valuation Method. The basic element of this method is to use a survey to construct or simulate a market or referendum for protection or improvement of a natural environment, habitat, or species, and then having the respondent indicate whether or not they would pay for an increment of protection, and if so, how much they would pay. While the method has developed a great deal of sophistication that has increased the validity of the willingness to pay responses, there is admittedly a degree of bias that can result in stated willingness to pay exceeding actual willingness to pay by a factor averaging two to three (Loomis 2011; Murphy et al. 2005; List and Gallet 2001). While not a perfect estimator of willingness to pay, the Contingent Valuation Method provides a useful means for estimating the public’s passive use values.

Numerous academic papers and even entire books have been written on the Contingent Valuation Method. Mitchell and Carson (1989) was one of the first, while Alberini and Kahn (2006) is a more recent treatment. To date there have been about 7,500 Contingent Valuation Method studies in over 130 countries (Carson 2011). A number of federal agencies have used or referenced stated preference methods, including the US Bureau of Reclamation, US Environmental Protection Agency, National Park Service, and state agencies such as the California Department of Fish and Game, Idaho Fish and Game, and Montana Fish, Wildlife, and Parks. The USFWS commissioned an original Contingent Valuation Method study of the economic values the public receives from reintroduction of wolves in the areas of Idaho, Montana, and Wyoming, and used those values in an EIS on

wolf reintroduction (USFWS 1994). The US Bureau of Reclamation, National Park Service, and Lower Elwha S'Klallam Tribe commissioned a Contingent Valuation Method study on the value of removal of the Elwha and Glines Canyon Dams (Meyer et al. 1995). The US Bureau of Reclamation also commissioned an original Contingent Valuation Method study on the values of providing stable river flows to benefit riparian vegetation, endangered species, and cultural resources. That study was cited by then-Secretary of the Interior Bruce Babbitt as a factor in selecting the more protective flow regime from Glen Canyon Dam despite it having more foregone hydroelectricity (Babbitt 1996).

The BLM and Forest Service conducted a literature search to demonstrate the potential range of values that could be associated with species that are candidates for listing as threatened or endangered, such as GRSG populations. Analysts first verified there are no existing studies on Total Economic Value or non-use valuation specific to the GRSG. This is not an uncommon occurrence, as there are dozens of rare or potentially threatened species that have not been valued despite the very high policy relevance of the species and the large magnitude of economic value at stake in these policy decisions.

The BLM and Forest Service used three criteria to identify studies that are most applicable to the current analysis: (1) whether the species valuation study was located in the same geographic region as the GRSG habitat; (2) whether the species was listed or not listed as threatened or endangered; and (3) whether the species was hunted or not (implying a mix of use and non-use values).

The primary database of articles was the recent peer-reviewed journal article by Richardson and Loomis (2009), which is a compilation of the economic values of threatened, endangered, and rare species. A literature review was also conducted to determine if there had been any recent studies on GRSG or closely related species. Unfortunately, there is not a perfect match in the literature in terms of geographic region (intermountain) and a species that is both hunted and rare. **Table BB-1**, Existing Estimates of Annual Total Economic Value of Protecting Habitat for Species Similar to GRSG, provides a summary of the studies with features most similar to the GRSG species.

As can be seen in **Table BB-1**, Existing Estimates of Annual Total Economic Value of Protecting Habitat for Species Similar to GRSG, there is one study with a geographic region overlapping the sub-region (Mexican spotted owl), and one study on a species that was hunted at the time (wild turkey). At the time of the study, the Mexican spotted owl was a threatened species under the Endangered Species Act, and respondents were told in the survey that it was a threatened species. The whooping crane, red-cockaded woodpecker, and peregrine falcon studies involved an endangered species.

All of these studies used the Contingent Valuation Method in a mail survey. Households were asked whether they would pay a specific dollar amount, with that amount varying across individuals in the sample (i.e., the valuation questions were “closed-ended,” although the wild turkey study and red-cockaded woodpecker also used an open-ended valuation question for some respondents). Researchers used the closed-ended valuation questions to generate a statistical valuation function. This valuation function exhibited internal validity:

the higher the dollar amount households were asked to pay, the lower the percentage of them that would pay that dollar amount.

**Table BB-1**  
**Existing Estimates of Annual Total Economic Value of Protecting Habitat for Species Similar to GRSG**

Region	Species	Listed	Hunted	Annual Value per Household <sup>b</sup>	Change Valued
Four Corners (AZ, CO, NM, UT)	Mexican Spotted Owl	Yes	No	\$58.49	Avoid extinction in 15 years in Four Corners region
New England	Wild Turkey	No	Yes	\$16.72 <sup>a</sup>	Avoid extinction in New England
Texas (also L.A., NYC, Chicago, Atlanta)	Whooping Crane	Yes	No	\$43.69 <sup>a</sup>	Avoid extinction
Maine	Peregrine Falcon	Yes	No	\$32.37 (one time)	Restore self-sustaining population
South Carolina & Rest of US	Red-Cockaded Woodpecker	Yes	No	\$14.69	Restore habitat to increase chance of survival to 99%

Sources: Loomis and Ekstrand 1997 (Mexican spotted owl); Stevens et al. 1991 (New England wild turkey); Bowker and Stoll 1988 (whooping crane); Kotchen and Reiling 2000 (peregrine falcon); Reaves et al. 1999 (red-cockaded woodpecker). All of these sources are as cited in Richardson and Loomis (2009).

Notes:

- a. Average of estimates from the study.
- b. As noted in the text, these stated preference values for household may have a degree of hypothetical bias that could overstate the actual monetary amount households would pay by a factor of two to three.

With the exception of the peregrine falcon study, which asked respondents to commit to a one-time payment, each survey asked respondents to pay annually to accomplish the stated goal (typically, preventing the species from going extinct in the region of interest, although this varied by study as the table shows). For the peregrine falcon and red-cockaded woodpecker, households were told that their payment would restore a self-sustaining population (i.e., one that would not go extinct).

The original wild turkey study provided an estimate of three values (in 1990 dollars) that were averaged and then adjusted to 2012 dollars using the Consumer Price Index, resulting in a value of \$16.72 per household per year. The same procedure was used to update the 1996 dollar values of the Mexican spotted owl to 2012, resulting in values of \$58.49 per household per year. The higher values for the Mexican spotted owl may be due to the large area of habitat (4.6 million acres stated in the survey and shown on a map) that would be protected in the Four Corners area by paying, and the fact the species was not a hunted species. The whooping crane values are fairly large at \$43.69 per household per year; this value represents a Total Economic Value, including both use and non-use value, as some of the sample included people who actively “used” the species (as wildlife viewers).

The study values in **Table BB-1**, Existing Estimates of Annual Total Economic Value of Protecting Habitat for Species Similar to GRSG, demonstrate that many people, or segments of the public, hold substantial value for protecting threatened and endangered species, which may carry over to the GRSG. However, additional studies would be needed to identify values specifically for GRSG protection. Given that protection is a public good available to all households in the intermountain west, the aggregate or intermountain regional value could be substantial.

### **BB.1.3 Values Associated with Grazing Land**

Public lands managed for livestock grazing provides both market values (e.g., forage for livestock) and non-market values. Many ranchers themselves value the ranching lifestyle in excess of the income generated by the ranching operations. This is evident in some ranch sales transaction data which suggests some ranch properties have sold for more than the market value of the public land forage (Bartlett et al. 2002; Taylor 2006). One of the primary reasons public lands ranchers indicate they own land is for the “tradition, values and culture” rather than primarily for profit (Tanaka et al. 2005). Many public land ranchers work elsewhere part-time and rely on the ranch for only 20 percent of their income (Hanus 2011), relying instead on outside jobs or other savings to support their ranching lifestyle. Land appreciation has also provided increased value and therefore served as an economic resource for ranchers (Tanaka et al. 2005; Torell et al. 2005). As several of these authors note, changes in public land grazing that reduce the profitability of grazing may not directly translate to withdrawal from ranching, due to the fact that economic factors are not necessarily the primary motivation for public land ranching.

Some studies have found non-market values of ranching associated with use values to residents (Mangun et al. 2005) and tourists in the form of open space and western ranch scenery (Ellingson et al. 2006). However, some others see non-market opportunity costs associated with livestock grazing that may, depending on management methods and other variables, reduce native plant species and forage for wildlife (Todres et al. 2003). The potential exists for other residents or visitors to prefer lifestyles or have lifestyle needs that are not consistent with grazing or ranching lifestyles or landscapes.

Methods available to measure the use values to residents and tourists associated with grazing land include stated preference methods similar to contingent valuation (Ellingson et al. 2006; Mangun et al. 2005). Methods for attempting to isolate any amenity values that ranchers themselves may hold include the hedonic price method. This method uses observed sale prices of ranch land as a function of the characteristics, including both conventional market factors (e.g., size of ranch and quantity of forage) but also amenity values (e.g., scenic views, presence of wildlife species, and on-site fishing or hunting opportunities) that may be provided by the ranch (Torell et al. 2005). The additional value that ranchers pay for the amenity values of the ranch provide some indication of how much they value these amenities. Using the hedonic price method to estimate a “lifestyle value” separate from the market and amenity values has yet to be done in the literature. This may be due to the fact that lifestyle values attributed to living on a ranch or ranching is present on nearly all ranch properties sold. As such, statistically it is difficult to isolate the contribution of ranching

lifestyle to differences in ranch property values as ranching lifestyle is a common feature of nearly all ranch properties sold.

## Fire and Invasives Assessment Tool (FIAT)

This Page Intentionally Blank

Administrative Draft  
Cooperating Agency Review

In the Great Basin Region (WAFWA Management Zones III, IV, and V), the US Fish and Wildlife Service (2013) identified wildfire as a primary threat to Greater Sage-Grouse (GRSG) and its habitat. In particular, it identified wildfire in response to invasive annual grasses and conifer expansion. The Fire and Invasives Assessment Tool (FIAT) provides the BLM and other land management agencies with a framework for prioritizing wildfire management and GRSG habitat conservation.

Supported by US Forest Service General Technical Report 326 (Chambers et. al. 2014; see **Attachment 1**), FIAT provides the BLM and other agencies with a mechanism to identify and prioritize areas within GRSG habitat for potential treatment based on their resistance and resilience characteristics. In the cold desert ecosystem typical throughout the Great Basin, soil moisture and temperature fundamentally influence a landscape's ability to resist environmental change. These factors also influence the landscape's ability to be resilient after long-term ecosystem shifts following a disturbance event, such as wildfire. Low resistance and resilient landscapes are typically characterized by low elevations, south-facing slopes, and porous soils. These areas will likely respond differently to fuels management, wildfire, and subsequent rehabilitation compared to more resistant and resilient landscapes, such as those at higher elevations or on north-facing slopes.

At the resource management planning level, FIAT consists of the following parts:

- The identification of areas at the landscape level, based on national datasets and scientific literature, where the threat to GRSG and its habitat from conifer expansion and wildfire/invasive annual grass is highest
- The identification of regional and local areas where focused wildfire and habitat management is critical to GRSG conservation efforts
- The identification of overarching management strategies for conifer expansion and invasive annual grasses in the areas of habitat recovery/restoration, fuels management, fire operations, and post-fire rehabilitation/emergency stabilization and rehabilitation (ESR)

**Attachment 2** outlines the FIAT landscape-level framework and describes the anticipated process for implementing the resource management strategies in the BLM district office and National Forest Unit. Ultimately, the outcomes of the FIAT process will provide land managers with spatially defined priorities and management protocols for the following:

- Operational decision-making during fires
- Implementation of NEPA projects for invasive annual grass and conifer reduction, fuel breaks, and ESR efforts in GRSG habitat

Tech. Rep. RMRS-GTR-326. Fort Collins, CO: U.S. Department of Agriculture, Forest Service, Rocky Mountain Research Station. 73 p.

## Abstract

This Report provides a strategic approach for conservation of sagebrush ecosystems and Greater Sage-Grouse (sage-grouse) that focuses specifically on habitat threats caused by invasive annual grasses and altered fire regimes. It uses information on factors that influence (1) sagebrush ecosystem resilience to disturbance and resistance to invasive annual grasses and (2) distribution, relative abundance, and persistence of sage-grouse populations to develop management strategies at both landscape and site scales. A sage-grouse habitat matrix links relative resilience and resistance of sagebrush ecosystems with sage-grouse habitat requirements for landscape cover of sagebrush to help decision makers assess risks and determine appropriate management strategies at landscape scales. Focal areas for management are assessed by overlaying matrix components with sage-grouse Priority Areas for Conservation (PACs), breeding bird densities, and specific habitat threats. Decision tools are discussed for determining the suitability of focal areas for treatment and the most appropriate management treatments.

## Introduction

---

An unprecedented conservation effort is underway across 11 States in the western United States to reduce threats to Greater Sage-Grouse (*Centrocercus urophasianus*; hereafter, sage-grouse) and the sagebrush ecosystems on which they depend (fig. 1). Recent efforts were accelerated by the March 2010 determination that sage-grouse warrant protection under the Federal Endangered Species Act, and by increased emphasis on broad collaboration among state and Federal partners to proactively identify and implement actions to reverse current trends (USFWS 2010, 2013). Conservation success hinges on being able to achieve “the long-term conservation of sage-grouse and healthy sagebrush shrub and native perennial grass and forb communities by maintaining viable, connected, and well-distributed populations and habitats across their range, through threat amelioration, conservation of key habitats, and restoration activities” (USFWS 2013). While strides are being made to curtail a host of threats across the range, habitat loss and fragmentation due to wildfire and invasive plants remain persistent challenges to

Figure 1. Greater Sage-Grouse (*Centrocercus urophasianus*) (photo by Charlotte Ganskopp).

achieving desired outcomes – particularly in the western portion of the range (Miller et al. 2011; USFWS 2010; 2013). Management responses to date have not been able to match the scale of this problem. Natural resource managers are seeking coordinated approaches that focus appropriate management actions in the right places to maximize conservation effectiveness (Wisdom and Chambers 2009; Murphy et al. 2013).

Improving our ability to manage for resilience to disturbance and resistance to invasive species is fundamental to achieving long-term sage-grouse conservation objectives. Resilient ecosystems have the capacity to *regain* their fundamental structure, processes, and functioning when altered by stressors like drought and disturbances like inappropriate livestock grazing and altered fire regimes (Holling 1973; Allen et al. 2005). Species resilience refers to the ability of a species to recover from stressors and disturbances (USFWS 2013), and is closely linked to ecosystem resilience. Resistant ecosystems have the capacity to *retain* their fundamental structure, processes, and functioning when exposed to stresses, disturbances, or invasive species (Folke et al. 2004). Resistance to invasion by nonnative plants is increasingly important in sagebrush ecosystems; it is a function of the abiotic and biotic attributes and ecological processes of an ecosystem that limit the population growth of an invading species (D'Antonio and Thomsen 2004). A detailed explanation of the factors that influence resilience and resistance in sagebrush ecosystems is found in Chambers et al. 2014.

In general, species are likely to be more resilient if large populations exist in large blocks of high quality habitat across the full breadth of environmental variability to which the species is adapted (Redford et al. 2011). Because sage-grouse are a broadly distributed and often wide-ranging species that may move long-distances between seasonal habitats (Connelly et al. 2011a,b), a strategic approach that integrates both landscape prioritization and site-scale decision tools is needed. This document develops such an approach for the conservation of sagebrush habitats across the range of sage-grouse with an emphasis on the western portion of the range. In recent years, information and tools have been developed that significantly increase our understanding of factors that influence the resilience of sagebrush ecosystems and the distribution of sage-grouse populations, and that allow us to strategically prioritize management activities where they are most likely to be effective and to benefit the species. Although the emphasis of this Report is on the western portion of the sage-grouse range, the approach has management applicability to other sagebrush ecosystems.

In this report, we briefly review causes and effects of invasive annual grasses and altered fire regimes, and then discuss factors that determine resilience to disturbances like wildfire and resistance to invasive annual grasses in sagebrush ecosystems. We illustrate how an understanding of resilience and resistance, sagebrush habitat requirements for sage-grouse, and consequences that invasive annual grasses and wildfire have on sage-grouse populations can be used to develop management strategies at both landscape and site scales. A sage-grouse habitat matrix is provided that links relative resilience and resistance with habitat requirements for landscape cover of sagebrush to both identify priority areas for management and determine effective management strategies at landscape scales. An approach for assessing focal areas for sage-grouse habitat management is described that overlays Priority Areas for Conservation (PACs) and breeding bird densities with resilience and resistance and habitat suitability to spatially link sage-grouse populations with habitat conditions and risks. The use of this approach is illustrated for the western portion of the range and for a diverse area in the northeast corner of Nevada. It concludes with a discussion of the tools available for determining the suitability of focal areas for treatment and the most appropriate management treatments. Throughout the document, the emphasis is on using this approach to guide and assist fire operations, fuels management, post-fire rehabilitation, and habitat restoration activities to maintain or enhance sage-grouse habitat.

# Threats of Invasive Annual Grasses and Altered Fire Regimes to Sagebrush Ecosystems and Sage-Grouse

---

## Effects on Sagebrush Ecosystems

Sage-grouse habitat loss and fragmentation due to wildfire and invasive plants are widely recognized as two of the most significant challenges to conservation of the species, particularly in the western portion of the range (Miller et al. 2011; USFWS 2010, 2013). During pre-settlement times, sagebrush-dominated ecosystems had highly variable fire return intervals that ranged from decades to centuries (Frost 1998; Brown and Smith 2000; Miller et al. 2011). At coarse regional scales, fire return intervals in sagebrush ecological types were determined largely by climate and its effects on fuel abundance and continuity. Consequently, fire frequency was higher in sagebrush types with greater productivity at higher elevations and following periods of increased precipitation than in lower elevation and less productive ecosystems (West 1983b; Mensing et al. 2006). At local scales within sagebrush types, fire return intervals likely were determined by topographic and soil effects on productivity and fuels and exhibited high spatial and temporal variability (Miller and Heyerdahl 2008).

Euro-American arrival in sagebrush ecosystems began in the mid-1800s and initiated a series of changes in vegetation composition and structure that altered fire regimes and resulted in major changes in sagebrush habitats. The first major change in fire regimes occurred when inappropriate grazing by livestock led to a decrease in native perennial grasses and forbs and effectively reduced the abundance of fine fuels (Knapp 1996; Miller and Eddleman 2001; Miller et al. 2011). Decreased competition from perennial herbaceous species, in combination with ongoing climate change and favorable conditions for woody species establishment at the turn of the twentieth century, resulted in increased abundance of shrubs (primarily *Artemisia* species) and trees, including juniper (*Juniperus occidentalis*, *J. osteosperma*) and piñon pine (*Pinus monophylla*), at mid to high elevations (Miller and Eddleman 2001; Miller et al. 2011). The initial effect of these changes in fuel structure was a reduction in fire frequency and size. The second major change in fire regimes occurred when non-native annual grasses (e.g., *Bromus tectorum*, *Taeniatherum caput-medusa*) were introduced from Eurasia in the late 1800s and spread rapidly into low to mid-elevation ecosystems with depleted understories (Knapp 1996). The invasive annual grasses increased the amount and continuity of fine fuels in many lower elevation sagebrush habitats and initiated annual grass/fire cycles characterized by shortened fire return intervals and larger, more contiguous fires (fig. 2; D'Antonio and Vitousek 1992; Brooks et al. 2004). Since settlement of the region, cheatgrass came to dominate as much as 4 million hectares (9.9 million acres) in the states of Nevada and Utah alone (fig. 3; Bradley and Mustard 2005). The final change in fire regimes occurred as a result of expansion of juniper and piñon pine trees into sagebrush types at mid to high elevations and a reduction of the grass, forb, and shrub species associated with these types. Ongoing infilling of trees is increasing woody fuels, but reducing fine fuels and resulting in less frequent fires (fig. 4; Miller et al. 2013). Extreme burning conditions (high winds, high temperatures, and low relative humidity) in high density (Phase III) stands are resulting in large and severe fires that result in significant losses of above- and below-ground organic matter (sensu Keeley 2009) and have detrimental ecosystem effects (Miller et al. 2013). Based on tree-ring analyses at several Great Basin sites, it is estimated that the extent of piñon and/or juniper woodland increased two to six fold since settlement, and most of that area will exhibit canopy closure within the next 50 years (Miller et al. 2008).

## Effects on Sage-Grouse Habitat Selection and Population Dynamics

Understanding the effects of landscape changes on sage-grouse habitat selection and population dynamics can help managers apply more strategic and targeted conservation actions to reduce risks. Two key land cover shifts resulting from invasive annual grasses and altered fire regimes are affecting the ability to achieve the range-wide goal of stable-to-increasing population trends – large-scale reduction of sagebrush cover and conversion of sagebrush ecosystems to annual grasslands.

Sage-grouse are true sagebrush obligates that require large and intact sagebrush landscapes. Consequently, wildfires occurring at the extremes of the natural range of variability that remove sagebrush, even temporarily, over large areas and over short time periods often have negative consequences for sage-grouse. Several range-wide studies have identified the proportion of sagebrush-dominated land cover as a key indicator of sage-grouse population persistence and, importantly, have revealed critical levels of sagebrush landscape cover required by sage-grouse (see Appendix 2 for a description of landscape cover and how it is derived). Knick et al. (2013) found that 90% of active leks in the western portion of the range had more than 40% landscape cover of sagebrush within a 5-km (3.1-mi) radius of leks. Another range-wide analysis documented a high risk of extirpation with <27% sagebrush landscape cover and high probability of persistence with >50% sagebrush landscape cover within 18-km (11.2-mi) of leks (Wisdom et al. 2011). Similarly, Aldridge et al. (2008) found long-term sage-grouse persistence required a minimum of 25%, and preferably at least 65%, sagebrush landscape cover at the 30-km (18.6-mi) scale. Considered collectively, cumulative disturbances that reduce the cover of sagebrush to less than a quarter of the landscape have a high likelihood of resulting in local population extirpation, while the probability of maintaining persistent populations goes up considerably as the proportion of sagebrush cover exceeds two-thirds or more of the landscape. Reduction of sagebrush cover is most critical in low to mid elevations where natural recovery of sagebrush can be very limited within timeframes important to sage-grouse population dynamics (Davies et al. 2011).

Nonnative annual grasses and forbs have invaded vast portions of the sage-grouse range, reducing both habitat quantity and quality (Beck and Mitchell 2000; Rowland et al. 2006; Miller et al. 2011; Balch et al. 2013). Due to repeated fires, some low- to mid-elevation native sagebrush communities are shifting to novel annual grassland states resulting in habitat loss that may be irreversible with current technologies (Davies et al. 2011; Miller et al. 2011; Chambers et al. 2014). At the broadest scales, the presence of non-native annual grasslands on the landscape may be influencing both sage-grouse distribution and abundance. In their analysis of active leks, Knick et al. (2013) found that most leks had very little annual grassland cover (2.2%) within a 5-km (3.1-mi) radius of the leks; leks that were no longer used had almost five times as much annual grassland cover as active leks. Johnson et al. (2011) found that lek use became progressively less as the cover of invasive annual species increased at both the 5-km (3.1-mi) and 18-km (11.2-mi) scales. Also, few leks had >8% invasive annual vegetation cover within both buffer distances.

Patterns of nest site selection also suggest local impacts of invasive annual grasses on birds. In western Nevada, Lockyer (2012) found that sage-grouse selected large expanses of sagebrush-dominated areas and, within those areas, sage-grouse selected microsites with higher shrub canopy cover and lower cheatgrass cover. Average cheatgrass cover at selected locations was 7.1% compared to 13.3% at available locations. Sage-grouse hens essentially avoided nesting in areas with higher cheatgrass cover. Kirol et al. (2012) also found nest-site selection was negatively correlated with the presence of cheatgrass in south-central Wyoming.

Sage-grouse population demographic studies in northern Nevada show that recruitment and annual survival also are affected by presence of annual grasslands at larger scales. Blomberg et al. (2012) analyzed land cover within a 5-km (3.1-mi) radius of leks and found that leks impacted by annual grasslands experienced lower recruitment than non-impacted leks, even following years of high precipitation. Leks that were not affected by invasive annual grasslands exhibited recruitment rates nearly twice as high as the population average and nearly six times greater than affected leks during years of high precipitation.

Piñon and juniper expansion at mid to upper elevations into sagebrush ecosystems also has altered fire regimes and reduced sage-grouse habitat availability and suitability over large areas with population-level consequences (Miller et al. 2011; Baruch-Mordo et al. 2013; Knick et al. 2013). Conifer expansion results in non-linear declines in sagebrush cover and reductions in perennial native grasses and forbs as conifer canopy cover increases (Miller et al. 2000) and this has direct effects on the amount of available habitat for sagebrush-obligate species. Sites in the late stage of piñon and juniper expansion and infilling (Phase III from Miller et al. 2005) have reduced fire frequency (due to decreased fine fuels), but are prone to higher severity fires (due to increased woody fuels) which significantly reduces the likelihood of sagebrush habitat recovery (fig. 5) (Bates et al. 2013). Even before direct habitat loss occurs, sage-grouse avoid or are negatively associated with conifer cover during all life stages (i.e., nesting, brood-rearing, and wintering; Doherty et al. 2008, 2010a; Atamian et al. 2010; Casazza et al. 2011). Also, sage-grouse incur population-level impacts at a very low level of conifer encroachment. The ability to maintain active leks is severely compromised when conifer canopy exceeds 4% in the immediate vicinity of the lek (Baruch-Mordo et al. 2013), and most active leks average less than 1% conifer cover at landscape scales (Knick et al. 2013).

**Figure 5.** A post-burn, Phase III, singleleaf piñon and Utah juniper dominated sagebrush ecosystem in which soils are highly erosive and few understory plants remain (photo by Jeanne C. Chambers).

## Resilience to Disturbance and Resistance to Invasive Annual Grasses in Sagebrush Ecosystems

Our ability to address the changes occurring in sagebrush habitats can be greatly enhanced by understanding the effects of environmental conditions on resilience to stress and disturbance, and resistance to invasion (Wisdom and Chambers 2009; Brooks and Chambers 2011; Chambers et al. 2014). In cold desert ecosystems, resilience of native ecosystems to stress and disturbance changes along climatic and topographic gradients. In these ecosystems, Wyoming big sagebrush (*Artemisia tridentata* spp. *wyomingensis*), mountain big sagebrush (*A. t.* spp. *vaseyana*), and mountain brush types (e.g., mountain big sagebrush, snowberry [*Symphoricarpos* spp.], bitterbrush [*Purshia tridentata*]) occur at progressively higher elevations and are associated with decreasing temperatures and increasing amounts of precipitation, productivity, and fuels (fig. 6; West and Young 2000). Piñon pine and juniper woodlands are typically associated with mountain big sagebrush types, but can occur with relatively cool and moist Wyoming big sagebrush types and warm and moist mountain brush types (Miller et al. 2013). Resilience to disturbance, including wildfire, has been shown to increase along these elevation gradients (fig. 7A) (Condon et al. 2011; Davies et al. 2012; Chambers et al. 2014; Chambers et al. *in press*). Higher precipitation and cooler temperatures, coupled with greater soil development and plant productivity at mid to high elevations, can result in greater resources and more favorable environmental conditions for plant growth and reproduction (Alexander et al. 1993; Dahlgren et al. 1997). In contrast, minimal precipitation and high temperatures at low elevations result in lower resource availability for plant growth (West 1983a,b;

**Figure 6.** The dominant sagebrush ecological types that occur along environmental gradients in the western United States. As elevation increases, soil temperature and moisture regimes transition from warm and dry to cold and moist and vegetation productivity and fuels become higher.

**Figure 7. (A)** Resilience to disturbance and **(B)** resistance to cheatgrass over a typical temperature/precipitation gradient in the cold desert. Dominant ecological sites occur along a continuum that includes Wyoming big sagebrush on warm and dry sites, to mountain big sagebrush on cool and moist sites, to mountain big sagebrush and root-sprouting shrubs on cold and moist sites. Resilience increases along the temperature/precipitation gradient and is influenced by site characteristics like aspect. Resistance also increases along the temperature/precipitation gradient and is affected by disturbances and management treatments that alter vegetation structure and composition and increase resource availability (modified from Chambers et al. 2014; Chambers et al. *in press*).

Smith and Nowak 1990). These relationships also are observed at local plant community scales where aspect, slope, and topographic position affect solar radiation, erosion processes, effective precipitation, soil development and vegetation composition and structure (Condon et al. 2011; Johnson and Miller 2006).

Resistance to invasive annual grasses depends on environmental factors and ecosystem attributes and is a function of (1) the invasive species' physiological and life history requirements for establishment, growth, and reproduction, and (2) interactions with the native perennial plant community including interspecific competition and response to herbivory and pathogens. In cold desert ecosystems, resistance is strongly influenced by soil temperature and moisture regimes (Chambers et al. 2007; Meyer et al. 2001). Germination, growth, and/or reproduction of cheatgrass is physiologically limited at low elevations by frequent, low precipitation years, constrained at high elevations by low soil temperatures, and optimal at mid elevations under relatively moderate temperature and water availability (fig. 7B; Meyer et al. 2001; Chambers et al. 2007). Slope, aspect, and soil characteristics modify soil temperature and moisture and influence resistance to cheatgrass at landscape to plant community scales (Chambers et al. 2007; Condon et al. 2011; Reisner et al. 2013). Genetic variation in cheatgrass results in phenotypic traits that increase survival and persistence in populations from a range of environments, and is likely contributing to the recent range expansion of this highly inbreeding species into marginal habitats (Ramakrishnan et al. 2006; Merrill et al. 2012).

The occurrence and persistence of invasive annual grasses in sagebrush habitats is strongly influenced by interactions with the native perennial plant community (fig. 7B). Cheatgrass, a facultative winter annual that can germinate from early fall through early spring, exhibits root elongation at low soil temperatures, and has higher nutrient uptake and growth rates than most native species (Mack and Pyke 1983; Arredondo et al. 1998; James et al. 2011). Seedlings of native, perennial plant species are generally poor competitors with cheatgrass, but adults of native, perennial grasses and forbs, especially those with similar growth forms and phenology, can be highly effective competitors with the invasive annual (Booth et al. 2003; Chambers et al. 2007; Blank and Morgan 2012).

Also, biological soil crusts, which are an important component of plant communities in warmer and drier sagebrush ecosystems, can reduce germination or establishment of cheatgrass (Eckert et al. 1986; Kaltenecker et al. 1999). Disturbances or management treatments that reduce abundance of native perennial plants and biological soil crusts and increase the distances between perennial plants often are associated with higher resource availability and increased competitive ability of cheatgrass (Chambers et al. 2007; Reisner et al. 2013; Roundy et al. *in press*).

The type, characteristics, and natural range of variability of stress and disturbance strongly influence both resilience and resistance (Jackson 2006). Disturbances like overgrazing of perennial plants by livestock, wild horses, and burros and more frequent or more severe fires are typically outside of the natural range of conditions and can reduce the resilience of sagebrush ecosystems. Reduced resilience is triggered by changes in environmental factors like temperature regimes, abiotic attributes like water and nutrient availability, and biotic attributes such as vegetation structure, composition, and productivity (Chambers et al. 2014) and cover of biological soil crusts (Reisner et al. 2013). Resistance to an invasive species can change when changes in abiotic and biotic attributes result in increased resource availability or altered habitat suitability that influences an invasive species' ability to establish and persist and/or compete with native species. Progressive losses of resilience and resistance can result in the crossing of abiotic and/or biotic thresholds and an inability of the system to recover to the reference state (Beisner et al. 2003; Seastedt et al. 2008).

Interactions among disturbances and stressors may have cumulative effects (Chambers et al. 2014). Climate change already may be shifting fire regimes outside of the natural range of occurrence (i.e., longer wildfire seasons with more frequent and longer duration wildfires) (Westerling et al. 2006). Sagebrush ecosystems generally have low productivity, and the largest number of acres burned often occurs a year or two after warm, wet conditions in winter and spring that result in higher fine fuel loads (Littell et al. 2009). Thus, annual grass fire cycles may be promoted by warm, wet winters and a subsequent increase in establishment and growth of invasive winter annuals. These cycles may be exacerbated by rising atmospheric CO<sub>2</sub> concentrations, N deposition, and increases in human activities that result in soil surface disturbance and invasion corridors (Chambers et al. 2014). Modern deviations from historic conditions will likely continue to alter disturbance regimes and sagebrush ecosystem response to disturbances; thus, management strategies that rely on returning to historical or "pre-settlement" conditions may be insufficient, or even misguided, given novel ecosystem dynamics (Davies et al. 2009).

## **Integrating Resilience and Resistance Concepts With Sage-Grouse Habitat Requirements to Manage Wildfire and Invasive Annual Grass Threats at Landscape Scales**

---

The changes in sagebrush ecosystem dynamics due to invasive annual species and longer, hotter, and drier fire seasons due to a warming climate make it unlikely that these threats can be ameliorated completely (Abatzoglou and Kolden 2011; USFWS 2013). Consequently, a strategic approach is necessary to conserve sagebrush habitat and sage-grouse (Wisdom et al. 2005; Meinke et al. 2009; Wisdom and Chambers 2009; Pyke 2011). This strategic approach requires the ability to (1) identify those locations that provide current or potential habitat for sage-grouse and (2) prioritize management actions based on the capacity of the ecosystem to respond in the desired manner and to effectively allocate resources to achieve desired objectives. Current understanding of the relationship of landscape cover of sagebrush to sage-grouse habitat provides the capacity to identify those locations on the landscape that have a high probability of

sage-grouse persistence (Aldridge et al. 2008; Wisdom et al. 2011; Knick et al. 2013). Similarly, knowledge of the relationships of environmental characteristics, specifically soil temperature and moisture regimes, to ecological types and their inherent resilience and resistance gives us the capacity to prioritize management actions based on probable effectiveness of those actions (Wisdom and Chambers 2009; Brooks and Chambers 2011; Miller et al. 2013; Chambers et al. 2014; Chambers et al. *in press*).

In this section, we discuss the use of landscape cover of sagebrush as an indicator of sage-grouse habitat, and the use of soil temperature and moisture regimes as an indicator of resilience to disturbance, resistance to invasive annual grasses and, ultimately, the capacity to achieve desired objectives. We then show how these two concepts can be coupled in a sage-grouse habitat matrix and used to determine potential management strategies at the landscape scales on which sage-grouse depends.

## Landscape Cover of Sagebrush as an Indicator of Sage-Grouse Habitat

Landscape cover of sagebrush is closely related to the probability of maintaining active sage-grouse leks, and is used as one of the primary indicators of sage-grouse habitat potential at landscape scales (Aldridge et al. 2008; Wisdom et al. 2011; Knick et al. 2013). Landscape cover of sagebrush less than about 25% has a low probability of sustaining active sage-grouse leks (Aldridge et al. 2008; Wisdom et al. 2011; Knick et al. 2013). Above 25% landscape cover of sagebrush, the probability of maintaining active sage-grouse leks increases with increasing sagebrush landscape cover. At landscape cover of sagebrush ranging from 50 to 85%, the probability of sustaining sage-grouse leks becomes relatively constant (Aldridge et al. 2008; Wisdom et al. 2011; Knick et al. 2013). For purposes of prioritizing landscapes for sage-grouse habitat management, we use 25% as the level below which there is a low probability of maintaining sage-grouse leks and 65% as the level above which there is little additional increase in the probability of sustaining active leks with further increases of landscape cover of sagebrush (fig. 8; Knick et al. 2013). Between about 25% and 65% landscape sagebrush cover, increases in landscape cover of sagebrush have a constant positive relationship with sage-grouse lek probability (fig. 8; Knick et al. 2013). Restoration and management activities that result in an increase in the amount of sagebrush dominated landscape within areas of pre-existing landscape cover between 25% and 65% likely will result in a higher probability of sage-grouse persistence, while declines in landscape cover of sagebrush likely will result in reductions in sage-grouse (Knick et al. 2013). It is important to note that

**Figure 8.** The proportion of sage-grouse leks and habitat similarity index (HSI) as related to the percent landscape cover of sagebrush. The HSI indicates the relationship of environmental variables at map locations across the western portion of the range to minimum requirements for sage-grouse defined by land cover, anthropogenic variables, soil, topography, and climate. HSI is the solid black line  $\pm$  1 SD (stippled lines). Proportion of leks are the grey bars. Dashed line indicates HSI values above which characterizes 90% of active leks (0.22). The categories at the top of the figure and the interpretation of lek persistence were added based on Aldridge et al. 2008; Wisdom et al. 2011; and Knick et al. 2013 (figure modified from Knick et al. 2013).

these data and interpretations relate only to persistence (i.e., whether or not a lek remains active) and it is likely that higher proportions of sagebrush cover or improved condition of sagebrush ecosystems may be required for population growth.

For the purposes of delineating sagebrush habitat relative to sage-grouse requirements for landscape cover of sagebrush, we calculated the percentage landscape sagebrush cover within each of the selected categories (1-25%, 26-65%, >65%) for the range of sage-grouse (fig. 9, 10). An explanation of how landscape cover of sagebrush is derived is in Appendix 2. Large areas of landscape sagebrush cover >65% are found primarily in Management Zones (MZ) II (Wyoming Basin), IV (Snake River Plains), and V (Northern Great Basin). In contrast, relatively small areas of landscape sagebrush cover >65% are located in MZ I (Great Plains), III (Southern Great Basin), VI (Columbia Basin), and VII (Colorado Plateau). Sagebrush is naturally less common in the Great Plains region compared to other parts of the range and previous work suggested that sage-grouse populations in MZ I may be more vulnerable to extirpation with further reductions in sagebrush cover (Wisdom et al. 2011). In the western portion of the range, where the threat of invasive annual grasses and wildfire is greatest, the area of sagebrush cover >65% differs among MZs. MZ III is a relatively arid and topographically diverse area in which the greatest extent of sagebrush cover >65% is in higher elevation, mountainous areas. MZs IV and V have relatively large extents of sagebrush cover >65% in relatively cooler and wetter areas, and MZs IV and VI have lower extents of sagebrush cover >65% in warmer and dryer areas and in areas with significant agricultural development. These differences in landscape cover of sagebrush indicate that different sets of management strategies may apply to the various MZs.

## Soil Temperature and Moisture Regimes as Indicators of Ecosystem Resilience and Resistance

Potential resilience and resistance to invasive annual grasses reflect the biophysical conditions that an area is capable of supporting. In general, the highest potential resilience and resistance occur with *cool to cold* (frigid to cryic) soil temperature regimes and relatively *moist* (xeric to ustic) soil moisture regimes, while the lowest potential resilience and resistance occur with *warm* (mesic) soil temperatures and relatively *dry* (aridic) soil moisture regimes (Chambers et al. 2014, Chambers et al. *in press*). Definitions of soil temperature and moisture regimes are in Appendix 3. Productivity is elevated by high soil moisture and thus resilience is increased (Chambers et al. 2014); annual grass growth and reproduction is limited by cold soil temperatures and thus resistance is increased (Chambers et al. 2007). The timing of precipitation also is important because cheatgrass and many other invasive annual grasses are particularly well-adapted to Mediterranean type climates with cool and wet winters and warm and dry summers (Bradford and Lauenroth 2006; Bradley 2009). In contrast, areas that receive regular summer precipitation (ustic soil moisture regimes) often are dominated by warm and/or cool season grasses (Sala et al. 1997) that likely create a more competitive environment and result in greater resistance to annual grass invasion and spread (Bradford and Lauenroth 2006; Bradley 2009).

Much of the remaining sage-grouse habitat in MZs I (Great Plains), II (Wyoming Basin), VII (Colorado Plateau), and cool-to-cold or moist sites scattered across the range, are characterized by moderate to high resilience and resistance as indicated by soil temperature and moisture regimes (fig. 11). Sagebrush habitats across MZ I are unique from a range-wide perspective because soils are predominantly cool and ustic, or bordering on ustic as a result of summer precipitation; this soil moisture regime appears to result in higher resilience and resistance (Bradford and Lauenroth 2006).

- Omitted or No Data

0 200 400 800 Kilometers

**Figure 11.** The soil temperature and moisture regimes for the range of sage-grouse (Management Zones I – VII; Stiver et al. 2006). Soil temperature and moisture classes were derived from the Natural Resources Conservation Service (NRCS) Soil Survey Geographic Database (SSURGO) (Soil Survey Staff 2014a). Gaps in that dataset were filled in with the NRCS State Soil Geographic Database (STATSGO) (Soil Survey Staff 2014b).

However, significant portions of MZs III (Southern Great Basin), much of IV (Snake River Plains), V (Northern Great Basin), and VI (Columbia Basin) are characterized largely by either warm and dry, or warm to cool and moist ecological types with moderate to low resilience and resistance (fig. 11; table 1). Areas within these MZs that have warm and dry soils are typically characterized by Wyoming big sagebrush ecosystems with low to moderately low resilience and resistance and are currently of greatest concern for sage-grouse conservation (fig. 12A). Areas with warm to cool soil temperature regimes and moist precipitation regimes are typically characterized by either Wyoming or mountain big sagebrush, have moderate to moderately low resilience and resistance,

**Table 1.** Predominant sagebrush ecological types in Sage-Grouse Management Zones III, IV, V, and VI based on soil temperature and soil moisture regimes, typical characteristics, and resilience to disturbance and resistance to invasive annual grasses (modified from Miller et al. 2014 a,b). Relative abundance of sagebrush species and composition of understory vegetation vary depending on Major Land Resource Area and ecological site type.

Ecological type	Characteristics	Resilience and resistance
Cold and Moist (Cryic/Xeric)	Ppt: 14 inches + Typical shrubs: <i>Mountain big sagebrush</i> , <i>snowfield sagebrush</i> , <i>snowberry</i> , <i>serviceberry</i> , <i>silver sagebrush</i> , and/or <i>low sagebrushes</i>	<i>Resilience</i> – <b>Moderately high</b> . Precipitation and productivity are generally high. Short growing seasons can decrease resilience on coldest sites. <i>Resistance</i> – <b>High</b> . Low climate suitability to invasive annual grasses.
Cool and Moist (Frigid/Xeric)	Ppt: 12-22 inches Typical shrubs: <i>Mountain big sagebrush</i> , <i>antelope bitterbrush</i> , <i>snowberry</i> , and/or <i>low sagebrushes</i>  Piñon pine and juniper potential in some areas	<i>Resilience</i> – <b>Moderately high</b> . Precipitation and productivity are generally high. Decreases in site productivity, herbaceous perennial species, and ecological conditions can decrease resilience. <i>Resistance</i> – <b>Moderate</b> . Climate suitability to invasive annual grasses is moderate, but increases as soil temperatures increase.
Warm and Moist (Mesic/Xeric)	Ppt: 12-16 inches Typical shrubs: <i>Wyoming big sagebrush</i> , <i>mountain big sagebrush</i> , <i>Bonneville big sagebrush</i> , and/or <i>low sagebrushes</i>  Piñon pine and juniper potential in some areas	<i>Resilience</i> – <b>Moderate</b> . Precipitation and productivity are moderately high. Decreases in site productivity, herbaceous perennial species, and ecological conditions can decrease resilience. <i>Resistance</i> – <b>Moderately low</b> . Climate suitability to invasive annual grasses is moderately low, but increases as soil temperatures increase.
Cool and Dry (Frigid/Aridic)	Ppt: 6-12 inches Typical shrubs: <i>Wyoming big sagebrush</i> , <i>black sagebrush</i> , and/or <i>low sagebrushes</i>	<i>Resilience</i> – <b>Low</b> . Effective precipitation limits site productivity. Decreases in site productivity, herbaceous perennial species, and ecological conditions further decrease resilience. <i>Resistance</i> – <b>Moderate</b> . Climate suitability to invasive annual grasses is moderate, but increases as soil temperatures increase.
Warm and Dry (Mesic/Aridic, bordering on Xeric)	Ppt: 8-12 inches Typical shrubs: <i>Wyoming big sagebrush</i> , <i>black sagebrush</i> and/or <i>low sagebrushes</i>	<i>Resilience</i> – <b>Low</b> . Effective precipitation limits site productivity. Decreases in site productivity, herbaceous perennial species, and ecological conditions further decrease resilience. Cool season grasses susceptibility to grazing and fire, along with hot dry summer fire conditions, promote cheatgrass establishment and persistence. <i>Resistance</i> – <b>Low</b> . High climate suitability to cheatgrass and other invasive annual grasses. Resistance generally decreases as soil temperature increases, but establishment and growth are highly dependent on precipitation.

and have the potential for piñon and juniper expansion (Miller et al. 2014a; Chambers et al. *in press*). Many of these areas also are of conservation concern because piñon and juniper expansion and tree infilling can result in progressive loss of understory species and altered fire regimes (Miller et al. 2013). In contrast, areas with cool to cold soil temperature regimes and moist precipitation regimes have moderately high resilience and high resistance and are likely to recover in a reasonable amount of time following wildfires and other disturbances (Miller et al. 2013) (fig. 12B)

**Figure 12.** A Wyoming big sagebrush ecosystem with warm and dry soils in southeast Oregon (top) (photo by Richard F. Miller), compared to a mountain big sagebrush ecosystem with cool and moist soils in central Nevada (bottom) (photo by Jeanne C. Chambers).

## Management Strategies Based on Landscape Cover of Sagebrush and Ecosystem Resilience and Resistance: The Sage-Grouse Habitat Matrix

Knowledge of the potential resilience and resistance of sagebrush ecosystems can be used in conjunction with sage-grouse habitat requirements to determine priority areas for management and identify effective management strategies at landscape scales (Wisdom and Chambers 2009). The sage-grouse habitat matrix (table 2) illustrates the relative resilience to disturbance and resistance to invasive annual grasses of sagebrush ecosystems in relation to the proportion of sagebrush cover on the landscape. As resilience and resistance go from high to low, as indicated by the rows in the matrix, decreases in sagebrush regeneration and abundance of perennial grasses and forbs progressively limit the capacity of a sagebrush ecosystem to recover after fire or other disturbances. The risk of annual invasives increases and the ability to successfully restore burned or otherwise disturbed areas decreases. As sagebrush cover goes from low to high within these same ecosystems, as indicated by the columns in the matrix, the capacity to provide adequate habitat cover for sage-grouse increases. Areas with less than 25% landscape cover of sagebrush are unlikely to provide adequate habitat for sage-grouse; areas with 26-65% landscape cover of sagebrush can provide habitat for sage-grouse but are at risk if sagebrush loss occurs without recovery; and areas with >65% landscape cover of sagebrush provide the necessary habitat conditions for sage-grouse to persist. Potential landscape scale management strategies can be determined by considering (1) resilience to disturbance, (2) resistance to invasive annuals, and (3) sage-grouse land cover requirements. Overarching management strategies to maintain or increase sage-grouse habitat at landscape scales based on these considerations are conservation, prevention, restoration, and monitoring and adaptive management (table 3; see Chambers et al. 2014). These strategies have been adapted for each of the primary agency programs including fire operations, fuels management, post-fire rehabilitation, and habitat restoration (table 4). Because sagebrush ecosystems occur over continuums of environmental conditions, such as soil temperature and moisture, and have differing land use histories and species composition, careful assessment of the area of concern always will be necessary to determine the relevance of a particular strategy (Pyke 2011; Chambers et al. 2014; Miller et al. 2014 a, b). The necessary information for conducting this type of assessment is found in the "Putting It All Together" section of this report.

Although the sage-grouse habitat matrix (table 2) can be viewed as partitioning land units into spatially discrete categories (i.e., landscapes or portions thereof can be categorized as belonging to one of nine categories), it is not meant to serve as a strict guide to spatial allocation of resources or to prescribe specific management strategies. Instead, the matrix should serve as a decision support tool for helping managers implement strategies that consider both the resilience and resistance of the landscape and landscape sagebrush cover requirements of sage-grouse. For example, low elevation Wyoming big sagebrush plant communities with relatively low resilience and resistance may provide important winter habitat resources for a given sage-grouse population. In a predominantly Wyoming big sagebrush area comprised of relatively low sagebrush landscape cover, a high level of management input may be needed to realize conservation benefits for sage-grouse. This doesn't mean that management activities should not be undertaken if critical or limiting sage-grouse habitat resources are present, but indicates that inputs will be intensive, potentially more expensive, and less likely to succeed relative to more resilient landscapes. It is up to the user of the matrix to determine how such tradeoffs influence management actions.

**Table 2.** Sage-grouse habitat matrix based on resilience and resistance concepts from Chambers et al. 2014, and sage-grouse habitat requirements from Aldridge et al. 2008, Wisdom et al. 2011, and Knick et al. 2013. Rows show the ecosystems relative resilience to disturbance and resistance to invasive annual grasses derived from the sagebrush ecological types in table 1 (1 = high resilience and resistance; 2 = moderate resilience and resistance; 3 = low resilience and resistance). Columns show the current proportion of the landscape (5-km rolling window) dominated by sagebrush (A = 1-25% land cover; B = 26-65% land cover; 3 = >65% land cover). Use of the matrix is explained in text. Overarching management strategies that consider resilience and resistance and landscape cover of sagebrush are in table 3. Potential management strategies specific to agency program areas, including fire operations, fuels management, post-fire rehabilitation, and habitat restoration are in table 4.

		Proportion of Landscape Dominated by Sagebrush		
		Low 1-25%	Moderate 26-65%	High >65%
High		<p>Too little sagebrush on the landscape significantly threatens likelihood of sage-grouse persistence.</p> <p><b>1A</b></p> <p>Natural sagebrush recovery is likely to occur, but if large, contiguous areas lack sagebrush, the time required for recovery may be too great.</p>	<p>Sage-grouse are sensitive to the amount of sagebrush remaining on the landscape and populations could be at-risk with additional disturbances that remove sagebrush.</p> <p><b>1B</b></p> <p>Natural sagebrush recovery is likely to occur, but certain areas may lack connectivity.</p>	<p>Sufficient sagebrush exists on the landscape and sage-grouse are highly likely to persist.</p> <p><b>1C</b></p> <p>Natural sagebrush recovery is likely to occur.</p>
		<p>Perennial herbaceous species are typically sufficient for recovery.</p> <p>Risk of annual invasives is low.</p> <p>Seeding/transplanting success is high.</p> <p>Recovery following inappropriate livestock use is often possible given changes in management.</p>		
Moderate		<p>Natural sagebrush recovery is likely on cooler and moister sites, but if large, contiguous areas lack sagebrush, the time required for recovery may be too great.</p> <p><b>2A</b></p>	<p>Natural sagebrush recovery is likely on cooler and moister sites, but certain areas may lack connectivity.</p> <p><b>2B</b></p>	<p>Natural sagebrush recovery is likely on cooler and moister sites.</p> <p><b>2C</b></p>
		<p>Perennial herbaceous species are usually adequate for recovery on cooler and moister sites.</p> <p>Risk of annual invasives is moderately high on warmer and drier sites.</p> <p>Seeding-transplanting success depends on site characteristics, and more than one intervention may be required especially on warmer and drier sites.</p> <p>Recovery following inappropriate livestock use depends on site characteristics and management.</p>		
Low		<p>Natural sagebrush recovery is not likely.</p> <p><b>3A</b></p>	<p>Natural sagebrush recovery may occur, but the time required will likely be too great and certain areas may lack connectivity.</p> <p><b>3B</b></p>	<p>Natural sagebrush recovery may occur, but the time required will likely be too great.</p> <p><b>3C</b></p>
		<p>Perennial herbaceous species are typically inadequate for recovery.</p> <p>Risk of annual invasives is high.</p> <p>Seeding/transplanting success depends on site characteristics, annual invasives, and post-treatment precipitation but is often low. More than one intervention likely will be required.</p> <p>Recovery following inappropriate livestock use is unlikely.</p>		

**Table 3.** Potential management strategies based on resilience to disturbance, resistance to annual grass invasion, and sage-grouse habitat requirements based on Aldridge et al. 2008; Wisdom et al. 2011; and Knick et al. 2013 (adapted from Chambers et al. 2014).

<b>Conserve – maintain or increase resilience to disturbance and resistance to invasive annuals in areas with high conservation value</b>	
Priorities	<ul style="list-style-type: none"> <li>Ecosystems with low to moderate resilience to fire and resistance to invasive species that still have large patches of landscape sagebrush cover and adequate perennial grasses and forbs – <i>ecological types with warm and dry and cool and dry soil temperature/moisture regimes.</i></li> <li>Ecosystems with a high probability of providing habitat for sage-grouse, especially those with &gt;65% landscape cover of sagebrush and adequate perennial herbaceous species – <i>all ecological types.</i></li> </ul>
Objective	<ul style="list-style-type: none"> <li>Minimize impacts of current and future human-caused disturbances and stressors.</li> </ul>
Activities	<ul style="list-style-type: none"> <li>Immediately suppress fire in moderate to low resilience and resistance sagebrush and wooded shrublands to prevent an invasive annual grass-fire cycle. Large sagebrush patches are high priority for protection from wildfires.</li> <li>Implement strategic fuel break networks to provide anchor points for suppression and reduce losses when wildfires escape initial attack.</li> <li>Manage livestock grazing to prevent loss of perennial native grasses and forbs and biological soil crusts and allow natural regeneration.</li> <li>Limit anthropogenic activities that cause surface disturbance, invasion, and fragmentation. (e.g., road and utility corridors, urban expansion, OHV use, and mineral/energy projects).</li> <li>Detect and control new weed infestations.</li> </ul>
<b>Prevent – maintain or increase resilience and resistance of areas with declining ecological conditions that are at risk of conversion to a degraded, disturbed, or invaded state</b>	
Priorities	<ul style="list-style-type: none"> <li>Ecosystems with moderate to high resilience and resistance – <i>ecological types with relatively cool and moist soil temperature and moisture regimes.</i> <ul style="list-style-type: none"> <li>Prioritize landscape patches that exhibit declining conditions due to annual grass invasion and/or tree expansion (e.g., at risk phase in State and Transition Models).</li> </ul> </li> <li>Ecosystems with a moderate to high probability of providing sage-grouse habitat, especially those with 26-65% landscape cover of sagebrush and adequate perennial native grasses and forbs – <i>all ecological types.</i></li> </ul>
Objectives	<ul style="list-style-type: none"> <li>Reduce fuel loads and decrease the risk of high intensity and high severity fire.</li> <li>Increase abundance of perennial native grasses and forbs and of biological soil crusts where they naturally occur.</li> <li>Decrease the longer-term risk of annual invasive grass dominance.</li> </ul>
Activities	<ul style="list-style-type: none"> <li>Use mechanical treatments like cut and leave or mastication to remove trees, decrease woody fuels, and release native grasses and forbs in warm and moist big sagebrush ecosystems with relatively low resistance to annual invasive grasses that are in the early to mid-phase of piñon and/or juniper expansion.</li> <li>Use prescribed fire or mechanical treatments to remove trees, decrease woody fuels, and release native grasses and forbs in cool and moist big sagebrush ecosystems with relatively high resistance to annual invasive grass that are in early to mid-phase of piñon and/or juniper expansion.</li> <li>Actively manage post-treatment areas to increase perennial herbaceous species and minimize secondary weed invasion.</li> <li>Consider the need for strategic fuel breaks to help constrain fire spread or otherwise augment suppression efforts.</li> </ul>
<b>Restore – increase resilience and resistance of disturbed, degraded, or invaded areas</b>	
Priorities	<ul style="list-style-type: none"> <li>Areas burned by wildfire – <i>all ecological types</i> <ul style="list-style-type: none"> <li>Prioritize areas with low to moderate resilience and resistance, and that have a reasonable expectation of recovery.</li> <li>Prioritize areas where perennial grasses and forbs have been depleted.</li> <li>Prioritize areas that experienced high severity fire.</li> </ul> </li> </ul>

(continued)

**Table 3.** (Continued).

	<ul style="list-style-type: none"> <li>• Sage-grouse habitat – <i>all ecological types</i> <ul style="list-style-type: none"> <li>○ Prioritize areas where restoration of sagebrush and/or perennial grasses is needed to create large patches of landscape cover of sagebrush or connect existing patches of sagebrush habitat.</li> <li>○ Prioritize areas with adequate landscape cover of sagebrush where restoration of perennial grasses and forbs is needed.</li> </ul> </li> <li>• Areas affected by anthropogenic activities that cause surface disturbance, invasion, and fragmentation. (e.g., road and utility corridors, urban expansion, OHV use, and mineral/energy projects) – <i>all ecological types</i>.</li> </ul>
<i>Objectives</i>	<ul style="list-style-type: none"> <li>• Increase soil stability and curtail dust.</li> <li>• Control/suppress invasive annual grasses and other invasive plants.</li> <li>• Increase landscape cover of sagebrush.</li> <li>• Increase perennial grasses and forbs and biological soil crusts where they naturally occur.</li> <li>• Reduce the risk of large fires that burn sage-grouse habitat.</li> </ul>
<i>Activities</i>	<ul style="list-style-type: none"> <li>• Use integrated strategies to control/suppress annual invasive grass and other annual invaders.</li> <li>• Establish and maintain fuel breaks or greenstrips in areas dominated by invasive annual grasses that are adjacent to areas with &gt;25% landscape sagebrush cover and adequate perennial native grasses and forbs.</li> <li>• Seed perennial grasses and forbs that are adapted to local conditions to increase cover of these species in areas where they are depleted.</li> <li>• Seed and/or transplant sagebrush to restore large patches of sagebrush cover and connect existing patches.</li> <li>• Repeat restoration treatments if they fail initially to ensure restoration success especially in warm and dry soil temperature moisture regimes where weather is often problematic for establishment.</li> <li>• Actively manage restored/rehabilitated areas to increase perennial herbaceous species and minimize secondary weed invasion.</li> </ul>
<p><b><i>Monitoring and Adaptive Management– implement comprehensive monitoring to track landscape change and management outcomes and provide the basis for adaptive management</i></b></p>	
<i>Priorities</i>	<ul style="list-style-type: none"> <li>• Regional environmental gradients to track changes in plant community and other ecosystem attributes and expansion or contraction of species ranges – <i>all ecological types</i>.</li> <li>• Assess treatment effectiveness – <i>all ecological types</i>.</li> </ul>
<i>Objectives</i>	<ul style="list-style-type: none"> <li>• Understand effects of wildfire, annual grass invasion, piñon and juniper expansion, climate change and other global stressors in sagebrush ecosystems</li> <li>• Increase understanding of the long- and short-term outcomes of management treatments.</li> </ul>
<i>Activities</i>	<ul style="list-style-type: none"> <li>• Establish a regional network of monitoring sites that includes major environmental gradients.</li> <li>• Collect pre- and post-treatment monitoring data for all major land treatments activities.</li> <li>• Collect data on ecosystem status and trends (for example, land cover type, ground cover, vegetation cover and height [native and invasive], phase of tree expansion, soil and site stability, oddities).</li> <li>• Use consistent methods to monitor indicators.</li> <li>• Use a cross-boundary approach that involves all major land owners.</li> <li>• Use a common data base for all monitoring results (e.g., Land Treatment Digital Library; <a href="http://greatbasin.wr.usgs.gov/ltl/">http://greatbasin.wr.usgs.gov/ltl/</a>).</li> <li>• Develop monitoring products that track change and provide management implications and adaptations for future management.</li> <li>• Support and improve information sharing on treatment effectiveness and monitoring results across jurisdictional boundaries (e.g., Great Basin Fire Science Delivery Project; <a href="http://www.gbfiresci.org">www.gbfiresci.org</a>).</li> </ul>

**Table 4.** Specific management strategies by agency program area for the cells within the sage-grouse habitat matrix (table 2). The rows indicate relative resilience and resistance (numbers) and the columns indicate landscape cover of sagebrush by category (letters). Resilience and resistance are based on soil temperature and moisture regimes (fig. 11) and their relationship to ecological types (table 1). Percentage of the landscape dominated by sagebrush is based on the capacity of large landscapes to support viable sage-grouse populations over the long term (fig. 8). Note that these guidelines are related to the sage-grouse habitat matrix, and do not preclude other factors from consideration when determining management priorities for program areas. The “Fire Operations” program area includes preparedness, prevention, and suppression activities.

---

**High Resilience to Disturbance and Resistance to Invasive Annual Grasses (1A, 1B, 1C)**

Natural sagebrush recovery is likely to occur. Perennial herbaceous species are sufficient for recovery. Risk of invasive annual grasses is typically low.

- 
- Fire Operations**
- Fire suppression is typically third order priority, but varies with large fire risk and landscape condition (cells 1A, 1B, 1C). Scenarios requiring higher priority may include:
    - Areas of sagebrush that bridge large, contiguous expanses of sagebrush and that are important for providing connectivity for sage-grouse (cells 1B, 1C).
    - Areas where sagebrush communities have been successfully reestablished through seedings or other rehabilitation investments (cells 1A, 1B, 1C)
    - Areas with later phase (Phase III) post-settlement piñon and juniper that have high resistance to control, are subject to large and/or severe fires, and place adjacent sage-grouse habitat at risk (cells 1A, 1B).
    - All areas when critical burning environment conditions exist. These conditions may be identified by a number of products including, but not limited to: Predictive Services 7-Day Significant Fire Potential Forecasts; National Weather Service Fire Weather Watches and Red Flag Warnings; fire behavior forecasts or other local knowledge.
- 
- Fuels Management**
- Fuels management to reduce large sagebrush stand losses is a second order priority, especially in cells 1B and 1C. Management activities include:
    - Strategic placement of fuel breaks to reduce loss of large sagebrush stands by wildfire. Examples include linear features or other strategically placed treatments that serve to constrain fire spread or otherwise augment suppression efforts.
    - Tree removal in early to mid-phase (Phases I, II), post-settlement piñon and juniper expansion areas to maintain shrub/herbaceous cover and reduce fuel loads.
    - Tree removal in later phase (Phase III), post-settlement piñon and juniper areas to reduce risks of large or high severity fires. Because these areas represent non-sage-grouse habitat, prescribed fire may be appropriate on cool and moist sites, but invasive plant control and restoration of sagebrush and perennial native grasses and forbs may be necessary.
- 
- Post-Fire Rehabilitation**
- Post-fire rehabilitation is generally low priority (cells 1A, 1B, 1C). Areas of higher priority include:
    - Areas where perennial herbaceous cover, density, and species composition is inadequate for recovery.
    - Areas where seeding or transplanting sagebrush is needed to maintain habitat connectivity for sage-grouse.
    - Steep slopes and soils with erosion potential.
- 
- Habitat Restoration and Recovery**
- Restoration is typically passive and designed to increase or maintain perennial herbaceous species, biological soil crusts and landscape cover of sagebrush (cells 1A, 1B, 1C). Areas to consider for active restoration include:
    - Areas where perennial herbaceous cover density, or composition is inadequate for recovery after surface disturbance.
    - Areas where seeding or transplanting sagebrush is needed to maintain habitat connectivity for sage-grouse.

---

**Moderate Resilience to Disturbance and Resistance to Invasive Annuals (2A, 2B, 2C)**

Natural sagebrush recovery is likely to occur on cooler and moister sites, but the time required may be too great if large, contiguous areas lack sagebrush. Perennial herbaceous species are usually adequate for recovery on cooler and moister sites. Risk of invasive annual grasses is moderately high on warmer and drier sites.

- 
- Fire Operations**
- Fire suppression is typically second order priority (cells 2A, 2B, 2C). Scenarios requiring higher priority may include:
    - Areas of sagebrush that bridge large, contiguous expanses of sagebrush and that are important for providing connectivity for sage-grouse (cells 2B, 2C).

Seeding and/or transplanting sagebrush as soon as possible is necessary for restoring sage-grouse habitat. Success will likely require more than one intervention due to low and variable precipitation.</li></ul></li></ul>

Another important consideration is that ecological processes such as wildfire can occur either within or across categories in the sage-grouse habitat matrix and it is necessary to determine the appropriate spatial context when evaluating management opportunities based on resilience and resistance and sage-grouse habitat. For example, if critical sage-grouse habitat occurs in close proximity to landscapes comprised mainly of annual grass-dominated plant communities, then fire risk to adjacent sage-grouse habitat can increase dramatically (Balch et al. 2013). In this scenario, management actions could include reducing the influence of invasive annual grasses with a strategic fuel break on the perimeter of intact sagebrush. Thus, management actions may have value to sustaining existing sage-grouse habitat, even if these measures are applied in locations that are currently not habitat; the spatial relationships of sagebrush and invasive annual grasses should be considered when prioritizing management actions and associated conservation measures.

## Informing Wildfire and Fuels Management Strategies to Conserve Sage-Grouse

---

Collectively, responses to wildfires and implementation of fuels management projects are important contributors to sage-grouse conservation. Resilience and resistance concepts provide a science-based background that can inform fire operations and fuels management strategies and allocation of scarce assets during periods of high fire activity. In fire operations, firefighter and public safety is the overriding objective in all decisions. In addition, land managers consider numerous other values at risk, including the Wildland-Urban Interface (WUI), habitats, and infrastructure when allocating assets and prioritizing efforts. Resilience and resistance concepts are especially relevant for evaluating tradeoffs related to current ecological conditions and rates of recovery and possible ecological consequences of different fire management activities. For example, prioritizing initial attack efforts based on ecological types and their resilience and resistance at fire locations is a possible future application of resilience and resistance concepts. Also, fire prevention efforts can be concentrated where human ignitions have commonly occurred near intact, high quality habitats that also have inherently low resilience and resistance.

Fuels management projects are often applied to (1) constrain or minimize fire spread; (2) alter species composition; (3) modify fire intensity, severity, or effects; or (4) create fuel breaks or anchor points that augment fire management efforts (fig. 13). These activities are selectively used based on the projected ecosystem response, anticipated fire patterns, and probability of success. For example, in areas that are difficult to restore due to low to moderate resilience, fuel treatments can be placed to minimize fire spread and conserve sagebrush habitat. In cooler and moister areas with moderate to high resilience and resistance, mechanical or prescribed fire treatments may be appropriate to prevent conifer expansion and dominance. Given projected climate change and longer fire seasons across the western United States, fuels management represents a proactive approach for modifying large fire trends. Fire operations and fuels management programs contribute to a strategic, landscape approach when coupled with data that illustrate the likelihood of fire occurrence, potential fire behavior, and risk assessments (Finney et al. 2010; Oregon Department of Forestry 2013). In tandem with resilience and resistance concepts, these data can further inform fire operations and fuels management decisions.

**Figure 13.** Fuel breaks may include roads, natural features, or other management imposed treatments intended to modify fire behavior or otherwise augment suppression efforts at the time of a fire. Such changes in fuel type and arrangement may improve suppression effectiveness by modifying flame length and fire intensity, and allow fire operations to be conducted more safely. The top photo shows a burnout operation along an existing road to remove available fuels ahead of an oncoming fire and constrain overall fire growth (photo by BLM Idaho Falls District). The bottom photo shows fuel breaks located along a road, which complimented fire control efforts when a fire intersected the fuel break and road from the right (photo by Ben Dyer, BLM).

## Putting it all Together

---

Effective management and restoration of sage-grouse habitat will benefit from a collaborative approach that prioritizes the best management practices in the most appropriate places. This section describes an approach for assessing focal areas for sage-grouse habitat management based on widely available data, including (1) Priority Areas for Conservation (PACs), (2) breeding bird densities, (3) habitat suitability as indicated by the landscape cover of sagebrush, (4) resilience and resistance and dominant ecological types as indicated by soil temperature and moisture regimes, and (5) habitat threats as indicated by cover of cheatgrass, cover of piñon and juniper, and by fire history. Breeding bird density data are overlain with landscape cover of sagebrush and with resilience and resistance to spatially link sage-grouse populations with habitat conditions and risks. We illustrate the use of this step-down approach for evaluating focal areas for sage-grouse habitat management across the western portion of the range, and we provide a detailed example for a diverse area in the northeast corner of Nevada that is comprised largely of PACs with mixed land ownership. The sage-grouse habitat matrix (table 2) is used as a tool in the decision process, and guidelines are provided to assist in determining appropriate management strategies for the primary agency program areas (fire operations, fuels management, post-fire rehabilitation, habitat restoration) for each cell of the matrix.

We conclude with discussions of the tools available to aid in determining the suitability of an area for treatment and the most appropriate management treatments such as ecological site descriptions and state and transition models and of monitoring and adaptive management. Datasets used to compile the maps in the following sections are in Appendix 4.

### Assessing Focal Areas for Sage-Grouse Habitat Management: Key Data Layers

**Priority areas for conservation:** The recent identification of sage-grouse strongholds, or Priority Areas for Conservation (PACs), greatly improves the ability to target management actions towards habitats expected to be critical for long-term viability of the species (fig. 14; USFWS 2013). Understanding and minimizing risks of large-scale loss of sagebrush and conversion to invasive annual grasses or piñon and juniper in and around PACs will be integral to maintaining sage-grouse distribution and stabilizing population trends. PACs were developed by individual states to identify those areas that are critical for ensuring adequate representation, redundancy, and resilience to conserve sage-grouse populations. Methods differed among states; in general, PAC boundaries were identified based on (1) sage-grouse population data including breeding bird density, lek counts, telemetry, nesting areas, known distributions, and sightings/observations; and (2) habitat data including occupied habitat, suitable habitat, seasonal habitat, nesting and brood rearing areas, and connectivity areas or corridors. Sage-grouse habitats outside of PACs also are important in assessing focal areas for management where they provide connectivity between PACs (genetic and habitat linkages), seasonal habitats that may have been underestimated due to emphasis on lek sites to define priority areas, habitat restoration and population expansion opportunities, and flexibility for managing habitat changes that may result from climate change (USFWS 2013). If PAC boundaries are adjusted, they will need to be updated for future analyses.

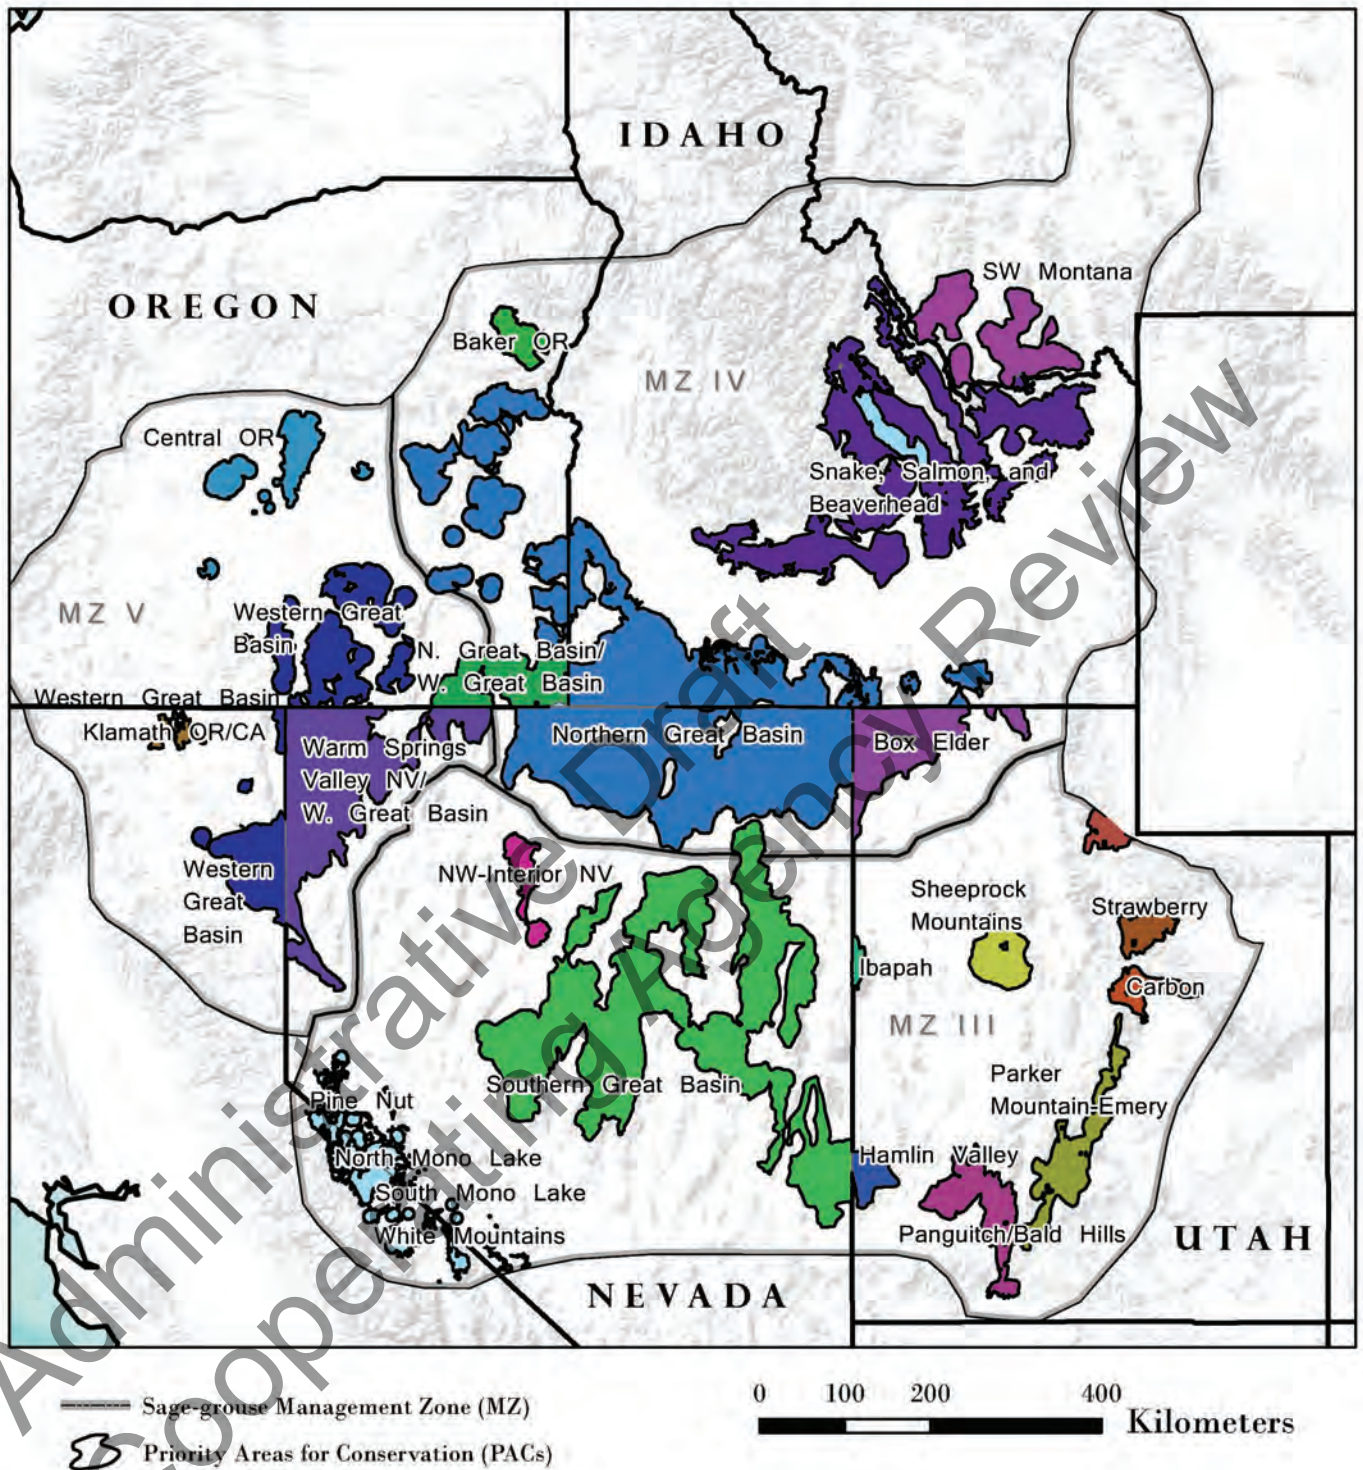

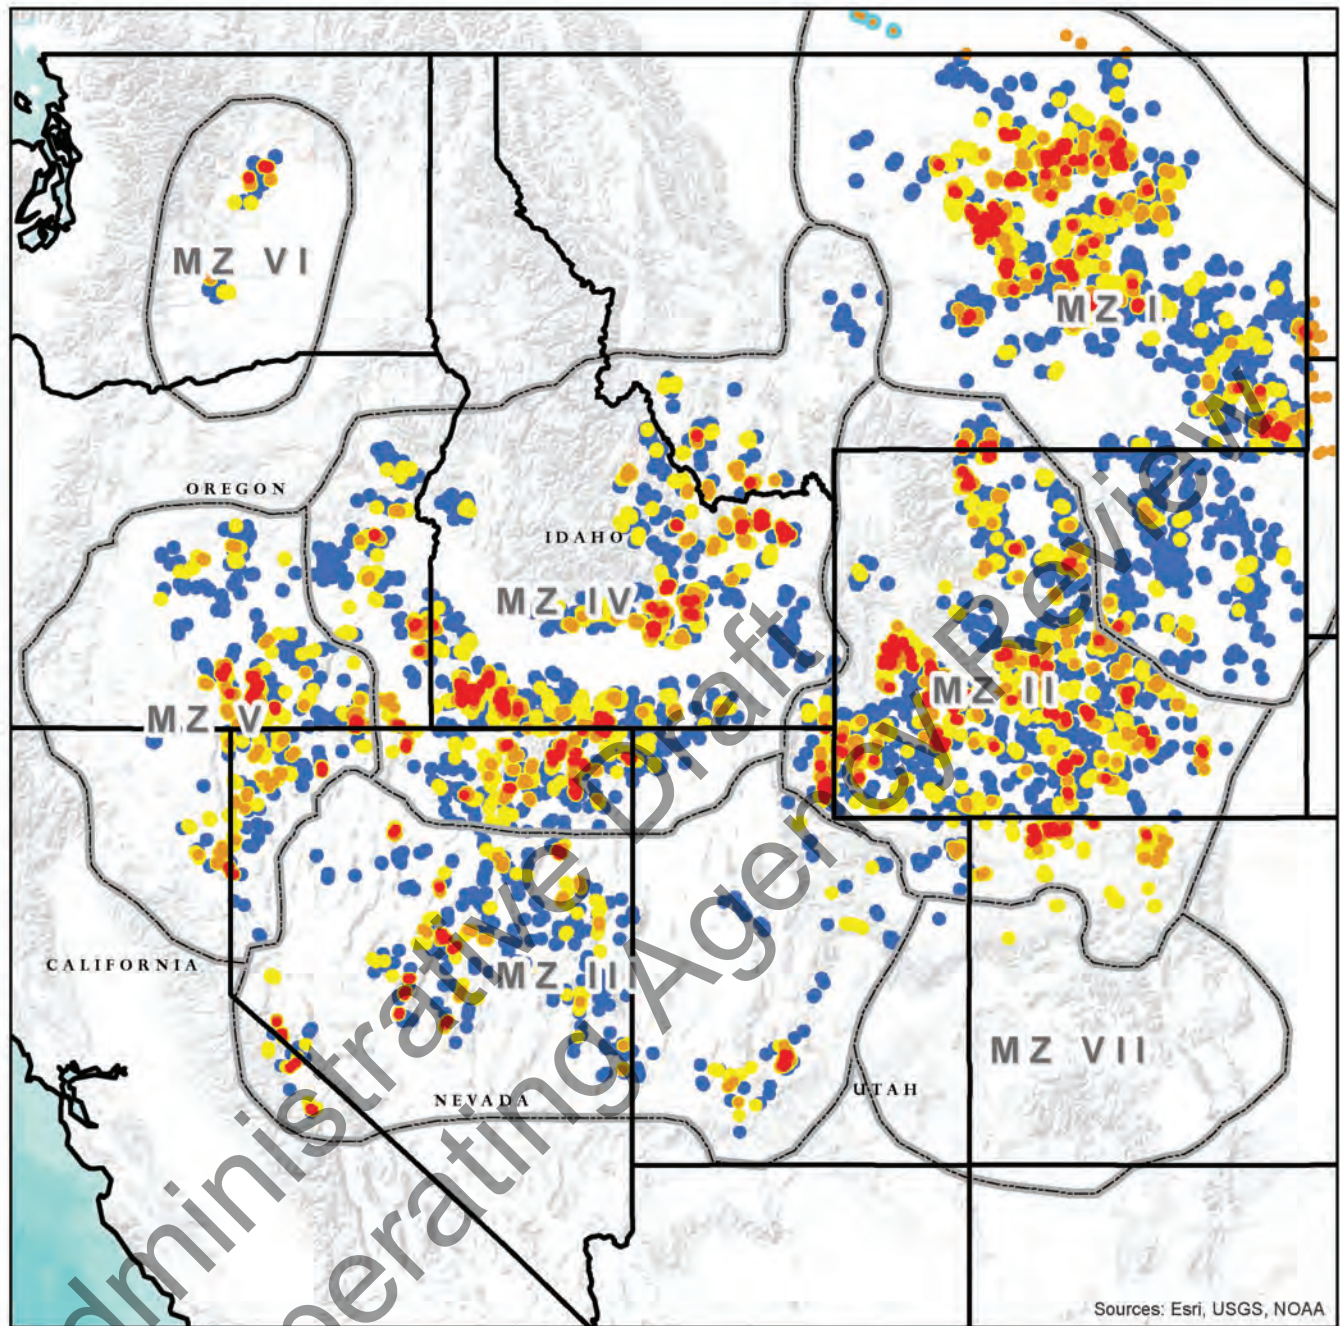

Figure 14. Priority Areas for Conservation (PACs) within the range of sage-grouse (USFWS 2013). Colored polygons within Management Zones delineate Priority Areas for Conservation (USFWS 2013).

**Breeding bird density:** Range-wide breeding bird density areas provide one of the few accessible data sets for further prioritizing actions within and adjacent to PACs to maintain species distribution and abundance. Doherty et al. (2010b) developed a useful framework for incorporating population data in their range-wide breeding bird density analysis, which used maximum counts of males on leks ( $n = 4,885$ ) to delineate breeding bird density areas that contain 25, 50, 75, and 100% of the known breeding population (fig. 15). Leks were mapped according to these abundance values and buffered by a 6.4 to 8.5 km (4.0 to 5.3 mi) radius to delineate nesting areas. Findings showed that while sage-grouse occupy extremely large landscapes, their breeding distribution is highly aggregated in comparably smaller identifiable population centers; 25% of the known population occurs within 3.9% (2.9 million ha; 7.2 million ac) of the species range, and 75% of birds are within 27.0% of the species range (20.4 million ha; 50.4 million ac) (Doherty et al. 2010b). The Doherty et al. (2010b) analysis emphasized breeding habitats primarily because little broad scale data exist for summer and winter habitat use areas. Even though the current breeding bird density data provide the most comprehensive data available, they do not include all existing sage-grouse populations. Incorporating finer scale seasonal habitat use data at local levels where it is available will ensure management actions encompass all seasonal habitat requirements.

For this assessment, we chose to use State-level breeding bird density results from Doherty et al. (2010b) instead of range-wide model results to ensure that important breeding areas in MZs III, IV, and V were not underweighted due to relatively higher bird densities in the eastern portion of the range. It is important to note that breeding density areas were identified using best available information in 2009, so these range-wide data do not reflect the most current lek count information or changes in conditions since the original analysis. Also, breeding density areas should not be viewed as rigid boundaries but rather as the means to prioritize landscapes regionally where step-down assessments and actions may be implemented quickly to conserve the most birds.

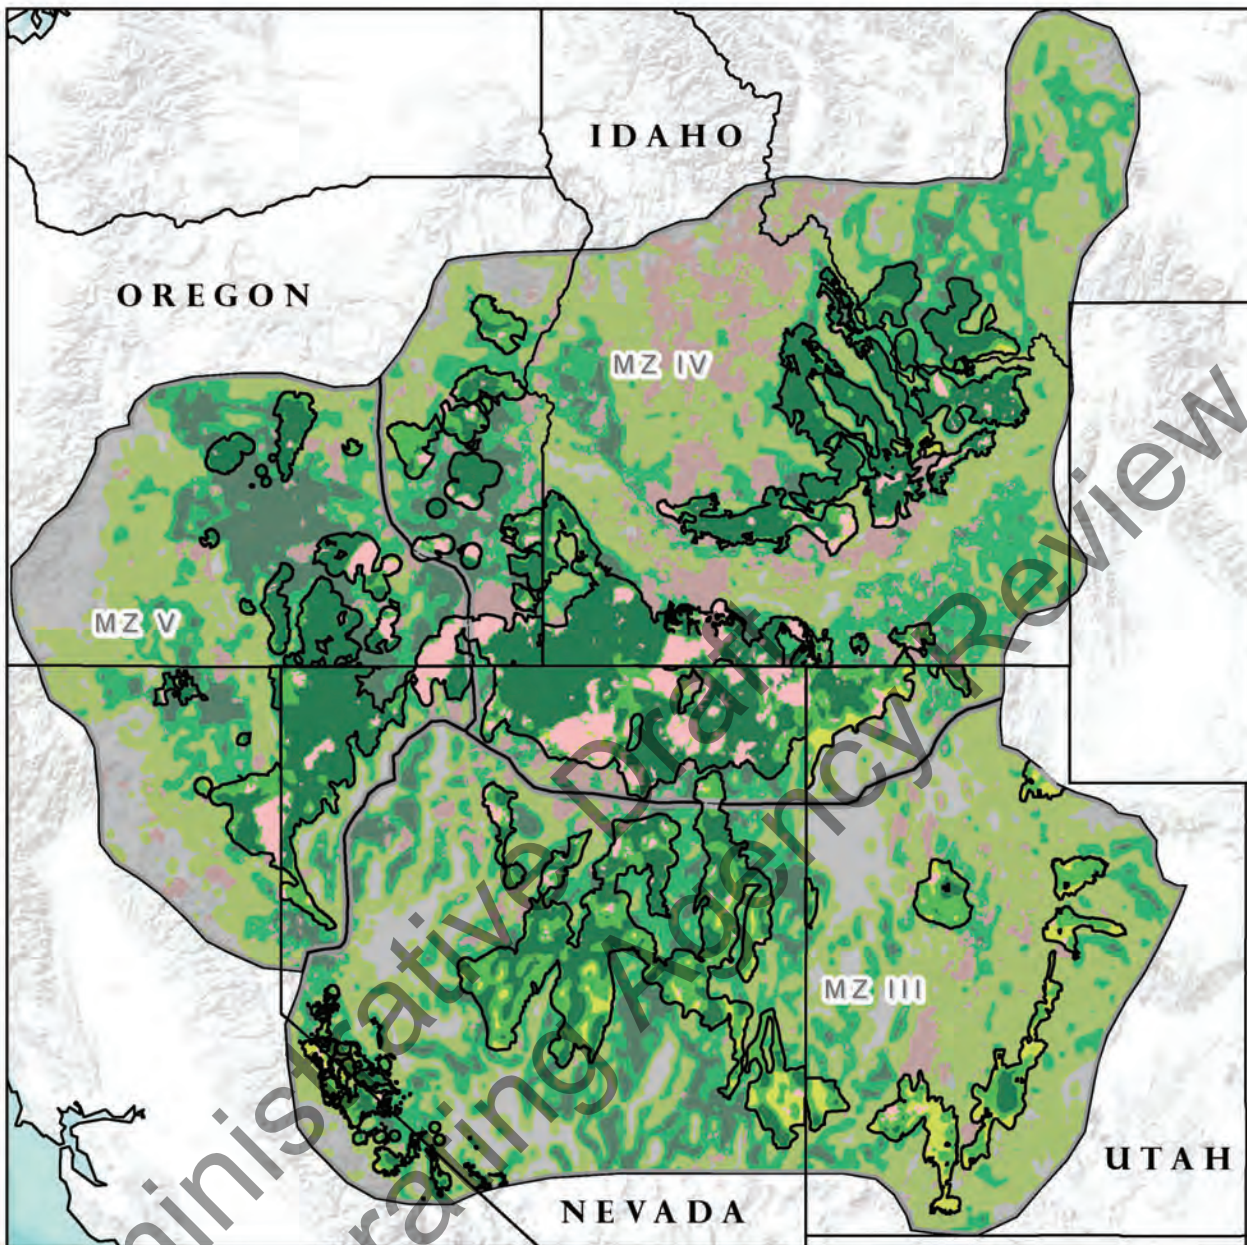

**Landscape cover of sagebrush:** Landscape cover of sagebrush is one of the key determinants of sage-grouse population persistence and, in combination with an understanding of resilience to disturbance and resistance to invasive annuals, provides essential information both for determining priority areas for management and appropriate management actions (fig. 10; tables 2 and 3). Landscape cover of sagebrush is a measure of large, contiguous patches of sagebrush on the landscape and is calculated from remote sensing databases such as LANDFIRE (see Appendix 4). We used the three cover categories of sagebrush landscape cover discussed previously to predict the likelihood of sustaining sage-grouse populations (1-25%, 25-65%, >65%). The sagebrush landscape cover datasets were created using a moving window to summarize the proportion of area (5-km [3.1-mi] radius) dominated by sagebrush surrounding each 30-m pixel and then assigned those areas to the three categories (see Appendix 2). Because available sagebrush cover from sources such as LANDFIRE does not exclude recent fire perimeters, it was necessary to either include these in the analysis of landscape cover of sagebrush or display them separately. Although areas that have burned since 2000 likely do not currently provide desired sage-grouse habitat, areas with the potential to support sagebrush ecological types can provide conservation benefits in the overall planning effort especially within long-term conservation areas like PACs. The landscape cover of sagebrush and recent fire perimeters are illustrated for the western portion of the range (fig. 16) and northeast Nevada (fig. 17).

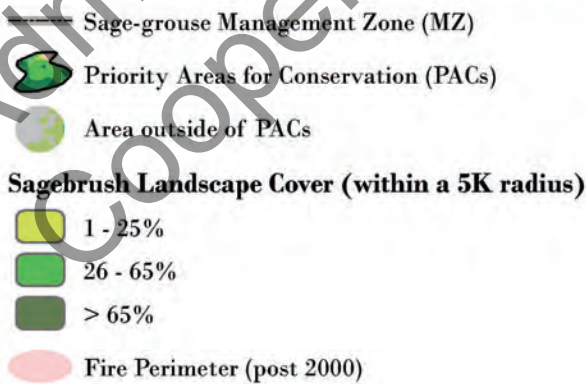

— Sage-grouse Management Zone (MZ)

**Figure 15.** Range-wide sage-grouse breeding bird densities from Doherty et al. 2010. Points illustrate breeding bird density areas that contain 25, 50, 75, and 100% of the known breeding population and are based on maximum counts of males on leks ( $n = 4,885$ ). Leks were mapped according to abundance values and buffered by 6.4 to 8.5 km (4.0 to 5.2 mi) to delineate nesting areas.

**Figure 16.** The landscape cover of sagebrush within each of three selected categories (1-25%, 26-65%, >65%) for Management Zones III, IV, and V (Stiver et al. 2006). The proportion of sagebrush (USGS 2013) within each of the categories in a 5-km (3.1-mi) radius surrounding each pixel was calculated relative to other land cover types for locations with sagebrush cover. Darker colored polygons within Management Zones delineate Priority Areas for Conservation (USFWS 2013).

**Figure 17.** The landscape cover of sagebrush within each of the selected categories (1-25%, 26-65%, >65%) for the north-eastern portion of Nevada. The proportion of sagebrush (USGS 2013) within each of the categories in a 5-km (3.1-mi) radius surrounding each pixel was calculated relative to other land cover types for locations with sagebrush cover. Darker colored polygons delineate Priority Areas for Conservation (USFWS 2013).

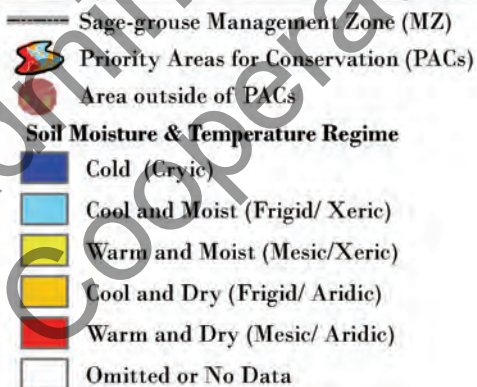

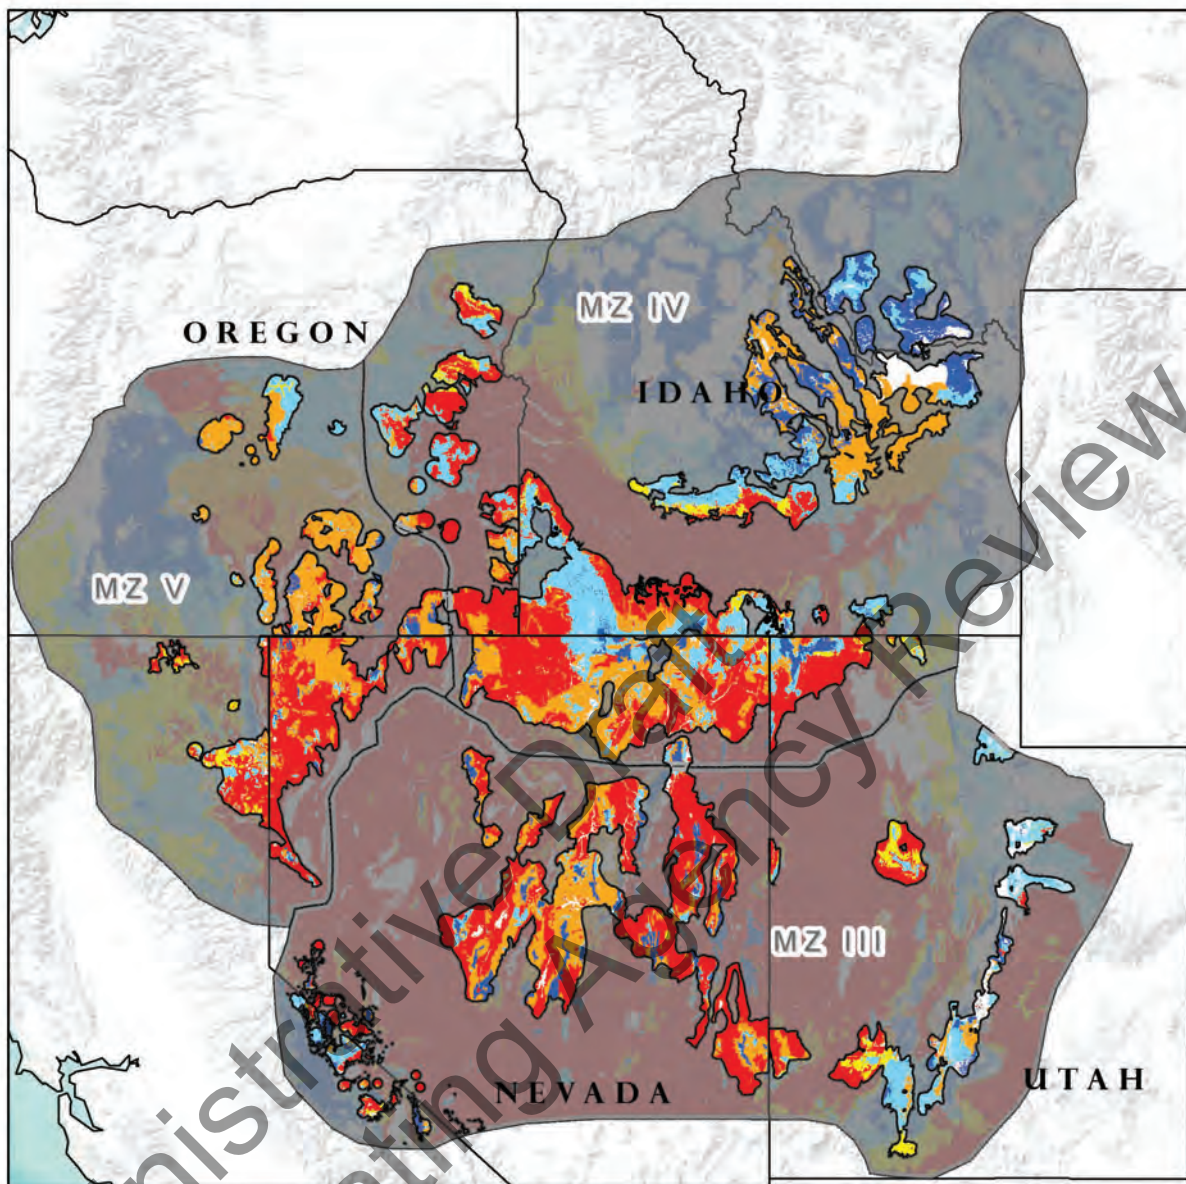

**Resilience to disturbance and resistance to annuals:** Soil temperature and moisture regimes are a strong indicator of ecological types and of resilience to disturbance and resistance to invasive annual plants (fig. 11; table 1). Resilience and resistance predictions coupled with landscape cover of sagebrush can provide critical information for determining focal areas for targeted management actions (tables 2, 3, and 4). The available data for the soil temperature and moisture regimes were recently compiled to predict resilience and resistance (see Appendix 3). These data, displayed for the western portion of the range and northeast Nevada (figs. 18 and 19), illustrate the spatial variability within the focal areas. Soil temperature and moisture regimes are two of the primary determinants of ecological types and of more detailed ecological site descriptions, which are described in the section on “Determining the Most Appropriate Management Treatments at the Project Scale.”

**Habitat threats:** Examining additional land cover data or models of invasive annual grasses and piñon and/or juniper, can provide insights into the current extent of threats in a planning area (e.g., Manier et al. 2013). In addition, evaluating data on fire occurrence and size can provide information on fire history and the rate and pattern of change within the planning area. Data layers for cheatgrass cover have been derived from Landsat imagery (Peterson 2006, 2007) and from model predictions based on species occurrence, climate variables, and anthropogenic disturbance (e.g., the Bureau of Land Management [BLM] Rapid Ecoregional Assessments [REAs]). The REAs contain a large amount of geospatial data that may be useful in providing landscape scale information on invasive species, disturbances, and vegetation types across most of the range of sage-grouse ([http://www.blm.gov/wo/st/en/prog/more/Landscape\\_Approach/reas.html](http://www.blm.gov/wo/st/en/prog/more/Landscape_Approach/reas.html)). Similarly, geospatial data for piñon and/or juniper have been developed for various States (e.g., Nevada and Oregon) and are becoming increasingly available rangewide. In addition, more refined data products are often available at local scales. Land managers can evaluate the available land cover datasets and select those land covers with the highest resolution and accuracy for the focal area. Land cover of cheatgrass and piñon and/or juniper and the fire history of the western portion of the range and northeast Nevada are in figures 20-25.

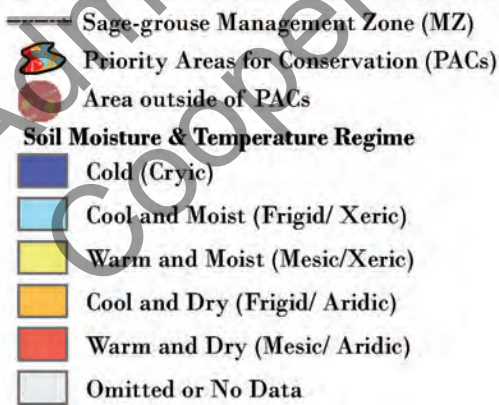

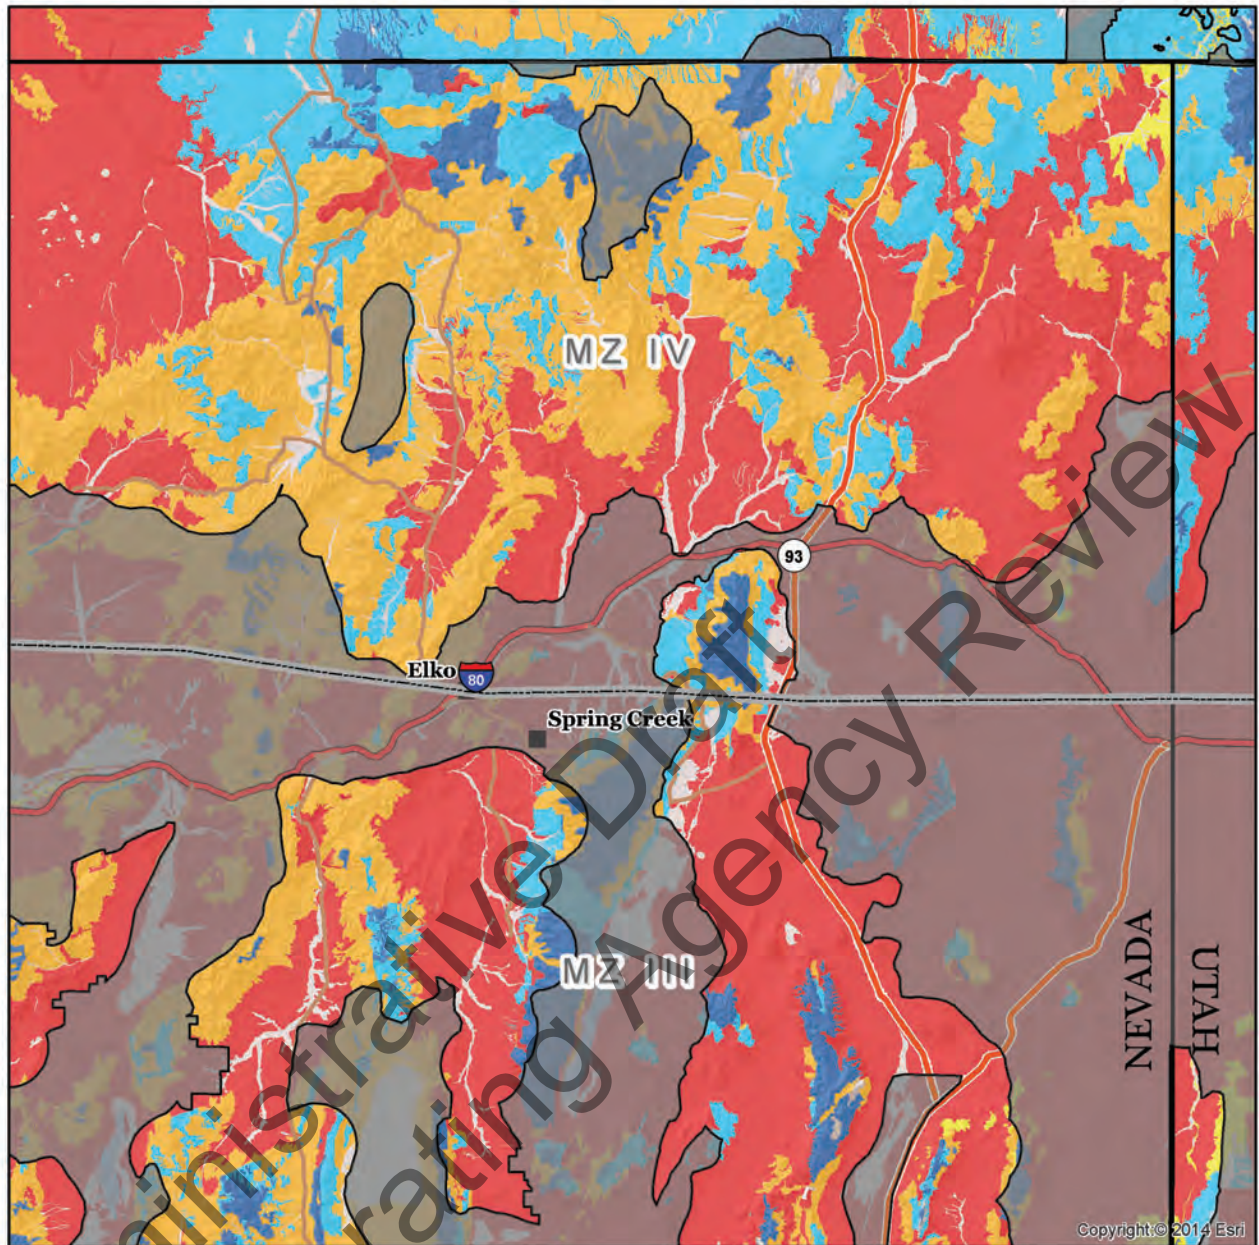

## Assessing Focal Areas for Sage-Grouse Habitat Management: Integrating Data Layers

Combining resilience and resistance concepts with sage-grouse habitat and population data can help land managers further gauge relative risks across large landscapes and determine where to focus limited resources to conserve sage-grouse populations. Intersecting breeding bird density areas with soil temperature and moisture regimes provides a spatial tool to depict landscapes with high bird concentrations that may have a higher relative risk of being negatively affected by fire and annual grasses (figs. 26, 27). For prioritization purposes, areas supporting 75% of birds (6.4 to 8.5 km [4.0 to 5.2 mi] buffer around leks) can be categorized as high density while remaining breeding bird density areas (75-100% category; 8.5-km [5.2-mi] buffer around leks) can be categorized as low density. Similarly, warm and dry types can be categorized as having relatively low resilience to fire and resistance to invasive species and all other soil temperature and moisture regimes can be categorized as having relatively moderate to high resilience and resistance. Intersecting breeding bird density areas with landscape cover of sagebrush provides another spatial component revealing large and intact habitat blocks and areas in need of potential restoration to provide continued connectivity (fig. 28).

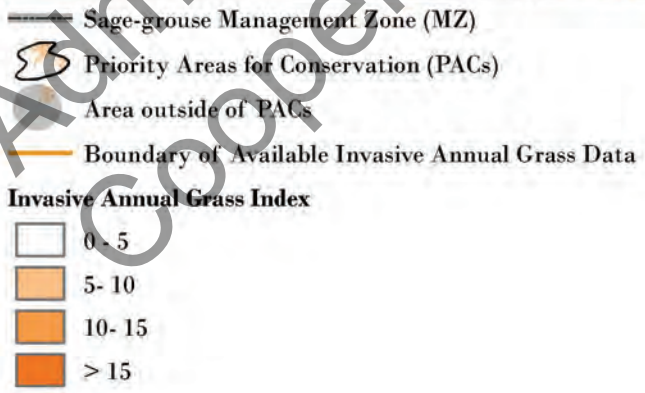

**Figure 18.** The soil temperature and moisture regimes within sage-grouse Management Zones III, IV, and V (Stiver et al. 2006). Soil temperature and moisture classes were derived from the Natural Resources Conservation Service (NRCS) Soil Survey Geographic Database (SSURGO) (Soil Survey Staff 2014a). Gaps in that dataset were filled in with the NRCS State Soil Geographic Database (STATSGO) (Soil Survey Staff 2014b). Darker colored polygons within Management Zones delineate Priority Areas for Conservation (USFWS 2013).

**Figure 19.** The soil temperature and moisture regimes for the northeast corner of Nevada. Soil temperature and moisture classes were derived from the Natural Resources Conservation Service (NRCS) Soil Survey Geographic Database (SSURGO) (Soil Survey Staff 2014a). Gaps in that dataset were filled in with the NRCS State Soil Geographic Database (STATSGO) (Soil Survey Staff 2014b). Darker colored polygons delineate Priority Areas for Conservation (USFWS 2013).

Relative resilience and resistance groups are derived from soil moisture and temperature classes (Soil Survey Staff 2014a, b) as described in text, and indicate risk of invasive annual grasses and wildfire. Lighter colored polygons within Management Zones delineate Priority Areas for Conservation (USFWS 2013).

**Figure 28.** Sage-grouse breeding bird densities (Doherty et al. 2010) for high breeding bird densities (areas that contain 75% of known breeding bird populations) and low breeding bird densities (areas that contain all remaining breeding bird populations) relative to sagebrush cover. Lighter colored polygons within Management Zones delineate Priority Areas for Conservation (USFWS 2013).

Resilience and resistance and sagebrush cover combined with bird population density data provide land managers a way to evaluate trade-offs of particular management options at the landscape scale. For example, high density, low resilience and resistance landscapes with >65% sagebrush landscape cover may require immediate attention for conservation efforts because they currently support a high concentration of birds but have the lowest potential to recover to desired conditions post-fire and to resist invasive plants when disturbed. Similarly, high density but moderate-to-high resilience and resistance landscapes with 26-65% sagebrush cover may be priorities for preventative actions like conifer removal designed to increase the proportion of sagebrush cover and maintain ecosystem resilience and resistance. Mapping relative resilience and resistance and landscape cover of sagebrush for sage-grouse breeding areas should be viewed as a component of the assessment process that can help local managers allocate resources to accelerate planning and implementation.

## Interpretations at the Management Zone (MZ) Scale: Western Portion of the Range

An examination of land cover and additional data layers for the western portion of the range reveals large differences among Management Zones (MZs) III, IV and V. MZs IV and V have larger areas with sagebrush cover >65% than MZ III (fig. 16). This may be partly explained by basin and range topography in MZ III, which is characterized by large differences in both environmental conditions and ecological types over relatively short distances. However, the cover of piñon and juniper in and adjacent to PACs in MZ III also is higher than in either MZ IV or V (fig. 22). The greater cover of piñon and juniper in MZ III appears to largely explain the smaller patches of sagebrush cover in the 26-65% and >65% categories.

Our capacity to quantify understory vegetation cover using remotely sensed data is currently limiting, but a visual examination of estimates for invasive annual grass (fig. 20; Peterson 2006, 2007) suggests a higher index (greater cover) in areas with relatively low resistance (warm soil temperatures) in all MZs (see fig. 18). This is consistent with current understanding of resistance to cheatgrass (Chambers et al. 2014; Chambers et al. *in press*). It is noteworthy that the invasive annual grass index is low for most of the central basin and range (central Nevada). Several factors may be contributing to the low index for this area including climate, the stage of piñon and juniper expansion and linked decrease in fire frequency, the relative lack of human development, and the relative lack of management treatments in recent decades (Wisdom et al. 2005; Miller et al. 2011). Not surprisingly, areas with a high annual grass index are outside or on the periphery of current PACs. However, it is likely that invasive annual grasses are present on many warmer sites and that they may increase following fire or other disturbances. In areas with low resistance to invasive annual grasses, they often exist in the understory of sagebrush ecosystems and are not detected by remote sensing platforms such as Landsat.

The number of hectares burned has been highest in MZ IV, adjacent areas in MZ V, and in areas with relatively low resilience and resistance in the northern portion of MZ III that have a high invasive annual grass index (figs. 18, 20, 24). A total of over 1.1 million hectares (2.7 million acres) burned in 2000 and 2006, while over 1.7 million hectares (4.2 million acres) burned in 2007 and 2012 and almost three quarters of these acres were in MZ IV (table 5). In some cases, these fires appear to be linked to the annual invasive grass index, but in others it clearly is not. At this point, there appears to be little relationship between cover of piñon and juniper and wildfire. Mega-fires comprised of hundreds of thousands of acres have burned in recent years, especially in MZ IV. These fires have occurred primarily in areas with low to moderate resilience and resistance and during periods with extreme burning conditions.

**Table 5.** The number of hectares (acres) burned in Management Zones III, IV, and V each year from 2000 to 2013.

Year	Management Zone III		Management Zone IV		Management Zone V		Total	
2000	155,159	(383,405)	868,118	(2,145,165)	88,871	(219,606)	1,112,148	(2,748,176)

<b>Total</b>	<b>1,485,034</b>	<b>(3,669,595)</b>	<b>5,855,920</b>	<b>(14,470,281)</b>	<b>1,385,400</b>	<b>(3,423,396)</b>	<b>8,726,354</b>	<b>(21,563,271)</b>

Coupling breeding bird densities with landscape cover of sagebrush indicates that populations with low densities tend to occur in areas where sagebrush cover is in the 26-65% category, and few populations occur in areas with <25% sagebrush cover (fig. 27) (Knick et al. 2013). Combining the breeding bird densities with resilience and resistance indicates significant variability in risks among high density populations within PACs (fig. 26). A large proportion of remaining high density centers within PACs occurs on moderate-to-high resilience and resistance habitats, while low density/low resilience and resistance areas tend to occur along the periphery of PACs or are disproportionately located in MZ III and southern parts of MZ V.

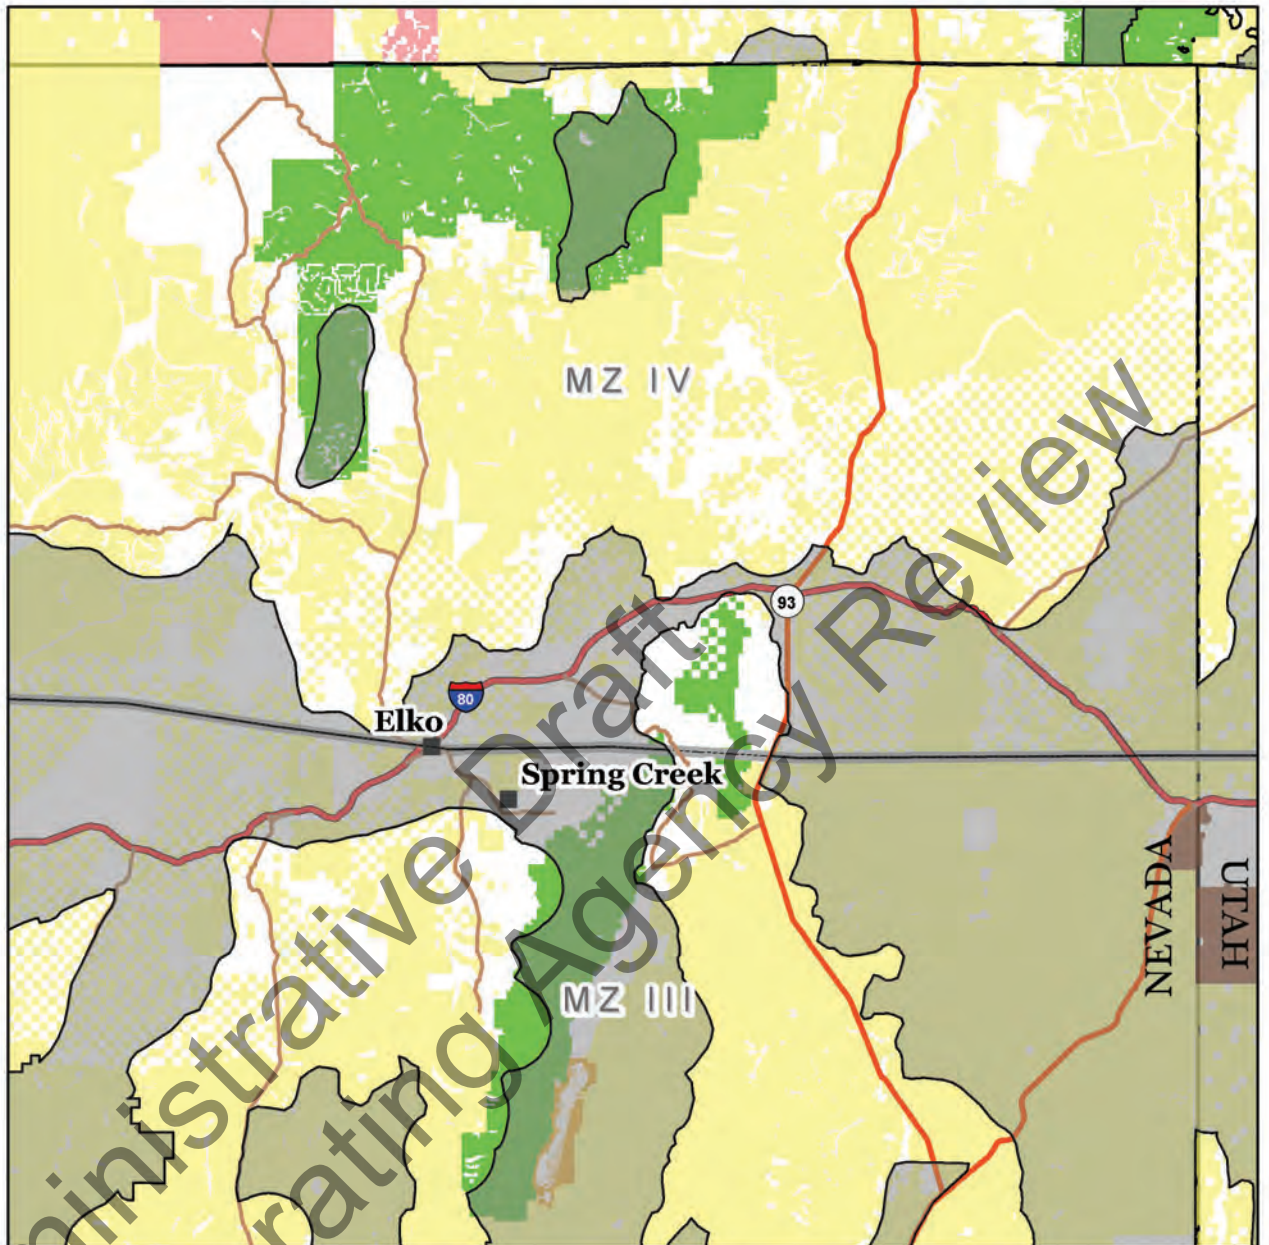

Examination of other data layers suggests that different wildfire and invasive species threats exist across the western portion of the range, and that management should target the primary threats to sage-grouse habitat within focal areas. In MZs IV and V invasive annual grasses—especially on the periphery of the PACs—and wildfire are key threats. However, recent wildfires are not necessarily linked to invasive annual grasses. This suggests that management strategies for these MZs emphasize fire operations, fuels management focused on decreasing fire spread, and integrated strategies to control annual grasses and increase post-fire rehabilitation and restoration success. Differences in piñon and/or juniper landscape cover exist among MZs with 5,131,900 ha (12,681,202 ac) in MZ III, 528,377ha (1,305,649 ac) in MZ IV, and 558,880 ha (1,381,024 ac) in MZ V. Portions of MZs IV and V are still largely in early stages of juniper expansion indicating a need to address this threat before woodland succession progresses. Because of generally low resilience and resistance in MZ III, greater emphasis is needed on habitat conservation, specifically minimizing or eliminating stressors. Also, greater emphasis on reducing cover of piñon and juniper is needed to reduce woody fuels and increase sagebrush ecosystem resilience to fire by increasing the recovery potential of native understory species.

## Interpretations at Regional and Local Land Management Scales: Northeast Nevada Example

The same land covers and data layers used to assess focal areas for sage-grouse habitat within MZs in the western portion of the species range can be used to evaluate focal areas for management in regional planning areas and land management planning units. The emphasis at the scale of the land planning area or management planning unit is on maintaining or increasing large contiguous areas of sagebrush habitat with covers in the 26-65% and especially >65% category. Resilience to disturbance and resistance to invasive annual grasses as indicated by soil temperature and moisture regimes is used to determine the most appropriate activities within the different cover categories. The sage-grouse habitat matrix in table 2 describes the capacity of areas with differing resilience and resistance to recover following disturbance and resist annual invasive grasses and provides the management implications for each of the different cover categories. Table 4 provides potential management strategies for the different sagebrush cover and resilience and resistance categories (cells) in the sage-grouse habitat matrix by agency program areas (fire operations, fuels management, post-fire rehabilitation, habitat restoration). Note that the guidelines in table 4 are related to the sage-grouse habitat matrix, and do not preclude other factors from consideration when determining management priorities for program areas.

Here, we provide an example of how to apply the concepts and tools discussed in this report by examining an important region identified in the MZ scale assessment. The northeastern corner of Nevada was selected to illustrate the diversity of sage-grouse habitat within planning areas and the need for proactive collaboration both within agencies and across jurisdictional boundaries in devising appropriate management strategies (figs. 17, 19, 21, 23, 25). This part of Nevada has large areas of invasive annual grasses and areas with piñon and juniper expansion, and it has experienced multiple large fires in the last decade. It includes a BLM Field Office, Forest Service (FS) land, State land, multiple private owners, and borders two States (fig. 29), which results in both complex ownership and natural complexity.

In the northeast corner of Nevada, an area 5,403,877 ha (13,353,271 ac) in size, numerous large fires have burned in and around PACs (fig. 25). Since 2000, a total of 1,144,317 ha (2,827,669 ac) have burned with the largest fires occurring in 2000, 2006, and 2007. This suggests that the primary management emphasis be on retaining existing areas of sagebrush in the 26-65% and especially >65% categories and promoting recovery of former sagebrush areas that have burned. Fire suppression in and around large, contiguous areas of sagebrush and also in and around successful habitat restoration or post-fire rehabilitation treatments is a first order priority. Fuels management also is a high priority and is focused on strategic placement of fuel breaks to reduce loss of large sagebrush stands by wildfire without jeopardizing existing habitat quality. Also, in the eastern portion of the area, piñon and juniper land cover comprises 471,645 ha (1,165,459 ac) (fig. 23). In this area, management priorities include (1) targeted tree removal in early to mid-phase (Phase I and II), post-settlement piñon and juniper expansion areas to maintain shrub/herbaceous cover and reduce fuel loads, and (2) targeted tree removal in later phase (Phase III) post-settlement piñon and juniper areas to reduce risk of high severity fire. In areas with moderate to high resilience and resistance, post-fire rehabilitation focuses on accelerating sagebrush establishment and recovery of perennial native herbaceous species. These areas often are capable of unassisted recovery and seeding is likely needed only in areas where perennial native herbaceous species have been depleted (Miller et al. 2013). Seeding introduced species can retard recovery of native perennial grasses and forbs that are important to sage-grouse and should be avoided in these areas (Knutson et al. 2014). Seeding or transplanting of sagebrush may be needed to accelerate establishment in focal areas.

- Forest Service (USFS)

**Figure 29.** Land ownership for the northeast corner of Nevada. Lighter colored polygons delineate Priority Areas for Conservation (USFWS 2013).

In areas with lower resilience and resistance and high breeding bird densities, large, contiguous areas of sagebrush with intact understories are a high priority for conservation (figs. 17, 19, 27). In these areas, emphasis is on maintaining or increasing habitat conditions by minimizing stressors and disturbance. Post-fire rehabilitation and restoration activities focus on areas that increase connectivity among existing large areas of sagebrush. Because of low and variable precipitation, more than one intervention may be required to achieve restoration or rehabilitation goals. Appropriately managing livestock, wild horse and burro use (if applicable), and recreational use in focal areas is especially important to promote native perennial grass and forb growth and reproduction and to maintain or enhance resilience and resistance.

## Determining the Most Appropriate Management Treatments at the Project Scale

Once focal areas and management priorities have been determined, potential treatment areas can be assessed to determine treatment feasibility and appropriate treatment methods. Different treatment options exist (figs. 30, 31) that differ in both suitability for a focal area and likely effectiveness. Field guides for sagebrush ecosystems and piñon and juniper expansion areas that incorporate resilience and resistance concepts are being developed to help guide managers through the process of determining both the suitability of an area for treatment and the most appropriate treatment. These guides are aligned with the different program areas and emphasize (1) fuel treatments (Miller et al. 2014a), (2) post-fire rehabilitation (Miller et al. 2014b), and (3) restoration (Pyke et al., in preparation). Additional information on implementing these types of management treatments is synthesized in Monsen et al. (2004) and Pyke (2011); additional information on treatment response is synthesized in Miller et al. (2013). In this section, we summarize the major steps in the process for determining the suitability of an area for treatment and the most appropriate treatment. We then provide an overview of two of the primary tools in the assessment process – ecological site descriptions (ESDs) and state and transition models (STMs). We conclude with a discussion of the importance of monitoring and adaptive management.

**Steps in the process:** Logical steps in the process of determining the suitability of an area for treatment and the most appropriate treatment(s) include (1) assessing the potential treatment area and identifying ecological sites, (2) determining the current successional state of the site, (3) selecting the appropriate action(s), and (4) monitoring and evaluation to determine post-treatment management. A general approach that uses questions to identify the information required in each step was developed (table 6). These questions can be modified to include the specific information needed for each program area and for treating different ecological sites. This format is used in the field guides described above.

**Figure 30.** Common vegetation treatments for sagebrush dominated ecosystems with relatively low resilience and resistance include seeding after wildfire in areas that lack sufficient native perennial grasses and forbs for recovery (top) (photo by Chad Boyd), and mowing sagebrush to reinvigorate native perennial grasses and forbs in the understory (bottom) (photo by Scott Schaff). Success of mowing treatments depends on having adequate perennial grasses and forbs on the site to resist invasive annual grasses and to promote recovery.

**Figure 31.** Vegetation treatments for sagebrush ecosystems exhibiting piñon and juniper expansion include cutting the trees with chainsaws and leaving them in place (top) (photo by Jeremy Roberts) and shredding them with a “bullhog” (middle) (photo by Bruce A. Roundy) on sites with relatively warm soils and moderately low resistance to cheatgrass. Prescribed fire (bottom) (photo by Jeanne C. Chambers) can be a viable treatment on sites with relatively cool and moist soils that have higher resilience to disturbance and resistance to invasive annual grasses. Treatment success depends on having adequate perennial grasses and forbs on the site to resist invasive annual grasses and promote recovery and will be highest on sites with relatively low densities of trees (Phase I to Phase II woodlands).

**Table 6.** General guidelines for conducting fuels management, fire rehabilitation, and restoration treatments (modified from Miller et al. 2007; Tausch et al. 2009; Pyke 2011; Chambers et al. 2013).

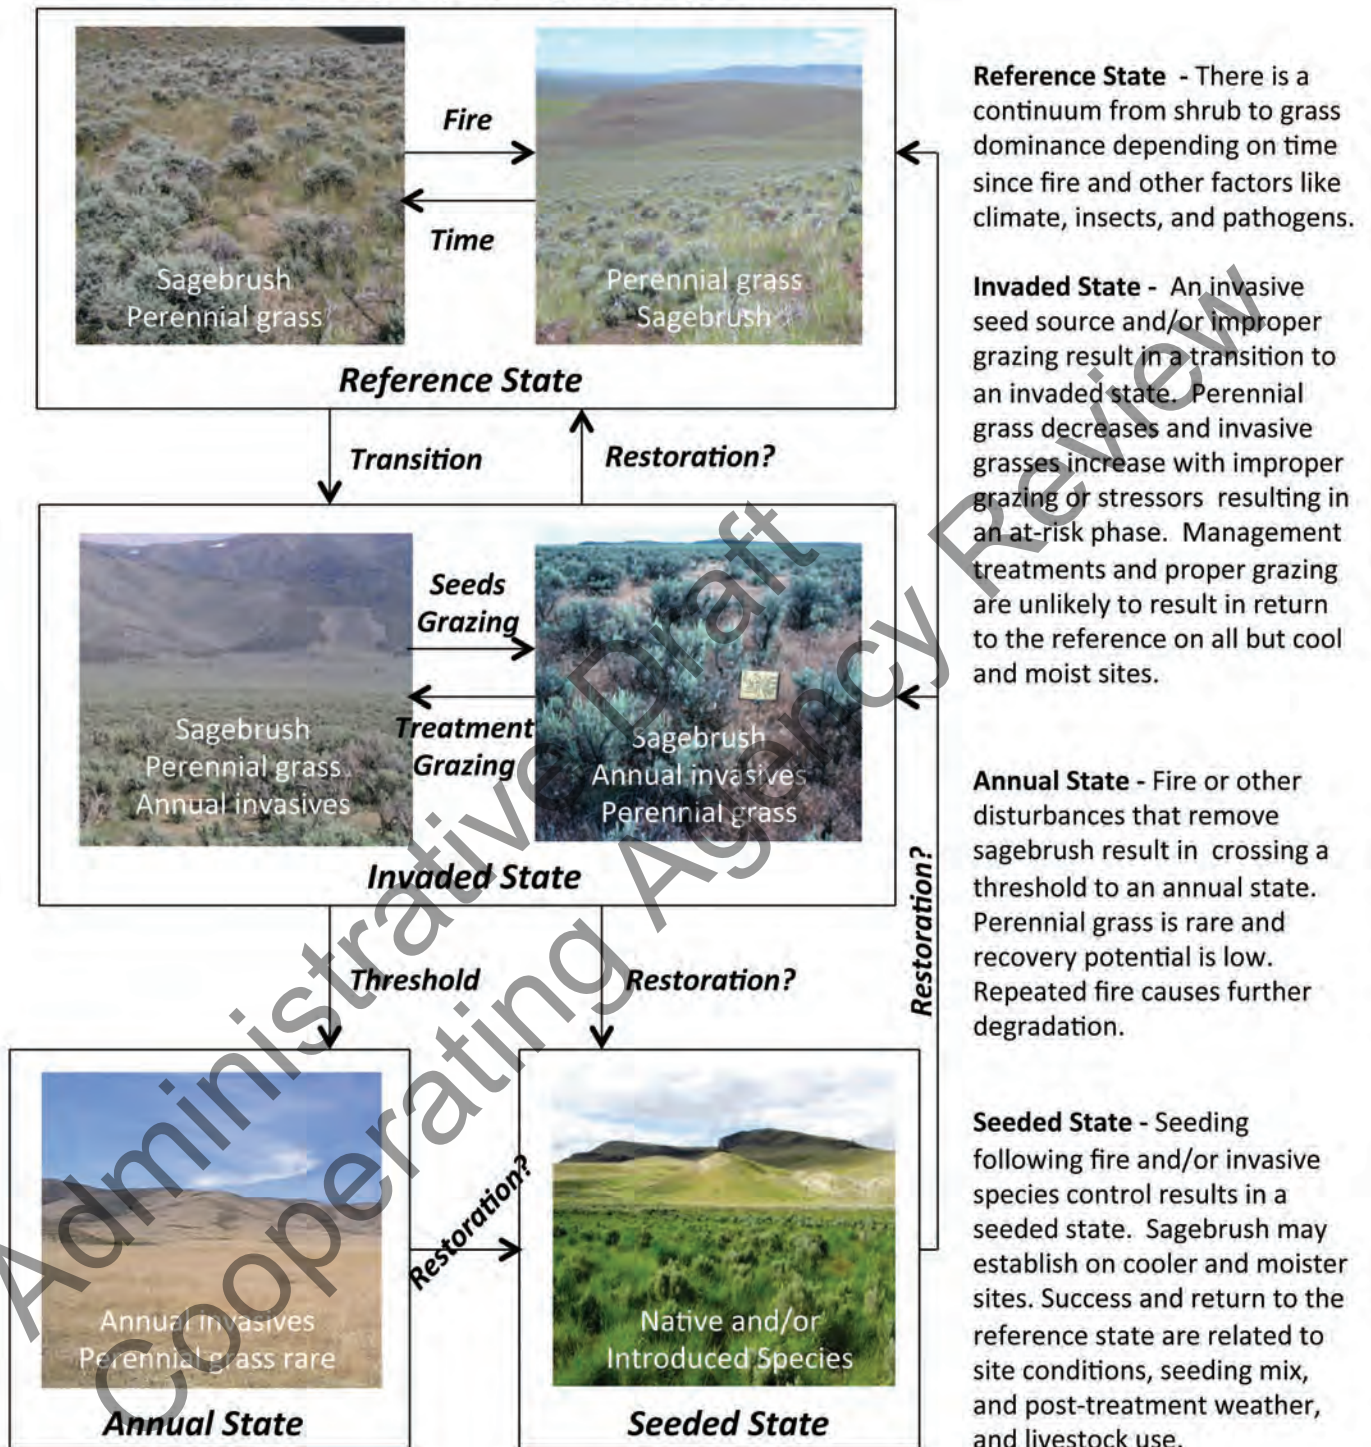

Steps in the process	Questions and considerations
I. Assess potential treatment area and identify ecological sites	<ol style="list-style-type: none"> <li>1. Where are priority areas for fuels management, fire rehabilitation or restoration within the focal area? Consider sage-grouse habitat needs and resilience and resistance.</li> <li>2. What are the topographic characteristics and soils of the area? Verify soils mapped to the location and determine soil temperature/moisture regimes. Collect information on soil texture, depth and basic chemistry for restoration projects.</li> <li>3. How will topographic characteristics and soils affect vegetation recovery, plant establishment and erosion? Evaluate erosion risk based on topography and soil characteristics.</li> <li>4. What are the potential native plant communities for the area? Match soil components to their correlated ESDs. This provides a list of potential species for the site(s).</li> </ol>
II. Determine current state of the site	<ol style="list-style-type: none"> <li>5. Is the area still within the reference state for the ecological site(s)?</li> </ol>
III. Select appropriate action	<ol style="list-style-type: none"> <li>6. How far do sites deviate from the reference state? How will treatment success be measured?</li> <li>7. Do sufficient perennial shrubs and perennial grasses and forbs exist to facilitate recovery?</li> <li>8. Are invasive species a minor component?</li> <li>9. Do invasive species dominate the sites while native life forms are missing or severely under represented? If so, active restoration is required to restore habitat.</li> <li>10. Are species from drier or warmer ecological sites present? Restoration with species from the drier or warmer sites should be considered.</li> <li>11. Have soils or other aspects of the physical environment been altered? Sites may have crossed a threshold and represent a new ecological site type requiring new site-specific treatment/restoration approaches.</li> </ol>
IV. Determine post-treatment management	<ol style="list-style-type: none"> <li>12. How long should the sites be protected before land uses begin? In general, sites with lower resilience and resistance should be protected for longer periods.</li> <li>13. How will monitoring be performed? Treatment effectiveness monitoring includes a complete set of measurements, analyses, and a report.</li> <li>14. Are adjustments to the approach needed? Adaptive management is applied to future projects based on consistent findings from multiple locations.</li> </ol>

**Ecological site descriptions:** ESDs and their associated STMs provide essential information for determining treatment feasibility and type of treatment. ESDs are part of a land classification system that describes the potential of a set of climate, topographic, and soil characteristics and natural disturbances to support a dynamic set of plant communities (Bestmeyer et al. 2009; Stringham et al. 2003). NRCS soil survey data (<http://soils.usda.gov/survey/>), including soil temperature/moisture regimes and other soil characteristics, are integral to ESD development. ESDs have been developed by the NRCS and their partners to assist land management agencies and private land owners with making resource decisions, and are widely available for the Sage-grouse MZs except where soil surveys have not been completed (for a detailed description of ESDs and access to available ESDs see: <http://www.nrcs.usda.gov/wps/portal/nrcs/main/national/technical/ecoscience/desc/>). ESDs assist managers to step-down generalized vegetation dynamics, including the concepts of resilience and resistance, to local scales. For example, variability in soil characteristics and the local environment (e.g., average annual precipitation as indicated by soil moisture regime) can strongly influence both plant community resilience to fire as well as the resistance of a plant community to invasive annual grasses after fire (table 1). Within a particular ESD, there is a similar level of resilience to disturbance and resistance to invasive annuals and this information can be used to determine the most appropriate management actions.

**State and transition models:** STMs are a central component of ecological site descriptions that are widely used by managers to illustrate changes in plant communities and associated soil properties, causes of change, and effects of management interventions (Stringham et al. 2003; Briske et al. 2005; USDA NRCS 2007) including in sagebrush ecosystems (Forbis et al. 2006; Barbour et al. 2007; Boyd and Svejcar 2009; Holmes and Miller 2010; Chambers et al. *in press*). These models use *state* (a relatively stable set of plant communities that are resilient to disturbance) and *transition* (the drivers of change among alternative states) to describe the range in composition and function of plant communities within ESDs (Stringham and others 2003; see Appendix 1 for definitions). The reference state is based on the natural range of conditions associated with natural disturbance regimes and often includes several plant communities (*phases*) that differ in dominant plant species relative to type and time since disturbance (Caudle et al. 2013). Alternative states describe new sets of communities that result from factors such as inappropriate livestock use, invasion by annual grasses, or changes in fire regimes. Changes or transitions among states often are characterized by *thresholds* that may persist over time without active intervention, potentially causing irreversible changes in community composition, structure, and function. *Restoration pathways* are used to identify the environmental conditions and management actions required for return to a previous state. Detailed STMs that follow current interagency guidelines (Caudle et al. 2013), are aligned with the ecological types (table 1), and are generally applicable to MZs III (Southern Great Basin), IV (Snake River Plains), V (Northern Great Basin), and VI (Columbia Basin) are provided in Appendix 5.

A generalized STM to illustrate the use of STMs is shown in figure 32 for the warm and dry Wyoming big sagebrush ecological type. This ecological type occurs at relatively low elevations in the western part of the range and has low to moderate resilience to disturbance and management treatments and low resistance to invasion (table 1). This type is abundant in the western portion of the range, but as the STM suggests, it is highly susceptible to conversion to invasive annual grass and repeated fire and is difficult to restore. Intact sagebrush areas remaining in the reference state within this ecological type are a high priority for conservation. Invaded states or locations with intact sagebrush that lack adequate native perennial understory are a high priority for restoration where they bridge large, contiguous areas of sagebrush. However, practical methods to accomplish this are largely experimental and/or costly and further development, including adaptive science and management, is needed.

## State and Transition Model Warm and Dry Wyoming Big Sagebrush

**Figure 32.** A state and transition model that illustrates vegetation dynamics and restoration pathways for the warm and dry, Wyoming big sagebrush ecological type. This ecological type occurs at relatively low elevations in the western part of the range and has low to moderate resilience to disturbance and management treatments and low resistance to invasion.

**Monitoring and adaptive management:** Monitoring programs designed to track ecosystem changes in response to both stressors and management actions can be used to increase understanding of ecosystem resilience and resistance, realign management approaches and treatments, and implement adaptive management (Reever-Morghan et al. 2006; Herrick et al. 2012). Information is increasing on likely changes in sagebrush ecosystems with additional stress and climate warming, but a large degree of uncertainty still exists. Currently, the NRCS National Resource Inventory is being used on private lands and is being implemented on public lands managed by BLM to monitor trends in vegetation attributes and land health at the landscape scale under the AIM (Assessment Inventory and Monitoring) strategy. Strategic placement of monitoring sites and repeated measurements of ecosystem status and trends (e.g., land cover type, ground cover, vegetation cover and height of native and invasive species, phase of tree expansion, soil and site stability, oddities) can be used to decrease uncertainty and increase effectiveness of management decisions. Ideally, monitoring sites span environmental/productivity gradients and sagebrush ecological types that characterize sage-grouse habitat. Of particular importance are (1) ecotones between ecological types where changes in response to climate are expected to be largest (Loehle 2000; Stohlgren et al. 2000), (2) ecological types with climatic conditions and soils that are exhibiting invasion and repeated fires, and (3) ecological types with climatic conditions and soils that are exhibiting tree expansion and increased fire risk. Monitoring the response of sagebrush ecosystems to management treatments, including both pre- and post-treatment data, is a first order priority because it provides information on treatment effectiveness that can be used to adjust methodologies.

Monitoring activities are most beneficial when consistent approaches are used among and within agencies to collect, analyze, and report monitoring data. Currently, effectiveness monitoring databases that are used by multiple agencies do not exist. However, several databases have been developed for tracking fire-related and invasive-species management activities. The National Fire Plan Operations and Reporting System (NF-PORS) is an interdepartmental and interagency database that accounts for hazardous fuel reduction, burned area rehabilitation and community assistance activities. To our knowledge, NF-PORS is not capable of storing and retrieving the type of effectiveness monitoring information that is needed for adaptive management. The FEAT FIREMON Integrated (FFI; <https://www.frames.gov/partner-sites/ffi/ffi-home/>) is a monitoring software tool designed to assist managers with collection, storage and analysis of ecological information. It was constructed through a complementary integration of the Fire Ecology Assessment Tool (FEAT) and FIREMON. This tool allows the user to select among multiple techniques for effectiveness monitoring. If effectiveness monitoring techniques were agreed on by the agencies, FFI does provide databases with standard structures that could be used in inter-agency effectiveness monitoring. Also, the National Invasive Species Information Management System (NISIMS) is designed to reduce redundant data entry regarding invasive species inventory, management and effectiveness monitoring with the goal of providing information that can be used to determine effective treatments for invasive species. However, NISIMS is currently available only within the BLM.

Common databases can be used by agency partners to record and share monitoring data. The Land Treatment Digital Library (LTDL [USGS 2010]) provides a method of archiving and collecting common information for land treatments and might be used as a framework for data storage and retrieval. Provided databases are relational (maintain a common field for connecting them), creating single corporate databases is not necessary. However, barriers that hinder database access within and among agencies and governmental departments may need to be lowered while still maintaining adequate data security. The LTDL has demonstrated how

this can work by accessing a variety of databases to populate useful information relating to land treatments.

For effectiveness of treatments to be easily useable for adaptive management, the agencies involved will need to agree on monitoring methods and a common data storage and retrieval system. Once data can be retrieved, similar treatment projects can be evaluated to determine how well they achieve objectives for sage-grouse habitat, such as the criteria outlined in documents like the Habitat Assessment Framework (Stiver et al. 2006). Results of monitoring activities on treatment effectiveness are most useful when shared across jurisdictional boundaries, and several mechanisms are currently in place to improve information sharing (e.g., the Great Basin Fire Science Delivery Project; [www.gbfiresci.org](http://www.gbfiresci.org)).

## Appendix 1. Definitions of Terms Used in This Document

---

**At-Risk Community Phase** — A community phase that can be designated within the reference state and also in alternative states. This community phase is the most vulnerable to transition to an alternative state (Caudle et al. 2013).

**Community Phase** — A unique assemblage of plants and associated soil properties that can occur within a state (Caudle et al. 2013).

**Ecological Site (ES)** — An Ecological Site (ES) is a conceptual division of the landscape that is defined as a distinctive kind of land based on recurring soil, landform, geological, and climate characteristics that differs from other kinds of land in its ability to produce distinctive kinds and amounts of vegetation and in its ability to respond similarly to management actions and natural disturbances (Caudle et al. 2013).

**Ecological Site Descriptions (ESD)** — The documentation of the characteristics of an ecological site. The documentation includes the data used to define the distinctive properties and characteristics of the ecological site; the biotic and abiotic characteristics that differentiate the site (i.e., climate, topography, soil characteristics, plant communities); and the ecological dynamics of the site that describes how changes in disturbance processes and management can affect the site. An ESD also provides interpretations about the land uses and ecosystem services that a particular ecological site can support and management alternatives for achieving land management (Caudle et al. 2013).

**Ecological Type** — A category of land with a distinctive (i.e., mappable) combination of landscape elements. The elements making up an ecological type are climate, geology, geomorphology, soils, and potential natural vegetation. Ecological types differ from each other in their ability to produce vegetation and respond to management and natural disturbances (Caudle et al. 2013).

**Historical Range of Variability** — Range of variability in disturbances, stressors, and ecosystem attributes that allows for maintenance of ecosystem resilience and resistance and that can be used to provide management targets (modified from Jackson 2006).

**Resilience** — Ability of a species and/or its habitat to recover from stresses and disturbances. Resilient ecosystems regain their fundamental structure, processes, and functioning when altered by stresses like increased CO<sub>2</sub>, nitrogen deposition, and drought and to disturbances like land development and fire (Allen et al. 2005; Holling 1973).

**Resistance** — Capacity of an ecosystem to retain its fundamental structure, processes and functioning (or remain largely unchanged) despite stresses, disturbances, or invasive species (Folke et al. 2004).

**Resistance to Invasion** — Abiotic and biotic attributes and ecological processes of an ecosystem that limit the population growth of an invading species (D'Antonio and Thomsen 2004).

**Restoration Pathways** — Restoration pathways describe the environmental conditions and practices that are required for a state to recover that has undergone a transition (Caudle et al. 2013).

**State** — A state is a suite of community phases and their inherent soil properties that interact with the abiotic and biotic environment to produce persistent functional and structural attributes associated with a characteristic range of variability (adapted from Briske et al. 2008).

**State-and-Transition Model** — A method to organize and communicate complex information about the relationships between vegetation, soil, animals, hydrology, disturbances (fire, lack of fire, grazing and browsing, drought, unusually wet periods, insects and disease), and management actions on an ecological site (Caudle et al. 2013).

**Thresholds** — Conditions sufficient to modify ecosystem structure and function beyond the limits of ecological resilience, resulting in the formation of alternative states (Briske et al. 2008).

**Transition** — Transitions describe the biotic or abiotic variables or events, acting independently or in combination, that contributes directly to loss of state resilience and result in shifts between states. Transitions are often triggered by disturbances, including natural events (climatic events or fire) and/or management actions (grazing, burning, fire suppression). They can occur quickly as in the case of catastrophic events like fire or flood, or over a long period of time as in the case of a gradual shift in climate patterns or repeated stresses like frequent fires (Caudle et al. 2013).

## Appendix 2. An Explanation of the Use of Landscape Measures to Describe Sagebrush Habitat

---

Understanding landscape concepts of plant cover relative to typical management unit concepts of plant cover is important for prioritizing lands for management of sage-grouse. Ground cover measurements of sagebrush made at a management unit (for example, line-intercept measurements) should not be confused for landscape cover and may not relate well to landscape cover since the areas of examination differ vastly (square meters for management units and square kilometers for landscapes).

A landscape is defined rather arbitrarily as a large area in total spatial extent, somewhere in size between sites (acres or square miles) and regions (100,000s of square miles). The basic unit of a landscape is a patch, which is defined as a bounded area characterized by a similar set of conditions. A habitat patch, for example, may be the polygonal area on a map representing a single land cover type. Landscapes are composed of a mosaic of patches. The arrangement of these patches (the landscape configuration or pattern) has a large influence on the way a landscape functions and for landscape species, such as sage-grouse, sagebrush habitat patches are extremely important for predicting if this bird will be present within the area (Connelly et al. 2011).

Remotely sensed data of land cover is typically used to represent landscapes. These data may combine several sources of data and may include ancillary data, such as elevation, to improve the interpretation of data. These data are organized into pixels that contain a size or grain of land area. For example, Landsat Thematic Mapper spectral data used in determining vegetation cover generally have pixels that represent ground areas of 900 m<sup>2</sup> (30- x 30-m). Each pixel's spectral signature can be interpreted to determine what type of vegetation dominates that pixel. Groups of adjacent pixels with the same dominant vegetation are clustered together into polygons that form patches.

Landscape cover of sagebrush is determined initially by using this vegetation cover map, but a 'rolling window' of a predetermined size (e.g., 5 km<sup>2</sup> or 5,556 pixels that are 30- by 30-m in size) is moved across the region one pixel at a time. The central pixel of the 'window' is reassigned a value for the proportion of pixels where sagebrush is the dominant vegetation. The process is repeated until pixels within the region are completely reassigned to represent the landscape cover of sagebrush within for the region drawn from a 5 km<sup>2</sup> window.

## Appendix 3. An Explanation of Soil Temperature and Moisture Regimes Used to Describe Sagebrush Ecosystems

Soil climate regimes (temperature and moisture) are used in Soil Taxonomy to classify soils; they are important to consider in land management decisions, in part, because of the significant influence on the amounts and kinds of vegetation that soils support. Soil temperature and moisture regimes are assigned to soil map unit components as part of the National Cooperative Soil Survey program. Soil survey spatial and tabular data for the Sage-grouse Management Zones (Stiver et al. 2006) were obtained for each State within the zones at the Geospatial Data Gateway (<http://datagateway.nrcs.usda.gov/>). Gridded Soil Survey Geographic (gSSURGO) file geodatabases were used to display a 10-meter raster dataset. Multiple soil components made up a soil map unit, and soil moisture and temperature regimes were linked to individual soil map components. Soil components with the same soil moisture and temperature class regime were aggregated, and the dominant soil moisture and temperature regime within each soil map unit was used to characterize the temperature and moisture regime. Only temperature and moisture regimes applicable to sagebrush ecosystems were displayed.

Abbreviated definitions of each soil temperature and moisture regime class are listed below. Complete descriptions can be found in *Keys to Soil Taxonomy, 11th edition*, available at [ftp://ftp-fc.sc.egov.usda.gov/NSSC/Soil\\_Taxonomy/keys/2010\\_Keys\\_to\\_Soil\\_Taxonomy.pdf](ftp://ftp-fc.sc.egov.usda.gov/NSSC/Soil_Taxonomy/keys/2010_Keys_to_Soil_Taxonomy.pdf).

<b>Soil temperature regimes</b>	
Cryic (Cold)	Soils that have a mean annual soil temperature of <8 °C, and do not have permafrost, at a depth of 50 cm below the surface or at a restrictive feature, whichever is shallower.
Frigid (Cool)	Soils that have a mean annual soil temperature of <8 °C and the difference between mean summer and mean winter soil temperatures is >6 °C at a depth of 50 cm below the surface or at a restrictive feature, whichever is shallower.
Mesic (Warm)	Soils that have a mean annual soil temperature of 8-15 °C and the difference between mean summer and mean winter soil temperatures is >6 °C at a depth of 50 cm below the surface or at a restrictive feature, whichever is shallower.
<b>Soil moisture regimes</b>	
Ustic (summer precipitation)	Generally there is some plant-available moisture during the growing season, although significant periods of drought may occur. Summer precipitation allows presence of warm season plant species.
Xeric (Moist; generally mapped at >12 inches mean annual precipitation)	Characteristic of arid regions. The soil is dry for at least half the growing season and moist for less than 90 consecutive days.
Aridic (Dry; generally mapped at <12 inches mean annual precipitation)	Characteristic of arid regions. The soil is dry for at least half the growing season and moist for less than 90 consecutive days.

Note: Soil moisture regimes are further divided into moisture subclasses, which are often used to indicate soils that are transitional to another moisture regime. For example, a soil with an Aridic moisture regime and a Xeric moisture subclass may be described as “Aridic bordering on Xeric.” Understanding these gradients becomes increasingly important when making interpretations and decisions at the site scale where aspect, slope, and soils affect the actual moisture regime on that site. More information on taxonomic moisture subclasses is available at [http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/ref/?cid=nrcs142p2\\_053576](http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/ref/?cid=nrcs142p2_053576).

## Appendix 5. State-and-transition models (STMs) for five generalized ecological types for big sagebrush (from Chambers et al. *in press*; Miller et al. 2014 a, b)

These STMs represent groupings of ecological sites that are characterized by Wyoming or mountain big sagebrush, span a range of soil moisture/temperature regimes (warm/dry to cold/moist), and characterize a large portion of Management Zones III (Southern Great Basin), IV (Snake River Plains), V (Northern Great Basin), and VI (Columbia Basin). Large boxes illustrate states that are comprised of community phases (smaller boxes). Transitions among states are shown with arrows starting with T; restoration pathways are shown with arrows starting with R. The “at risk” community phase is most vulnerable to transition to an alternative state. Precipitation Zone is designated as PZ.

**Figure A.5A.** STM for a cryic/xeric mountain big sagebrush/mountain brush ecological type characterized by moderately high resilience and high resistance.

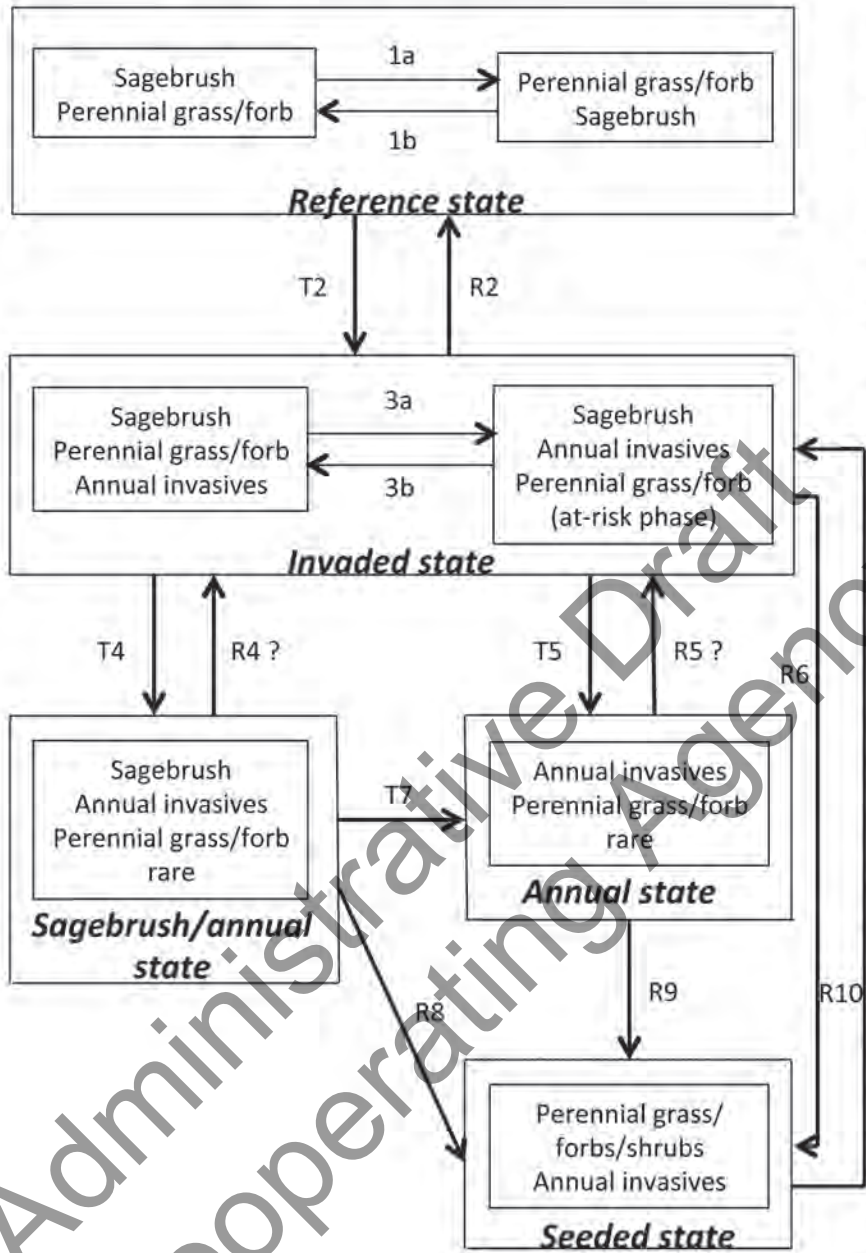

COOL FRIGID/XERIC  
MOUNTAIN BIG SAGEBRUSH (12 -14 IN + PZ)  
Piñon pine and/or juniper potential  
Moderately high resilience and resistance

(1a) Disturbances such as wildfire, insects, disease, and pathogens result in less sagebrush and more perennial grass/forb. (1b) Sagebrush increases with time . (2) Time combined with seed sources for piñon and/or juniper trigger a Phase I Woodland. (3 and 5) Fire and or fire surrogates (herbicides and/or mechanical treatments) that remove trees may restore perennial grass/forb and sagebrush dominance. (4a) Increasing tree abundance results in a Phase II woodland with depleted perennial grass/forb and shrubs and an at-risk phase. (4b) Fire surrogates (herbicides and/or mechanical treatments) that remove trees may restore perennial grass/forb and sagebrush dominance. (T6) Infilling of trees and/or improper grazing can result in a biotic threshold crossing to a wooded state with increased risk of high severity crown fires . (R6) Fire, herbicides and/or mechanical treatments that remove trees may restore perennial grass/forb and sagebrush dominance. (T7) An irreversible abiotic threshold crossing to an eroded state can occur depending on soils, slope, and understory species. (R8 and R9) Seeding after fire may be required on sites with depleted perennial grass/forb, but seeding with aggressive introduced species can decrease native perennial grass/forb. Annual invasives are typically rare. Seeded eroded states may have lower productivity. (R10) Depending on seed mix and grazing, return to the reference state may be possible if an irreversible threshold has not been crossed.

Figure A.5B. STM for a cool frigid/xeric mountain big sagebrush ecological type that has piñon pine and/or juniper potential and is characterized by moderately high resilience and resistance.

COOL MESIC TO COOL FRIGID/XERIC  
 MOUNTAIN BIG SAGEBRUSH (12-14 IN PZ)  
 Moderate resilience and resistance

(1a) Perennial grass/forb increases due to disturbances that decrease sagebrush like wildfire, insects, disease, and pathogens.

(1b) Sagebrush Increases with time .

(T2) An invasive seed source and/or improper grazing trigger an invaded state.

(R2) Proper grazing, fire, herbicides, and/or mechanical treatments may restore perennial grass/forb and sagebrush dominance with few invasives.

(3a) Perennial grass/forb decreases and sagebrush and invasives increase with improper grazing by livestock resulting in an at-risk phase. Decreases in sagebrush due to insects, disease or pathogens can further increase invasives.

(3b) Proper grazing, herbicides, or mechanical treatments that reduce sagebrush may increase perennial grass/forb and decrease invasives.

(T4) Improper grazing results in a sagebrush/annual state.

(R4) Proper grazing may facilitate return to the invaded state on cooler/wetter sites if sufficient grass/forb remains .

(T5 and T7) Fire or other disturbances that remove sagebrush result in an annual state. Perennial grass/forb are rare and recovery potential is reduced. Repeated fire can result in a biotic threshold crossing to annual dominance on warmer/drier sites, and root-sprouting shrubs may increase.

(R5) Cooler and wetter sites may return to the invaded or reference state with lack of fire, proper grazing, and favorable weather.

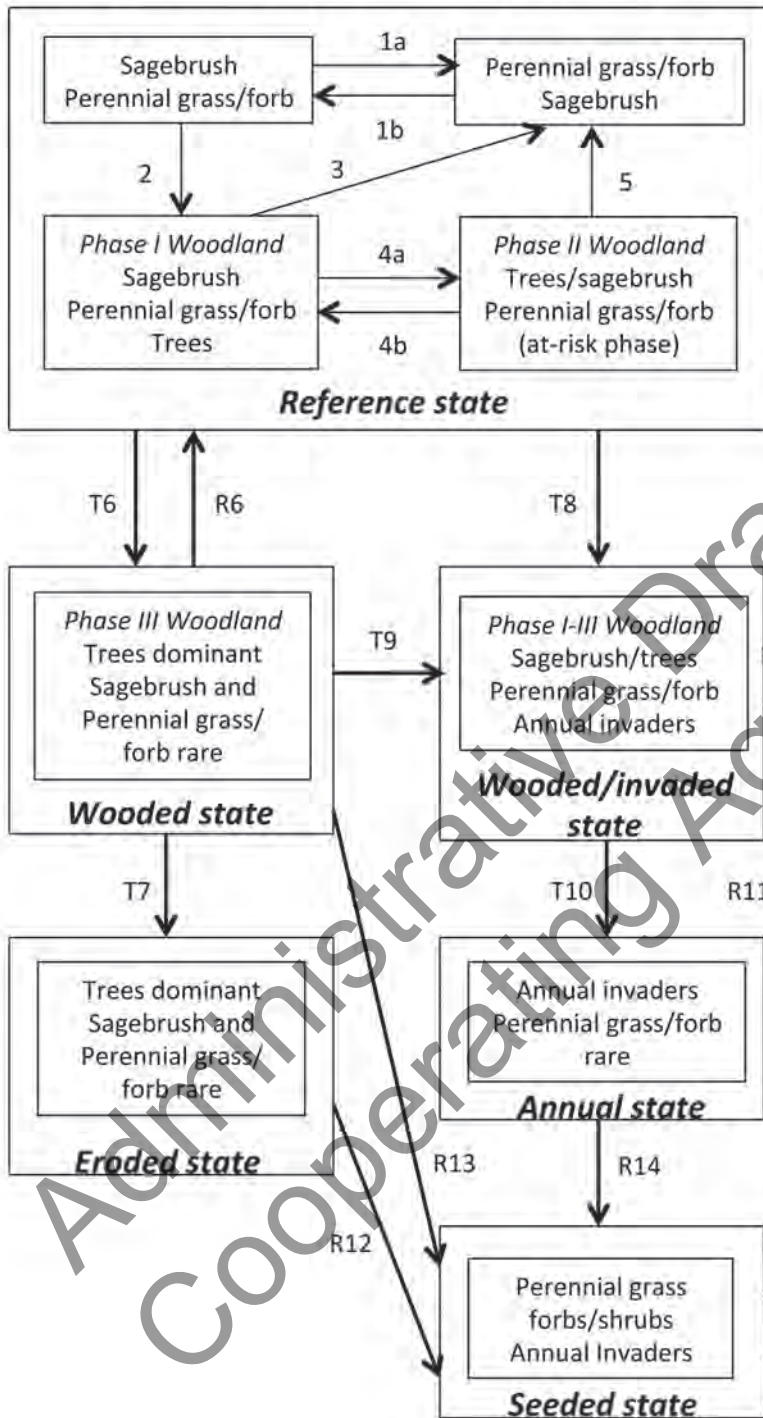

(R6, R8 and R9) Seeding following fire and/or invasive species control results in a seeded state. Sagebrush may recolonize depending on patch size, but annual invaders are still present.

(R10) Cooler and wetter sites may return to the invaded or possibly reference state depending on seeding mix, grazing and weather.

Figure A.5C. STM for a cool mesic to cool frigid/xeric mountain big sagebrush ecological type that is characterized by moderate resilience and resistance.

COOL MESIC TO WARM FRIGID/XERIC  
 BIG SAGEBRUSH (12-14 IN + PZ)  
 Piñon pine and/or juniper potential

**Moderate resilience and moderately low resistance**

(1a) Disturbances such as wildfire, insects, disease, and pathogens result in less sagebrush and more perennial grass/forb.

(1b) Sagebrush increases with time.

(2) Time combined with seed sources for piñon and/or juniper trigger a Phase I Woodland.

(3 and 5) Fire and or fire surrogates (herbicides and/or mechanical treatments) that remove trees may restore perennial grass/forb and sagebrush dominance on cooler/wetter sites. On warmer/drier sites with low perennial grass/forb abundance resistance to invasion is moderately low.

(4a) Increasing tree abundance results in a Phase II woodland with depleted perennial grass/forb and shrubs and an at-risk phase.

(4b) Fire surrogates (herbicides and/or mechanical treatments) that remove trees may restore sagebrush and perennial grass/forb dominance.

(T6) Infilling of trees and improper grazing can result in a biotic threshold crossing to a wooded state with increased risk of high severity crown fires.

(R6) Fire, herbicides and/or mechanical treatments that remove trees may restore perennial grass/forb and sagebrush dominance on cooler/wetter sites.

(T7) An irreversible abiotic threshold crossing to an eroded state can occur depending on soils, slope, and understory species.

(T8 and T9) An invasive seed source and/or improper grazing can trigger a wooded/invaded state.

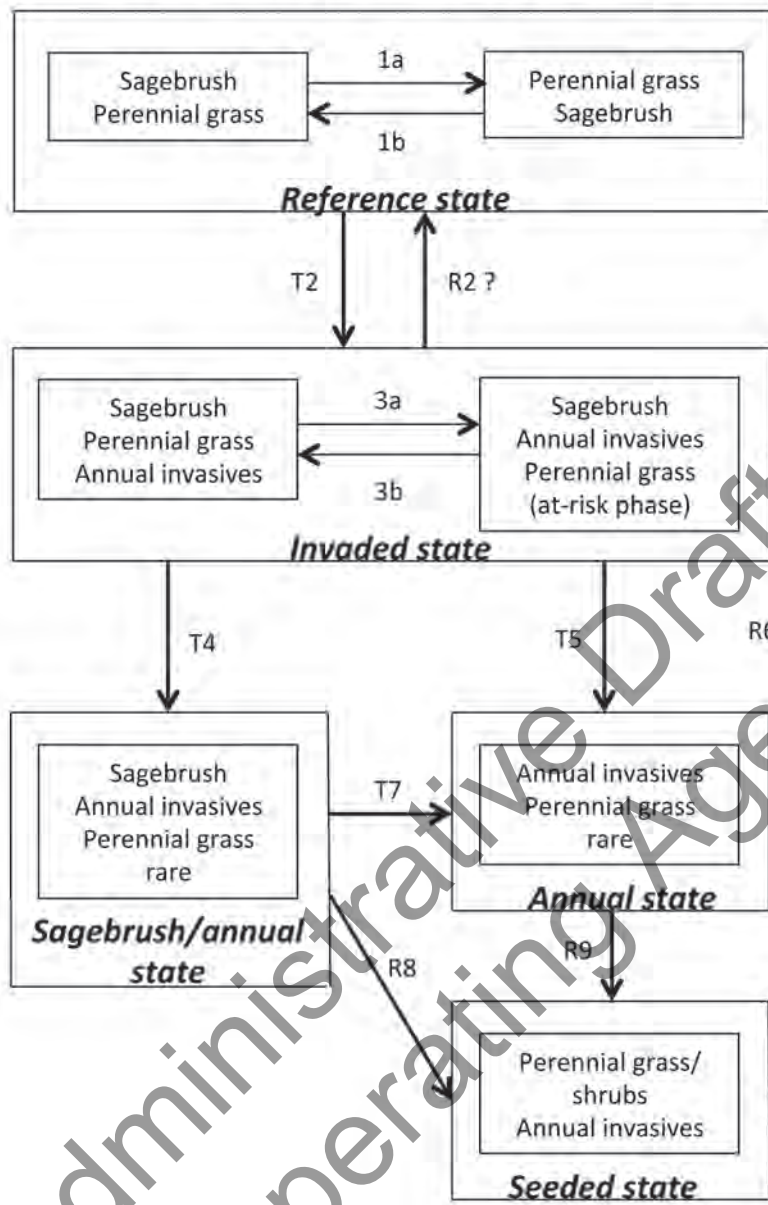

(T10) Fire or other disturbances that remove trees and sagebrush can result in a biotic threshold crossing to annual dominance on warmer/drier sites with low resilience.

(R11, R12, R13, and R14) Seeding after fire and/or invasive species control increases perennial grass/forb. Sagebrush may recolonize depending on seed sources, but annual invaders are still present. Seeded eroded states may have lower productivity.

(R15) Depending on seed mix, grazing, and level of erosion, return to the reference state may occur on cooler and wetter sites if an irreversible threshold has not been crossed.

**Figure A.5D.** STM for a cool mesic to warm frigid/xeric mountain big sagebrush ecological type type that has piñon pine and/or juniper potential and is characterized by moderate resilience and moderately low resistance.

MESIC/ARIDIC  
 WYOMING BIG SAGEBRUSH (8 TO 12 IN PZ)  
 Low to moderate resilience and low resistance

(1a) Perennial grass increases due to disturbances that decrease sagebrush like wildfire, insects, disease, and pathogens.  
 (1b) Sagebrush increases with time .  
 (T2) An invasive seed source and/or improper grazing trigger an invaded state.  
 (R2) Proper grazing, fire, herbicides and/ or mechanical treatments are unlikely to result in return to the reference state on all but the coolest and wettest sites.  
 (3a) Perennial grass decreases and both sagebrush and invasives increase with improper grazing resulting in an at-risk phase. Decreases in sagebrush due to insects, disease or pathogens can further increase invasives.  
 (3b) Proper grazing and herbicides or mechanical treatments that reduce sagebrush may restore perennial grass and decrease invaders on wetter sites (10-12"). Outcomes are less certain on drier sites (8-10") and/or low abundance of perennial grass.  
 (T4) Improper grazing triggers a largely irreversible threshold to a sagebrush/ annual state.  
 (T5 and T7) Fire or other disturbances that remove sagebrush result in an annual state. Perennial grass is rare and recovery potential is low due to low precipitation, mesic soil temperatures, and competition from annual invasives. Repeated fire can cause further degradation.  
 (R6, R8 and R9) Seeding following fire and/or invasive species control results in a seeded state. Sagebrush may recolonize depending on patch size, but annual invasives are still present.  
 (R10) Seeding effectiveness and return to the invaded state are related to site conditions, seeding mix, and post-treatment weather.

## Wildfire and Invasive Species Assessments

Administrative Draft  
Cooperating Agency Review

UNITED STATES DEPARTMENT OF THE INTERIOR  
BUREAU OF LAND MANAGEMENT  
WASHINGTON, D.C. 20240-0036  
<http://www.blm.gov>

August 28, 2014

In Reply Refer To:  
6711 (AD-200, FA-100) I

EMS TRANSMISSION 09/03/2014  
Instruction Memorandum No. 2014-134  
Expires: 09/30/2015

**To:** State Directors: CA, ID, NV, OR, UT

**From:** Assistant Director, Resources and Planning

**Subject:** Completion of Wildfire and Invasive Species DD: 9/8/2014 & 1/30/2015  
Assessments in Greater Sage-Grouse Habitat

**Program Areas:** Wildlife, Special Status Species, Range, Forestry, Emergency Stabilization and Rehabilitation, Riparian, Plant Conservation, Fire Operations, Fire Planning, and Fuels Management

**Purpose:** This Instruction Memorandum (IM) provides guidance for Bureau of Land Management (BLM) offices to cooperate with interagency partners to complete "Step 2" of the Wildfire and Invasive Species assessments (hereafter called FIAT assessments) for six priority landscapes in Greater sage-grouse (hereinafter "sage-grouse") habitats. These assessments will help to quantify future planned actions by the BLM to inform the US Fish and Wildlife Service's sage-grouse listing decision in 2015. The FIAT assessments are also consistent with the direction provided in the *Identification of Multi-year Funding Priorities and Consideration for Healthy Lands Focal Areas IM (WO IM-2014-124)* and the *Sage-Grouse Habitat and Wildland Fire Management IM (WO IM-2014-114)*.

**Policy/Action:** The FIAT assessments will be used to develop collaborative implementation plans that address threats to sage-grouse resulting from invasive annual grasses, wildfires, and conifer expansion in Priority Areas for Conservation (PACs). The completion of this first round of the PAC assessments within the Great Basin will inform the next phase of assessments as the BLM continues to expand into other sage-grouse habitat into 2015, including the Rocky Mountain

States as appropriate.

The State offices listed in Attachment 1 will complete "Step 2" of the FIAT assessments for six priority landscapes in cooperation with interagency partners following the schedule as defined in the Action Plan and a description of the collaboration process and team structure. Attachment 2 illustrates the names and locations of the PACs. The June 2014 FIAT Assessment (Attachment 3) completed "Step 1" of the FIAT assessment process and provides guidance for completing "Step 2".

The FIAT assessments are non-decisional in nature, and involve two steps:

**Step 1:** This step has been completed and is documented in the June 2014 FIAT Assessment protocol (Attachment 3). Step 1 identified focal habitats where management strategies will be prioritized (within or near these important habitats), patterns of resistance to invasive annual grasses and resilience after disturbance, landscape sagebrush cover, and conifer expansion within the six PACs. In addition to presenting the regional context, outcomes of Step 1 included geospatial data which define focal habitats, high density sage-grouse populations, and their intersection with threat factors. This data will be provided to state offices and appropriate field offices to use in their assessments.

**Step 2:** State and local offices will utilize Step 1 information and local data to conduct the FIAT assessments for the six PACs. As described in Attachment 3, offices will utilize Step 1 geospatial data supplemented with appropriate local data to best describe local conditions, treatment needs, and management priorities in or around focal habitats in the six PACs. Outcomes from Step 2 will include spatially identified conservation activities for the program areas of Fuels Management, Habitat Recovery/Restoration, Fire Operations, and Post-Fire Rehabilitation.

The PACs which have been identified for initial assessments include multiple land ownerships, jurisdictions, and in most cases, multiple states requiring a collaborative approach in carrying out the assessments. Partners who will contribute to FIAT assessments include, but are not limited to, National Forests, State wildlife agencies, the Natural Resources Conservation Service, the US Fish and Wildlife Service, tribes, and other local partners.

State Directors need to identify a State lead and the names of the core members of their team to Doug Havlina ([dhavlina@blm.gov](mailto:dhavlina@blm.gov)), the national lead for this effort, by September 8, 2014. The core team members are expected to participate in a

training workshop in Reno, NV September 16-18. The purpose of the workshop is to familiarize team members with the FIAT process, describe the data requirements, and provide the teams with a consistent approach to complete FIAT assessments.

**Timeframe:** This IM is effective immediately. The FIAT assessments for the six initial PACs will be completed by January 30, 2015.

**Budget Impact:** Moderate; one-time costs will be incurred as field offices complete FIAT assessments with adjoining agencies.

**Background:** The FIAT assessment process was approved by BLM leadership at the 2013 sage-grouse Federal Family meetings in Denver, Colorado and Portland, Oregon. In addition, BLM's Sage-Grouse National Policy Team approved the process in June 2014.

Wildfires, invasive annual grasses, and conifer encroachment are identified as primary threats. These threats contribute to fragmentation of habitats, large scale conversion to unsuitable plant communities, and ultimately declining sage-grouse populations. The BLM is moving towards completion of Resource Management Plan (RMP) amendments and revisions by winter 2015 to address these and other threats. While RMPs describe goals, objectives, and management actions to conserve sage-grouse, they generally lack specificity related to project prioritization, extent and location. This information is important to the 2015 USFWS listing decision. As such, FIAT assessments fulfill a key role by providing quantified descriptions of future conservation actions to inform the sage-grouse listing decision.

This assessment relies in large part on concepts of resistance to invasive annual grasses and resilience following disturbance across sage steppe environmental gradients along with sage-grouse habitat landscape cover requirements (available as a U.S. Forest Service General Technical Report at:

[http://www.fs.fed.us/rm/pubs/rmrs\\_gtr326.html](http://www.fs.fed.us/rm/pubs/rmrs_gtr326.html)

**Manual/Handbook Sections Affected:** None.

**Coordination:** This IM has been coordinated between Resources and Planning (WO200), Fire and Aviation (FA100), Fire Operations (FA300), and Fire Planning and Fuels Management (FA600).

**Contacts:** Questions may be directed to Douglas Havlina ([dhavlina@blm.gov](mailto:dhavlina@blm.gov)) Natural Resource Specialist - Fire Ecology, 208-387-5061.

Initial Draft Assessment Coordination Webinar	January 5, 2015
Final Draft for Great Basin Regional Management Team Review with State Directors	January 23, 2015
Final Assessments Approved by State Directors	January 30, 2015

### **Process for Collaboration**

Priority landscapes involve multiple ownerships, jurisdictions, and in most cases, multiple states. Consequently, the affected Bureau of Land Management (BLM) State Offices will work cooperatively to complete assessments. Partners which may contribute to FIAT assessments include National Forests managed by the U.S. Forest Service within priority landscapes, the Natural Resources Conservation Service, the USFWS, tribes, State wildlife agencies, and other local partners. A specific BLM State Office has been assigned as the lead for each of the six FIAT assessments (see above).

It is imperative that the assessment teams coordinate with the teams assessing adjacent priority landscapes and appropriate FIAT Development Team members. The Western Great Basin and Warm Springs Valley NV/Western Great Basin priority landscapes will be combined into one assessment for priority consistency across the areas and process efficiency. Similarly, the Northern Great Basin assessment will include the Box Elder PAC in Utah and the Management Zone IV portion of the Northern Great Basin/Western Great Basin PAC in Southeast Oregon. The Southern Great Basin PAC assessment will include the Hamlin Valley in Utah and the Management Zone V portion of the Northern Great Basin/Western Great Basin PAC in Southeast Oregon.

A FIAT training workshop will take place at Nevada State Office in Reno Nevada on September 16-18, 2014. The outcome of the training will be to familiarize designated team members with the FIAT process, understand the data requirements and provide the teams with a consistent approach to complete the FIAT assessment.

The employees required to attend the training will include the Sage Grouse Management Zone Project Team Lead, the project zone GIS Specialist, and two other team members designated by the Project Team Lead. The structure of this team may vary slightly given the requirements of each State. Select members of the FIAT Development Team will be involved in training, technical assistance, and review as assessments are conducted. State points-of-contact will coordinate attendance with Doug Havlina, meeting coordinator, at (208) 387-5061.

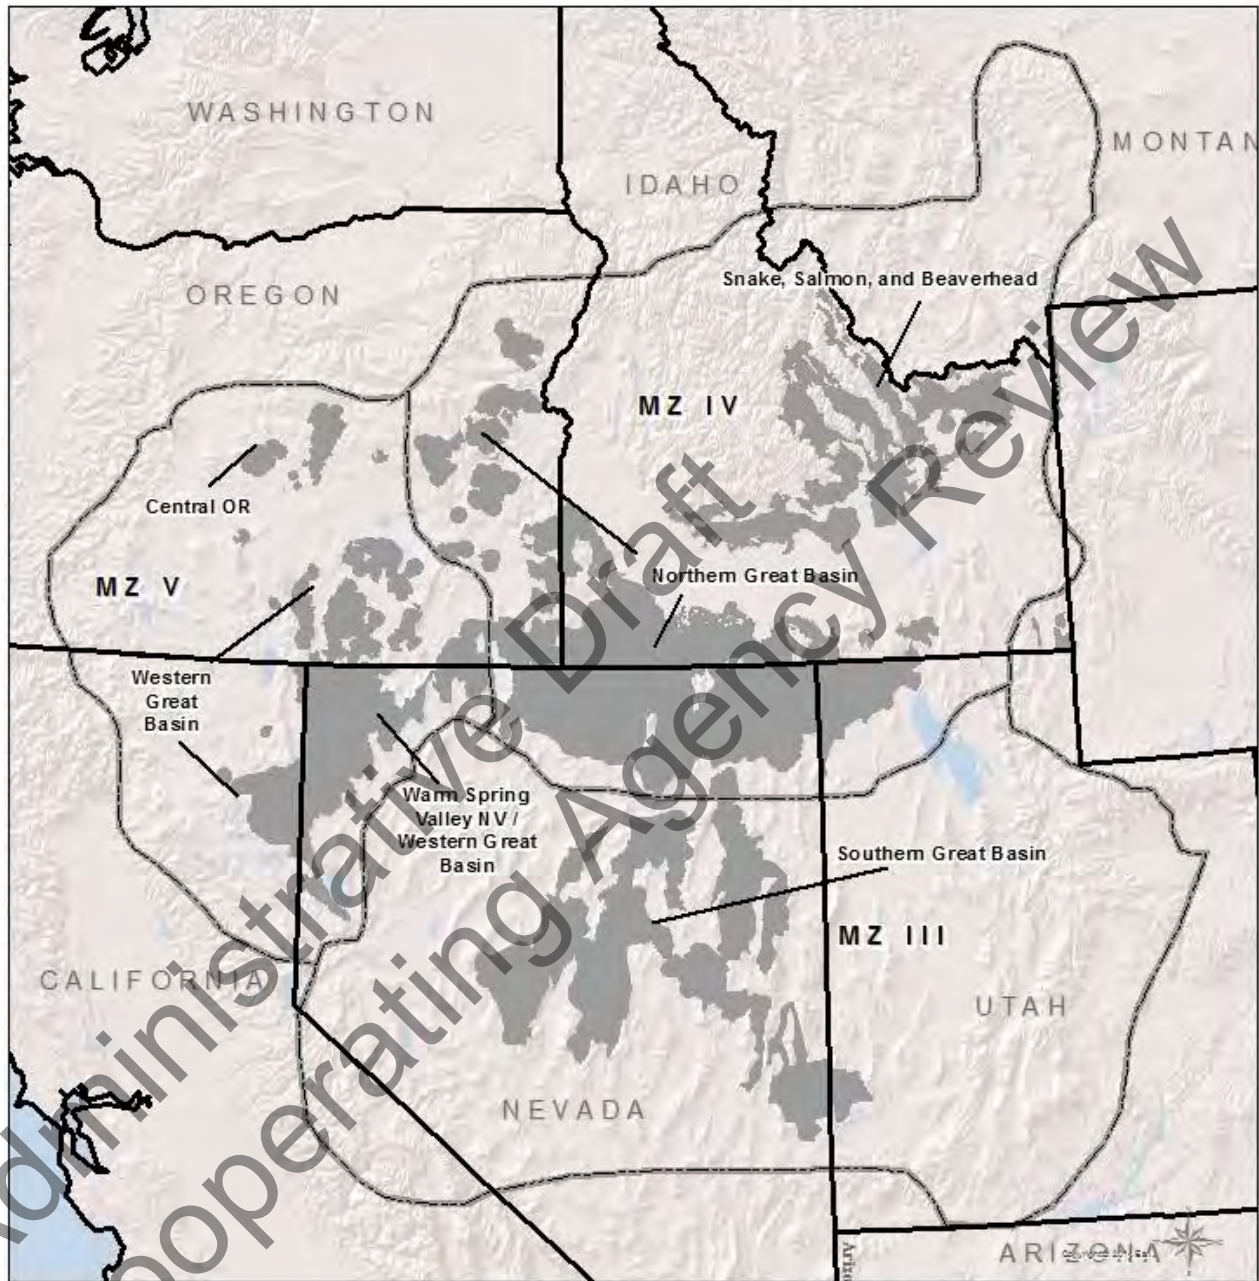

### **Core Team Structure**

The State will determine the membership of their team(s). The suggested teams should include the following positions:

1. Team Lead \*
2. GIS Specialist \*
3. Fire Planner
4. Fuels Specialist
5. Vegetation (Restoration) Specialist
6. Wildlife Biologist
7. Ecologist
8. Forester/Woodland Management Specialist
9. Writer- Editor
10. FWS Liaison
11. FS Liaison (Management Zones III & IV)
12. State Agencies
13. NRCS Liaison

# Greater Sage-Grouse Wildfire, Invasive Annual Grasses & Conifer Expansion Assessment

June 2014

## Introduction and Background

The purpose of this assessment is to identify priority habitat areas and management strategies to reduce the threats to Greater Sage-Grouse resulting from impacts of invasive annual grasses, wildfires, and conifer expansion. The Conservation Objectives Team (COT) report (USFWS 2013) and other scientific publications identify wildfire and conversion of sagebrush habitat to invasive annual grass dominated vegetative communities as two of the primary threats to the sustainability of Greater Sage-Grouse (*Centrocercus urophasianus*, hereafter sage-grouse) in the western portion of the species range. For the purposes of this assessment protocol, invasive species are limited to, and hereafter referred to, as **invasive annual grasses** (e.g., primarily cheatgrass [*Bromus tectorum*]). Conifer expansion (also called encroachment) is also addressed in this assessment.

The United States Fish and Wildlife Service (USFWS) will consider the amelioration of impacts, location and extent of treatments, degree of fire risk reduction, locations for suppression priorities, and other proactive measures to conserve sage-grouse in their 2015 listing decision. This determination will be made based in part upon information contained in the United States (US) Department of the Interior, Bureau of Land Management (BLM) resource management plan (RMP) amendments and Forest Service land resource management plan (LRMP) amendments, including this assessment.

This assessment is based in part on National Resources Conservation Service (NRCS) soil surveys that include geospatial information on soil temperature and moisture regimes associated with resistance and resiliency properties (see following section on *Soil Temperature and Moisture Regimes*). While this assessment is applicable across the range of sage-grouse, the analysis is limited to Western Association of Fish and Wildlife Management Agencies' (WAFWA) Management Zones III, IV, and V (roughly the Great Basin region) because of the significant issues associated with invasive annual grasses and the high level of wildfires in this region. The utility of this assessment process is dependent on incorporating improved information and geospatial data as it becomes available. Although the resistance and resilience concepts have broad applications (e.g., infrastructure development), this assessment is limited to developing strategies to reduce threats to sage-grouse habitat (e.g., invasive annual grasses and wildfires).

Draft Greater Sage-Grouse Environmental Impact Statements (EISs) contain a suggested framework in the appendices ("Draft Greater Sage-Grouse Wildland Fire and Invasive Species Assessment") that provided a consistent approach to conduct these assessments. The current protocol was developed by the Fire and Invasive Species Team (FIAT), a team of wildland fire specialists and other resource specialists and managers, to specifically incorporate resistance to invasive annual grasses and resilience after disturbance principles into the assessment protocol. In October 2013, the BLM, Forest Service, and USFWS agreed to incorporate this approach into the final EISs.

The cornerstone of the FIAT protocol is recent scientific research on resistance and resilience of Great Basin ecosystems (Chambers et al. *In press*) and the USFWS-sponsored project with the Western Association of Fish and Wildlife Agencies (WAFWA) to assemble an interdisciplinary team to provide additional information on wildland fire and invasive plants and to develop strategies for addressing

these issues. This interagency collaboration between rangeland scientists, fire specialists, and sage-grouse biologists resulted in the development of a strategic, multi-scale approach for employing ecosystem resilience and resistance concepts to manage threats to sage-grouse habitats from wildfire and invasive annual grasses (Chambers et al. *In prep.* ). This paper is being published as a Forest Service Rocky Mountain Research Station General Technical Report and is available at [www.rockymountainresearchstation.fs.fed.us/publications/2016/01/01/20160101a](http://www.rockymountainresearchstation.fs.fed.us/publications/2016/01/01/20160101a). It serves as the reference and basis for the protocol described in this assessment.

The assessment process sets the stage for:

- Identifying important sage-grouse occupied habitats and baseline data layers important in defining and prioritizing sage-grouse habitats
- Assessing the resistance to invasive annual grasses and resilience after disturbance and prioritizing focal habitats for conservation and restoration
- Identifying geospatially explicit management strategies to conserve sage-grouse habitats

Management strategies are types of actions or treatments that managers typically implement to resolve resource issues. They can be divided into proactive approaches (e.g., fuels management and habitat recovery/restoration) and reactive approaches (e.g., fire operations and post-fire rehabilitation). Proactive management strategies can favorably modify wildfire behavior and restore or improve desirable habitat with greater resistance to invasive annual grasses and/or resilience after disturbances such as wildfires. Reactive management strategies are employed to reduce the loss of sage-grouse habitat from wildfires or stabilize soils and reduce impacts of invasive annual grasses in sage-grouse habitat after wildfires. Proactive management strategies will result in long-term sage-grouse habitat improvement and stability, while reactive management strategies are essential to reducing current impacts of wildfires on sage-grouse habitat, thus maintaining long-term habitat stability. Management strategies include:

#### **Proactive Strategies-**

- 1. Fuels Management** includes projects that are designed to change vegetation composition and/or structure to modify fire behavior characteristics for the purpose of aiding in fire suppression and reducing fire extent.
- 2. Habitat Restoration/Recovery**
  - a. Recovery, referred to as passive restoration (Pyke 2011), is focused on changes in land use (e.g., improved livestock grazing practices) to achieve a desired outcome where the plant community has not crossed a biotic or physical threshold.
  - b. Restoration is equivalent to active restoration (Pyke 2011) and is needed when desired species or structural groups are poorly represented in the community and reseeding, often preceded by removal of undesirable species, is required. Note: The Fuels Management program supports recovery/restoration projects through its objective to restore and maintain resilient landscapes.

#### **Reactive Strategies-**

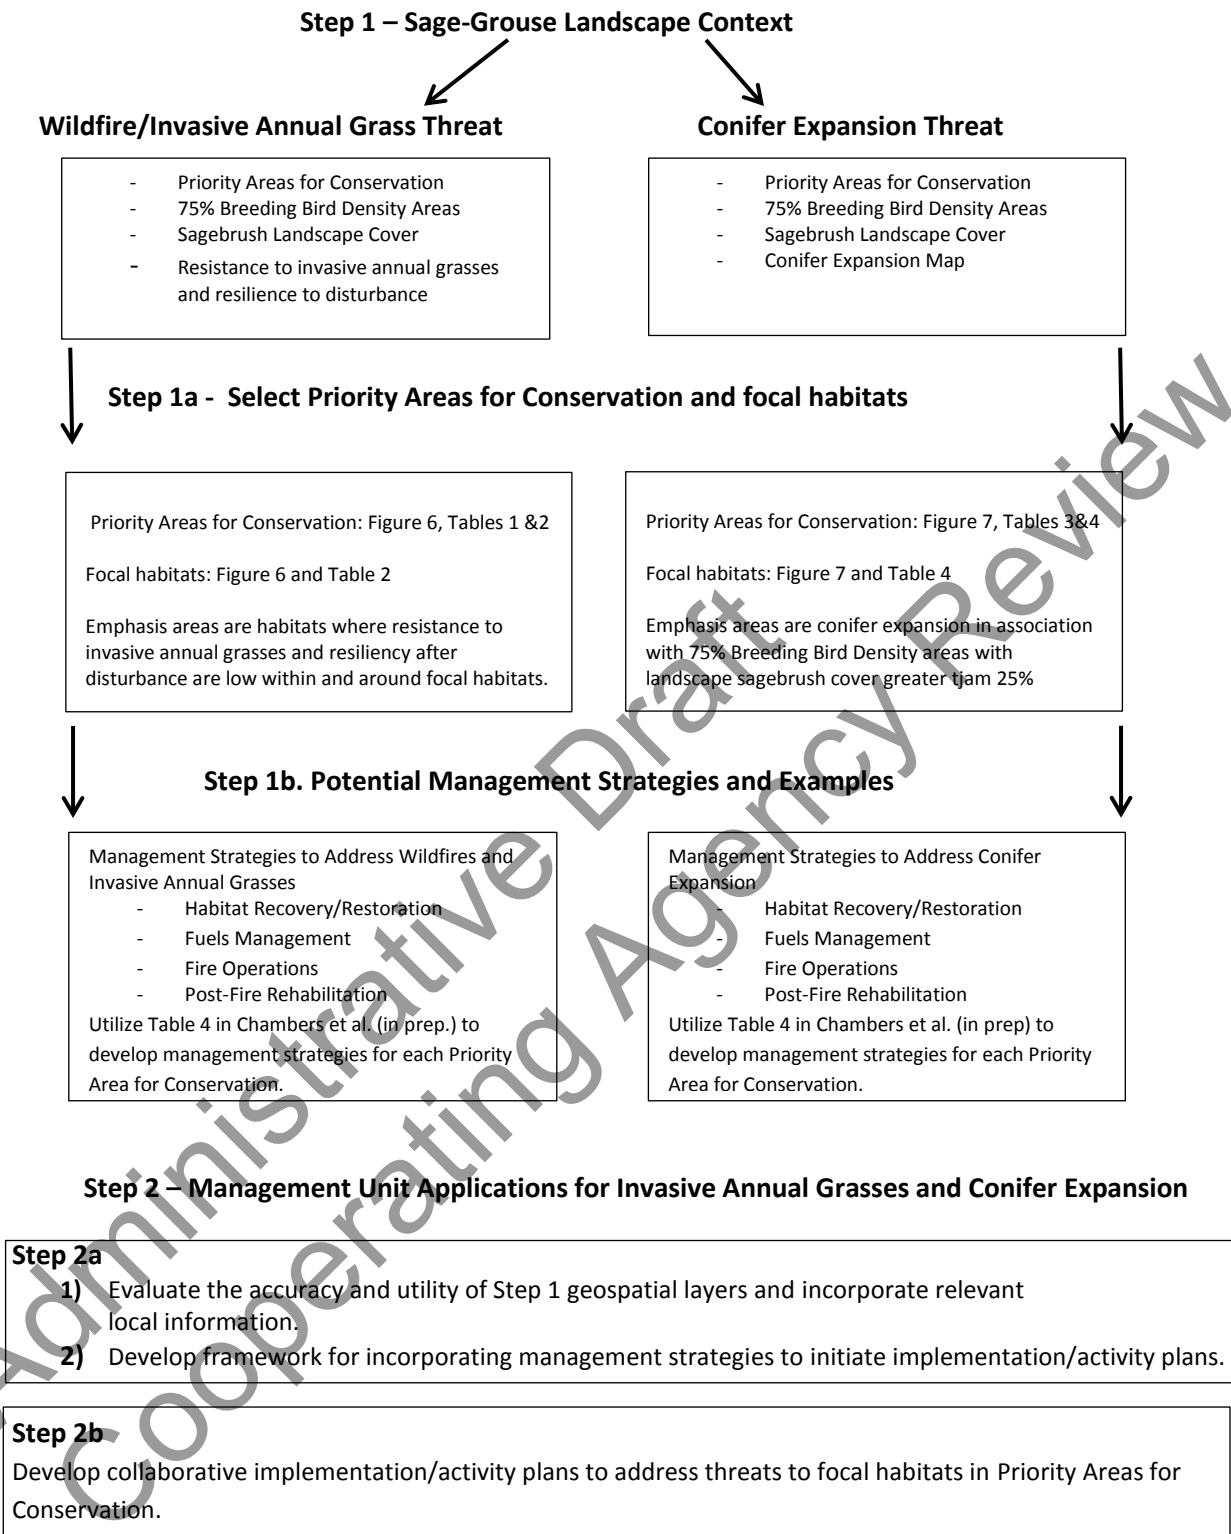

3. **Fire Operations** includes preparedness, prevention, and suppression activities. When discussing specific components of fire operations, the terms fire preparedness, fire prevention and fire suppression are used.
4. **Post-Fire Rehabilitation** includes the BLM's Emergency Stabilization and Rehabilitation (ES&R) Program and the Forest Service's Burned Area Emergency Response (BAER) Program. Policy limits application of funds from 1 to 3 years, thus treatments to restore or enhance habitat after this period of time are considered habitat recovery/restoration.

The assessment process included two steps with sub-elements. First, important Priority Areas for Conservation (PACs) and focal habitats are identified (**Step 1a**). Second, potential management **strategies** (described above) are identified to conserve or restore focal habitats threatened by wildfires, invasive annual grasses, and conifer expansion (primarily pinyon pine and/or juniper species, **Step 1b**). Focal habitats are the portions of a PAC with important habitat characteristics, bird populations, and threats (e.g., wildfires, invasive annual grasses, and conifer expansion) where this assessment will be applied. Areas adjacent to or near the focal habitats can be considered for management treatments such as fire control and fuels management if these locations can reduce wildfire impacts to focal habitats. Soil temperature and moisture regimes are used to characterize capacity for resistance to invasive annual grasses and resilience after disturbance (primarily wildfires) within focal habitats to assist in identifying appropriate management strategies, especially in areas with good habitat characteristics that have low recovery potential following disturbance. Soil moisture and temperature regime relationships have not been quantified to the same degree as for conifer expansion; however, Chambers et al. (*In prep.*) discuss preliminary correlations between these two variables.

The results of Steps 1a and 1b, along with associated geospatial data files, are available to local management units to complete Step 2 of the assessment process. Step 2 is conducted by local management units to address wildfire, invasive annual grasses, and conifer expansion in or near focal habitat areas. First, local information and geospatial data are collected and evaluated to apply and improve on Step 1 focal habitat area geospatial data (**Step 2a**). Second, focal habitat activity and implementation plans are developed and include prioritized management **tactics and treatments** to implement effective, fuels management, habitat recovery/restoration, fire operations, and post-fire rehabilitation strategies (**Step 2b**). This assessment will work best if Step 2b is done across management units (internal and externally across BLM and Forest Service administrative units and with other entities). **Figure 1**, Assessment Flow Chart, contains an illustration of the steps in the assessment process.

This analysis does not necessarily address the full suite of actions needed to maintain the current distribution and connectivity of sage-grouse habitats across the Great Basin because resources available to the federal agencies are limited at this time. Future efforts designed to maintain and connect habitats across the range will be needed as current focal areas are addressed and additional resources become available.

**Figure 1, Assessment Flow Chart**

# Step 1

The first component of the Wildfire and Invasive Annual Grasses Assessment describes the factors that collectively provide the sage-grouse landscape context. Step 1a provides this context by discussing PACs, breeding bird density (BBD), soil temperature and moisture regimes (indicators of resistance to annual grasses and resilience after disturbance), landscape sagebrush cover, and conifer expansion. See Chambers et al. (2014 in prep.) for a detailed description of Invasive Annual Grass and Wildfire threats to sage-grouse habitat. Priority PACs and focal habitats are derived from the information provided in this sage-grouse landscape context section.

## Step 1a- Sage-grouse landscape context

This component of the assessment identifies important PACs and associated focal habitats where wildfire, invasive annual grasses, and conifer expansion pose the most significant threats to sage-grouse.

The primary focus of this assessment is on sage-grouse populations across the WAFWA Management Zones III, IV, and V (**Figure 2**, Current PACs for WAFWA Management Zones III, IV, and V). Sage-grouse are considered a landscape species that require very large areas to meet their annual life history needs. Sage-grouse are highly clumped in their distribution (Doherty et al. 2010), and the amount of landscape cover in sagebrush is an important predictor of sage-grouse persistence in these population centers (Knick et al. 2013). States have used this information combined with local knowledge to identify PACs to help guide long-term conservation efforts. FIAT used data sets that were available across the three management zones as an initial step for prioritizing selected PACs and identifying focal habitats for fire and invasive annual grasses and conifer expansion assessments. These data sets (also described in Chambers et al. *In prep.* ) include:

### Priority Areas for Conservation (PACs)

PACs have been identified by states as key areas that are necessary to maintain redundant, representative, and resilient sage-grouse populations (USFWS 2013; see Figure 2). A primary objective is to minimize threats within PACs (e.g., wildfire and invasive annual grasses impacts) to ensure the long-term viability of sage-grouse and its habitats. A secondary priority is to conserve sage-grouse habitats outside of PACs since they may also be important for habitat connectivity between PACs (genetic and habitat linkages), habitat restoration and population expansion opportunities, and flexibility for managing habitat changes that may result from climate change. PACs have also been identified by the USFWS as one of the reporting geographic areas that will be considered during listing determinations for sage-grouse.

The combination of PACs with BBD data (described below) assists us in identifying connectivity between populations. PAC boundaries may be modified in the future requiring adjustments in focal habitat areas and management strategy priorities.

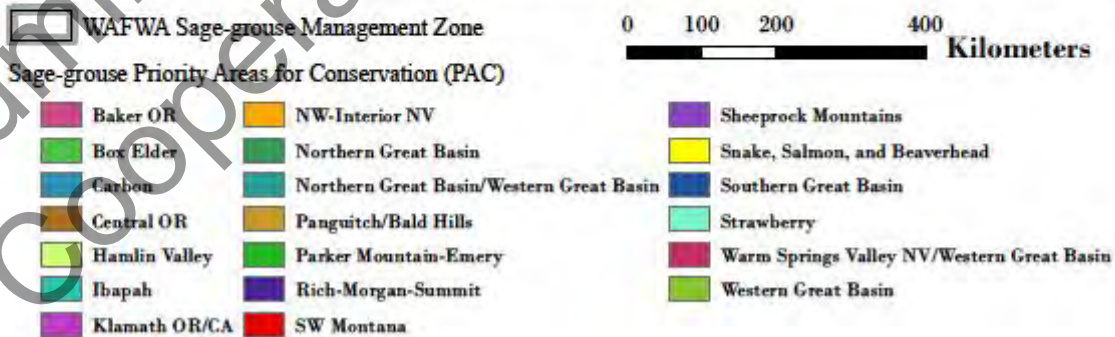

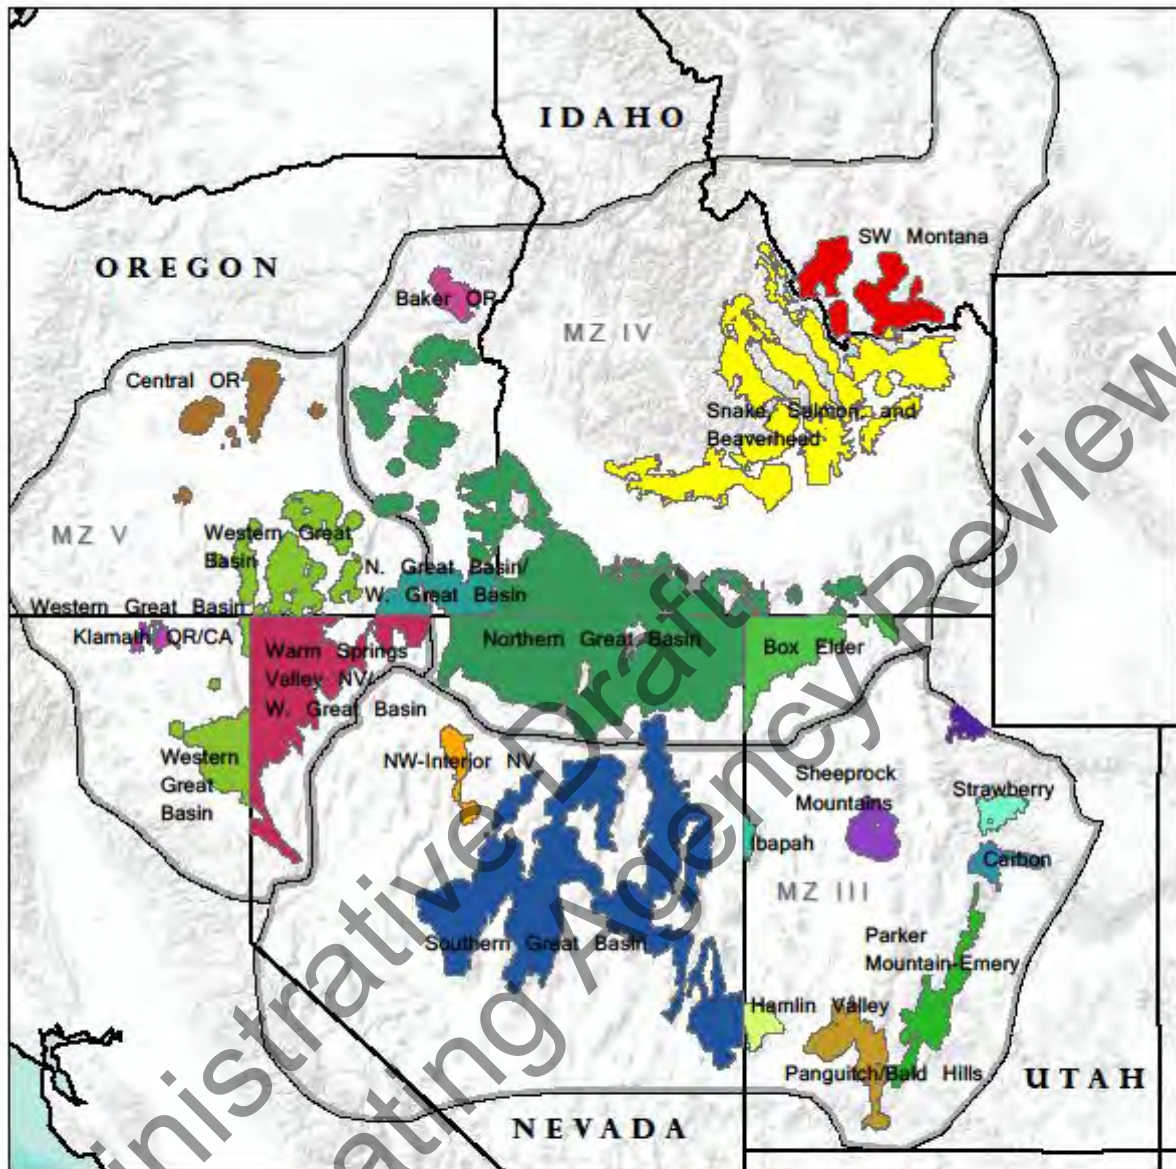

Figure 2, Current PACs for WAFWA Management Zones III, IV, and V. Bi-State sage-grouse populations were not included for this analysis and are being addressed in separate planning efforts.

### Breeding Bird Density

Doherty et al. (2010) provided a useful framework for identifying population concentration centers in their range-wide BBD mapping. FIAT used maximum counts of males on leks (4,885 males) to delineate breeding bird density areas that contain 25, 50, 75, and 100 percent of the known breeding population. Leks were then mapped according to abundance values and buffered by 4 to 5.2 miles (6.4 to 8.5 kilometers) to delineate nesting areas. Findings showed that while sage-grouse occupy extremely large landscapes, their breeding distribution is highly aggregated in comparably smaller identifiable population centers; 25 percent of the known population occurs within 3.9 percent (7.2 million acres [2.92 million hectares]) of the species range, and 75 percent of birds are within 27 percent of the species range (50.5 million acres [20.4 million hectares]; Doherty et al. 2010). See **Figures 3**, Sage-Grouse Breeding Bird Density Thresholds.

This analysis places emphasis on breeding habitats because little broad/mid-scale data exists for associated brood-rearing (summer) and winter habitat use areas. Finer scale seasonal habitat use data should be incorporated (or, if not available studies, should be conducted) at local levels to ensure management actions encompass all seasonal habitat requirements. Federal administrative units should consult with state wildlife agencies for additional seasonal habitat information.

For this assessment, FIAT chose to use the 75 percent BBD as an indicator of high bird density areas that informed the approach used by state wildlife agencies to initially identify PACs. Range-wide BBD areas provide a means to further prioritize actions within relatively large PACs to maintain bird distribution and abundance. FIAT used state level BBD data from Doherty et al. (2010) instead of range-wide model results to ensure important breeding areas in Management Zones III, IV, and V were not underweighted due to relatively higher bird densities in the eastern portion of the range. BBD areas of 75 to 100 percent are included in Appendix 1 to provide context for local management units when making decisions concerning connectivity between populations and PACs.

Note that breeding density areas were identified using best available information in 2009, so this range-wide data does not reflect the most current lek count information and changes in conditions since the original analysis. Subsequent analysis should use the most current information available. Also, BBD areas should not be viewed as rigid boundaries but rather as a means to regionally prioritize landscapes where step down assessments and actions should be implemented quickly to conserve the most birds.

### Soil Temperature and Moisture Regimes

Invasive annual grasses and wildfires can be tied to management strategies through an understanding of resistance and resilience concepts. Invasive annual grasses has significantly reduced sage-grouse habitat throughout large portions of its range (Miller et al. 2011). While abandoned leks were linked to increased nonnative annual grass presence, active leks were associated with less annual grassland cover than in the surrounding landscape (Knick et al. 2013). Invasive annual grasses also increases fire frequency, which directly threatens sage-grouse habitat and further promotes the establishment of invasive annual grasses (Balch et al. 2013). This nonnative annual grass and fire feedback loop can result in conversion from sagebrush shrublands to annual grasslands (Davies 2011).

In cold desert shrublands, vegetation community resistance to invasive annual grasses, especially cheatgrass, and resilience following disturbance is strongly influenced by soil temperature and moisture regimes (Chambers et al. 2007; Meyer et al. 2001). Generally, cooler and moister soil temperature/moisture regimes are associated with more resilient vegetation communities as indicated by increases in vegetation productivity and ability to compete and recover from disturbance along elevation gradients (Chambers et al. 2007; Chambers et al. *in press*). Also, colder soil temperatures are associated with more resistant communities due to limitations on invasive annual grass growth and reproduction. Thus, communities with warm and dry soil temperature and moisture regimes tend to have relatively low resilience and resistance. Communities with cool and dry soil temperature and moisture regimes also can have relatively low resilience and resistance with the degree of resistance to cheatgrass depending on soil temperature (see Figure 9 in Chambers et al. *In prep.*). A continuum in resistance and resilience exists across soil temperature and moisture regimes that will need to be considered when developing implementation or activity plans in Step 2. These relationships can be used to help prioritize management actions within sage-grouse habitat using broadly available data.

To capture relative resistance and resilience to disturbance and invasive annual grasses across the landscape, soil temperature and moisture regime information (described in greater detail in Chambers et al. *In prep.*) were obtained from the Natural Resources Conservation Service (NRCS) Soil Survey Geographic Database (SSURGO) data. Where gaps in this coverage existed, the NRCS US General Soil Map (STATSGO2) data was used (Soil Survey Staff 2014; see Appendix 1). The STATSGO2 database includes soils mapped at a 1:250,000-scale; the SSURGO database includes soils mapped at the 1:20,000 scale. Interpretations made from soil temperature and moisture regimes from the STATSGO2 database will not have the same level of accuracy as those made from the SSURGO database.

Areas characterized by warm and dry soil temperature and moisture regimes (low relative resistance and resilience) were intersected with sage-grouse breeding habitat and sagebrush landscape cover to identify candidate areas (emphasis areas) for potential management actions that mitigate threats from invasive annual grasses and wildfire (**Figure 4**, Soil Moisture and Temperature Regimes for Management Zones III, IV, and V, and **Figure 5**, Intersection of High Density (75% BBD) Populations). These data layers provide the baseline information considered important in prioritizing areas where conservation and management actions could be developed to address invasive annual grasses in a scientifically defensible manner (see Table 4 in Chambers et al. *In prep.*).

### Sagebrush Landscape Cover

The amount of the landscape in sagebrush cover is closely related to the probability of maintaining active sage-grouse leks, and is used as one of the primary indicators of sage-grouse habitat potential at landscape scales (Aldridge et al. 2008; Wisdom et al. 2011; Knick et al. 2013). For purposes of prioritizing landscapes for sage-grouse habitat management, FIAT used less than or equal to 25 percent sagebrush landscape cover as a level below which there is a low probability of maintaining sage-grouse leks, and greater than or equal to 65 percent as the level above which there is a high probability of sustaining sage-grouse populations with further increases of landscape cover of sagebrush (Aldridge et al. 2008; Wisdom et al. 2011; Knick et al. 2013). Increases in landscape cover of sagebrush have a constant positive relationship with sage-grouse lek probability at between about 25 percent and 65 percent landscape sagebrush cover (Knick et al. 2013). It is important to note that these data and interpretations relate only to persistence (i.e., whether or not a lek remains active), and it is likely that higher proportions of sagebrush cover may be required for population growth.

For the purposes of delineating sagebrush habitat relative to sage-grouse requirements for landscape cover of sagebrush, FIAT calculated the percentage of landscape sagebrush cover (Landfire 2013) within a 3-mile (5-kilometer) radius of each 98-foot by 98-foot (30 meter by 30 meter) pixel in Management Zones III, IV, and V (see Appendix 2 in Chambers et al. (*In prep.*) for how landscape sagebrush cover was calculated). FIAT then grouped the percentage of landscape sagebrush cover into each of the selected categories (0 to 25 percent, 25 to 65 percent, 65 to 100 percent; **Figure 6**, Sagebrush Landscape Cover and Fire Perimeters for the Analysis Area). Landfire data was based on 2000 satellite imagery so wildfire perimeters after that date were incorporated into this layer to better reflect landscape sagebrush cover. Burned areas were assumed to fall into the 0 to 25 percent landscape cover class.

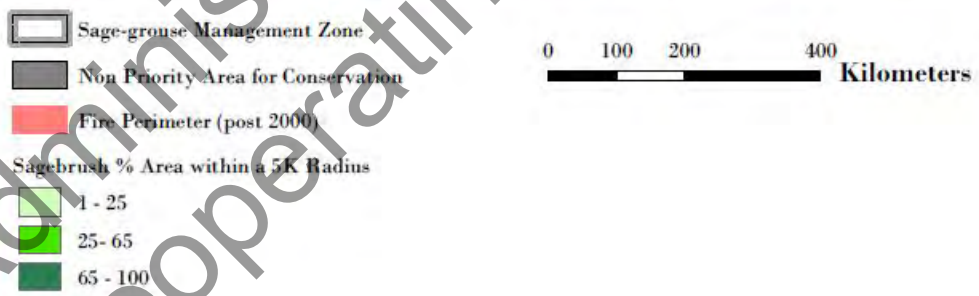

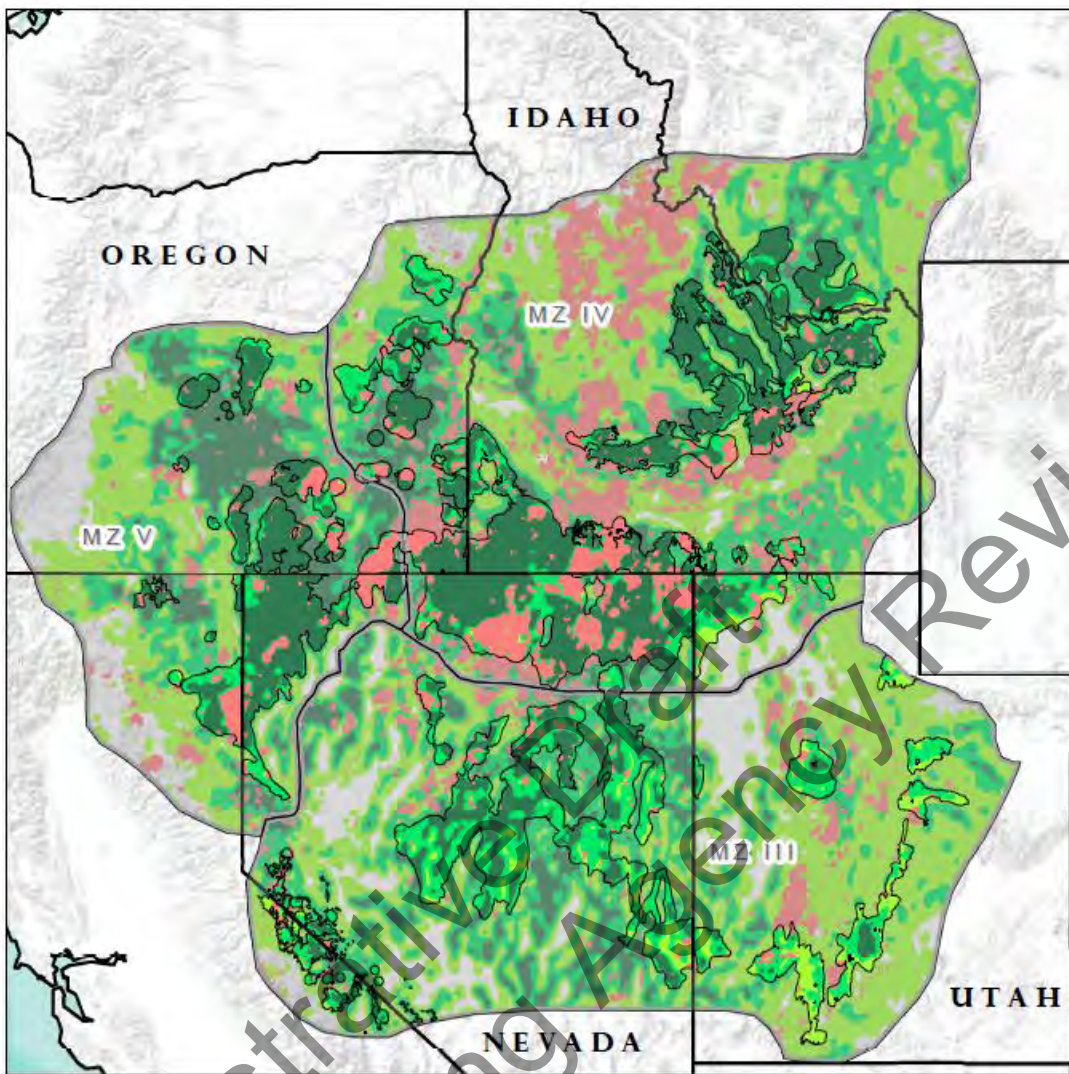

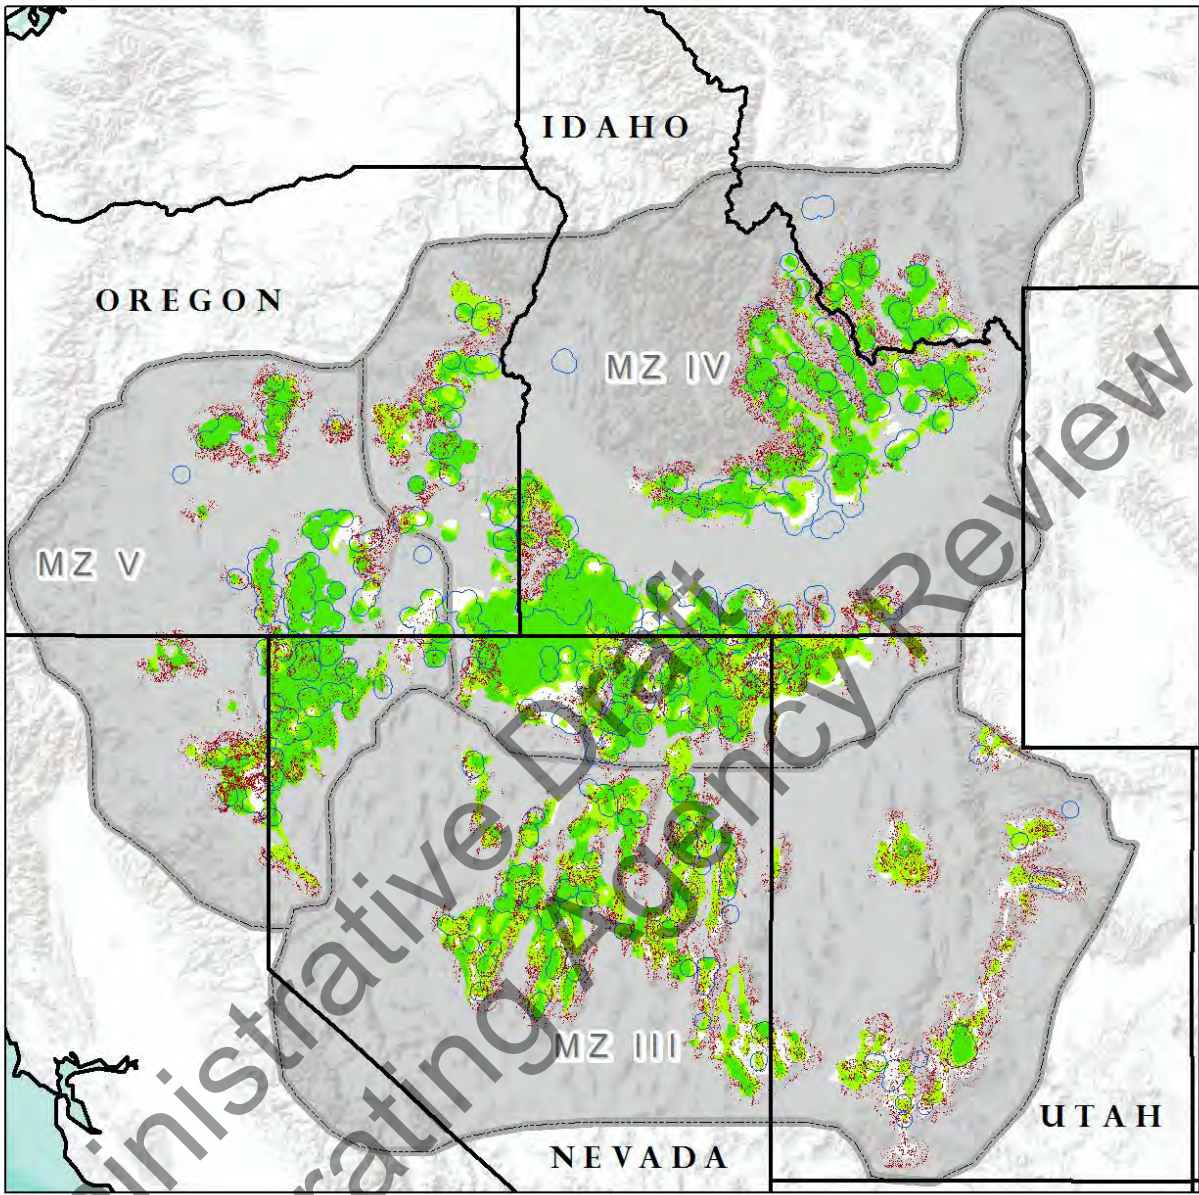

Figure 6, Sagebrush Landscape Cover and Fire Perimeters (post-2000) for the Analysis Area

### Conifer Expansion

Conifer expansion into sagebrush landscapes also directly reduces sage-grouse habitat by displacing shrubs and herbaceous understory as well as by providing perches for avian predators. Conifer expansion also leads to larger, more severe fires in sagebrush systems by increasing woody fuel loads (Miller 2013). Sage-grouse populations have been shown to be impacted by even low levels of conifer expansion (Baruch-Mordo et al. 2013). Active sage-grouse leks persist in regions of relatively low conifer woodland and are threatened by conifer expansion (Baruch-Mordo et al. 2013; Knick et al. 2013).

To estimate where sage-grouse breeding habitat faces the largest threat of conifer expansion, FIAT used a risk model developed by Manier et al. (2013) that locates regions where sagebrush landscapes occur within 250 meters of conifer woodland (**Figure 7**, Modeled Conifer Expansion for PACs with Greater Than 25% Sagebrush Landscape Cover In and Around 75% BBD). Although the model is coarse, it is available for the entirety of the three sage-grouse management zones analyzed. FIAT encourages using more accurate conifer expansion data in Step 2.

## Step 1a. Identifying PACs and focal habitats

A primary goal for the conservation of sage-grouse populations is the identification of important habitats needed to ensure the persistence and recovery of the species. Loss of habitat, and by inference populations, in these habitats would likely imperil the species in the Great Basin. The first objective is to protect and restore those habitats that provide assurances for retaining large well connected populations.

PACs and the 75 percent BBD maps were used to provide a first-tier stratification (e.g., focal habitats) for prioritizing areas where conservation actions could be especially important for sage-grouse populations. Although these areas are a subset of the larger sage-grouse habitats, they are readily identifiable and include habitats (e.g., breeding and nesting habitats that are considered critical for survival; Connelly et al. 2000; Holloran et al. 2005; Connelly et al. 2011) and necessary for the recovery of the species across its range.

The prioritization of habitats for conservation purposes was based on the several primary threats to remaining sage-grouse populations in the Great Basin including the loss of sagebrush habitats to wildfire and invasive annual grasses, and conifer expansion. The first, and probably the most urgent threat for sage-grouse, is the loss of sagebrush habitat due to wildfire and invasive annual species (e.g., cheatgrass; See Figure 11 in Chambers et al. [*In prep.*]). Areas of highest concern are those with low resistance to cheatgrass and low resilience after disturbance (warm/dry and some cool/dry temperature and moisture regimes sites) that are either **within or in close proximity** to remaining high density populations of sage-grouse (Figure 5). Sagebrush habitats (greater than 25 percent sagebrush landscape cover) prone to conifer expansion, particularly pinyon pine and/or juniper, are also a management concern when within or adjacent to high density sage-grouse populations (Figure 7).

Because these two threats occur primarily at different points along an elevational gradient and are associated with different soil temperature and moisture regimes, separate approaches are used to select PACs and focal habitats for each.

### **High Density Populations at Highest Risk from Wildfire and Invasive Annual Grasses**

PACs in Management Zones III, IV, and V. were evaluated on the basis of high density (75 percent) BBDs, sagebrush landscape cover, and soil temperature and moisture regimes to identify initial PACs that are a priority for assessments and associated focal habitats. **Figure 8**, High Priority PACs with High Density Sage-Grouse Populations (75% BBD), displays the results of the analysis focusing on the intersection of high density (75 percent BBD) populations, the warm and dry sites, and the proportion of these habitats in the three sagebrush landscape cover classes by management zone, and PACs within the Great Basin. **Table 1**, Relative Ranking of PACs Based on High Density (75% BBD) Populations, Warm/ Dry Sites, and Percentage of Habitat in Sagebrush Landscape Cover Classes, displays quantitative outputs of this analysis. The table allows a comparison of these data, and assists in selecting five PACs that provide the greatest contribution to high density sage-grouse populations, and the amounts (acres and proportion) within those PACs of sagebrush cover classes associated with warm and dry soil temperature and moisture regimes.

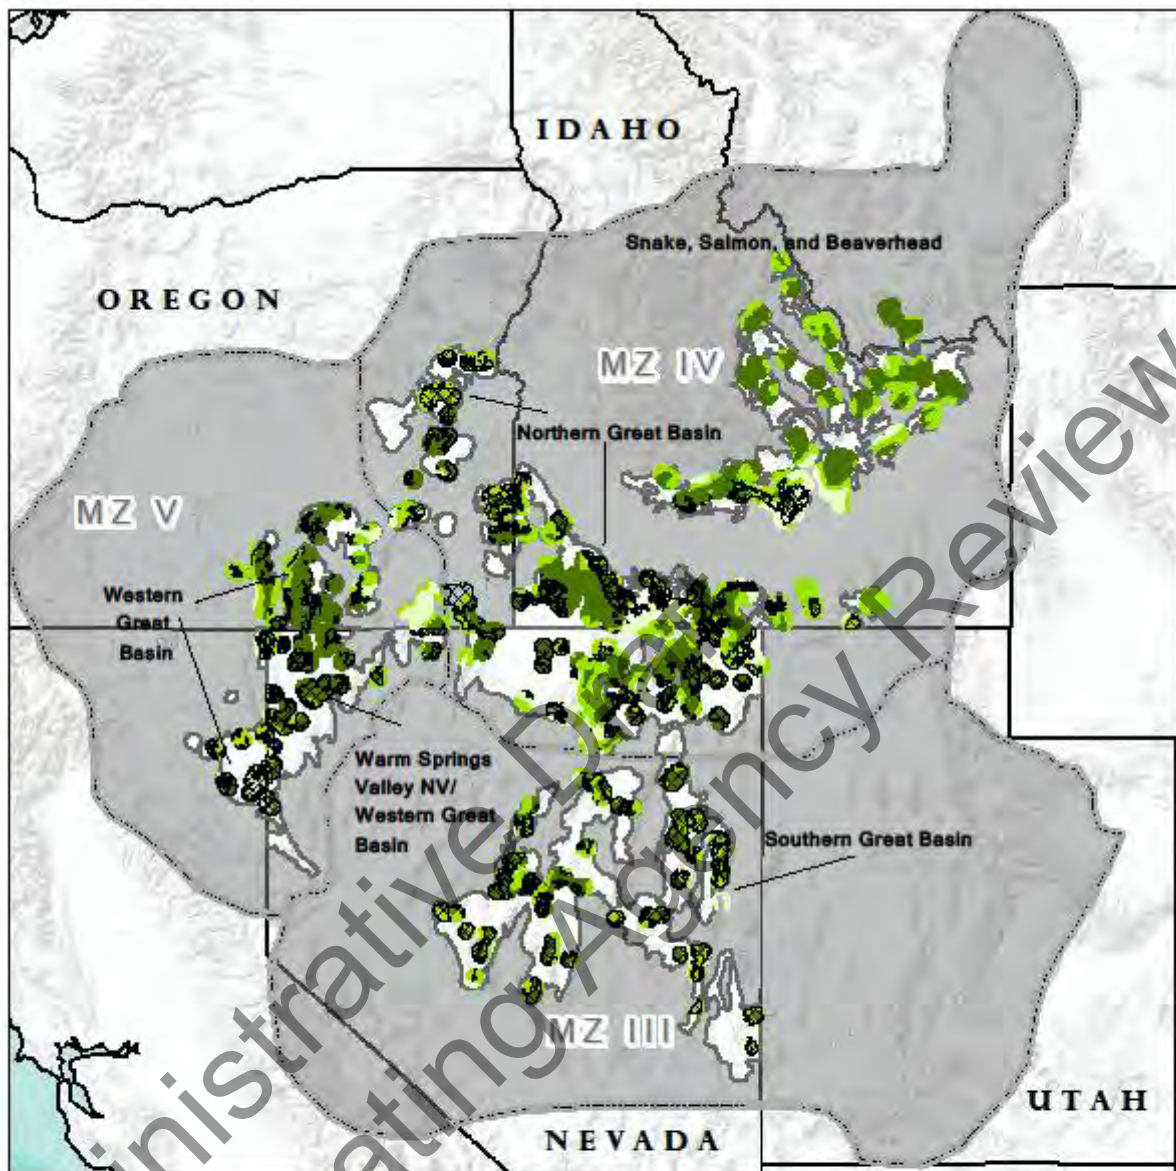

Figure 8, High Priority PACs with High Density Sage-Grouse Populations (75% BBD) sagebrush landscape cover classes, and areas with low resistance and resilience relative to wildfires and invasive annual species.

**Table 1, Relative Ranking of PACs Based on High Density (75% BBD) Populations, Warm/ Dry Sites, and Percentage of Habitat in Sagebrush Landscape Cover Classes**

3	Sheeprock Mountains	611374	0	0%	0 (NA)	0 (NA)	0 (NA)
5	Klamath OR/CA	162667	0	0%	0 (NA)	0 (NA)	0 (NA)

\* Numbers in parenthesis indicate the percent of acres relative to total acres of breeding bird density (75%)

These five PACs comprise 90 percent and 95 percent of remaining PAC sagebrush landscape cover in the 25 to 65 percent and greater than or equal to 65 percent sagebrush landscape cover classes, respectively, of the 75 percent BBD associated with low resistance/resilience habitats. The 75 percent BBD habitats in the Northern, Southern Great Basin, and Warm Spring PACs appear particularly important for two reasons. They represent a significant part of the remaining habitats for the Great Basin metapopulation, and they have the greatest amount of low resiliency habitat remaining that still functions as sage-grouse habitat.

An examination of the 5 selected PACs shows that the sum of the 75 percent BBD within these PACs is 16,995,496 acres (**Table 2**, PACs with the Highest Acres and Proportions of 75% BBD acres, and Acres and Proportions of 75% BBD Acres within the Warm/Dry Soil Temperature and Moisture Class). These are the **focal habitats**. These five PACs constitute 84 percent of the 75 percent BBD low resiliency habitats for all Management Zones III, IV, and V PACs. Within and immediately around these focal habitats, 5,751,293 acres are in high BBD areas with landscape sagebrush cover in the 25-65 percent and ≥ 65 percent classes and in the warm and dry soil temperature and moisture regimes. These are the habitats in the most danger to loss due to their low resistance to invasive annual grasses and low resilience following wildfire. Within the focal habitats in the high priority PACs, low resistance and resilience areas (cross-hatched areas in Figure 8) are a high priority (emphasis area) for implementing management strategies. Applying management strategies outside the emphasis areas are appropriate if the application of fire operations and fuels management activities will be more effective in addressing wildfire threats.

**Table 2, PACs with the Highest Acres and Proportions of 75% BBD acres, and Acres and Proportions of 75% BBD Acres within the Warm/Dry Soil Temperature and Moisture Class (see Figure 8)**

PAC	PAC Acres	Acres of 75% BBD in PAC (focal habitat)	Proportion of 75% BBD within PACs	Warm & Dry Soils within 75% BBD by Sagebrush Landscape Cover Classes Greater Than 25%*	
				25-65%	>65%
Northern Great Basin	13,045,515	7,383,442	0.57	674,517(9%)	1,745,163(24%)
Southern Great Basin	9,461,355	3,146,056	0.33	792,780(25%)	1,062,091(34%)
Snake, Salmon, and Beaverhead	5,477,014	2,823,205	0.52	89,146(3%)	95,970(3%)
Warm Springs Valley NV/Western Great Basin	3,520,937	1,558,166	0.44	207,365(13%)	741,353(48%)
Western Great Basin	3,177,253	2,084,626	0.66	140,141(7%)	202,767(10%)
<b>Total for 5 PACS</b>	<b>34,682,074</b>	<b>16,995,496</b>	<b>0.49</b>	<b>1,903,949</b>	<b>3,847,344</b>

\* This category represents the emphasis areas for applying appropriate management strategies in or near the focal habitats due to the lower probability of recovery after disturbance and higher probability of invasive annual grasses and existing wildfire threats.

## High Density Sage-Grouse Habitats at Risk from Conifer Expansion

PACs, sagebrush landscape cover, and the 75 percent BBD data were also used in conjunction with the conifer expansion data (Mainer et al. 2013) to provide an initial stratification to determine PACs where conifer removal would benefit important sagebrush habitats. Conifer expansion threats are primarily western juniper in the northern Great Basin and pinyon pine/Utah juniper in the southern Great Basin.

Figure 7 displays results of the analysis focusing on the intersection of the 75 percent BBD, and modeled conifer expansion areas within two sagebrush landscape cover classes by management zone and PACs within the Great Basin. To identify high density sage-grouse areas affected by conifer expansion, the amount and proportion of acres estimated to be affected were calculated by sagebrush cover class to assist in the identification of the focal habitats (**Table 3**). **Table 4**, displays quantitative outputs of this analysis using the 25 to 65 percent and greater than 65 percent landscape sagebrush cover classes for the PACs. Thus, **focal habitats** for addressing conifer expansion are the areas within and near conifer expansion in sagebrush landscape cover classes of 25 to 65 percent and greater than 65 percent. Conifer expansion in these two sagebrush landscape cover classes in the 75 percent BBD areas constitutes an emphasis area for treatments to address conifer expansion. Landscapes with less than 25 percent sagebrush cover may require significant additional management actions to restore sagebrush on those landscapes and therefore were considered a lower priority for this analysis. Focal habitats are identified in Table 4 and displayed in **Figure 9**.

Table 3 assists in identifying those PACs that provide the greatest contribution to high density sage-grouse populations, and the amounts (acres and proportion) within those PACs of sagebrush cover classes associated with modelled conifer expansion areas. Although there are uncertainties associated with the model, the results help managers identify specific geographic areas where treatments in conifer (pinyon and/or juniper) could benefit existing important sage-grouse populations.

The results of the screening revealed 5 PACs that contribute substantially to the 75 percent BBD habitats and are currently impacted most by conifer expansion (primarily pinyon pine and/or juniper; Table 4 and Figure 9). Four of the five PACs identified as high priority for conifer expansion treatments were also high priorities for wildfires and invasive annual grass threats. This is likely due to the size of the PACs and the relative importance of these PACs for maintaining the Great Basin sage-grouse meta-populations. As expected, the locations of high density sage-grouse habitats affected by conifer expansion differ spatially from those associated with low resilience habitats within and among the PACs, primarily due to differences in the biophysical settings (e.g., elevation and rainfall) that contribute to threats from invasive annual grasses and wildfires.

Three PACs (Snake/Salmon/Beaverhead, Southwest Montana, and Northern Great Basin/Western Great Basin) ranked high due to their relatively large proportion of high density breeding habitats (Table 3), but were not selected since the threat of conifer expansion was relatively low. One PAC, (Snake/Salmon/Beaverhead, was identified as a potential high priority area but was dismissed because results of the conifer expansion model likely overestimated impacts due to the adjacent conifer forests in this region. The COT Report also identified conifers as a “threat present but localized” in these areas, whereas, the top five PACs prioritized all have conifers identified as a widespread priority threat to address (USFWS 2013).

**Table 3, Relative Ranking of PACs Based on High Density (75% BBD) Populations, Modeled Conifer Expansion, and Percentage of Habitats in Sagebrush Landscape Cover Classes**

Administrative Draft  
Cooperating Agency Review

**Figure 9, Five PACs Significantly Impacted by Conifer Expansion** that contribute substantially to the 75% BBD and that have sagebrush landscape cover greater than 25%.

While the coarse-scale conifer expansion data used in this analysis likely over estimates the extent of the pinyon pine and/or juniper threat, results suggest that far fewer acres are currently affected by conifers than might be at risk from fire and invasive annual grasses impacts. Conifer expansion into sage-grouse habitats occurs at a slower rate, allowing more time for treatment, but early action may be needed to prevent population level impacts on sage-grouse (Baruch-Mordo et al. 2013). Furthermore, conifer expansion is primarily occurring on cooler and moister sites that are more resilient and where restoration is more likely to be effective (Miller et al. 2011), providing managers the opportunity to potentially offset at least some habitat loss expected to continue in less resilient ecosystems. While the available data set used to estimate conifer expansion provides only a coarse assessment of the problem, considerable efforts are currently underway to map conifers across sage-grouse range. These maps are expected to be available in the near future and should be used by land managers to better target project level conifer removal.

FIAT cautions against using the plotted locations of estimated conifer expansion for local management decisions due to the coarse-scale nature of this range-wide data set. Conifer expansion estimates are primarily provided here to aid in judging the relative scope of the threat in each PAC.

Administrative Draft  
Cooperating Agency Review

## Step 1b. Potential Management Strategies

Potential management **strategies** (e.g., fuels management, habitat recovery/restoration, fire operations, post-fire rehabilitation) to conserve or restore Step 1 focal habitats are described below to assist local management units to initiate Step 2. These examples are illustrative and do not contain the full range of management strategies that may be required to address wildfires, invasive annual grasses, and conifer expansion within PACs and associated focal habitats. In general, the priority for applying management strategies is to first maintain or conserve intact habitat and second to strategically restore habitat (after a wildfire or proactively to reconnect habitat). Management strategies will differ when applying the protocol to:

**Wildfire and Invasive Annual Grass.** (See PACs identified in Table 2 and focal habitats shown in Figure 8). Focal habitats, as they relate to wildfires and invasive annual grasses, are defined as sage-grouse habitat in priority PACs within 75 percent BBD. Within these focal habitats, sagebrush communities with low resilience to disturbance and resistance to invasive annual grasses (warm and dry soil temperature and moisture regimes) are an emphasis area for management actions. Appendix 5 (A) in Chambers et al. (*In prep.*) includes a generalized state and transition model with an invasive annual grass component and warm and dry soil temperature and moisture regime associated with 8 to 12 inches of annual precipitation. This state and transition models is useful in developing management strategies to deal with annual grass issues as it contains useful restoration pathways.

Burn Probability is another tool that can be used to assist managers to identify the relative likelihood of large fire occurrence across the landscape within PACs and focal habitats. Burn probability raster data were generated by the Missoula Fire Lab using the large fire simulator - FSim - developed for use in the national Interagency [Fire Program Analysis \(FPA\)](#) project. FSim uses historical weather data and LANDFIRE fuel model data to simulate fires burning. Using these simulated fires, an overall burn probability is returned by FSim for each 270m pixel. The burn probability data was overlaid spatially with PACs, soil data, and shrub cover data. The majority of the high and very high burn probability acres lie within the top 5 PACs and are within areas with >25% sagebrush cover. Several of the other PACs have a greater overall percentage of the warm/dry soil regime with high/very high burn probability (northern great basin, baker, and NW interior NV) but the total acres are relatively few. Areas identified with high and very high burn probability are most likely to experience large fires given fire history, fuels, weather and topography. Results are displayed in the table 5 and Figure 10.

**Table 5, Percentages of sage-grouse PAC areas with high and very high burn probability, 75% BBD within PAC, 75% BBD and warm dry/temperature regime, and 75% BBD and warm dry/temperature and warm dry/temperature with high and very high burn probability.**

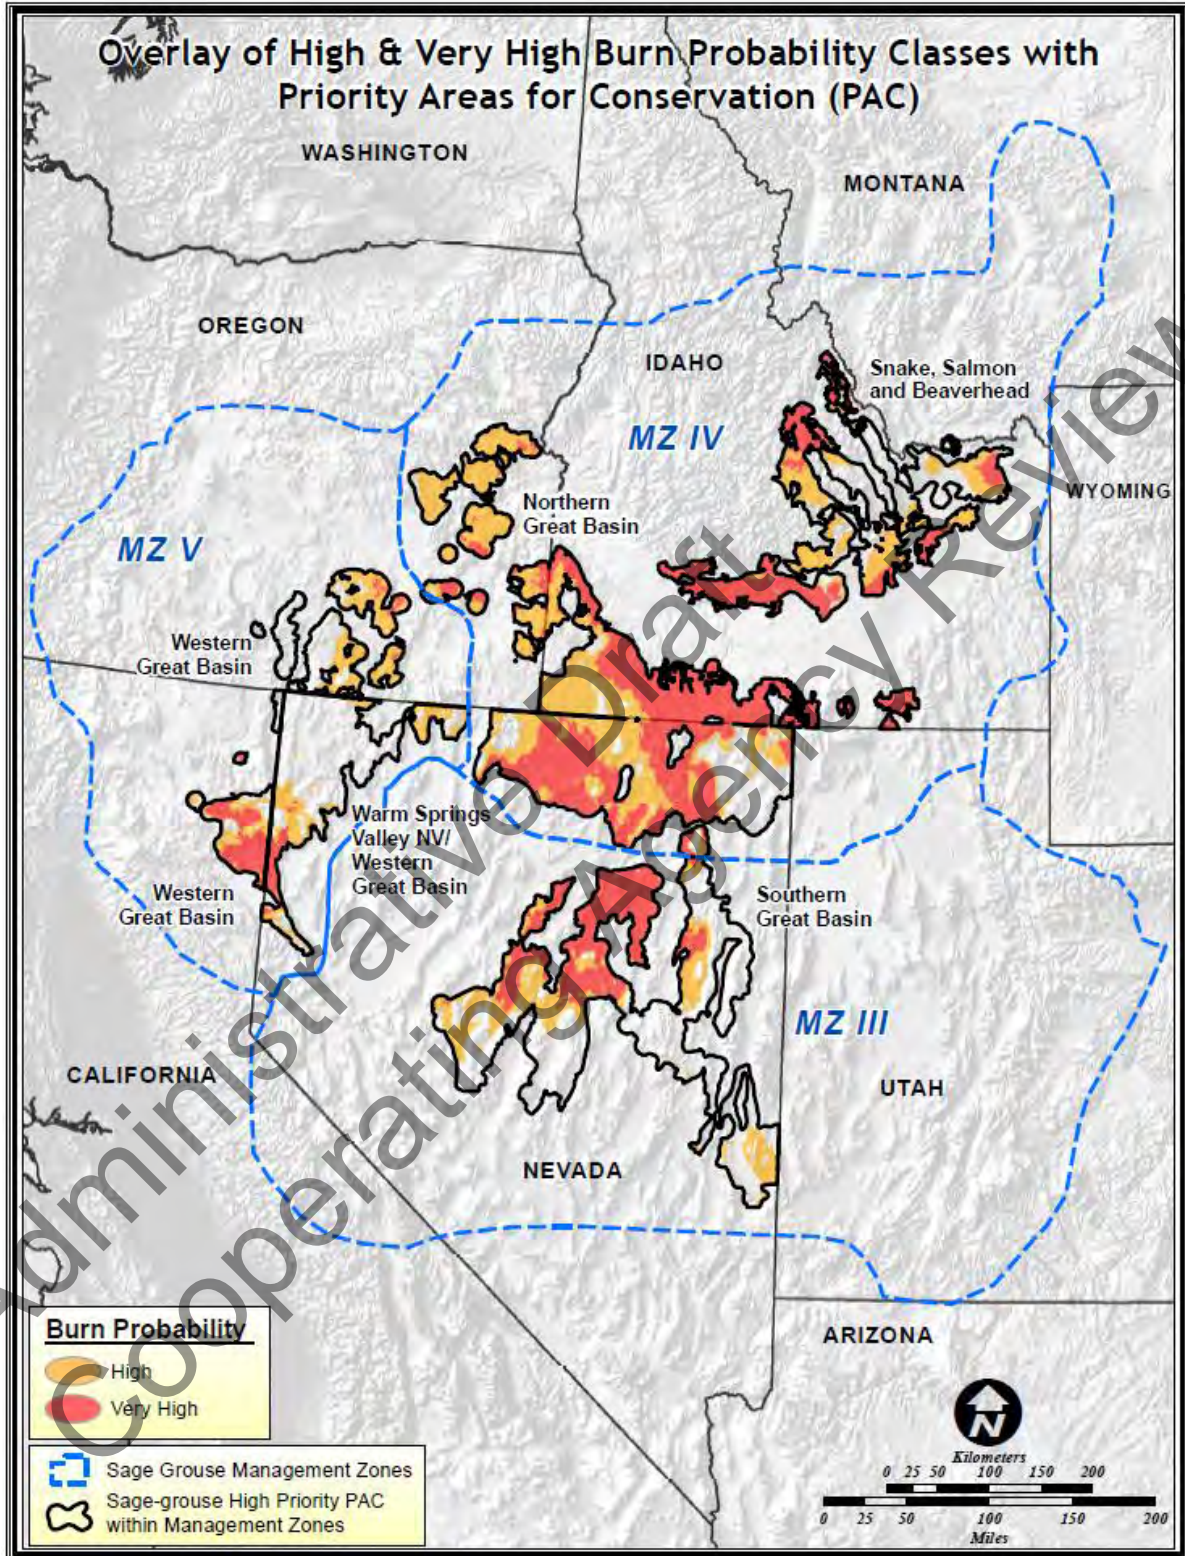

Figure 10, Burn Probability (high and very high) in priority invasive annual grass and wildfire PACs. .

**Conifer Expansion.** (See priority PACs for assessment identified in Table 4 and focal habitats shown in Figure 9). Focal habitats, as they relate to conifer expansion, are defined as sage-grouse habitat in a priority PAC with sagebrush landscape cover between 25 and 100 percent that is either near or in a conifer expansion area. The relationship between conifer expansion and resilience to disturbance and resistance to expansion is not documented to the same degree as with invasive annual grasses. However, Appendix 5 (D. and E.) in Chambers et al. (*In prep.*) includes two generalized state and transition models for conifer expansion with warm to cool and soil temperature regimes associated with precipitation ranges from 12 to 14 or more inches of annual precipitation. These state and transition models are useful in developing management strategies to deal with conifer expansion as they contain useful restoration pathways.

Chambers et al. (*In prep.*) is recommended for review at this point for information on applying resistance and resilience concepts along with sage-grouse habitat characteristics to develop management strategies to address wildfires, invasive annual grasses, and conifer expansion. The following tables are recommended for use in developing management strategies in or near focal habitats:

Table 1. Soil temperature and moisture regimes relationship to vegetation types and resistance and resilience.

Table 2. Sage-grouse habitat matrix showing the relationship between landscape sagebrush cover and resistance and resilience.

Table 3. Potential management strategies based on sage-grouse habitat requirements and resistance and resilience.

Table 4. Management strategies (fire suppression, fuels management, post-fire rehabilitation, and habitat restoration) associated with each cell in the sage-grouse habitat matrix (Table 2).

The “Putting it all together” section of the Chambers et al. (*In prep.*) also contains a case study from Northeast Nevada illustrating applications of management strategies to address the conservation, protection, and restoration of sage-grouse habitat.

To further assist in understanding Step 1b, examples of general priorities for management strategies are provided below and illustrated in Appendix 3 and 4:

1. Fuels Management: Projects that are designed to change vegetation composition and/or structure to modify potential fire behavior for the purpose of improving fire suppression effectiveness and limiting fire spread and intensity.
  - a. Identify priorities and potential measures to reduce the threats to sage-grouse habitat resulting from changes in invasive annual grasses (primary focus on exotic annual grasses and conifer encroachment) and wildland fires. Place high priority on areas dominated by invasive annual grasses that are near or adjacent to low resistance and resilience habitats that are still intact.

- b. Areas on or near perimeter of successful post-fire rehabilitation and habitat restoration projects where threats of subsequent fire are present are important for consideration.
    - c. Fuels management can be a high priority in large tracts of intact sagebrush if impacts on sage-grouse populations are minimal and outweighed by the potential benefits of reduced wildfire impacts in area being protected.
  2. Habitat Recovery/Restoration Recovery (passive restoration) is a high priority in intact sagebrush stands to improve resistance and resilience before a disturbance. For example, where understory perennial herbaceous species are limited, improved livestock grazing practices can increase the abundance of these species and promote increased resistance to annual grasses.
    - a. Habitat restoration is important where habitat connectivity issues are present within focal habitats.
    - b. Pinyon pine and/or juniper removal in Phase I and II stands adjacent to large, contiguous areas of sagebrush (greater than 25 percent sagebrush landscape cover) is a priority.
  3. Fire Operations (includes preparedness, prevention and suppression activities).
    - a. Higher priority should be placed on areas with greater than 65 percent cover than on areas with 25 to 65 percent cover, followed by 0 to 25 percent cover (these categories are continuums not discrete thresholds).
    - b. Higher priority should be placed on lower resistance/resilience habitats compared with higher resistance/resilience habitats.
    - c. Fire operations in areas restored or post-fire rehabilitation treatment where subsequent wildfires can have detrimental effect on investment and recovery of habitat are important for consideration.
    - d. Fire operations (suppression) are especially important in low elevation winter sagebrush habitat with low resistance and resiliency.
  4. Post-Fire Rehabilitation
    - a. High priority should be placed on supporting short-term natural recovery and long-term persistence in higher resistance and resiliency habitats (with appropriate management applied).
    - b. High priority should be placed on reseeding in moderate to low resistance and resiliency habitats, but only if competition from invasive annual grasses, if present, can be controlled prior to seeding.

## Step 2

Step 2 is carried out by local management units using the Step 1 geospatial data, focal habitats, and the associated management strategies. Step 2 includes evaluating the availability and accuracy of local information and geospatial data used to develop local management strategies in or near focal habitats (Step 2a).

It also involves developing focal habitat activity/implementation plans that include prioritized management tactics and treatments to implement effective fuels management, habitat recovery/restoration, fire operations, and post-fire rehabilitation (Step 2b). These activity/implementation plans will serve as the basis for NEPA analysis of site-specific projects.

## **Step 2a- Review of Step 1 Data and Incorporation of Local Information**

Evaluate the accuracy and utility of Step 1 geospatial layers for focal habitats by incorporating more accurate or locally relevant:

- Vegetation maps (especially sagebrush cover)
- Updated or higher resolution conifer expansion layers (if applicable)
- Soil survey and ecological site descriptions
- Weather station, including Remote Automatic Weather Stations, data
- PACs, focal habitats, winter habitats, sage-grouse population distributions (i.e., more recent BBD surveys)
- Maps of cheatgrass and other invasive annual grasses that degrade sage-grouse habitat
- Wildfire polygons including perimeters and unburned islands within burn polygons
- Treatment locations and success (consult US Geological Survey Land Treatment Digital Library at <http://ltdl.wr.usgs.gov/>). The Land Treatment Digital Library allows the user to search on treatment results on an ecological site basis.
- Models and tools to help inform management strategies. For example, data which characterizes wildfire potential can help identify risk to focal habitats and help plan fire suppression and fuels management strategies to address these risks.
- Rapid Ecoregional Assessments
- Land Use Plans
- Appropriate monitoring or inventory information
- Any other geospatial data or models that could improve the accuracy of the assessment process

It is essential that subregional or local information and geospatial data be subjected to a quality control assessment to ensure that it is appropriate to use in developing Step 2b activity and implementation plans. Since PACs and focal habitats usually transcend multiple administrative boundaries, a collaborative approach is highly recommended for Step 2a.

A series of questions tied to the management strategies described in the Introduction section follows to assist managers in developing the framework to complete Step 2b (development of activity/implementation plans). The questions that follow apply to the focal habitats (and buffer areas around focal areas where management strategies may be more effectively applied) and will help in developing coordinated implementation/activity plans. These questions should not limit the scope of the assessment and additional questions relative to local situations are encouraged. These questions portray the minimum degree of specificity for focal habitats in order for offices to complete Step 2a.

## Fuels Management

1. Where are the priority fuels management areas (spatially defined treatment opportunity areas that consider fire risk, fuels conditions, and focal habitats [including areas adjacent to focal habitats])?
2. Based on fire risk to focal habitats, what types of fuels treatments should be implemented to reduce this threat (for example, linear features that can be used as anchors during suppression operations)?
3. Considering resistance/resilience concepts and the landscape context from Step 1, where should treatments be applied in and around focal habitats to:
  - a. Constrain fire spread?
  - b. Reduce the extent of conifer expansion?
  - c. Augment future suppression efforts by creating fuel breaks or anchors for suppression?
4. Based on opportunities for fire to improve/restore focal habitats, what types of fuels treatments should be implemented to compliment managed wildfire by modifying fire behavior and effects?
5. Are there opportunities to utilize a coordinated fuels management approach across jurisdictional boundaries?
6. What fuel reduction techniques will be most effective that are within acceptable impact ranges of local sage-grouse populations, including but not limited to grazing, prescribed fire, chemical, and biological and mechanical treatments? Will combinations of these techniques improve effectiveness (e.g., using livestock to graze fine fuels in a mowed fuel break in sagebrush)?

## Habitat Recovery/Restoration

1. Are there opportunities for habitat restoration treatments to protect, enhance or maintain sage-grouse focal habitat especially to restore connectivity of focal area habitat?
2. Considering the resistance and resilience GIS data layer (Figure 4) and the Sage-Grouse Habitat Matrix (Chambers et al. *In prep.*; Table 2), where and why would passive or active restoration treatments be used?
3. What are the risks and opportunities of restoring habitat with low resistance and resilience including the warm/dry and cool/dry soil moisture/temperature regime areas?
4. Are there opportunities to utilize a coordinated approach across jurisdictional boundaries to effectively complete habitat restoration in focal habitats?

## Fire Operations

1. Where are priority fire management areas (spatially defined polygons having the highest need for preparedness and suppression action)?

2. Where are the greatest wildfire risks to focal habitats considering trends in fire occurrence and fuel conditions (see Figure 10)?
3. Where do opportunities exist that could enhance or improve suppression capability in and around focal habitats?
  - a) For example, increased water availability through installation of helicopter refill wells or water storage tanks.
  - b) Decreased response time through pre-positioned resources or staffing remote stations.
4. Should wildfire be managed (per land use plan objectives) for improving focal habitat (e.g., reducing conifer expansion), and if so where, and under what conditions?
5. How can fire management be coordinated across jurisdictional boundaries to reduce risk or to improve focal habitats?

### **Post-fire Rehabilitation**

1. Where are areas that are a high priority for post-fire rehabilitation to improve habitat connectivity if a wildfire occurs?
2. Which areas are more conducive (higher resistance and/or resilience) to recovery and may not need reseeding after a wildfire?
3. What opportunities to build in fire resistant fuel breaks to reduce the likelihood of future wildfires impacts on seeded or recovering areas?
4. Are there opportunities to utilize a coordinated approach across jurisdictional boundaries to implement rehabilitation practices?

The outcome of Step 2a is the assembly of the pertinent information and GIS layers to assist managers in developing implementation or activity plans to address wildfires, invasive annual grasses, and conifer expansion in focal habitats. Activity plans generally refer to plans where management of a resource is changed (livestock grazing plans) whereas implementation plans are generally associated with treatments.

### **Step 2b- Preparation of Activity/Implementation Plans**

Activity/implementation plans are prepared to implement the appropriate management strategies within and adjacent to focal habitats. Since focal habitats cross jurisdictional boundaries, it is especially important that a collaborative approach be used to develop implementation/activity plans. The process of identifying partners and creating collaborative teams to develop these plans is a function of state, regional, and local managers and is not addressed as part of this step.

Implementation/activity plans are required to:

1. Address issues in and around focal habitats related to wildfires, invasive annual grasses, and conifer expansion

2. Use resistance to invasive annual grasses and resilience after disturbance (where appropriate) as part of the selection process for implementing management strategies
3. Emphasize application of management strategies within or near focal habitats with low resistance and resilience (warm/dry and cool/dry soil moisture/temperature regimes) invasive annual grasses and wildfires
4. Use the best available local information to inform the assessment process
5. Encourage collaboration and coordination with focal habitats across jurisdictional boundaries
6. Be adaptive to changing conditions, disturbances, and modifications of PAC boundaries

FIAT recommends considering other factors, such as adaptive management for climate change, local sagebrush mortality due to aroga moth or other pests, and cheatgrass die-off areas in developing activity/implementation plans. The latter two factors could influence where and what kind of management strategies may be needed to address the loss of habitat or changes in fuel characteristics (e.g., load and flammability) associated with these mortality events.

The following recommendations are provided to assist in the preparation of activity/implementation plans:

#### **Fuels Management**

1. Spatially delineate priority areas for fuel management treatments per Step 2a information considering:
  - a. Linear fuel breaks along roads
  - b. Other linear fuel breaks to create anchor points
  - c. Prescribed burning which would meet objectives identified in the Fish and Wildlife Service's Conservation Objectives Team (COT) report
  - d. Mechanical (e.g., treatment of conifer expansion into sagebrush communities)
  - e. Other mechanical, biological, or chemical treatments
  - f. If they exist, spatially delineated areas where fuel treatments would increase the ability to use fire to improve/enhance focal habitats.
2. Identify coordination needed between renewable resource, fire management, and fuels management staff to facilitate planning and implementation of fuels treatments.
3. Quantify a projected level of treatment within or near focal habitats.
  - a. Identify treatments (projects) to be planned within or near focal habitats.
  - b. Include a priority and proposed work plan for proposed treatments.

#### **Habitat Recovery/Restoration**

1. Spatially delineate priority areas for restoration, using criteria established in Step 2a. Priority areas for restoration should be delineated by treatment methods:
  - a. Seeding priority areas
  - b. Invasive annual grasses priority treatment areas (herbicide, mechanical, biological, combination)

- c. Priority areas requiring combinations of treatments (e.g., herbicide followed by seeding).
  - d. Include tables, maps or appropriate info.
2. Identify coordination needed between renewable resource, fire management, and fuels management staff to facilitate planning and implementation of restoration treatments.
3. Include a priority or implementation schedule for proposed restoration treatment

### **Fire Operations**

1. Spatially delineate priority areas for fire suppression, based upon criteria established in Step 2a. Priority areas for fire operations should be delineated by type, such as:
  - a. Initial attack priority areas
  - b. Resource pre-positioning and staging priority areas
2. Spatially delineate areas where opportunities exist to enhance or improve suppression capability.
3. Spatially delineate areas where wildfire can be managed to achieve land use plan and COT objectives.

### **Post-Fire Rehabilitation**

1. Spatially delineate priority areas for post-fire rehabilitation using criteria in Step 2a.
2. Priority areas for post-fire rehabilitation should be based on resistance and resiliency and pre-fire landscape sagebrush cover and include consideration of:
  - a. Seeding priority areas
  - b. Invasive annual grasses priority treatment areas (herbicide, mechanical, biological (herbivory or seeding),
  - c. Priority areas requiring combinations of treatments (e.g., herbicide followed by seeding)
3. Identify coordination needed between renewable resource, fire management, and fuels management staff to facilitate planning and implementation of post-fire rehabilitation treatments.

This completes the assessment process and sets the stage for more detailed project planning and NEPA associated with implementing on-the-ground treatments and management changes.

Members of the FIAT Development and Review teams are listed in Appendix 5.

 Kilometers

**Appendix 3.** Example of potential management strategies applied to Wildfire/Invasive Annual Grass Scenario.

- 1** High priority for habitat restoration and post-fire rehabilitation to restore connectivity.
- 2** High priority for fire suppression within and around area given >65% sagebrush landscape cover and low resistance/resilience.
- 3** High priority for fuels management to reduce likelihood of wildfires in low resistance/resilience habitat with >65% landscape cover.

Appendix 4. Management strategy example for Western Juniper expansion.

- 1 High priority (emphasis area) for juniper control (>25% landscape sagebrush cover & 75% BBD)
- 2 Moderate priority (emphasis area) for juniper control (>25% landscape sagebrush cover)
- 3 Very low priority (<25% landscape sagebrush cover)

## Appendix 5. Members of FIAT Development and Review Team

### Development Team

Mike Pellant*	BLM, Team Lead, Boise, Idaho
Dave Pyke*	US Geological Survey, Scientist, Corvallis, Oregon
Jeanne Chambers*	RMRS, Scientist, Reno, Nevada
Jeremy Maestas*	NRCS, Wildlife Biologist
Chad Boyd*	ARS, Scientist, Burns, Oregon
Lou Ballard	USFWS, NIFC, Boise, Idaho
Randy Sharp	Forest Service Management (retired)
Doug Havlina	BLM, NIFC, NIFC Fire Ecologist
Tim Metzger	Forest Service Fire Management Specialist
Todd Hopkins	USFWS, Great Basin LCC, Reno, Nevada
Tom Rinkes	BLM (retired biologist), Boise, Idaho
Clint McCarthy	Forest Service, Biologist (retired)
Joe Tague	BLM Management Liaison, Reno, Nevada
Steve Knick	US Geological Survey, Team Technical Assistance, Boise, Idaho
Mina Wuenschel	BLM Great Basin LCC GIS Specialist, Reno, Nevada
Mike Gregg	USFWS, Biologist, Burbank, Washington

\* indicates member of the WAWFA Resistance and Resilience team.

### Review Team

Laurie Kurth	Forest Service Fire Ecologist, Washington, D.C.
Chris Theisen	Forest Service Deputy Forest Fire Mgt. Officer, Sparks, Nevada
Lauren Mermejo	BLM, Great Basin Sage-Grouse Project Manager, Reno, Nevada
Glen Stein	Forest Service National Sage Grouse Project Manager, Ogden, Utah
Jessie Delia	USFWS, Biologist (T&E), Portland, Oregon
Mike Ielimi	Forest Service, National Invasive Species Coordinator, Washington, D.C.
Tate Fisher/Krista Gollnick	BLM NIFC, Fire Planning, Boise, Idaho
Ken Collum	BLM, Eagle Lake Field Office Manager, Susanville, California
Chuck Mark	Forest Service Supervisor, Salmon-Challis Forest
Dave Repass	BLM, ES&R Coordinator, Washington Office
Peggy Olwell	BLM Native Plant Initiative, Washington Office

## Buffers

Administrative Draft  
Cooperating Agency Review

This Page Intentionally Blank

Administrative Draft  
Cooperating Agency Review

## Appendix DD – Buffers

### Applying Lek Buffer-Distances When Approving Actions

- *Buffer Distances and Evaluation of Impacts to Leaks*

Evaluate impacts to leaks from actions requiring NEPA analysis. In addition to any other relevant information determined to be appropriate (e.g. State wildlife agency plans), the BLM will assess and address impacts from the following activities using the lek buffer-distances as identified in the USGS Report *Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review* ([Open File Report 2014-1239](#)). The BLM will apply the lek buffer-distances specified as the lower end of the interpreted range in the report unless justifiable departures are determined to be appropriate (see below). The lower end of the interpreted range of the lek buffer-distances is as follows:

  - linear features (roads) within 3.1 miles of leaks
  - infrastructure related to energy development within 3.1 miles of leaks.
  - tall structures (e.g., communication or transmission towers, transmission lines) within 2 miles of leaks.
  - low structures (e.g., fences, rangeland structures) within 1.2 miles of leaks.
  - surface disturbance (continuing human activities that alter or remove the natural vegetation) within 3.1 miles of leaks.
  - noise and related disruptive activities including those that do not result in habitat loss (e.g., motorized recreational events) at least 0.25 miles from leaks.

Justifiable departures to decrease or increase from these distances, based on local data, best available science, landscape features, and other existing protections (e.g., land use allocations, state regulations) may be appropriate for determining activity impacts. The USGS report recognized “that because of variation in populations, habitats, development patterns, social context, and other factors, for a particular disturbance type, there is no single distance that is an appropriate buffer for all populations and habitats across the sage-grouse range”. The USGS report also states that “various protection measures have been developed and implemented... [which have] the ability (alone or in concert with others) to protect important habitats, sustain populations, and support multiple-use demands for public lands”. All variations in lek buffer-distances will require appropriate analysis and disclosure as part of activity authorization.

In determining lek locations, the BLM will use the most recent active or occupied lek data available from the state wildlife agency.

- *For Actions in GHMA*

The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leaks as identified in the NEPA analysis.

  - Impacts should first be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.
  - If it is not possible to relocate the project outside of the applicable lek buffer-distance(s) identified above, the BLM may approve the project only if:
    - Based on best available science, landscape features, and other existing protections, (e.g., land use allocations, state regulations), the BLM determines that a lek buffer-distance other than the applicable distance identified above offers the same or a greater

level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area; or

- The BLM determines that impacts to GRSG and its habitat are minimized such that the project will cause minor or no new disturbance (ex. co-location with existing authorizations); and
- Any residual impacts within the lek buffer-distances are addressed through compensatory mitigation measures sufficient to ensure a net conservation gain, as outlined in the Mitigation Strategy (Appendix X).

- *For Actions in PHMA & IHMA*

The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis. Impacts should be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.

The BLM may approve actions in PHMA and IMHA that are within the applicable lek buffer distance identified above only if:

- The BLM, with input from the state fish and wildlife agency, determines, based on best available science, landscape features, and other existing protections, that a buffer distance other than the distance identified above offers the same or greater level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area.
- The BLM will explain its justification for determining the approved buffer distances meet these conditions in its project decision.

Cooperating Agency Review

## INTRODUCTION

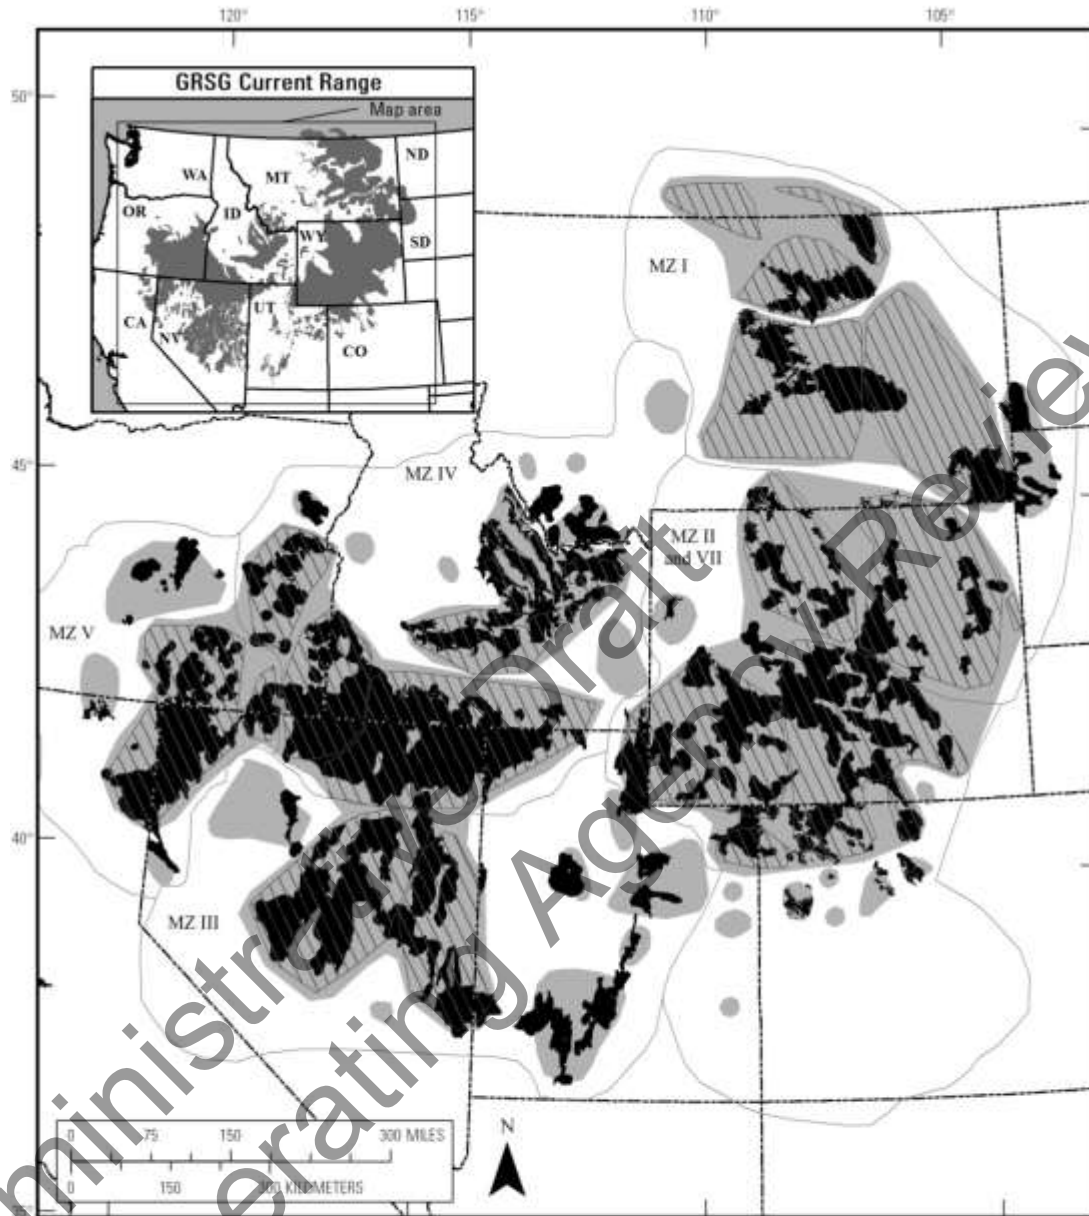

The purpose of this U.S. Bureau of Land Management (BLM) and U.S. Forest Service (USFS) Greater Sage-Grouse Monitoring Framework (hereafter, monitoring framework) is to describe the methods to monitor habitats and evaluate the implementation and effectiveness of the BLM's national planning strategy (attachment to BLM Instruction Memorandum 2012-044), the BLM resource management plans (RMPs), and the USFS's land management plans (LMPs) to conserve the species and its habitat. The regulations for the BLM (43 CFR 1610.4-9) and the USFS (36 CFR part 209, published July 1, 2010) require that land use plans establish intervals and standards, as appropriate, for monitoring and evaluations based on the sensitivity of the resource to the decisions involved. Therefore, the BLM and the USFS will use the methods described herein to collect monitoring data and to evaluate implementation and effectiveness of the Greater Sage-Grouse (GRSG) (hereafter, sage-grouse) planning strategy and the conservation measures contained in their respective land use plans (LUPs). A monitoring plan specific to the Environmental Impact Statement, land use plan, or field office will be developed after the Record of Decision is signed. For a summary of the frequency of reporting, see Attachment A, An Overview of Monitoring Commitments. Adaptive management will be informed by data collected at any and all scales.

To ensure that the BLM and the USFS are able to make consistent assessments about sage-grouse habitats across the range of the species, this framework lays out the methodology—at multiple scales—for monitoring of implementation and disturbance and for evaluating the effectiveness of BLM and USFS actions to conserve the species and its habitat. Monitoring efforts will include data for measurable quantitative indicators of sagebrush availability, anthropogenic disturbance levels, and sagebrush conditions. Implementation monitoring results will allow the BLM and the USFS to evaluate the extent that decisions from their LUPs to conserve sage-grouse and their habitat have been implemented. State fish and wildlife agencies will collect population monitoring information, which will be incorporated into effectiveness monitoring as it is made available.

This multiscale monitoring approach is necessary, as sage-grouse are a landscape species and conservation is scale-dependent to the extent that conservation actions are implemented within seasonal habitats to benefit populations. The four orders of habitat selection (Johnson 1980) used in this monitoring framework are described by Connelly et al. (2003) and were applied specifically to the scales of sage-grouse habitat selection by Stiver et al. (*in press*) as first order (broad scale), second order (mid scale), third order (fine scale), and fourth order (site scale). Habitat selection and habitat use by sage-grouse occur at multiple scales and are driven by multiple environmental and behavioral factors. Managing and monitoring sage-grouse habitats are complicated by the differences in habitat selection across the range and habitat use by individual birds within a given season. Therefore, the tendency to look at a single indicator of habitat suitability or only one scale limits managers' ability to identify the threats to sage-grouse

and to respond at the appropriate scale. For descriptions of these habitat suitability indicators for each scale, see “Sage-Grouse Habitat Assessment Framework: Multiscale Habitat Assessment Tool” (HAF; Stiver et al. *in press*).

Monitoring methods and indicators in this monitoring framework are derived from the current peer-reviewed science. Rangewide, best available datasets for broad- and mid-scale monitoring will be acquired. If these existing datasets are not readily available or are inadequate, but they are necessary to inform the indicators of sagebrush availability, anthropogenic disturbance levels, and sagebrush conditions, the BLM and the USFS will strive to develop datasets or obtain information to fill these data gaps. Datasets that are not readily available to inform the fine- and site-scale indicators will be developed. These data will be used to generate monitoring reports at the appropriate and applicable geographic scales, boundaries, and analysis units: across the range of sage-grouse as defined by Schroeder et al. (2004), and clipped by Western Association of Fish and Wildlife Agencies (WAFWA) Management Zone (MZ) (Stiver et al. 2006) boundaries and other areas as appropriate for size (e.g., populations based on Connelly et al. 2004). (See Figure 1, Map of Greater Sage-Grouse range, populations, subpopulations, and Priority Areas for Conservation as of 2013.) This broad- and mid-scale monitoring data and analysis will provide context for RMP/LMP areas; states; GRSG Priority Habitat, General Habitat, and other sage-grouse designated management areas; and Priority Areas for Conservation (PACs), as defined in “Greater Sage-grouse (*Centrocercus urophasianus*) Conservation Objectives: Final Report” (Conservation Objectives Team [COT] 2013). Hereafter, all of these areas will be referred to as “sage-grouse areas.”

**Figure 1.** Map of Greater Sage-Grouse range, populations, subpopulations, and Priority Areas for Conservation as of 2013.

This monitoring framework is divided into two sections. The broad- and mid-scale methods, described in Section I, provide a consistent approach across the range of the species to monitor implementation decisions and actions, mid-scale habitat attributes (e.g., sagebrush availability and habitat degradation), and population changes to determine the effectiveness of the planning strategy and management decisions. (See Table 1, Indicators for monitoring implementation of the national planning strategy, RMP/LMP decisions, sage-grouse habitat, and sage-grouse populations at the broad and mid scales.) For sage-grouse habitat at the fine and site scales, described in Section II, this monitoring framework describes a consistent approach (e.g., indicators and methods) for monitoring sage-grouse seasonal habitats. Funding, support, and dedicated personnel for broad- and mid-scale monitoring will be renewed annually through the normal budget process. For an overview of BLM and USFS multiscale monitoring commitments, see Attachment A.

**Table 1.** Indicators for monitoring implementation of the national planning strategy, RMP/LMP decisions, sage-grouse habitat, and sage-grouse populations at the broad and mid scales.

	Implementation	Habitat		Population (State Wildlife Agencies)
<i>Geographic Scales</i>		Availability	Degradation	Demographics
Broad Scale: From the range of sage-grouse to WAFWA Management Zones	BLM/USFS National planning strategy goal and objectives	Distribution and amount of sagebrush within the range	Distribution and amount of energy, mining, and infrastructure facilities	WAFWA Management Zone population trend
Mid Scale: From WAFWA Management Zone to populations; PACs	RMP/LMP decisions	Mid-scale habitat indicators (HAF; Table 2 herein, e.g., percent of sagebrush per unit area)	Distribution and amount of energy, mining, and infrastructure facilities (Table 2 herein)	Individual population trend

## I. BROAD AND MID SCALES

First-order habitat selection, the broad scale, describes the physical or geographical range of a species. The first-order habitat of the sage-grouse is defined by populations of sage-grouse associated with sagebrush landscapes, based on Schroeder et al. 2004, and Connelly et al. 2004, and on population or habitat surveys since 2004. An intermediate scale between the broad and mid scales was delineated by WAFWA from floristic provinces within which similar environmental factors influence vegetation communities. This scale is referred to as the WAFWA Sage-Grouse Management Zones (MZs). Although no indicators are specific to this scale, these MZs are biologically meaningful as reporting units.

Second-order habitat selection, the mid-scale, includes sage-grouse populations and PACs. The second order includes at least 40 discrete populations and subpopulations (Connelly et al. 2004). Populations range in area from 150 to 60,000 mi<sup>2</sup> and are nested within MZs. PACs range from 20 to 20,400 mi<sup>2</sup> and are nested within population areas.

Other mid-scale landscape indicators, such as patch size and number, patch connectivity, linkage areas, and landscape matrix and edge effects (Stiver et al. *in press*) will also be assessed. The methods used to calculate these metrics will be derived from existing literature (Knick et al. 2011, Leu and Hanser 2011, Knick and Hanser 2011).

### A. Implementation (Decision) Monitoring

Implementation monitoring is the process of tracking and documenting the implementation (or the progress toward implementation) of RMP/LMP decisions. The BLM and the USFS will monitor implementation of project-level and/or site-specific actions and authorizations, with their associated conditions of approval/stipulations for sage-grouse, spatially (as appropriate) within Priority Habitat, General Habitat, and other sage-grouse designated management areas, at a minimum, for the planning area. These actions and authorizations, as well as progress toward completing and implementing activity-level plans, will be monitored consistently across all planning units and will be reported to BLM and USFS headquarters annually, with a summary report every 5 years, for the planning area. A national-level GRSG Land Use Plan Decision Monitoring and Reporting Tool is being developed to describe how the BLM and the USFS will consistently and systematically monitor and report implementation-level activity plans and implementation actions for all plans within the range of sage-grouse. A description of this tool for collection and reporting of tabular and spatially explicit data will be included in the Record of Decision or approved plan. The BLM and the USFS will provide data that can be integrated with other conservation efforts conducted by state and federal partners.

## **B. Habitat Monitoring**

The U.S. Fish and Wildlife Service (USFWS), in its 2010 listing decision for the sage-grouse, identified 18 threats contributing to the destruction, modification, or curtailment of sage-grouse habitat or range (75 FR 13910 2010). The BLM and the USFS will, therefore, monitor the relative extent of these threats that remove sagebrush, both spatially and temporally, on all lands within an analysis area, and will report on amount, pattern, and condition at the appropriate and applicable geographic scales and boundaries. These 18 threats have been aggregated into three broad- and mid-scale measures to account for whether the threat predominantly removes sagebrush or degrades habitat. (See Table 2, Relationship between the 18 threats and the three habitat disturbance measures for monitoring.) The three measures are:

Measure 1: Sagebrush Availability (percent of sagebrush per unit area)

Measure 2: Habitat Degradation (percent of human activity per unit area)

Measure 3: Energy and Mining Density (facilities and locations per unit area)

These three habitat disturbance measures will evaluate disturbance on all lands, regardless of land ownership. The direct area of influence will be assessed with the goal of accounting for actual removal of sagebrush on which sage-grouse depend (Connelly et al. 2000) and for habitat degradation as a surrogate for human activity. Measure 1 (sagebrush availability) examines where disturbances have removed plant communities that support sagebrush (or have broadly removed sagebrush from the landscape). Measure 1, therefore, monitors the change in sagebrush availability—or, specifically, where and how much of the sagebrush community is available within the range of sage-grouse. The sagebrush community is defined as the ecological systems that have the capability of supporting sagebrush vegetation and seasonal sage-grouse habitats within the range of sage-grouse (see Section I.B.1., Sagebrush Availability). Measure 2 (see Section I.B.2., Habitat Degradation Monitoring) and Measure 3 (see Section I.B.3., Energy and Mining Density) focus on where habitat degradation is occurring by using the footprint/area of direct disturbance and the number of facilities at the mid scale to identify the relative amount of degradation per geographic area of interest and in areas that have the capability of supporting sagebrush and seasonal sage-grouse use. Measure 2 (habitat degradation) not only quantifies footprint/area of direct disturbance but also establishes a surrogate for those threats most likely to have ongoing activity. Because energy development and mining activities are typically the most intensive activities in sagebrush habitat, Measure 3 (the density of active energy development, production, and mining sites) will help identify areas of particular concern for such factors as noise, dust, traffic, etc. that degrade sage-grouse habitat.

**Table 2.** Relationship between the 18 threats and the three habitat disturbance measures for monitoring.

Note: Data availability may preclude specific analysis of individual layers. See the detailed methodology for more information.

<b>USFWS Listing Decision Threat</b>	<b>Sagebrush Availability</b>	<b>Habitat Degradation</b>	<b>Energy and Mining Density</b>
Agriculture	X		
Urbanization	X		
Wildfire	X		
Conifer encroachment	X		
Treatments	X		
Invasive Species	X		
Energy (oil and gas wells and development facilities)		X	X
Energy (coal mines)		X	X
Energy (wind towers)		X	X
Energy (solar fields)		X	X
Energy (geothermal)		X	X
Mining (active locatable, leasable, and saleable developments)		X	X
Infrastructure (roads)		X	
Infrastructure (railroads)		X	
Infrastructure (power lines)		X	
Infrastructure (communication towers)		X	
Infrastructure (other vertical structures)		X	
Other developed rights-of-way		X	

The methods to monitor disturbance found herein differ slightly from methods used in Manier et al. 2013, which provided a baseline environmental report (BER) of datasets of disturbance across jurisdictions. One difference is that, for some threats, the BER data were for federal lands only. In addition, threats were assessed individually, using different assumptions from those in this monitoring framework about how to quantify the location and magnitude of threats. The methodology herein builds on the BER methodology and identifies datasets and procedures to use the best available data across the range of the sage-grouse and to formulate a consistent approach to quantify impact of the threats through time. This methodology also describes an approach to combine the threats and calculate each of the three habitat disturbance measures.

### **B.1. Sagebrush Availability (Measure 1)**

Sage-grouse populations have been found to be more resilient where a percentage of the landscape is maintained in sagebrush (Knick and Connelly 2011), which will be determined by sagebrush availability. Measure 1 has been divided into two submeasures to describe sagebrush availability on the landscape:

Measure 1a: the current amount of sagebrush on the geographic area of interest, and

Measure 1b: the amount of sagebrush on the geographic area of interest compared with the amount of sagebrush the landscape of interest could ecologically support.

Measure 1a (the current amount of sagebrush on the landscape) will be calculated using this formula: [the existing updated sagebrush layer] divided by [the geographic area of interest]. The appropriate geographic areas of interest for sagebrush availability include the species' range, WAFWA MZs, populations, and PACs. In some cases these sage-grouse areas will need to be aggregated to provide an estimate of sagebrush availability with an acceptable level of accuracy.

Measure 1b (the amount of sagebrush for context within the geographic area of interest) will be calculated using this formula: [existing sagebrush divided by [pre-EuroAmerican settlement geographic extent of lands that could have supported sagebrush]. This measure will provide information to set the context for a given geographic area of interest during evaluations of monitoring data. The information could also be used to inform management options for restoration or mitigation and to inform effectiveness monitoring.

The sagebrush base layer for Measure 1 will be based on geospatial vegetation data adjusted for the threats listed in Table 2. The following subsections of this monitoring framework describe the methodology for determining both the current availability of sagebrush on the landscape and the context of the amount of sagebrush on the landscape at the broad and mid scales.

### a. Establishing the Sagebrush Base Layer

The current geographic extent of sagebrush vegetation within the rangewide distribution of sagegrouse populations will be ascertained using the most recent version of the Existing Vegetation Type (EVT) layer in LANDFIRE (2013). LANDFIRE EVT was selected to serve as the sagebrush base layer for five reasons: 1) it is the only nationally consistent vegetation layer that has been updated multiple times since 2001; 2) the ecological systems classification within LANDFIRE EVT includes multiple sagebrush type classes that, when aggregated, provide a more accurate (compared with individual classes) and seamless sagebrush base layer across jurisdictional boundaries; 3) LANDFIRE performed a rigorous accuracy assessment from which to derive the rangewide uncertainty of the sagebrush base layer; 4) LANDFIRE is consistently used in several recent analyses of sagebrush habitats (Knick et al. 2011, Leu and Hanser 2011, Knick and Hanser 2011); and 5) LANDFIRE EVT can be compared against the geographic extent of lands that are believed to have had the capability of supporting sagebrush vegetation pre-EuroAmerican settlement [LANDFIRE Biophysical Setting (BpS)]. This fifth reason provides a reference point for understanding how much sagebrush currently remains in a defined geographic area of interest compared with how much sagebrush existed historically (Measure 1b). Therefore, the BLM and the USFS have determined that LANDFIRE provides the best available data at broad and mid scales to serve as a sagebrush base layer for monitoring changes in the geographic extent of sagebrush. The BLM and the USFS, in addition to aggregating the sagebrush types into the sagebrush base layer, will aggregate the accuracy assessment reports from LANDFIRE to document the cumulative accuracy for the sagebrush base layer. The BLM—through its Assessment, Inventory, and Monitoring (AIM) program and, specifically, the BLM’s landscape monitoring framework (Taylor et al. 2014)—will provide field data to the LANDFIRE program to support continuous quality improvements of the LANDFIRE EVT layer. The sagebrush layer based on LANDFIRE EVT will allow for the mid-scale estimation of the existing percent of sagebrush across a variety of reporting units. This sagebrush base layer will be adjusted by changes in land cover and successful restoration for future calculations of sagebrush availability (Measures 1a and 1b).

This layer will also be used to determine the trend in other landscape indicators, such as patch size and number, patch connectivity, linkage areas, and landscape matrix and edge effects (Stiver et al. *in press*). In the future, changes in sagebrush availability, generated annually, will be included in the sagebrush base layer. The landscape metrics will be recalculated to examine changes in pattern and abundance of sagebrush at the various geographic boundaries. This information will be included in effectiveness monitoring (See Section I.D., Effectiveness Monitoring).

Within the USFS and the BLM, forest-wide and field office-wide existing vegetation classification mapping and inventories are available that provide a much finer level of data than what is provided through LANDFIRE. Where available, these finer-scale products will be useful for additional and complementary mid-scale indicators and local-scale analyses (see Section II,

Fine and Site Scales). The fact that these products are not available everywhere limits their utility for monitoring at the broad and mid scale, where consistency of data products is necessary across broader geographies.

### ***Data Sources for Establishing and Monitoring Sagebrush Availability***

There were three criteria for selecting the datasets for establishing and monitoring the change in sagebrush availability (Measure 1):

- Nationally consistent dataset available across the range
- Known level of confidence or accuracy in the dataset
- Continual maintenance of dataset and known update interval

Datasets meeting these criteria are listed in Table 3, Datasets for establishing and monitoring changes in sagebrush availability.

### ***LANDFIRE Existing Vegetation Type (EVT) Version 1.2***

LANDFIRE EVT represents existing vegetation types on the landscape derived from remote sensing data. Initial mapping was conducted using imagery collected in approximately 2001. Since the initial mapping there have been two update efforts: version 1.1 represents changes before 2008, and version 1.2 reflects changes on the landscape before 2010. Version 1.2 will be used as the starting point to develop the sagebrush base layer.

Sage-grouse subject matter experts determined which of the ecological systems from the LANDFIRE EVT to use in the sagebrush base layer by identifying the ecological systems that have the capability of supporting sagebrush vegetation and that could provide suitable seasonal habitat for the sage-grouse. (See Table 4, Ecological systems in BpS and EVT capable of supporting sagebrush vegetation and capable of providing suitable seasonal habitat for Greater Sage-Grouse.) Two additional vegetation types that are not ecological systems were added to the EVT: *Artemisia tridentata* ssp. *vaseyana* Shrubland Alliance and *Quercus gambelii* Shrubland Alliance. These alliances have species composition directly related to the Rocky Mountain Lower Montane-Foothill Shrubland ecological system and the Rocky Mountain Gambel Oak-Mixed Montane Shrubland ecological system, both of which are ecological systems in LANDFIRE BpS. In LANDFIRE EVT, however, in some map zones, the Rocky Mountain Lower Montane-Foothill Shrubland ecological system and the Rocky Mountain Gambel Oak-Mixed Montane Shrubland ecological system were named *Artemisia tridentata* ssp. *vaseyana* Shrubland Alliance and *Quercus gambelii* Shrubland Alliance, respectively.

**Table 3.** Datasets for establishing and monitoring changes in sagebrush availability.

Dataset	Source	Update Interval	Most Recent Version Year	Use
BioPhysical Setting v1.1	LANDFIRE	Static	2008	Denominator for sagebrush availability
Existing Vegetation Type v1.2	LANDFIRE	Static	2010	Numerator for sagebrush availability
Cropland Data Layer	National Agricultural Statistics Service	Annual	2012	Agricultural updates; removes existing sagebrush from numerator of sagebrush availability
National Land Cover Dataset Percent Imperviousness	Multi-Resolution Land Characteristics Consortium (MRLC)	5-Year	2011 (next available in 2016)	Urban area updates; removes existing sagebrush from numerator of sagebrush availability
Fire Perimeters	GeoMac	Annual	2013	< 1,000-acre fire updates; removes existing sagebrush from numerator of sagebrush availability
Burn Severity	Monitoring Trends in Burn Severity	Annual	2012 (2-year delay in data availability)	> 1,000-acre fire updates; removes existing sagebrush from numerator of sagebrush availability except for unburned sagebrush islands

**Table 4.** Ecological systems in BpS and EVT capable of supporting sagebrush vegetation and capable of providing suitable seasonal habitat for Greater Sage-Grouse.

Ecological System	Sagebrush Vegetation that the Ecological System has the Capability of Producing
Colorado Plateau Mixed Low Sagebrush Shrubland	<i>Artemisia arbuscula</i> ssp. <i>longiloba</i> <i>Artemisia bigelovii</i> <i>Artemisia nova</i> <i>Artemisia frigida</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i>
Columbia Plateau Low Sagebrush Steppe	<i>Artemisia arbuscula</i> <i>Artemisia arbuscula</i> ssp. <i>longiloba</i> <i>Artemisia nova</i>

Columbia Plateau Scabland Shrubland	<i>Artemisia rigida</i>
Columbia Plateau Steppe and Grassland	<i>Artemisia</i> spp.
Great Basin Xeric Mixed Sagebrush Shrubland	<i>Artemisia arbuscula</i> ssp. <i>longicaulis</i> <i>Artemisia arbuscula</i> ssp. <i>longiloba</i> <i>Artemisia nova</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i>
Inter-Mountain Basins Big Sagebrush Shrubland	<i>Artemisia tridentata</i> ssp. <i>tridentata</i> <i>Artemisia tridentata</i> ssp. <i>xericensis</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i>
Inter-Mountain Basins Big Sagebrush Steppe	<i>Artemisia cana</i> ssp. <i>cana</i> <i>Artemisia tridentata</i> ssp. <i>tridentata</i> <i>Artemisia tridentata</i> ssp. <i>xericensis</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i> <i>Artemisia tripartita</i> ssp. <i>tripartita</i> <i>Artemisia frigida</i>
Inter-Mountain Basins Curl-Leaf Mountain Mahogany Woodland and Shrubland	<i>Artemisia tridentata</i> ssp. <i>vaseyana</i> <i>Artemisia arbuscula</i> <i>Artemisia tridentata</i>
Inter-Mountain Basins Mixed Salt Desert Scrub	<i>Artemisia tridentata</i> ssp. <i>wyomingensis</i> <i>Artemisia spinescens</i>
Inter-Mountain Basins Montane Sagebrush Steppe	<i>Artemisia tridentata</i> ssp. <i>vaseyana</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i> <i>Artemisia nova</i> <i>Artemisia arbuscula</i> <i>Artemisia tridentata</i> ssp. <i>spiciformis</i>
Inter-Mountain Basins Semi-Desert Shrub-Steppe	<i>Artemisia tridentata</i> <i>Artemisia bigelovii</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i>
Northwestern Great Plains Mixed Grass Prairie	<i>Artemisia cana</i> ssp. <i>cana</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i> <i>Artemisia frigida</i>
Northwestern Great Plains Shrubland	<i>Artemisia cana</i> ssp. <i>cana</i> <i>Artemisia tridentata</i> ssp. <i>tridentata</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i>
Rocky Mountain Gambel Oak-Mixed Montane Shrubland	<i>Artemisia tridentata</i>
Rocky Mountain Lower Montane-Foothill Shrubland	<i>Artemisia nova</i> <i>Artemisia tridentata</i> <i>Artemisia frigida</i>
Western Great Plains Floodplain Systems	<i>Artemisia cana</i> ssp. <i>cana</i>
Western Great Plains Sand Prairie	<i>Artemisia cana</i> ssp. <i>cana</i>
Wyoming Basins Dwarf Sagebrush Shrubland and Steppe	<i>Artemisia arbuscula</i> ssp. <i>longiloba</i> <i>Artemisia nova</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i> <i>Artemisia tripartita</i> ssp. <i>rupicola</i>
<i>Artemisia tridentata</i> ssp. <i>vaseyana</i> Shrubland Alliance (EVT only)	<i>Artemisia tridentata</i> ssp. <i>vaseyana</i>
<i>Quercus gambelii</i> Shrubland Alliance (EVT only)	<i>Artemisia tridentata</i>

### ***Accuracy and Appropriate Use of LANDFIRE Datasets***

Because of concerns over the thematic accuracy of individual classes mapped by LANDFIRE, all ecological systems listed in Table 4 will be merged into one value that represents the sagebrush base layer. With all ecological systems aggregated, the combined accuracy of the sagebrush base layer (EVT) will be much greater than if all categories were treated separately.

LANDFIRE performed the original accuracy assessment of its EVT product on a map zone basis. There are 20 LANDFIRE map zones that cover the historical range of sage-grouse as defined by Schroeder (2004). (See Attachment B, User and Producer Accuracies for Aggregated Ecological Systems within LANDFIRE Map Zones.) The aggregated sagebrush base layer for monitoring had user accuracies ranging from 57.1% to 85.7% and producer accuracies ranging from 56.7% to 100%.

*LANDFIRE EVT data are not designed to be used at a local level.* In reports of the percent sagebrush statistic for the various reporting units (Measure 1a), the uncertainty of the percent sagebrush will increase as the size of the reporting unit gets smaller. LANDFIRE data should never be used at the 30m pixel level (900m<sup>2</sup> resolution of raster data) for any reporting. The smallest geographic extent for using the data to determine percent sagebrush is at the PAC level; for the smallest PACs, the initial percent sagebrush estimate will have greater uncertainties compared with the much larger PACs.

### ***Agricultural Adjustments for the Sagebrush Base Layer***

The dataset for the geographic extent of agricultural lands will come from the National Agricultural Statistics Service (NASS) Cropland Data Layer (CDL) (<http://www.nass.usda.gov/research/Cropland/Release/index.htm>). CDL data are generated annually, with estimated producer accuracies for “large area row crops ranging from the mid 80% to mid-90%,” depending on the state ([http://www.nass.usda.gov/research/Cropland/sarsfaqs2.htm#Section3\\_18.0](http://www.nass.usda.gov/research/Cropland/sarsfaqs2.htm#Section3_18.0)). Specific information on accuracy may be found on the NASS metadata website (<http://www.nass.usda.gov/research/Cropland/metadata/meta.htm>). CDL provided the only dataset that matches the three criteria (nationally consistent, known level of accuracy, and periodically updated) for use in this monitoring framework and represents the best available agricultural lands mapping product.

The CDL data contain both agricultural classes and nonagricultural classes. For this effort, and in the baseline environmental report (Manier et al. 2013), nonagricultural classes were removed from the original dataset. The excluded classes are:

Barren (65 & 131), Deciduous Forest (141), Developed/High Intensity (124), Developed/Low Intensity (122), Developed/Med Intensity (123), Developed/Open Space (121), Evergreen Forest (142), Grassland Herbaceous (171), Herbaceous Wetlands (195), Mixed Forest (143), Open

Water (83 & 111), Other Hay/Non Alfalfa (37), Pasture/Hay (181), Pasture/Grass (62), Perennial Ice/Snow (112), Shrubland (64 & 152), Woody Wetlands (190).

The rule set for adjusting the sagebrush base layer for agricultural lands (and for updating the base layer for agricultural lands in the future) is that once an area is classified as agriculture in any year of the CDL, those pixels will remain out of the sagebrush base layer even if a new version of the CDL classifies that pixel as one of the nonagricultural classes listed above. The assumption is that even though individual pixels may be classified as a nonagricultural class in any given year, the pixel has not necessarily been restored to a natural sagebrush community that would be included in Table 4. A further assumption is that once an area has moved into agricultural use, it is unlikely that the area would be restored to sagebrush. Should that occur, however, the method and criteria for adding pixels back into the sagebrush base layer would follow those found in the sagebrush restoration monitoring section of this monitoring framework (see Section I.B.1.b., Monitoring Sagebrush Availability).

#### ***Urban Adjustments for the Sagebrush Base Layer***

The National Land Cover Database (NLCD) (Fry et al. 2011) includes a percent imperviousness dataset that was selected as the best available dataset to be used for urban adjustments and monitoring. These data are generated on a 5-year cycle and are specifically designed to support monitoring efforts. Other datasets were evaluated and lacked the spatial specificity that was captured in the NLCD product. Any new impervious pixel in NLCD will be removed from the sagebrush base layer through the monitoring process. Although the impervious surface layer includes a number of impervious pixels outside of urban areas, this is acceptable for the adjustment and monitoring for two reasons. First, an evaluation of national urban area datasets did not reveal a layer that could be confidently used in conjunction with the NLCD product to screen impervious pixels outside of urban zones. This is because unincorporated urban areas were not being included, thus leaving large chunks of urban pixels unaccounted for in this rule set. Second, experimentation with setting a threshold on the percent imperviousness layer that would isolate rural features proved to be unsuccessful. No combination of values could be identified that would result in the consistent ability to limit impervious pixels outside urban areas. Therefore, to ensure consistency in the monitoring estimates, all impervious pixels will be used.

#### ***Fire Adjustments for the Sagebrush Base Layer***

Two datasets were selected for performing fire adjustments and updates: GeoMac fire perimeters and Monitoring Trends in Burn Severity (MTBS). An existing data standard in the BLM requires that all fires of more than 10 acres are to be reported to GeoMac; therefore, there will be many small fires of less than 10 acres that will not be accounted for in the adjustment and monitoring attributable to fire. Using fire perimeters from GeoMac, all sagebrush pixels falling

within the perimeter of fires less than 1,000 acres will be used to adjust and monitor the sagebrush base layer.

For fires greater than 1,000 acres, MTBS was selected as a means to account for unburned sagebrush islands during the update process of the sagebrush base layer. The MTBS program (<http://www.mtbs.gov>) is an ongoing, multiyear project to map fire severity and fire perimeters consistently across the United States. One of the burn severity classes within MTBS is an unburned to low-severity class. This burn severity class will be used to represent unburned islands of sagebrush within the fire perimeter for the sagebrush base layer. Areas within the other severity classes within the fire perimeter will be removed from the base sagebrush layer during the update process. Not all wildfires, however, have the same impacts on the recovery of sagebrush habitat, depending largely on soil moisture and temperature regimes. For example, cooler, moister sagebrush habitat has a higher potential for recovery or, if needed, restoration than does the warmer, dryer sagebrush habitat. These cooler, moister areas will likely be detected as sagebrush in future updates to LANDFIRE.

#### ***Conifer Encroachment Adjustment for the Sagebrush Base Layer***

Conifer encroachment into sagebrush vegetation reduces the spatial extent of sage-grouse habitat (Davies et al. 2011, Baruch-Mordo et al. 2013). Conifer species that show propensity for encroaching into sagebrush vegetation resulting in sage-grouse habitat loss include various juniper species, such as Utah juniper (*Juniperus osteosperma*), western juniper (*Juniperus occidentalis*), Rocky Mountain juniper (*Juniperus scopulorum*), pinyon species, including singleleaf pinyon (*Pinus monophylla*) and pinyon pine (*Pinus edulis*), ponderosa pine (*Pinus ponderosa*), lodgepole pine (*Pinus contorta*), and Douglas fir (*Pseudotsuga menziesii*) (Gruell et al. 1986, Grove et al. 2005, Davies et al. 2011).

A rule set for conifer encroachment was developed to adjust the sagebrush base layer. To capture the geographic extent of sagebrush that is likely to experience conifer encroachment, ecological systems within LANDFIRE EVT version 1.2 (NatureServe 2011) were identified if they had the capability of supporting both the conifer species (listed above) and sagebrush vegetation. Those ecological systems were deemed to be the plant communities with conifers most likely to encroach into sagebrush vegetation. (See Table 5, Ecological systems with conifers most likely to encroach into sagebrush vegetation.) Sagebrush vegetation was defined as including sagebrush species or subspecies that provide habitat for the Greater Sage-Grouse and that are included in the HAF. (See Attachment C, Sagebrush Species and Subspecies Included in the Selection Criteria for Building the EVT and BpS Layers.) An adjacency analysis was conducted to identify all sagebrush pixels that were directly adjacent to these conifer ecological systems, and these pixels were removed from the sagebrush base layer.

**Table 5.** Ecological systems with conifers most likely to encroach into sagebrush vegetation.

EVT Ecological Systems	Coniferous Species and Sagebrush Vegetation that the Ecological System has the Capability of Producing
Colorado Plateau Pinyon-Juniper Woodland	<i>Pinus edulis</i> <i>Juniperus osteosperma</i> <i>Artemisia tridentata</i> <i>Artemisia arbuscula</i> <i>Artemisia nova</i> <i>Artemisia tridentata</i> ssp. <i>tridentata</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i> <i>Artemisia bigelovii</i> <i>Artemisia pygmaea</i>
Columbia Plateau Western Juniper Woodland and Savanna	<i>Juniperus occidentalis</i> <i>Pinus ponderosa</i> <i>Artemisia tridentata</i> <i>Artemisia arbuscula</i> <i>Artemisia rigida</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i>
East Cascades Oak-Ponderosa Pine Forest and Woodland	<i>Pinus ponderosa</i> <i>Pseudotsuga menziesii</i> <i>Artemisia tridentata</i> <i>Artemisia nova</i>
Great Basin Pinyon-Juniper Woodland	<i>Pinus monophylla</i> <i>Juniperus osteosperma</i> <i>Artemisia arbuscula</i> <i>Artemisia nova</i> <i>Artemisia tridentata</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i>
Northern Rocky Mountain Ponderosa Pine Woodland and Savanna	<i>Pinus ponderosa</i> <i>Artemisia tridentata</i> <i>Artemisia arbuscula</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i>
Rocky Mountain Foothill Limber Pine-Juniper Woodland	<i>Juniperus osteosperma</i> <i>Juniperus scopulorum</i> <i>Artemisia nova</i> <i>Artemisia tridentata</i>
Rocky Mountain Poor-Site Lodgepole Pine Forest	<i>Pinus contorta</i> <i>Pseudotsuga menziesii</i> <i>Pinus ponderosa</i> <i>Artemisia tridentata</i>
Southern Rocky Mountain Pinyon-Juniper Woodland	<i>Pinus edulis</i> <i>Juniperus monosperma</i> <i>Artemisia bigelovii</i> <i>Artemisia tridentata</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i>
Southern Rocky Mountain Ponderosa Pine Woodland	<i>Pinus ponderosa</i> <i>Pseudotsuga menziesii</i>

	<i>Pinus edulis</i> <i>Pinus contorta</i> <i>Juniperus</i> spp. <i>Artemisia nova</i> <i>Artemisia tridentata</i> <i>Artemisia arbuscula</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i>
--	---

***Invasive Annual Grasses Adjustments for the Sagebrush Base Layer***

There are no invasive species datasets from 2010 to the present (beyond the LANDFIRE data) that meet the three criteria (nationally consistent, known level of accuracy, and periodically updated) for use in the determination of the sagebrush base layer. For a description of how invasive species land cover will be incorporated in the sagebrush base layer in the future, see Section I.B.1.b., Monitoring Sagebrush Availability.

***Sagebrush Restoration Adjustments for the Sagebrush Base Layer***

There are no datasets from 2010 to the present that could provide additions to the sagebrush base layer from restoration treatments that meet the three criteria (nationally consistent, known level of accuracy, and periodically updated); therefore, no adjustments were made to the sagebrush base layer calculated from the LANDFIRE EVT (version 1.2) attributable to restoration activities since 2010. Successful restoration treatments before 2010 are assumed to have been captured in the LANDFIRE refresh.

**b. Monitoring Sagebrush Availability**

***Monitoring Sagebrush Availability***

Sagebrush availability will be updated annually by incorporating changes to the sagebrush base layer attributable to agriculture, urbanization, and wildfire. The monitoring schedule for the existing sagebrush base layer updates is as follows:

***2010 Existing Sagebrush Base Layer*** = [Sagebrush EVT] minus [2006 Imperviousness Layer] minus [2009 and 2010 CDL] minus [2009/10 GeoMac Fires that are less than 1,000 acres] minus [2009/10 MTBS Fires that are greater than 1,000 acres, excluding unburned sagebrush islands within the perimeter] minus [Conifer Encroachment Layer]

***2012 Existing Sagebrush Update*** = [2010 Existing Sagebrush Base Layer] minus [2011 Imperviousness Layer] minus [2011 and 2012 CDL] minus [2011/12 GeoMac Fires < 1,000 acres] minus [2011/12 MTBS Fires that are greater than 1,000 acres, excluding unburned sagebrush islands within the perimeter]

***Monitoring Existing Sagebrush post 2012*** = [Previous Existing Sagebrush Update Layer] minus [Imperviousness Layer (if new data are available)] minus [Next 2 years of CDL] minus [Next 2 years of GeoMac Fires < 1,000 acres] minus [Next 2 years of MTBS Fires that are greater than

1,000 acres, excluding unburned sagebrush islands within the perimeter] plus  
[restoration/monitoring data provided by the field]

### ***Monitoring Sagebrush Restoration***

Restoration after fire, after agricultural conversion, after seedings of introduced grasses, or after treatments of pinyon pine and/or juniper are examples of updates to the sagebrush base layer that can add sagebrush vegetation back into sagebrush availability in the landscape. When restoration has been determined to be successful through rangewide, consistent, interagency fine- and site-scale monitoring, the polygonal data will be used to add sagebrush pixels back into the broad- and mid-scale sagebrush base layer.

### ***Measure 1b: Context for Monitoring the Amount of Sagebrush in a Geographic Area of Interest***

Measure 1b describes the amount of sagebrush on the landscape of interest compared with the amount of sagebrush the landscape of interest could ecologically support. Areas with the potential to support sagebrush were derived from the BpS data layer that describes sagebrush pre-EuroAmerican settlement (v1.2 of LANDFIRE).

The identification and spatial locations of natural plant communities (vegetation) that are believed to have existed on the landscape (BpS) were constructed based on an approximation of the historical (pre-EuroAmerican settlement) disturbance regime and how the historical disturbance regime operated on the current biophysical environment. BpS is composed of map units that are based on NatureServe (2011) terrestrial ecological systems classification.

The ecological systems within BpS used for this monitoring framework are those ecological systems that are capable of supporting sagebrush vegetation and of providing seasonal habitat for sage-grouse (Table 4). Ecological systems selected included sagebrush species or subspecies that are included in the HAF and listed in Attachment C.

The BpS layer does not have an associated accuracy assessment, given the lack of any reference data. Visual inspection of the BpS data, however, reveals inconsistencies in the labeling of pixels among LANDFIRE map zones. The reason for these inconsistencies is that the rule sets used to map a given ecological system will vary among map zones based on different physical, biological, disturbance, and atmospheric regimes of the region. These variances can result in artificial edges in the map. Metrics will be calculated, however, at broad spatial scales using BpS potential vegetation type, not small groupings or individual pixels. Therefore, the magnitude of these observable errors in the BpS layer will be minor compared with the size of the reporting units. Since BpS will be used to identify broad landscape patterns of dominant vegetation, these inconsistencies will have only a minor impact on the percent sagebrush availability calculation. *As with the LANDFIRE EVT, LANDFIRE BpS data are not designed to be used at a local level. LANDFIRE data should never be used at the 30m pixel level for reporting.*

In conclusion, sagebrush availability data will be used to inform effectiveness monitoring and initiate adaptive management actions as necessary. The 2010 estimate of sagebrush availability will serve as the base year, and an updated estimate for 2012 will be reported in 2014 after all datasets become available. The 2012 estimate will capture changes attributable to wildfire, agriculture, and urban development. Subsequent updates will always include new fire and agricultural data and new urban data when available. Restoration data that meet the criteria for adding sagebrush areas back into the sagebrush base layer will be factored in as data allow. Given data availability, there will be a 2-year lag (approximately) between when the estimate is generated and when the data used for the estimate become available (e.g., the 2014 sagebrush availability will be included in the 2016 estimate).

### ***Future Plans***

Geospatial data used to generate the sagebrush base layer will be available through the BLM's EGIS web portal and geospatial gateway or through the authoritative data source. Legacy datasets will be preserved so that trends may be calculated. Additionally, accuracy assessment data for all source datasets will be provided on the portal either spatially, where applicable, or through the metadata. Accuracy assessment information was deemed vital to help users understand the limitation of the sagebrush estimates; it will be summarized spatially by map zone and will be included in the portal.

LANDFIRE plans to begin a remapping effort in 2015. This remapping has the potential to improve the overall quality of data products greatly, primarily through the use of higher-quality remote sensing datasets. Additionally, the BLM and the Multi-Resolution Land Characteristics Consortium (MRLC) are working to improve the accuracy of vegetation map products for broad- and mid-scale analyses through the Grass/Shrub mapping effort. The Grass/Shrub mapping effort applies the Wyoming multiscale sagebrush habitat methodology (Homer et al. 2009) to depict spatially the fractional percent cover estimates for five components rangewide and West-wide. These five components are percent cover of sagebrush vegetation, percent bare ground, percent herbaceous vegetation (grass and forbs combined), annual vegetation, and percent shrubs. A benefit of the design of these fractional cover maps is that they facilitate monitoring "within" class variation (e.g., examination of declining trend in sagebrush cover for individual pixels). This "within" class variation can serve as one indicator of sagebrush quality that cannot be derived from LANDFIRE's EVT information. The Grass/Shrub mapping effort is not a substitute for fine-scale monitoring but will leverage fine-scale data to support the validation of the mapping products. An evaluation will be conducted to determine if either dataset is of great enough quality to warrant replacing the existing sagebrush layers. At the earliest, this evaluation will occur in 2018 or 2019, depending on data availability.

## **B.2. Habitat Degradation Monitoring (Measure 2)**

The measure of habitat degradation will be calculated by combining the footprints of threats identified in Table 2. The footprint is defined as the direct area of influence of “active” energy and infrastructure; it is used as a surrogate for human activity. Although these analyses will try to summarize results at the aforementioned meaningful geographic areas of interest, some may be too small to report the metrics appropriately and may be combined (smaller populations, PACs within a population, etc.). Data sources for each threat are found in Table 6, Geospatial data sources for habitat degradation. Specific assumptions (inclusion criteria for data, width/area assumptions for point and line features, etc.) and methodology for each threat, and the combined measure, are detailed below. All datasets will be updated annually to monitor broad- and mid-scale year-to-year changes and to calculate trends in habitat degradation to inform adaptive management. A 5-year summary report will be provided to the USFWS.

### **a. Habitat Degradation Datasets and Assumptions**

#### ***Energy (oil and gas wells and development facilities)***

This dataset will compile information from three oil and gas databases: the proprietary IHS Enerdeq database, the BLM Automated Fluid Minerals Support System (AFMSS) database, and the proprietary Platts (a McGraw-Hill Financial Company) GIS Custom Data (hereafter, Platts) database of power plants. Point data from wells active within the last 10 years from IHS and producing wells from AFMSS will be considered as a 5-acre (2.0ha) direct area of influence centered on the well point, as recommended by the BLM WO-300 (Minerals and Realty Management). Plugged and abandoned wells will be removed if the date of well abandonment was before the first day of the reporting year (i.e., for the 2015 reporting year, a well must have been plugged and abandoned by 12/31/2014 to be removed). Platts oil and gas power plants data (subset to operational power plants) will also be included as a 5-acre (2.0ha) direct area of influence.

***Additional Measure: Reclaimed Energy-related Degradation.*** This dataset will include those wells that have been plugged and abandoned. This measure thereby attempts to measure energy-related degradation that has been reclaimed but not necessarily fully restored to sage-grouse habitat. This measure will establish a baseline by using wells that have been plugged and abandoned within the last 10 years from the IHS and AFMSS datasets. Time lags for lek attendance in response to infrastructure have been documented to be delayed 2–10 years from energy development activities (Harju et al. 2010). Reclamation actions may require 2 or more years from the Final Abandonment Notice. Sagebrush seedling establishment may take 6 or more years from the point of seeding, depending on such variables as annual precipitation, annual temperature, and soil type and depth (Pyke 2011). This 10-year period is conservative and assumes some level of habitat improvement 10 years after plugging. Research by Hemstrom et al. (2002), however,

proposes an even longer period—more than 100 years—for recovery of sagebrush habitats, even with active restoration approaches. Direct area of influence will be considered 3 acres (1.2ha) (J. Perry, personal communication, February 12, 2014). This additional layer/measure could be used at the broad and mid scale to identify areas where sagebrush habitat and/or potential sagebrush habitat is likely still degraded. This layer/measure could also be used where further investigation at the fine or site scale would be warranted to: 1) quantify the level of reclamation already conducted, and 2) evaluate the amount of restoration still required for sagebrush habitat recovery. At a particular level (e.g., population, PACs), these areas and the reclamation efforts/success could be used to inform reclamation standards associated with future developments. Once these areas have transitioned from reclamation standards to meeting *restoration* standards, they can be added back into the sagebrush availability layer using the same methodology as described for adding restoration treatment areas lost to wildfire and agriculture conversion (see Monitoring Sagebrush Restoration in Section I.B.1.b., Monitoring Sagebrush Availability). This dataset will be updated annually from the IHS dataset.

### ***Energy (coal mines)***

Currently, there is no comprehensive dataset available that identifies the footprint of active coal mining across all jurisdictions. Therefore, point and polygon datasets will be used each year to identify coal mining locations. Data sources will be identified and evaluated annually and will include at a minimum: BLM coal lease polygons, U.S. Energy Information Administration mine occurrence points, U.S. Office of Surface Mining Reclamation and Enforcement coal mining permit polygons (as available), and U.S. Geological Survey (USGS) Mineral Resources Data System mine occurrence points. These data will inform where active coal mining may be occurring. Additionally, coal power plant data from Platts power plants database (subset to operational power plants) will be included. Aerial imagery will then be used to digitize manually the active coal mining and coal power plants surface disturbance in or near these known occurrence areas. While the date of aerial imagery varies by scale, the most current data available from Esri and/or Google will be used to locate (generally at 1:50,000 and below) and digitize (generally at 1:10,000 and below) active coal mine and power plant direct area of influence. Coal mine location data source and imagery date will be documented for each digitized coal polygon at the time of creation. Subsurface facility locations (polygon or point location as available) will also be collected if available, included in density calculations, and added to the active surface activity layer as appropriate (if an actual direct area of influence can be located).

### ***Energy (wind energy facilities)***

This dataset will be a subset of the Federal Aviation Administration (FAA) Digital Obstacles point file. Points where “Type\_” = “WINDMILL” will be included. Direct area of influence of these point features will be measured by converting to a polygon dataset as a direct area of

influence of 3 acres (1.2ha) centered on each tower point. See the BLM's "Wind Energy Development Programmatic Environmental Impact Statement" (BLM 2005). Additionally, Platts power plants database will be used for transformer stations associated with wind energy sites (subset to operational power plants), also with a 3-acre (1.2ha) direct area of influence.

### ***Energy (solar energy facilities)***

This dataset will include solar plants as compiled with the Platts power plants database (subset to operational power plants). This database includes an attribute that indicates the operational capacity of each solar power plant. Total capacity at the power plant was based on ratings of the in-service unit(s), in megawatts. Direct area of influence polygons will be centered over each point feature representing 7.3ac (3.0ha) per megawatt of the stated operational capacity, per the report of the National Renewable Energy Laboratory (NREL), "Land-Use Requirements for Solar Power Plants in the United States" (Ong et al. 2013).

### ***Energy (geothermal energy facilities)***

This dataset will include geothermal wells in existence or under construction as compiled with the IHS wells database and power plants as compiled with the Platts database (subset to operational power plants). Direct area of influence of these point features will be measured by converting to a polygon dataset of 3 acres (1.2ha) centered on each well or power plant point.

### ***Mining (active developments; locatable, leasable, saleable)***

This dataset will include active locatable mining locations as compiled with the proprietary InfoMine database. Aerial imagery will then be used to digitize manually the active mining surface disturbance in or near these known occurrence areas. While the date of aerial imagery varies by scale, the most current data available from Esri and/or Google will be used to locate (generally at 1:50,000 and below) and digitize (generally at 1:10,000 and below) active mine direct area of influence. Mine location data source and imagery date will be documented for each digitized polygon at the time of creation. Currently, there are no known compressive databases available for leasable or saleable mining sites beyond coal mines. Other data sources will be evaluated and used as they are identified or as they become available. Point data may be converted to polygons to represent direct area of influence unless actual surface disturbance is available.

### ***Infrastructure (roads)***

This dataset will be compiled from the proprietary Esri StreetMap Premium for ArcGIS. Dataset features that will be used are: Interstate Highways, Major Roads, and Surface Streets to capture most paved and "crowned and ditched" roads while not including "two-track" and 4-wheel-drive routes. These minor roads, while not included in the broad- and mid-scale monitoring, may support a volume of traffic that can have deleterious effects on sage-grouse leks. It may be

appropriate to consider the frequency and type of use of roads in a NEPA analysis for a proposed project. This fine- and site-scale analysis will require more site-specific data than is identified in this monitoring framework. The direct area of influence for roads will be represented by 240.2ft, 84.0ft, and 40.7ft (73.2m, 25.6m, and 12.4m) total widths centered on the line feature for Interstate Highways, Major Roads, and Surface Streets, respectively (Knick et al. 2011). The most current dataset will be used for each monitoring update. *Note: This is a related but different dataset than what was used in BER (Manier et al. 2013). Individual BLM/USFS planning units may use different road layers for fine- and site-scale monitoring.*

### ***Infrastructure (railroads)***

This dataset will be a compilation from the Federal Railroad Administration Rail Lines of the USA dataset. Non-abandoned rail lines will be used; abandoned rail lines will not be used. The direct are of influence for railroads will be represented by a 30.8ft (9.4m) total width (Knick et al. 2011) centered on the non-abandoned railroad line feature.

### ***Infrastructure (power lines)***

This line dataset will be derived from the proprietary Platts transmission lines database. Linear features in the dataset attributed as “buried” will be removed from the disturbance calculation. Only “In Service” lines will be used; “Proposed” lines will not be used. Direct area of influence will be determined by the kV designation: 1–199 kV (100ft/30.5m), 200–399 kV (150ft/45.7m), 400–699 kV (200ft/61.0m), and 700-or greater kV (250ft/76.2m) based on average right-of-way and structure widths, according to BLM WO-300 (Minerals and Realty Management).

### ***Infrastructure (communication towers)***

This point dataset will be compiled from the Federal Communications Commission (FCC) communication towers point file; all duplicate points will be removed. It will be converted to a polygon dataset by using a direct area of influence of 2.5 acres (1.0ha) centered on each communication tower point (Knick et al. 2011).

### ***Infrastructure (other vertical structures)***

This point dataset will be compiled from the FAA’s Digital Obstacles point file. Points where “Type\_” = “WINDMILL” will be removed. Duplicate points from the FCC communication towers point file will be removed. Remaining features will be converted to a polygon dataset using a direct area of influence of 2.5 acres (1.0ha) centered on each vertical structure point (Knick et al. 2011).

### ***Other Developed Rights-of-Way***

Currently, no additional data sources for other rights-of-way have been identified; roads, power lines, railroads, pipelines, and other known linear features are represented in the categories

described above. The newly purchased IHS data do contain pipeline information; however, this database does not currently distinguish between above-ground and underground pipelines. If additional features representing human activities are identified, they will be added to monitoring reports using similar assumptions to those used with the threats described above.

#### **b. Habitat Degradation Threat Combination and Calculation**

The threats targeted for measuring human activity (Table 2) will be converted to direct area of influence polygons as described for each threat above. These threat polygon layers will be combined and features dissolved to create one overall polygon layer representing footprints of active human activity in the range of sage-grouse. Individual datasets, however, will be preserved to indicate which types of threats may be contributing to overall habitat degradation.

This measure has been divided into three submeasures to describe habitat degradation on the landscape. Percentages will be calculated as follows:

Measure 2a. Footprint by geographic area of interest: Divide area of the active/direct footprint by the total area of the geographic area of interest (% disturbance in geographic area of interest).

Measure 2b. Active/direct footprint by historical sagebrush potential: Divide area of the active footprint that coincides with areas with historical sagebrush potential (BpS calculation from habitat availability) within a given geographic area of interest by the total area with sagebrush potential within the geographic area of interest (% disturbance on potential historical sagebrush in geographic area of interest).

Measure 2c. Active/direct footprint by current sagebrush: Divide area of the active footprint that coincides with areas of existing sagebrush (EVT calculation from habitat availability) within a given geographic area of interest by the total area that is current sagebrush within the geographic area of interest (% disturbance on current sagebrush in geographic area of interest).

#### **B.3. Energy and Mining Density (Measure 3)**

The measure of density of energy and mining will be calculated by combining the locations of energy and mining threats identified in Table 2. This measure will provide an estimate of the intensity of human activity or the intensity of habitat degradation. The number of energy facilities and mining locations will be summed and divided by the area of meaningful geographic areas of interest to calculate density of these activities. Data sources for each threat are found in Table 6. Specific assumptions (inclusion criteria for data, width/area assumptions for point and line features, etc.) and methodology for each threat, and the combined measure, are detailed

below. All datasets will be updated annually to monitor broad- and mid-scale year-to-year changes and 5-year (or longer) trends in habitat degradation.

**Table 6.** Geospatial data sources for habitat degradation (Measure 2).

<b>Degradation Type</b>	<b>Subcategory</b>	<b>Data Source</b>	<b>Direct Area of Influence</b>	<b>Area Source</b>
<b>Energy (oil &amp; gas)</b>	Wells	IHS; BLM (AFMSS)	5.0ac (2.0ha)	BLM WO-300
	Power Plants	Platts (power plants)	5.0ac (2.0ha)	BLM WO-300
<b>Energy (coal)</b>	Mines	BLM; USFS; Office of Surface Mining Reclamation and Enforcement; USGS Mineral Resources Data System	Polygon area (digitized)	Esri/Google Imagery
	Power Plants	Platts (power plants)	Polygon area (digitized)	Esri Imagery
<b>Energy (wind)</b>	Wind Turbines	Federal Aviation Administration	3.0ac (1.2ha)	BLM WO-300
	Power Plants	Platts (power plants)	3.0ac (1.2ha)	BLM WO-300
<b>Energy (solar)</b>	Fields/Power Plants	Platts (power plants)	7.3ac (3.0ha)/MW	NREL
<b>Energy (geothermal)</b>	Wells	IHS	3.0ac (1.2ha)	BLM WO-300
	Power Plants	Platts (power plants)	Polygon area (digitized)	Esri Imagery
<b>Mining</b>	Locatable Developments	InfoMine	Polygon area (digitized)	Esri Imagery
<b>Infrastructure (roads)</b>	Surface Streets (Minor Roads)	Esri StreetMap Premium	40.7ft (12.4m)	USGS
	Major Roads	Esri StreetMap Premium	84.0ft (25.6m)	USGS
	Interstate Highways	Esri StreetMap Premium	240.2ft (73.2m)	USGS
<b>Infrastructure (railroads)</b>	Active Lines	Federal Railroad Administration	30.8ft (9.4m)	USGS
<b>Infrastructure (power lines)</b>	1-199kV Lines	Platts (transmission lines)	100ft (30.5m)	BLM WO-300
	200-399 kV Lines	Platts (transmission lines)	150ft (45.7m)	BLM WO-300
	400-699kV Lines	Platts (transmission lines)	200ft (61.0m)	BLM WO-300
	700+kV Lines	Platts (transmission lines)	250ft (76.2m)	BLM WO-300
<b>Infrastructure (communication)</b>	Towers	Federal Communications Commission	2.5ac (1.0ha)	BLM WO-300

**a. Energy and Mining Density Datasets and Assumptions**

***Energy (oil and gas wells and development facilities)***

(See Section I.B.2., Habitat Degradation Monitoring.)

***Energy (coal mines)***

(See Section I.B.2., Habitat Degradation Monitoring.)

***Energy (wind energy facilities)***

(See Section I.B.2., Habitat Degradation Monitoring.)

***Energy (solar energy facilities)***

(See Section I.B.2., Habitat Degradation Monitoring.)

***Energy (geothermal energy facilities)***

(See Section I.B.2., Habitat Degradation Monitoring.)

***Mining (active developments; locatable, leasable, saleable)***

(See Section I.B.2., Habitat Degradation Monitoring.)

**b. Energy and Mining Density Threat Combination and Calculation**

Datasets for energy and mining will be collected in two primary forms: point locations (e.g., wells) and polygon areas (e.g., surface coal mining). The following rule set will be used to calculate density for meaningful geographic areas of interest including standard grids and per polygon:

- 1) Point locations will be preserved; no additional points will be removed beyond the methodology described above. Energy facilities in close proximity (an oil well close to a wind tower) will be retained.
- 2) Polygons will not be merged, or features further dissolved. Thus, overlapping facilities will be retained, such that each individual threat will be a separate polygon data input for the density calculation.
- 3) The analysis unit (polygon or 640-acre section in a grid) will be the basis for counting the number of mining or energy facilities per unit area. Within the analysis unit, all point features will be summed, and any individual polygons will be counted as one (e.g., a coal mine will be counted as one facility within population). Where polygon features overlap multiple units (polygons or pixels), the facility will be counted as one in each unit where the polygon occurs (e.g., a polygon crossing multiple 640-acre

sections would be counted as one in each 640-acre section for a density per 640-acre-section calculation).

- 4) In methodologies with different-sized units (e.g., MZs, populations, etc.) raw facility counts will be converted to densities by dividing the raw facility counts by the total area of the unit. Typically this will be measured as facilities per 640 acres.
- 5) For uniform grids, raw facility counts will be reported. Typically this number will also be converted to facilities per 640 acres.
- 6) Reporting may include summaries beyond the simple ones above. Zonal statistics may be used to smooth smaller grids to help display and convey information about areas within meaningful geographic areas of interest that have high levels of energy and/or mining activity.
- 7) Additional statistics for each defined unit may also include adjusting the area to include only the area with the historical potential for sagebrush (BpS) or areas currently sagebrush (EVT).

Individual datasets and threat combination datasets for habitat degradation will be available through the BLM's EGIS web portal and geospatial gateway. Legacy datasets will be preserved so that trends may be calculated.

### **C. Population (Demographics) Monitoring**

State wildlife management agencies are responsible for monitoring sage-grouse populations within their respective states. WAFWA will coordinate this collection of annual population data by state agencies. These data will be made available to the BLM according to the terms of the forthcoming Greater Sage-Grouse Population Monitoring Memorandum of Understanding (MOU) (2014) between WAFWA and the BLM. The MOU outlines a process, timeline, and responsibilities for regular data sharing of sage-grouse population and/or habitat information for the purposes of implementing sage-grouse LUPs/amendments and subsequent effectiveness monitoring. Population areas were refined from the "Greater Sage-grouse (*Centrocercus urophasianus*) Conservation Objectives: Final Report" (COT 2013) by individual state wildlife agencies to create a consistent naming nomenclature for future data analyses. These population data will be used for analysis at the applicable scale to supplement habitat effectiveness monitoring of management actions and to inform the adaptive management responses.

### **D. Effectiveness Monitoring**

Effectiveness monitoring will provide the data needed to evaluate BLM and USFS actions toward reaching the objective of the national planning strategy (BLM IM 2012-044)—to conserve sage-grouse populations and their habitat—and the objectives for the land use planning

area. Effectiveness monitoring methods described here will encompass multiple larger scales, from areas as large as the WAFWA MZ to the scale of this LUP. Effectiveness data used for these larger-scale evaluations will include all lands in the area of interest, regardless of surface ownership/management, and will help inform where finer-scale evaluations are needed, such as population areas smaller than an LUP or PACs within an LUP (described in Section II, Fine and Site Scales). Data will also include the trend of disturbance within these areas of interest to inform the need to initiate adaptive management responses as described in the land use plan.

Effectiveness monitoring reported for these larger areas provides the context to conduct effectiveness monitoring at finer scales. This approach also helps focus scarce resources to areas experiencing habitat loss, degradation, or population declines, without excluding the possibility of concurrent, finer-scale evaluations as needed where habitat or population anomalies have been identified through some other means.

To determine the effectiveness of the sage-grouse national planning strategy, the BLM and the USFS will evaluate the answers to the following questions and prepare a broad- and mid-scale effectiveness report:

- 1) Sagebrush Availability and Condition:
  - a. What is the amount of sagebrush availability and the change in the amount and condition of sagebrush?
  - b. What is the existing amount of sagebrush on the landscape and the change in the amount relative to the pre-EuroAmerican historical distribution of sagebrush (BpS)?
  - c. What is the trend and condition of the indicators describing sagebrush characteristics important to sage-grouse?
- 2) Habitat Degradation and Intensity of Activities:
  - a. What is the amount of habitat degradation and the change in that amount?
  - b. What is the intensity of activities and the change in the intensity?
  - c. What is the amount of reclaimed energy-related degradation and the change in the amount?
- 3) What is the population estimation of sage-grouse and the change in the population estimation?
- 4) How are the BLM and the USFS contributing to changes in the amount of sagebrush?
- 5) How are the BLM and the USFS contributing to disturbance?

The compilation of broad- and mid-scale data (and population trends as available) into an effectiveness monitoring report will occur on a 5-year reporting schedule (see Attachment A), which may be accelerated to respond to critical emerging issues (in consultation with the USFWS and state wildlife agencies). In addition, effectiveness monitoring results will be used to identify emerging issues and research needs and inform the BLM and the USFS adaptive

management strategy (see the adaptive management section of this Environmental Impact Statement).

To determine the effectiveness of the sage-grouse objectives of the land use plan, the BLM and the USFS will evaluate the answers to the following questions and prepare a plan effectiveness report:

- 1) Is this plan meeting the sage-grouse habitat objectives?
- 2) Are sage-grouse areas within the LUP meeting, or making progress toward meeting, land health standards, including the Special Status Species/wildlife habitat standard?
- 3) Is the plan meeting the disturbance objective(s) within sage-grouse areas?
- 4) Are the sage-grouse populations within this plan boundary and within the sage-grouse areas increasing, stable, or declining?

The effectiveness monitoring report for this LUP will occur on a 5-year reporting schedule (see Attachment A) or more often if habitat or population anomalies indicate the need for an evaluation to facilitate adaptive management or respond to critical emerging issues. Data will be made available through the BLM's EGIS web portal and the geospatial gateway.

### **Methods**

At the broad and mid scales (PACs and above) the BLM and the USFS will summarize the vegetation, disturbance, and (when available) population data. Although the analysis will try to summarize results for PACs within each sage-grouse population, some populations may be too small to report the metrics appropriately and may need to be combined to provide an estimate with an acceptable level of accuracy. Otherwise, they will be flagged for more intensive monitoring by the appropriate landowner or agency. The BLM and the USFS will then analyze monitoring data to detect the trend in the amount of sagebrush; the condition of the vegetation in the sage-grouse areas (MacKinnon et al. 2011); the trend in the amount of disturbance; the change in disturbed areas owing to successful restoration; and the amount of new disturbance the BLM and/or the USFS has permitted. These data could be supplemented with population data (when available) to inform an understanding of the correlation between habitat and PACs within a population. This overall effectiveness evaluation must consider the lag effect response of populations to habitat changes (Garton et al. 2011).

*Calculating Question 1, National Planning Strategy Effectiveness:* The amount of sagebrush available in the large area of interest will use the information from Measure 1a (I.B.1., Sagebrush Availability) and calculate the change from the 2012 baseline to the end date of the reporting period. To calculate the change in the amount of sagebrush on the landscape to compare with the historical areas with potential to support sagebrush, the information from Measure 1b (I.B.1., Sagebrush Availability) will be used. To calculate the trend in the condition of sagebrush at the mid scale, three sources of data will be used: the BLM's Grass/Shrub mapping effort (Future Plans in Section I.B.1., Sagebrush Availability); the results from the calculation of the landscape

indicators, such as patch size (described below); and the BLM's Landscape Monitoring Framework (LMF) and sage-grouse intensification effort (also described below). The LMF and sage-grouse intensification effort data are collected in a statistical sampling framework that allows calculation of indicator values at multiple scales.

Beyond the importance of sagebrush availability to sage-grouse, the mix of sagebrush patches on the landscape at the broad and mid scale provides the life requisite of space for sage-grouse dispersal needs (see the HAF). The configuration of sagebrush habitat patches and the land cover or land use between the habitat patches at the broad and mid scales also defines suitability. There are three significant habitat indicators that influence habitat use, dispersal, and movement across populations: the size and number of habitat patches, the connectivity of habitat patches (linkage areas), and habitat fragmentation (scope of unsuitable and non-habitats between habitat patches). The most appropriate commercial software to measure patch dynamics, connectivity, and fragmentation at the broad and mid scales will be used, along with the same data layers derived for sagebrush availability.

The BLM initiated the LMF in 2011 in cooperation with the Natural Resources Conservation Service (NRCS). The objective of the LMF effort is to provide unbiased estimates of vegetation and soil condition and trend using a statistically balanced sample design across BLM lands. Recognizing that sage-grouse populations are more resilient where the sagebrush plant community has certain characteristics unique to a particular life stage of sage-grouse (Knick and Connelly 2011, Stiver et al. *in press*), a group of sage-grouse habitat and sagebrush plant community subject matter experts identified those vegetation indicators collected at LMF sampling points that inform sage-grouse habitat needs. The experts represented the Agricultural Research Service, BLM, NRCS, USFWS, WAFWA, state wildlife agencies, and academia. The common indicators identified include: species composition, foliar cover, height of the tallest sagebrush and herbaceous plant, intercanopy gap, percent of invasive species, sagebrush shape, and bare ground. To increase the precision of estimates of sagebrush conditions within the range of sage-grouse, additional plot locations in occupied sage-grouse habitat (Sage-Grouse Intensification) were added in 2013. The common indicators are also collected on sampling locations in the NRCS National Resources Inventory Rangeland Resource Assessment (<http://www.nrcs.usda.gov/wps/portal/nrcs/detail/national/technical/nra/nri/?&cid=stelprdb1041620>).

The sage-grouse intensification baseline data will be collected over a 5-year period, and an annual sage-grouse intensification report will be prepared describing the status of the indicators. Beginning in year 6, the annual status report will be accompanied with a trend report, which will be available on an annual basis thereafter, contingent on continuation of the current monitoring budget. This information, in combination with the Grass/Shrub mapping information, the mid-scale habitat suitability indicator measures, and the sagebrush availability information will be used to answer Question 1 of the National Planning Strategy Effectiveness Report.

*Calculating Question 2, National Planning Strategy Effectiveness:* Evaluations of the amount of habitat degradation and the intensity of the activities in the area of interest will use the information from Measure 2 (Section I.B.2., Habitat Degradation Monitoring) and Measure 3 (Section I.B.3., Energy and Mining Density). The field office will collect data on the amount of reclaimed energy-related degradation on plugged and abandoned and oil/gas well sites. The data are expected to demonstrate that the reclaimed sites have yet to meet the habitat restoration objectives for sage-grouse habitat. This information, in combination with the amount of habitat degradation, will be used to answer Question 2 of the National Planning Strategy Effectiveness Report.

*Calculating Question 3, National Planning Strategy Effectiveness:* The change in sage-grouse estimated populations will be calculated from data provided by the state wildlife agencies, when available. This population data (Section I.C., Population [Demographics] Monitoring) will be used to answer Question 3 of the National Planning Strategy Effectiveness Report.

*Calculating Question 4, National Planning Strategy Effectiveness:* The estimated contribution by the BLM or the USFS to the change in the amount of sagebrush in the area of interest will use the information from Measure 1a (Section I.B.1., Sagebrush Availability). This measure is derived from the national datasets that remove sagebrush (Table 3). To determine the relative contribution of BLM and USFS management, the current Surface Management Agency geospatial data layer will be used to differentiate the amount of change for each management agency for this measure in the geographic areas of interest. This information will be used to answer Question 4 of the National Planning Strategy Effectiveness Report.

*Calculating Question 5, National Planning Strategy Effectiveness:* The estimated contribution by the BLM or the USFS to the change in the amount of disturbance in the area of interest will use the information from Measure 2a (Section I.B.2., Monitoring Habitat Degradation) and Measure 3 (Section I.B.3., Energy and Mining Density). These measures are all derived from the national disturbance datasets that degrade habitat (Table 6). To determine the relative contribution of BLM and USFS management, the current Surface Management Agency geospatial data layer will be used to differentiate the amount of change for each management agency for these two measures in the geographic areas of interest. This information will be used to answer Question 5 of the National Planning Strategy Effectiveness Report.

Answers to the five questions for determining the effectiveness of the national planning strategy will identify areas that appear to be meeting the objectives of the strategy and will facilitate identification of population areas for more detailed analysis. Conceptually, if the broad-scale monitoring identifies increasing sagebrush availability and improving vegetation conditions, decreasing disturbance, and a stable or increasing population for the area of interest, there is evidence that the objectives of the national planning strategy to maintain populations and their habitats have been met. Conversely, where information indicates that sagebrush is decreasing and vegetation conditions are degrading, disturbance in sage-grouse areas is increasing, and/or

populations are declining relative to the baseline, there is evidence that the objectives of the national planning strategy are not being achieved. Such a determination would likely result in a more detailed analysis and could be the basis for implementing more restrictive adaptive management measures.

With respect to the land use plan area, the BLM and the USFS will summarize the vegetation, disturbance, and population data to determine if the LUP is meeting the plan objectives. Effectiveness information used for these evaluations includes BLM/USFS surface management areas and will help inform where finer-scale evaluations are needed, such as seasonal habitats, corridors, or linkage areas. Data will also include the trend of disturbance within the sage-grouse areas, which will inform the need to initiate adaptive management responses as described in the land use plan.

*Calculating Question 1, Land Use Plan Effectiveness:* The condition of vegetation and the allotments meeting land health standards (as articulated in “BLM Handbook 4180-1, Rangeland Health Standards”) in sage-grouse areas will be used to determine the LUP’s effectiveness in meeting the vegetation objectives for sage-grouse habitat set forth in the plan. The field office/ranger district will be responsible for collecting this data. In order for this data to be consistent and comparable, common indicators, consistent methods, and an unbiased sampling framework will be implemented following the principles in the BLM’s AIM strategy (Taylor et al. 2014; Toevs et al. 2011; MacKinnon et al. 2011), in the BLM’s Technical Reference “Interpreting Indicators of Rangeland Health” (Pellant et al. 2005), and in the HAF (Stiver et al. *in press*) or other approved WAFWA MZ-consistent guidance to measure and monitor sage-grouse habitats. This information will be used to answer Question 1 of the Land Use Plan Effectiveness Report.

*Calculating Question 2, Land Use Plan Effectiveness:* Sage-grouse areas within the LUP that are achieving land health stands (or, if trend data are available, that are making progress toward achieving them)—particularly the Special Status Species/wildlife habitat land health standard—will be used to determine the LUP’s effectiveness in achieving the habitat objectives set forth in the plan. Field offices will follow directions in “BLM Handbook 4180-1, Rangeland Health Standards,” to ascertain if sage-grouse areas are achieving or making progress toward achieving land health standards. One of the recommended criteria for evaluating this land health standard is the HAF indicators.

*Calculating Question 3, Land Use Plan Effectiveness:* The amount of habitat disturbance in sage-grouse areas identified in this LUP will be used to determine the LUP’s effectiveness in meeting the plan’s disturbance objectives. National datasets can be used to calculate the amount of disturbance, but field office data will likely increase the accuracy of this estimate. This information will be used to answer Question 3 of the Land Use Plan Effectiveness Report.

*Calculating Question 4, Land Use Plan Effectiveness:* The change in estimated sage-grouse populations will be calculated from data provided by the state wildlife agencies, when available, and will be used to determine LUP effectiveness. This population data (Section I.C., Population [Demographics] Monitoring) will be used to answer Question 4 of the Land Use Plan Effectiveness Report.

Results of the effectiveness monitoring process for the LUP will be used to inform the need for finer-scale investigations, initiate adaptive management actions as described in the land use plan, initiate causation determination, and/or determine if changes to management decisions are warranted. The measures used at the broad and mid scales will provide a suite of characteristics for evaluating the effectiveness of the adaptive management strategy.

## **II. FINE AND SITE SCALES**

Fine-scale (third-order) habitat selected by sage-grouse is described as the physical and geographic area within home ranges during breeding, summer, and winter periods. At this level, habitat suitability monitoring should address factors that affect sage-grouse use of, and movements between, seasonal use areas. The habitat monitoring at the fine and site scale (fourth order) should focus on indicators to describe seasonal home ranges for sage-grouse associated with a lek or lek group within a population or subpopulation area. Fine- and site-scale monitoring will inform LUP effectiveness monitoring (see Section I.D., Effectiveness Monitoring) and the hard and soft triggers identified in the LUP's adaptive management section.

Site-scale habitat selected by sage-grouse is described as the more detailed vegetation characteristics of seasonal habitats. Habitat suitability characteristics include canopy cover and height of sagebrush and the associated understory vegetation. They also include vegetation associated with riparian areas, wet meadows, and other mesic habitats adjacent to sagebrush that may support sage-grouse habitat needs during different stages in their annual cycle.

As described in the Conclusion (Section III), details and application of monitoring at the fine and site scales will be described in the implementation-level monitoring plan for the land use plan.

The need for fine- and site-scale-specific habitat monitoring will vary by area, depending on proposed projects, existing conditions, habitat variability, threats, and land health. Examples of fine- and site-scale monitoring include: habitat vegetation monitoring to assess current habitat conditions; monitoring and evaluation of the success of projects targeting sage-grouse habitat enhancement and/or restoration; and habitat disturbance monitoring to provide localized disturbance measures to inform proposed project review and potential mitigation for project impacts. Monitoring plans should incorporate the principles outlined in the BLM's AIM strategy (Toevs et al. 2011) and in "AIM-Monitoring: A Component of the Assessment, Inventory, and Monitoring Strategy" (Taylor et al. 2014). Approved monitoring methods are:

- “BLM Core Terrestrial Indicators and Methods” (MacKinnon et al. 2011);
- The BLM’s Technical Reference “Interpreting Indicators of Rangeland Health” (Pellant et al. 2005); and,
- “Sage-Grouse Habitat Assessment Framework: Multiscale Assessment Tool” (Stiver et al. *in press*).

Other state-specific disturbance tracking models include: the BLM’s Wyoming Density and Disturbance Calculation Tool (<http://ddct.wygisc.org/>) and the BLM’s White River Data Management System in development with the USGS. Population monitoring data (in cooperation with state wildlife agencies) should be included during evaluation of the effectiveness of actions taken at the fine and site scales.

Fine- and site-scale sage-grouse habitat suitability indicators for seasonal habitats are identified in the HAF. The HAF has incorporated the Connelly et al. (2000) sage-grouse guidelines as well as many of the core indicators in the AIM strategy (Toevs et al. 2011). There may be a need to develop adjustments to height and cover or other site suitability values described in the HAF; any such adjustments should be ecologically defensible. To foster consistency, however, adjustments to site suitability values at the local scale should be avoided unless there is strong, scientific justification for making those adjustments. That justification should be provided. WAFWA MZ adjustments must be supported by regional plant productivity and habitat data for the floristic province. If adjustments are made to the site-scale indicators, they must be made using data from the appropriate seasonal habitat designation (breeding/nesting, brood-rearing, winter) collected from sage-grouse studies found in the relevant area and peer-reviewed by the appropriate wildlife management agency(ies) and researchers.

When conducting land health assessments, the BLM should follow, at a minimum, “Interpreting Indicators of Rangeland Health” (Pellant et al. 2005) and the “BLM Core Terrestrial Indicators and Methods” (MacKinnon et al. 2011). For assessments being conducted in sage-grouse designated management areas, the BLM should collect additional data to inform the HAF indicators that have not been collected using the above methods. Implementation of the principles outlined in the AIM strategy will allow the data to be used to generate unbiased estimates of condition across the area of interest; facilitate consistent data collection and rollup analysis among management units; help provide consistent data to inform the classification and interpretation of imagery; and provide condition and trend of the indicators describing sagebrush characteristics important to sage-grouse habitat (see Section I.D., Effectiveness Monitoring).

### III. CONCLUSION

This Greater Sage-Grouse Monitoring Framework was developed for all of the Final Environmental Impact Statements involved in the sage-grouse planning effort. As such, it describes the monitoring activities at the broad and mid scales and provides a guide for the BLM and the USFS to collaborate with partners/other agencies to develop the land use plan- specific monitoring plan.

**Attachment A. An Overview of Monitoring Commitments**

	Broad and Mid Scales					Fine and Site Scales
	Implementation	Sagebrush Availability	Habitat Degradation	Population	Effectiveness	
<b>How will the data be used?</b>	Track and document implementation of land use plan decisions and inform adaptive management	Track changes in land cover (sagebrush) and inform adaptive management	Track changes in disturbance (threats) to sage-grouse habitat and inform adaptive management	Track trends in sage-grouse populations (and/or leks; as determined by state wildlife agencies) and inform adaptive management	Characterize the relationship among disturbance, implementation actions, and sagebrush metrics and inform adaptive management	Measure seasonal habitat, connectivity at the fine scale, and habitat conditions at the site scale, calculate disturbance, and inform adaptive management
<b>Who is collecting the data?</b>	BLM FO and USFS Forest	NOC and NIFC	National datasets (NOC), BLM FOs, and USFS Forests as applicable	State wildlife agencies through WAFWA	Comes from other broad- and mid-scale monitoring types, analyzed by the NOC	BLM FO and SO, USFS Forests and RO (with partners)
<b>How often are the data collected, reported, and made available to USFWS?</b>	Collected and reported annually; summary report every 5 years	Updated and changes reported annually; summary report every 5 years	Collected and changes reported annually; summary report every 5 years	State data reported annually per WAFWA MOU; summary report every 5 years	Collected and reported every 5 years (coincident with LUP evaluations)	Collection and trend analysis ongoing, reported every 5 years or as needed to inform adaptive management
<b>What is the spatial scale?</b>	Summarized by LUP with flexibility for reporting by other units	Summarized by PACs (size dependent) with flexibility for reporting by other units	Summarized by PACs (size dependent) with flexibility for reporting by other units	Summarized by PACs (size dependent) with flexibility for reporting by other units	Summarized by MZ and LUP with flexibility for reporting by other units (e.g., PAC)	Variable (e.g., projects and seasonal habitats)
<b>What are the potential personnel and budget impacts?</b>	Additional capacity or re-prioritization of ongoing monitoring work and budget realignment	At a minimum, current skills and capacity must be maintained; data management costs are TBD	At a minimum, current skills and capacity must be maintained; data layer purchase cost are TBD	No additional personnel or budget impacts for the BLM or the USFS	Additional capacity or re-prioritization of ongoing monitoring work and budget realignment	Additional capacity or re-prioritization of ongoing monitoring work and budget realignment

Mogollon Rim	66.7%	100.0%	1.7%
Death Valley Basin	0.0%	0.0%	1.2%

There are two anomalous map zones with 0% user and producer accuracies, attributable to no available reference data for the ecological systems of interest.

*User accuracy* is a map-based accuracy that is computed by looking at the reference data for a class and determining the percentage of correct predictions for these samples. For example, if I select any sagebrush pixel on the classified map, what is the probability that I'll be standing in a sagebrush stand when I visit that pixel location in the field? *Commission Error* equates to including a pixel in a class when it should have been excluded (i.e., commission error = 1 – user's accuracy).

*Producer accuracy* is a reference-based accuracy that is computed by looking at the predictions produced for a class and determining the percentage of correct predictions. In other words, if I know that a particular area is sagebrush (I've been out on the ground to check), what is the probability that the digital map will correctly identify that pixel as sagebrush? *Omission Error* equates to excluding a pixel that should have been included in the class (i.e., omission error = 1 – producer's accuracy).

## Key Habitat Map Update Process

Administrative Draft  
Cooperating Agency Review

This Page Intentionally Blank

Administrative Draft  
Cooperating Agency Review

## **Appendix F – Idaho Key Habitat Map Update Process and Provisions for Addressing GRSG documented in New Areas Outside Priority, Important and General Habitat Management Areas**

### **Modifications to Priority, Important and General Habitat Management Areas:**

The BLM and FS have worked closely with the State of Idaho and USFWS in using the best available science to delineate GRSG occupancy in Idaho to the extent possible, as reflected in the boundaries of the Priority, Important and General Habitat Management Areas (PHMA, IHMA, GHMA) identified in this Plan. These management areas will be reviewed and updated approximately every 5 years. Prior to a specific 5-year update, however, it is possible that due to progress toward conservation and habitat restoration, vegetation succession or new information arising from scientific studies or targeted surveys, additional areas of occupied GRSG habitat may be identified, occurring outside the three management areas. Such new areas of occupancy must be based on sound science (e.g., telemetry, formal habitat assessments documenting GRSG usage etc.) and represent an occupied seasonal habitat. They must not be based solely on random or occasional observations of GRSG. In these areas GRSG habitat on BLM and/or FS lands will be managed in accordance with Required Design Features, seasonal restrictions and/or BMPs deemed appropriate by BLM or FS for that area. During the 5-year map update, formal designation of these new areas as PHMA, IHMA or GHMA will be considered by BLM/FS in coordination with the State of Idaho and USFWS along with other recommendations for modification to existing PHMA, IHMA or GHMA areas.

### **Modifications to the Key Habitat Map:**

The Idaho GRSG Key habitat map displays several broad vegetation classes relevant to GRSG conservation and habitat restoration, that underlie and help inform the Priority, Important and General Habitat Management Areas. These vegetation classes include Key habitat, perennial grasslands, annual grasslands and conifer encroachment areas, and have been utilized in GRSG conservation in Idaho since 2000.

As directed in IM ID-2013-010, Idaho BLM annually updates the Key Habitat map. The purpose of this Instruction Memorandum (IM) is to request updates to the Idaho Sage-grouse Habitat Planning Map. The update is needed to reflect habitat changes resulting from wildfire, succession, and vegetation treatments that occurred or were observed since the last update. This update is also intended to capture additional edits recommended by the field offices, sage-grouse Local Working Groups (LWG), or agency partners in sage-grouse conservation.

**Factors to Consider During Edits:** The following factors are applicable to land of any ownership status for which the Bureau of Land Management (BLM) data are available, or for which data or other information are provided by non-BLM partners. If such new data are unavailable, or not provided by partners, retain the existing spatial data in the dataset:

1. Wildfires that have occurred in the most recent calendar year fire season on land administered by the BLM and on land not administered by the BLM.
2. Vegetation management projects that have been completed within key habitat or potential restoration areas of sage-grouse planning areas. This includes activities

such as burned area rehabilitation seeding projects, sagebrush thinning/reduction, conifer thinning/reduction, restoration of annual grasslands, new fuel breaks, etc. However, only consider those treatment areas completed and where a change in habitat classification has occurred (e.g., from annual grassland to perennial grassland; perennial grassland to key habitat, etc.). Areas planned for treatment or in the process of treatment (e.g., cheatgrass chemical treatment is completed, but seeding is pending) should not be included until an observed change in habitat category is achieved.

3. Changes in habitat status resulting from vegetation succession, such as perennial grasslands that have transitioned to key habitat due to increased sagebrush cover.
4. Habitat mapping errors or omissions that have been identified in the existing Idaho Sage-grouse Habitat Planning Map and other edits recommended by sage-grouse conservation partners, as appropriate. For this item, it is crucial that BLM field office biologists or an alternate staff specialist coordinate closely with their agency partners, especially the UFSFS and the Idaho Department of Fish and Game (IDFG), to actively solicit and resolve additional suggested edits that we may not be aware of. Those edits must also be incorporated into the respective BLM office's update submission. This is vital to ensure that the update is completed efficiently and as collaboratively as possible.
5. Since the Idaho Sage-grouse Habitat Planning Map is intended for use by all conservation partners in Idaho, it is important that we maintain a seamless coverage across land ownerships. In that regard, when editing, do not clip out BLM (or non-BLM land) on the basis of land ownership. Rather, make edits based on vegetation boundaries only, using the best available information and professional judgment. If you have uncertainties about accuracies for certain areas, document that in the metadata as appropriate.
6. Based on discussions during map updates in recent years, we will again use a 10.0 acre minimum polygon size for wildfires since data are readily available to that scale. For vegetation treatments, we will also use a minimum area of 10 acres. For sagebrush or other vegetation patches (e.g., key habitat, perennial grassland, annual grassland, conifer encroachment), delineate habitat to the extent you have data, recognizing that some offices may have more recent, finer resolution data than others.
7. Areas that have recently burned, for which the field has little or no information as to habitat status, should be classified as "recent burn." Efforts to document the general habitat status in these areas should be made the following field season if possible, in preparation for the next map update. The field may also attribute 2013 fires as perennial grassland or annual grassland, as appropriate.

8. Sage-grouse habitat polygon descriptions relevant to this IM include key habitat, perennial grassland, annual grassland, and conifer encroachment potential restoration areas.
  - o Key habitat includes areas of generally intact sagebrush that provide sage-grouse habitat during some portion of the year.
  - o Perennial grassland can be reclassified as key habitat once average sagebrush canopy cover is at least 10 percent.
  - o Annual grassland areas may be reclassified as perennial grassland once a restoration, fuels treatment or related project, such as an Emergency Stabilization and Rehabilitation (ES&R) seeding, is considered successful (i.e., seeded perennial species have successfully established).
  - o Conifer encroachment areas may be reclassified as key habitat following treatment of conifers if sagebrush cover is at least 10 percent and there is a perennial understory. They can also be reclassified as perennial grasslands if native perennial herbaceous species are dominant or if an associated restoration seeding is successful.
9. Field offices must ensure that original project-level data utilized in this update, including Global Positioning System data files, spatial, tabular and metadata associated with specific vegetation treatments, restoration projects, ES&R projects, etc., are archived at the field level and readily accessible in the event of future data calls.

## Anthropogenic Disturbance And Adaptive Management

Administrative Draft  
Cooperating Agency Review

This Page Intentionally Blank

Administrative Draft  
Cooperating Agency Review

## Appendix G – Anthropogenic Disturbance and Adaptive Management

### Part I – Baseline Map and Description of Development

The **biologically significant units (BSUs)** are geographical/spatial areas within Greater Sage-grouse habitat that contains relevant and important habitats which is used as the basis for comparative calculations to support evaluation of changes to habitat. The BSUs include all land ownerships for evaluation, although application of the anthropogenic disturbance cap is specific only to BLM and Forest Service lands. The BSUs are used in the evaluation of anthropogenic disturbance and in the adaptive management habitat trigger.

For the Idaho and Southwestern Montana Greater Sage-Grouse Plan Amendment EIS the biologically significant units are defined as:

***Idaho: All of the modeled nesting<sup>1</sup> and delineated winter habitat, which is based on 2011 data, occurring within Priority and/or Important Habitat Management Areas within individual Conservation Areas<sup>2</sup>***

***Montana: All of the Priority Habitat Management Area***

These BSUs form the geographic basis for the calculation of anthropogenic disturbance and in the soft and hard adaptive management habitat triggers.

While the BSUs define the geographic extent and scale of the Subregion's landscape that will be considered in evaluating anthropogenic disturbance and the adaptive management habitat triggers, how disturbance and habitat triggers are calculated differ since anthropogenic disturbance and habitat loss affect Greater Sage-grouse differently (Knick et al. 2013).

The BSU is the total area (acreage) of nesting and wintering habitat within Priority or Important Habitat Management Areas, separately, by each Conservation Area. For Idaho this results in 8 BSUs, 2 each within the Idaho Conservation Areas – 1 in Priority Habitat Management Areas and 1 in Important Habitat Management Areas. There is 1 BSU in southwest Montana and 1 BSU for the Utah portion of the Sawtooth National Forest (Raft River BSU). There are a total of 10 BSUs within the Idaho and Southwestern Montana Subregion as shown in Map-G-1.

In developing these BSUs it was determined at the subregional level that data from these units must be compatible with aggregation to the PAC and WAFWA Management Zone levels, in order to meet FWS needs. In addition, BSUs must be edge matched/aligned with neighboring states. All sub-regions acknowledge there may be locally important biologically significant units smaller than PACs which may or may not be rolled up to PAC level. The Subregions also

<sup>1</sup> Modeled nesting habitat is defined as those areas of Priority or Important Habitat Management Areas within 6.2 miles of 2011 active leks.

<sup>2</sup> The Utah portion of the Sawtooth National Forest is calculated separately for the Southern Conservation area.

acknowledge that assessing disturbance at larger scales such as certain PACs, or via rollup of data, provides a baseline metric for future comparison, but dilution may likely mask disturbance concerns occurring at more local scales.

The application of these calculations requires certain assumptions and associated baseline values which set an appropriate benchmark for future comparison.

For the adaptive management evaluation in Idaho the baseline year for comparison of both the population and habitat values is set at 2011. Sage-grouse have been monitored by counting males on leks since the 1950's (IDFG files). Average male lek attendance (statewide average) reached a low point in 1996 (IDFG in file). A more consistent and intensified survey of leks began with the annual monitoring of all 78 lek routes across southern Idaho in 1996. Average male lek attendance has fluctuated since 1996 (Figure G-1) in response to favorable or unfavorable conditions (e.g. weather, habitat improvements or loss, and West Nile virus). Peaks were in 2000, 2006, and 2011 with low points in 2002 and 2009. The increase in male lek attendance after previous declines indicates that sage-grouse populations can rebound over a relatively short time frame (e.g. 5 years) given desirable conditions. The baseline was set at 2011 because the average number of males is approximately the medium (8 higher and 7 lower years) of the counts between 1996-2011. At the statewide scale, the 2011 baseline allows 10% and 20% population triggers to be above the second lowest point in 2009. Application of the trigger at a smaller (Conservation Area) scale is a more conservative approach that will indicate potential trends sooner than if applied at the state-wide scale.

Figure G-1. Idaho Trend in Male Sage-grouse Lek Attendance.

## Part II – Anthropogenic Disturbance Calculation

In the USFWS's 2010 listing decision for sage-grouse, the USFWS identified 18 threats contributing to the destruction, modification, or curtailment of the sage-grouse's habitat or range (75 FR 13910 2010). The 18 threats have been aggregated into three measures:

- Sagebrush Availability (percent of sagebrush per unit area)
- Habitat Degradation (percent of human activity per unit area)
- Density of Energy and Mining (facilities and locations per unit area)

Habitat Degradation and Density of Energy and Mining will be evaluated under the Disturbance Cap and Density Cap respectively and are further described in this appendix. The three measures, in conjunction with other information, will be considered during the NEPA process for projects authorized or undertaken by the BLM.

### Disturbance Cap:

This land use plan has incorporated a 3% disturbance cap within Greater Sage-Grouse (GRSG) Priority Habitat Management Areas (PHMAs) and the subsequent land use planning actions if the cap is met:

*For Idaho and Montana, if the 3 percent anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSG PHMA (or IHMA in Idaho) Habitat Management Areas in any given BSU, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the General Mining Law of 1872, as amended, valid existing rights, etc.) will be permitted by BLM within GRSG PHMAs and IHMAs in any given BSU until the disturbance has been reduced to less than the cap. As measured according to the Monitoring Framework (Appendix G) for the intermediate scale.*

*For Idaho, if the 3 percent disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area (Appendix G) in a PHMA (or IHMA in Idaho), then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain the area under the cap (subject to applicable laws and regulations, such as the General Mining Law of 1872, as amended, valid existing rights, etc.).*

*For Montana, if the 3 percent disturbance cap is exceeded on lands (regardless of land ownership) or if anthropogenic disturbance and habitat loss associated with conversion to agricultural tillage or fire exceed 5% within a project analysis area in PHMAs, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 Mining Law, valid existing rights, etc.) will be permitted by*

*Idaho and Southwestern Montana Greater Sage-Grouse Proposed LUPA/Final EIS*

June 2015

*BLM within PHMA in a project analysis area until the disturbance has been reduced to less than the cap. If the BLM determines that the State of Montana has adopted a GRSG Habitat Conservation Program that contains comparable components to those found in the State of Wyoming's Core Area Strategy including an all lands approach for calculating anthropogenic disturbances, a clear methodology for measuring the density of operations, and a fully operational Density Disturbance Calculation Tool, the 3% disturbance cap will be converted to a 5% cap for all sources of habitat alteration within a project analysis area.*

The disturbance cap applies to the PHMA within both the Biologically Significant Units (BSU) and at the project authorization scale. For the BSUs, west-wide habitat degradation (disturbance) data layers (Table 1) will be used at a minimum to calculate the amount of disturbance and to determine if the disturbance cap has been exceeded as the land use plans (LUP) are being implemented. Locally collected disturbance data will be used to determine if the disturbance cap has been exceeded for project authorizations, and may also be used to calculate the amount of disturbance in the BSUs.

Although locatable mine sites are included in the degradation calculation, mining activities under the 1872 mining law may not be subject to the 3% disturbance cap. Details about locatable mining activities will be fully disclosed and analyzed in the NEPA process to assess impacts to sage-grouse and their habitat as well as to BLM goals and objectives, and other BLM programs and activities.

Formulas for calculations of the amount of disturbance in the PHMA in a BSU and or in a proposed project area are as follows:

- For the BSUs:

$$\% \text{ Degradation Disturbance} = \frac{\text{(combined acres of the 12 degradation threats}^1\text{)}}{\text{(acres of all lands within the PHMAs in a BSU)}} \times 100.$$

- For the Project Analysis Area:

$$\% \text{ Degradation Disturbance} = \frac{\text{(combined acres of the 12 degradation threats}^1\text{ plus the 7 site scale threats}^2\text{)}}{\text{(acres of all lands within the PHMA in the project analysis area)}} \times 100.$$

<sup>1</sup> see Table 1. <sup>2</sup> see Table 2

The denominator in the disturbance calculation formula consists of all acres of lands classified as PHMA within the analysis area (BSU or project area). Areas that are not sage-grouse seasonal habitats, or are not currently supporting sagebrush cover (e.g., due to wildfire), are not excluded

from the acres of PHMA in the denominator of the formula. Information regarding sage-grouse seasonal habitats, sagebrush availability, and areas with the potential to support sage-grouse populations will be considered along with other local conditions that may affect sage-grouse during the analysis of the proposed project area.

Density Cap:

This land use plan has also incorporated a cap on the density of energy and mining facilities at an average of one facility per 640 acres in the PHMA in a project authorization area. If the disturbance density in the PHMA in a proposed project area is on average less than 1 facility per 640 acres, the analysis will proceed through the NEPA process incorporating mitigation measures into an alternative. If the disturbance density is greater than an average of 1 facility per 640 acres, the proposed project will either be deferred until the density of energy and mining facilities is less than the cap or co-located it into existing disturbed area (subject to applicable laws and regulations, such as the 1872 Mining Law, valid existing rights, etc.). Facilities included in the density calculation (Table 3) are:

- Energy (oil and gas wells and development facilities)
- Energy (coal mines)
- Energy (wind towers)
- Energy (solar fields)
- Energy (geothermal)
- Mining (active locatable, leasable, and saleable developments)

Project Analysis Area Method for Permitting Surface Disturbance Activities:

- Determine potentially affected occupied leks by placing a four mile boundary around the proposed area of physical disturbance related to the project. All occupied leks located within the four mile project boundary and within PHMA will be considered affected by the project.
- Next, place a four mile boundary around each of the affected occupied leks.
- The PHMA within the four mile lek boundary and the four mile project boundary creates the project analysis area for each individual project. If there are no occupied leks within the four-mile project boundary, the project analysis area will be that portion of the four-mile project boundary within the PHMA.
- Digitize all existing anthropogenic disturbances identified in Table 1 and the 7 additional features that are considered threats to sage-grouse (Table 2). Using 1 meter resolution NAIP imagery is recommended. Use existing local data if available.

- Calculate percent existing disturbance using the formula above. If existing disturbance is less than 3%, proceed to next step. If existing disturbance is greater than 3%, defer the project.
- Add proposed project disturbance footprint area and recalculate the percent disturbance. If disturbance is less than 3%, proceed to next step. If disturbance is greater than 3%, defer project.
- Calculate the disturbance density of energy and mining facilities (listed above). If the disturbance density is less than 1 facility per 640 acres, averaged across project analysis area, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than 1 facility per 640 acres, averaged across the project analysis area, either defer the proposed project or co-locate it into existing disturbed area.
- If a project that would exceed the degradation cap or density cap cannot be deferred due to valid existing rights or other existing laws and regulations, fully disclose the local and regional impacts of the proposed action in the associated NEPA.

**Table 3.** Relationship between the 18 threats and the three habitat disturbance measures for monitoring and disturbance calculations.

USFWS Listing Decision Threat	Sagebrush Availability	Habitat Degradation	Energy and Mining Density
Agriculture	X		
Urbanization	X		
Wildfire	X		
Conifer encroachment	X		
Treatments	X		
Invasive Species	X		

Energy (oil and gas wells and development facilities)	X	X
Energy (coal mines)	X	X
Energy (wind towers)	X	X
Energy (solar fields)	X	X
Energy (geothermal)	X	X
Mining (active locatable, leasable, and saleable developments)	X	X
Infrastructure (roads)	X	
Infrastructure (railroads)	X	
Infrastructure (power lines)	X	
Infrastructure (communication towers)	X	
Infrastructure (other vertical structures)	X	
Other developed rights-of-way	X	

The following data sets would *not* be used to calculate anthropogenic disturbance, but would be used in the habitat baseline to estimate habitat availability or the amount of sagebrush on the landscape within biologically significant units.

1. Habitat treatments
2. Wildfire
3. Invasive plants
4. Conifer encroachment
5. Agriculture
6. Urbanization, Ex-urban and rural development

#### ***Travel and Transportation Disturbance in Sage-Grouse Habitat***

The following would count as disturbance (see Part V for definitions):

5 Linear transportation features identified as roads that have a maintenance intensity of 3 or

Linear transportation features identified as primitive roads, temporary routes, or administrative routes that have a functional classification and a maintenance intensity of level 3 or 5

Non-Disturbance

The following items would not count as disturbance:

Linear transportation features identified as trails.  
Linear transportation features identified as primitive roads, temporary routes, or administrative routes that have a maintenance intensity of either level 0 or 1.  
Linear transportation features identified as primitive routes.  
Linear disturbances.

### ***Derivation of the Disturbance Formula -***

There is no definitive and scientifically proven formula to determine impact to GRSG from disturbance described in current research. However, Knick et al. (2013) did describe certain relationships between GRSG and anthropogenic disturbance that have been used, in conjunction with specific assumptions to describe a mathematical relationship between human disturbance footprint, effective GRSG habitat and effects to GRSG.

The variables in the equation are defined as:

Acres of a Biologically Significant Unit (BSU)  
Acres of Anthropogenic Development within the BSU  
Acres of Effective GRSG Habitat (sagebrush) within the BSU

Knick et al. (2013) defined their unit of comparison (analogous to a biologically significant unit) as an area within 5 km of the lek. Within this area they also found that 79% of this area contained sagebrush (analogous to effective GRSG habitat). Results of the study show that “Ninety-nine percent of active leks were in landscapes with <3% developed”. This shows that when areas within 5 km of a lek containing 79% sagebrush were 3% developed there was a measurable effect on the presence of GRSG – this defines a disturbance threshold of 3% at which point GRSG are affected. Knick et al. developed a habitat similarity relationship between the proportion of leks and percent of sagebrush which shows the highest proportion of leks when sagebrush percentage is between 70-90% (Knick et al. 2013, Figure 5, Connelly et al. 2000, Wisdom et al. 2011). Above 90% and below 70% the proportion of leks is reduced. This helps define the optimum range for sagebrush at between 70-90% and also indicates that the disturbance threshold of 3% is also dependent upon and varies with the percent of sagebrush present (effective habitat).

These findings from Knick et al. (2013) help define some mathematical parameters to define a modeled relationship between disturbance, effective habitat and effects to GRSG. Figure G-2 illustrates three different ‘disturbance curves’ that reflect the relationship between disturbance (y-axis) and effective habitat (sagebrush percentage) (x-axis) when the footprint disturbed is equivalent to 3% of the area. The red boxes (A) represent the conceptual relationship between disturbance and effective habitat as described and interpreted from Knick et al. (2013). The blue diamonds (B) represent a simple calculation based only on disturbance footprint, without regard to effective habitat. The green triangles (C) represent the derived formula to model the relationship.

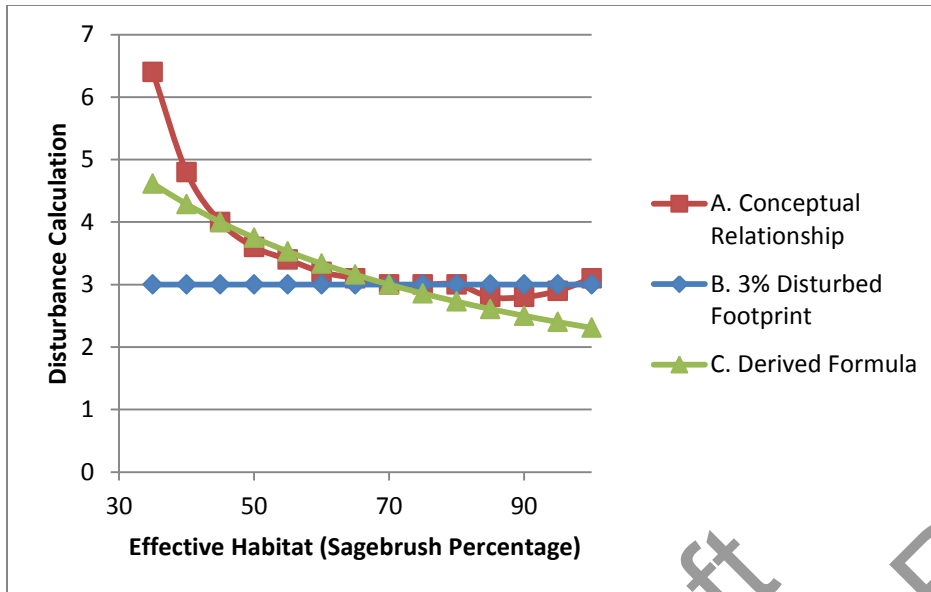

The 'A' disturbance curve shows that when the disturbance footprint is 3% of the area and the sagebrush percentage is between 70-90% the disturbance calculation would be 3. When sagebrush percent falls below 70% or rises above 90%, the change in habitat, even without a change in disturbed footprint would begin to affect the presence of GRSG. As the amount of sagebrush declines while disturbance remains the same there would be an increasing effect to GRSG presence. This disturbance curve is conceptual and Knick et al. (2013) does not explicitly define this relationship, although this relationship does reflect numerical the observations described in Knick et al. (2013).

The 'B' disturbance curve is a straight calculation based only on disturbed footprint over a specified area. It does not account for variability of sagebrush percentage, and the only variable is the acres of disturbance. For an area that is 3% disturbed the relationship 'curve' is a flat line at 3, regardless of sagebrush percentage. This 'curve' or calculation would match the conceptual curve when sagebrush percentage is between 70 and 90%. This calculation would not account for changes in effective habitat due to loss through fire or gain through restoration and rehabilitation. The 'C' disturbance curve models and approximates the conceptual relationship described in Knick et al. (2013). It accounts for changes in effective habitat that would translate into variable effects to GRSG based on loss or gain of habitat. It includes the ability to consider habitat loss such as from fire and to consider habitat gain such as from rehabilitation efforts including conifer removal. The model matched the conceptual relationship in the range of 70% sagebrush and approximates the conceptual relationship in areas with more or less sagebrush cover. The conceptual relationship assumes a more exponential relationship to GRSG effects from loss of habitat, while the derived formula assumes a more linear relationship. There are no available scientific studies that more clearly define the nature of the relationship. The derived formula and the conceptual relationship are substantially similar from 35-90% sagebrush percentage to validate the derived formula's relative approximation of the relationship.

Figure G-2. Disturbance Relationships

**Development of the Modeled Formula:**

In order to manage and apply a defined disturbance cap it is necessary to take the findings of the appropriate scientific research and utilize them as appropriately as possible to develop management strategies and evaluation techniques consistent with the management objective. Most scientific research is not completed with the intent to develop specific management objectives or approaches; however, it is through the management approaches that the scientific findings utilized to inform management.

Development of the modeled formula began by describing the simplest relationship of disturbance across a defined area by defining the disturbance percentage as:

$$\% \text{ Disturbance} = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}}{\text{Acres within Area of Concern}} \right) * 100$$

This accounts for disturbance, but does not account for changes in effective habitat or sagebrush percentage as described in Knick et al. (2013). To account for effective habitat the formula needs to include a term that adjusts the resulting calculation with regard to effective habitat. This should be reflected as an adjustment to the denominator (acres within area of concern). The denominator would be weighted based on the amount of effective habitat. In mathematical terms this would give a denominator of:

$$(\text{Acres within Area of Concern}) * (\text{Adjustment Based on Effective Habitat})$$

The adjustment term must equal 1.0 when the effective habitat is somewhere between 70-90% as described in Knick et al. (2013). Assuming the adjustment term is related to the relative percentage of sagebrush or effective habitat then the *Adjustment Based on Effective Habitat* could be expressed as:

*Acres of Effective Habitat within the Area of Concern*  
*Acres within the Area of Concern*

However, this term does not equal 1.0 when effective habitat is less than 100%. In order to meet the requirement of equaling 1.0 a constant must be added. This constant, when added to the percentage calculated in the previous term must equal 1.0 when the *Acres of Effective Habitat within the Area of Concern* is somewhere between 70-90%. In the Idaho and Southwestern Montana Subregional Plan an objective of 70% effective habitat has been defined, which is consistent with Knick et al. (2013). If the objective is 70% then the constant that must be added to this term is 0.3 in order to meet the requirement of equaling 1.0 at 70% effective habitat. This defines the following derived formula that approximates the conceptual relationship described in Knick et al. (2013).

*Disturbance Percentage*

$$= \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance within Area of Concern}}{\text{Acres within the Area of Concern} * \left( \frac{\text{Acres of Effective Habitat within the Area of Concern}}{\text{Acres within the Area of Concern}} + 0.3 \right)} \right) \times 100$$

**Scale:**

The particular scale for which this formula is calculated is defined by the Area of Concern. The Knick et al. (2013) used a study area defined by the area within 5 km of an individual lek. The disturbance relationships described previously are applicable at this scale and begin to break down or lose their integrity at greater distances from the lek (18 km). This concern, coupled with limited availability of consistent data across broader areas undermines the reliability and accuracy of the calculation when including areas more distant from the lek.

From a management perspective there is a need to address concerns at the broader scale to help manage those threats before they become a concern at the site specific scale. In Idaho, nesting location data collected by Idaho Department of Fish and Game (IDFG), shows that most nesting habitat occurs within 6.2 miles (10 km) of the lek. IDFG has also collected telemetry data on GRSG movements and used this data to help define wintering areas. Nesting and wintering areas are the most limited and seasonal habitats in Idaho and additional disturbance in those areas could have impacts to GRSG presence. For these reasons the Area of Concern, referred to as the Biologically Significant Unit have been delineated to include nesting and wintering habitats. This results in areas that include more acres than just those associated within a 5 km area of an individual lek as described by Knick et al. (2013), but that are associated (within 6.2 miles or 10 km) with leks. While the Knick et al. (2013) study did not include winter habitat, because of their relative importance they have also been included as part of the BSU since conceivably disturbances that would cause lek abandonment would also likely cause abandonment or avoidance of other seasonal habitat areas. Using other administratively defined areas not delineated or based on specific GRSG use may undermine the utility and integrity of the disturbance relationship and calculation.

This approach, built upon the findings in Knick et al. (2013), uses those findings to help inform management at a broader scale that would help determine management actions based on disturbance evaluations. Using the BSU as the Area of Concern is a scale larger than described in Knick et al. (2013), but still within the predictive bounds described in that study. The formula can be used to calculate disturbance at the BSU scale to help inform a disturbance cap, and it can also be used at the site or project scale to help inform specific project activities.

### **Additional Questions and Answers Regarding the Idaho Disturbance Calculation**

The measurement and application of a disturbance threshold with regard to a species using the various locations of the landscape for different parts of its life history is extremely complicated. The previous discussion is a description of the derivation of that calculation and application. What follows are specific responses to questions that have arisen based on the previous discussion. While all of the following answers are supported in the previous discussion they are not necessary described as explicitly there as they are below.

***Question: Why has Idaho BLM developed a calculation apart from the rest of the Great Basin planning areas when USFWS has been looking for a consistent approach to the extent possible?***

**Response:** The alternative included in the Draft EIS's describing the National Technical Team Report (Alternative B in the Idaho and Southwestern Montana DEIS) included a management action to apply a 3% disturbance cap. However, there was no description of how this would be applied, calculated or implemented in subsequent management. The Preferred Alternatives (D & E) did not include a disturbance cap since disturbance was not identified as a major concern causing loss of habitat in Idaho or Southwestern Montana and its measurement and applicability was not defined and deemed highly problematic to implement in a meaningful way. During the early 2014 Federal Family Meeting (FFM) USFWS indicated that inclusion of such a disturbance threshold was necessary in order for USFWS to have the assurance and certainty necessary when assessing GRSG listing. At that point, outside of Wyoming's Disturbance Density Calculation Tool there was no developed approach to measure or calculate disturbance to evaluate a disturbance cap against.

Idaho BLM invited Dr. Steve Knick to discuss his study regarding disturbance (the only known scientific research describing a disturbance cap). Also as a result of that FFM the BLM's NOC began working on developing a disturbance calculation process that was not as intensive as the Wyoming DDCT approach, based on BLM guidance that anthropogenic disturbance measurement would not follow that approach in other states due the intensive and workload associated with that approach would not be feasible to implement in other states.

Idaho BLM followed the provided guidance to develop biologically significant units (BSUs). The NOC developed 3 equations to try and relate disturbance and habitat. These equations were specifically applicable to broad scales but not applicable to site specific scales. Idaho BLM took the information and built a simple equation measuring and evaluating absolute disturbance to compare against the cap. That equation was defined as:

*Acres of Anthropogenic Disturbance within the BSU*  
*Acres within the BSU*

At the time of the August Federal Family Meeting the Idaho BLM had further refined the previous equation to more accurately reflect the findings in Knick's research. Disturbance was discussed at that meeting and it was evident that there was no other clear guidance from either the WO, the NOC or efforts from other states in this subject. Idaho was the only state to have put effort into the need identified by USFWS and the only effort to have a reasonable, scientifically based approach. Idaho did not intentionally deviate from consistent approaches being developed apart from the other Great Basin planning areas; and in fact until late 2014 Idaho is the only Great Basin planning effort to have put an approach together.

***Why is the Idaho calculation important or relevant given that an anthropogenic disturbance cap is not likely to be hit?***

***Response:*** Loss of habitat from anthropogenic disturbance is not a major issue in Idaho and Southwestern Montana; however, that does not mean that measurement and evaluation of a disturbance cap can be arbitrary, or any less supportable, or inconsistent with the scientific research available if that research can help inform the conditions and evaluation appropriately. That is why the Idaho disturbance calculation is defined consistent with the scientific research making it reflective of the known effects to GRSG and supportable to base management decisions upon.

***Is loss of habitat from fire considered in the Idaho calculation?***

***Response:*** The Idaho calculation does consider the effect fire has on the habitat and includes loss of habitat from fire as part of the calculation by weighting the denominator based on the actual habitat available to the GRSG. The rationale described is in direct reference to the original equation Idaho BLM used:

*Acres of Anthropogenic Disturbance within the BSU*  
*Acres within the BSU*

which does not account for changes in habitat due to loss through fire or gain through restoration. As stated previously Idaho's approach was not developed as a deviation or in comparison to other planning effort attempts at calculating the disturbance cap because such attempts did not yet exist when Idaho's approach was completed.

***Why does the Idaho calculation include two terms which seem to complicate the evaluation (the entire area of the BSU and the constant)?***

***Response:*** The two terms at issue here are precisely what make the equation relevant and scientifically accurate and supportable, they may make the calculation more complex but natural systems are complex and mathematical equations developed to describe those systems may be somewhat complex. That they are difficult to interpret does not invalidate their inclusion and

their value, in numerical description, which those terms contribute to describing a complex situation. The actual relationship described in Knick et al., when graphed would resemble:

This graph shows the conceptual relationship curve of anthropogenic disturbance suggested by Knick et al. In that research it was shown that when anthropogenic disturbance reached 3% within an area surrounding leks (5-18km) then lek attendance was impacted through fewer birds attending on leks. In the graph above the curve assumes that the area described has 3% of its acres under some sort of anthropogenic developed. According to Knick et al. when 70-80 percent of an area is effective habitat for GRSG then anthropogenic development totaling 3% of that area will start to reduce lek attendance. That research also shows that if the effective habitat percentage within that area is over 90% or less than 70% lek attendance is affected when less than 3% of the area contains anthropogenic development. This relationship would mathematically be described using a parabolic (as opposed to a linear) equation, making it a much more accurate reflection of a complex system but also making it even more complex and difficult to interpret. In addition, while Knick et al. suggests this relationship, and defines the effects at a 3% anthropogenic disturbance level in conjunction with 70-80% effective habitat. Knick et al., and we are aware of no other scientific studies, does not describe the trajectory of the curve above 80% or below 60%, so actually developing a more accurate, parabolic formula, is not possible at this time.

The Idaho equation is:

$$Disturbance\ Percentage = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance in the BSU}}{\text{Acres within the BSU} * \left( \frac{\text{Acres of Effective Habitat within the BSU}}{\text{Acres within the BSU}} + 0.3 \right)} \right) \times 100$$

This equation is meant to describe a spatially reality, for that reason it is imperative that the terms be linked with that spatially reality. Without this link any equation descriptive of a spatial reality would become meaningless to the reality it is trying to describe. The purpose of a disturbance cap and a supporting disturbance calculation is to measure and evaluate anthropogenic disturbance over a given area. For the purposes of application this area is defined as the biologically significant unit or BSU. For Idaho the BSU was delineated consistent with

*Idaho and Southwestern Montana Greater Sage-Grouse Proposed LUPA/Final EIS*

June 2015

BLM guidance and reflective of the Knick et al. research. Idaho's BSU are defined as: all of the modeled nesting and delineated winter habitat, which is based on 2011 data, occurring within Priority and/or Important Habitat Management Areas within individual Conservation Areas for all land ownerships. Modeled nesting habitat is defined as a 10 km area around leks. Based on Idaho Department of Fish and Wildlife surveys and monitoring information this area around leks encompasses a vast majority of the nesting habitat (i.e. IDFG data show that over 90% of nesting occurs within 10 km of the lek). This 10 km is within the 5-18 km range for which Knick et al. identified their research was applicable. Knick communicated to the Idaho ID Team that beyond 18 km the disturbance relationship to lek attendance described in his research was not discernable). The equation calculates a disturbance value within that BSU area by totaling the acres of disturbance within that area and dividing by that area appropriately adjusted by effective habitat within that area to reflect a higher impact of disturbance when effective habitat is lower than the low end of the 70-80% optimum range (This optimum range is also supported by Connelly et al. 2000 (80%) and the BLM's National Technical Team Report (70%)). The equation does not accurately depict the disturbance relationship when effective habitat is greater than 80%. This is due to the fact the equation is linear as opposed to parabolic (discussed earlier) and that the areas within Idaho of most concern for continued presence of GRSG and impacts from anthropogenic disturbance do not exceed 80% effective habitat. Areas of effective habitat greater than 80%, only occurs in the Mountain Valleys Conservation Area where existing disturbance is well below 2%. Therefore the applicability of the equation to these conditions is limited.

Anthropogenic disturbance is being measured and evaluated within the entire BSU, not just the effective habitat area, which is why it is important to define the denominator across the BSU scale, not just a portion of the BSU, which is where the spatial link becomes critical. How the denominator is described mathematically defines the scale over which the numerator is measured; changing that scale would also require adjustments to the numerator to be mathematically correct and maintain the spatial link critical for using a numeric equation to describe a spatial effect.

The presence of the constant (0.3) is a mathematical necessity that defines the relationship, it is neither irrelevant, nor is it a 'correction' factor. Correction implies there is something incorrect or erroneous in the equation. The effective habitat denominator adjustment term:

$$\left( \frac{\text{Acres of Effective Habitat within the BSU}}{\text{Acres within the BSU}} + 0.3 \right)$$

This entire term, in order to accurately reflect Knick et al. (see previous conceptual curve graph), must equal 1 when effective habitat within the BSU represents 70% of the BSU. Without the constant 0.3 added to the effective habitat proportion this term would not equal 1 when effective habitat is at 70%, it would not be a mathematical correct approximation of the disturbance relationship, it would lose its spatial link since this term needs to account for 100% of the acres in the BSU at the 70% habitat/3% disturbance intercept and would therefore become meaningless with respect to the spatial relationship that is being approximated.

***Does the Idaho equation allow for more disturbance before hitting the cap than other calculations?***

**Response:** This conclusion would need to be qualified based on the validity of the equation being used for comparison. For example an equation represented by the disturbance relationship expressed as:

$$\frac{\text{Acres of Disturbance}}{\text{Effective Habitat}}$$

This equation has the benefit of simplicity; however there are several fundamental flaws with this simple calculation which without further refinement to link the spatial reality with the mathematical formula make any comparisons invalid. This equation does not appropriately address: 1) spatial representation; 2) scale of the calculation; 3) consistency with known science; or 4) multiple considerations of single disturbances (i.e. double counting, which links back to the spatial representation aspect of the equation).

When using mathematical equations to describe real-world conditions it is imperative that the link between the spatial conditions and the mathematical representation of those conditions be understood and maintained. Otherwise any comparison does not have an appropriate foundation for comparison and is ultimately of limited, if any, use. To help illustrate this equation would more accurately be written:

$$\frac{(\text{Acres of Disturbance within Effective Habitat} + \text{Acres of Disturbance outside Effective Habitat})}{(\text{Acres of Concern (BSU)} - \text{Acres outside Effective Habitat})}$$

While more complicated, this equation is more accurate in depicting the actual formula used in a spatially representative way. This is further described when all the acres within the Area of Concern or BSU are Effective Habitat; Acres outside Effective Habitat would be zero, effectively eliminating that term and similarly Acres of Disturbance outside Effective Habitat would be zero since there are no acres outside Effective Habitat, therefore eliminating that term as well; leaving the original simplified version of this equation. However, when there are no Acres outside Effective Habitat within the Acres of Concern is the ONLY condition where this simplified equation actually represents and links to the real-world spatial conditions which are being described. So it is ONLY at this point (when the BSU contains 100% Effective Habitat) that the Idaho methodology and this simple equation can be appropriately compared. As described earlier the Idaho methodology (equation) does not accurately reflect the spatial conditions (according to Knick et al.) above 80% Effective Habitat (See previous discussion regarding why this is not a significant issue in need of resolution). Below 70% Effective Habitat where the Idaho methodology reflects the scientific relationships comparisons; the simple equation loses its spatial link and comparisons are not valid or appropriate.

***So why is the spatial link lost?***

**Response:** A key principle in translating spatial conditions to mathematical equations is, in this instance, each acre of either disturbance, within effective or outside effective habitat in the equation represents a real acre of disturbance, a real acre within effective habitat or a real acre

outside effective habitat. If there are acres outside Effective Habitat within the Area of Concern the more accurate equation described above shows that those acres are REMOVED through subtraction from the denominator. This changes the scale of the calculation effectively redefining the spatial extent over which the Acres of Disturbance appropriate to the new scale/denominator can be measured. So this equation redefines the spatial extent for comparison through removing acres from the denominator, while at the same time it includes acres of disturbance in the numerator. The spatial representation is lost when the same acres are both included in the numerator but removed from the denominator.

***Why is the Idaho calculation not applied more broadly, i.e. within other planning areas?***

***Response:*** Using Idaho's methodology in other states will be problematic because the site-specific data available in the Key Habitat Map needed to support Idaho's methodology are not readily available in other states. Idaho has collected, reviewed and updated on an annual basis for 12+ years a GRSG Key Habitat Map. This map tracks effective habitat, effects to that habitat from fire, restoration efforts and use by GRSG. This is the data utilized in the adjustment factor for the denominator and it is critical to the use of the equation, without this data actual meaningful application of the equation would not be possible or relevant.

***How is effective habitat defined?***

***Response:*** For Idaho's methodology effective habitat is taken to be the Key Habitat areas described by the Idaho Key Habitat Map. Key habitat includes areas of generally intact sagebrush that provide sage-grouse habitat during some portion of the year. This map also identifies areas that could provide GRSG habitat or currently provide habitat at less than optimum levels. These areas are also spatially depicted and as described as: R1 – perennial grass areas with limited sagebrush presence; R2 – annual grassland areas with limited perennial grasses or sagebrush presence; and R3- juniper encroachment within areas previously dominated by sagebrush.

**Example 1 – Anthropogenic Disturbance**

In the Southern Conservation Area the Priority BSU was delineated to include 784,958 acres and the Important BSU was delineated to include 1,036,455 acres, which represent the acres of the Biologically Significant Unit to be used in the denominator. The acres of Effective Habitat in the Priority BSU are 424,656 and in the Important BSU are 447,497. This sets up two equations – one for Priority Habitat Management Areas and one for Important Habitat Management Areas.

The existing footprint acres of disturbance within the Priority BSU are 17,661 acres and the footprint acres of disturbance within the Important BSU are 12,748 acres.

This gives the following two equations to define the baseline disturbance condition in the BSUs:

$$Priority = \frac{17661}{(784958 * ((\frac{424656}{784958}) + 0.3))} * 100$$

Or 
$$\left( \frac{17661}{784958 * ((0.54) + 0.3)} \right) * 100$$

Or 
$$\left( \frac{17661}{784958 * (0.84)} \right) * 100$$

Yielding a percent disturbance in the Priority BSU of 2.68%

$$Important = \frac{12748}{(1036455 * ((\frac{447497}{1036455}) + 0.3))} * 100$$

Yielding the percent disturbance in the Important BSU of 1.68%

If by 2015 we project additional development within the Priority BSU to be 2120 acres (a 12% increase) and development within the Important BSU to be 4000 acres (a 30% increase) then the Priority footprint acres becomes 20,161 acres and the Important footprint acres becomes 16,748 acres. The resulting evaluation for this cumulative disturbance is calculated by:

$$Priority = \frac{19781}{(784958 * ((\frac{424656}{784958}) + 0.3))} * 100 \quad Important = \frac{16748}{(1036455 * ((\frac{447497}{1036455}) + 0.3))} * 100$$

Yielding the percent disturbance as: Priority = 3.00% and Important = 2.21%

In the examples, given the existing disturbance footprint it would require development of an additional 2,120 acres in the Priority BSU and an additional 10,005 acres in the Important BSU before the 3% cap would be engaged.

### Part III – Montana Disturbance Calculation

Montana will use a 3% disturbance cap until the state of Montana strategy, similar to WY's Core Area Strategy that uses a 5% disturbance cap for all lands and all disturbances, is fully implemented. BLM MT will develop, and include in their plans, the conditions to be met prior to the change in the disturbance cap.

- I. Use of west-wide habitat degradation data as well as the use of locally collected disturbance data to determine the level of existing disturbance:
  - a) In the GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, use the west-wide data at a minimum and/or locally collected disturbance data as available (e.g., DDCT) for the anthropogenic disturbance types listed in Table 1.
- II. Use of locally collected disturbance data for project authorizations:
  - a) In a proposed project analysis area, digitize all existing anthropogenic disturbances identified in the GRSG Monitoring Framework and the 7 additional features that are considered threats to sage-grouse (Table 2). Using 1 meter resolution NAIP imagery is recommended. Use local data if available.
- III. Fire-burned and habitat treatment areas will not be included in the project scale degradation disturbance calculation for managing sage-grouse habitat under a disturbance cap. These areas will be considered part of a sagebrush availability when rangewide, consistent, interagency fine- and site-scale monitoring has been completed and the areas have been determined to meet sage-grouse habitat requirements. These and other disturbances identified in Table 3 will be part of a sagebrush availability evaluation and will be considered along with other local conditions that may affect sage-grouse during the analysis of the proposed project area.
- IV. Planning units are directed to use a density cap related to the density of energy and mining facilities (listed below) during project scale authorizations. If the disturbance density in a proposed project area is on average less than 1/ 640 acres, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than an average of 1/ 640 acres, either defer the proposed project or co-locate it into existing disturbed area (*subject to applicable laws and regulations, such as the 1872 Mining Law, valid existing rights, etc.*).
  - Energy (oil and gas wells and development facilities)
  - Energy (coal mines)
  - Energy (wind towers)
  - Energy (solar fields)
  - Energy (geothermal)
  - Mining (active locatable, leasable, and saleable developments)

- V. Planning units are directed to continue using the baseline data from the 2013 USGS Baseline Environmental Report (BER) in the Affected Environment section of the proposed plans/ FEISs. West-wide sagebrush availability and habitat degradation data layers will be used for the Priority Habitat Management Areas in each population for monitoring (see the GRSG Monitoring Framework in the Monitoring Appendix of the EIS) and management purposes as the LUPs are being implemented. The BER reported on individual threats across the range of sage-grouse while the west-wide disturbance calculation consolidated the anthropogenic disturbance data into a single measure using formulas from the GRSG Monitoring Framework. These calculations will be completed on an annual basis by the BLM's National Operation Center. Planning units will be provided the 2014 baseline disturbance calculation derived from the west-wide data once the RODs are signed that describe the Priority Habitat Management Areas.
- VI. Planning units are directed to use the three measures (sagebrush availability, habitat degradation, density of energy and mining) in conjunction with other information during the NEPA process to most effectively site project locations, such as by clustering disturbances and/or locating facilities in already disturbed areas. Although locatable mine sites are included in the degradation calculation, mining activities under the 1872 mining law may not be subject to the 3% disturbance cap. Details about locatable mining activities should be fully disclosed and analyzed in the NEPA process to assess impacts to sage-grouse and their habitat as well as to BLM goals and objectives, and other BLM programs and activities.

#### Additional Information/Formulas

Disturbance Calculations for the BSUs and for the Project Analysis Areas:

- For the BSUs: **% Degradation Disturbance = (combined acres of the 12 degradation threats\*) ÷ (acres of all lands within the PHMAs in a BSU) x 100.**
- For the Project Analysis Area: **% Degradation Disturbance = (combined acres of the 12 degradation threats<sup>1</sup> plus the 7 site scale threats<sup>2</sup>) ÷ (acres of all lands within the project analysis area in the PHMA) x 100.**

<sup>1</sup> see Table 3. <sup>2</sup> see Table 2

Project analysis area method for permitting surface disturbance activities:

- Determine potentially affected occupied leks by placing a four mile boundary around the proposed area of physical disturbance related to the project. All occupied leks located within the four mile project boundary and within PHMA will be considered affected by the project.
- Next, place a four mile boundary around each of the affected occupied leks.
- The PHMA within the four mile lek boundary and the four mile project boundary creates the project analysis area for each individual project. If there are no occupied leks within the four-mile project boundary, the project analysis area will be that portion of the four-mile project boundary within the Priority Habitat Management Area.
- Map disturbances or use locally available data. Use of NAIP imagery is recommended. In Wyoming, burned areas are included in this step.

- Calculate percent existing disturbance using the formula above. If existing disturbance is less than 3%, proceed to next step. If existing disturbance is greater than 3%, defer the project.
- Add proposed project disturbance footprint area and recalculate the percent disturbance. If disturbance is less than 3%, proceed to next step. If disturbance is greater than 3%, defer project.
- Calculate the disturbance density of energy and mining facilities (listed above). If the disturbance density is less than 1 facility per 640 acres, averaged across project analysis area, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than 1 facility per 640 acres, averaged across the project analysis area, either defer the proposed project or co-locate it into existing disturbed area.
- If a project that would exceed the degradation cap or density cap cannot be deferred due to valid existing rights or other existing laws and regulations, fully disclose the local and regional impacts of the proposed action in the associated NEPA.

**Background**

*Idaho and Southwestern Montana Greater Sage-Grouse Proposed LUPA/Final EIS*  
June 2015

In the USFWS's 2010 listing decision for sage-grouse, the USFWS identified 18 threats contributing to the destruction, modification, or curtailment of the sage-grouse's habitat or range (75 FR 13910 2010). In April 2014, the Interagency GRSG Disturbance and Monitoring Sub-Team finalized the Greater Sage-Grouse Monitoring Framework (hereafter, framework) to track these threats. The 18 threats have been aggregated into three measures to account for whether the threat predominantly removes sagebrush or degrades habitat. The three measures are:

- Measure 1: Sagebrush Availability (percent of sagebrush per unit area)
- Measure 2: Habitat Degradation (percent of human activity per unit area)
- Measure 3: Density of Energy and Mining (facilities and locations per unit area)

The BLM is committed to monitoring the three disturbance measures and reporting them to the FWS on an annual basis. However, for the purposes of calculating the amount of disturbance to provide information for management decisions and inform the success of the sage-grouse planning effort, the data depicting the location and extent of the 12 anthropogenic types of threats will be used at a minimum in the BSUs and those same 12 anthropogenic and the additional 7 types of features that are threats to sage-grouse will be used in the project analysis areas.

**ACRONYMS**

PHMA = Priority Habitat Management Area      BSU = Biologically Significant Unit  
EVT = Existing Vegetation Type                  BpS = Areas of Biotic Potential

<sup>1</sup> Only mines with a Plan of Operation (>5 acres of disturbance) will be included.

<sup>2</sup> Westwide data will be used only if state or local data are not available.

<sup>3</sup> This format was removed from the table. January 2015.

<sup>4</sup> This may be one of several variables used to inform Adaptive Management. The BSU is the scale at which Adaptive Management will be applied.

<sup>5</sup> A moving window analysis will be conducted at this scale by the NOC using westwide data. If available, state and local data/analysis should be used for Adaptive Management

<sup>6</sup> The project analysis area will be based on a 4-mile radius project boundary combined with a 4-mile lch boundary for lchs within the 4mi project boundary in PHMA (DDCT methodology).

<sup>7</sup> See Table 2

## Part IV - Adaptive Management

### Adaptive Management Habitat Trigger-

The specific formula for the change in habitat for the habitat trigger is defined by the following

Within Idaho and Utah all factors are measured within the modeled nesting and wintering habitat within Priority or Important Habitat Management Areas (calculated separately) by Conservation Area; in Southwest Montana all factors are measured within the Priority Habitat Management Area.

In simple description the adaptive management habitat trigger calculation is the percentage of Effective Habitat (defined as areas of generally intact sagebrush that provide Greater sage-grouse habitat during some portion of the year) within modeled nesting and wintering areas within Priority or Important Habitat Management Areas by Conservation Area within a particular year when compared to the Effective Habitat within modeled nesting and wintering areas within Priority or Important Habitat Management Areas by Conservation Area as of the 2011 baseline. Using Effective Habitat as the metric of comparison removes non-habitat acres from the calculation. The calculation is evaluated within both Priority and Important Habitat Management Areas separately within each of the 10 BSUs.

For purposes of evaluating the adaptive management habitat triggers, Effective Habitat in Idaho is tracked using the Key Habitat Map which is updated annually by BLM in coordination with IDFG, Forest Service, US FWS and Local Working Groups and tracks the areas of generally intact sagebrush providing Greater sage-grouse habitat during some portion of the year. Effective habitat equates to areas described as Key Habitat on the Key Habitat Map. Appendix F contains a description of the Key Habitat Map maintenance and update process including the inclusion of disturbances from fire and temporary disturbances and habitat restoration/rehabilitation.

Factors: EHP(Y) – where Y is the year and EHC is the acres of Effective Habitat for that year within the baseline 2011 nesting and wintering areas within the Priority Habitat Management Area by Conservation Area

EHI(Y) - where Y is the year and EHI is the acres of Effective Habitat for that year within the baseline 2011 nesting and wintering areas within the Important Habitat Management Area by Conservation Area

ADP(Y) – where Y is the year and AD is the acres of anthropogenic disturbance within Effective Habitat for that year within the 2011 nesting and wintering areas within the Priority Habitat Management Area by Conservation Area

ADI(Y) – where Y is the year and AD is the acres of anthropogenic disturbance within Effective Habitat for that year (Y) within the baseline 2011 nesting and wintering areas within the Important Habitat Management Area by Conservation Area

EHP(2011) – the Effective Habitat within the baseline 2011 nesting and wintering areas within the Priority Habitat Management Area by Conservation Area

EHI(2011) - the Effective Habitat within the baseline 2011 nesting and wintering areas within the Important Habitat Management Area by Conservation Area

ADP(2011) – the acres of anthropogenic disturbance within Effective Habitat within the baseline 2011 nesting and wintering areas within the Priority Habitat Management Area by Conservation Area

ADI(2011) – the acres of anthropogenic disturbance within Effective Habitat within the baseline 2011 nesting and wintering areas within the Important Habitat Management Area by Conservation Area

Formulas:

$$\text{Priority Habitat Management Area} = 100 - \left( \frac{EHP(Y) - ADP(Y)}{EHP(2011) - ADP(2011)} \right) * 100$$

$$\text{Important Habitat Management Area} = 100 - \left( \frac{EHI(Y) - ADI(Y)}{EHI(2011) - ADI(2011)} \right) * 100$$

When this calculation equals or exceeds 10 then an adaptive trigger has been engaged as per AM-7 & AM-8.

Tables 2-7 describe the acreages associated with the BSUs by Conservation Area for the Idaho and Southwestern Montana Subregion. The tables contain values for the entire BSU (Priority and Important), including all ownerships, acres of effective habitat within the BSUs and acres of anthropogenic disturbance within the BSUs.

These values will be used to provide several examples applying the anthropogenic disturbance and adaptive management habitat trigger evaluations. These are for illustrative purposes and do not represent an actual evaluation of ground conditions.

### **Example 2 – Adaptive Management – Habitat**

In the Southern Conservation Area the Priority BSU was delineated to include 784,958 acres, of which 424,656 acres were Effective habitat; therefore EHP(2011) is equal to 424,656 acres. Development within the Effective Habitat in 2011 was measured at 10,074 acres; therefore ADP(2011) is equal to 10,074 acres.

If in 2015 we project a cumulative loss of 42,000 Effective habitat acres due to wildfire (10% loss) and an additional 1000 acres of anthropogenic development (10% increase), then EHP(2015) is equal to 424,656 – 42,000 or 382,656 and ADP(2015) is equal to 10,074+1000 or 11,074. The evaluation for the adaptive management trigger is calculated by:

$$100 - \left( \frac{382656 - 11074}{424656 - 10074} \right) * 100$$

This simplifies to:  $100 - \left( \frac{371582}{414582} \right) * 100$

Or  $100 - (0.896 * 100)$

Or  $100 - 89.6$

Or  $10.4 - \text{equivalent to } 10.4\%$

This evaluation shows a loss of greater than 10 percent and less than 20 percent which would engage the soft habitat trigger as described in AM-8 and not the hard habitat trigger described in AM-7.

### **Soft Trigger Considerations and Implementation Actions**

The Sage-Grouse Implementation Task Force, in coordination with BLM and Forest Service would utilize monitoring information to assess when triggers have been tripped. When information indicates that the soft habitat or population trigger may have been tripped, a Sage-Grouse Implementation Task Force, in coordination with BLM and Forest Service - aided by the technical expertise of IDF&G - would assess the factor(s) leading to the decline and identify potential management actions. The Sage-Grouse Implementation Task Force may consider and recommend to BLM possible changes in management to the PHMA. As to the IHMA, the Sage-Grouse Implementation Team may review the causes for decline and potential management changes only to the extent those factors significantly impair the state's ability to meet the overall management objective. It is anticipated IDF&G will collect data annually and will make recommendations to the Implementation Team by August 31st for population triggers and January 15th for habitat triggers.

Only where the monitoring information indicates the cause(s) of the decline is not a primary threat will the Sage-Grouse Implementation Task Force would analyze the secondary threats to the species and determine whether further management actions are needed.

### **Adaptive Management Population Trigger**

#### **Framework**

#### **Population & Habitat Trigger Justification**

#### Triggers

Because unexpected events (e.g., wildfire, West Nile Virus) may result in a substantial loss of habitat or decline in sage-grouse populations, adaptive management triggers have been developed. These triggers are intended to improve sage-grouse population trends, protect the overall baseline population, preserve a buffer population, and conserve sage-grouse habitat.

The triggers have both population and habitat components. Population components consider population growth and change in lek size. The habitat component considers loss of breeding and/or winter habitat. Lek size has been related to population change in numerous studies (Connelly and Braun 1997, Connelly et al. 2004, Baumgart 2011, Garton et al. 2011). Garton et al. (2011) used both characteristics as well as number of active leks to assess change for sage-grouse populations throughout the west. A variety of researchers (Swensen et al. 1987, Connelly et al. 2000a, Miller et al. 2011) have shown that loss of winter or breeding habitats resulted in decreased sage-grouse populations. The adaptive management triggers set at a lambda value less than one, a 20% decline in males counted on lek routes, and a 20% loss of breeding or winter habitat as break points that would initiate a population or habitat trigger.

#### Population Growth (Finite Rate of Change)

Although populations cannot be accurately estimated, lek counts of males provide a robust method for assessing population trend and estimating population growth ( $\lambda$ ) in an unbiased fashion. Calculating  $\lambda$  (finite rate of change) between successive years for a sage-grouse population is described in Garton et al. (2011). The ratio of males counted in a pair of successive years estimates the finite rate of change ( $\lambda_t$ ) at each lek site in that one-year interval. These ratios can be combined across leks within a population for each year to estimate  $\lambda_t$  for the entire population (or Conservation Zone) or combined across all leks to estimate  $\lambda_t$  for the state between successive years as:

$$\lambda(t) = \frac{\sum_{i=1}^n M_i(t+1)}{\sum_{i=1}^n M_i(t)}$$

where  $M_i(t)$  = number of males counted at lek  $i$  in year  $t$ , across  $n$  leks counted in both years  $t$  and  $t+1$ . Ratio estimation under classic probability sampling designs—simple random, stratified, cluster, and probability proportional to size (PPS)—assumes the sample units (leks counted in two successive years in this case) are drawn according to some random process but the strict requirement to obtain unbiased estimates is that the ratios measured represent an unbiased sample of the ratios (i.e., finite rates of change) from the population or other area sampled. This assumption seems appropriate for leks and the possible tendency to detect (or count) larger leks than smaller leks does not bias the estimate of  $\lambda_t$  across a population or region (Garton et al. 2011), but makes it analogous to a PPS sample showing dramatically increased precision over simple random samples (Scheaffer et al. 1996). Also precision can be estimated for  $\lambda$ .

Because small game populations (including sage-grouse) typically fluctuate among years due to weather and other environmental variables, a  $\lambda_t$  for any given year is not very meaningful. However, a series of years where  $\lambda_t$  remains at or above 1.0 indicates a stable to increasing population. Moreover, this situation would also provide strong evidence of the effectiveness of conservation actions that may have been employed.

#### Definition of “Significance” for Hard Population Trigger:

The Governor’s Alternative (E) did not define criteria for “significantly less than 1.0”. For purposes of the Plan, IDFG proposes to use a 90% confidence interval around lambda over a three-year period. to evaluate whether  $\lambda$  is significantly less than 1.0. If the 90% confidence interval is less than and does not include 1.0, than  $\lambda$  is significantly less than 1.0. The  $\lambda$  and variance will be calculated following Garton et al. (2011). A 90% confidence interval is justified because:

1. Under a 90% confidence interval the probability of making a false conclusion is 10%, however, the error will be on the conservative side; i.e., the error would benefit the sage-grouse population.
2. The  $\lambda$  criteria would not be used alone; as stated in the ADPP,  $\lambda$  would be used in concert with trend in maximum number of males.

#### Males Counted on Leks

Lek attendance by males has been used as an indicator of population trend in some areas since at least the early 1950s. For many years it was the only indicator used to assess status of sage-grouse populations. However, recent research has shown that male attendance at leks can be affected by severity of the previous winter, weather, timing of counts during spring, and a variety of other factors (Emmons and Braun 1984, Hupp 1987, Baumgart 2011). Baumgart (2011) indicated the probability of male sage-grouse attending leks in south-central Idaho varied among years and appeared to be tied to winter severity. Although lek data provide a powerful data set for assessing population trends over time (Garton et al. 2011), counts for a single year may not reflect trends very well. Thus using lek counts as a trigger must consider the inherent variation in these counts. Moreover, males counted on leks appear to have the most value for assessing population change when used in conjunction with other indicators of population status (e.g., finite rate of change).

Emmons and Braun (1984) reported that lek attendance rates varied from 86% for yearling males to 92% for adult males. These rates were pooled over 5 day periods and may have overestimated attendance (Connelly et al. 2011). In contrast, Walsh et al. (2004) reported average daily male attendance rates of 42% (range = 7-85%) and 19% (range = 0-38%) for adult and yearling sage-grouse, respectively but these rates were not adjusted for detection rate and were likely biased low (Connelly et al. 2011). Moreover, this study involved very small sample sizes (17 adult males, 9 yearling males over 15 leks) and only one breeding season and it was not clear whether all leks in the study area were known and sampled. Preliminary data from Utah (D. Dahlgren, personal communication) indicated that in a study area about 30 miles south of Idaho male sage-grouse lek attendance rates varied from roughly 60% at the beginning of April to about 90% at the end of the month. Recent findings in Idaho (Baumgart 2011) predicted the probability of lek

attendance for an adult male following an “average” winter would range from 0.894 (SE = 0.025) on week 3 (~1 April) to 0.766 (SE = 0.040) on week 8 (~ 5 May). Published information suggests that a change in maximum number of males counted on leks of say 10-15% cannot confidently be considered a reflection of population status. However, a 20% decline in maximum number of males counted on leks would likely not be related to lek attendance patterns but instead would reflect a population decline. Thus, the trigger was set at 20%.

### Habitat Trigger

Numerous studies have documented the negative effects of habitat loss including fire and energy development on sage-grouse (Connelly et al. 2000b, Fischer et al. 1996, Nelle et al. 2000, Doherty et al. 2008), but few studies have related the amount of sagebrush habitat lost to population change. In a Montana study area with a non-migratory sage-grouse population, there was a 73% decline in breeding males after 16% of the study area was plowed (Swenson et al. 1987). Walker et al. (2007) indicated that the lowest probability for lek persistence within a landscape occurred where, within 6.4 km of a lek center, the area has < 30% sagebrush. Similarly, Wisdom et al. (2011) reported sage-grouse occupying landscapes with <27% sagebrush as dominant cover would have a low probability of persistence. Connelly et al. (2000a) showed that a fire in 1989 that removed 58% of the sagebrush cover in sage-grouse breeding and winter habitat led to an almost 95% decline in the breeding population a few years later. Similarly, a fire that removed about 30% of breeding/winter habitat resulted in substantial population declines over the next few years (J. W. Connelly, unpublished data; Table 1). A 30% loss of breeding and winter habitat is thus far the lowest amount of habitat loss for which a population response could be detected and landscapes with < 30% area in sagebrush within 6.4 km of lek center have the lowest probability of lek persistence. Idaho is taking a more conservative approach than suggested by the literature. A soft trigger is set at a 10% loss of breeding or winter habitat in Core or Important management zones of a Conservation Area, which initiates a review of the management approach. A hard trigger is set at a 20% loss of breeding or winter habitat within a Core Habitat Zone of a Conservation Area, which automatically causes a change in management status of the corresponding Important Habitat Zone.

Table 1. Nest success (%) in SE Idaho study areas before and after a fire in the Table Butte study area. The fire occurred in August 2000.

Year	Area	
	Table Butte	Upper Snake
1999	54	
2000	45	61
2001 <sup>a</sup>	18	56
2002	20	65

**Potential Implementation Level Actions to Consider in the Event Soft Trigger Criteria are Met**

- ✓ Increase monitoring and evaluation of sage-grouse populations in Priority Habitat Management Area (area of concern).
- ✓ Implement Priority Habitat Management Area management strategy in corresponding Important Habitat Management Area of the same Conservation Area.
- ✓ Implement Priority Habitat Management Area RDFs in corresponding Important Habitat Management Area of the same Conservation Area.
- ✓ Not allow any new (large) infrastructure development within the Priority Habitat Management Area (no exceptions allowed).
- ✓ Reallocate resources to focus on primary threats in the Priority Habitat Management Area (e.g. direct resources from other parts of the state to the area of concern).
- ✓ Reallocate resources to focus on secondary threats in the Priority Habitat Management Area (e.g. direct resources from other parts of the state to the area of concern).
- ✓ Apply Priority Habitat Management Area criteria for all primary threats, and/or all secondary threats to the Important Habitat Management Area.
- ✓ Reallocate resources to focus on primary threats in the Important Habitat Management Area (e.g. direct resources from other parts of the state to the area of concern).
- ✓ Reallocate resources to focus on secondary threats in the Important Habitat Management Area (e.g. direct resources from other parts of the state to the area of concern).

**Adaptive Grazing Management Response**

*Idaho and Southwestern Montana Greater Sage-Grouse Proposed LUPA/Final EIS*  
June 2015

Improperly managed livestock grazing generally affects seasonal sage-grouse habitat at the site level. Therefore, the specific issues contributing to tripping an adaptive management trigger would need to be defined. Generally, these might be nesting cover from perennial grasses in breeding/nesting habitat, condition and forb availability in brood rearing habitat, and possibly sagebrush cover in winter habitat.

BLM would focus resources to accelerate land health assessments and/or assessment of specific habitat metrics in the areas where deficiencies in site-level habitat metrics are suspected to be a causal factor in tripping a soft or hard trigger. If it is identified that one or more site-level habitat objectives is not being met due to livestock, and an imminent likelihood of resource damage may occur from continued grazing, decisions could be issued in accordance with 4110.3-3(b) to provide immediate protection of resources while a full review of the grazing allotments and grazing permits is conducted. BLM would then focus resources at the state level to accelerate the grazing permit renewal in the area where the trigger has been tripped in order to expedite progress towards meeting land health standards.

## **Part V - Travel and Transportation Management Definitions for Use in Anthropogenic Disturbance Calculation**

**Roads** are linear routes managed for use by low clearance vehicles having four or more wheels, and are maintained for regular and continuous use.

**Primitive Roads** are linear routes managed for use by four-wheel drive or high-clearance vehicles. They do not normally meet any design standards.

**Trails** are linear routes managed for human-powered, stock, or OHV forms of transportation or for historical or heritage values. Trails are not generally managed for use by four-wheel drive or high-clearance vehicles.

**Linear Disturbances** are human-made linear features that are not part of the designated transportation network are identified as "Transportation Linear Disturbances." These may include engineered (planned) as well as unplanned single and two-track linear features that are not part of the BLM's transportation system.

**Primitive Routes** are any transportation linear feature located within a WSA or lands with wilderness characteristics designated for protection by a land use plan and not meeting the wilderness inventory road definition.

**Temporary routes** are short-term overland roads, primitive roads or trails which are authorized or acquired for the development, construction or staging of a project or event that has a finite lifespan. Temporary routes are not intended to be part of the permanent or designated transportation network and must be reclaimed when their intended purpose(s) has been fulfilled. Temporary routes should be constructed to minimum standards necessary to accommodate the intended use; the intent is that the project proponent (or their representative) will reclaim the route once the original project purpose or need has been completed. Temporary routes are considered emergency, single use or permitted activity access. Unless they are specifically intended to accommodate public use, they should not be made available for that use. A temporary route will be authorized or acquired for the specific time period and duration specified in the written authorization (permit, ROW, lease, contract etc.) and will be scheduled and budgeted for reclamation to prevent further vehicle use and soil erosion from occurring by providing adequate drainage and re-vegetation.

**Administrative routes** are those that are limited to authorized users (typically motorized access). These are existing routes that lead to developments that have an administrative purpose, where the agency or permitted user must have access for regular maintenance or operation. These authorized developments could include such items as power lines, cabins, weather stations, communication sites, spring

### ***Maintenance Intensities***

#### **Level 0**

##### Maintenance Description:

Existing routes that will no longer be maintained and no longer be declared a route. Routes identified as Level 0 are identified for removal from the Transportation System entirely.

Maintenance Objectives:

- No planned annual maintenance.
- Meet identified environmental needs.
- No preventative maintenance or planned annual maintenance activities.

**Level 1**

Maintenance Description:

Routes where minimum (low intensity) maintenance is required to protect adjacent lands and resource values. These roads may be impassable for extended periods of time.

Maintenance Objectives:

- Low (Minimal) maintenance intensity.
- Emphasis is given to maintaining drainage and runoff patterns as needed to protect adjacent lands. Grading, brushing, or slide removal is not performed unless route bed drainage is being adversely affected, causing erosion.
- Meet identified resource management objectives.
- Perform maintenance as necessary to protect adjacent lands and resource values.
- No preventative maintenance.
- Planned maintenance activities limited to environmental and resource protection.
- Route surface and other physical features are not maintained for regular traffic.

**Level 3**

Maintenance Description:

Routes requiring moderate maintenance due to low volume use (for example, seasonally or year-round for commercial, recreational, or administrative access). Maintenance Intensities may not provide year-round access but are intended to generally provide resources appropriate to keep the route in use for the majority of the year.

Maintenance Objectives:

- Medium (Moderate) maintenance intensity.
- Drainage structures will be maintained as needed. Surface maintenance will be conducted to provide a reasonable level of riding comfort at prudent speeds for the route conditions and intended use. Brushing is conducted as needed to improve sight distance when appropriate for management uses. Landslides adversely affecting drainage receive high priority for removal; otherwise, they will be removed on a scheduled basis.
- Meet identified environmental needs.
- Generally maintained for year-round traffic.
- Perform annual maintenance necessary to protect adjacent lands and resource values.
- Perform preventative maintenance as required to generally keep the route in acceptable condition.
- Planned maintenance activities should include environmental and resource protection efforts, annual route surface.
- Route surface and other physical features are maintained for regular traffic.

## Level 5

### Maintenance Description:

Route for high (maximum) maintenance due to year-round needs, high volume of traffic, or significant use. Also may include route identified through management objectives as requiring high intensities of maintenance or to be maintained open on a year-round basis.

### Maintenance Objectives:

- High (Maximum) maintenance intensity.
- The entire route will be maintained at least annually. Problems will be repaired as discovered. These routes may be closed or have limited access due to weather conditions but are generally intended for year-round use.
- Meet identified environmental needs.
- Generally maintained for year-round traffic.
- Perform annual maintenance necessary to protect adjacent lands and resource values.
- Perform preventative maintenance as required to generally keep the route in acceptable condition.
- Planned maintenance activities should include environmental and resource protection efforts, annual route surface.
- Route surface and other physical features are maintained for regular traffic.

## Anthropogenic Disturbance Calculation

Administrative Draft  
Cooperating Agency Review

This Page Intentionally Blank

Administrative Draft  
Cooperating Agency Review

## Appendix H – Anthropogenic Disturbance Calculation

### Disturbance Density Calculation

#### GRSG Local/Site Disturbance Calculation

- **All sub-regions:** Agreed to use the same types of disturbances for fine/site scale monitoring as were used for broad and mid-scale analysis. Would use local data and/or more current satellite imagery if available. Recognize that site specific data, where available, provide a more accurate measure of land cover, disturbance and conifer encroachment than Landfire. In the long-term, ensure fine/site scale monitoring provides results that can be used across the GRSG range and “rolled up” for reporting purposes. In the short term (<5 years), locally derived vegetation data may not be available or easily rolled up, so use of seamless land cover data such as Sagestitch is recommended.

Great Basin sub-regions agreed to use the same type of data sets as used for broad and mid-scale to monitor local/site level conditions. Supplement with local data where available and/or more accurate. The following data layers or local surrogate would be used.

1. Energy (oil and gas wells and development facilities) Based on local info, actual footprint; see NOC language for certain exceptions.
2. Energy (coal mines) Actual footprint
3. Energy (wind towers) Based on local info, actual footprint
4. Energy (solar fields) Based on local info, actual footprint
5. Energy (geothermal) Based on local info, actual footprint
6. Mining (active developments; locatable, leasable, saleable) Based on local info, actual footprint
7. Infrastructure (roads) actual footprint; see road attachment for specific guidance
8. Infrastructure (railroads) abandoned railroads are NOT a disturbance
9. Infrastructure (power lines) Using NOC guidance, apply these widths:
  - <100 kV: use ROW width
  - 100-199kV: 100 ft
  - 200-399kV: 150 ft
  - 400-699kV: 200 ft
  - 700-799kV: 250 ft
10. Infrastructure (communication towers, fire lookouts, met towers) Based on local info, actual footprint
11. Other developed rights-of-ways

The National Monitoring Framework lists the data sets by threat. These are:

<b>FWS Listing Decision Threat</b>	<b>Sagebrush Habitat Availability</b>	<b>Habitat Degradation (Human Activities)</b>	<b>Density of Energy and Mining Facilities</b>
Agriculture	X		
Urbanization	X		
Wildfire	X		
Conifer encroachment	X		
Treatments	X*		
Invasive Species	X*		
Energy (oil and gas wells and development facilities)		X	X
Energy (coal mines)		X	X
Energy (wind towers)		X	X
Energy (solar fields)		X	X
Energy (geothermal)		X	X
Mining (active locatable, leasable, and salable developments)		X	X
Infrastructure (roads)		X	
Infrastructure (railroads)		X	
Infrastructure (power lines)		X	
Infrastructure (communication towers)		X	
Infrastructure (other vertical structures)		X	
Other developed rights of ways		X*	

The following data sets would **not** be used to calculate anthropogenic disturbance, but would be used in the habitat baseline to estimate habitat availability or the amount of sagebrush on the landscape within biologically significant units. Use best available data, where Landfire or Sagestitch could be used for biophysical setting (bps), compared to existing vegetation type.

1. Habitat treatments
2. Wildfire
3. Invasive plants
4. Conifer encroachment
5. Agriculture
6. Urbanization, Ex-urban and rural development

**Biologically Significant Unit:**

- Idaho proposes use of Priority and Important Habitat Management Areas that generally match PACs, but also anticipates assessing disturbance at other scales including nesting and winter habitat, 5 km lek neighborhood, Conservation Areas and/or at the project-scale, depending on need.
- For all subregions, data from these units would be rolled up to the PAC and WAFWA Management Zone, to meet FWS needs. In addition, units must be edge matched/aligned with neighboring states. All sub-regions acknowledge there may be locally important biologically significant units smaller than PACs which may or may not be rolled up to PAC level. The Subregions also acknowledge that assessing disturbance at larger scales such as certain PACs, or via rollup of data, provides a baseline metric for future comparison, but dilution may likely mask disturbance concerns occurring at more local scales.

***Travel and Transportation Disturbance in Sage-Grouse Habitat***

The following would count as disturbance:

- Linear transportation features identified as roads that have a maintenance intensity of 3 or 5
- Linear transportation features identified as primitive roads, temporary routes, or administrative routes that have a functional classification and a maintenance intensity of level 3 or 5

Non-Disturbance

The following items would not count as disturbance:

- Linear transportation features identified as trails.
- Linear transportation features identified as primitive roads, temporary routes, or administrative routes that have a maintenance intensity of either level 0 or 1.

Linear transportation features identified as primitive routes.  
Linear disturbances.

Administrative Draft  
Cooperating Agency Review

### ***Travel and Transportation Management Definitions***

**Roads** are linear routes managed for use by low clearance vehicles having four or more wheels, and are maintained for regular and continuous use.

**Primitive Roads** are linear routes managed for use by four-wheel drive or high-clearance vehicles. They do not normally meet any design standards.

**Trails** are linear routes managed for human-powered, stock, or OHV forms of transportation or for historical or heritage values. Trails are not generally managed for use by four-wheel drive or high-clearance vehicles.

**Linear Disturbances** are human-made linear features that are not part of the designated transportation network are identified as “Transportation Linear Disturbances.” These may include engineered (planned) as well as unplanned single and two-track linear features that are not part of the BLM’s transportation system.

**Primitive Routes** are any transportation linear feature located within a WSA or lands with wilderness characteristics designated for protection by a land use plan and not meeting the wilderness inventory road definition.

**Temporary routes** are short-term overland roads, primitive roads or trails which are authorized or acquired for the development, construction or staging of a project or event that has a finite lifespan. Temporary routes are not intended to be part of the permanent or designated transportation network and must be reclaimed when their intended purpose(s) has been fulfilled. Temporary routes should be constructed to minimum standards necessary to accommodate the intended use; the intent is that the project proponent (or their representative) will reclaim the route once the original project purpose or need has been completed. Temporary routes are considered emergency, single use or permitted activity access. Unless they are specifically intended to accommodate public use, they should not be made available for that use. A temporary route will be authorized or acquired for the specific time period and duration specified in the written authorization (permit, ROW, lease, contract etc.) and will be scheduled and budgeted for reclamation to prevent further vehicle use and soil erosion from occurring by providing adequate drainage and re-vegetation.

**Administrative routes** are those that are limited to authorized users (typically motorized access). These are existing routes that lead to developments that have an administrative purpose, where the agency or permitted user must have access for regular maintenance or operation. These authorized developments could include such items as power lines, cabins, weather stations, communication sites, spring

### ***Maintenance Intensities***

#### **Level 0**

##### Maintenance Description:

Existing routes that will no longer be maintained and no longer be declared a route. Routes identified as Level 0 are identified for removal from the Transportation System entirely.

Maintenance Objectives:

- No planned annual maintenance.
- Meet identified environmental needs.
- No preventative maintenance or planned annual maintenance activities.

**Level 1**

Maintenance Description:

Routes where minimum (low intensity) maintenance is required to protect adjacent lands and resource values. These roads may be impassable for extended periods of time.

Maintenance Objectives:

- Low (Minimal) maintenance intensity.
- Emphasis is given to maintaining drainage and runoff patterns as needed to protect adjacent lands. Grading, brushing, or slide removal is not performed unless route bed drainage is being adversely affected, causing erosion.
- Meet identified resource management objectives.
- Perform maintenance as necessary to protect adjacent lands and resource values.
- No preventative maintenance.
- Planned maintenance activities limited to environmental and resource protection.
- Route surface and other physical features are not maintained for regular traffic.

**Level 3**

Maintenance Description:

Routes requiring moderate maintenance due to low volume use (for example, seasonally or year-round for commercial, recreational, or administrative access). Maintenance Intensities may not provide year-round access but are intended to generally provide resources appropriate to keep the route in use for the majority of the year.

Maintenance Objectives:

- Medium (Moderate) maintenance intensity.
- Drainage structures will be maintained as needed. Surface maintenance will be conducted to provide a reasonable level of riding comfort at prudent speeds for the route conditions and intended use. Brushing is conducted as needed to improve sight distance when appropriate for management uses. Landslides adversely affecting drainage receive high priority for removal; otherwise, they will be removed on a scheduled basis.
- Meet identified environmental needs.
- Generally maintained for year-round traffic.
- Perform annual maintenance necessary to protect adjacent lands and resource values.
- Perform preventative maintenance as required to generally keep the route in acceptable condition.
- Planned maintenance activities should include environmental and resource protection efforts, annual route surface.
- Route surface and other physical features are maintained for regular traffic.

## Level 5

### Maintenance Description:

Route for high (maximum) maintenance due to year-round needs, high volume of traffic, or significant use. Also may include route identified through management objectives as requiring high intensities of maintenance or to be maintained open on a year-round basis.

### Maintenance Objectives:

- High (Maximum) maintenance intensity.
- The entire route will be maintained at least annually. Problems will be repaired as discovered. These routes may be closed or have limited access due to weather conditions but are generally intended for year-round use.
- Meet identified environmental needs.
- Generally maintained for year-round traffic.
- Perform annual maintenance necessary to protect adjacent lands and resource values.
- Perform preventative maintenance as required to generally keep the route in acceptable condition.
- Planned maintenance activities should include environmental and resource protection efforts, annual route surface.
- Route surface and other physical features are maintained for regular traffic.

# Appendix I

## Montana Action Screen and Mitigation Process

Administrative Draft  
Cooperating Agency Review

This Page Intentionally Blank

Administrative Draft  
Cooperating Agency Review

## Appendix I – Montana Project/Action Screen and Mitigation Process

The BLM/USFS will ensure that any activities or projects in GRSG habitats would: 1) only occur in compliance with the Idaho and Southwestern Montana sub-region GRSG goals and objectives for PHMA and GHMA; and 2) maintain neutral or positive GRSG population trends and habitat by avoiding, minimizing, and offsetting unavoidable impacts to assure a conservation gain at the scale of this LUP and within GRSG population areas, State boundaries, and WAFWA Management Zones through the application of mitigation for implementation-level decisions. Impacts to GRSG could include loss or disturbance of nesting or wintering habitat as well as disruption of breeding activities at the lek site. The mitigation process will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy, while also following Secretary of the Interior Order 3330 and consulting BLM, USFWS and other current and appropriate mitigation guidance. If it is determined that residual impacts to GRSG from implementation-level actions would remain after applying avoidance and minimization measures to the extent possible, then compensatory mitigation projects will be used to offset residual impacts, or the project may be deferred or denied if necessary to achieve the goals and objectives for PHMA and GHMA in the Idaho and Southwestern Montana Sub-region GRSG LUPA/EIS.

To ensure that impacts from activities proposed in GRSG PHMA and GHMA are appropriately mitigated, the BLM will apply mitigation measures and conservation actions and potentially modify the location, design, construction, and/or operation of proposed land uses or activities to comply with statutory requirements for environmental protection. The mitigation measures and conservation actions (**Appendix B**) for proposed projects or activities in these areas will be identified as part of the National Environmental Policy Act (NEPA) environmental review process, through interdisciplinary analysis involving resource specialists, project proponents, government entities, landowners or other Surface Management Agencies. Those measures selected for implementation will be identified in the Record of Decision (ROD) or Decision Record (DR) for those authorizations and will inform a potential lessee, permittee, or operator of the requirements that must be met when using BLM-administered public lands and minerals to mitigate, per the mitigation hierarchy referenced above, impacts from the activity or project such that sage-grouse goals and objectives are met. Because these actions create a clear obligation for the BLM to ensure any proposed mitigation action adopted in the environmental review process is performed, there is assurance that mitigation will lead to a reduction of environmental impacts in the implementation stage and include binding mechanisms for enforcement (CEQ Memorandum for Heads of Federal Departments and Agencies 2011).

To achieve the goals and objectives for PHMA and GHMA in the Idaho and Southwestern Montana Sub-region GRSG LUPA/EIS, the BLM will assess all proposed land uses or activities such as road, pipeline, communication tower, or powerline construction, fluid and solid mineral development, range improvements, and recreational activities proposed for location in GRSG PHMA and GHMA in a step-wise manner. The following steps identify a screening process for review of proposed activities or projects in these areas. This process will provide a consistent approach and ensure that authorization of these projects, if granted, will appropriately mitigate impacts and be consistent with the LUP goals and objectives for GRSG. The following steps

provide for a sequential screening of proposals. However, Steps 2 through 6 can be done concurrently.

### **Step 1 – Determine Proposal Adequacy**

This screening process is initiated upon formal submittal of a proposal for authorization for use of BLM lands. The actual documentation of the proposal would include at a minimum a description of the location, scale of the project and timing of the disturbance. The acceptance of the proposal(s) for review would be consistent with existing protocol and procedures for each type of use.

### **Step 2 – Evaluate Proposal Consistency with LUP**

This initial review should evaluate whether the proposal would be allowed as prescribed in the LUP. For example, some activities or types of development are prohibited in PHMA or GHMA. Evaluation of projects will also include an assessment of the current state of the Adaptive Management hard and soft triggers. If the proposal is for an activity that is specifically prohibited, the applicant should be informed that the application is being rejected since it would not be allowed, regardless of the design of the project.

### **Step 3 – Determine Proposal Consistency with Density and Disturbance Limitations**

If the proposed activity occurs within a PHMA, evaluate whether the disturbance from the activity exceeds the limit on the amount of disturbance allowed within the activity or project area (DDCT process). If current disturbance within the activity area or the anticipated disturbance from the proposed activity exceeds this threshold, the project would be deferred until such time as the amount of disturbance within the area has been reduced below the threshold, redesigned so as to not result in any additional surface disturbance (collocation) or redesigned to move it outside of PHMA.

### **Step 4 – Determine Projected Sage-Grouse Population and Habitat Impacts**

Determine if the project will have a direct or indirect impact on GRSG populations or habitat within PHMA or GHMA. This will include:

- Reviewing GRSG Habitat delineation maps to initially assess potential impacts to GRSG. Use of the *USGS report Conservation Buffer Distance Estimates for Greater Sage-Grouse—A Review* to assess potential project impacts based upon the distance to the nearest lek, using the most recent active lek data available from the state wildlife agency. This assessment will be based upon the direction in **Appendix B**:
- Review and application of current science recommendations.

- Reviewing the ‘Baseline Environment Report’ (USGS) which identifies areas of direct and indirect effect for various anthropogenic activities.
- Consultation with agency or State Wildlife Agency biologist.
- Evaluating consistency with (at a minimum) State GRSG regulations
- Or other methods needed to provide an accurate assessment of impacts.

If the proposal will not have a direct or indirect impact on either the habitat or population, document the findings in the NEPA and proceed with the appropriate process for review, decision and implementation of the project.

### **Step 5 – Apply Avoidance and Minimization Measures to Comply with Sage-Grouse Goals and Objectives**

If the project can be relocated so as to not have an impact on GRSG and still achieve objectives of the proposal and the disturbance limitations, relocate the proposed activity and proceed with the appropriate process for review, decision and implementation (NEPA and Decision Record). This step does not consider redesign of the project to reduce or eliminate direct and indirect impacts, but rather authorization of the project in a physical location that will not impact GRSG. If the preliminary review of the proposal concludes that there may be adverse impacts to GRSG habitat or populations in Step 4 and the project cannot be effectively relocated to avoid these impacts, proceed with the appropriate process for review, decision and implementation (NEPA and Decision Record) with the inclusion of appropriate mitigation requirements to further reduce or eliminate impacts to GRSG habitat and populations and achieve compliance with GRSG objectives. Mitigation measures could include disturbance buffer limits, timing of disturbance limits, noise restrictions, design modifications of the proposal, site disturbance restoration, post project reclamation, etc. (see **Appendix B** for a more complete list of measures). Compensatory or offsite mitigation may be required (Step 6) in situations where residual impacts remain after application of all avoidance and minimization measures.

### **Step 6 – Apply Compensatory Mitigation or Reject / Defer Proposal**

If screening of the proposal (Steps 1 through 5) has determined that direct and indirect impacts cannot be eliminated through avoidance or minimization, evaluate the proposal to determine if compensatory mitigation can be used to offset the remaining adverse impacts and achieve GRSG goals and objectives. If the impacts cannot be effectively mitigated, reject or defer the proposal. The criteria for determining this situation could include but are not limited to:

- The current trend within PHMA is down and additional impacts, whether mitigated or not, could lead to further decline of the species or habitat.
- The proposed mitigation is inadequate in scope or duration, has proven to be ineffective or is unproven in terms of science based approach.

- The project would impact habitat that has been determined to be a limiting factor for species sustainability.
- Other site specific information and analysis that determined the project would lead to a downward change of the current species population or habitat and not comply with GRSG goals and objectives.

If, following application of available impact avoidance and minimization measures, the project can be mitigated to fully offset impacts and assure conservation gain to the species and comply with GRSG goals and objectives, proceed with the appropriate process for review, decision and implementation (NEPA and Decision Record).

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy to guide the application of the mitigation hierarchy to address greater sage-grouse impacts within that Zone. The WAFWA Management Zone Regional Mitigation Strategy will be applicable to the States/Field Offices/Forests within the Zone's boundaries. Subsequently, the BLM Field Office/USFS Forest's NEPA analyses for implementation-level decisions, which have the potential to impact GRSG, will include analysis of mitigation recommendations from the relevant WAFWA Management Zone Regional Mitigation Strategy(ies).

Implementation of the Regional Mitigation Strategy may involve managing compensatory mitigation funds, implementing compensatory mitigation projects, certifying mitigation/conservation banks, and reporting on the effectiveness of those projects. These types of mitigation implementation actions may be most effectively managed at the State-level, in collaboration with partners. BLM State Office/USFS Region may find it most effective to enter into an agreement with a State-level program administrator (e.g. a NGO, a State-level entity) to help manage these aspects of mitigation. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

The BLM's Regional Mitigation Manual MS-1794 serves as a framework for developing and implementing a Regional Mitigation Strategy. **Appendix J** provides additional guidance specific to the development and implementation of a WAFWA Management Zone Regional Mitigation Strategy.

# Appendix J

## Mitigation

Administrative Draft  
Cooperating Agency Review

This Page Intentionally Blank

Administrative Draft  
Cooperating Agency Review

## Appendix J – Mitigation

### Part I – Regional Mitigation Strategy

#### General

In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see glossary).

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy that will inform the NEPA decision making process including the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. A robust and transparent Regional Mitigation Strategy will contribute to greater sage-grouse habitat conservation by reducing, eliminating, or minimizing threats and compensating for residual impacts to greater sage-grouse and its habitat.

The BLM's Regional Mitigation Manual MS-1794 serves as a framework for developing and implementing a Regional Mitigation Strategy. The following sections provide additional guidance specific to the development and implementation of a WAFWA Management Zone Regional Mitigation Strategy.

#### Developing a WAFWA Management Zone Regional Mitigation Strategy

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy to guide the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy should consider any State-level greater sage-grouse mitigation guidance that is consistent with the requirements identified in this Appendix. The Regional Mitigation Strategy should be developed in a transparent manner, based on the best science available and standardized metrics.

As described in Chapter 2, the BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater

sage-grouse, within 90 days of the issuance of the Record of Decision. The Strategy will be developed within one year of the issuance of the Record of Decision.

The Regional Mitigation Strategy should include mitigation guidance on avoidance, minimization, and compensation, as follows:

- Avoidance
  - Include avoidance areas (e.g. right-of-way avoidance/exclusion areas, no surface occupancy areas) already included in laws, regulations, policies, and/or land use plans (e.g. Resource Management Plans, Forest Plans, State Plans); and,
  - Include any potential, additional avoidance actions (e.g. additional avoidance best management practices) with regard to greater sage-grouse conservation.
- Minimization
  - Include minimization actions (e.g. required design features, best management practices) already included in laws, regulations, policies, land use plans, and/or land-use authorizations; and,
  - Include any potential, additional minimization actions (e.g. additional minimization best management practices) with regard to greater sage-grouse conservation.
- Compensation
  - Include discussion of impact/project valuation, compensatory mitigation options, siting, compensatory project types and costs, monitoring, reporting, and program administration. Each of these topics is discussed in more detail below.
    - Residual Impact and Compensatory Mitigation Project Valuation Guidance
      - A common standardized method should be identified for estimating the value of the residual impacts and value of the compensatory mitigation projects, including accounting for any uncertainty associated with the effectiveness of the projects.
      - This method should consider the quality of habitat, scarcity of the habitat, and the size of the impact/project.
      - For compensatory mitigation projects, consideration of durability (see glossary), timeliness (see glossary), and the potential for failure (e.g. uncertainty associated with effectiveness) may require an upward adjustment of the valuation.
      - The resultant compensatory mitigation project will, after application of the above guidance, result in proactive conservation measures for Greater Sage-grouse (consistent with BLM Manual 6840 – Special Status Species Management, section .02).
    - Compensatory Mitigation Options
      - Options for implementing compensatory mitigation should be identified, such as:
        - Utilizing certified mitigation/conservation bank or credit exchanges.
        - Contributing to an existing mitigation/conservation fund.
        - Authorized-user conducted mitigation projects.

- For any compensatory mitigation project, the investment must be additional (i.e. additionality: the conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project).
- Compensatory Mitigation Siting
  - Sites should be in areas that have the potential to yield a net conservation gain to the greater sage-grouse, regardless of land ownership.
  - Sites should be durable (see glossary).
  - Sites identified by existing plans and strategies (e.g. fire restoration plans, invasive species strategies, healthy land focal areas) should be considered, if those sites have the potential to yield a net conservation gain to greater sage-grouse and are durable.
- Compensatory Mitigation Project Types and Costs
  - Project types should be identified that help reduce threats to greater sage-grouse (e.g. protection, conservation, and restoration projects).
  - Each project type should have a goal and measurable objectives.
  - Each project type should have associated monitoring and maintenance requirements, for the duration of the impact.
  - To inform contributions to a mitigation/conservation fund, expected costs for these project types (and their monitoring and maintenance), within the WAFWA Management Zone, should be identified.
- Compensatory Mitigation Compliance and Monitoring
  - Mitigation projects should be inspected to ensure they are implemented as designed, and if not, there should be methods to enforce compliance.
  - Mitigation projects should be monitored to ensure that the goals and objectives are met and that the benefits are effective for the duration of the impact.
- Compensatory Mitigation Reporting
  - Standardized, transparent, scalable, and scientifically-defensible reporting requirements should be identified for mitigation projects.
  - Reports should be compiled, summarized, and reviewed in the WAFWA Management Zone in order to determine if greater sage-grouse conservation has been achieved and/or to support adaptive management recommendations.
- Compensatory Mitigation Program Implementation Guidelines
  - Guidelines for implementing the State-level compensatory mitigation program should include holding and applying compensatory mitigation funds, operating a transparent and credible accounting system, certifying mitigation credits, and managing reporting requirements.

### Incorporating the Regional Mitigation Strategy into NEPA Analyses

The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

## Implementing a Compensatory Mitigation Program

The BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be managed at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

### **Glossary Terms**

**Additionality:** The conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project. (adopted and modified from BLM Manual Section 1794).

**Avoidance mitigation:** Avoiding the impact altogether by not taking a certain action or parts of an action. (40 CFR 1508.20(a)) (e.g. may also include avoiding the impact by moving the proposed action to a different time or location.)

**Compensatory mitigation:** Compensating for the (residual) impact by replacing or providing substitute resources or environments. (40 CFR 1508.20)

**Compensatory mitigation projects:** The [restoration](#), [creation](#), [enhancement](#), and/or [preservation](#) of impacted resources (adopted and modified from 33 CFR 332), such as on-the-ground actions to improve and/or protect habitats (e.g. chemical vegetation treatments, land acquisitions, conservation easements). (adopted and modified from BLM Manual Section 1794).

**Compensatory mitigation sites:** The durable areas where compensatory mitigation projects will occur. (adopted and modified from BLM Manual Section 1794).

**Durability (protective and ecological):** the maintenance of the effectiveness of a mitigation site and project for the duration of the associated impacts, which includes resource, administrative/legal, and financial considerations. (adopted and modified from BLM Manual Section 1794).

**Minimization mitigation:** Minimizing impacts by limiting the degree or magnitude of the action and its implementation. (40 CFR 1508.20 (b))

**Residual impacts:** Impacts that remain after applying avoidance and minimization mitigation; also referred to as unavoidable impacts.

**Timeliness:** The lack of a time lag between impacts and the achievement of compensatory mitigation goals and objectives (BLM Manual Section 1794).

Cooperating Agency Review

## Part II – Idaho Mitigation Framework

### FRAMEWORK FOR MITIGATION OF IMPACTS FROM INFRASTRUCTURE PROJECTS ON SAGE-GROUSE AND THEIR HABITATS

Sage-Grouse Mitigation Subcommittee of the Idaho Sage-Grouse State Advisory Committee<sup>1</sup>  
December 6, 2010

#### INTRODUCTION

The Conservation Plan for Greater Sage-grouse in Idaho (Idaho Sage-Grouse Advisory Committee 2006; as amended in 2009) calls for the development of a “proposal for a mitigation and crediting program for sagebrush steppe habitats in Idaho and recommendations for policy consideration” (Measure 6.2.4.). In early 2010, the Idaho Sage-grouse Advisory Committee (SAC) established the Mitigation Subcommittee to complete this task.<sup>1</sup> The Mitigation Subcommittee met several times from the late spring, through the fall of 2010 and found broad areas of agreement among its diverse participants.

This report presents the Mitigation Subcommittee’s consensus recommendations for the creation of an Idaho-based program to compensate for the impacts of infrastructure projects on sagegrouse and their habitats. This program – called the Mitigation Framework – would serve as a science-based “mitigation module” that project developers and government regulators could use to achieve compensatory mitigation objectives called for in project plans and permits. While compensatory mitigation may help offset certain impacts arising from infrastructure projects, mitigation should not be considered a substitute for first avoiding and then minimizing impacts.

In addition, it is important to recognize that federal and state regulatory or land-management agencies, and county or local governments may also require additional stipulations, conditions of approval or other requirements as well as on-site mitigation, in accordance with applicable law, regulation or policy.

This document proposes a general outline or “skeleton” of policies and procedures for such a program. The Mitigation Framework is designed to be transparent, inclusive, and accountable to defined objectives. The Subcommittee’s purpose is to describe the program in enough detail to foster a dialogue among SAC members, spot important issues and points of agreement, and assess the level of support for developing a functioning mitigation program for Idaho sagegrouse and their habitats.

---

<sup>1</sup> Subcommittee participants: John Robison and Lara Rozzelle, Idaho Conservation League; Brett Dumas, Idaho Power Company; Paul Makela and Tom Rinkes, BLM; Don Kemner, Idaho Department of Fish and Game; Will Whelan and Trish Klahr, The Nature Conservancy; Rich Rayhill, Ridgeline Energy, LLC; Lisa LaBolle and Kirsten Sikes, Idaho Office of Energy Resources; Nate Fisher, Idaho Office of Species Conservation; John Romero, Citizen at Large.

## EXECUTIVE SUMMARY

The state of Idaho is seeing an increasing number of infrastructure projects, such as transmission lines and wind energy facilities, proposed in the state's sagebrush steppe ecosystems. Where federal permits are required, the environmental review process for these projects will analyze how these projects affect sage-grouse and will consider a range of potential mitigation measures to avoid, minimize, or offset any impacts. It is likely that the environmental review process will lead at least some developers and agencies to implement compensatory mitigation.

Compensatory mitigation consists of compensating for residual project impacts that are not avoided or minimized by providing substitute resources or habitats, often at a different location than the project area. For sage-grouse, this would include, among other things, protecting and restoring sagebrush habitats to offset habitat losses and other effects of infrastructure projects.

This framework describes the general outline for a sage-grouse compensatory mitigation program in Idaho. This program would employ an "in-lieu fee" approach to compensatory mitigation through which a project developer would pay funds into an account managed by the mitigation program for performance of mitigation actions that provide measureable benefits for sage-grouse and their habitats within Idaho.

The Mitigation Framework does not alter the legal standards or procedures for review and approval of infrastructure projects. Rather, it offers an option that project developers and/or regulators may choose for implementing mitigation plans and agency permit conditions. It should be emphasized that this program would not relieve project developers and permitting agencies of their obligation to avoid and minimize environmental impacts through appropriate project siting, design and implementation.

Although the initial focus is on sage-grouse, the Mitigation Framework can be readily adapted to provide compensatory mitigation for other sagebrush obligate and associated species. The suitability of the Framework for other species and natural features has not been evaluated.

The objectives of the Mitigation Framework include:

- Provide a credible, efficient, transparent, and flexible mechanism to implement compensatory mitigation;
- Ensure that sage-grouse impacts are offset by actions that benefit the affected species and habitats;
- Provide increased certainty for developers and agencies;
- Involve private and public partners in crafting solutions;
- Provide developers the opportunity to offset the impacts of project development and operation on sage-grouse and sage-grouse habitat, and provide a consistent mechanism to offset impacts to the species that can be evaluated in future reviews of the species' status; and
- Evaluate issues based on best available scientific information, while acknowledging and responding to scientific uncertainty.

The Mitigation Framework would be established through a memorandum of agreement (MOA) among entities that have the capacity and commitment to assist in its implementation. Such parties may include land and wildlife management agencies, counties, tribes, participating private infrastructure development companies, and non-governmental organizations. The MOA would define the specific roles and responsibilities, procedures, and tasks needed to operate an Idaho-based compensatory mitigation program.
