The Mitigation Framework envisions a program with the following attributes: (1) a Mitigation Team and program administrator to steer the mitigation program and ensure strong oversight; (2) technically sound and transparent guidelines for estimating compensatory mitigation costs; (3) a science-based statewide strategy to guide the selection of mitigation actions that will receive funding; (4) provisions that the costs of operating the program will be borne by infrastructure developers that use the Mitigation Framework to deliver compensatory mitigation; (5) monitoring the implementation and effectiveness of mitigation actions funded by the Mitigation Framework program; (6) a system to track benefits provided by the Mitigation Framework to sage-grouse habitat in Idaho; and (7) periodic evaluation and adaptation of the Mitigation Framework program.

This framework provides only a general outline of a proposed Idaho-based compensatory mitigation program. It is intended to assess the level of support for crafting the agreements and completing the technical tasks needed to bring the Mitigation Framework into being.

## DISCUSSION

### I. The Role of Compensatory Mitigation in Infrastructure Development and Sage-grouse Conservation

#### A. Mitigation Basics

Broadly defined, “mitigation” refers to a wide range of measures that are taken to avoid, minimize, rectify, reduce, or compensate for the adverse impacts of actions affecting the environment. See 40 C.F.R. § 1508.20 (definition of “mitigation” in National Environmental Policy Act (NEPA) rules). In this general sense, mitigation should be an integral part of all phases of project planning and implementation.

The focus of this report is on compensatory mitigation – also known as “biodiversity offsets” or “offsite mitigation.” Compensatory mitigation consists of compensating for residual project impacts that are not avoided or minimized by providing substitute resources or habitats, often at a different location than the project area. For instance, a project developer may fund the restoration of a particular type of habitat in order to replace or “offset” similar habitat that is lost as a result of project construction.

This Framework adopts an “in-lieu fee” approach to compensatory mitigation. Under this approach, a project developer provides funding to a compensatory mitigation program administrator who then distributes the funds to the appropriate government agency, foundation or other organization for performance of mitigation actions. In an in-lieu fee program, the responsibility for actually delivering the compensatory mitigation is transferred

from the developer to the program administrator once the developer provides the necessary funds to the in-lieu fee program. It is important to emphasize that compensatory mitigation does not relieve project developers and permitting agencies of their obligation to avoid and minimize environmental impacts. This Framework endorses the principle known as the “mitigation hierarchy,” which holds that decision makers should consider the elements of environmental mitigation in the following order of priority:

1. Avoid environmental impacts through project siting and design;
2. Minimize the impacts during construction, operation, maintenance, and decommissioning by implementing appropriate conservation measures related to timing and conduct of project activities;
3. Restore areas that have been disturbed or otherwise rectify on-site project-related impacts to the greatest extent practicable; and
4. Compensate for residual impacts (direct and indirect effects that are not mitigated on-site) by providing replacement habitats or other benefits.

This means that compensatory mitigation is addressed only after efforts to avoid, minimize, and mitigate the impacts have been addressed. It also should be noted that significant impacts to habitat areas that support special functions and values for sage-grouse may simply not be replaceable through mitigation and therefore the best course may be to avoid those areas altogether.

#### **B. Need for an Idaho Compensatory Mitigation Program**

In recent years, the state of Idaho has seen an increase in the number of major infrastructure projects proposed in the state’s sagebrush steppe ecosystems. Several current proposals involve high voltage transmission lines that would cross over hundreds of miles of sage-grouse habitat. Large scale energy infrastructure projects such as wind farms may also affect large areas of sagegrouse habitat. Where these projects are located at least partially on federally managed public lands they will be required by federal law to go through an extensive environmental review process under NEPA before relevant federal permits are issued. The NEPA process requires the permitting agencies to consider the projects’ environmental effects (both positive and negative), alternatives, and potential mitigation measures. Impacts on sage-grouse will be one of the topics analyzed in the NEPA process.

Even after efforts are taken to avoid and minimize impacts, it is possible that some of these infrastructure projects will degrade some sage-grouse habitat, cause direct sage-grouse mortality, or lead to indirect effects such as avoidance of previously occupied habitat. The extent to which project developers and regulators adopt compensatory mitigation as a means to offset these impacts is not fully known. However, it is likely that at least some developers and regulators will seek to implement compensatory mitigation to benefit sage-grouse and their habitats. Energy companies and other developers face daunting challenges in carrying out compensatory mitigation for sage-grouse habitat. Just identifying specific mitigation actions requires a major effort. Actually implementing sagebrush restoration and enhancement projects is even more difficult and expensive – typically involving years of effort and a significant risk of failure. Delivering this type of technically complex

environmental mitigation may be well outside the core business of many infrastructure developers.

### **C. Advantages of the Mitigation Framework**

The Mitigation Framework proposes to respond to these challenges by creating a statewide program to deliver scientifically sound compensatory mitigation for multiple projects. Project developers and regulators would no longer have to design, fund and implement their own mitigation programs. Instead, they would have the option of contributing money to a central fund overseen by agencies with expertise in habitat management and non-governmental partners with similar experience. This approach to compensatory mitigation offers three major advantages. The first advantage stems from the increased efficiency of an Idaho-wide mitigation program compared with fragmented, project-by-project mitigation programs. Mitigation efforts require a significant investment in planning, administration, project oversight, and monitoring. The Mitigation Framework would consolidate these functions, thus avoiding needless duplication. The second advantage is that a state mitigation fund can be used for sage-grouse conservation more strategically and at a greater scale than project-by-project mitigation. As described in more detail below, the Mitigation Framework would fund sage-grouse habitat protection and restoration projects in accordance with a statewide strategy that uses landscape-scale analyses to identify the specific measures and habitats that will provide the greatest benefit for Idaho sagegrouse populations. This Idaho-based mitigation strategy will be integrated with other conservation strategies throughout the range of sage-grouse to ensure that actions taken in Idaho benefit the species as a whole. Third, this method can engage the capacity and competence of natural resources agencies, local governments, private companies, and non-governmental organizations. The Mitigation Framework proposes to enlist these entities in shaping Idaho's strategy, developing criteria for use of the fund, and proposing and implementing habitat protection and restoration projects. The benefits of the Mitigation Framework can be summarized as follows:

#### *Benefits for Project Developers:*

An efficient and reliable mechanism for meeting compensatory mitigation objectives and permit conditions; and Increased certainty regarding project costs.

#### *Benefits for Regulatory Agencies:*

Increased certainty that in-lieu fees will result in strategic "on-the-ground" mitigation actions that benefit sage-grouse.

#### *Benefits for Sage-Grouse:*

Increased certainty that scientifically sound mitigation actions that benefit sage-grouse and offset impacts and habitat losses associated with infrastructure development will be implemented.

### **D. Ensuring Accountability**

*Idaho and Southwestern Montana Greater Sage-Grouse Proposed LUPA/Final EIS*  
June 2015

In-lieu fee compensatory mitigation does pose one potentially significant drawback that must be acknowledged and addressed: a poorly designed program may lack accountability for delivering meaningful on-the-ground benefits for sage-grouse. Simply having a project developer contribute to an in-lieu fee mitigation account does not by itself compensate for the sage-grouse impacts caused by the project. Actual mitigation is possible only after well-conceived habitat protection and restoration projects are planned, funded, implemented, monitored, and successful in achieving stated objectives. The Mitigation Framework seeks to ensure accountability by adopting a series of rigorous and transparent procedures. As described below, the Framework would: (1) ensure that program administration and monitoring functions are adequately funded; (2) provide technically sound guidelines for estimating the costs of delivering compensatory mitigation; (3) establish a sciencebased statewide strategy to guide the program; (4) develop project selection criteria and a request for proposals based on the strategy; (5) require monitoring of the implementation and effectiveness of mitigation actions funded by the program; (6) track benefits the Mitigation

Framework program provides to sage-grouse in Idaho; and (7) require periodic evaluation of the program. Taken together, these procedures provide a high degree of certainty that the Mitigation Framework will be able to turn in-lieu fee payments into tangible, lasting compensatory mitigation for sage-grouse. As described in greater detail in Section E, below, project developers that seek to use the Mitigation Framework will need to show two things. First, they will need to show that their projects' impacts on sage-grouse and their habitats have been evaluated using a scientifically sound process. Second, they will need to show that their contributions to the mitigation fund reflect the Mitigation Framework's compensation guidelines to ensure that funding will be adequate to offset project impacts. Having demonstrated those things, the project developers should then be able to rely on their in-lieu fee contribution to the mitigation account as satisfying their compensatory mitigation objectives or obligations.

## II. Core Elements of Idaho Sage-Grouse Mitigation Program

### A. Program Objectives

- Provide a credible, efficient, transparent, and flexible mechanism to implement compensatory mitigation;
- Ensure that sage-grouse impacts are offset by mitigation actions that benefit the sage-grouse and their habitats;
- Provide increased certainty for developers and agencies;
- Involve private and public partners in crafting solutions;
- Provide developers the opportunity to offset project impacts on sage-grouse and sage-grouse habitat, and provide a consistent mitigation mechanism that can be evaluated in future reviews of the species' status; and
- Evaluate issues based on best available scientific information while acknowledging and responding to scientific uncertainty.

### B. Scope

The Mitigation Framework proposes to mitigate for impacts to Idaho sage-grouse and their habitats in Idaho. The initial focus of the Mitigation Framework is on sage-grouse. However, this program can be readily adapted to provide compensatory mitigation for other sagebrush obligate and associate species, such as pygmy rabbits, if project developers and regulators call for such mitigation.

Whether this Framework is suited for mitigation of impacts to a broader suite of species or natural features has not been evaluated. It should be noted that some subcommittee members expect to advocate in other forums that compensatory mitigation should extend beyond sagegrouse. The Mitigation Framework focuses on infrastructure projects because this type of development is the most likely to give rise to compensatory mitigation under existing environmental policies. As used here, the term “infrastructure” refers to building structures that significantly disturb sage-grouse habitat, including but not limited to projects for electricity transmission, energy generation, pipeline conveyance, transportation, communications, and similar purposes. The Mitigation Framework is not intended to apply to existing projects that are not changing in scope or to the renewal of on-going activities, such as grazing permits. In addition, the Framework is not suited to projects with minor impacts because their contributions to the mitigation program would be too small to justify the effort needed to establish and administer inlieu fee payments.

### **C. Integration with Environmental Review Procedures**

The Mitigation Framework does not alter the legal standards or procedures for review and approval of infrastructure projects. Rather, the Framework offers an option that project developers and/or regulators may choose for implementing mitigation plans and agency permit conditions. The Mitigation Framework is intended to complement the environmental review process conducted pursuant to NEPA and other federal environmental laws as well as county land use planning authorities. Many energy and other infrastructure projects undergo review and approval at the county level. The issues examined and the level of environmental analysis varies widely among individual counties and individual developers. If a county or developer decides to address sage-grouse impacts, it will be able to use the Mitigation Framework as a mechanism for meeting compensatory mitigation objectives that may arise from the county permitting process.

### **D. Mitigation Strategy**

The next step focuses on the Mitigation Team’s task of developing a statewide, science-based strategy that will guide the use of the mitigation fund. The mitigation program strategy would establish priorities for the use of compensatory mitigation funding based on factors/risks identified in the U.S. Fish and Wildlife Service’s 12-Month Findings for Petitions to List Greater Sage-Grouse (*Centrocercus urophasianus*) as Threatened or Endangered (USFWS 2010) and in the Conservation Plan for Greater Sage-grouse in Idaho (2006). The strategy sets mitigation priorities with a landscape view of sage-grouse needs and highlights mitigation opportunities in Idaho based on best available science. In setting priorities, the strategy considers species and community size, landscape condition, and regional context. The strategy is responsive to the threats and risks described in the sage-grouse 12- month findings. The strategy will also generally describe the types of mitigation actions, project specifications, and best practices that are likely

to produce measureable benefits for sage-grouse habitat. Finally, the strategy addresses both implementation and effectiveness monitoring requirements for mitigation actions funded through the program. The Mitigation Framework's strategy will draw heavily from the State of Idaho's sage-grouse conservation plan but has a narrower focus. It is intended to provide the specific guidance on program priorities, accepted mitigation measures, and geographic areas of emphasis that potential mitigation project sponsors will need to know when they apply for funds. The strategy plays a crucial role in steering mitigation funding to those activities and places that can provide the most effective benefits for Idaho sage-grouse populations consistent with strategies to increase the viability of the species throughout its range. To this end, the strategy will address one of the major policy questions that arise in the design of compensatory mitigation systems: how closely should the mitigation actions be linked to the type and location of the habitat that was originally affected by the infrastructure project. Stated in the alternative, does removal of the mitigation action from the area of impact improve the effectiveness of or benefit from the action. Some compensatory mitigation systems place a heavy emphasis on this link by favoring "in-kind" and "on-site" compensatory mitigation over "out-of-kind" and "off-site" compensatory mitigation. The subcommittee members generally favor an approach that allows funding to flow to the projects and locations within Idaho that will provide the greatest overall positive impact on sage-grouse populations. The Mitigation Framework calls for a monitoring program that would assess habitat gains provided by mitigation actions and compare them with the mitigation objectives of the participating infrastructure projects. The nature and purpose of this monitoring is described more fully in Mitigation Program Step 4, below.

Once the strategy is complete, the Mitigation Team will develop project ranking criteria and procedures that will guide the selection of the mitigation actions that will receive funding. The goal is to fund projects that provide high quality, lasting benefits based on landscape scale analyses that actually compensate for project impacts.

#### **E. Compensation Guidelines**

The Mitigation Framework Program will develop guidelines that may be used by developers and/or regulators to determine the cost of meeting their compensatory mitigation objectives. These compensatory mitigation objectives determine the extent of compensatory mitigation for each project and are generally incorporated into project plans or permits. The compensation guidelines will provide transparent, technically sound principles for determining how much it costs to deliver habitat mitigation for sage-grouse. In other words, the guidelines will represent best estimates of the true cost of implementing the mitigation actions needed to meet each project's compensatory mitigation objectives. The guidelines may be used by the project developer and the Mitigation Framework Program Administrator to establish the in-lieu fee that the developer will contribute to the mitigation fund. Specific valuation methods will be developed at a later time and will likely draw from compensatory mitigation systems used elsewhere in the West. Although the details have yet to be worked out, the following outline illustrates the core concepts and principles (shown in bold lettering) that are likely to be employed by the MOA parties in setting the Mitigation Framework's in-lieu fee structure.

- A common unit of measurement would be established for describing and tracking both the project impacts and the benefits of any compensatory mitigation actions. This unit of measurement can be a physical unit such as "acres impacted" or more specifically "acres of summer brood rearing habitat impacted" or "habitat units" lost.

- While the “common unit of measurement” noted above addresses the area of habitat impacted and mitigated, habitat compensation ratios are used to address the quality of the habitat affected by the infrastructure project. These ratios could specify the number of acres of mitigation required per acre of impacted habitat based on the size, habitat quality/condition and function of the impacted habitat; for more critical or important habitat, more mitigation acres might be required. Thus, habitats with higher quality and importance could have higher compensation ratios.
- Several factors are taken into account in calculating how much it will cost to actually compensate for the acres or habitat units. The recommended approach is to evaluate on the costs of implementing a conceptual portfolio of potential mitigation actions or offset activities that provide benefits for sage-grouse. This portfolio of model projects would include a balanced mix of accepted habitat protection and restoration measures reflecting the types of projects expected to be funded by the mitigation program (in accordance with the strategy discussed above). Examples of projects in this portfolio may include such actions as restoring sagebrush canopy and a native understory on recently burned land, improving riparian areas and wet meadows in early brood-rearing habitat, conservation easements to prevent habitat loss, and land management practices that improve sage-grouse habitat. Project costs include the full range of expenses needed to complete all phases of the mitigation action, including administration and monitoring. The average costs of these model mitigation actions per acre or habitat unit is the foundation of the in-lieu fee calculation.
- In addition, the in-lieu fee should also be adjusted to take into consideration the issue of lag time –the time between when habitat is lost at the impacted site relative to when habitat functions are gained at the compensation site.
- The fee also needs to account for contingencies associated with delivering compensatory mitigation, including an estimate of the risk of failure (i.e., the probability that offsite mitigation will not result in any measureable conservation outcomes) for each mitigation site or project.
- In addition to the fee calculated above, costs for establishing and operating the program, including travel, technical consultation and monitoring of program effectiveness must be included. This overhead fee could range from 5-15% depending on the size and complexity of the proposed mitigation program.

#### **F. Program Structure and Oversight**

The Mitigation Framework would be established through a memorandum of agreement (MOA) among the entities that would participate in its implementation. The MOA would define the specific roles and responsibilities, procedures, and tasks needed to operate an Idaho-based compensatory mitigation program. The MOA would serve as a joint powers agreement for state and local government parties. The MOA would establish the following administrative structure for the Mitigation Framework:

1. **Core Team:** A core group would oversee the Mitigation Framework program and provide policy-level guidance for the Science Team and Fund Administrator, described below. The

Core Team would be composed of three to seven representatives of diverse perspectives among the MOA signatories.

2. Science Team: A team of experts drawn from MOA signatories and other targeted organizations will administer the science-based and technical aspects of the program. The Science Team would consist of several individuals with expertise in relevant areas such as habitat protection and restoration, landscape ecology/spatial analysis, wildlife biology, sage-grouse ecology, project development, and mitigation policy.

The Team would focus on developing the policies and statewide strategy that will guide the program, making requests for mitigation project proposals (RFPs), ranking mitigation proposals that will receive funding, tracking monitoring reports and project benefits, and evaluating program success.

3. Program Administrator: A program administrator will be responsible for fund management and administrative tasks. The program administrator will provide administrative support for the Mitigation Team, manage the mitigation account, and administer grants, contracts, and other agreements.

4. Advisory Committee: A broader advisory committee consisting of agencies, companies and organizations with the skills and commitment that will provide useful advice to the Core Team regarding the implementation of the Mitigation Framework. The specific make up of each of these groups will be determined at a later time. Potential participants in the Mitigation Framework include but are not limited to representatives of:

***State of Idaho:***

Department of Fish and Game  
Management  
Office of Energy Resources  
Office of Species Conservation  
Idaho Department of Lands  
Service

***Energy Companies:***

Idaho Power  
Ridgeline Energy  
Conservancy  
Idaho Tribes  
Idaho Sage-Grouse Advisory Committee  
interests)  
Sage-Grouse Local Working Groups

***United States:***

Bureau of Land  
U.S. Fish and Wildlife Service  
U.S. Forest Service  
Natural Resources Cons.

***Non-Governmental Organizations:***

Idaho Conservation League  
The Nature  
Idaho Counties  
Public Land Users (e.g., grazing

**G. Funding the Mitigation Program**

The costs of administering the program will be sustained by the project developers that seek compensatory mitigation. Therefore, a portion of the in-lieu fee that project developers contribute to the mitigation account will be applied for program administration. As noted above, protecting and restoring sagebrush habitats are time consuming and expensive undertakings. Ensuring that these activities are conducted with strong oversight should be viewed as an exceptionally wise investment.

### III. Mitigation Program Steps

The Mitigation Framework envisions a five-step process for developing, implementing, and monitoring compensatory mitigation.

#### **A. Step 1 – Assessment of Project Impacts and Development of Mitigation Objectives**

Assessment of project impacts should be undertaken by the project developers proposing new infrastructure projects and the government agencies that conduct environmental reviews of those projects. Although the Mitigation Framework process is not responsible for this step, it is nevertheless crucial to the integrity of the mitigation program. Specifically, the Framework's success in achieving its goal of offsetting major infrastructure project impacts on sage-grouse depends on an accurate accounting of those impacts. For many projects, this analysis will be done as part of the environmental review procedures required by NEPA. As noted above, NEPA requires federal agencies to address the full range of direct, indirect and cumulative impacts of the proposed project, alternatives to the proposed action, and potential mitigation before they act on permit applications. Once impacts have been assessed and compensatory mitigation objectives set, the project developer is ready to engage the Mitigation Framework, starting with determining the developer's in-lieu fee contribution.

#### **B. Step 2 – Determine the In-lieu Fee Contribution**

The goal of Step 2 is to use valuation techniques, such as the guidelines presented above, to convert the complex range of project impacts, including direct, indirect and cumulative impacts, into monetary terms that become the basis for the in-lieu fee payment. The accepted in-lieu fee compensatory mitigation plan could be a condition of the instrument approving the project (FONSI, ROD, right-of-way grant, conditional use permit, etc.) and thus legally requires the project developer comply with the approved mitigation plan.

#### **C. Step 3 – Commitment of Mitigation Funds by Project Developer**

Infrastructure project developers can employ the Mitigation Framework by entering into an agreement with the program administrator with regard to a specific infrastructure project. This project agreement sets forth the parties' respective responsibilities, including the project developer's commitment to pay the in-lieu fee. Importantly, the agreement provides that the project developer's funds can only be used for the purposes set forth in the Mitigation Framework. The agreement may also include "conditions" as requested by regulatory agencies or project developers. For instance, the agreement might provide that the in lieu fee

will be used to fund mitigation actions in specific geographic areas in order to meet permit requirements. The program administrator, based on consultation with the MOA parties, may decline to enter into an agreement that is inconsistent with the Mitigation Framework principles or includes conditions that are burdensome or unworkable. Once the agreement specifying the payment structure and schedule is signed, the project developer makes the required in-lieu fee deposits to an interest bearing account managed by the program administrator. After the completion of this step, the project developer is no longer engaged in the Mitigation Framework – unless it has decided to participate as a MOA party.

#### **D. Step 4 – Issue Request for Proposals (RFP) and Select, Implement, and Monitor Mitigation Actions**

At least at annual intervals, the Mitigation Team will issue an RFP that invite private companies, non-governmental organizations, and agencies to submit proposals for sage-grouse habitat protection, restoration, and/or enhancement actions. The RFP will provide guidance to mitigation project sponsors on program priorities and criteria. These priorities and criteria will be drawn from the mitigation program strategy including identification of geographic areas where mitigation might provide the greatest benefits as well as identification of the threats that present the highest risk to the species or its core habitat. The Mitigation Team should also reach out to federal, state, and local agencies, non-governmental organizations and the general public in order to facilitate discussion, engage stakeholders, raise awareness of the program and generate responses to the RFP. The RFP will solicit project proposals that contain an operation or implementation plan and address at least the following elements:

- Geographic area;
- Threats addressed and how the mitigation action project will offset impacts resulting from those threats;
- An analysis of current sage-grouse conditions in the area;
- Resource goals and objectives the mitigation action project will seek to provide;
- A description of any coordination with federal, state, tribal and local resource management and regulatory authorities or other stakeholder involvement required to complete the mitigation action (e.g., requirement for NEPA compliance or county permit);
- A description of recent or proposed projects and events in the vicinity of the proposed project, if any, such as fire rehabilitation treatments, restoration or enhancement treatments or other activities that complement the effectiveness or intent of the proposed, mitigation action;
- A description of the long term protection, management, stewardship for the project being implemented, and the entity responsible for these activities; and
- A commitment to periodic evaluation and reporting on the progress of the project in meeting stated goals and objectives, including a process for adaptively redirecting the project if necessary.

When selecting projects, the Mitigation Team will estimate the biological benefits of the projects activities, the likely success of those activities, the duration of benefit expected and

measure those benefits in relation to the strategy and RFP objectives. Mitigation Team and the program administrator will work together on continuing program administration and oversight including annual reporting of program activities, expenditures, and benefits. An annual program report will describe program activities, budget, and assessment of whether the mitigation strategy and associated projects are benefitting sage-grouse and at what level or scale. The Mitigation Team and/or Program Administrator should implement a monitoring program to measure and validate whether project-specific objectives have been met. Monitoring is required of all compensatory mitigation actions to determine if the project is meeting its performance standards and objectives. As mentioned above, at regular intervals, the total habitat and/or population gains provided by the programs will be compared with the habitat/population losses associated with the participating infrastructure projects. The purpose of this comparison is to evaluate the mitigation program and make any necessary program adjustments – particularly if the monitoring shows that the mitigation benefits are not compensating for habitat losses. This comparison will not be a basis for imposing new, unexpected requirements on the infrastructure project developers.

## CONCLUSION

The framework of policies, principles and procedures outlined above are meant to start a dialogue among parties engaged in sage-grouse conservation and infrastructure development. If these parties agree with the Mitigation Subcommittee that there is great value in establishing an Idaho-based compensatory mitigation program, then this framework will mark the beginning of an inclusive effort to fill in the details and complete the tasks needed to bring such a program into being. We have confidence in our collective ability to create a compensatory mitigation program that will benefit infrastructure developers, agencies, conservation interests, and – not least – Idaho's sage-grouse.

### **Part III –**

## **IDAHO AND SOUTHWESTERN MONTANA SUBREGION- NET CONSERVATION GAIN PROCESS**

### **Introduction**

The Net Conservation Gain strategy is a means of assuring that proposed anthropogenic activities, when approved and implemented will not result in long-term degradation of Greater Sage-Grouse habitat or population and will have a net conservation benefit to the species. The attached 'flow chart' identifies a screening process for review of proposed anthropogenic activities. The goal of the process is to provide a consistent approach regardless of the administrative location of the project and to ensure that authorization of these projects will not contribute to the decline of the species. Though the initial Steps (1-6) are done prior to initiating the NEPA process, the authorized officer must ensure that appropriate documentation regarding the rationale and conclusion for each is included in the administrative record.

The flow chart provides for a sequential screening of proposals. However, Steps 2-6 can be done concurrently. Steps 7-12 are related to project implementation.

### **Step 1**

This screening process is initiated upon formal submittal of a proposal for authorization for use of federal lands (BLM or Forest Service). The actual documentation would include, at a minimum, a description of the location, scale of the project, and timing of the disturbance and would be consistent with existing protocol and procedures for the specific type of use. It is anticipated that the proposals would be submitted by a third party.

### **Step 2**

This initial review would evaluate whether the proposal would be allowed as prescribed in the Greater-Sage-Grouse Land Use Plan Amendment. For example, certain activities are prohibited in suitable habitat, such as wind or solar energy development. If the proposal is an activity that is specific prohibited, the submitter would be informed that the proposal is being rejected since it would not be consistent with the Land Use Plan, regardless of the design of the project.

In addition to consistency with program allocations, the Land Use Plan identifies a limit on the amount of disturbance that is allowed within a 'biological significant unit' (BSU). If current disturbance within the affected unit exceeds this threshold, the project should be deferred until such time as the amount of disturbance within the area has been reduced, through restoration or other management actions.

### **Step 3**

In reviewing a proposal, determine if the project will have a direct or indirect impact on population or habitat (PPH or PGH). This can be done by:

1. Reviewing Greater Sage-Grouse Habitat maps.
2. Reviewing the 'Base Line Environment Report' (USGS) which identifies the area of direct and indirect effects for various anthropogenic activities.
3. Consultation with agency, Fish and Wildlife Service, or State Agency wildlife biologist.
4. Reviewing the standard and guidelines in the plan amendments (such as buffer distances for the proposed activity).
5. Other methods

If the proposal will not have a direct or indirect impact on either the habitat or population, proceed with the appropriate process for review, decision, and implementation of the project.

#### **Step 4**

If the project could have a direct or indirect impact of sage-grouse habitat or population, evaluate whether the proposal can be relocated so as to not have the indirect or direct impact and still achieve the intent of the proposal. This Step does not consider redesign of the project as a means of not having direct or indirect impacts but rather authorization of the project in a physical location that will not impact Greater Sage-grouse. If the project can be relocated so as to not have an impact on sage-grouse and still achieve objectives of the proposal, inform applicant and proceed with the appropriate process for review, decision, and implementation of the relocated project.

#### **Step 5**

If the preliminary review of the proposal concludes that there may be impacts to sage-grouse habitat and/or population, and the project cannot be effectively relocated to eliminate these impacts; evaluate whether the agency has the authority to modified or deny the project. If the agency does NOT have the discretionary authority to modify or deny the proposal, proceed with the authorization process (NEPA) and include appropriate mitigation requirements that minimize impacts to sage-grouse habitat and populations. Mitigations could include a combination of actions such as timing of disturbance, design modifications of the proposal, site disturbance restoration, and compensatory mitigation actions.

#### **Step 6**

If the agency has the discretionary authority to deny the project and after careful screening of the proposal (Steps 1-4) has determined that direct and indirect cannot be eliminated, evaluate the proposal to determine if the adverse impacts can be mitigated. If the impacts cannot be effectively mitigated within the BSU, reject or defer the proposal. The criteria for determining this situation would include but not limited to:

- Natural disturbance within the BSU is significant and additional activities within the area would adversely impact the species.

- The current trend within the BSU is down and additional impacts, whether mitigated or not, could lead to further decline of the species or habitat.
- The proposed mitigation has proven to be ineffective or is unproven in terms of science based approach.
- The additional impacts, after applying effective mitigation, would exceed the disturbance threshold for the BSU.
- The project would impact habitat that has been determined, through monitoring, to be a limiting factor for species sustainability within the BSU.
- Other site specific criteria that determined the project would lead to a downward trend to the current species population or habitat with the BSU.

If the project can be mitigated to provide for a net conservation benefit to the species, proceed with the design of the mitigation plan and authorization (NEPA) of the Project. The authorization process could identify issues that may require additional mitigation or denial/deferring of the project based on site specific impacts to the Greater Sage-grouse.

## Travel Management Planning Guidelines

Administrative Draft  
Cooperating Agency Review

This Page Intentionally Blank

Administrative Draft  
Cooperating Agency Review

## Appendix L – Travel Management Planning Guidelines:

- Among other designation criteria from 43 CFR 8342.1(b), “areas and trails shall be located to minimize harassment of wildlife or significant disruption of wildlife habitats. Special attention will be given to protect endangered or threatened species and their habitats.
- During subsequent travel management planning, all routes would undergo a route evaluation to determine its purpose and need and the potential resource and/or user conflicts from motorized travel. Where resource and/or user conflicts outweigh the purpose and need for the route, the route would be considered for closure or considered for relocation outside of sensitive GRSG habitat.
- During implementation-level travel planning, threats to GRSG and their habitat would be considered when evaluating route designations and/or closures.
- During subsequent travel management planning, routes that do not have a purpose or need would be considered for closure.
- During subsequent travel management planning, routes that are duplicative, parallel, or redundant would be considered for closure.
- During subsequent travel management planning, seasonal restrictions on OHV use would be considered in important seasonal habitats where OHV use is a threat.
- During subsequent travel management planning, OHV timing limitations would be considered in important seasonal habitats where OHV use is a threat.
- During subsequent travel management planning, consider limiting over snow vehicle (OSV) travel to designated routes, consider seasonal closures in GRSG wintering areas from November 1 through March 31 or define Designation Criteria (i.e. minimization criteria) to regulate over snow vehicle traffic.
- During subsequent travel management planning, routes not required for public access or recreation with a current administrative/agency purpose or need would be evaluated for administrative access only.
- During subsequent travel management planning, consider prioritizing restoration of routes not designated in a Travel Management Plan.
- During subsequent travel management planning, consider using seed mixes or transplant techniques that will maintain or enhance GRSG habitat when rehabilitating linear disturbances.
- During subsequent travel management planning, consider scheduling road maintenance to avoid disturbance during sensitive periods and times to the extent

practicable. Consider using time of day limits (After 10:00 AM to 7:00 PM) to reduce impacts on GRSG during breeding and nesting periods.

Over-snow vehicle – a motor vehicle that is designed for use over snow and that runs on a track or tracks and/or a ski or skis, while in use over snow.

## GRSG Implementation and Coordination

Administrative Draft  
Cooperating Agency Review

This Page Intentionally Blank

Administrative Draft  
Cooperating Agency Review

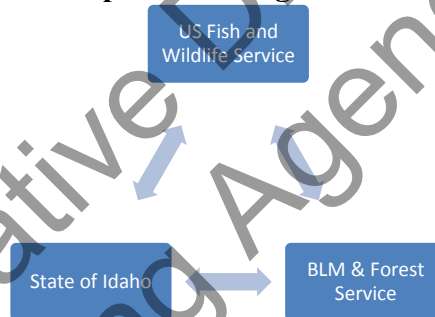

## Appendix M – GRSG Implementation and Coordination

The BLM, Forest Service, US Fish and Wildlife Service and the State of Idaho have coordinated on GRSG monitoring and management for numerous years as part of the 2006 Idaho Sage Grouse Conservation Plan. Much of this ongoing work provides a firm foundation from which to build future coordination efforts, especially in regard to implementation of the GRSG RMP Amendment. With some specific adjustments and additional inclusions in those efforts the effective implementation of the GRSG RMP Amendment can be achieved.

There are several decisions, or components of decisions that would benefit from close coordination between the State of Idaho, BLM, Forest Service and the US Fish and Wildlife Service. These include: application and assessment of the adaptive management strategy; application of the right-of-way screening process; and development and implementation of any potential project mitigation efforts.

Figure 1 describes a conceptual relationship between the agencies for coordination and project evaluation/implementation.

**Figure 1 – Conceptual Relationship Between Agencies**

For description an example project proposal will be tracked through the consideration and evaluation process.

### **I. Project Proposal is Initially Screened by BLM or Forest Service**

This initial screened would evaluate whether the proposal conforms to the land use plan allocation decisions (Open, Open with Limitations, Closed). The BLM/Forest Service Field Office or Ranger District would work in coordination with the State or Supervisor's Office to evaluate this conformance.

For BLM if the proposal is not in conformance then a non-conformance letter from the State Director would be sent to the project proponent and the project would not be considered further.

If the project were found to conform to the land use plan allocations then consideration would continue.

### **II. Project Proposal would be Coordinated with State and USFWS**

The State Implementation Task Force (set up through Idaho Executive Order) would convene to apply the right-of-way screening process to the proposal, informed by GRSG population monitoring accomplished by IDF&G. This evaluation would be vetted through the Governor's Office and a recommendation from the Governor would be provided to the BLM/Forest Service.

The BLM and/or Forest Service would work with local offices to apply the right-of-way screening process to the proposal, informed by the disturbance level (cap), and habitat conditions (amount).

The BLM/Forest Service decision maker would utilize the information from internal review and State recommendations to determine whether the project conforms to all land use plan guidance and whether to consider the project further.

For BLM if the proposal is not in conformance then a non-conformance letter from the State Director would be sent to the project proponent and the project would not be considered further.

If the project were found to conform to the land use plan guidance then consideration would continue.

### **III. BLM and/or Forest Service would Initiate Project NEPA**

The NEPA analysis would be developed by the local unit office in full consideration of local habitat conditions. This process would describe alternatives to the proposal that would reduce or eliminate impacts and full identify residual impacts to GRSG.

### **IV. Share Residual Impacts with the State of Idaho and USFWS**

The State Implementation Task Force would consider the residual impacts and work to develop an appropriate mitigation package to be included within analysis of the project proposal. This Governor would recommend to BLM the inclusion of the mitigation package within the project proposal.

### **V. BLM Incorporates and Analyzes Mitigation in NEPA Evaluation**

### **VI. State of Idaho would Administer Mitigation Consistent with the Mitigation Strategy**

As part of the implementation of the GRSG RMP Amendment the BLM and Forest Service will work cooperatively with the State to develop a Mitigation Strategy. Part of this strategy will define the operating procedures such as credits, banking, funding process, etc. This component is likely to strongly involve State oversight, with the specifics remaining to be determined.

### **VII. Mitigation is Implemented**

## Proposed Plan Mapping Adjustments

Administrative Draft  
Cooperating Agency Review

This Page Intentionally Blank

Administrative Draft  
Cooperating Agency Review

## **Appendix N – Mapping Adjustments in Development of Proposed Plan Map Map Differences between Draft EIS Preferred Alternatives and Proposed Plan**

**Overview:** The preparation of the Alternative D (BLM/FS Alternative) GRSG map in the DEIS (the GRSG Management Area map) involved modeling of Preliminary Priority and Preliminary General Habitat (PPH/PGH) by Idaho BLM using available GRSG lek data, Breeding Bird Density and Lek Connectivity Models, available winter habitat and additional refinements using available land use or vegetation data (e.g., agriculture, timber), and as well as expert opinion and additional local data. The Southwest Montana GRSG areas were refined by Montana BLM based on modeling and map refinements previously completed by Montana Fish, Wildlife and Parks, based on their Core area designations. For the Utah portion of the Sawtooth National Forest, BLM/FS adopted Utah BLM’s designation for that area.

For Alternative E in the DEIS, the Idaho Governor’s Sage-Grouse Task Force re-configured the initial BLM PPH/PGH data to create three categories of Management Zones (Core, Important, General), using additional population and habitat information, to support an adaptive management strategy focused on GRSG conservation.

During review of the DEIS, mapping adjustments were made in response to public comments and were based on agency field and personnel input and discussions with State of Idaho and USFWS. Specifically, adjustments were intended to address the broad scale nature of the initial map and to address disparities. Specifically, certain portions of the Alt D and Alt E maps still encompassed some areas of non-habitat, such as timber or farm lands; or they were missing some areas of potential restoration or other locally definable areas or habitat; or were designated inappropriately as Core and/or Important.

As a result, in preparing the Proposed Plan/FEIS, BLM, FS, FWS and the State of Idaho worked together to refine the GRSG Habitat Management Area map. To resolve map disparities between Alternatives D and E, and to provide more recognizable boundaries of Habitat Management Areas on the ground, BLM and FS worked closely with field personnel in December 2013. During the winter and spring of 2014, BLM and FS also worked closely with the State of Idaho and U.S. Fish and Wildlife Service (Idaho Fish and Wildlife Office, Boise) in re-evaluating the Core, Important or General Management Zone designations of Alt E, in order to move forward with a map for the Proposed Plan (Alternative G) that met BLM and FS objectives for habitat and State of Idaho and FWS objectives for populations. The final Proposed Plan map is identified in Tables 1 & 2, displayed in Map 1, and summarized as follows:

- Refinements in General Habitat delineations. Additional areas in south-central Idaho, Mountain Home and the Weiser area were added as General Habitat Management Areas (approximately 488,018 acres); these areas were previously encompassed by “Restoration” areas identified in Alt. F, of the DEIS. The additional areas contain similar habitat characteristics as General habitat areas. Specifically, General Habitat Management Areas (GHMAs) encompass habitat outside of Priority Habitat Management Areas (PHMAs) or Important Habitat Management Areas (IHMAs) and contain approximately 10% of the occupied GRSG leks that are also of relatively low male attendance compared to leks in PHMA or IHMA. The GHMAs are generally characterized by lower quality, disturbed or patchy habitat or low lek connectivity. These additional areas added

to the GHMAs are annual grassland or perennial grassland areas, from the Idaho “Key Habitat Map” that had been previously excluded from the initial PPH/PGH model; or were based on additional field input. These areas have restoration potential to GRSG habitat, or involve past or ongoing restoration efforts therefore were incorporated into the Alternative G map, based on recommendations from the field and are characterized by lower quality, disturbed or patchy habitat or low lek connectivity. As a result, the additional areas embody the same or similar characteristics as those areas identified as General habitat in the DEIS.

- **Small Isolated Areas.** These areas (i.e., less than 500 acres in size) referred to as “Donut holes” of non-habitat inside of a larger matrix of habitat were classified according to the surrounding habitat. As a result of mapping corrections and refinements, data was collected from BLM Field Offices. This data showed that there were many areas that contained holes of non-habitat within larger tracts of habitat. In order to ensure efficient and practicable management of these areas, these areas (holes) will be managed according to the habitat management designation that governs the surrounding area. The total acreage of all of these areas is a small percentage of the total planning area. Specifically, the areas that comprise the “donut holes” amounts to 6,746 acres out of approximately 11,000,000 acres of habitat in the planning area. This amounts to only 0.06% of the entire planning area/habitat.
- **Snapping of Priority, Important, or General Habitat Management Areas** to meaningful edges or features (canyons, allotment/pasture boundaries, roads etc.) was completed at the field level to facilitate use of the map designations at the field level.
- **Refinements in Important and Priority Habitat delineations.** The refined mapping of Priority and Important Habitat Management Areas for Alternative G contains areas of Priority and Important habitat that are outside of those previously identified as PACs. In the case of Priority, these arose from very minor adjustments in localized areas during the snapping exercise. Similar refinements were made for Important designations, however in the southern Big Desert area near Craters of the Moon National Monument roughly 200,000 acres of General habitat identified in Alternative E were identified as having the same characteristics as Important habitat and therefore are depicted as Important in the Administrative Draft Proposed Plan (see Table 2 Desert Conservation Area, Southern Big Desert Area Geographic Area). Smaller areas of IHMA refinements as described above were identified in the Owyhee Mountains, Cotterel/Jim Sage Mountains, Curlew National Grasslands and Bear Lake area. See Table 2 below for mapping adjustment details and acreages. Specifically, Important Habitat Management Areas are defined as areas of moderate to high conservation value to GRSG that are generally adjacent to PPMAs but reflect reduced GRSG population and/or habitat characteristics.

**Table 2. Mapping Adjustment Details by Geographic Area:**

<b>Conservation Area</b>	<b>Geographic Area</b>	<b>Initial Recommendation (BLM/FS field)</b>	<b>Final Decision and Rationale</b>	<b>Location and Acres (Depicted on Map 1)</b>
<b>WEST OWYHEE</b>				
	Mountain tops in the Owyhee Mtns.	Field recommended including the top of mountains, previously mapped as non-habitat, as General. Some local records of bird use; likely some summer use	Left mountain tops as <u>non-habitat</u> . Difficult to justify as General based on nominal bird use and limited other information. No known lek or winter habitat.	A = 127,468 acres  Is the total of non-habitat mountain tops
	Juniper encroachment surrounding Owyhee mountains	Field recommended classifying as Important due to potential for juniper control efforts and habitat improvement. No leks or winter habitat in vicinity.	Kept as <u>General</u> . Difficult to justify as “Important” due to general lack of leks/nest habitat or winter habitat in that zone. Juniper work should probably focus on juniper encroachment in adjacent Core areas. General designation does not preclude restoration work, if otherwise justified.	B = 229,290 acres  Is the total number of GHMA in this area
	Owyhee front	This was a large oblong area recommended by the field to be changed from Important (as in Alt E) to Core, along the Owyhee Front. The majority of the area is overlain by recently modeled winter habitat and also encompasses a number of occupied and undetermined status leks and nesting habitat. BLM	Multiple discussions with the State and US FWS led to a delineation where much of the Owyhee Front remained as Important, with an additional area of Core (~25,000 ac) identified that overlaid a cluster of leks and nesting/winter habitat. Area maintained as Important has fewer and smaller leks.	C1 = 554,026 acres  Total Area of IHMA in the Owyhee Front  C2 = 70,827 Acres of PHMA Total in the Owyhee Front

*Idaho and Southwestern Montana Greater Sage-Grouse Proposed LUPA/Final EIS*  
June 2015

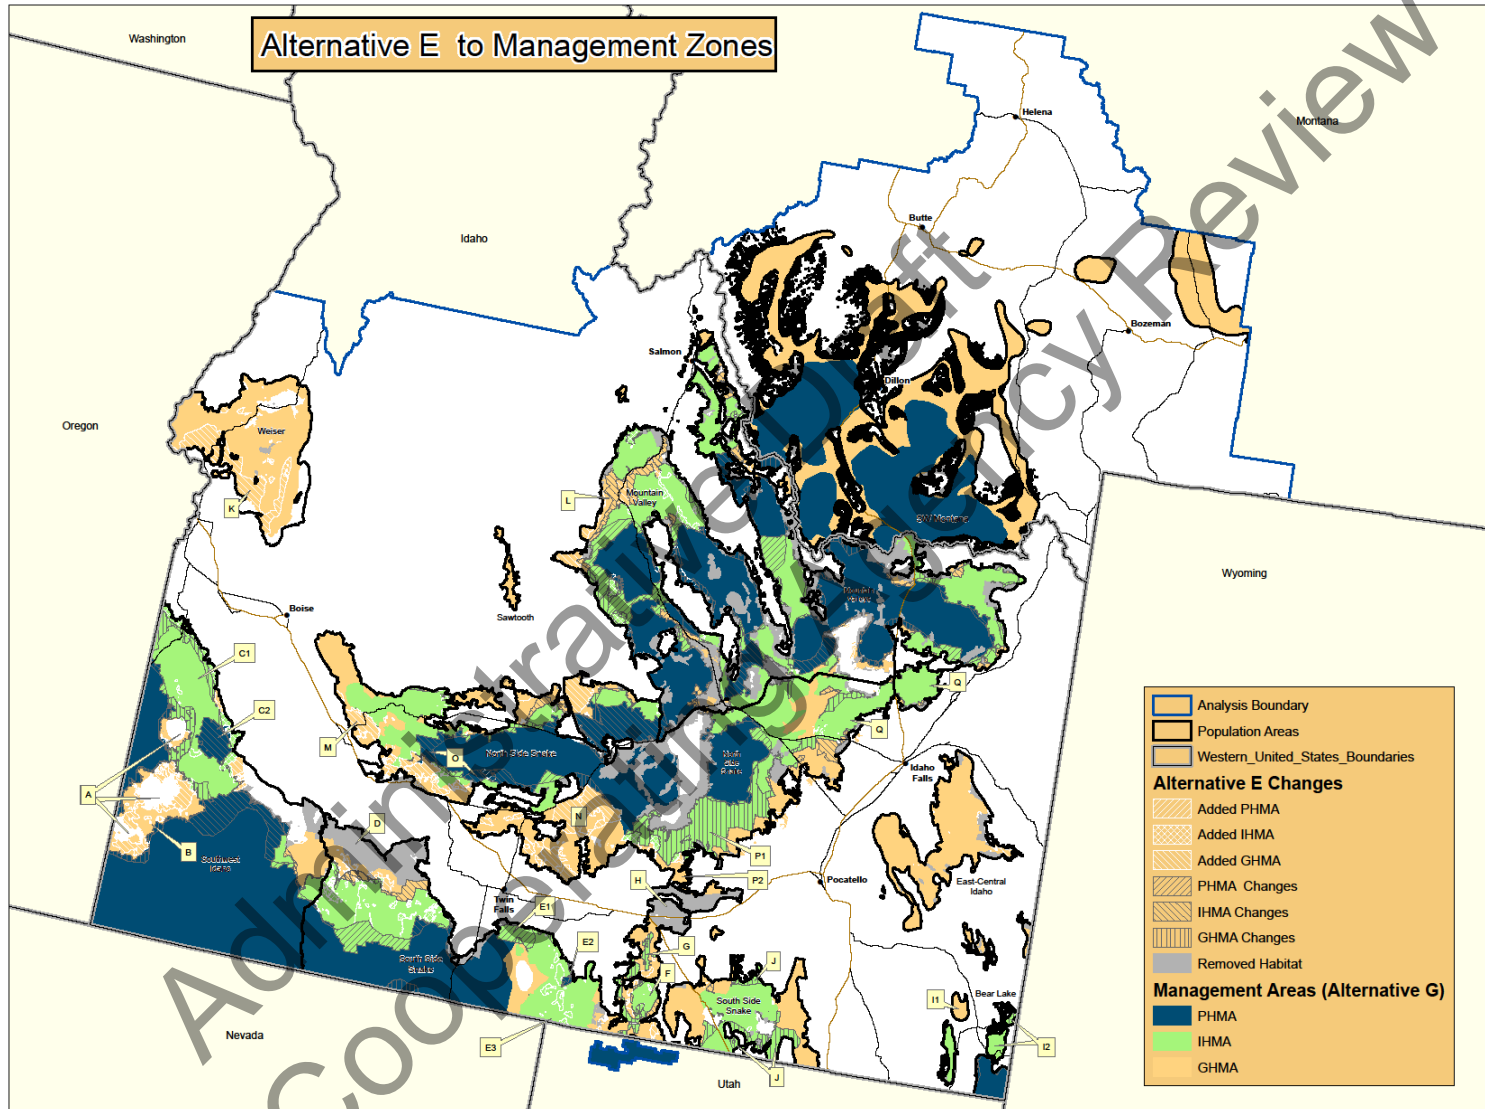

Conservation Area	Geographic Area	Initial Recommendation (BLM/FS field)	Final Decision and Rationale	Location and Acres (Depicted on Map 1)
		also had concerns with protecting connectivity.		
<b>SOUTHERN</b>				
	Jarbidge FO	Field recommended removal of General habitat at north end of FO that burns repeatedly and modification of some Core to Important in southern 1/3 of the area.	Adopted recommendation for final map.	D = 232,331 acres GHMA Removed
	Burley FO-South Hills	Field recommended changing Core in west half or so of the South Hills to Important, based on existing infrastructure, recreation activity. Also included and important area of winter habitat west of Oakley as Core and added some General to Middle Mountain area.	Adopted recommendations a noted. Also retained Goose Creek area as <u>Important</u> as in Alt E.	E1 = 39,260 acres South Hills E2 = 5,283 acres Priority E3 = 26,174 acres Goose Creek Area as IHMA
	Burley FO-Jim Sage	Field recommended making part of Jim Sage Core; additional edits to Important and General.	Majority of Jim Sage mapped as Important. Proposed Core was small area not readily implementable.	F = 47,629 acres IHMA in Jim Sage
	Burley FO-Cotterel	Field added some Important patches to top of Cotterels.	Adopted recommendation.	G = 14,279 acres IHMA on Cotterel Mountains
	Burley FO-No Mans/Basalt;	Field recommended removing the General habitat that extends from the	Adopted recommendation.	H = 137,827 acres Total of non-habitat

<b>Conservation Area</b>	<b>Geographic Area</b>	<b>Initial Recommendation (BLM/FS field)</b>	<b>Final Decision and Rationale</b>	<b>Location and Acres (Depicted on Map 1)</b>
	North of Interstate area.	north end of the Cotterels to Lake Walcott. There has been no known GRSG use for many years.		
	Pocatello FO-Bear Lake	Field cleaned up slivers and added some Core. Recommended dropping the larger "U" shaped area of General. Recommended two smaller polygons of I and G north of Bear Lake be Core.	Retained the U shaped area as General habitat as there are two leks just to south. The polygons north of Bear Lake were designated "Important".	I1 = 23,448 acres I2 = 39,249 acres IHMA N of bear lake
	Pocatello FO-Curlew area	Some additions/revisions to I and G.	Adopted recommendations.	J = 74,820 Habitat change from G to IHMA
<b>MOUNTAIN VALLEY</b>				
	Weiser	Field recommended adding substantial areas of Core and Important as well as additional, previously unmapped General based on additional scrutiny of imagery and lek information.	Keep <u>entire area as General</u> as shown in Alt E. Added in some additional General in SW portion based on imagery and adjacency to existing habitat. Size and number of leks did not justify proposed designation.	K = 181,308 acres GHMA added in the South
	Challis	Field did extensive, detailed work edge snapping. Added	Adopted the edge snapping and addition of General. Uniqueness and	L = 135,608 acres

Conservation Area	Geographic Area	Initial Recommendation (BLM/FS field)	Final Decision and Rationale	Location and Acres (Depicted on Map 1)
		some new General; changed a large area from Important (Alt E) to Core, per leks, uniqueness/isolated nature of area and connectivity with Moyer Basin to north.	isolated nature is not a characteristic considered in the classification.	Total GHMA habitat in the area
<b>DESERT</b>				
	Mountain Home	Field recommended certain “Restoration Type 2” (cheatgrass) areas shown on the “Key Habitat Map” be classified as Important. No leks. Adjacent to Interstate. Nesting habitat and winter habitat (in north half).	Adopted the addition of the R2 but classified as <u>General</u> . Since it is R2 (cheatgrass), it was difficult to justify as Important without more compelling information.	M = 44,939 acres GHMA added
	Wild Horse	Large area not on Alt D or E maps, but currently mapped as R2 (annual grassland) per the Key habitat map has ongoing restoration focus by Shoshone Field Office. Field recommended this area be added as Important. No significant lek presence (only one, small to south); majority is in between mapped winter areas.	Adopted addition of the R2 areas, but classified as <u>General</u> . Could be upgraded in future if restoration efforts show progress and GRSG use, but not justified as Important at this time.	N = 188,475 acres GHMA Added
	Core area in Shoshone FO	Some additional Core added by edge snapping exercise.	Adopted recommendation.	O = 79,687 acres
	Southern Big Desert area	Field recommended adding southern Big Desert area as Core due to leks, connectivity with Craters	Adopted S. Big Desert area as Important, adding to the overall area of PACs. Number and size of leks did not warrant Core designation.	P1 = 363,818 Total acres of IHMA in the South Desert and Brigham

Conservation Area	Geographic Area	Initial Recommendation (BLM/FS field)	Final Decision and Rationale	Location and Acres (Depicted on Map 1)
		<p>Nat. Monument core to the west and northern Big Desert Core. Also cut out some edge habitat that interfaced with agricultural land, lava.</p>	<p>Also designated <u>Important</u> for the areas generally adjacent to southern end of the Craters of the Moon National Monument lava in the Brigham Point Area etc. This added a small acreage to the overall are of initial PACs.</p> <p>Areas to the south of Power lines and east/south side of the Wapi flow were designated <u>General</u>.</p>	<p>Point Area</p> <p>P2 = 61,175 total of GHMA acres</p>
	<p>Idaho Falls/Roberts</p>	<p>Field recommended adding some areas of Core per snapping efforts around the edges.</p> <p>Added two small patches of Core near the Interstate; Added moderate sized Core area near Howe (but low lek density, no wintering habitat mapped).</p>	<p>Retained as Important. Changing the small patches near the Interstate to Core would create doughnut holes of different classification not implementable on the ground.</p>	<p>Q = 50,223 acres</p> <p>Stayed IHMA habitat</p>

# Appendix O

## Reasonably Foreseeable Development Scenario for Greater Sage-Grouse Habitat in the Idaho and Southwestern Montana Sub-Region

This Page Intentionally Blank

Administrative Draft  
Cooperating Agency Review

**O. Reasonably Foreseeable Development Scenario for Greater Sage-Grouse Habitat in Idaho and Southwestern Montana Sub-region**

**O.1 Introduction**

This Reasonably Foreseeable Development Scenario (RFDS) is a required component of the GRSG LUPA/EIS and addresses potential fluid mineral exploration and development over the next 15 years, and its resulting potential impact on leasing and development of federal and nonfederal lands and/or mineral rights within occupied GRSG habitat in the Idaho/southwest Montana sub-region. This RFDS applies primarily to BLM-administered and National Forest System lands and split-estate underlain by federal minerals, although it takes into consideration nonfederal development in the cumulative impact analysis.

This RFDS generally follows the procedures outlined in BLM Instruction Memorandum 2004-089, Policy for Reasonably Foreseeable Development Scenarios for Oil and Gas. It projects a baseline scenario of activity assuming that all potentially productive areas are open under standard lease terms and conditions, except those areas designated as closed to leasing by law, regulation, or executive order. Under these conditions, this RFDS provides a maximum development scenario. The effect of the alternatives on potential development is also included in this scenario.

**O.2 Oil and Gas Resources**

The reasonably foreseeable disturbance acreage associated with oil and gas development from existing plans is presented in Table B-1.

The Four Rivers RFDS concluded it was reasonable to anticipate 6 to 10 exploration wells would be drilled on Federal lands north of the Payette River east of Payette. Due to the recent discovery and development of private lands near New Plymouth, and because several expressions of interest have been received, the nearby Federal lands (some of which are split estate) are considered to have medium potential for the discovery and development of a natural gas resource. Leasing is deferred pending completion of the Four Rivers RMP/EIS. The lands are not located in GRSG habitat. Due to existing road density in the area, it was concluded that approximately one mile of temporary road would be required for each exploratory well.

The Jarbidge RFDS concluded it was reasonable to anticipate up to 2 exploration wells would be drilled, only because lands have been nominated for leasing on lands in the vicinity of Brown's Bench (leasing is deferred pending the completion of the Jarbidge RMP/EIS). The potential for discovery of an oil or gas resource is considered low. Therefore no field development is anticipated. Due to existing road density in the area, it was concluded that approximately two miles of temporary road would be required for each exploratory well. These lands are located in PPH.

**Table O-1**  
**Reasonably Foreseeable Development Scenario for the Idaho and Southwest Montana Sub-region**

Plan Name/RFDS	# of Exploration Wells Predicted	Acres of Drill Pads <sup>1</sup>	Miles of Road <sup>2</sup>	Acres of Roads <sup>3</sup>	Acres Disturbed from Exploration	# of Discovery Wells	Exploration Wells Reclaimed (acres)	# Step-out Wells	Acres Disturbed from Step-out	Total Permanent Disturbance (acres)
Four Rivers	6-10	18-30	8	40	48-80	1	35-65	4	32	46
Jarbidge	2	6	4	20	26	0	26	0	0	0
Pocatello	5	15	20	100	115	1	92	4	32	55
Dillon	6	18	10.5	105	123	2	100	4	32	55
Caribou NF	4	12	24	120	132	0	120	0	0	0
TOTALS	23-27	69-81	66.5	332.5 acres	401.5-413.5	4	376-406	12	96	156

<sup>1</sup> Assumes 3 acres each

<sup>2</sup> Miles of road per exploration well varies by RFDS. Miles of road for step-out wells equals one mile per well (in accordance with Idaho well spacing rule)

<sup>3</sup> Assumes 5 acres per mile

Administrative Draft  
Cooperating Agency Review

The Pocatello RFDS concluded it was reasonable to anticipate that 5 exploratory wells would be drilled, likely in the Bear Lake area. Lands have been nominated, but leasing is deferred pending the outcome of this EIS. The area has moderate potential for the discovery of a limited gas field (see oil and gas potential report for more information). Due to existing road density in the area, it was concluded that approximately four miles of temporary road would be required for each exploratory well. These lands are located in PPH.

The Dillon RFDS concluded it was reasonable to anticipate that 6 exploratory wells would be drilled, and each well would require 3.5 miles of temporary road. Of these wells, two are anticipated to encounter commercial quantities of oil or gas. Dillon predicted that 2 additional step-out wells would be drilled for each discovery well. Given the location of lands with moderate potential in the Dillon RFDS, it is assumed that three of the 6 exploratory wells would be located in PPH, and that one well would encounter commercial quantities of oil or gas, resulting in one three-well field.

The Caribou NF RFDS concluded it was reasonable to anticipate that 4 exploratory wells would be drilled, and that each well would require 6 miles of temporary road. Mineral potential is low to moderate. It is anticipated that the wells would be dry and that no field development would occur. It is assumed the wells would not be located in GRSG habitat.

Administrative Draft  
Cooperating Agency Review

**Table O-2**  
**RFDS by Alternative**

Alternative	# of Exploration Wells Predicted	Acres of Drill Pads (3 acres ea)	Total Miles of Road	Acres of Roads (5 ac. per mile)	Acres Disturbed from Exploration	Exploration Wells Reclaimed (acres)	# of Discovery Wells	# Step-out Wells	Acres Disturbed from Step-out	Total Permanent Disturbance (acres)	Geophysical Exploration Allowed?
Alternative A	25	75	66.5	332.5	401.5-413.5	376-406	4	12	96	156	Yes
Alternative B	13 <sup>1</sup>	39	34	170	209	209	2	6	48	73.5	No <sup>2</sup>
Alternative C	13 <sup>3</sup>	39	34	170	209	209	2	6	48	73.5	No
Alternative D	23 <sup>4</sup>	69	62.5	312.5	375.5-387.5	350-386	4	12	96	156	Yes, with TLs
Alternative E	19 <sup>5</sup>	57	45	275	332	203	4	10	80	128.5	Not addressed
Alternative F	13 <sup>6</sup>	39	34	170	209	209	2	6	48	73.5	No <sup>2</sup>
Proposed Plan	15 <sup>7</sup>	45	38	190	235	235	2	6	48	73.5	Yes, with TLs

<sup>1</sup> Alternative B is closed to leasing in PHMA. No leasing on Bear Lake Plateau (Pocatello) or Jarbidge. Assume half the number of wells in Dillon (assume half is in PHMA)

<sup>2</sup> Only allow geophysical exploration within PHMA to obtain exploratory information for areas outside of and adjacent to PHMA. Only allow geophysical operations by helicopter-portable drilling methods and in accordance with seasonal timing restrictions and/or other restrictions that may apply. Geophysical exploration shall be subject to seasonal restrictions that preclude activities in breeding, nesting, brood rearing and winter habitats during their season of use by GRSG.

<sup>3</sup> Alternative C is closed to leasing in PHMA. Since no wells are predicted in GHMA under Alternative B, numbers are the same as Alternative B.

<sup>4</sup> Alternative D no to low potential areas within PHMA or IHMA are closed to leasing. Therefore no leasing would be allowed in Jarbidge.

<sup>5</sup> Alternative E is open with NSO in PHMA and GHMA. This is the same as Alternative C in Idaho and same as Alternative A in MT (added 10 wells total for MT- 6 exploratory plus 4 step-outs).

<sup>6</sup> Alternative F is closed to leasing in PHMA (Same as Alternative B). No leasing on Bear Lake Plateau (Pocatello) or in Jarbidge, and assume half the number of wells in Dillon (assume half is in PHMA)

<sup>7</sup> Under the Proposed Plan, PHMA and IHMA are open to leasing, subject to NSO w/rare exceptions. Only those wells predicted in non-habitat would be drilled- include those in Four Rivers (8 wildcat + 4 step-out), half the wells in Dillon (3 wildcat + 2 step-out), and 4 wildcat wells in Caribou NF (no production predicted).

### O.3 Geothermal Resources

BLM currently has 19 existing geothermal leases, 11 of which are located in or near GRSG habitat. While most of the planning area has moderate potential for the discovery of a geothermal resource, it is predicted, for the purposes of this planning document, that the following 8 areas of public lands in Idaho are likely to experience exploration and possible development of the resource for the purposes of energy production:

- Raft River, in southern Cassia County: It is assumed that the operator of the existing 13 MW power plant would increase its output by drilling additional wells on adjacent public lands they now lease. It is also assumed that a different leaseholder would drill the 5 wells it has been approved to drill on public lands, as well as additional unspecified wells, to develop a second power plant at Raft River. It is likely the plant would be located on private land. FEIS update: Two leases have been terminated since publication of the DEIS. They were located in better GRSG habitat (north and west of existing leases) than the leases that remain. The five wells still have not been drilled, but lessee has submitted a new plan to drill a total of 18 wells on federal leases, as well as a utilization plan for a power plant to be located on private land. Assume a 25 mw power plant would be constructed (on private, with wells and pipelines on federal leases).
- Crane Creek, in Washington County: Lessee has drilled temperature gradient holes, but has not proposed development drilling to date. It is assumed, for planning purposes, that a power plant would be developed, possibly on-lease, requiring approximately 12 large bore production wells. FEIS update: no new activity has occurred and no new proposals have been submitted to BLM.
- Magic Reservoir, in Camas/Blaine Counties: Lessee has not done any exploration to date, however existing data indicates this has potential for power production. It is assumed that a small field would be discovered and a 10 MW power plant would be constructed. FEIS update: these two leases have been terminated. BLM has no plans to re-lease the area. The RFDS is therefore revised to no discovery or power plant construction.
- West of Weiser, in Washington County: Lessee has not performed any exploration to date. It is assumed that temperature gradient drilling would be conducted on lease. Due to the scattered land ownership pattern in this area, it is not assumed that the geothermal resource would be developed for energy production in the next 10 years. FEIS update: no activity has occurred and no proposals have been submitted to BLM. Castle Creek, in Owyhee County: Numerous water wells in the general area have encountered a higher geothermal gradient than normal, indicating a possible heat source at depth. Normal faulting provides a conduit for fluid flow. Leases offered but no bidders. It is not assumed that the resource would be developed for energy production in the next 10 years.

- Blackfoot/Grays Lake area, in Caribou/Bonneville Counties: higher than normal geothermal gradient indicated in an oil and gas well drilled in 1980's. No other information available. It is not assumed that the resource would be developed for energy production in the next 10 years.

## Slickspot Peppergrass Conservation Agreement

This Page Intentionally Blank

Administrative Draft  
Cooperating Agency Review

**CONSERVATION AGREEMENT****U.S. Bureau of Land Management – Idaho State Office****U.S. Fish and Wildlife Service –****Idaho Fish and Wildlife Office****September 2014****Idaho Bureau of Land Management Existing Land Use Plans and On-going  
Actions Affecting Slickspot Peppergrass****I. INTRODUCTION**

This Conservation Agreement updates the January 2013 agreement between the Idaho State Office Bureau of Land Management (BLM) and the Idaho Fish and Wildlife Office of the U.S. Fish and Wildlife Service (USFWS) to provide for the conservation of slickspot peppergrass related to existing Idaho BLM Land Use Plans (LUPs) and a subset of ongoing actions. The Conservation Agreement and associated conservation measures guide the BLM management actions and serve as a basis for consultation or conference on these LUPs between the BLM and the USFWS regarding slickspot peppergrass, a species proposed for listing under the Endangered Species Act (ESA) of 1973, as amended.

Land use plans provide guidance and direction for managing public lands administered by the BLM. They ensure that public land is managed in accordance with the intent of Congress as stated in the Federal Land Policy Management Act (FLPMA) (43 U.S.C. 1701 et seq.). Resource management planning is used by the BLM to allocate resources and select appropriate uses for public land. There are three LUPs that are addressed under the scope of this Conservation Agreement. The LUPs include the 1983 Kuna Management Framework Plan, the 1987 Jarbidge Resource Management Plan (RMP), and the 1988 Cascade RMP. At the time these LUPs were prepared, there was no requirement to consult with the USFWS on slickspot peppergrass. Currently LUP revisions are in progress for the Jarbidge Field Office and the Four Rivers Field Office that will update and replace these three LUPs. The BLM and the USFWS will consult on these revised LUPs when they are at the appropriate state of development and depending on the outcome of the proposed reinstatement of slickspot peppergrass as a threatened species under the ESA.

This Conservation Agreement also addresses on-going actions currently authorized by the BLM including livestock grazing, rights-of-way activities, and military training.

## **II. OBJECTIVE AND INTENT**

This Conservation Agreement is intended to promote the conservation of slickspot peppergrass, a species proposed for listing which has not yet undergone consultation or conference at the LUP level or for ongoing actions. The conservation measures describe desired recovery and conservation objectives with corresponding implementation actions and will be analyzed in the associated Biological Assessment (BA). These conservation measures replace or create guidance within the LUPs regarding programmatic management direction for slickspot peppergrass. It is the intent of the BLM and the USFWS that specific conservation measures will be fully implemented and that this Conservation Agreement will remain in effect and binding on both parties until such time as new LUPs or amendments are prepared with completed section 7 compliance as appropriate, and Records of Decision signed. At that time, programmatic management direction for slickspot peppergrass will be included in the new or revised LUP or amendment, and this Conservation Agreement, or portions thereof in the case of programmatic amendments, will no longer apply to the planning area. For example, this Conservation Agreement is not applicable to the Snake River Birds of Prey planning area as section 7 consultation has been completed on the 2008 Snake River Birds of Prey RMP, which contains management direction for slickspot peppergrass similar to what is found within Appendix A of the 2006 version of this Conservation Agreement. Additionally, the conservation measures associated with this agreement may be modified based on the current USFWS analysis of new information and assessment of threats being conducted as part of the listing determination process. Any additional information which becomes available prior to completion of the LUPs that may enhance conservation of the species, such as new information provided when the species is listed, critical habitat is designated, and/or a recovery plan completed; may trigger an update of conservation measures within this agreement.

While a high priority for the BLM, both the BLM and the USFWS recognize that funding constraints may affect the ability to implement specific conservation measures as planned. BLM will work to leverage stakeholder partnerships to allow for flexible cost recovery associated with conservation actions. Where funding is lacking, the BLM and the USFWS will cooperate to set priorities and adjust dates for accomplishment. In addition, minor modifications to conservation measures may be necessary as the conference process progresses. Any modification must be agreed to by the BLM and the USFWS, and shall not materially alter the meaning or intent of a conservation measure as stated at the time of signature of this agreement.

## **III. PARTIES TO THE CONSERVATION AGREEMENT**

U.S. Bureau of Land Management, Idaho; and  
U.S. Fish and Wildlife Service, Idaho Fish and Wildlife Office

## **IV. AUTHORITY FOR CONSERVATION AGREEMENTS**

The commitments and actions in this Conservation Agreement are within existing authorities of the signatory agencies. The primary authority for the USFWS and the BLM to enter into this Conservation Agreement derives from the ESA.

The primary purpose of the ESA is to provide a means whereby ecosystems upon which endangered and threatened species depend may be conserved. Section 7(a) directs Federal agencies to utilize their authorities (e.g., FLPMA) in furtherance of the purposes of this Act by carrying out programs for the conservation of endangered species and threatened species. Further, under Section 7(b), each Federal agency is expected to, in consultation and with the assistance of the USFWS, ensure that any action authorized, funded or carried out by the agency is not likely to jeopardize the continued existence of any endangered or threatened species. Section 3 of the ESA includes the following definition for conservation as is intended under this Conservation Agreement:

The terms “conserve,” “conserving,” and “conservation” mean to use and the use of all methods and procedures which are necessary to bring any endangered species or threatened species to the point at which the measures provided pursuant to this Act are no longer necessary. Such methods and procedures include, but are not limited to, all activities associated with scientific resources management such as research, census, law enforcement, habitat acquisition and maintenance, propagation, live trapping, and transplantation, and, in the extraordinary case where population pressures within a given ecosystem cannot be otherwise relieved, may include regulated taking.

Additional authorities for the USFWS derive from the Fish and Wildlife Act of 1956, as amended; and the Fish and Wildlife Coordination Act, as amended.

In addition to the ESA, FLPMA (43 U.S.C. 1701 et. seq) provides the BLM with the authorities required for this Conservation Agreement:

The public lands be managed in a manner that will protect the quality of scientific, scenic, historical, ecological, environmental, air and atmospheric, water resource, and archeological values; that, where appropriate, will preserve and protect certain public lands in their natural condition; that will provide food and habitat for fish and wildlife and domestic animals; and that will provide for outdoor recreation and human occupancy and use.

The BLM Special Status Species Management Manual 6840 provides specific policy guidance as it pertains to the ESA, FLPMA and this Conservation Agreement. For listed species, the policy states the following:

being conducted as part of the listing determination process. Responsibilities for implementing the actions are indicated, along with time frames for implementation. Most of the conservation measures will be implemented as standard operating actions conducted during day-to-day management activities. In addition, LUP conservation measure guidance and direction will be applied to ongoing actions. However, as site-specific information will be available for the ongoing actions, additional conservation measures may be considered.

## **Part 1: Programmatic Planning**

Programmatic planning conservation measures include those that are needed for consultation at all planning levels including future LUPs, ongoing activities and proposed projects. In addition to the existing LUP conference activities, the BLM will complete all necessary section 7 compliance for new or revised LUPs that may affect this species and its habitat.

## **Part 2: Projects/Activity Plans – Planning and Implementation**

### **A. Ongoing Actions**

This category includes all activities currently ongoing and permitted on BLM land. These include actions that have gone through the agency planning process and have a documented agency decision (decision memorandum, decision notice, or record of decision). The BLM will complete section 7 compliance for ongoing activities that have the potential to directly affect an element occurrence and associated occupied slickspot peppergrass habitat concurrent with the conference effort for existing LUPs. The BLM will also adaptively manage all ongoing activities as described in the associated Biological Assessment, and adjust the action as appropriate to ensure management objectives for slickspot peppergrass are met.

### **B. Proposed Actions**

This category includes all new proposed projects or activities as well as all renewal actions. Project-level inventories will be completed as appropriate during project planning if inventory information is not available or adequate to determine if impacts to the species or habitat may occur. If direct or indirect negative impacts to the species or its habitats are anticipated as a result of new BLM actions, the activity will be modified to avoid or minimize anticipated negative impacts. The BLM will complete all necessary section 7 compliance for new activities that may affect this species and its habitat.

### **Part 3: Monitoring**

Conservation measures for slickspot peppergrass include a provision to implement adaptive management as needed to achieve conservation objectives. At the project level, this will be accomplished by conducting site-specific implementation and effectiveness monitoring to track progress toward achieving the conservation measures. The BLM and the USFWS Level 1 Teams will meet annually to review the implementation and effectiveness monitoring results for projects of concern, determine if current management actions are on a trajectory toward meeting management goals within the established time frames, and modify management actions as needed if progress toward goals is inadequate. Implementation of the programmatic and on-going actions conservation measures will be monitored through the reporting and monitoring requirements of this Conservation Agreement (Section VII).

### **VII. CONSERVATION AGREEMENT MONITORING AND REPORTING**

The agencies agree to a joint, annual review in October of each year to assess progress in implementing this Conservation Agreement. In addition, monitoring specific to forage kochia use will be assessed by BLM and FWS every 5 years to inform future use of this species as a tool and determine if changes to conservation measures (e.g. buffer widths) regarding use of this species are appropriate. Any recommendations will be presented to the Idaho BLM State Director and the USFWS Field Office Supervisor by November of each year. This review could lead to the modification and exceptions discussed in Section VIII below. These modifications or exceptions will be formalized within the scope of this Conservation Agreement.

### **VIII. AMENDMENTS, EXCEPTIONS, AND DURATION OF AGREEMENT**

Exceptions or amendments to this agreement may be jointly agreed to by the signatories on a case-by-case basis, where such changes would better provide for protection and conservation of species, where conflicts must be resolved between species, where priorities need to be adjusted due to funding constraints, or, when new, relevant scientific information becomes available. Such exceptions or amendments shall be agreed to by modification. All modifications within the scope of this agreement shall be made by issuance of a modification executed by all parties prior to any changes being performed.

This agreement shall be considered fully executed when all signatories have signed. The agreement shall remain in effect and binding on both parties until such time as new land use plans or amendments are completed which contain programmatic management direction for slickspot peppergrass, when section 7 compliance under the Endangered Species Act of 1973, as amended, is completed, and when Records of Decision are signed.

**IX. QUALIFICATIONS AND CONTACTS**

This agreement in no way restricts any of the signatories from participating in similar activities with other public or private agencies, organizations, and individuals. This agreement is neither a fiscal nor a funds obligations document. Any endeavor involving reimbursement or contribution of funds between the parties to this agreement will be handled in accordance with applicable laws, regulations, and procedures including those for government procurement and printing. Such endeavors will be outlined in separate agreements that shall be made in writing by representatives of the parties and shall be independently authorized by appropriate statutory authority. This agreement does not provide such authority. Specifically, this agreement does not establish authority for non-competitive award to the cooperator of any contract or other agreement. Any contract or agreement for training or other services must fully comply with all applicable requirements for competition.

The principal contacts for this agreement are:

<b>LUP Programs Evaluated</b>	<b>Conservation Measures</b>	<b>BLM Implementation Actions</b>
<p>Special Status Animal and Plant Management Note: Common to All Programs</p>	<p>The conservation measures contained throughout this table implement important elements included in the Candidate Conservation Agreement (CCA) for slickspot peppergrass. The conservation measures reflect BLM's commitment to support species conservation.</p> <p>1) In cooperation with Idaho Department of Fish and Game (IDFG) Idaho Natural Heritage Program (INHP), U.S. Fish and Wildlife Service (USFWS), Idaho Army National Guard (IDARNG), the U.S. Air Force (USAF), and others:</p> <p>a) Develop and use survey protocols consistent with the USFWS Rare Plant Survey Guidelines to conduct Stage 1, 2, and 3 surveys (see Figure 2 at the end of this table for the general survey process).</p> <p>b) Cooperate to refine slickspot peppergrass habitat and potential habitat maps (Stage 1 survey, Figure 2), and to identify and map slickspot peppergrass occurrences (Stage 2 survey, Figure 2).</p>	<p>The implementation actions reflect BLM's commitment to support species conservation and meet ESA objectives. Actions apply to BLM lands and activities only. Habitat terms used throughout this document are defined in <b>Appendix B: Definitions</b>.</p> <p>1) Following actions to be completed in cooperation with others:</p> <p>a) Apply current survey methods, and assure that inventories are done at the appropriate time of the year by qualified botanists, or by persons who are under the guidance of botanists.</p> <p>b) Surveys, mapping, and data management (refer to Figure 2 , <i>Inventory Flowchart for Slickspot Peppergrass</i>, at the end of this table):</p> <p>i) Cooperate with IDFG, INHP, and USFWS to record, refine, and map all habitat features including potential habitat, slickspot peppergrass habitat, non-habitat, occupied habitat, and element occurrences (EOs), for BLM lands (see Appendix B, <i>Definitions</i>). Use current GIS standards for mapping and database management. In cooperation with INHP, maintain a spatial database of species population and habitat information for BLM lands.</p> <p>ii) BLM will continue to conduct Stage 1 and 2 surveys, report survey information to the INHP, and incorporate the information into the adaptive management strategy.</p>

LUP Programs Evaluated	Conservation Measures	BLM Implementation Actions
	<p>c) Cooperate in regular monitoring of slickspot peppergrass population trends and land health conditions on BLM lands, and follow current monitoring protocols. Land health conditions include forb diversity to support pollinators and habitat for slickspot peppergrass.</p>	<p>iii) BLM's intent will be to continue to conduct Stage 1 and Stage 2 surveys concurrently with the goal of completing these surveys within 10 years. BLM will work collaboratively with USFWS to prioritize new survey areas based on areas that have a high likelihood of species occurrence, or that are needed for BLM project purposes. The amount of habitat to be surveyed each year will be based on available annual funding and staffing. As of 2013, approximately 10,000 acres have had three years of surveys completed and are now classified as unoccupied slickspot peppergrass habitat (see Figure 2).</p> <p>iv) Prioritize Stage 2 surveys to address slickspot peppergrass habitat with a high likelihood of species occurrence. Surveys should be scheduled to complement other program needs. Coordinate surveys annually with USFWS.</p> <p>c) Follow the Habitat Integrity and Population (HIP) monitoring protocol or other accepted methodology. BLM will cooperate with others to conduct annual monitoring within all EOs on BLM lands to assess the effectiveness of the conservation measures as part of the adaptive management strategy.</p> <p>i) Establish permanent ecological reference areas (ERAs) in selected EOs to evaluate land health conditions associated with slickspot peppergrass.</p> <p>ii) Use data from the ERAs to assist in completing land health assessments. This information will be used to evaluate permitted management actions and to design restoration projects for slickspot peppergrass.</p>

LUP Programs Evaluated	Conservation Measures	BLM Implementation Actions
	<p><u>d)</u> Participate in research essential to conservation of the species</p> <p><u>e)</u> Continue to support seed banks in a long-term seed storage facility.</p> <p><u>f)</u> Support the establishment and maintenance of new populations in habitat categories for slickspot peppergrass. The goal of these activities is to maintain or enhance viable populations.</p> <p><b>2)</b> Ensure that ongoing Federal actions support or do not preclude species conservation in habitat categories for slickspot peppergrass.</p>	<p><u>d)</u> BLM will participate in research as funding allows. Areas to focus on include, but are not limited to, the following:</p> <p><i>i)</i> Elimination and control of invasive species.</p> <p><i>ii)</i> Effects of ground disturbance (including fire) and seed predation on the species.</p> <p><i>iii)</i> Determination of specific limiting factors in terms of habitat needs and characteristics.</p> <p><i>iv)</i> Population viability analyses.</p> <p><u>e)</u> As needed, provide funding to a suitable repository to support a seed bank.</p> <p><u>f)</u> Reintroduce slickspot peppergrass at selected experimental reintroduction or historic sites as funding allows.</p> <p><b>2)</b> Ongoing BLM authorized activities:</p> <p><u>a)</u> Based on the results of annual Stage 1 and 2 surveys, review ongoing activities in habitat categories for slickspot peppergrass. The Level 1 Team will conduct these reviews in a manner consistent with streamlining procedures where local section 7 compliance activities with USFWS (if necessary) have not yet been completed.</p> <p><u>b)</u> If reviews indicate that direct or indirect negative impacts to the species or its habitat are occurring as a result of ongoing discretionary BLM actions, the activity will be modified to avoid or minimize anticipated negative impacts and, where feasible, promote species</p>

LUP Programs Evaluated	Conservation Measures	BLM Implementation Actions
	<p>3) Ensure that new Federal actions support or do not preclude species conservation in habitat categories for slickspot peppergrass.</p>	<p>conservation.</p> <p>c) Where needed, complete Section 7 compliance for ongoing activities that may affect this species and its habitat. Following the annual review of Stage 1 and 2 surveys outlined in (2)(a) above, initiate section 7 compliance activities for ongoing actions, as appropriate.</p> <p>d) Where habitat categories for slickspot peppergrass exists, BLM will conserve remaining stands of sagebrush and native vegetation in making activity plan and project level decisions.</p> <p>3) New proposed BLM authorized activities:</p> <p>a) Consistent with streamlining procedures, BLM will require project-level inventory data for any project in slickspot peppergrass habitat and in potential habitat during project planning if inventory information is not available or adequate. BLM will use the protocols described in (1)(a).</p> <p>b) If direct or indirect negative impacts to the species or its habitat are anticipated as a result of new BLM actions, the activity will be modified to avoid or minimize negative impacts and, where feasible, promote species conservation.</p> <p>c) Where needed, complete section 7 compliance for new activities that may affect this species and its habitat.</p> <p>d) Where habitat categories for slickspot peppergrass exists, BLM will conserve remaining stands of sagebrush and native vegetation in making activity plan and project level decisions.</p>

<b>LUP Programs Evaluated</b>	<b>Conservation Measures</b>	<b>BLM Implementation Actions</b>
	<p>4) Implement adaptive management as needed to achieve conservation objectives.</p> <p>5) Support programs to conserve and enhance slickspot peppergrass on non-Federal lands.</p> <p>6) Include language in all use authorizations to require rehabilitation of habitat categories for slickspot peppergrass and in the case of trespass or permit violations, if damage occurs.</p>	<p>4) Conduct site-specific implementation and effectiveness monitoring of management actions. Adjust management as needed to ensure that management objectives are met. See additional details within other programs.</p> <p>5) Take advantage of opportunities to support conservation of slickspot peppergrass through easements, cooperative management efforts, and other programs.</p> <p>6) As a part of use authorizations / violations (to include but not limited to rights-of-way, grazing and off highway vehicle (OHV) trespass), require rehabilitation to native vegetation in habitat categories for slickspot peppergrass if trespass or permit violation occurs and the habitat is damaged. If ecological site conditions preclude the use of native species, use non-invasive, non-native plant species for rehabilitation in trespass or permit violation situations.</p>
Air Resources	None	None
Soil and Water Resources: Riparian/Wetland Areas (includes weed management)	None	None
Upland Vegetation Management: Rangelands (includes weed management)	<p>1) Activities within the <b>Upland Vegetation Management: Rangelands (includes weed management)</b> program will implement relevant conservation measures as described in the <b>Special Status Animal and Plant Management</b> program section to promote conservation. As a part of promoting conservation, the goals are to promote habitat conservation, to avoid negative impacts, or to minimize impacts if avoidance is not possible.</p> <p>2) Although non-chemical methods will be the preferred approach in occupied habitat,</p>	<p>1) Apply relevant conservation measures from the <b>Special Status Animal and Plant Management</b> program section at the beginning of this table.</p> <p>2) Site-specific stipulations will be developed locally using these criteria:</p>

<b>LUP Programs Evaluated</b>	<b>Conservation Measures</b>	<b>BLM Implementation Actions</b>
	<p>when appropriate, projects involving the application of pesticides (including herbicides, fungicides, and other related chemicals) in habitat categories for slickspot peppergrass that may affect the species will be analyzed at the project level and designed such that pesticide applications will support conservation and minimize risks of exposure.</p> <p>3) Where needed and feasible, coordinate with adjacent land owners and local governments regarding control of noxious weeds in upland areas through cooperative weed management programs. One of BLM's priorities within the cooperative weed management program is the protection of special status plants on BLM lands.</p>	<p>a) Evaluate the benefits and risks of vegetation treatment including the following: application methods; pesticides, carriers, and surfactants used; needed treatment buffers; and use of non-chemical weed control (for example, bio-controls, hand pulling).</p> <p>b) Apply appropriate spatial and temporal buffers to avoid species' exposure to harmful chemicals.</p> <p>c) Explore opportunities to eradicate competing non-native invasive plants in habitat categories for slickspot peppergrass where slickspots are being invaded by such plants.</p> <p>d) Implement appropriate revegetation and weed control measures to reduce the risks of non-native invasive plant infestations following ground/soil disturbing actions in habitat categories for slickspot peppergrass.</p> <p>e) BLM will provide USDA APHIS with the location of habitat categories of slickspot peppergrass. Mormon cricket, grasshopper, or other insect control in habitat categories for slickspot peppergrass will only include those methods that minimize impacts to the plant's pollinators.</p> <p>3) Take advantage of coordination opportunities as they arise.</p>

<b>LUP Programs Evaluated</b>	<b>Conservation Measures</b>	<b>BLM Implementation Actions</b>
	<p>4) BLM will promote diversity, richness, and health of native plant communities to support pollinators and habitat for slickspot peppergrass.</p>	<p>4) BLM will focus slickspot peppergrass habitat conservation and restoration efforts in habitat categories for slickspot peppergrass to encourage connectivity among populations through the following measures:</p> <p>a) Where habitat categories for slickspot peppergrass exist, BLM will conserve remaining stands of sagebrush and native vegetation in making activity plan and project level decisions.</p> <p>b) Vegetation treatment projects undertaken in habitat categories for slickspot peppergrass will be compatible with species habitat restoration objectives, as described in item (d) below.</p> <p>c) BLM will select and implement specific projects to restore habitat categories for slickspot peppergrass in degraded areas as funding allows, such as planting shrubs and forbs and controlling weeds, within and adjacent to occupied habitat. Apply methods described in item (d) below.</p> <p>d) When conducting vegetation treatment projects in habitat categories for slickspot peppergrass, BLM will use seeding techniques that minimize soil disturbance such as minimum-till drills and rangeland drills equipped with depth bands, use native plant materials and seed during restoration activities, and select native forbs that benefit slickspot peppergrass insect pollinators.</p>
<p>Forest and Woodland Management (includes weed management)</p>	<p>None</p>	<p>None</p>
<p>Wildlife and Wildlife Habitat</p>	<p>1) Activities within the <b>Wildlife and Wildlife Habitat Management</b> program will</p>	<p>1) Apply relevant conservation measures from the <b>Special Status Animal and</b></p>

<b>LUP Programs Evaluated</b>	<b>Conservation Measures</b>	<b>BLM Implementation Actions</b>
Management	<p>implement relevant conservation measures as described in the <b>Special Status Animal and Plant Management</b> program section to promote conservation.</p> <p>2) Manage facilities installed for wildlife to promote maintenance of habitat categories for slickspot peppergrass.</p> <p>3) Restore wildlife habitat while promoting slickspot peppergrass conservation.</p>	<p><b>Plant Management</b> program section at the beginning of this table.</p> <p>2) For review of ongoing actions, see <b>Special Status Animal and Plant Management</b> program section item (2). For new actions, see <b>Special Status Animal and Plant Management</b> program section item (3). As appropriate to avoid or minimize negative impacts, modify existing and avoid placement of new wildlife facilities in occupied habitat.</p> <p>3) Any restoration efforts for wildlife within habitat categories for slickspot peppergrass will be compatible with the species' habitat requirements.</p>
Fish and Aquatic Habitat Management	None	None
Livestock Grazing Management: Permits and Leases	<p>1) Activities within the <b>Livestock Grazing Management: Permits And Leases</b> program will implement relevant conservation measures as described in the <b>Special Status Animal and Plant Management</b> program section to promote conservation.</p> <p>2) Manage livestock grazing and trailing to conserve suitable habitat conditions for slickspot peppergrass while implementing rangeland health standards and guidelines (S&amp;Gs). Apply the <i>Implementation of Annual Grazing Adaptive Management</i> (Figure III.C-2), located at the end of this conservation measures table, to adjust livestock use as appropriate.</p>	<p>1) Apply relevant conservation measures from the <b>Special Status Animal and Plant Management</b> program section at the beginning of this table</p> <p>2) Permit or lease renewal actions and annual authorizations:</p> <p>a) For review of ongoing actions, see <b>Special Status Animal and Plant Management</b> program section item (2).</p> <p>b) Schedule surveys in habitat categories for slickspot peppergrass as needed for S&amp;G assessments associated with permit and lease renewals. Use survey procedures and flowchart (<b>Figure 2, Inventory Flowchart for Slickspot Peppergrass</b>) referenced in <b>Special Status Animal and Plant Management</b> program section 1(b).</p>

LUP Programs Evaluated	Conservation Measures	BLM Implementation Actions
		<p>c) For new actions, see <b>Special Status Animal and Plant Management</b> program section item (3).</p> <p>d) As part of adaptive management to avoid or minimize negative impacts, modify livestock grazing activities as outlined in <b>Figure 1. Implementation of Annual Grazing Adaptive Management</b>, located at the end of this conservation measures table. In addition, the following measures will be implemented, as appropriate:</p> <p>i) As part of range readiness assessments, delay livestock turnout when saturated soils are a negative factor in slickspot peppergrass species conservation.</p> <p>ii) Minimize gathering livestock in element occurrences (EOs).</p> <p>iii) Avoid impacts to EOs from herd movement through rested and deferred pastures.</p> <p>iv) Trailing permits will not be authorized through EOs unless conducted on existing roads in accordance with FWS 2012 Letter of Concurrence. In the Jarbidge FO of the Twin Falls District, no livestock trailing will be authorized through EOs, proposed critical habitat, or occupied habitat. In the Four Rivers FO of the Boise District, livestock trailing permits will not be authorized through EOs, proposed critical habitat, or occupied habitat unless conducted on existing roads or historic routes described within the Four Rivers FO 2012 livestock trailing consultation with FWS (FWS tracking number 01EIFW00-2012-I-0206).</p> <p>v) Sheep grazing permits will be modified to restrict bedding, trailing, or watering herds within 1/2 mile of EOs.</p>

LUP Programs Evaluated	Conservation Measures	BLM Implementation Actions
	<p>3) As part of adaptive management, BLM will conduct scheduled compliance inspections in pastures with occupied habitat as part of BLM range use supervision to minimize impacts.</p>	<p>vi) Supplements will be placed at least 1/2 mile from EOs. Supplements will be placed so that livestock are drawn away from the EO and avoid trailing through the EO en route to the supplement or a water source. Management requirements will be adjusted to maintain an appropriate distance between supplements and existing EOs to avoid impacts.</p> <p>vii) No new domestic horse AUMs will be authorized in pastures containing EOs to avoid trampling impacts.</p> <p>3) BLM, in coordination with the USFWS, will create a schedule to prioritize compliance inspections associated with livestock grazing permits in occupied habitat areas. These compliance inspections are a complement to the HIP monitoring listed under Special Status Animal and Plant Management and where practical the efforts may be combined. BLM staff will conduct inspections as determined by the schedule.</p> <p>a) BLM range staff will conduct pre-season range readiness checks for soil moisture conditions in allotments with occupied habitat.</p> <p>b) BLM will conduct post-use monitoring for trampling in slickspots within EOs (could be done in conjunction with utilization compliance checks).</p> <p>c) Monitoring results will be documented in a standard format (to be developed by BLM) in the grazing allotment files. Copies will be provided to the USFWS as completed.</p>

LUP Programs Evaluated	Conservation Measures	BLM Implementation Actions
	<p>4) Provide adequate rest from livestock use for areas treated after major disturbances in habitat categories for slickspot peppergrass. Major disturbances may include fire, fire rehabilitation, or other soil-disturbing occurrences.</p> <p>5) BLM will work cooperatively with the livestock permittees to promote slickspot peppergrass conservation.</p>	<p>d) Apply Grazing Adaptive Management Implementation Flowchart as outlined in Figure 1.</p> <p>4) Protect treated areas by using temporary livestock closures or other measures. The length of rest will be determined by achieving certain goals associated with plant establishment outlined in the restoration, fire rehabilitation, or other plan.</p> <p>5) BLM will train permittees on slickspot peppergrass plant and habitat recognition. BLM will also work with permittees to use the INHP rare plant observation form to report survey information in a standard format.</p>
<p>Livestock Grazing Management: Livestock Management Facilities</p>	<p>1) Activities within the <b>Livestock Grazing Management: Livestock Management Facilities</b> program will implement relevant conservation measures as described in the <b>Special Status Animal and Plant Management</b> program section to promote conservation.</p> <p>2) Manage livestock facilities to promote slickspot peppergrass conservation while implementing rangeland health S&amp;Gs.</p>	<p>1) Apply relevant conservation measures from the <b>Special Status Animal and Plant Management</b> program section at the beginning of this table.</p> <p>2) For review of ongoing actions, see <b>Special Status Animal and Plant Management</b> program section item (2). For new actions, see <b>Special Status Animal and Plant Management</b> program section item (3). As appropriate to avoid or minimize negative impacts, modify existing and avoid placement of new livestock facilities in occupied habitat areas.</p> <p>a) Within pastures, place water facilities to support slickspot peppergrass conservation:</p> <p>i) Existing water troughs (includes troughs that are tied into pipelines, as well as both permanent and movable troughs to which water is delivered throughout the grazing season) will be</p>

LUP Programs Evaluated	Conservation Measures	BLM Implementation Actions
		<p>moved at least 1/2 mile from EOs, when feasible. Where troughs cannot be moved (for example, because of topographical constraints, additional disturbance, or impacts to sensitive species), management will be adjusted to mitigate the impacts during the periods of critical concern for slickspot peppergrass (such as when soils are saturated and subject to trampling impacts). Management adjustments could include shutting the water off seasonally, changing pasture boundary fences, or other appropriate measures.</p> <p><i>ii</i>) New water troughs (not including existing water troughs moved in (2)(a)(i), above) will be placed at least 1 mile from EOs. A deviation from this standard may be developed on a case-by-case basis through collaboration with the USFWS. New water troughs will be placed so that cattle are drawn away from the EO and avoid trailing through an EO en route to a water source.</p> <p><i>iii</i>) Temporary water troughs (short-term, emergency, or single-season use) will be located at least 1 mile from EOs. A deviation to this standard may be developed on a case-by-case basis through collaboration with the USFWS. New water troughs will be placed so that cattle are drawn away from the EO and avoid trailing through an EO en route to a water source.</p> <p><i>b</i>) Placement of new livestock infrastructure will be compatible with slickspot peppergrass habitat conservation. ESA consultation is required if new fencing is proposed in EO's.</p>
Wild Horse Management	1) Activities within the <b>Wild Horse Management</b> program will implement relevant conservation measures as described in the <b>Special Status Animal and Plant</b>	1) Apply relevant conservation measures from the <b>Special Status Animal and Plant Management</b> program section at the beginning of this table.

LUP Programs Evaluated	Conservation Measures	BLM Implementation Actions
	<p><b>Management</b> program section to promote conservation.</p> <p>2) If the range of wild horses and slickspot peppergrass occupied habitat overlaps now or in the future, protect these areas from wild horses by including applicable conservation measures in herd management plans.</p>	<p>2) Manage wild horse herd size to minimize conflicts with slickspot peppergrass. Limit trampling in occupied habitat by implementing appropriate range management practices, such as fencing and water trough placement.</p>
<p>Recreation Management</p>	<p>1) Activities within the <b>Recreation Management</b> program will implement relevant conservation measures as described in the <b>Special Status Animal and Plant Management</b> program section to promote conservation.</p> <p>2) Developed facilities (paved campgrounds, vault toilets, interpretive kiosks, etc.): Manage existing and new recreation facilities to promote conservation of species habitat.</p>	<p>1) Apply relevant conservation measures from the <b>Special Status Animal and Plant Management</b> program section at the beginning of this table.</p> <p>2) Management of existing and new facilities:</p> <p>a) For review of <b>existing facilities</b>, see <b>Special Status Animal and Plant Management</b> program section item (2). As appropriate to avoid or minimize negative impacts, modify existing facilities.</p> <p>b) For <b>new facilities</b>, or for expansion of uses at existing facilities, see <b>Special Status Animal and Plant Management</b> program section item (3). In addition, avoid development of new recreation facilities or expansion of existing facilities in habitat categories of slickspot peppergrass if negative impacts are anticipated.</p> <p>c) BLM will educate recreationists on special status species and invasive weeds, focusing on occupied and selected habitat areas. BLM will develop and install educational signage at entry points and key recreational points regarding the biology and conservation of this species and other special status species.</p>

<b>LUP Programs Evaluated</b>	<b>Conservation Measures</b>	<b>BLM Implementation Actions</b>
	<p><b>3)</b> Dispersed use areas (informal areas, including camping areas and tie-up areas for pack animals): Manage dispersed use sites to promote conservation of species habitat. This includes limiting disturbances to the species resulting from human uses.</p> <p><b>4)</b> Commercial and noncommercial recreation permits, including hunting guides and outfitter camps: issue commercial and noncommercial recreation permits to promote conservation of habitat categories for slickspot peppergrass. This includes management of physical facilities (such as camps), as well as disturbances to habitat categories for slickspot peppergrass resulting from human uses.</p>	<p><b>3)</b> For review of ongoing activities, see <b>Special Status Animal and Plant Management</b> program section item (2). In addition, minimize human activity in and adjacent to occupied habitat if negative impacts are occurring. Close areas, either seasonally or year-round, as needed to protect the species and its habitat.</p> <p><b>4)</b> Issuance and review of existing and new permits:</p> <p>a) For review of existing permits, see <b>Special Status Animal and Plant Management</b> program section item (2). If needed, modify existing permits that negatively impact habitat for this species.</p> <p>b) For new permits, see <b>Special Status Animal and Plant Management</b> program section item (3). Avoid issuing recreation permits in habitat categories of slickspot peppergrass if negative impacts are expected. In particular, avoid permitting new recreation activities in and adjacent to occupied habitat. If a recreation permit is to be issued, apply stipulations to the permit to support or to not preclude species conservation and educate permit holders about species' biology and needs.</p> <p>c) BLM will not authorize organized recreation activities in habitat categories for slickspot peppergrass if negative impacts are anticipated (for example, OHV races, equestrian events, and other events).</p>
<p>Recreation Management: Travel Management</p>	<p><b>1)</b> Activities within the <b>Recreation Management: Travel Management</b> program will implement relevant conservation measures as described in the <b>Special Status Animal and Plant Management</b> program section to promote conservation.</p>	<p><b>1)</b> Apply relevant conservation measures from the <b>Special Status Animal and Plant Management</b> program section at the beginning of this table.</p>

LUP Programs Evaluated	Conservation Measures	BLM Implementation Actions
	<p>2) Manage roads, OHV routes and areas, as well as non-motorized trails, to promote species habitat conservation. This includes management of roads and trails, as well as ground disturbance resulting from human uses.</p> <p>3) Perform compliance checks on OHV closures to protect occupied habitat, identify problems as soon as possible, and take immediate corrective measures.</p>	<p>2) Review of existing and new roads, OHV routes and areas, and non-motorized trails:</p> <p>a) For existing roads, designated OHV routes and areas, and designated non-motorized trails, see <b>Special Status Animal and Plant Management</b> program section item (2). Modify roads and routes in and adjacent to habitat categories for slickspot peppergrass if negative impacts are occurring. Implement restrictions to reduce ground disturbance. Seek opportunities to close and revegetate roads, OHV routes, or non-motorized trails and use areas in and adjacent to habitat if negative impacts are occurring.</p> <p>b) For new roads, OHV routes and areas, and non-motorized trails, see <b>Special Status Animal and Plant Management</b> program section item (3). Avoid creating new roads, trails, routes, and areas if negative impacts are expected in and adjacent to habitat categories of slickspot peppergrass</p> <p>c) Evaluate off-road vehicle use in occupied habitat, and where needed, limit access or close areas to motorized and mechanical vehicles to promote species conservation.</p> <p>3) See <b>Special Status Animal and Plant Management</b> program section item (2).</p>
Visual Resource Management	None	None
Special Designation Area Management	1) Activities within the <b>Special Designation Area Management</b> program will implement relevant conservation measures as described in the <b>Special Status Animal and Plant Management</b> program section to promote conservation.	1) Apply relevant conservation measures from the <b>Special Status Animal and Plant Management</b> program section at the beginning of this table.

<b>LUP Programs Evaluated</b>	<b>Conservation Measures</b>	<b>BLM Implementation Actions</b>
	<p>2) Explore the potential for new designations that would enhance species conservation.</p>	<p>2) Evaluate establishing ACECs for several stronghold populations of slickspot peppergrass during land use plan amendments or revisions.</p>
<p>Fire Management: Fire Suppression</p>	<p>1) Activities within the <b>Fire Management: Fire Suppression</b> program will implement relevant conservation measures as described in the <b>Special Status Animal and Plant Management</b> program section to promote conservation. Human life and firefighter safety and property take priority over species protection.</p> <p>2) Fire suppression efforts will be conducted, as possible, to protect habitat categories for slickspot peppergrass. Place a high priority on protecting habitat categories for slickspot peppergrass.</p>	<p>1) Apply relevant conservation measures from the <b>Special Status Animal and Plant Management</b> program section at the beginning of this table.</p> <p>2) Fire management activities:</p> <p>a) Fire Management Plans will include Standard Operating Procedures (SOP's) that address conservation of slickspot peppergrass.</p> <p>i) BLM will provide adequate fire suppression coverage at all stations to meet management objectives with the intent to suppress 90% of fires to the acreages specified in the fire management plans for slickspot peppergrass. As funding allows, BLM will maintain existing remote fire guard stations easily accessible to occupied habitat (for example, Juniper Butte fire guard station) and explore opportunities to establish additional stations to provide better initial attack and reduced response times for wildfires in slickspot peppergrass habitat.</p> <p>ii) Apply minimum impact suppression tactics (MIST) in habitat categories for slickspot peppergrass, as appropriate. Consult with resource advisors to determine where MIST tactics should be applied to avoid or minimize negative impacts.</p> <p>iii) Although MIST are preferred, aggressive fire suppression tactics (e.g.,</p>

LUP Programs Evaluated	Conservation Measures	BLM Implementation Actions
	<p>3) As needed, coordinate with appropriate agency personnel regarding fire suppression activities in or adjacent to habitat categories for slickspot peppergrass</p>	<p>blade lines, back fires, etc. in habitat) may be applied if EO's are threatened.</p> <p>b) Do not locate fire base camps, staging areas, and fueling areas within occupied habitat.</p> <p>3) Ongoing interagency coordination.</p> <p>a) BLM and cooperators will expand on and continue to provide special status plant and habitat awareness training to fire resource advisors, Incident Commanders, Engine Operators, and Fire Operations Supervisors.</p> <p>b) BLM and cooperators will distribute maps and inform fire crews on locations of the EOs to maximize fire protection and to avoid or minimize impacts from fire suppression activities.</p>
<p>Fire Management: Emergency Stabilization and Rehabilitation</p>	<p>1) Activities within the <b>Fire Management: Emergency Stabilization and Rehabilitation</b> program will implement relevant conservation measures as described in the <b>Special Status Animal and Plant Management</b> program section to promote conservation.</p> <p>2) Implement Emergency Stabilization and Rehabilitation (ES&amp;R) activities to consider slickspot peppergrass in and adjacent to slickspot peppergrass habitat rehabilitation.</p>	<p>1) Apply relevant conservation measures from the <b>Special Status Animal and Plant Management</b> program section at the beginning of this table.</p> <p>2) The following measures will be applied:</p> <p>a) Wildfires within habitat categories for slickspot peppergrass will be evaluated for ES&amp;R treatments, regardless of size with an emphasis on retaining native plant resiliency including early seral native grasses, forbs, and biological soil crusts.</p> <p>b) As needed, protect disturbed and recovering areas using temporary closures or other measures. BLM will continue to rest areas from land use</p>

LUP Programs Evaluated	Conservation Measures	BLM Implementation Actions
		<p>activities to meet ES&amp;R objectives as defined through ES&amp;R plans.</p> <p>c) BLM ES&amp;R efforts for slickspot peppergrass, subject to funding availability, should enhance shrub establishment and forb diversity. BLM will implement the following measures during fire ES&amp;R efforts:</p> <p>i) BLM will use seeding techniques that minimize soil disturbance; such techniques may include minimum-till drills and rangeland drills equipped with depth bands when ES&amp;R projects have the potential to impact occupied or proposed critical habitat categories for slickspot peppergrass. Based on ES&amp;R monitoring data, if these methods prove to be unsuccessful, other methods will be evaluated to maximize success.</p> <p>ii) BLM will use native plant materials and seed during ES&amp;R activities. BLM will include native forbs in seed mixtures that will benefit slickspot peppergrass insect pollinators commensurate with ES&amp;R program policy.</p> <p>iii) If native plant materials and seed are not available, or where site capability precludes the use of natives due to past disturbances, non-invasive, non-native species may be used for stabilization activities in habitat categories for slickspot peppergrass.</p> <p>iv) In slickspot peppergrass habitat and potential habitat, non-native species are acceptable for stabilization activities where site disturbances exceed the capability for extant native vegetation to regenerate. Potentially invasive non-native species such as intermediate wheatgrass and forage kochia will not be used within 1.5 miles of EOs. Within</p>

LUP Programs Evaluated	Conservation Measures	BLM Implementation Actions
	<p>3) Fire rehabilitation projects involving the application of pesticides in slickspot peppergrass habitat will be analyzed and implemented in accordance with the approach described in the <b>Upland Vegetation Management: Rangelands (includes weed management)</b> program section.</p>	<p>slickspot peppergrass habitat and potential habitat, potentially invasive non-native species such as intermediate wheatgrass and forage kochia may be used for stabilization activities that are specifically designed as greenstrip fuel break projects, if an environmental analysis determines that the benefits of their use outweigh the risk of invasion to slickspot peppergrass and its habitat relative to other alternative fuel break methods. For these projects, environmental analyses will use the best available scientific and biological information, current BLM and USFWS guidance, and incorporate a comprehensive monitoring strategy. These site specific treatments will also be reviewed via the Level 1 streamlining process.</p> <p>When used in ESR fuel break projects, control measures for intermediate wheatgrass and forage kochia will be incorporated into project design features. Control measures will be informed by a comprehensive monitoring strategy that triggers subsequent adaptive management actions.</p> <p>v) Apply conservation measure (3), Implementation Action (ii) in Fire Management: Non-Fire Fuels Management. Program to ESR actions</p> <p>3) See <b>Upland Vegetation Management: Rangelands (includes weed management)</b> program section.</p>
<p>Fire Management: Wildland Fire Use</p>	<p>1) Wildland fire use projects will not be allowed in habitat categories for slickspot peppergrass.</p>	<p>1) When developing wildland fire use plans, do not allow wildland fire use in habitat categories for slickspot</p>

<b>LUP Programs Evaluated</b>	<b>Conservation Measures</b>	<b>BLM Implementation Actions</b>
		peppergrass.
Fire Management: Prescribed Fire	<p>1) Activities within the <b>Fire Management: Prescribed Fire</b> program will implement relevant conservation measures as described in the <b>Special Status Animal and Plant Management</b> program section to promote conservation.</p> <p>2) Prescribed fire projects will be designed to conserve and enhance habitat categories for slickspot peppergrass.</p>	<p>1) Apply relevant conservation measures from the <b>Special Status Animal and Plant Management</b> program section at the beginning of this table.</p> <p>2) Prescribed fire in habitat categories for slickspot peppergrass will only be used as a tool for assisting with species conservation (for example, a burn in preparation to decrease cheatgrass litter before herbicide application, or to clear fence lines of accumulated windblown weeds).</p>
Fire Management: Non-Fire Fuels Management	<p>1) Activities within the <b>Fire Management: Non-Fire Fuels Management</b> program will implement relevant conservation measures as described in the <b>Special Status Animal and Plant Management</b> program section to promote conservation.</p> <p>2) Implement projects involving the application of pesticides in accordance with the approach described in the <b>Upland Vegetation Management: Rangelands (includes weed management)</b> program section.</p> <p>3) Fuels management projects conducted in habitat categories for slickspot peppergrass should have long-term benefits to slickspot peppergrass.</p>	<p>1) Apply relevant conservation measures from the <b>Special Status Animal and Plant Management</b> program section at the beginning of this table.</p> <p>2) See <b>Upland Vegetation management: Rangelands (includes weed management)</b> program section.</p> <p>3) Avoid fuels management projects in occupied and critical habitat, unless such projects would enhance species conservation or are necessary for hazardous fuels reduction near the urban interface. Implement protection measures to avoid or minimize negative impacts to the species. In critical and occupied habitat categories for slickspot peppergrass, design native seed mixes that emphasize locally adapted plant material that will promote species conservation. When appropriate, use native plant materials and seed during project activities, and select species that</p>

LUP Programs Evaluated	Conservation Measures	BLM Implementation Actions
		<p>benefit slickspot peppergrass insect pollinators.</p> <p>a) Because of potential negative impacts to habitat categories for slickspot peppergrass from linear fuel breaks, which can act as weed dispersal corridors, the following measures will be applied in habitat categories for slickspot peppergrass:</p> <p>i) BLM will monitor the effectiveness of existing fuel breaks (location, dry fuel load, and weed composition) in protecting habitat categories for slickspot peppergrass.</p> <p>ii) BLM may create and maintain fuel breaks where frequent fires can threaten habitat categories for slickspot peppergrass. New fuel breaks in habitat categories for slickspot peppergrass will be designed to conserve and/or enhance species habitat. Where appropriate and where objectives will be met, native vegetation should be emphasized in the creation of new fuel breaks. Other fuel break methods may include mowing or brown strips. If native vegetation or seed will not meet objectives, or site disturbance or site conditions preclude their use, fuel breaks may include non-native, non-invasive, species that will not invade slickspots.</p> <p>In slickspot peppergrass habitat all ESR implementation actions/methods in conservation measure (2) and all upland vegetation management implementation actions/methods in conservation measure (4) that are also applicable will be implemented for non-fire fuels management program projects.</p> <p>Potentially invasive non-native species such as intermediate wheatgrass and</p>

LUP Programs Evaluated	Conservation Measures	BLM Implementation Actions
		<p>forage kochia will not be used within 1.5 miles of EOs. When used in fuel break projects, control measures for potentially invasive non-native species such as intermediate wheatgrass and forage kochia will be incorporated into project design features. Control measures will be informed by a comprehensive monitoring strategy that triggers subsequent adaptive management actions. These site specific treatments will also be reviewed via the Level 1 streamlining process.</p> <p>All fuel breaks located in habitat categories for slickspot peppergrass will have a robust, project specific monitoring strategy that shall include implementation monitoring, effectiveness monitoring, and specific hard and soft triggers for implementation of vegetation control measures, fuel break maintenance, and fuel break modification actions specific to slickspot peppergrass conservation.</p> <p><i>iii)</i> Consider actions to repair or restore fuel breaks so they function as desired. Apply conservation measure (2) in the <b>Fire Management: Emergency Stabilization and Rehabilitation</b> program section and conservation measure (4) in the <b>Upland Vegetation Management</b> program.</p> <p><i>b)</i> In addition to the reduction in fuels associated with appropriately managed livestock grazing (see relevant conservation measures from <b>Livestock Grazing Management</b> section of this table), BLM may create fuel breaks using techniques such as mowing or targeted grazing to strategically reduce fuel loads where frequent fires can threaten habitat categories for slickspot peppergrass if the benefit of these actions can be demonstrated to outweigh the risks to slickspot peppergrass and its habitat.</p>

<b>LUP Programs Evaluated</b>	<b>Conservation Measures</b>	<b>BLM Implementation Actions</b>
<p>Fire Management: Community Assistance</p>	<p>1) Activities within the <b>Fire Management: Community Assistance</b> program will implement relevant conservation measures as described in the <b>Special Status Animal and Plant Management</b> program section to promote conservation.</p> <p>2) Follow all measures included throughout the Fire Management program sections.</p>	<p>1) Apply relevant conservation measures from the <b>Special Status Animal and Plant Management</b> program section at the beginning of this table.</p> <p>2) See actions within Fire Management program sections. Incorporate into community assistance agreements.</p>
<p>Lands and Realty Management: Land Tenure Adjustment (land sale, exchanges, withdrawals, etc.)</p>	<p>1) Activities within the <b>Lands and Realty Management: Land Tenure Adjustment (land sale, exchanges, withdrawals, etc.)</b> program will implement relevant conservation measures as described in the <b>Special Status Animal and Plant Management</b> program section to promote conservation.</p> <p>2) Where feasible and funding is available, acquire through land exchange or purchase private lands that contain habitat categories for slickspot peppergrass.</p> <p>3) Retain occupied slickspot peppergrass habitat in Federal ownership unless such a transfer would result in a net benefit to the species.</p>	<p>1) Apply relevant conservation measures from the <b>Special Status Animal and Plant Management</b> program section at the beginning of this table.</p> <p>2) As feasible depending on funding and other factors, BLM will opportunistically acquire habitat categories for slickspot peppergrass, particularly occupied habitat and critical habitat, in land exchanges and purchases.</p> <p>3) Review each land tenure decision in terms of species habitat. Avoid the loss of occupied habitat and critical habitat from Federal ownership. If property with occupied habitat or critical habitat is being considered for transfer out of Federal ownership, ensure that the action will result in a greater net benefit for this species. BLM will coordinate with USFWS as early as possible to discuss methods to assure that the proposed land tenure adjustment benefits the species.</p>
<p>Lands and Realty Management: Land Use Permits and Leases</p>	<p>1) Activities within the <b>Lands and Realty Management: Land Use Permits and Leases</b> program will implement relevant conservation measures as described in the <b>Special Status Animal and Plant</b></p>	<p>1) Apply relevant conservation measures from the <b>Special Status Animal and Plant Management</b> program section at the beginning of this table.</p>

LUP Programs Evaluated	Conservation Measures	BLM Implementation Actions
	<p>Management program section to promote conservation.</p> <p>2) Issue new land use permits and leases and review existing permits and leases at renewal to conserve species habitat. This includes management of physical facilities, as well as ground disturbance resulting from human uses.</p>	<p>2) For new authorizations, as well as those being renewed, see <b>Special Status Animal and Plant Management</b> program section item (3). Avoid issuing new authorizations, or renewing existing authorizations, in or adjacent to habitat categories for slickspot peppergrass if negative impacts are expected. If an authorization is to be issued or re-issued in such areas, apply stipulations to the authorization that support species conservation and that avoid or minimize negative impacts. BLM will require control of noxious weed species on new, renewing, or amending land use permits. In addition, BLM will require control of invasive, non-native species on new, renewing, or amending land use permits within the ground disturbance footprint within (INHP) B- or C-ranked EOs and critical habitat.</p> <p>a) Conduct periodic project compliance inspections during implementation of projects involving soil disturbance. BLM may require a qualified botanist to monitor slickspots to avoid impacts during ground disturbing activities in habitat categories for slickspot peppergrass.</p> <p>b) BLM will require that new or renewing permit or lease holders establish at least 50% perennial cover after all ground disturbing activities, unless ecological site conditions preclude that level of cover. If a native species component existed prior to the ground disturbance, then the native species component of the perennial cover should be restored.</p>
<p>Lands and Realty Management: Rights-of-Way</p>	<p>1) Activities within the <b>Lands and Realty Management: Rights-of-Way</b> program will implement relevant conservation measures as</p>	<p>1) Apply relevant conservation measures from the <b>Special Status Animal and Plant Management</b> program section at</p>

LUP Programs Evaluated	Conservation Measures	BLM Implementation Actions
	<p>described in the <b>Special Status Animal and Plant Management</b> program section to promote conservation.</p> <p>2) Issue new rights-of-way and review existing rights-of-way at renewal to conserve species habitat. This includes management of physical facilities, as well as disturbances to the species resulting from human uses.</p> <p>3) As appropriate, require a qualified botanist to monitor slickspots to avoid or minimize impacts during BLM authorized activities in habitat categories for slickspot peppergrass</p>	<p>the beginning of this table.</p> <p>2) For new rights-of-way and renewal of existing rights-of-way, see <b>Special Status Animal and Plant Management</b> program section item (3) Avoid issuing new rights-of-way, or renewing rights-of-way, in or adjacent to habitat categories for slickspot peppergrass if negative impacts are expected. In habitat categories for slickspot peppergrass, only issue or re-issue rights-of-way with stipulations to avoid negative impacts to the habitat. BLM will require control of noxious weed species on new, renewing, or amending rights-of-way authorizations. In addition, BLM will require control of invasive, non-native species on new, renewing, or amending rights-of-way authorizations within the rights-of-way footprint, and an additional width on each side of the rights-of-way within (INHP) B- or C-ranked EOs and critical habitat.</p> <p>a) BLM will require that new or renewing permit or lease holders establish at least 50% perennial cover after all ground disturbing activities, unless ecological site conditions preclude that level of cover. If a native species component existed prior to the ground disturbance, then the native species component of the perennial cover should be restored.</p> <p>3) BLM may require a qualified botanist to monitor slickspots to avoid impacts during soil disturbing activities in habitat categories for slickspot peppergrass.</p>
Mineral	1) Activities within the <b>Mineral</b>	1) Apply relevant conservation measures

<b>LUP Programs Evaluated</b>	<b>Conservation Measures</b>	<b>BLM Implementation Actions</b>
<p>Management: Locatable Minerals</p>	<p><b>Management: Locatable Minerals</b> program will implement relevant conservation measures as described in the <b>Special Status Animal and Plant Management</b> program section to promote conservation.</p> <p>2) Approve plans of operations or allow notice level operations so as not to preclude species habitat conservation. This includes management of physical facilities, as well as disturbances to the species resulting from human uses.</p>	<p>from the <b>Special Status Animal and Plant Management</b> program section at the beginning of this table.</p> <p>2) Approval of plans of operations and notice-level operations:  a) For review of existing plans of operation and notice-level operations, see <b>Special Status Animal and Plant Management</b> program section item (2). To the extent allowed by law, modify plans of operation or notice-level operations that may have negative impacts on the species or its habitat. For notice-level operations, notify the operator that modifications to proposed activities will be required to avoid negative impacts.</p> <p>b) For new plans of operation and notice-level operations, see <b>Special Status Animal and Plant Management</b> program section item (3). To the extent allowed by law, avoid approving plans of operation or notice-level operations that may have negative impacts on the species or its habitat. For notice-level operations, notify the operator that modifications to proposed activities will be required to avoid negative impacts. If a plan of operations is to be approved in or adjacent to habitat categories for slickspot peppergrass, apply stipulations to support or to not preclude species conservation. A notice will require modification by the operator until BLM determines that it will not result in undue or unnecessary degradation.</p>
<p>Mineral Management: Saleable and Leasable Minerals</p>	<p>1) Activities within the <b>Mineral Management: Saleable and Leasable Minerals</b> program will implement relevant conservation measures as described in the <b>Special Status Animal and Plant Management</b> program section to promote conservation.</p> <p>2) Approve development of saleable or</p>	<p>1) Apply relevant conservation measures from the <b>Special Status Animal and Plant Management</b> program section at the beginning of this table.</p> <p>2) Approval of saleable and leasable</p>

<b>LUP Programs Evaluated</b>	<b>Conservation Measures</b>	<b>BLM Implementation Actions</b>
	<p>leasable minerals so as not to preclude species habitat conservation. This includes management of physical facilities, as well as disturbances to the species resulting from human uses.</p>	<p>minerals:</p> <p>a) For review of existing mineral leases, see <b>Special Status Animal and Plant Management</b> program section item (2). Modify existing mineral leases if negative impacts are occurring.</p> <p>b) For new sales or leases, see <b>Special Status Animal and Plant Management</b> program section item (3). Avoid development of saleable or leasable minerals in or adjacent to habitat categories for slickspot peppergrass if negative impacts are expected. If a minerals lease or sale is to be issued in or adjacent to habitat, apply stipulations to support or to not preclude species conservation.</p>
<p>Cultural Management</p>	<p>1) Activities within the <b>Cultural Management</b> program will implement relevant conservation measures as described in the <b>Special Status Animal and Plant Management</b> program section to promote conservation.</p>	<p>1) Apply relevant conservation measures from the <b>Special Status Animal and Plant Management</b> program section at the beginning of this table.</p>
<p>Paleontology</p>	<p>1) Activities within the <b>Paleontology</b> program will implement relevant conservation measures as described in the <b>Special Status Animal and Plant Management</b> program section to promote conservation.</p>	<p>1) Apply relevant conservation measures from the <b>Special Status Animal and Plant Management</b> program section at the beginning of this table.</p>

Administrative Draft  
Cooperating Agency Review

# APPENDIX B

## Definitions

<b>Adaptive Management</b>	A type of natural resource management that implies making decisions as part of an ongoing process. Monitoring the results of actions will provide a flow of information that may indicate the need to change a course of action. Scientific findings and the needs of society may also indicate the need to adapt resource management to new information.
<b>Adjacent</b>	The area outside of a mapped habitat area, but within a zone of influence to the habitat area for which a BLM activity may affect the species. Some activities, such as those that can affect watershed conditions and erosion, can have wide zones of influence for aquatic species. Other activities, such as those that do not affect the slickspot peppergrass habitat but can affect use of that habitat, can have a narrower zone of influence. Thus, this adjacent zone of influence will vary among species and land use activities. The species-specific and land use-specific application of this term will be determined at the local level.
<b>Avoid</b>	To the extent possible do not implement the action indicated. If the action needs to take place, then add stipulations or take additional steps to minimize impacts. Avoidance is the preferred management approach in the identified habitats for species conservation.
<b>Best Management Practices (BMPs)</b>	Generally accepted state-of-the-art techniques and procedures used in project-level operations to avoid or minimize impacts to species and their habitats.
<b>Conserve</b>	The terms "conserve," "conserving," and "conservation" mean to use all methods and procedures that are necessary for species recovery. For project management, the priority for conservation is to avoid impacts, then to minimize and mitigate if adverse impacts are unavoidable.
<b>Element occurrence (EO)</b>	An area of land in which a species like slickspot peppergrass is or was present (NatureServe 2002 as cited in Colket et al. 2006, page 1). EO features are designated by the Idaho Conservation Data Center as separate EOs if they are >1 km apart (Colket et al. 2006, page 2).

**Habitat**

The habitat definitions for slickspot peppergrass are divided into six classifications that meet certain site characteristics and resource conditions, including the presence of slickspots and/or slickspot peppergrass plants. Each classification may have different management strategies in the conservation measures.

- **Non-habitat:** Areas that do not contain slickspots, or slickspots do not have the proper soil characteristics to support slickspot peppergrass.
- **Surrounding habitat:** Landscape-scale matrices of vegetation communities that may influence adjacent slickspot peppergrass occupied habitat.
- **Potential habitat:** Areas within the known range of slickspot peppergrass that have certain general soil and elevation characteristics that indicate the potential for the area to support slickspot peppergrass, although the presence of slickspots or the plant is unknown. These areas meet the following criteria:
  - Natric and natric-like soils forming "slickspots," and associated soil series, or phases thereof, which support Loamy 7- to 10-inch and 10- to 13-inch Wyoming big sagebrush Ecological Sites (Major Land Resource Areas 11-Snake River Plains, and 25 Owyhee High Plateau) and have a aridic bordering on xeric soil moisture regime; and
  - 2,200 to 5,400 feet elevation.

The use of the term "potential habitat" acknowledges the potential for an area to support slickspot peppergrass based on general characteristics even though uncertainty remains because of the lack of site-specific habitat information.

- **Slickspot Peppergrass Habitat:** Potential habitat areas with Wyoming big sagebrush ecological sites that through Stage 1 surveys have documented slickspot microsites (natric and natric-like soil types) within 2,200 feet and 5,400 feet elevation in Southwest Idaho. Slickspot peppergrass habitat includes areas with slickspots of unknown occupancy and in some cases may be dominated by non-native vegetation such as annual grasses or crested wheatgrass. In addition, to maintain ecological continuity, if there is less than 0.5 miles between areas defined as slickspot peppergrass habitat, then the

entire area is considered slickspot peppergrass habitat. Surveyed potential habitat not meeting these criteria will no longer be considered habitat for slickspot peppergrass.

- **Occupied habitat:** The term "occupied habitat" refers to areas where slickspot peppergrass has been documented or identified as an element occurrence (EO) and includes the area generally within 0.5 mile of that occurrence that is important to maintain or improve habitat integrity and pollinator populations necessary for species conservation. For analysis purposes, a generalized area delineated by a 0.5 mile radius circle was drawn around each EO (this circle may include areas of non-habitat). This area identified as occupied habitat may or may not include additional slickspots or slickspot peppergrass plants beyond the EO. Further refinement of occupied habitat may be accomplished through field surveys considering existing resource conditions as well as specific habitat quality and integrity.
- **Unoccupied Habitat:** Slickspots that have the proper soil characteristics to support slickspot peppergrass, but Stage 2 surveys 3 out of 12 years did not indicate that a seedbank is present.

Livestock gathering

Collecting scattered livestock into a group for management purposes.

Livestock herding

Moving a herd of livestock within or between pastures of an allotment. Permits are not required and it is part of the grazing plan.

Livestock trailing

An activity involving moving a livestock herd across allotment(s) where the trailing party has no grazing permit.

Minimize

To reduce to the smallest possible amount, extent, size, or degree as is feasible from a technical or management standpoint.

Modify

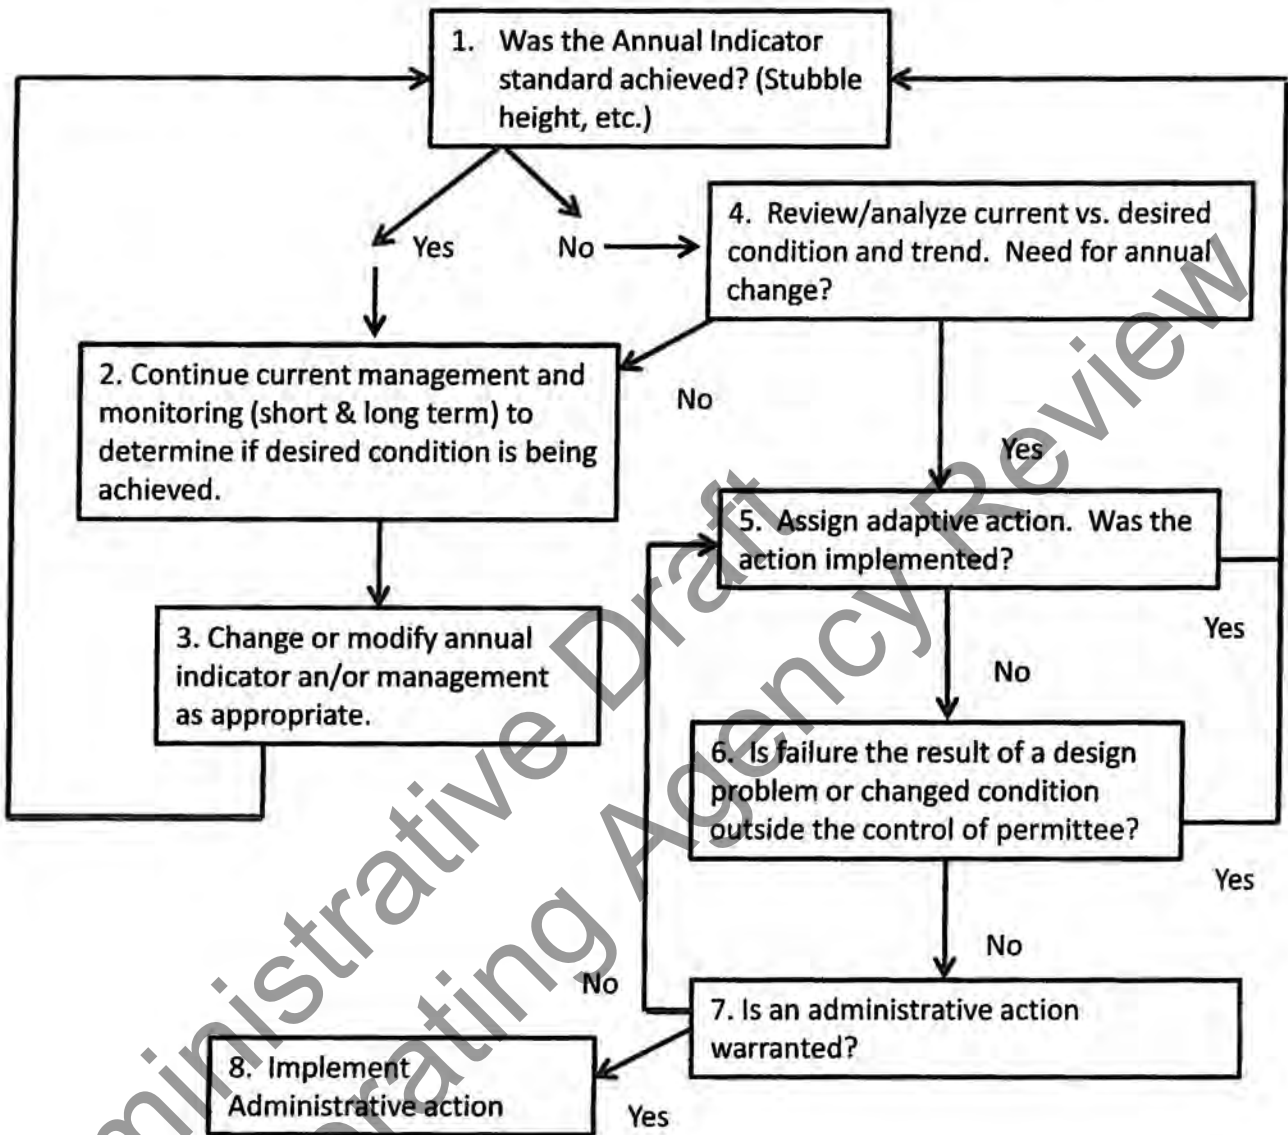

To "modify" a management activity could have a wide variety of site-specific actions, ranging from eliminating the activity, to changing seasonal use, or to minor operational changes. The goal of modifying an activity is to meet the intent of a specific conservation measure or its implementing action.

Penetrating trampling

Breaking of the restrictive layer underneath the silt surface area during saturated conditions exposing the clay layer of a slickspot. The restrictive layer of a slickspot is the heavy clay (35-45% clay content) prismatic structured subsoil layer (Bt1 horizon) below the salty vesicular surface layer (E horizon) and above the lighter textured (25-35% clay content) blocky structured clayey layer (Bt2 horizon).

## **Brief Description of Governor's Alternative for the State of Idaho**

In December 2011 Secretary of the Interior Ken Salazar invited western governors to create state-specific GRSG conservation plans to provide for the needs of GRSG and help preclude the need to list the species. In response to this invitation Governor Otter issued Executive Order 2012-02 on March 9, 2012 establishing the Governor's Sage-Grouse Task Force (Task Force). The Task Force was a diverse group of stakeholders comprised of representatives from local sage-grouse working groups, conservation interests, state and local officials and industry. The Task Force was charged with providing recommendations on actions for developing a state-wide regulatory mechanism to preclude the need to list the species under the ESA.

From March through May 2012, the Task Force met eight times in various locations across the State of Idaho. The Task Force conducted an information gathering and decision-making process consistent with state laws and regulations. Each meeting was open to the public and provided an opportunity for the public to comment on GRSG conservation and its potential effects. Additionally, the IDFG hosted a Web page displaying the times and locations of Task Force meetings, agenda, meeting notes, and presentations made during the meetings (IDFG 2012b).

On June 15, 2012, after much deliberation and discussion, the Task Force - aided by the technical expertise of IDFG including that of GRSG expert Dr. Jack Connelly, USFWS, and other relevant State and Federal agencies—delivered its recommendations to Governor Otter for review and consideration. After carefully reviewing those recommendations, the Governor developed a set of “guiding principles” used to develop a draft alternative for the State of Idaho for incorporation into the BLM and Forest Service land-use plan (LUP) amendment process. After 30-days of public comments, modifications to the Governor's alternative were made followed by the submission of the alternative to the BLM and Forest Service on September 5, 2012.

The Governor's Alternative has continued to be collaboratively refined since September 5th, 2012. In March 2013, Governor Otter wrote to the USFWS to clarify elements of the Alternative, but to also request the agency's “concurrence” with the strategy. Brian Kelly, Idaho State Supervisor for the Service replied to the Governor in April 2013 concurring with the general structure of the alternative and its major foundational elements, including the grazing management component. Since then, the State of Idaho has worked closely with the relevant state and federal agencies to further refine aspects of the Governor's alternative for the BLM and Forest Service analysis and submitted additional clarification and management actions to the agencies on July 1, 2013.

Alternative E was based on inputs from the Idaho Governor's Office (for federal lands within Idaho) and the Utah Governor's Office (for the portion of the Sawtooth National Forest in Utah that would be analyzed within the Idaho/southwest Montana sub-region). Lands in Montana would be managed under Alternative A for this alternative. Alternative E focuses primarily on management for the threats of wildfire, invasive species, and large infrastructure projects, and secondarily on management for the threats of improper livestock grazing management and related infrastructure, West Nile Virus, and recreation. It

recommends use of an adaptive management approach and implementation of triggers or thresholds that adjust zone criteria.

The refined Idaho Governor's Alternative has been incorporated as Idaho's portion of Alternative E, and draws heavily from recommendations developed by the Task Force. The Utah Governor's Alternative has been incorporated as the Utah portion of Alternative E. The intent of the Idaho and Utah's Governor's Alternative is to provide specific multiple-use management and direction for the conservation and management of the GRSG in lands administered by the BLM and Forest Service.

The actions described in this alternative for Idaho build upon, supplement, or replace the Idaho 2006 State Plan and LWG plans by identifying habitat zones, adaptive regulatory triggers and concrete best management practices for primary threats (e.g., wildfire, invasive species and infrastructure) and some secondary threats (e.g., recreation, improper livestock grazing and West Nile virus) as identified by the Service necessary to preclude a listing (for the sake of completeness, Idaho's 2006 Plan is incorporated herein by reference). Activities not addressed by this alternative, such as predation issues, will continue to be guided by the 2006 State Plan, LWG plans or relevant federal resource management plans. This alternative would replace land management plan direction inconsistent with the GRSG management actions described, unless otherwise prescribed by statute, regulation or valid existing authorizations. This alternative would retain land management plan direction that is not inconsistent with actions described to provide guidance for projects and activities within the Sage-Grouse Management Area (SGMA). It is important to note that any action taken under these provisions would have to undergo a site-specific NEPA analysis.

This alternative includes measurable population objective (e.g., population within the CHZ), and utilizing monitoring to ensure that objective is met; and setting metrics that trigger changes in practices or review of current practices to ensure the conservation objective is met long-term. Specifically, the use of four separate Conservation Areas (CAs), described below, in which the adaptive triggers are individually applied adds an increased level of sensitivity to change.

This alternative includes the establishment, through Idaho Governor's Executive Order, of an Implementation Task Force following the implementation model based on the State's success in developing a federal rule for the management and conservation of the inventoried roadless areas within Idaho (73 Federal Register 61,456 October 16, 2008).

Habitat restoration and vegetation management under Alternative E would focus on prioritizing conifer removal and restoring sagebrush and perennial grasslands. Native vegetation would be used for restoration to the extent practicable. In addition, invasive species would be controlled for three years after wildfire treatments. Alternative E provides guidance to reduce wildfire response time, create fuel breaks, and improve the wildfire suppression baseline. Targeted grazing would be allowed in all habitat management zones to reduce fine fuels and mitigate for the risk of wildfire.

This alternative emphasizes the need for livestock permittees to achieve the Idaho Rangeland Health Standards while also achieving flexibility and management predictability through the use of the state's adaptive construct.

*Executive Department  
State of Idaho*

**C.L. "BUTCH" OTTER**  
GOVERNOR

*State Capitol  
Boise*

**EXECUTIVE DEPARTMENT  
STATE OF IDAHO  
BOISE**

**EXECUTIVE ORDER NO. 2012-02**

**ESTABLISHING THE GOVERNOR'S SAGE-GROUSE TASK FORCE**

*WHEREAS, the greater sage-grouse inhabits significant portions of the sage-steppe habitat in Idaho;*

*WHEREAS, the State of Idaho currently enjoys viable and widespread populations of the species;*

*WHEREAS, the State of Idaho by and through the Sage-grouse Advisory Committee (SAC) and the Local Working Groups (LWGs) has a long track record of successful engagement in managing and conserving the species and its habitat;*

*WHEREAS, the State by and through the involvement of the SAC and the LWGs developed a state-wide management plan for the species in 2006 and amended in 2009 (2009 Plan);*

*WHEREAS, the sage-grouse has been the subject of several petitions to list, federal regulatory actions and multiple rounds of litigation regarding its status under the Endangered Species Act (ESA);*

*WHEREAS, on March 23, 2010, the U.S. Fish and Wildlife Service (Service) determined the species warrants listing over all of its range, including Idaho, but is precluded by higher-priority listing actions;*

*WHEREAS, due to the Service's decision, the sage-grouse is currently considered a "candidate" species under the ESA;*

*WHEREAS, on February 2, 2012, the United States District Court for the District of Idaho ruled the Service must reevaluate the status of the species under the ESA by September 30, 2015;*

*WHEREAS, in response to this decision, the Secretary of the Interior has invited the eleven (11) western states impacted by a potential listing of the species to develop state-specific regulatory mechanisms to conserve the species and preclude the need to list under the ESA;*

*WHEREAS, the development of a state-specific regulatory mechanism in Idaho will be critical in demonstrating to the Service the species does not warrant federal protection;*

*WHEREAS, the Bureau of Land Management (BLM) is currently implementing national Instruction Memoranda to guide interim management of public lands and to develop sage-grouse conservation measures for incorporation into the agency's existing Resource Management Plans (RMPs) by September 2014;*

*WHEREAS, the development of a state-specific regulatory mechanism, consistent with the objectives of this Executive Order, may allow the State the opportunity to be exempted from the applicability of these Instruction Memoranda guiding interim management of public lands within Idaho;*

*WHEREAS, the development of a state-specific regulatory mechanism will enable the BLM to incorporate the State's plan as an alternative in its environmental analysis pursuant to the National Environmental Policy Act (NEPA);*

*WHEREAS, it is vital to the interests of the State to develop a state-specific regulatory mechanism as the listing of the species would adversely impact the economy of Idaho, including the ability to generate revenues from private property and State endowment lands;*

*WHEREAS, the listing of the species would have a significant impact on the State's custom, culture and way of life; and*

*WHEREAS, development of the State's regulatory mechanism must be driven by the most current scientific information, input from a variety of stakeholders and aimed at conserving the species and its habitat while maintaining predictable and multiple uses of private, state and public lands.*

*NOW, THEREFORE, I, C.L. "BUTCH" OTTER, Governor of the State of Idaho, by the authority vested in me under the Constitution and laws of the State of Idaho do hereby create the Sage-Grouse Task Force.*

*1. The creation of the Governor's Sage-Grouse Task Force:*

*A. The members of the Governor's Sage-Grouse Task Force (Task Force) shall be appointed by and serve at the pleasure of the Governor through calendar year 2012.*

*i. The Task Force shall be composed of fifteen (15) members, representing the various geographic areas of the State within the range of the species.*

*ii. The Office of the Governor will chair this entity.*

*iii. The Office of Species Conservation and the Idaho Department of Fish and Game will staff this entity.*

*B. The Task Force members shall be appointed from the following categories:*

*i. Individuals who:*

- Represent agricultural interests; or*
- Represent energy or mineral development interests.*

*ii. Individuals representing:*

- A local working group; or*
- A nationally, regionally or locally recognized environmental organization; or*
- Nationally or locally recognized wildlife or sportsmen's groups.*

*iii. Individuals who:*

- Hold State elected office; or*
- Hold county elected office; or*
- Represent the public at large.*

*2. Duties of the Task Force:*

*A. Provide the Governor recommendations on policies and actions, using the 2009 Plan and other on-going activities as a backdrop, for developing a state-wide regulatory mechanism to preclude the need to list the species;*

- B. The recommendations must be based on the following objectives and/or criteria:*
- i. Conserve the species and its habitat while maintaining predictable and multiple uses of private, state and public lands;*
  - ii. Identify and designate key/core sage-grouse habitat based on the biological needs of the species;*
  - iii. Tailor the management recommendations to the import of the habitat and is attuned to the interests of the State;*
  - iv. Address the following primary threats to the species as identified by the Service:*
    - Habitat fragmentation due to wildfire and invasive species;*
    - Conversion of habitat for agriculture or urbanization; and*
    - Energy development/infrastructure.*
  - v. Address the following secondary threats to the species as identified by the Service:*
    - Disease/West Nile virus;*
    - Management issues related to livestock grazing;*
    - Collisions with fences and power lines;*
    - Mining;*
    - Prescribed fire and range treatments;*
    - Water development; and*
    - Conifer invasion.*
  - vi. Identify opportunities for pro-active sage-grouse habitat enhancement projects; and*
  - vii. Recognize, encourage and incentivize land use practices that are actively maintaining or improving sage-grouse habitat as evidenced by improvements in habitat quality, active lek routes or stable/increasing populations of the species.*
- C. The duties of the Task Force are solely advisory.*
- D. The Task Force will provide its recommendations to the Governor no later than May 31, 2012.*
- E. Technical Expertise:*
- i. The Task Force may request consultation, information and technical expertise from Directors or their designees of state agencies regarding the biological needs of the species, activities on state, federal and private lands potentially impacted by the status of the species, and requirements of the ESA and other relevant statutory requirements, including but not limited to the Office of Species Conservation, the Idaho Department of Fish and Game, the Idaho Department of Lands, the Office of Energy Resources, the Idaho State Department of Agriculture and the Idaho Department of Parks and Recreation.*
  - ii. The Task Force may request comments, information and technical expertise from the American Indian Tribes of Idaho, the universities of the State, federal agencies, including but not limited to the Service, the BLM, the U.S. Forest Service and the Natural Resources Conservation Services, and members of the public.*

*IN WITNESS WHEREOF, I have hereunto set my hand and caused to be affixed the Great Seal of the State of Idaho at the Capitol in Boise on this 9th day of March, in the year of our Lord two thousand and twelve, and of the independence of the United States of America the two hundred thirty-sixth and of the Statehood of Idaho the one hundred twenty-second.*

Administrative Draft  
Cooperating Agency Review

July 13, 2012

Brian Kelly, State Director  
U.S. Fish and Wildlife Service  
Idaho State Office  
1387 South Vinnell Way  
Boise, ID 83709-1657

**RE: Governor's Draft Alternative for Sage-Grouse Management**

Dear Brian,

I appreciate your attendance and participation on my annual trail ride to discuss the State of Idaho's effort to conserve the sage-grouse and its habitat while maintaining predictable levels of land use across all ownerships. As I stated during our discussion, Idaho's sage-grouse plan must work for the State and preclude the need to list the species under the Endangered Species Act (ESA). We can only achieve this meaningful objective and solve this complex natural resource issue if the State, federal government and other important stakeholders truly view this as an opportunity to form a partnership. I believe this was Secretary Salazar's intent when he invited the affected states to craft state-specific plans for the species.

To this end, and as you are fully aware, my Sage-Grouse Task Force (Task Force) was assigned to provide recommendations and policies to serve as a foundation for a successful management strategy. I'm confident you would agree the Task Force made significant inroads in developing such a strategy within a very aggressive timeframe. Based largely on these recommendations, I recently released a draft plan for the species and requested public input.

I believe the draft plan provides a solid framework and moves us one step closer to completing this difficult and important task. Recognizing that further detail and refinement need to take place based on continued stakeholder input, I request feedback on the following questions:

- Whether the management framework – based on a thematic habitat continuum and population metrics – outlined in my Draft Alternative represents a sound policy that should move forward; and

- Whether or not the habitat zones, especially the Core Habitat Zone and Important Habitat Zone, are consistent with the U.S. Fish and Wildlife Service’s understanding of the most important sage-grouse habitats in the State.

I look forward to continuing our dialogue and discussion of this important issue. It is essential that we keep the lines of communication open to ensure we achieve our mutual objectives.

As Always—Idaho, “Esto Perpetua”

C.L. “Butch” Otter

AUG 01 2012

The Honorable C.L. "Butch" Otter  
Governor of Idaho  
State Capitol  
Boise, Idaho 83702

Subject: Draft Federal Alternative of Governor C.L. 'Butch' Otter for Greater Sage-Grouse Management in Idaho-June 29, 2012

Dear Governor Otter:

Thank you for your letter of July 13, 2012, regarding your Draft Alternative for Sage-Grouse Management. Let me begin by following up on the trail ride discussion you hosted in June, and reiterate the U.S. Fish and Wildlife Service's (Service) appreciation for your leadership on this important issue. Your staff, the Task Force you appointed, Idaho Department of Fish and Game and the Office of Species Conservation worked diligently to develop a draft state strategy under an aggressive timeline. Their work built on years of effort by many in Idaho, in particular the foundational accomplishments of the local working groups. My staff and I appreciated the opportunity to serve as technical advisors throughout the Task Force process. Your letter requested that the Service provide feedback regarding (1) whether the "management framework – based on a thematic habitat continuum and population metrics" was a sound policy that should move forward, and (2) whether or not the "habitat zones, especially the Core Habitat Zone and Important Habitat Zone" are consistent with the Service's understanding of the most important sage-grouse habitats in the State.

The Service believes the management framework that you have developed provides a sound policy outline from which to build upon to meet the long-term conservation goals of greater sage-grouse in Idaho. The thematic approach based on conservation objectives that are monitored in an adaptive management construct that your framework incorporates, are fundamental attributes of the Service's own approach to strategic conservation (USFWS and USGS 2006). My staff and I look forward to continuing to work with you (and the Bureau of Land Management and U.S. Forest Service as they work through their land management planning processes) to identify and resolve issues that will help solidify the adequacy of this framework, and associated policy, necessary for our 2015 Endangered Species Act listing review.

The Core and Important Habitat Zones, as currently drafted by the Task Force, are indeed among the most important sage-grouse habitats in the State. In identifying these zones, the Task Force had the foresight to address not only the conservation of what are now the most important habitats, but also a means to provide for long-term conservation and restoration of sage-steppe habitat and rangelands in Idaho. Addressing the threats to sage-grouse across jurisdictional boundaries in these areas will be important for our listing review in 2015. Specifically, I look forward to continued conversations regarding how the State will approach implementation of long-term conservation on State and private lands where necessary.

Thank you for the opportunity to provide feedback on the draft alternative. The compressed timeframes which you have worked within to assemble this framework is commendable. In closing, the Service agrees that success in this endeavor hinges on our ability to work with many in a partnership. We look forward to our continued role as one of those partners with you and others to assist the conservation of greater sage-grouse in Idaho. If you have any questions regarding the information provided here please do not hesitate to contact me at 208-378-5243 or Jason Pyron of my staff at 208-685-6958.

Sincerely,

Brian T. Kelly, State Supervisor  
Idaho Field Office

C.L. "BUTCH" OTTER  
GOVERNOR

August 17, 2012

Steve Ellis, State Director  
Bureau of Land Management  
Idaho State Office  
1387 S. Vinnell Way  
Boise, ID 83709-1657

Dear Steve,

I appreciate your attendance and participation on my annual trail ride to discuss the State of Idaho's effort to conserve the sage-grouse and its habitat while maintaining predictable levels of land use across all ownerships. As I stated during our discussion, Idaho's sage-grouse plan must work for the State and preclude the need to list the species under the Endangered Species Act (ESA). We can only achieve this meaningful goal and solve this complex natural resource issue if the State, federal government and other important stakeholders truly view this as an opportunity to form a partnership. I believe this was Secretary Salazar's intent when he invited the affected states to craft state-specific plans for the species.

As you are fully aware, my Sage-Grouse Task Force (Task Force) was assigned to provide recommendations and policies to serve as a foundation for a successful management strategy. I'm confident you would agree the Task Force made significant inroads in developing such a strategy within a very aggressive timeframe. Based largely on these recommendations, I released a draft plan for the species and requested public input.

I believe the draft plan provides a solid framework and moves us one step closer to completing this difficult and important task. As the State continues working with stakeholders to refine my proposal, I request feedback on the following questions prior to submitting a revised version of the State's Alternative:

- Whether the management framework outlined in my Draft Alternative – based on a thematic habitat continuum and population metrics – represents a sound policy that should move forward; and

- Whether my Draft Alternative is consistent with the agency’s multiple-use mandate as well as the National Greater Sage-Grouse Land Use Planning Strategy.

It is essential that I receive answers to these questions to ensure all stakeholders are striving to achieve the mutual objectives outlined by the Secretary and my Executive Order (2012-02). One near-term objective, as noted in my Executive Order, is to have the “opportunity to be exempted from the applicability of these Instruction Memoranda guiding interim management of public lands within Idaho.” This aim was recently affirmed in a Nevada BLM Instruction Memo (NV 2012-058) stating, “Nevada BLM may adopt the Governor’s strategy through a subsequent Instruction Memorandum and upon concurrence by the U.S. Fish and Wildlife Service....”

As you are aware, I sent a similar letter to Brian Kelly, state director of the U.S. Fish and Wildlife Service (Service), requesting his agency’s perspective on my draft plan. As the agency charged with implementing the ESA, the Service opined:

The Service believes the management framework that you have developed provides a sound policy outline from which to build upon to meet the long-term conservation goals of greater sage-grouse in Idaho. The thematic approach based on conservation objectives that are monitored in an adaptive construct that your framework incorporates, are fundamental attributes of the *Service’s own approach to strategic conservation* (USFWS and USGS 2006).

(emphasis added).

Thus, from your answers to these two questions the State can discern whether the agencies are moving in the same direction with regard to my plan, ultimately affording Idaho the opportunity for a state-specific Instruction Memorandum. Thank you for your consideration and support on this issue.

Honorable C. L. "Butch" Otter  
Office of the Governor  
PO Box 83720  
Boise, ID 83720

Dear Governor Otter:

I appreciate your letter of August 17, 2012, and our discussion about sage-grouse management at your annual trail ride in June. As I indicated during our discussion on the trail ride, I am encouraged by the efforts of your Sage-Grouse Task Force (Task Force) and look forward to receiving your final alternative for consideration in our resource management planning effort. I share Idaho's goal of long term conservation of sage-grouse and its habitat, which may make it unnecessary to list the species under the Endangered Species Act.

We support the efforts of the State of Idaho and your Task Force to advance sage-grouse conservation across public lands, state lands, and private lands. The State of Idaho and local working groups have been the foundation for advancing sage-grouse conservation in Idaho in coordination with federal agencies and other partners. Your Task Force represents a diversity of interests and expertise that worked diligently under an aggressive timeframe to develop a draft alternative. This spring we committed \$75,000 towards the task force planning effort and my staff actively participated in all task force meetings as technical advisors. My technical staff has thoroughly reviewed the State of Idaho's Draft Alternative released to the public in June and we believe it is a thoughtful approach to sage-grouse conservation on public lands. Jeff Foss and wildlife specialists on my staff have had follow-up discussions with Tom Perry and Virgil Moore to share ideas as the Draft Alternative is being finalized.

Your letter requested feedback on two questions: 1) Whether the management framework outlined in the State of Idaho's Draft Alternative—based on a thematic habitat continuum and population metrics—represents a sound policy that should move forward; and 2) Whether the State of Idaho's Draft Alternative is consistent with the agency's multiple-use mandate as well as the National Greater Sage-grouse Land Use Planning Strategy. The management framework detailed in the Idaho's Draft Alternative provides a sound management platform and represents one in a range of alternatives we will fully consider in our resource management planning process that is underway. The management framework outlined in the Draft Alternative incorporates habitat information and population metrics that are central to developing a sound management strategy. The adaptive regulatory triggers and emergency response outlined in the

Draft Alternatives represent an innovative approach to addressing the complex and dynamic threats that influence the sage-grouse habitat. Adaptive management is of particular importance in Idaho where the threats of wildfire and invasive species are actively impacting habitat conditions and maintenance of large, intact stands of sagebrush.

The management framework for the Draft Alternative addresses many of the issues we received from the public during scoping and many of the responsibilities the BLM has as a multiple-use agency. For example, the Draft Alternative provides a strategy for guiding land management activities to address the primary threats of wildfire, invasive species, and fragmentation of habitat resulting from large-scale infrastructure projects. The Draft Alternative also provides a strategy to address impacts to sage-grouse habitat from improper livestock grazing and recreation activities. A rigorous analysis of a range of alternatives in BLM's draft Environmental Impact Statement (EIS) will provide the basis to evaluate the effectiveness of the alternatives in achieving sage-grouse conservation. Upon public review and comment and development of a final EIS, I will have a reasoned basis for issuing a final decision to amend our resource management plans by 2014.

BLM's National Greater Sage-grouse Land Use Planning Strategy provides guidance for incorporating the National Technical Team report "into at least one alternative in the land use planning process." The National Greater Sage-grouse Land Use Planning Strategy also provides guidance for use and update of preliminary priority habitat and preliminary general habitat maps that were developed in coordination with the Idaho Department of Fish and Game. The State of Idaho's Draft Alternative meets the purpose and need of the sage-grouse program and is responsive to BLM's National Sage-grouse Planning Strategy which calls for explicit objectives, desired habitat conditions, management actions, and area-wide use restrictions. Given that the National Greater Sage-grouse Land Use Planning Strategy is largely guiding the planning process, I believe it is reasonable to add the State of Idaho's Alternative to the range of alternatives analyzed in the EIS.

BLM's interim management of sage-grouse is outlined in IM 2012-043 which provides policies and procedures for management while the resource management plans are undergoing amendment and revision. The instruction memorandum states "*BLM field offices do not need to apply the conservation policies and procedures described in this IM in areas in which (1) a state and/or local regulatory mechanism has been developed for conservation of the Greater Sage-grouse in coordination and concurrence with the FWS; and (2) the state sage-grouse plan has subsequently been adopted by the BLM through the issuance of a state level BLM IM. If BLM programs are not addressed in the adopted state Greater Sage-grouse Plan then program direction will default to the policies and procedures set forth in this WO IM.*" If the U.S. Fish and Wildlife Service provides concurrence on Idaho's regulatory mechanism for the conservation of Greater Sage-grouse, Idaho BLM will initiate discussions with your staff about BLM policy considerations and organizational capacity for potentially adopting the State's Final Alternative as interim direction until the BLM issues the final EIS and Record of Decision, by the end of 2014.

I appreciate the continued strong coordination between the State of Idaho and Idaho BLM in the conservation of sage-grouse and public land management. We will continue to be actively engaged with sage-grouse planning efforts led by the State of Idaho and look forward to receiving your final alternative for inclusion in our EIS effort. My primary management point of contact for sage-grouse conservation is Jeff Foss, Deputy State Director for Resource Services (208-373-3801).

Thank you for your leadership in advancing conservation of sage-grouse and close coordination with Idaho BLM regarding public land management in Idaho.

Sincerely,

Steven A. Ellis  
State Director  
Idaho BLM

## BACKGROUND

As Governor of the State of Idaho, I hereby submit to the U.S. Secretary of the Interior and U.S. Secretary of Agriculture (collectively, “the Secretary”) the State of Idaho’s Alternative (“Idaho’s Alternative”) for incorporation into the National Greater Sage-Grouse Land Use Planning Strategy (“Strategy”) of the U.S. Bureau of Land Management (“BLM”) and U.S. Forest Service (“USFS”) (*see* BLM/USFS 2012). The Strategy aims to incorporate objectives, desired habitat conditions and management actions into land use plans for Federal lands – for the BLM, the Resource Management Plans (“RMPs”) required by the Federal Land Policy and Management Act (“FLPMA”) and for the USFS, the land management plans (“LMPs”) required by the National Forest Management Act (“NFMA”)—by September 30, 2014. The ultimate outcome for the Strategy is to conserve the Greater sage-grouse (*Centrocercus urophasianus*) (“sage-grouse”) and its habitat and potentially avoid a listing under the Endangered Species Act (“ESA”) (*see* BLM 2011a).

The State of Idaho wishes to express its appreciation for the Secretary’s recognition of the important role states can play in managing and conserving the sage-grouse. This recognition is also evinced in the ESA as it directs the Secretary to “take[ing] into account those efforts” being made by a state prior to a listing determination. 16 U.S.C. § 1533(b)(1)(A). Accordingly, I believe the recommendations contained herein not only provide a balanced approach to this complex natural resource issue, but also ensure the long-term sustainability of those habitat attributes necessary to preclude the need to list the species under the ESA.

In order to place Idaho’s Alternative in proper context, it is necessary to set out a brief overview of the process the State employed. As Idaho currently enjoys viable and widespread populations of sage-grouse, I was fully aware of the need for a carefully planned process to ensure we conserved the species and its habitat while maintaining predictable levels of land use. I would strongly urge our Federal partners to approach the issue in this fashion.

### GOVERNOR’S SAGE-GROUSE TASK FORCE

On March 9, 2012, I issued Executive Order 2012-02 establishing the Governor’s Sage-Grouse Task Force, hereafter “Task Force” (*see* Task Force Website, available at: <http://fishandgame.idaho.gov/public/wildlife/?getPage=310>). The Task Force was a diverse group of stakeholders comprised of representatives from local sage-grouse working groups, conservation interests, state and local officials and industry. The Task Force was charged with providing recommendations on actions for developing a state-wide regulatory mechanism to preclude the need to list the species under the ESA.

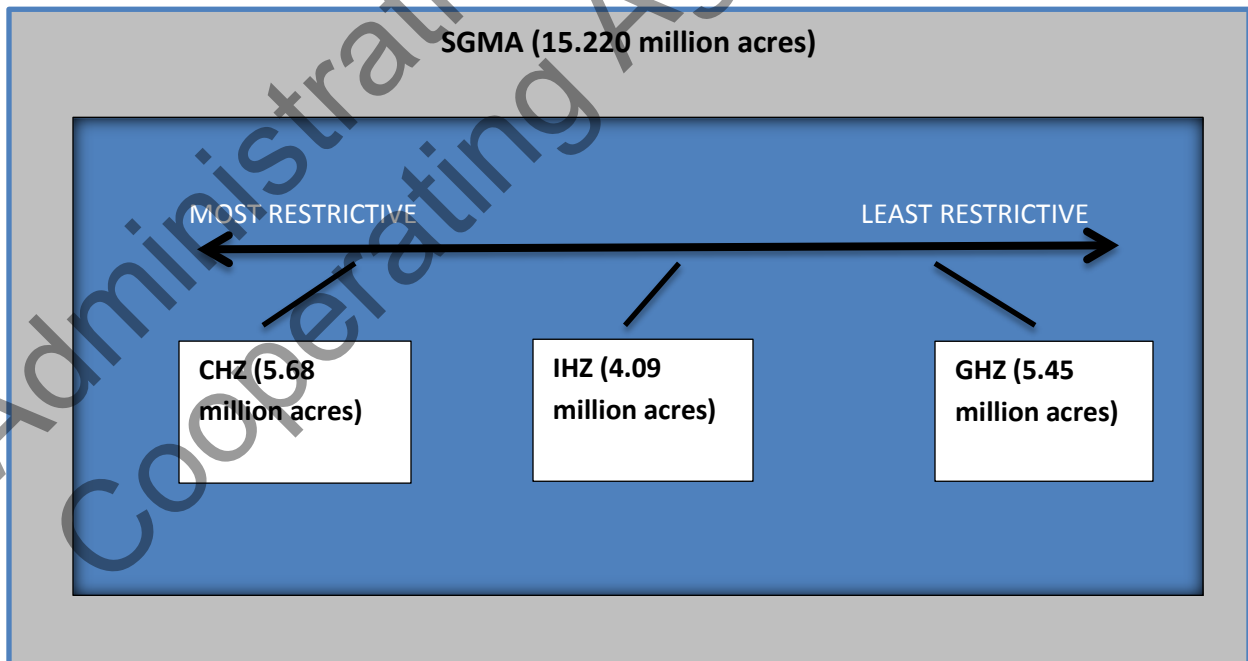

In March through May 2012, the Task Force met eight times in various locations across the State of Idaho. Each meeting was open to the public and provided an opportunity for the public to comment on sage-grouse conservation and its potential effects. Additionally, the Idaho Department of Fish and Game (“IDFG”) hosted a Web page displaying the times and locations of Task Force meetings, agenda, meeting notes, and presentations made during the meetings. See IDFG 2012b. Thus, the Task Force conducted an open and transparent information-gathering and decision-making process.

After much deliberation and discussion, the Task Force on June 15, 2012—aided by the technical expertise of IDFG, the U.S. Fish and Wildlife Service (“Service”), and other relevant State and Federal agencies—delivered its recommendations to me for review and consideration. After carefully reviewing those recommendations, I developed a set of “guiding principles” to help evaluate the strength of the Task Force’s recommendations, public comments and other important considerations. These guiding principles will be discussed in further detail under section I.

#### OVERVIEW OF THE STATE’S ALTERNATIVE

Consistent with the unanimous recommendation of the Task Force, the State is adopting the designation of a Sage-Grouse Management Area (“SGMA”) with three distinct management zones: Core Habitat (“CHZ”), Important Habitat (“IHZ”) and General Habitat (“GHZ”).

**Figure 1. Idaho’s Sage-Grouse Management Area<sup>1</sup>**

<sup>1</sup> The acreages displayed in Figure 1 are approximate values.

Generally, these management zones outline a suite of basic management activities that may, under certain conditions, or may not occur within a given area. In other words, the three management zones within the SGMA represent a management continuum that includes at one end, a relatively restrictive approach aimed at providing a high level of protection to the species within the CHZ, and on the other end, a relatively flexible approach for the GHZ allowing for more multiple-use activities. While the IHZ provides greater flexibility than in the CHZ, the overall quality and ecological importance of the habitat within this zone is more closely aligned with the habitat in the CHZ than in the GHZ.

Allocation to a specific management zone does not mandate or direct the relevant Federal agency to propose or implement any action; rather, the three habitat zones provide an array of permitted and prohibited activities. Activities not specifically addressed by the Alternative are still subject to the allowances and restrictions of the applicable resource management plan.

The measures set forth below are essential to sage-grouse conservation in Idaho and should receive not only priority consideration in the Strategy, but also in the shaping of future agency budgets. In order to accomplish the objectives set out below, I strongly urge State and Federal agencies, including the Service, BLM, USFS and other federal agencies to work collaboratively to ensure uniform and consistent application of Idaho's Alternative. In particular, BLM needs to make federal funding for fire suppression, especially in the CHZ, a top priority.

It is important to note that this document does not represent a complete list of sage-grouse actions for the State of Idaho. This document only provides special management for sage-grouse on lands managed by the BLM and USFS, and while beneficial to other sage-steppe species, agencies will still have the obligation to analyze other values when considering a proposed action.

That said, with this management framework in place, the State will approach willing private parties, local governments, other Federal partners, and the Idaho Department of Lands to see what actions are necessary and appropriate to complement the State's Federal Alternative. Furthermore, it is important to note that the relevant Federal agencies in considering these measures as part of environmental analyses, planning updates and ESA listing determinations, should recognize that actions on these lands can have direct and indirect impacts on State endowment trust lands managed by the Idaho Department of Lands. Thus, it is important to evaluate sage-grouse management in a comprehensive and holistic manner.

## STATE OF IDAHO'S ALTERNATIVE

The following section further explains the “guiding principles” used to develop Idaho’s Alternative.

### I. GUIDING PRINCIPLES

#### A. Task Force Recommendations

Because the Task Force represents the diverse stakeholders associated with this issue, the State has made a concerted effort to defer to their recommendations. In areas where the Task Force provided alternative recommendations and/or left actions to the discretion of the State, we have endeavored to capture the intent of the Task Force consistent with the parameters set out in the Governor’s Executive Order.

#### B. ESA Considerations

On March 23, 2010, the Service determined the species warrants listing over all of its range, including Idaho, but is precluded by higher listing actions. 75 Fed. Reg. 13,910 (Mar. 23, 2010). Specifically, the Service found Federal resource management plans deficient with respect to addressing the primary threats to the species—namely, habitat fragmentation due to wildfires, invasive species and infrastructure development. *See* 75 Fed. Reg. at 13,973-80.

Following the Service’s decision, the United States District Court for the District of Idaho ruled that pursuant to a D.C. District Court settlement, the agency must reevaluate the status of the species under the ESA by September 30, 2015. In response to this deadline, the Secretary of the Interior in December 2011 invited the eleven western states impacted by a potential listing of the species to develop state-specific regulatory mechanisms to address these cited deficiencies in an effort to preclude a listing under the ESA. Accordingly, one of the State’s primary objectives in submitting this Alternative is to develop a management framework that passes muster under the ESA.

#### C. Idaho’s Management Approach

The State’s management approach was designed to be clear and measurable over varying spatial and temporal scales. This approach consists of management objectives attempting to address key decision points outlined in the Service’s 2010 determination. As mentioned above, the Service’s 2010 decision cited lack of regulatory mechanisms and habitat loss as the primary drivers for its warranted but precluded decision. Importantly, both of these factors affect the population status of the species. The Idaho Sage-Grouse Management Approach includes: (1) implementation of regulatory mechanisms to support the overall management and conservation objectives of the species; (2) stabilization of habitats and populations, including a systematic review of habitat and

population status; and (3) development of adaptive regulatory triggers and a wildfire emergency clause to address sudden and unanticipated changes.

The best available information indicates that wildfire, invasive species and infrastructure, as defined below, are the primary threats to sage-grouse in Idaho. The State aided by the valuable contributions of the Task Force developed a suite of regulatory measures to address these primary threats as well as some activities identified by the Service as secondary threats (e.g., recreation, improper livestock grazing and West Nile virus). The State believes that implementation of these measures will provide significant conservation benefits to sage-grouse, other sage-steppe obligate species, and should be sufficient to preclude a listing under the ESA in Idaho.

Notwithstanding these efforts, unexpected and catastrophic events (e.g., major wildfire event(s), West Nile virus) may result in a substantial loss of habitat and concomitant decline in sage-grouse populations sufficient to trigger a change in the regulatory approach to the issue. Hence, the State has developed adaptive regulatory triggers and an emergency wildfire clause to ensure the populations and habitats within the CHZ, and to a lesser extent, the IHZ are maintained and enhanced. These adaptive triggers are intended to provide a regulatory backstop for navigating unanticipated and deleterious impacts to the species.

If these measures prove necessary, the State would still be well positioned to conserve the species and its habitat, while maintaining predictable levels of land use. It is important to note the development and implementation of regulatory triggers, primarily to deal with wildfire, is a new approach for managing this particular species. With that recognition, the State anticipates continuing to work with its partners to refine this feature of the plan to ensure the triggers are properly attuned to the needs of the State and the species.

To aid in the assessment of this management approach, the State has divided the SGMA into four individual Conservation Areas (“CA”) across the State: two north (Mountain Valleys, Desert) and two south (West Owyhee, Southern) of the Snake River. Each Conservation Area is divided into Core, Important, and General management zones (“MZs”) based upon modeling of sage-grouse breeding bird density, habitat connectivity and persistence, scientific knowledge based on surveys and radio-telemetry studies, and the recommendations of the Task Force.

Although wildfire, infrastructure, and invasive species pose threats for sage-grouse in all CAs, wildfire and invasive species tend to be a greater issue in the Desert and West Owyhee CAs than in the Mountain Valleys or Southern CAs. Additionally, sage-grouse habitats in the Desert and West Owyhee CAs are relatively contiguous, while those in the Mountain Valleys and Southern CAs tend to be more fragmented. North of the Snake River, the CHZ is approximately three million acres, while the CHZ south of the Snake River is approximately 2.7 million acres.

Acreage for the CHZ and IHZ in the four CAs is presented in Table 1. These four CAs are further described below:

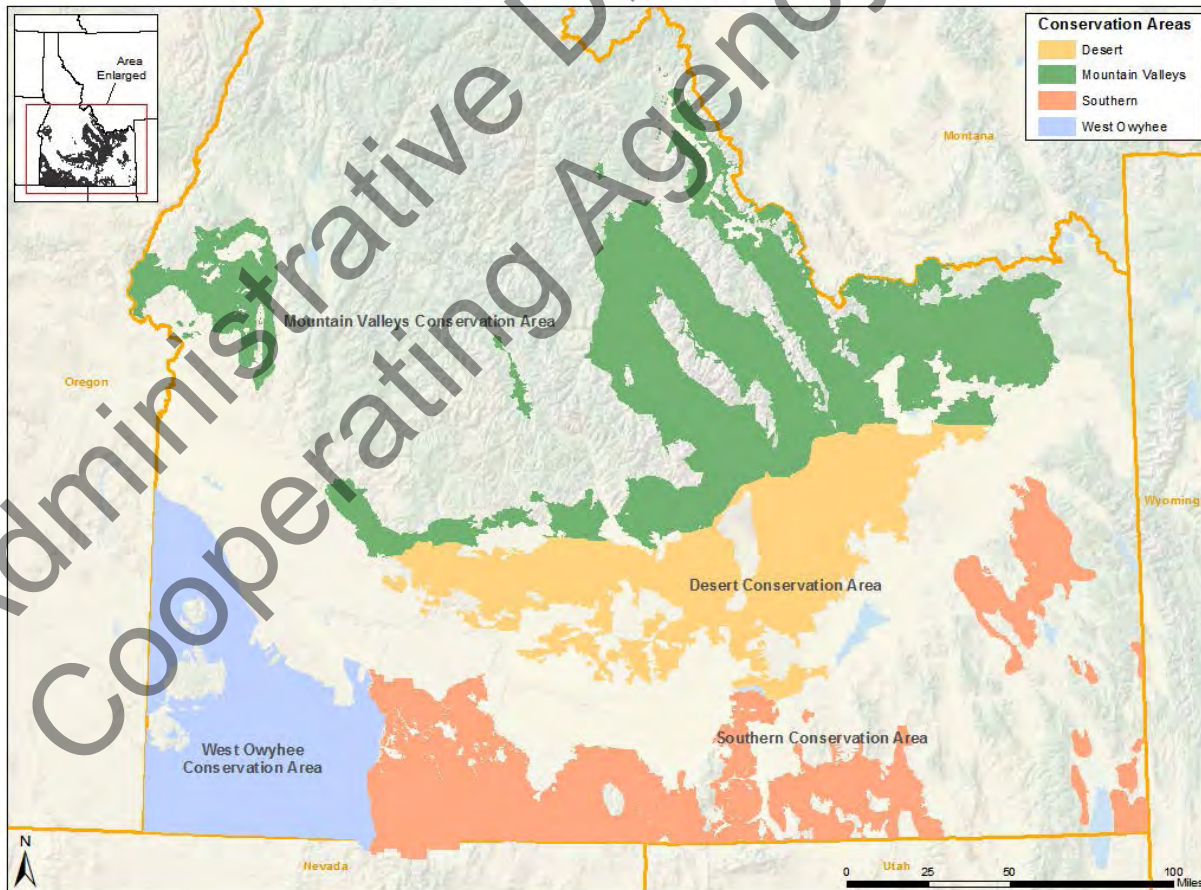

#### North of the Snake River

- Mountain Valleys CA— Starting at Rexburg and extending west, sage-grouse habitat north and west of Highway 33 to Howe, Highway 33/22 to Arco, Highway 26/20/93 to Carey, Highway 20 west to Mountain Home, south from Mountain Home on Highway 51 to the Snake River. West-Central is included in this area.
- Desert CA—South of the above CA.

#### South of the Snake River

- West Owyhee CA—West of the Jarbidge River.
- Southern CA—East of the Jarbidge River, including East Idaho uplands and Bear Lake Plateau.

### Sage Grouse Conservation Areas

Date: 8/30/2012

## MANAGEMENT OBJECTIVES

**Objective 1: Implement Regulatory Mechanisms** – The State’s first objective is to implement the regulatory mechanisms provided herein to maintain and enhance sage-grouse habitats, populations and connectivity in areas within the CHZ, buffered by strategic areas within IHZ, dominated by sagebrush. Through the implementation of these mechanisms, the State will be able to provide a level of protection sufficient to conserve at least 65% of the current known leks within the State, which are fully captured in the CHZ. Recognizing the risk and difficulty of controlling wildfire, invasive species and providing the opportunity to consider limited high-value infrastructure development, the IHZ provides an additional population buffer.

The effectiveness of this objective with respect to the primary threats of wildfire, invasive species and infrastructure will be assessed every three years for each Conservation Area. Secondary threats addressed in this Alternative will be evaluated according to the various schedules contained in the regulatory language. IDFG will serve as the lead in conducting these assessments in concert with the Governor’s Office of Species Conservation and relevant Federal agencies as the management of the species is currently under the jurisdiction of the State of Idaho.

**Objective 2: Stabilize Habitats and Populations** – The second management objective examines the effectiveness of the regulatory measures by monitoring the stability of habitat and population trends over time. As described above, the State recognizes the need to regularly analyze the effectiveness of the regulatory measures as well as to discern whether active conservation and restoration efforts, including conifer control, wildfire suppression, and more passive habitat protection techniques such as fuel breaks are effective strategies. Areas within the CHZ, and to a lesser extent the IHZ, will be used for baseline comparison to evaluate progress in achieving this objective.

During the first three-year period (2012-2015) of implementation, Idaho’s management approach will emphasize limiting habitat loss in the CHZ and IHZ respectively to no more than a ten percent (10%) loss due to fire and/or infrastructure development resulting in a proportionate reduction of males counted on leks within a particular Conservation Area. This allowance is made because of the difficulty in developing effective wildfire suppression programs, including allocation of appropriate resources and infrastructure projects currently planned and/or underway.

Should a ten percent loss occur within this timeframe, IDFG in coordination with the Governor’s Office of Species Conservation and other relevant State and Federal agencies will initiate a management review of the State’s regulatory approach to assess the causal factors for declines. Conceptually, the review would include a determination of whether the loss is based on a population-related decline (e.g., West Nile virus, drought) or is driven by habitat loss. If the loss

is habitat-driven, the review team will assess the effectiveness of current best management practices, funding levels and restoration efforts in order to preclude the triggering of the adaptive regulatory triggers.

Three primary indicators provide a baseline for population status:

- 1) Maximum number of males counted on lek routes in 2011 within CHZ.
- 2) Number of active leks counted in 2011 within CHZ.
- 3) Average rate of population change.

Males counted on lek routes, numbers of leks and rate of population change provide a solid baseline against which future comparisons will be made to assess the success of the approach or indicate when populations may be in trouble potentially triggering additional conservation actions.

Using the average value for  $\lambda$  (finite rate of change) for 2009-2011 within CHZ is a relatively new approach for monitoring sage-grouse populations. Under this evaluation, population growth calculations ( $\lambda$ ) will be compared to a value of 1.0 which indicates a stable population and evaluated for statistical significance.

Recognizing that this indicator was not discussed in any detail with the Task Force, the State will continue working with its partners to better understand this population evaluation tool to ensure a consistent on-the-ground application. In addition, the State may request a review of this approach by Dr. Oz Garton (Bio-statistician, University of Idaho). The State reserves the right to modify or remove the evaluation tool if it's application would lead to the regulatory triggers being tripped unnecessarily, or conversely, not being sensitive enough to changes on the landscape.

Table 1. Acreage of the CHZ and IHZ by Conservation Area in 2011.

Area	Core	% Core	Important	% Imp
North of the Snake River	2,994,000	34	2,480,000	28
Desert	1,044,000	33	751,000	24
Mountain Valleys	1,949,000	36	1,729,000	32
South of the Snake River	2,686,000	41	1,609,000	24
Southern	948,000	25	975,000	26
West Owyhee	1,738,000	61	634,000	22
Grand Total	5,680,000	37	4,089,000	27

Table 2. Species Population in the CHZ and IHZ by Conservation Area based on 2011 lek data.

### **ADAPTIVE REGULATORY TRIGGERS AND WILDFIRE EMERGENCY RESPONSE CLAUSE**

As mentioned above, sage-grouse adaptive regulatory triggers were developed to provide a regulatory backstop to prevent further loss and stabilize habitats and populations in the CHZ and IHZ where a demonstrated significant loss has either occurred over time or unexpectedly. These adaptive triggers are used when dramatic shifts in population or habitat occurs. Additionally, an emergency wildfire clause was developed to direct immediate response following a significant loss of sage grouse habitat due to catastrophic wildfire.

Whereas a review of the management approach is initiated when a Conservation Area exceeds a ten percent loss, an adaptive regulatory trigger—extending the conservation benefit of the measures in the CHZ to the IHZ—automatically occurs if two out of the three criteria outlined below are demonstrated. In developing these triggers it is important to note that sage-grouse populations often lag in their response to habitat loss and fragmentation. A negative population response may not be detected for three to five years following the habitat disturbance. Therefore, a habitat measure is also a component of the adaptive management trigger.

- i. Maximum number of males on lek routes declines by >20% over a three-year period compared to 2011 values.
- ii. A 30% or greater loss of sagebrush habitat is documented within defined breeding or winter habitat during a three-year period.
- iii. The finite rate of change ( $\lambda$ ) over 3 years starting with the baseline years 2009- 2011 is significantly less than 1.0.

As mentioned above, the number of active leks is a valuable indicator of population status and can be used to further inform decisions guided by the above triggers. Declines by >20% over a three-year period compared to 2011 values would indicate a problem. With the stated caveat above, the State may add, modify or remove criterion (iii) replacing the rate of change for evaluating whether to apply the adaptive regulatory trigger.

When the adaptive regulatory trigger is operative, population data and associated habitats will be reviewed to determine whether the problem is habitat related (e.g., fire) or caused by some other population-related issue (e.g., West Nile virus). If the problem is habitat related, the CHZ best management practices (*see* Section V, below) will be applied to areas in the IHZ within the same Conservation Area. For example, and while the trigger is operational, a project proponent in the IHZ would have to meet the more stringent criteria of the CHZ for developing new infrastructure. If the problem is not habitat related, appropriate management actions will be employed to minimize or alleviate the threat.

As mentioned previously, the State is also proposing an emergency clause to address dramatic habitat loss due to wildfire similar to the losses experienced in the Murphy Complex Fire. The current emergency clause states that where a wildfire burns 200,000 acres or more of CHZ habitat, and at least 50% of the burned acres contained important breeding or wintering habitat, the CHZ regulatory provisions shall apply to the IHZ within the relevant Conservation Area. The State may revise this clause based on a better understanding—e.g., mapping—of the important breeding and wintering habitat within the CHZ and IHZ.

#### **D. Existing State Sage-Grouse Plan**

In 1997, the then Idaho Sage-grouse Task Force, under the direction of the IDFG Commission, completed the Idaho Sage-grouse Management Plan (“1997 Plan”). The 1997 Plan divided Idaho into sage-grouse management areas and called for the creation of Local Working Groups (“LWGs”) to develop sage-grouse management plans for each of Idaho’s sage-grouse planning areas. Currently, for twelve local planning areas, nine LWG plans are completed, one LWG plan is nearly complete, and one plan is in progress.

Between 1999 and 2003, the Service received eight petitions to list the species as endangered or threatened under the ESA. In April 2004, the Service determined three of the petitions to list the species provided substantial information that listing might be warranted, thus initiating a comprehensive range-wide status review.

Based on the status review, the Idaho State Sage-Grouse Advisory Committee (“SAC”) in 2003 was convened to assist the State in updating the 1997 Plan. The Conservation Plan for the Greater Sage-Grouse in Idaho was completed in 2006 (“2006 Plan”). The 2006 Plan was amended in 2009 to include the completion of the Implementation Chapter.

This Alternative builds upon, supplements, and in some instances replaces the 2006 State Plan and LWG plans by identifying habitat zones, adaptive regulatory triggers and concrete best management practices for primary and some secondary threats as identified by the Service necessary to preclude a listing. For activities not addressed by this Alternative, including predation issues, the 2006 State Plan and LWG plans will continue to be operative. For the sake of completeness, Idaho’s 2006 Plan is incorporated herein by reference.

## **E. Valid Existing Rights**

All management zones and recommendations are intended to be subject to and protect all valid existing rights. It is critical, especially for areas within the CHZ and IHZ that existing land uses and landowner activities continue to occur, particularly agricultural activities on all land ownerships.

## **F. Maps**

The State recognizes that any attempt to map sage-grouse habitat must, by necessity, be at a broad, programmatic scale. The mapping of boundaries presented above is not intended to equate to verified boundary locations or on-the-ground habitat types from which the public can determine with certainty whether any particular location is inside or outside of a particular management zone.

Rather, the mapping exercise is intended to give governmental entities, land managers, project proponents and the public a general idea of where certain types of habitat and conservation priorities are spatially located as of the date of the map. The State also recognizes that this mapping exercising depicting current habitat for the species is not static, and any map must be verified through site-specific environmental analysis. Moreover, the map does not alleviate the duty of State and Federal agencies to determine the actual quality and trends of the habitat at a specific location where, for example, a project is proposed or grazing permit is up for renewal.

## **G. Infrastructure**

When the Alternative refers to measures regarding infrastructure, it is referring to discrete, large-scale anthropogenic features, including highways, high voltage transmission lines, commercial wind projects, energy development (e.g., oil and gas development, geothermal wells), airports, mines, cell phone towers, landfills, residential and commercial subdivisions, etc.

Infrastructure related to small-scale ranch, home and farm businesses (e.g., stock ponds, fences, range improvements) do not fall within this definition. These issues are not included within this definition, and are addressed in other sections of the Alternative or through local resource management plans.

## **H. Mitigation Framework**

Where compensatory mitigation—such as, for new infrastructure project authorized in the CHZ—is required to off-set impacts to sage-grouse or their habitats, the Idaho Sage-Grouse Mitigation Framework (see ISAC 2011) is the preferred mechanism to plan, select, implement and monitor these types of projects. Potential compensatory mitigation should be guided by a science-based statewide strategy to guide the selection of mitigation actions that will receive funding based on the benefits to sage-grouse populations. For example, restoration efforts are

likely to target perennial grasses and conifer encroachment areas within or adjacent to the CHZ, and secondarily, on perennial grasses and conifer encroachment areas within the IHZ with low fire risk. The Task Force recognized the importance of these targeted restoration efforts by including areas within the management regime of the CHZ current not meeting the general biological standard of 25-50% breeding bird density as described below in order to ensure these areas would still retain high restoration potential.

Mitigation efforts will focus on increasing the resiliency and productivity of sage-grouse populations and habitats, especially within the CHZ. Should these efforts materialize; the State will consider establishing a mitigation bank of sage-grouse habitation restoration projects that future development projects would repay through compensatory mitigation requirements. The State recognizes that this is a key provision in this Alternative, and intends to provide more detail on this component through the Governor's Implementation Commission.

### **I. Livestock Grazing Management**

No studies exist directly relating livestock grazing systems or stocking rates to sage-grouse abundance or productivity. Most concerns about the effects of grazing on sage-grouse are localized in nature, whereas the species is demonstrated to be more responsive to stressors at a larger landscape. Therefore, grazing should be viewed as a landscape stressor with monitoring and management actions tailored accordingly.

Numerous studies have been published providing detailed information on characteristics of sage-grouse seasonal habitats (Knick and Connelly 2011). These studies provide insight on heights and cover of sagebrush and herbaceous plants needed for productive habitats (Connelly et al. 2000).

Based on this information, opportunities exist for livestock permittees, Federal and State agencies and university researchers to collaborate in an effort to fine-tune knowledge of current conditions and needed management actions in sage-grouse habitats throughout southern Idaho. This work would provide needed insight into current conditions within sage-grouse habitat and guide specific management actions necessary for ensuring healthy and stable sage-grouse populations.

#### **Approach:**

While grazing management options should be considered at a landscape scale, livestock grazing is typically considered in a site-specific context over time where vegetative condition can be manipulated by the timing and intensity of grazing practices. Currently, this is being done by designating allotments and scheduling grazing periods based on factors such as elevation, weather and plant growth (e.g., high elevations are grazed during summer months).

The three habitat zones provide additional options for scheduled grazing and should be considered. Altering grazing schemes in allotments within the CHZ, where needed and

appropriate, may be facilitated by enhanced grazing opportunities with introduced seedings or areas with lower value to sage-grouse (e.g., GHZ). The unintended consequences of altering grazing use, such as a possible increased risk of wildfire, must be carefully considered in any management proposal.

Guidelines for managing sage-grouse habitats and populations have been published (Connelly et al. 2000, Hagen et al. 2007) and are often included in various management plans. These guidelines describe *characteristics* of productive sage-grouse habitats based on a large number of studies conducted throughout the species' range. However, they do not reflect data collected in all parts of the range nor do they reflect data collected from randomly sampled locations. Thus, this information should not be considered as providing *standards* by which to judge effects of livestock grazing on the ultimate quality of sage-grouse seasonal habitats.

Proper grazing management greatly benefits from flexibility and the opportunity to schedule and adjust intensity, timing, duration, and frequency of grazing use over time in a manner that maintains rangeland health and habitat quality. In addition, vegetative characteristics of sage-grouse seasonal ranges can change spatially and temporally due to a wide variety of other influences. Therefore, these sage-grouse habitat characteristics should be viewed as a tool for assessing habitats and guiding management actions but not as a means of dictating grazing strategies or stocking rates. On-the-ground management actions and strategies to meet these habitat characteristics should be informed local resource knowledge and conditions.

#### **Management Framework:**

Grazing within the CHZ and IHZ will be managed according to the process outlined in the text below. The first step, and perhaps the most important, is to inform and educate affected permittees regarding sage-grouse habitat needs and conservation measures. These habitat needs or characteristics outlined in Tables 3-5 will be incorporated into relevant resource management plans as the desired conditions with the understanding that these desired conditions may not be achievable: (a) due to the existing ecological condition, ecological potential or the existing vegetation; or (b) due to casual events unrelated to existing livestock grazing.

Based on these habitat characteristics, conduct fine and site scale-habitat assessments to help inform grazing management. Where necessary, a determination of factors causing any failure to achieve the habitat characteristics (Tables 3, 4 and 5) will be conducted at a resolution sufficient to document the habitat condition. This determination will include consideration of local spatial and inter-annual variability. A determination of issues attributable to livestock grazing management should not result from one year of data at a specific location within an allotment.

The assessment process will be completed in conjunction with scheduled term grazing permit renewals (i.e., every ten years). Given limited agency resources, prioritization will be given to areas that have the potential to provide the greatest benefit to sage-grouse. Allocation of resources should be concentrated on allotments within the CHZ that have declining sage-grouse populations. Following those permits within the CHZ, resources will be further prioritized to

allotments within the IHZ with breeding habitats that have decreasing lek counts. (See Flow Chart below). Sage-grouse populations that are stable or trending upward will be a lower priority for permit renewal and the assessment process.

Typically, summer habitats will be managed to provide the conditions described in Table 3; winter Table 4; and breeding habitats in Table 5. However, the assessment/determination process must rely on published characteristics of sage-grouse habitat and the Ecological Site Descriptions, existing vegetation, habitat inventories/assessments (Stiver et al. 2010), and where available, state and transition models that describe vegetation and other physical attributes for sage-grouse. The related characteristics within the categories shown below will also be included. These characteristics indicate the ability of a given area to provide sage-grouse habitat.

Category 1: The grazing allotment (or any pasture/significant area therein) has the existing vegetation and/or existing ecological condition (seral state) to provide sage-grouse habitat

Category 2: The grazing allotment (or any pasture/significant area therein) has the ecological potential to provide sage-grouse habitat.

If the process and conditions outlined above demonstrate that livestock grazing is limiting achievement of the habitat characteristics (Tables 3-5), renewed permits will include measures, including but not limited to the actions outlined in (J), to achieve desired habitat conditions. These measures must be tailored to address the specific management issues.

Additionally, adaptive management changes related to existing grazing permits should only be undertaken if improper grazing is determined to be the causal factor in not meeting habitat characteristics, specific to site capability, based upon monitoring over time with appropriate site variability.

**Table 3. General Characteristics of Late Brood Rearing Habitat.**

Habitat Features	Habitat Indicators	Habitat Characteristics	
		Upland Sagebrush Communities	Riparian/Wet Meadow Communities
Protective Cover	Sagebrush Canopy Cover	10-25%	N/A
	Sagebrush Height	16-31 inches	N/A

	Sagebrush Proximity	N/A	Protective sagebrush cover (10-25%) is within 300 m of riparian/meadow feeding area.
<b>Protective Cover and Food</b>	Grass/forb canopy cover	>15%	N/A
<b>Food</b>	Forb Availability	Succulent forbs are available during the summer. Generally applies to higher elevations, such as mtn. big sage sites.	Riparian and wet meadow conditions are such that succulent forbs are available during the summer.

**Table 4. General Characteristics of Winter Habitat.**

<b>Habitat Features</b>	<b>Habitat Indicators</b>	<b>Habitat Characteristics</b>
<b>Protective Cover and Food</b>	Sagebrush Canopy Cover	10-30% exposed above snow
	Sagebrush Height	10-14 inches exposed above snow

**Table 5. General Characteristics of Productive Breeding/Nesting and Early Brood Rearing Habitat.**

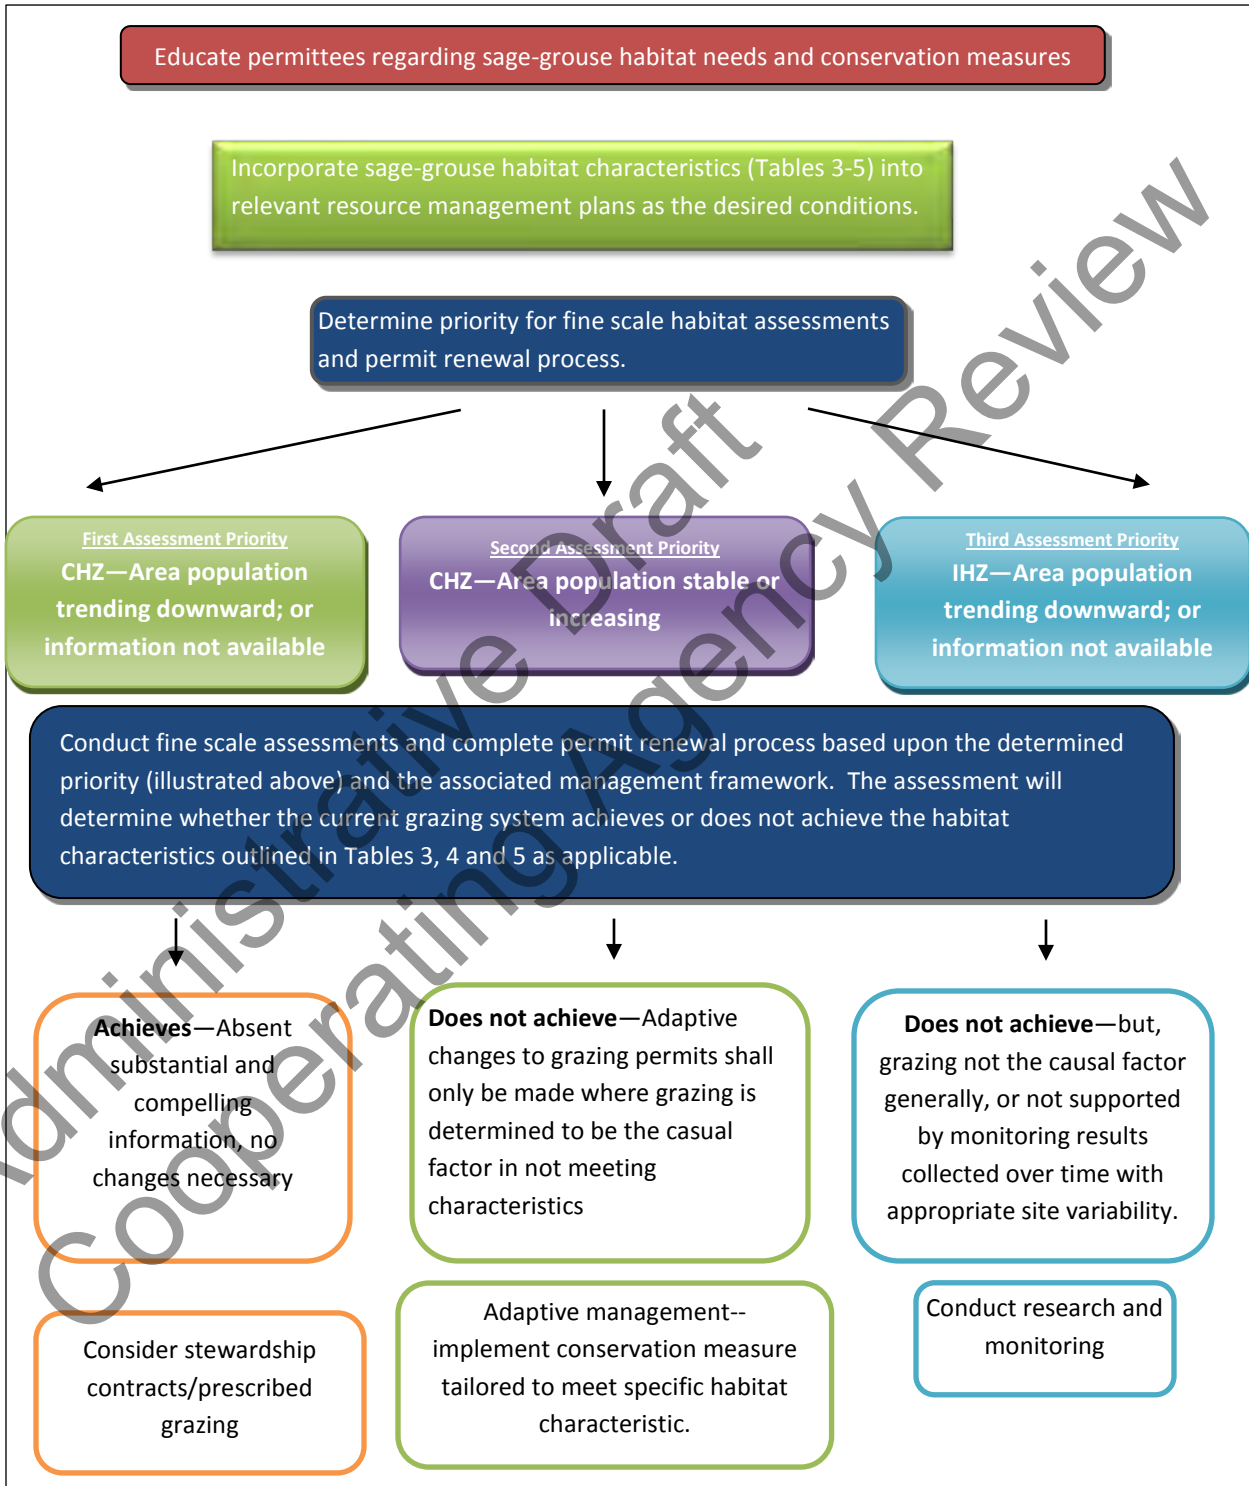

Habitat Features	Habitat Indicators	Habitat Characteristics	
		Arid Sites	Mesic Sites
Protective Cover	Sagebrush Canopy Cover	15-25%	15-25%
	Sagebrush Height	12-31 inches	16-31 inches
	Sagebrush Growth Form	Spreading	Spreading
	Perennial Grass/Forbs Heights (post hatch)	Adequate residual nesting cover <sup>2</sup>	
	Perennial Grass Canopy Cover	Not specified	>15%
Protective Cover and Food	Forb Canopy Cover	Not specified	>10%
	Total Grass/Forb Cover	>15%	>25%

<sup>2</sup> As defined by Connelly et al. 2000, Hausleitner 2003, and Holloran et al. 2005.

<b>Food</b>	Forb Availability Good abundance and availability relative to ecological site potential

Administrative Draft  
Cooperating Agency Review

**Figure 3. Livestock Grazing Management in CHZ and IHZ**

## **J. Implementation of Idaho's Alternative**

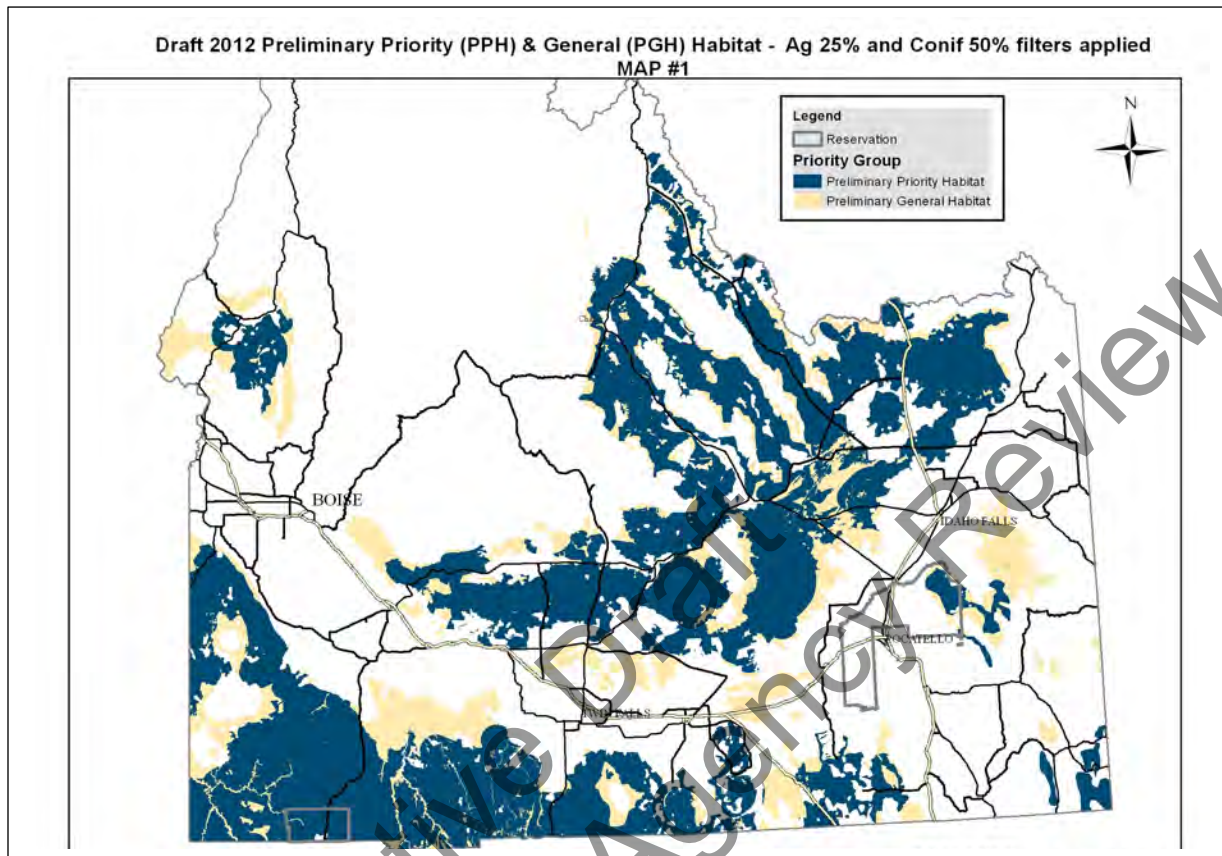

The Governor's Task Force has been a good model of collaborative problem-solving and decision-making. Should Idaho's Alternative be selected and incorporated into relevant resource management plans, I intend to establish by Executive Order an Implementation Task Force to ensure the intent of the State's Alternative is properly implemented. Specifically, the newly-formed group will examine situations where project proponents attempt to develop new infrastructure in the CHZ using the exemption process as described below; and whether proposed projects comply with the criteria outlined in the IHZ. This implementation model has proven successful in implementing the Idaho Roadless Rule.

Additionally, a key component to this alternative is adaptive management. While the State firmly believes the regulatory measures and other features of the plan effectively preclude the need to list, there is a need to continuously evaluate new information as it becomes available. For example, the U.S. Forest Service's research on *Pyrenophora semeniperda* ("black fingers of death") has shown effectiveness in eliminating the cheatgrass carryover seed. The State strongly encourages the Federal government to continue its research on this topic, and may modify this plan to make the application of this tool as an integral part of fire suppression.

## **II. IDAHO'S SAGE-GROUSE MANAGEMENT AREA (SGMA)**

As mentioned previously, the State is adopting the designation of the SGMA with three distinct management zones CHZ, IHZ and GHZ. Recognizing and identifying distinct management zones within the SGMA enables the State and the Federal government to prioritize conservation and restoration efforts to those areas that provide the most effective opportunities to benefit sage-grouse populations and their habitat while maintaining predictable levels of land use. **Map 1**, as developed by the BLM, depicts two habitat areas and provided the Task Force with an initial starting point for discussions.

**Map 1. Idaho Sage-Grouse Preliminary “Priority” and “General” Habitat Areas.**

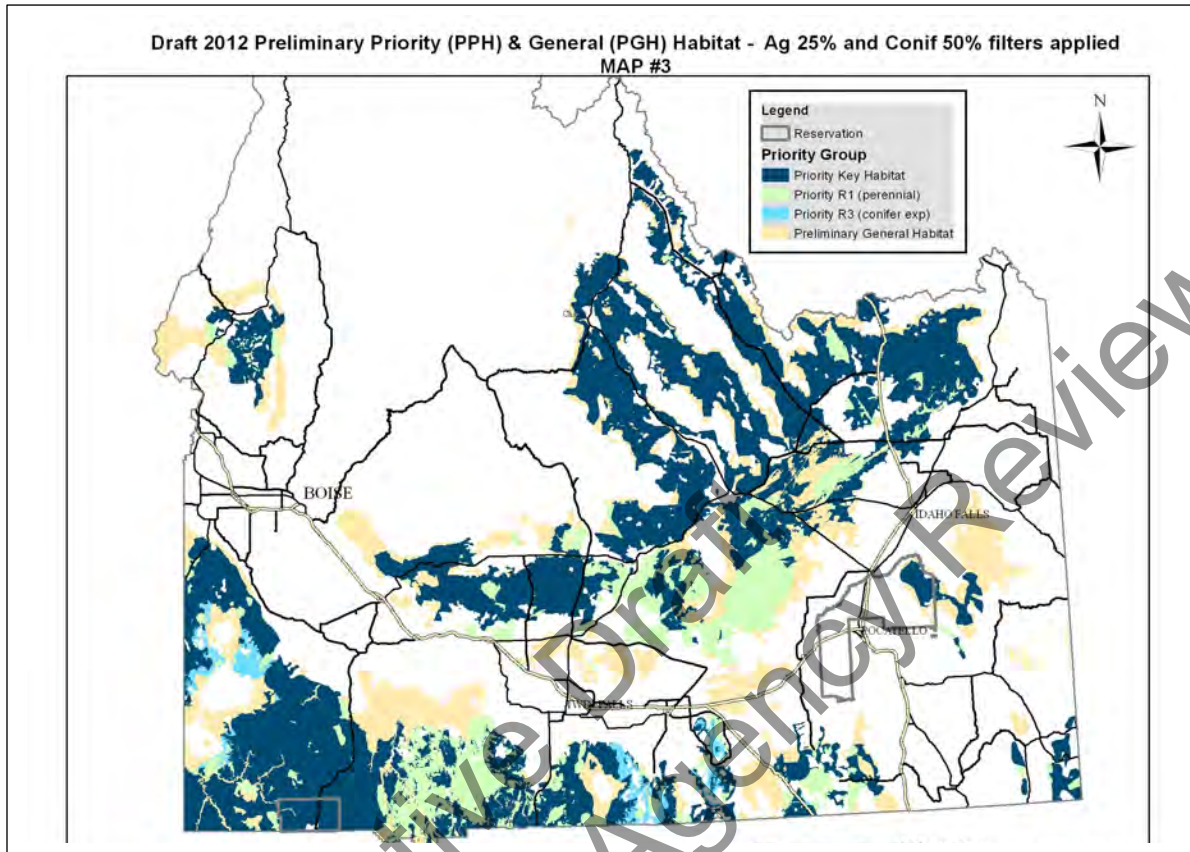

The two habitat areas in **Map 1** are referred to as preliminary “priority” habitat (“PPH”) and preliminary “general” habitat (“PGH”). BLM defines PPH as those areas having the highest conservation value to maintaining greater sage-grouse populations, while PGH is defined as areas of occupied seasonal or year-round habitat outside of “priority” habitat. (Makela and Major 2012).

The State believes this mapping approach fosters an “in or out” management regime that does not adequately take advantage of the opportunity to provide better and more precise management direction based on the quality and location of sage-grouse populations and habitats in Idaho.

The need to refine habitat areas for Idaho-specific management purposes led to the development of **Map 2**. It improves on **Map 1** by differentiating three different vegetative types within the “priority” habitat areas: sagebrush, perennial grasses and conifer encroachment. The latter two types offer opportunities for restoration of sagebrush habitat for the species.

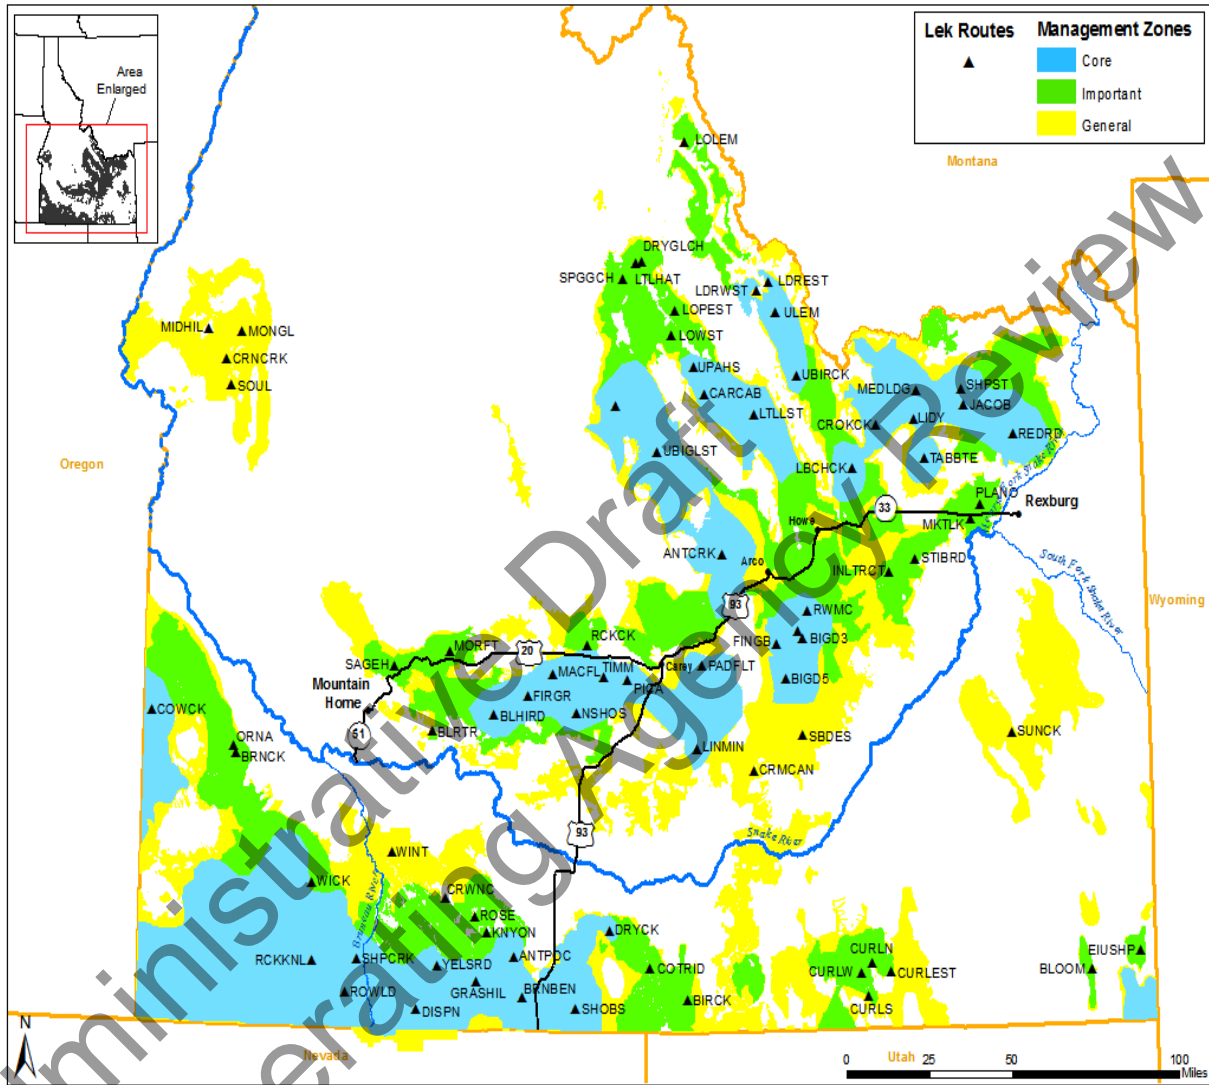

**Map 2. Refined Idaho Sage-Grouse Areas.**

For the development of Idaho's Alternative, I am adopting the Task Force's creation of the SGMA and the three management zones: CHZ, IHZ and GHZ. These are depicted on **Map 3**.

Map 3. Idaho SGMA Habitat Zones.

### Sage Grouse Management Zones & Lek Route Locations

**Table 6. Map 3 Lek Legend**

Map Label	Lek Route Name	Map Label	Lek Route Name
ANTCRK	Antelope Creek	LOWST	Lower Pahsimeroi West

LINMIN	Lincoln/Minidoka	WICK	Wickahoney
LOLEM	Lower Lemhi	WINT	Winter Camp
LOPEST	Lower Pahsimeroi East	YELSRD	Yellow Sign Road

In sum, the CHZ and IHZ on **Map 3** total approximately 9.770 million acres, account for ninety percent (90%) of the known leks or breeding display areas in Idaho, and are believed to harbor the vast majority of the State's sage-grouse populations. Evidence for this includes census data that ninety-five percent (95%) of the male sage-grouse counted at leks are in these two zones. By contrast, the GHZ encompasses approximately 5.45 million acres, on which are found ten percent (10%) of the known leks and five percent (5%) of the male sage-grouse attending leks. Thus, the GHZ is the lowest priority for conservation or restoration efforts.

The three management zones within the SGMA take into account the distribution of sage-grouse populations in Idaho. Specifically, the CHZ and IHZ focus on protecting each of the two key meta-populations in the State. These meta-populations consist of a large aggregation of

interconnected breeding subpopulations of sage-grouse that have the highest likelihood of long-term persistence. One meta-population is located north of the Snake River and includes the North Magic Valley, Big Desert, and Basin and Range areas; the other is located south of the Snake River and includes south central Idaho, the upper Bruneau-Jarbridge Plateau, and the Owyhee Uplands.

Approximately sixty-five percent (65%) of the SGMA is administered by the BLM, and another seven percent (7%) by the USFS. Any proposed actions on lands managed by the Federal government, regardless of the management zone such projects may fall in, will still require appropriate site-specific environmental analysis under the National Environmental Policy Act (“NEPA”) and any requisite site-specific decision-making, e.g. 43 C.F.R. Subpart 4160 (BLM) and 36 C.F.R. Part 251 (USFS) prior to approving proposed management actions.

Additionally, applicable resource management plan components must be followed during the planning and implementation of a project. For example, infrastructure development within the GHZ does not contain any special conservation measures for sage-grouse. However, within this management theme, some resource management plan components set sideboards or conditions for development. In particular, there may be other species listed under the ESA that mandates direction to reduce or minimize adverse effects. This direction is not inconsistent with this Alternative. Therefore, these consistent conditions would still apply to actions permissible under the Alternative and if the project cannot comply with the plan requirements, the proposed project would have to be modified, abandoned, or the specific plan component amended.

In addition to the overall desired conditions and ecosystem characteristics discussed earlier, this management zone addresses the following general conditions and uses.

### **III. IDAHO’S MANAGEMENT ZONES**

#### **A. CHZ**

**Current Condition:** The CHZ encompasses approximately 5.68 million acres and supports the highest breeding densities of sage-grouse in Idaho. These areas include approximately sixty-five percent (65%) of the known active leks and are occupied by approximately seventy-three percent (73%) of male sage-grouse counted at leks throughout the SGMA. This management theme represents, and generally exceeds, the State’s base population objective for the species.

The CHZ represents strongholds for sage-grouse populations in Idaho and supports the largest populations. Thus, this zone should represent the highest priority for conservation efforts and policies to address the primary threats to the species, such as wildfire, as described in the Service’s 2010 listing determination.

Areas designated within the CHZ were mapped based on the following key data sets:

Twenty-five (25%) and fifty (50%) breeding bird density classes, which represent the top fifty (50%) of all leks in terms of male attendance, buffered at times by portions of the seventy-five (75%) class, depending on location, and the top two categories of the BLM's connectivity and persistence model (Makela and Major).<sup>3</sup> The lek connectivity model estimates the likelihood that those leks or population are likely to persist through time (Knick and Hanser 2011).

Depending on location, additional lands beyond the 25% and 50% thresholds have been included in the CHZ to consolidate key breeding areas, to include wilderness areas and lands within national monuments, and to foster population connectivity with neighboring states. The State recognizes that these are fluid boundaries because the habitat is not static, and as new information regarding the species becomes available, it may be necessary to adjust the boundaries for the three management zones.

**Desired Future Condition:** Maintaining or improving the status of the species within this management zone requires Federal agencies, in conjunction with the State and local partners, to work collaboratively to increase the resiliency of the habitat to disturbances, such as wildfire, and limit habitat fragmentation and loss only to projects pursuant to valid existing rights or incremental upgrades and/or that demonstrate, among other things, a significant high value benefit to the State of Idaho as well as provide compensatory mitigation consistent with the guiding principles above.

**Management Focus:** Management by Federal agencies should focus on the maintenance and enhancement of the habitats, population and connectivity areas identified in this zone.

Federal agencies need to marshal existing—and target future Federal resources—to reduce the number and size of wildfires, especially in the West Owyhee Conservation Area.

Idaho landowners and sage-grouse local working groups have already invested significant efforts in the CHZ and should continue to be informed and involved as these recommendations are refined and implemented. The State encourages local landowners to continue practices that aid in meeting conservation objectives for the CHZ.

<sup>3</sup> In 2010, the BLM entered into an agreement with the Service to model sage-grouse “breeding bird density” (“BBD”) at three scales: across the range of the species; by WAFWA sage-grouse zones; and by State (Doherty et al. 2011). The BBD analyses involve ranking leks by attendance (i.e., highest to lowest number of males counted on leks) and summing the number of males until a desired percent-population threshold is met, hence the categories used—top 25%, 50%, 75% and 100% of the population.

Table of Generally Suitable Uses and Activities in CHZ<sup>4</sup>

Use/Activity	Yes	No	Conservation Measures
Fire Management	X		Only human safety and structure protection shall take precedence.
Invasive Species	X		Actively manage exotic undesirable species sufficiently to prevent invasion.
Infrastructure		X	Limited exceptions are permissible.
Recreation	X		Prioritize the completion of comprehensive travel planning.
Livestock Grazing	X		Prioritize allotments for permit renewal and assessment process for allotments with declining sage-grouse populations.

As illustrated in the table above, prospective infrastructure development authorized by the State Director is presumptively prohibited unless conducted pursuant to valid existing rights or as part of an incremental upgrade. The Task Force also recommended that a limited exemption process should be available to facilitate limited situations where a project proponent can satisfy stringent criteria and provide compensatory mitigation. It is important to note that a proponent would have to meet all the criteria outlined in the regulatory language.

<sup>4</sup> This table, along with the successive tables for each management zone, is for general illustrative purposes only. See Section V for Idaho’s Alternative regulatory language for a complete understanding of the prohibitions and permissions for each management zone.

As the Task Force recommended, one of the key criterion for obtaining an exemption was a project proponent's demonstration that the project would provide a high-value benefit to meet critical existing needs and/or important societal objectives to the State of Idaho. In the draft Alternative, several commenters noted a discomfort with having federal officials determine what projects meet the exemption criteria. Because this Alternative is aimed at providing special management direction for sage-grouse on lands managed by the Federal government, the State does not have the authority to make land allocation decisions. More specifically, these commenters argued that these same Federal officials are not well-positioned to determine whether a project under this exemption provides a "high value" benefit to the State.

The State agrees with this line of reasoning. Thus, the factor is retained as part of the analysis, and should this Alternative be implemented, the State intends as part of the Implementation Commission to evaluate this factor as part of its responsibility to provide the Governor recommendations on site-specific projects developed through this plan.

Recognizing that maintaining and improving sage-grouse populations within the CHZ is important to the State's overall population objective, the balance between the economic value of future infrastructure projects and conserving the species to prevent an ESA listing clearly tilts in favor of the species within this the management zone. That said, it is impossible to predict projects that could be important to the economic vitality of the State in the future. Thus, the "high value" evaluation by the Implementation Commission will be critical in balancing these interests.

## **B. IHZ**

**Current Condition:** The IHZ encompasses approximately 4.09 million acres. These areas include approximately twenty-five percent (25%) of the known active leks and are occupied by an estimated twenty-two percent (22%) of sage-grouse males. This management zone generally captures high-quality habitat and populations necessary for providing a management buffer for the CHZ, connecting patches of the CHZ, and supporting important populations and habitat independent of the CHZ.

The IHZ is primarily defined by the seventy-five (75%) breeding bird density areas. Given the migratory life history of many sage-grouse populations, a portion of the birds breeding in CHZ may make seasonal use of areas within the IHZ. The IHZ also includes areas of value for migration corridors, connectivity among breeding areas, and long-term persistence of each of the two key meta-populations of sage-grouse in Idaho.

**Desired Future Condition:** Maintaining or improving the status of the species within this management zone requires Federal agencies, in conjunction with the State and local partners, to work collaboratively to increase the resiliency of the habitat to disturbances, such as fire, and

limit unnecessary and undue habitat fragmentation to projects that demonstrate, among other things, a high value benefit to the State of Idaho.

**Management Focus:** Management by Federal agencies should focus strategically on areas within this zone that have the best opportunities for conserving, enhancing or restoring habitat for sage-grouse. Management by Federal agencies should employ more aggressive wildfire and invasive species management practices to prevent further encroachment of these two primary threats into the CHZ. The IHZ should also afford project proponents greater flexibility than in the CHZ with the understanding that the project still must demonstrate, among other things, a high value benefit to the State.

Table of Generally Suitable Uses and Activities in IHZ

Use/ Activity	Yes	No	Conservation Measures
<b>Fire Management</b>	X		<b>Where appropriate, develop more aggressive strategies to reduce fuel loads.</b>
<b>Invasive Species</b>	X		<b>Actively manage exotic undesirable species to prevent invasion in the CHZ without impairing sage-grouse populations.</b>
<b>Infrastructure</b>	X		<b>Permissible subject to certain criteria. Mitigate unavoidable impacts.</b>
<b>Recreation</b>	X		<b>Same as CHZ.</b>
<b>Livestock Grazing</b>	X		<b>Same as CHZ.</b>

### C. GHZ

**Current Condition:** The GHZ encompasses approximately 5.45 million acres. This management zone generally includes few active leks, and fragmented or marginal habitat. The GHZ also includes habitat for two isolated populations of sage-grouse in the East Idaho Uplands and West Central Idaho. While these two areas generally represent better habitat than the remainder of the GHZ, the isolated nature of these populations make it unlikely that they will contribute to the long-term persistence of the two key meta-populations in the State of Idaho. Thus, local working group efforts will be key in these areas.

**Desired Future Condition:** Rely on efforts of local working groups to maintain populations where applicable.

**Management Focus:** Management by Federal agencies should focus, to the extent practicable, on facilitating multiple-use activities in order to avoid siting conflicts in the other management zones. Management by Federal agencies should employ a more aggressive wildfire and invasive species management practices to prevent further encroachment of these two primary threats into the CHZ/IHZ.

Table of Generally Suitable Uses and Activities in GHZ

Use/Activity	YES	NO	Conservation Measures
Fire Management	X		Aggressive fire suppression techniques should be utilized.
Invasive Species	X		Employ aggressive invasive species measures in conjunction with CWMAs.
Infrastructure	X		Consistent with local resource management plans.
Recreation	X		No special application for sage-grouse.
Livestock Grazing	X		No special application for sage-grouse.

#### IV. COOPERATING AGENCY STATUS

The State of Idaho formally requests cooperating agency status in this process. The Governor's Office of Species Conservation in conjunction with IDFG will serve as the State's

representatives in this process. The Task Force will continue to serve in an advisory capacity to ensure the State's Alternative is properly analyzed.

## V. IDAHO'S REGULATORY LANGUAGE FOR LANDS MANAGED BY THE FEDERAL GOVERNMENT

### A. Purpose.

The purpose of this Alternative is to provide, in the context of multiple-use management, Idaho-specific direction for the conservation and management of the greater sage-grouse in lands administered by the Bureau of Land Management and the U.S. Forest Service.

### B. Definitions.

The following terms and definitions apply to Idaho's Alternative:

*Adaptive Regulatory Triggers:* Provides a regulatory backstop where a significant and unanticipated loss of sage-grouse habitats and populations occurs by applying the conservation benefits of the CHZ to the IHZ within the relevant Conservation Area.

*Infrastructure:* Discrete, large-scale anthropogenic features, including but not limited to, highways, high voltage transmission lines, commercial wind projects, energy development (e.g., oil and gas development, geothermal wells), airports, mines, cell phone towers, landfills, residential and commercial subdivisions. Infrastructure related to small-scale ranch, home and farm businesses, including but not limited to, stock ponds, fences, range improvements do not meet this definition and are addressed in other portions of the Alternative or relevant resource management plans.

*Sage-Grouse Management Objective for the State of Idaho:* Maintain and enhance the habitat and populations of sage-grouse located within the Core Habitat Zone ("CHZ"), while strategically buffered by areas within the Important Habitat Zone ("IHZ") having the best opportunities for conserving, enhancing or restoring habitat for sage-grouse. In the first three years of implementation, the approach will emphasize limiting habitat loss in the CHZ and IHZ respectively to no more than ten percent (10%) resulting in a proportionate reduction of males counted on leks within an individual Conservation Area.

*Sage-Grouse Management Area:* The Sage-Grouse Management Area ("SGMA") pursuant to this Alternative identified in **Map 3** that accounts for the entire known sage-grouse population in the State of Idaho.

*State Director:* The Idaho State Director for the Bureau of Land Management ("BLM"). Where relevant and appropriate, the term "State Director" also means "Regional Forester" for lands subject to the management of the U.S. Forest Service.

**C. SGMA.**

1. *Designations.* All relevant National Forest System lands and BLM lands as designated in **Map 3** are hereby designated as the SGMA. Notwithstanding the need to make technical corrections, absent substantial and compelling evidence, these designations pursuant to **Map 3** should not be altered for at least five (5) years.
2. *Management Classifications.* Management classifications for the SGMA express a management continuum. The following classifications are established: Core Habitat Zone (“CHZ”), Important Habitat Zone (“IHZ”) and General Habitat Zone (“GHZ”).
3. *Conservation Areas.* In order to achieve the State’s Management Approach, the following Conservation Areas are established: West Owyhee Conservation Area; Southern Conservation Area; Desert Conservation Area; and Mountain Valleys Conservation Area.
4. *Maps.* The State Director and the Director of the Idaho Department of Fish and Game shall maintain and make available to the public a map of the SGMA, including records regarding any corrections or modifications of such maps pursuant to this Alternative.

**D. CHZ.** Management by Federal and State agencies should focus on the maintenance and enhancement of habitats, populations and connectivity in areas within this management zone.

1. *Wildfire*

- i. Incorporate the BLM Washington Office Instruction Memorandum (“WO IM”) 2011-138 to reduce the number and size of wildfires in sage-grouse habitat.
- ii. Only human safety and structure protection shall take precedence over the protection of sage-grouse habitat.
- iii. Evaluate and decrease wildfire response time by twenty-five percent (25%). In order to achieve this objective:
  - a. Prioritize, maintain and improve a high initial attack success rate in suppression response and staging decisions;
  - b. Utilize available maps under (C)(4) and spatial data depicting sage-grouse habitats within this zone;
  - c. Redeploy firefighting resources not being fully utilized outside the SGMA to the extent such redeployment will not cause harm to human safety and structure protection; and
  - d. Request the necessary federal appropriations to achieve this objective.

- iv. Evaluate the current fire suppression baseline, and in conjunction with the measures below, develop a consistent plan that improves on this baseline by twenty-five percent (25%).
- a. Federal firefighters shall ensure close coordination with State firefighters, local fire departments and local expertise to create the best possible network of strategic fuel breaks and road access to minimize and reduce the size of a wildfire following ignition;
  - b. To the extent practicable, the close coordination described in (a) should result in consistent fire response plans and mutual aid agreements necessary to achieve the management objective in (iv);
  - c. Request and place additional firefighting resources and establish new Incident Attack Centers, with particular emphasis in the West Owyhee Conservation Area;
  - d. Create and maintain effective fuel breaks in strategic locations that will modify fire behavior and increase fire suppression effectiveness according to the following criteria:
    - Target establishment of fuel breaks along existing roads or other disturbances.
    - Identify and target higher-risk roads for fuel break construction and maintenance based on fire history maps.
    - Implement a strategic approach to using these roads for rapid fire response.
    - Analyze the benefits of the fuel break against the additional loss of sagebrush cover and risk on invasive weeds.
    - Fire breaks must be properly maintained.
  - e. Request the necessary federal appropriations to achieve this objective.

2. *Invasive Species*

- i. Actively manage exotic undesirable species to limit presence.
- ii. Monitor and control invasive vegetation post-wildfire treatment for at least three years.
- iii. Emphasize the use of native seeds for fuels management treatment based on availability, adaptation (site potential), and probability of success.

- a. Reallocate native plant seeds for Emergency Stabilization and Rehabilitation (ES&R) from outside the SGMA and the GHZ to this management zone if necessary.
  - b. Where the probability of obtaining sufficient native seed is low, non-native seeds may be used provided sage-grouse habitat objectives are met.
3. *Habitat Restoration*
- i. Prioritize the removal of conifers through methods appropriate for the terrain and most likely to facilitate expeditious sage-grouse population and habitat recovery. To the extent possible, utilize removal methods creating the least amount of disturbance.
    - a. Efforts should focus on areas with highest restoration potential typically evidenced by low canopy cover, existing sagebrush understory, and adjacent current populations.
    - b. Refrain from using prescribed fire and conducting removal projects in juniper stands older than one hundred years.
    - c. Maximize the use of Natural Resource Conservation Service funding through permittee grants under the Environmental Quality Incentives Program (EQUIP) and Wildlife Habitat Improvement (WHIP) programs.
  - ii. In perennial grasslands, actively restore sagebrush canopy cover and the ecological functions of the site. To the extent practicable, utilize native understory.
    - a. Prioritize areas for restoration with lower risks of wildfire and exotic species invasion.
4. *Infrastructure*
- i. The development of infrastructure authorized after the effective date of the record of decision in areas designated as CHZ is prohibited, except if developed pursuant to valid existing rights or incremental upgrade and/or capacity increase of existing development (authorized prior to the record of decision) subject to best management practices in (G).
    - a. Impacts of proposed actions authorized in (i) shall be limited to the authorized existing footprint with no more than a fifty percent (50%), depending on industry practice, increase in footprint size and associated impacts; and
    - b. Projects authorized under (i) would only be subject to compensatory mitigation if new significant and unavoidable impacts are demonstrated to be associated with the project.

- ii. Notwithstanding the limited prohibition in (4)(i), the State Director may authorize infrastructure development only in situations where the development:
  - a. Cannot be reasonably accomplished outside of the CHZ; and
  - b. Demonstrates the population trend for the species within the relevant Conservation Area is stable or increasing over a three-year period; and
  - c. Demonstrates the individual or cumulative exceptions under this provision must best reduce habitat fragmentation ensuring the impacts will not accelerate and/or cause a population decline of the species within the relevant Conservation Area; and
  - d. Co-locate with existing infrastructure to the maximum extent practicable; and
  - e. Shall mitigate unavoidable impacts through an appropriate compensatory mitigation plan.
- iii. Proposed development authorized under (4)(ii) are subject to the applicable best management practices in (G).
- iv. Notwithstanding the limited prohibition in 4(i), the State Director may authorize, after the record of decision, oil and gas development only under the following circumstances:
  - a. Exploration activities utilizing temporary roads are permissible provided site disturbance is minimized.
  - b. There shall be no surface use or occupancy unless the State Director finds that the surface development, based on site-specific analysis, will not accelerate and/or cause declines in sage-grouse populations within the relevant Conservation Area based on the application of the criteria in 4(ii) and the best management practices in (G).

5. *Secondary Threats*

i. *Recreation*

- a. Prioritize the completion of Comprehensive Transportation Management Travel Plans (“CTMTPs”) to minimize disturbance to sage-grouse populations and reduce the risk of wildfire and other habitat disturbances associated with cross-country travel.
- b. Prior to the completion of CTMTPs, restrict vehicles to existing routes.

- c. Adopt a “restricted to designated routes” approach where appropriate to the extent such designation does not interfere with administrative use.
- d. Discourage the creation of new roads and trails. Re-route existing routes where appropriate.
- e. Identify and reduce activities demonstrating repeated displacement of nesting birds. Where existing routes are demonstrated to affect occupied leks, apply seasonal and time based use-restrictions tailored to address the site-specific conditions of the area.

ii. *West Nile Virus*

- a. Reduce the risk of transmission of West Nile Virus to sage-grouse by minimizing the creation of breeding habitat for mosquitoes.
- b. Consider the potential impacts of West Nile Virus transmission prior to permitting new ponds or reservoirs.
- c. Minimize the construction of new ponds or reservoirs except as needed to meet important resource management and/or restoration objectives.
- d. Non-pond/reservoir watering facilities, such as troughs and bottomless tanks, should be developed and maintained to provide high quality water that minimizes the development of habitat for mosquitoes.
- e. Maintenance of functioning float valves and water return features should be constructed to prohibit water from being spilled on the ground surrounding the trough and/or tank.
- f. To the extent practicable, water should be returned to the original water source to reduce suitable habitat for mosquitoes.

iii. *Livestock Grazing Management*

- a. Incorporate the sage-grouse habitat characteristics in **Tables 3-5** and management considerations into relevant resource management plans as desired conditions recognizing that these conditions may not be achievable (1) due to the existing ecological condition, ecological potential, or the existing vegetation; or (2) due to casual events unrelated to existing livestock grazing.
- b. Prioritize permit renewal and the land health assessments outlined in (iii)(c) in allotments with declining sage-grouse populations.

- c. Conduct fine and site scale-habitat assessments and, where appropriate, a determination of factors causing any failure to achieve the habitat characteristics in Tables 3-5. The assessment(s) shall be conducted at a resolution sufficient to document the habitat condition and will include local spatial and inter-annual variability. Any determination relative to the habitat characteristics (Tables 3-5) shall be based upon existing ecological condition, ecological potential, and existing vegetation information to ensure the assessment recognizes whether or not these habitat characteristics are achievable.
  - d. The assessment will rely on published characteristics of sage-grouse habitat and the Ecological Site Descriptions, and **Tables 3-5**, and where available and applicable, rangeland health determinations made in accordance with 43 C.F.R. 418.2(c).
  - e. After conducting the assessment in (iii)(c), if the current grazing system achieves the habitat characteristics (Tables 3-5), absent substantial and compelling information no further grazing management changes are necessary.
  - f. If the process and conditions outlined in (iii)(c) demonstrate that livestock grazing is limiting achievement of the habitat characteristics (Tables 3-5), renewed permits will include measures, including but not limited to the actions outlined in (J), to achieve desired habitat conditions. These measures must be tailored to address the specific management issues.
  - g. Adaptive management changes related to existing grazing permits should only be undertaken where improper grazing is determined to be the casual factor in not meeting habitat characteristics, specific to site capability, based upon monitoring over with appropriate spatial variability.
  - h. Where management changes are needed and necessary pursuant to (f), implement management actions that are narrowly tailored to address the specific habitat objective applied at the allotment and/or activity plan level, including but not limited to the actions outlined in (J).
- iv. *Livestock Grazing Infrastructure*
- a. To the extent practicable, reduce the impacts of fences and livestock management facilities on sage-grouse.

- b. Mark fences with permanent flagging or other suitable device to reduce sage-grouse collisions on flat to gently rolling terrain in areas of moderate to high fence densities (i.e., more than one kilometer of fence per square kilometer) located within two kilometers of occupied leks.
- c. Identify and remove unnecessary fences.
- d. Placement of new fences and livestock management facilities, including corrals, loading facilities, water tanks and windmills, should consider their impact on sage-grouse.
- e. Avoid constructing new fences within one kilometer (0.6 miles) of occupied leks.
- f. To the extent practicable, place new, taller structures, including corrals, loading facilities, water storage tanks, windmills, at least one kilometer from occupied leks.

**E. IHZ.** Management by Federal and State agencies should focus on areas within this zone that have the best opportunities for conserving, enhancing or restoring habitat for sage-grouse. Management by Federal agencies should also provide the necessary flexibility to permit high-value infrastructure projects.

1. *Wildfire*

- i. Incorporate the BLM WO IM 2011-138 to reduce the number and size of wildfires in sage-grouse habitat.
- ii. Only human safety and structure protection shall take precedence over the protection of sage-grouse habitat.
- iii. Evaluate and decrease wildfire response time by twenty percent (20%) in the West Owyhee Conservation Area. Decrease wildfire response time in all other conservation areas by fifteen percent (15%). In order to achieve this objective:
  - a. Prioritize, maintain and improve a high initial attack success rate in suppression response and staging decisions;
  - b. Utilize available maps under (C)(4) and spatial data depicting sage-grouse habitats within this zone;
  - c. Redeploy firefighting resources not being fully utilized outside the SGMA to the extent such redeployment will not cause harm to human safety and structure protection; and
  - d. Request the necessary federal appropriations to achieve this objective.

- iv. Evaluate the current fire suppression baseline, and in conjunction with the measures below, develop a management plan that improves on this baseline by fifteen percent (15%).
  - a. Federal firefighters shall ensure close coordination with State firefighters, local fire departments and local expertise (i.e., livestock grazing permittees and road maintenance personnel) to create the best possible network of strategic fuel breaks and road access to minimize and reduce the size of a wildfire following ignition;
  - b. To the extent practicable, the close coordination described in (a) shall result in consistent fire response plans and mutual aid agreements necessary to achieve the objective in (1)(v); and
  - c. Request the necessary federal appropriations to achieve this objective.
- v. Create and maintain effective fuel breaks in strategic locations that will modify fire behavior and increase fire suppression effectiveness.
  - a. Target establishment of fuel breaks along existing roads or other disturbances.
  - b. Identify and target higher-risk roads for fuel break construction and maintenance based on fire history maps.
  - c. Implement a strategic approach to using these roads for rapid fire response.
  - d. Closely evaluate the benefits of the fuel break against the additional loss of sagebrush cover and risk of invasive weeds.
  - e. Fire breaks must be properly maintained.
- vi. Prescribe or target livestock grazing where demonstrated to be appropriate as a tool for reducing fuel loads, reducing invasive species populations and maintaining functional fire breaks.
  - a. Test the effectiveness and monitor the results on a site-specific basis through stewardship contracting.
- vii. Reduce human-caused ignitions by coordinating with Federal, State and local jurisdiction on fire and litter prevention programs.

2. *Invasive Species*

- i. Actively manage exotic undesirable species to limit presence in the CHZ.
- ii. Monitor and control invasive vegetation post-wildfire treatment for at least three years.

- iii. Emphasize the use of native seeds for fuels management treatment based on availability, adaptation (site potential), and probability of success.
  - a. Reallocate native plant seeds for Emergency Stabilization and Rehabilitation (ES&R) from outside the SGMA and the GHZ to this management zone.
  - b. Where the probability of success or native seed availability is low, non-native seeds may be used provided sage-grouse habitat objectives are met.
- iv. Require best management practices for construction projects to prevent invasion.
- v. Actively pursue eradication or control of noxious weeds and/or invasive species posing a risk to sage-grouse habitats using a variety of chemical, mechanical and other appropriate means in coordination with the local Cooperative Weed Management Area (CWMA).
- vi. Establish an effective monitoring program to evaluate the success of weed control efforts in conjunction with the CWMAs.

3. *Habitat Restoration*

- i. Prioritize the removal of conifers through methods appropriate for the terrain and most likely to facilitate expeditious sage-grouse habitat recovery. Especially prioritize and target removal treatments adjacent to the CHZ. To the extent possible, utilize methods creating the least amount of disturbance.
  - a. Areas with highest restoration potential will typically have low canopy cover, existing sagebrush understory, and adjacent current populations.
  - b. Refrain from using prescribed fire and conducting removal projects in juniper stands older than one-hundred years.
  - c. Maximize the use of Natural Resource Conservation Service funding through permittee grants under the Environmental Quality Incentives Program (EQUIP) and Wildlife Habitat Improvement (WHIP) programs.
- ii. In perennial grasslands, actively restore sagebrush canopy cover and the ecological functions of the site. To the extent practicable, utilize native understory.
  - a. Prioritize areas for restoration with lower risks of wildfire and exotic species invasion, especially in areas adjacent to the CHZ.

4. *Infrastructure*

- i. The State Director may authorize new infrastructure development where in the State Director's judgment the circumstances set out below exist.
  - a. Cannot reasonably be achieved, technically or economically, outside of this management zone; and
  - b. To the extent practicable, co-locate the project with existing infrastructure. In the event co-location is not practicable, the siting should best reduce cumulative impacts and/or impacts to other high value natural, cultural, or societal resources; and
  - c. Should not result in unnecessary and undue habitat fragmentation or other impacts causing a decline in the population of the species within the relevant Conservation Area; and
  - d. Mitigate unavoidable impacts through an appropriate compensatory mitigation plan; and
  - e. Comply with the applicable best management practices in (G).
- ii. For oil and gas leases issued after the effective date of the record of decision, exploration activities utilizing temporary roads shall be exempt, provided site disturbance is minimized. Surface use or occupancy is permissible if projects can demonstrate, based on site-specific analysis, that such activities will not cause declines in sage-grouse populations through implementation of the best management practices in (G). Projects authorized under (ii) must mitigate unavoidable impacts through an appropriate compensatory mitigation plan.

5. *Secondary Threats*

i. *Recreation*

- a. Prioritize the completion of Comprehensive Transportation Management Travel Plans ("CTMTPs") to minimize disturbance to sage-grouse and reduce the risk of wildfire and other habitat disturbances associated with cross-country travel.
- b. Prior to the completion of CTMTPs, restrict vehicles to existing routes.
- c. Adopt a "restricted to designated routes" approach where appropriate to the extent such designation does not interfere with administrative use.

- d. To the extent practicable, discourage the creation of new roads and trails. Re-route existing routes where appropriate.
  - e. Identify and reduce activities demonstrating repeated displacement of nesting birds. Where existing routes are demonstrated to affect occupied leks, apply seasonal and time based use-restrictions tailored to the site-specific conditions of the area.
- ii. *West Nile Virus*
- a. Reduce the risk of the transmission of West Nile Virus to sage-grouse by minimizing the creation of breeding habitat for mosquitoes.
  - b. Consider the potential impacts of West Nile Virus transmission prior to permitting new ponds or reservoirs.
  - c. Minimize to the extent practicable, construction of new ponds or reservoirs except as needed to meet important resource management and/or restoration objectives.
  - d. Non-pond/reservoir watering facilities, such as troughs and bottomless tanks, should be developed and maintained to provide high quality water that suppresses development of habitat for mosquitoes.
  - e. Maintenance of functioning float valves and water return features should be constructed to prohibit water from being spilled on the ground surrounding the trough and/or tank.
  - f. To the extent practicable, water should be returned to the original water source to reduce suitable habitat for mosquitoes.
- iii. *Livestock Grazing Management*
- a. See V.D.5.iii.
- iv. *Livestock Grazing Infrastructure*
- a. To the extent practicable, reduce the impacts of fences and livestock management facilities on sage-grouse.
  - b. Mark fences with permanent flagging or other suitable device to reduce sage-grouse collisions on flat to gently rolling terrain in areas of moderate to high fence densities (i.e., more than one kilometer of fence per square kilometer) located within two kilometers of occupied leks.
  - c. Identify and remove unnecessary fences.
  - d. Placement of new fences and livestock management facilities, including corrals, loading facilities, water tanks

and windmills, should consider their impact on sage-grouse.

- e. Avoid constructing new fences within one kilometer of occupied leks.
- f. To the extent practicable, place new, taller structures, including corrals, loading facilities, water storage tanks, windmills, at least one kilometer from occupied leks.

**F. GHZ.** Management by Federal agencies should focus on multiple-use management consistent with local resource management plans.

1. *Wildfire*

- i. Incorporate the BLM WO IM 2011-138 to reduce the number and size of wildfires in sage-grouse habitat.
- ii. Fire suppression efforts should be emphasized, recognizing that other local, regional, and national fire suppression priorities may take precedent.
- iii. Aggressively create and maintain effective fuel breaks in strategic locations that will modify fire behavior and increase fire suppression effectiveness. The fire breaks should target areas necessary to provide a buffer between the GHZ and the other management zones.
  - a. Target establishment of fuel breaks along existing roads or other disturbances.
  - b. Identify and target higher-risk roads for fuel break construction and maintenance based on fire history maps.
  - c. Implement a strategic approach for using these roads to enable rapid fire response.
  - d. Fuel breaks must be properly maintained and sited with consideration of active leks and risk of invasive weeds.
- iv. Actively employ prescribed or targeted grazing as a primary tool for reducing fuel loads, reducing invasive species populations and maintaining functional fire breaks to the extent such activities do not adversely affect breeding habitats (i.e. occupied leks, nesting and early brood-rearing).

2. *Invasive Species*

- i. Aggressively manage exotic undesirable species sufficient to prevent invasion into other management zones.
- ii. Aggressively pursue eradication or control of noxious weeds and/or invasive species posing a risk to sage-grouse habitats using a variety of chemical, mechanical and other appropriate means in

- coordination with the local Cooperative Weed Management Area (CWMA).
- iii. Establish an effective monitoring program to evaluate the success of weed control efforts in conjunction with the CWMA.
3. *Infrastructure*
    - i. A responsible official may authorize infrastructure construction consistent with the relevant land management components as provided for in (H).
  4. *Secondary Threats*
    - i. *Recreation*
      - a. Nothing in this Alternative shall be construed as affecting the use of motorized equipment and mechanical transport in this management zone.
    - ii. *West Nile Virus*
      - a. Minimize the creation of breeding habitat for mosquitoes in sage-grouse habitat.
      - b. Prior to permitting new ponds or reservoirs, consider the impacts of West Nile Virus transmission.
      - c. Non-pond/reservoir watering facilities, such as troughs and bottomless tanks should be developed and maintained to provide high quality water that suppresses the development of habitat for mosquitoes.
    - iii. *Livestock Grazing Management*
      - a. Nothing in this Alternative shall be construed as affecting existing grazing permits in this management zone. Grazing permits are still subject to the grazing regulations (43 C.F.R. Part 4100, including Fundamentals of Rangeland Health, 43 C.F.R. Subpart 4160.
    - iv. *Livestock Grazing Infrastructure*
      - a. Identify and remove unnecessary fences.

**G. Infrastructure—Best Management Practices.**

1. For proposed actions authorized in the CHZ and IHZ, the following best management practices are applicable:
  - i. Utilize existing roads, or realignments of existing routes to the extent possible.
  - ii. Construct new roads to minimum design standards needed for production activities.
  - iii. To the extent possible, micro-site linear facilities to reduce impacts to sage-grouse habitats.

- iv. Locate staging areas outside the CHZ to the extent possible.
  - v. To the extent possible, co-locate linear facilities within one kilometer of existing linear facilities.
  - vi. New transmission lines, excluding those lines under (viii), will be deemed co-located and/or permissible if construction occurs between July 1 and March 14 (or between July 1 and November 30 in winter concentration areas) and within one kilometer either side of existing 115-kilovolt (kV) or larger transmission lines to create a corridor no wider than two kilometers.
  - vii. New transmission lines, excluding those lines under (viii), outside of this two kilometer corridor can only be constructed where it can be demonstrated that the activity will not cause declines in sage-grouse populations or if the activity reduces cumulative impacts and/or avoids other important natural, cultural or societal resources.
  - viii. Locate essential public services, including but not limited to, distribution lines, domestic water lines and gas lines, at least one kilometer from active sage-grouse leks. If one kilometer avoidance is not possible, construct lines outside of March 15 to June 30.
  - ix. In addition to the applicable best management practices (i-viii), wind energy development, projects must also comply with the 2012 U.S. Fish and Wildlife Service's Wind Energy Guidelines.
2. For oil and gas leases issued after the effective date of the record of decision, the following best management practices are applicable:
- i. Evaluate the affected area in accordance with the process outlined in the State of Wyoming's Executive Order 2011-5.
  - ii. For development within the CHZ, surface disturbance will be limited to three percent of suitable habitat per an average of 640 acres. Development within the IHZ will be limited to five percent of suitable habitat per an average of 640 acres.
  - iii. There shall be no surface occupancy ("NSO") within one kilometer of the perimeter of occupied sage-grouse leks; provided this distance is supported by the best available science at the time the development undergoes site-specific environmental analysis.
  - iv. Activity (production and maintenance activity exempted) will be allowed from July 1 to March 14 outside of the one kilometer perimeter of a lek where brood rearing, nesting and early brood-rearing habitat is present.

- v. Areas solely used as winter concentration areas, exploration and development activity will be allowed March 14 to December 1.
- vi. Locate main roads used to transport production and/or waste products >1.5 kilometers from the perimeter of occupied sage-grouse leks. Locate other roads used to provide facility site access and maintenance >1.5 kilometers from the perimeter of occupied sage-grouse leks. Construct roads to minimum design standards needed for production activities.
- vii. New noise levels, at the perimeter of a lek, should not exceed 10dBA above ambient noise (existing activity included) from 6:00 PM to 8:00 AM during the initiation of breeding (March 1-May 15). Ambient noise level should be determined by measurements taken at the perimeter of a lek at sunrise.
- viii. Absent some demonstration to the contrary, the proposed sagebrush treatment associated with this activity will not reduce canopy cover to less than 15 percent.

#### **H. Scope and Applicability.**

1. This Alternative does not revoke, suspend, or modify any permit, contract, or other legal instrument authorizing the occupancy and use of the applicable Federal lands prior to the effective date of the record of decision and prior to the completion of any statutory or regulatory decision-making process to revoke, suspend, or modify such permit, contract or legal instrument.
2. This Alternative does not revoke, suspend, or modify any project or activity decision made prior to the effective date of the record of decision.
3. Nothing in this Alternative shall be construed as restricting mineral leases, contracts, permits, and associated activities prior to the effective date of the record of decision.
4. Nothing in this Alternative shall affect mining activities conducted pursuant to the General Mining Law of 1872.
5. For the purposes of sage-grouse management, the provisions set forth in this Alternative shall take precedence over any inconsistent land management plan component unless prescribed by statute or regulation. Land management components that are not inconsistent with this Alternative will continue to provide guidance for projects and activities within the SGMA.
6. The best management practices in (G) and other protective stipulations in this Alternative should be evaluated on a continuous basis and at a

minimum, as new science, information and data emerge regarding the habitats and behaviors of the species.

7. Nothing in this Alternative waives any applicable requirements regarding site-specific environmental analysis, public involvement, consultation with Tribes and other agencies, or compliance with applicable laws.

#### **I. Corrections and Adaptive Regulatory Triggers.**

Correction or modification of designations made pursuant to this Alternative may occur under the following circumstances.

1. *Administrative Corrections.* Administrative corrections to the map of lands identified in **Map 3** include, but are not limited to, adjustments that remedy clerical errors, typographical errors, mapping errors, or improvements in mapping technology. The State Director may issue administrative corrections after a 30-day public notice.
2. *Adaptive Regulatory Trigger.* Where two out of the following three criteria are demonstrated within a Conservation Area, excluding areas within the GHZ, the measures in (D) shall apply to the IHZ containing wintering or breeding habitat in the relevant Conservation Area:
  - i. Finite rate of change ( $\lambda$ ) over three years starting with the baseline years 2009- 2011 is significantly less than 1.0. This is a moving average for rate of change (i.e. 2011-2013, 2012-2014, 2013-2015, etc.) when compared to 1.0 (indicating a stable population).
  - ii. Number of males on lek routes declines by >20% over a three-year period compared to 2011 values.
  - iii. A 30% or greater loss of sagebrush habitat is documented within defined breeding or winter habitat during a three-year period.
3. *Regulatory Trigger No Longer Necessary.* Where the core population data within the relevant Conservation Area meets or exceeds the 2011 values over a three-year period, areas within the IHZ are no longer subject to the CHZ management provisions.
4. *Emergency Wildfire Clause.* Where a wildfire burns 200,000 acres or more of the CHZ, and at least fifty percent of the burned acres contained important breeding or wintering habitat, the CHZ regulatory provisions in (D) shall apply to the IHZ within the appropriate Conservation Area.

- #### **J. Adaptive Management Measures for Livestock Grazing:**
- Based upon the assessment process, the ecological conditions, the ecological potential and the status of sage-grouse populations, the following measures could be employed singly, or in combination where appropriate, in the development and

implementation of grazing management programs. Flexibility in administering grazing programs and providing offsetting grazing options over relatively large landscapes will help successfully implement these measures.

1. Employ grazing management systems that ensure adequate nesting and early brood rearing habitat within the breeding landscape.
2. When use-pattern mapping or monitoring demonstrates an opportunity to adjust livestock distribution to benefit occupied sage-grouse breeding habitat, include as appropriate herding, salting, and water-source management (e.g., turning troughs/pipelines on/off, extending pipelines/moving troughs) in grazing programs.
3. If available and feasible, utilize exotic perennial grass seedings and/or annual grasslands to avoid breeding season of use of occupied sage-grouse habitat.
4. Modify authorized seasons of use within grazing permits to provide greater flexibility in managing livestock for the benefit of sage-grouse.
5. Where appropriate, maintain residual herbaceous vegetation at the end of the growing/grazing season to contribute to nesting and brood-rearing habitat during the coming nesting season. Table 5.
6. Insure that permittees are informed of management and movement requirements related to avoidance of recent burns, rehabilitation seedings or other restoration sites.
7. Manage grazing of riparian areas, meadows, springs, and seeps in a manner that promotes vegetative structure and composition appropriate to the site. In some cases enclosure fencing may be a viable option. However, recognize the availability and quality of desired herbaceous species may be improved by periodic grazing use of the enclosure.
8. Implement management actions (grazing decisions, allotment management plan/conservation plan development, or other agreements) to modify grazing management to meet seasonal sage-grouse habitat requirements. Employ proper grazing management by providing flexibility in scheduling the intensity, timing, duration and frequency of grazing use over time that best promotes management objectives. During drought periods, prioritize evaluating effects of drought in the CHZ relative to grouse needs for food and cover. Ensure that post-drought management allows for vegetation recovery that meets sage-grouse needs in priority sage-grouse habitat areas.
9. When using salt or mineral supplements: a) place them in existing disturbed sites, areas with reduced sagebrush cover—e.g., seedings or cheatgrass sites—to reduce impacts to sage-grouse breeding habitat, b)

where feasible use salts or mineral supplements to improve management of livestock for the benefit of sage-grouse habitat.

10. In general, avoid constructing new fences within 2 km of occupied leks. Where feasible, place new, taller structures, such as corrals, loading facilities, water-storage tanks, windmills, etc., at least 2 km from occupied leks to reduce opportunities for perching raptors. Careful consideration, based on local conditions, should also be given to the placement of new fences or structures near other important seasonal habitats (winter-use areas, movement corridors etc.) to reduce potential impacts.
11. New spring developments in sage-grouse habitat should be designed to maintain or enhance the free-flowing characteristics of springs and wet meadows. Analyze developed springs, seeps and associated pipelines to determine if modifications are necessary to maintain the continuity of the predevelopment riparian area within priority sage-grouse habitat. Make modifications where necessary, considering impacts to other water users when such considerations are neutral or beneficial to sage-grouse.
12. Ensure that new and existing livestock troughs and open water storage tanks are fitted with ramps to facilitate the use of and escape from troughs by sage-grouse and other wildlife. Do not use floating boards or similar objects, as these are too unstable and are ineffective. Use BMPs to mitigate potential impacts from West Nile virus.
13. When placing new water developments in sage-grouse breeding habitat, choose sites and designs that will provide the greatest enhancement for sage-grouse and sage-grouse habitat.
14. Avoid new water developments in higher quality native breeding/early brood habitats that have not had significant prior grazing use except in situations in which water developments may aid in better livestock distribution across the allotment and will not adversely impact the species.
15. Identify and when feasible, establish strategically located forage reserves focusing on areas unsuitable for sage-grouse habitat restoration or lower priority habitat restoration areas.
16. Monitor for, and treat invasive species associated with, existing range improvements.
17. Consider initiating vegetative manipulation projects where sagebrush canopy cover exceeds optimal characteristics to promote grass and forb understory growth. These projects should only be undertaken where it can be achieved without negatively impacting the species.

Cooperating Agency Review

# Office of the Governor

## STATE OF WYOMING EXECUTIVE DEPARTMENT EXECUTIVE ORDER

Order 2011-5  
(Replaces 2010-4)

### GREATER SAGE-GROUSE CORE AREA PROTECTION

**WHEREAS**, the Greater Sage-Grouse (*Centrocercus urophasianus*) inhabits much of the sagebrush-steppe habitat in Wyoming; and

**WHEREAS**, the sagebrush-steppe habitat type is abundant across the state of Wyoming; and

**WHEREAS**, the state of Wyoming currently enjoys robust populations of Greater Sage-Grouse; and

**WHEREAS**, the state of Wyoming has management authority over Greater Sage-Grouse populations in Wyoming; and

**WHEREAS**, the Greater Sage-Grouse has been the subject of several petitions to list the species as a threatened or endangered species pursuant to the Endangered Species Act; and

**WHEREAS**, the United States Department of the Interior has determined that listing the Greater Sage-Grouse as a threatened or endangered species is warranted over all of its range, including the populations in Wyoming; and

**WHEREAS**, the United States Department of the Interior has determined that listing the Greater Sage-Grouse as a threatened or endangered species is currently precluded by higher priority listing actions; and

**WHEREAS**, the Greater Sage-Grouse is currently considered a "candidate" species under the auspices of the Endangered Species Act; and

**WHEREAS**, the United States Department of the Interior is required to review the status of all candidate species every year; and

**WHEREAS**, the listing of the Greater Sage-Grouse would have a significant adverse effect on the economy of the state of Wyoming, including the ability to generate revenues from state lands; and

**WHEREAS**, the listing of the Greater Sage-Grouse would have a significant adverse effect on the custom and culture of the state of Wyoming; and

**WHEREAS**, the Wyoming State Legislature and other agencies have dedicated significant state resources to conserve Greater Sage-Grouse populations in Wyoming; and

**WHEREAS**, the state of Wyoming has developed a “Core Population Area” strategy to weave the many on-going efforts to conserve the Greater Sage-Grouse in Wyoming into a statewide strategy; and

**WHEREAS**, members of the Sixtieth Legislature of the State of Wyoming signed a Joint Resolution recognizing “the Greater Sage Grouse Core Area Strategy [then embodied under Governor’s Executive Order 2008-2] as the State of Wyoming’s primary regulatory mechanism to conserve sage-grouse and preclude the need for listing the bird as a threatened or endangered species pursuant to the Endangered Species Act of 1973.”; and

**WHEREAS**, on April 17, 2008, the Office of the Governor requested that the U.S. Fish and Wildlife Service review the “Core Population Area” strategy to determine if it was a “sound policy that should be moved forward” and on May 7, 2008, the U.S. Fish and Wildlife Service responded that the “core population area strategy, as outlined in the Implementation Team’s correspondence to the Governor, is a sound framework for a policy by which to conserve greater sage-grouse in Wyoming”; and

**WHEREAS**, on November 10, 2010, the U.S. Fish and Wildlife Service again confirmed that “This long-term, science-based vision for the conservation of greater sage-grouse has set the stage for similar conservation efforts across the species range,” and that “the Core Population Area Strategy for the greater sage-grouse provides an excellent model for meaningful conservation of sage-grouse is fully supported and implemented”; and

**WHEREAS**, several western states have adopted or are considering adopting the Wyoming Core Area Strategy, thus making the concept consistent across the species range; and

**WHEREAS**, new science, information and data continue to emerge regarding “Core Population Areas” and the habitats and behaviors of the Greater Sage-Grouse, which led the Governor’s Sage-Grouse Implementation Team to re-evaluate the original “core population areas” and protective stipulations for Greater Sage-Grouse.

**NOW, THEREFORE**, pursuant to the authority vested in me by the Constitution and Laws of the State, and to the extent such actions are consistent with the statutory obligations and authority of each individual agency including those found in Title 9, Chapter 5, Article 3 of Wyoming State Statutes, otherwise cited as the Wyoming Regulatory Takings Act, I, Matthew H. Mead, Governor of the State of Wyoming, do hereby issue this Executive Order providing as follows:

1. Management by state agencies should focus on the maintenance and enhancement of Greater Sage-Grouse habitats, populations and connectivity areas identified in Attachment A. Absent substantial and compelling information, these Core Population Areas should not be altered for at least five (5) years.
2. Existing land uses within Core Population Areas should be recognized and respected by state agencies. It is assumed that activities existing in Core Population Areas prior to August 1, 2008 will not be managed under Core Population Area stipulations. Examples of existing activities include oil and gas, mining, agriculture, processing facilities, housing and other uses that were in place prior to the development of the Core Population Areas (prior to August 1, 2008). Provided these activities are within a defined project boundary (such as a recognized federal oil and gas unit, drilling and spacing unit, mine plan, subdivision plat, etc.) they should be allowed to continue within the existing boundary, even if the

use exceeds recommended stipulations (see Attachment B) recognizing that all applicable federal actions shall continue.

3. New development or land uses within Core Population Areas should be authorized or conducted only when it can be demonstrated that the activity will not cause declines in Greater Sage-Grouse populations.
4. Development consistent with the stipulations set forth in Attachment B shall be deemed sufficient to demonstrate that the activity will not cause declines in Greater Sage-Grouse populations.
5. Funding, assurances (including efforts to develop Candidate Conservation Agreements and Candidate Conservation Agreements with Assurances), habitat enhancement, reclamation efforts, mapping and other associated proactive efforts to assure viability of Greater Sage-Grouse in Wyoming should be focused and prioritized to take place in Core Population Areas.
6. To the greatest extent possible, a non-regulatory approach shall be used to influence management alternatives within Core Population Areas. Management alternatives should reflect unique localized conditions, including soils, vegetation, development type, predation, climate and other local realities.
7. For activities outside of Core Population Areas, no more than a one-quarter (1/4) mile no surface occupancy standard and a two (2) mile seasonal buffer should be applied to occupied leks. Incentives to enable development of all types outside Core Population Areas should be established (these should include stipulation waivers, enhanced permitting processes, density bonuses, and other incentives). Development scenarios should be designed and managed to maintain populations, habitats and essential migration routes where possible. It is recognized that some incentives may result in reduced numbers of sage-grouse outside of Core Population Areas.
8. Incentives to accelerate or enhance required reclamation in habitats adjacent to Core Population Areas should be developed, including but not limited to stipulation waivers, funding for enhanced reclamation, and other strategies. It is recognized that some incentives may result in reduced numbers of sage-grouse outside of the Core Population Areas.
9. Existing rights should be recognized and respected.
10. On-the-ground enhancements, monitoring, and ongoing planning relative to sage-grouse and sage-grouse habitat should be facilitated by sage-grouse local working groups whenever possible.
11. Fire suppression efforts in Core Population Areas should be emphasized, recognizing that other local, regional, and national suppression priorities may take precedent. However, public and firefighter safety remains the number one priority for all fire management activities.
12. State and federal agencies, including the U.S. Fish and Wildlife Service, Bureau of Land Management, U.S. Forest Service, and other federal agencies shall work collaboratively to ensure a uniform and consistent application of this Executive Order to maintain and enhance Greater Sage-Grouse habitats and populations.
13. State agencies shall work collaboratively with local governments and private landowners to maintain and enhance Greater Sage-Grouse habitats and populations in a manner consistent with this Executive Order.

14. It is critical that existing land uses and landowner activities continue to occur in core areas, particularly agricultural activities on private lands. For the most part, these activities on private lands are not subject to state agency review or approval. Only those activities occurring after August 1, 2008 which state agencies are required by state or federal statute to review or approve are subject to consistency review. This Executive Order in no way adds or expands the review or approval authority of any state agency. It is acknowledged that such land uses and activities could have localized impacts on Greater Sage-Grouse. To offset these impacts, Core Population Areas have been mapped to include additional habitat beyond that strictly necessary to prevent listing of the species. The additional habitat included within the Core Population Area boundaries is adequate to accommodate continuation of existing land uses and landowner activities. As a result, state agencies are not required to review most existing land uses and landowner activities in Core Population Areas for consistency with this Executive Order. Attachment C contains a list of existing land uses and landowner activities that do not require review for consistency.

15. It will be necessary to construct significant new transmission infrastructure to transport electricity generated in Wyoming to out-of-state load centers. New transmission lines constructed within Core Population Areas will be consistent with this Executive Order if they are constructed between July 1 and March 14 (or between July 1 and November 30 in winter concentration areas) and within one half (1/2) mile either side of existing (prior to Governor's Executive Order 2010-4) 115 kV or larger transmission lines creating a corridor no wider than one (1) mile. New transmission lines outside this one (1) mile wide corridor within Core Population Areas should be authorized or conducted only when it can be demonstrated that the activity will not cause declines in Greater Sage-Grouse populations.

16. For purposes of consistency with this Executive Order there is established a transmission line corridor through Core Population Areas in south central and southwestern Wyoming as illustrated on Attachment D. This two (2) mile wide corridor represents the state of Wyoming's preferred alternative for routing transmission lines across the southern portion of the state while reducing impacts to Core Population Areas and other natural resources. New transmission lines constructed within this corridor shall be considered consistent with this Executive Order if construction occurs within the corridor between July 1 and March 14 (or between July 1 and November 30 in winter concentration areas).

17. New distribution, gathering, and transmission lines sited outside established corridors within Core Population Areas should be authorized or conducted only when it can be demonstrated by the state agency that the activity will not cause declines in Greater Sage-Grouse populations.

18. State agencies shall strive to maintain consistency with the items outlined in this Executive Order, but it should be recognized that adjustments to the stipulations may be necessary based upon local conditions and limitations. The goal is to minimize future disturbance by co-locating proposed disturbances within areas already disturbed or naturally unsuitable.

19. The protective stipulations outlined in this Executive Order should be reevaluated on a continuous basis and at a minimum annually, as new science, information and data emerge regarding Core Population Areas and the habitats and behaviors of the Greater Sage-Grouse.

20. State agencies shall report to the Office of the Governor within ninety (90) days of signing and annually thereafter detailing their actions to comply with this Executive Order.

This Executive Order shall remain in effect until August 18, 2015, at which time all provisions of this Executive Order shall be reevaluated.

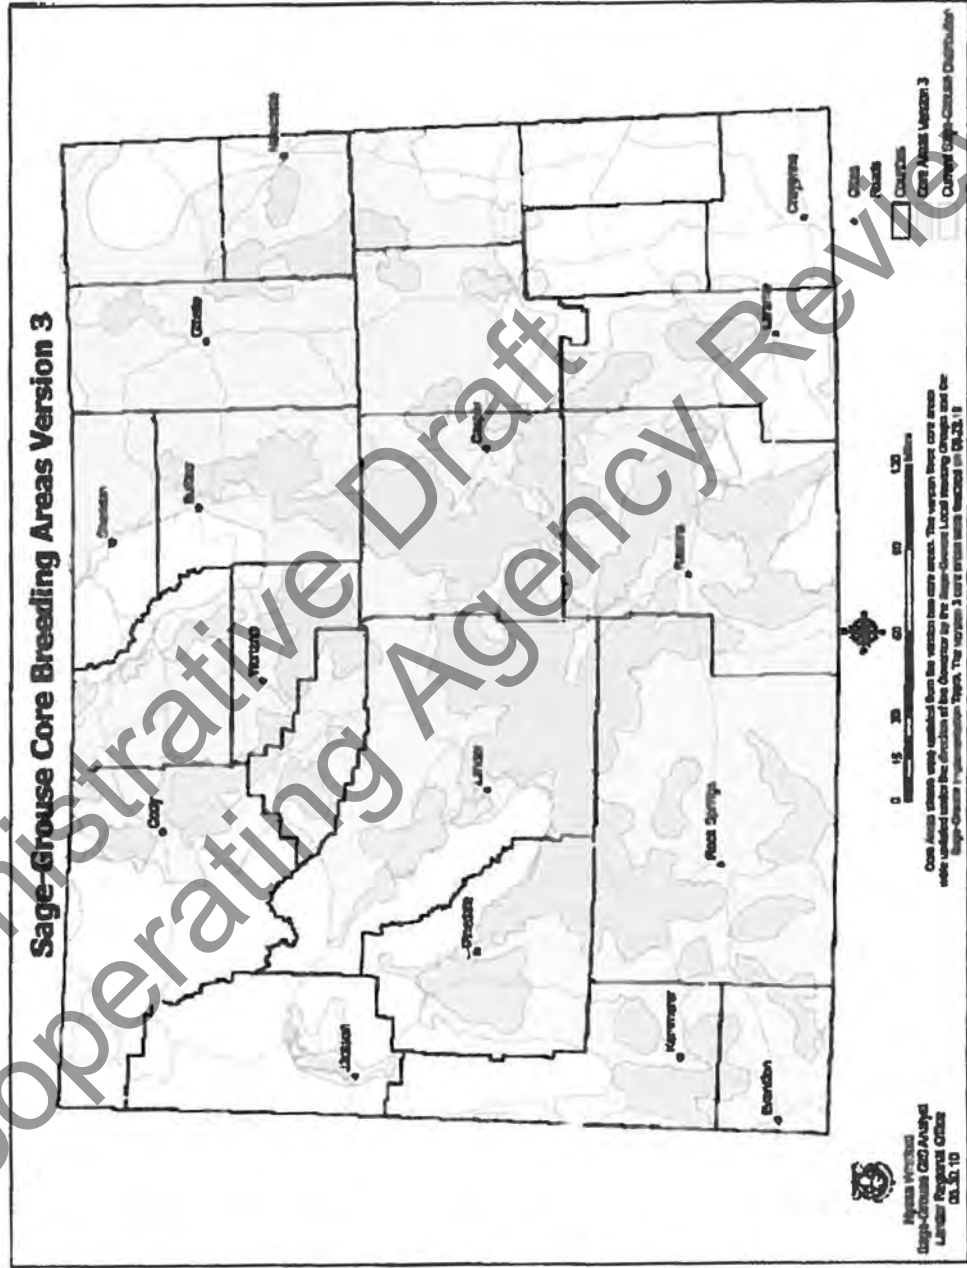

Given under my hand and the Executive Seal of the State of Wyoming this 2 day of Dec, 2011.

  
Matthew H. Mead  
Governor

Cooperating Agency Review

# ATTACHMENT A

## ATTACHMENT B

### Permitting Process and Stipulations for Development in Sage-Grouse Core Areas

#### PERMITTING PROCESS

**Point of Contact:** The first point of contact for addressing sage-grouse issues for any state permit application should be the Wyoming Game and Fish Department (WGFD). Project proponents (proponents) need to have a thorough description of their project and identify the potential effects on sage-grouse prior to submitting an application to the permitting agency (details such as a draft project implementation area analysis, habitat maps and any other information will help to expedite the project). Project proponents should contact WGFD at least 45-60 days prior to submitting their application. More complex projects will require more time. It is understood that WGFD has a role of consultation, recommendation, and facilitation, and has no authority to either approve or deny the project. The purpose of the initial consultation with the WGFD is to become familiar with the project proposal and ensure the project proponent understands recommended stipulations and stipulation implementation process.

**Maximum Disturbance Process:** All activities will be evaluated within the context of maximum allowable disturbance (disturbance percentages, location and number of disturbances) of suitable sage-grouse habitat (See Appendix 1 for definition of suitable sage-grouse habitat and disturbance of suitable sage-grouse habitat) within the area affected by the project. The maximum disturbance allowed will be analyzed via a Density/Disturbance Calculation Tool (DDCT) process conducted by the Federal Land Management Agency on federal Land and the project proponent on non-federal (private, state) land. Unsuitable habitat occurring within the project area will not be included in the disturbance cap calculations.

1. Density/Disturbance Calculation Tool (DDCT): Determine all occupied leks within a core population area that may be affected by the project by placing a 4 mile boundary around the project boundary (as defined by the proposed area of disturbance related to the project). All occupied leks located within the 4 mile boundary and within a core population area will be considered affected by the project.

A four-mile boundary will then be placed around the perimeter of each affected lek. The core population area within the boundary of affected leks and the 4 mile boundary around the project boundary creates the DDCT for each individual project. Disturbance will be analyzed for the DDCT as a whole and for each individual affected lek within the DDCT. Any portion of the DDCT occurring outside of core area will be removed from the analysis.

If there are no affected leks within the 4 mile boundary around the project boundary, the DDCT area will be that portion of the 4 mile project boundary within the core population area.

2. Disturbance analysis: Total disturbance acres within the DDCT will be determined through an evaluation (Appendix 1) of:
  - a. Existing disturbance (sage-grouse habitat that is disturbed due to existing anthropogenic activity and wildfire).

- b. Approved permits (that have approval for on the ground activity) not yet implemented.
3. Habitat Assessment:
- a. A habitat assessment is not needed for the initial DDCT area provided that the entire DDCT area is considered suitable.
  - b. A habitat assessment should be conducted when the initial DDCT indicates proposed project will cause density/disturbance thresholds to be exceeded, to see whether siting opportunities exist within unsuitable or disturbed areas that would reduce density/disturbance effects.
  - c. When a habitat assessment is conducted it should create a baseline survey identifying:
    - i. Suitable and unsuitable habitat within the DDCT area
    - ii. Disturbed habitat within the DDCT area
    - iii. Sage-grouse use of suitable habitat (seasonal, densities, etc.)
    - iv. Priority restoration areas (which could reduce the 5% cap)
      - A. Areas where plug and abandon activities will eliminate disturbance
      - B. Areas where old reclamation has not produced suitable habitat
    - v. Areas of invasive species
    - vi. Other assurances in place (CCAA, easements, habitat, contracts, etc.)
4. Determination of existing and allowable suitable habitat disturbance: Acres of disturbance within suitable habitat divided by the total suitable habitat within the DDCT area times 100 equals the percent of disturbed suitable habitat within the DDCT area. Subtracting the percentage of existing disturbed suitable habitat from 5% equals new allowable suitable habitat disturbance until plant regeneration or reclamation reduces acres of disturbed habitat within the DDCT area.

**Permitting:** The complete analysis package developed by consultation and review outlined herein will be forwarded to the appropriate permitting agency. WGFD recommendations will be included, as will other recommendations from project proponents and other appropriate agencies. Project proponent shall have access to all information used in developing recommendations. Where possible and when requested by the project proponent, state agencies shall provide the project proponent with development alternatives other than those contained in the project proposal.

**Exempt Activities:** A list of exempt (“de minimus”) activities, including standard uses of the landscape is available in Attachment C.

## GENERAL STIPULATIONS

These stipulations are designed to maintain existing suitable sage-grouse habitat by permitting development activities in core areas in a way that will not cause declines in sage-grouse populations. General stipulations are recommended to apply to all activities in core areas, with the exception of exempt (“de minimus”) actions defined herein (Attachment C) or specifically identified activities. The specific industry stipulations are considered in addition to the general stipulations.

- 1. **Surface Disturbance:** Surface disturbance will be limited to 5% of suitable sage-grouse habitat per an average of 640 acres. The DDCT process will be used to determine the

level of disturbance. Distribution of disturbance may be considered and approved on a case-by-case basis. Unsuitable habitat should be identified in a seasonal and landscape context, on a case-by-case basis, outside the 0.6 mile buffer around leks. This will incentivize proponents to locate projects in unsuitable habitat to avoid creating additional disturbance acres. Acres of development in unsuitable habitat are not considered disturbance acres. The primary focus should be on protection of suitable habitats and protecting from habitat fragmentation. See Appendix 1 for a description of suitable, unsuitable habitat and disturbance.

2. **Surface Occupancy:** Within 0.6 miles of the perimeter of occupied sage-grouse leks there will be no surface occupancy (NSO). NSO, as used in these recommendations, means no surface facilities including roads shall be placed within the NSO area. Other activities may be authorized with the application of appropriate seasonal stipulations, provided the resources protected by the NSO are not adversely affected. For example, underground utilities may be permissible if installation is completed outside applicable seasonal stipulation periods and significant resource damage does not occur. Similarly, geophysical exploration may be permissible in accordance with seasonal stipulations.
3. **Seasonal Use:** Activity (production and maintenance activity exempted) will be allowed from July 1 to March 14 outside of the 0.6 mile perimeter of a lek in core areas where breeding, nesting and early brood-rearing habitat is present. In areas used solely as winter concentration areas, exploration and development activity will be allowed March 14 to December 1. Activities in unsuitable habitat may also be approved year-round (including March 15 to June 30) on a case-by-case basis (except in specific areas where credible data shows calendar deviation). Activities may be allowed during seasonal closure periods as determined on a case-by-case basis. While the bulk of winter habitat necessary to support core sage-grouse populations likely occurs inside Core Population Areas, seasonal stipulations (December 1 to March 14) should be considered in locations outside Core Population Areas where they have been identified as winter concentration areas necessary for supporting biologically significant numbers of sage-grouse nesting in Core Population Areas. All efforts should be made to minimize disturbance to mature sagebrush cover in identified winter concentration areas.
4. **Transportation:** Locate main roads used to transport production and/or waste products > 1.9 miles from the perimeter of occupied sage-grouse leks. Locate other roads used to provide facility site access and maintenance > 0.6 miles from the perimeter of occupied sage-grouse leks. Construct roads to minimum design standards needed for production activities.
5. **Overhead Lines:** Bury lines when possible, if not; locate overhead lines at least 0.6 miles from the perimeter of occupied sage-grouse leks. New lines should be raptor proofed if not buried.
6. **Noise:** New noise levels, at the perimeter of a lek, should not exceed 10 dBA above ambient noise (existing activity included) from 6:00 p.m. to 8:00 a.m. during the initiation of breeding (March 1 – May 15). Ambient noise levels should be determined by measurements taken at the perimeter of a lek at sunrise.
7. **Vegetation Removal:** Vegetation removal should be limited to the minimum disturbance required by the project. All topsoil stripping and vegetation removal in suitable habitat

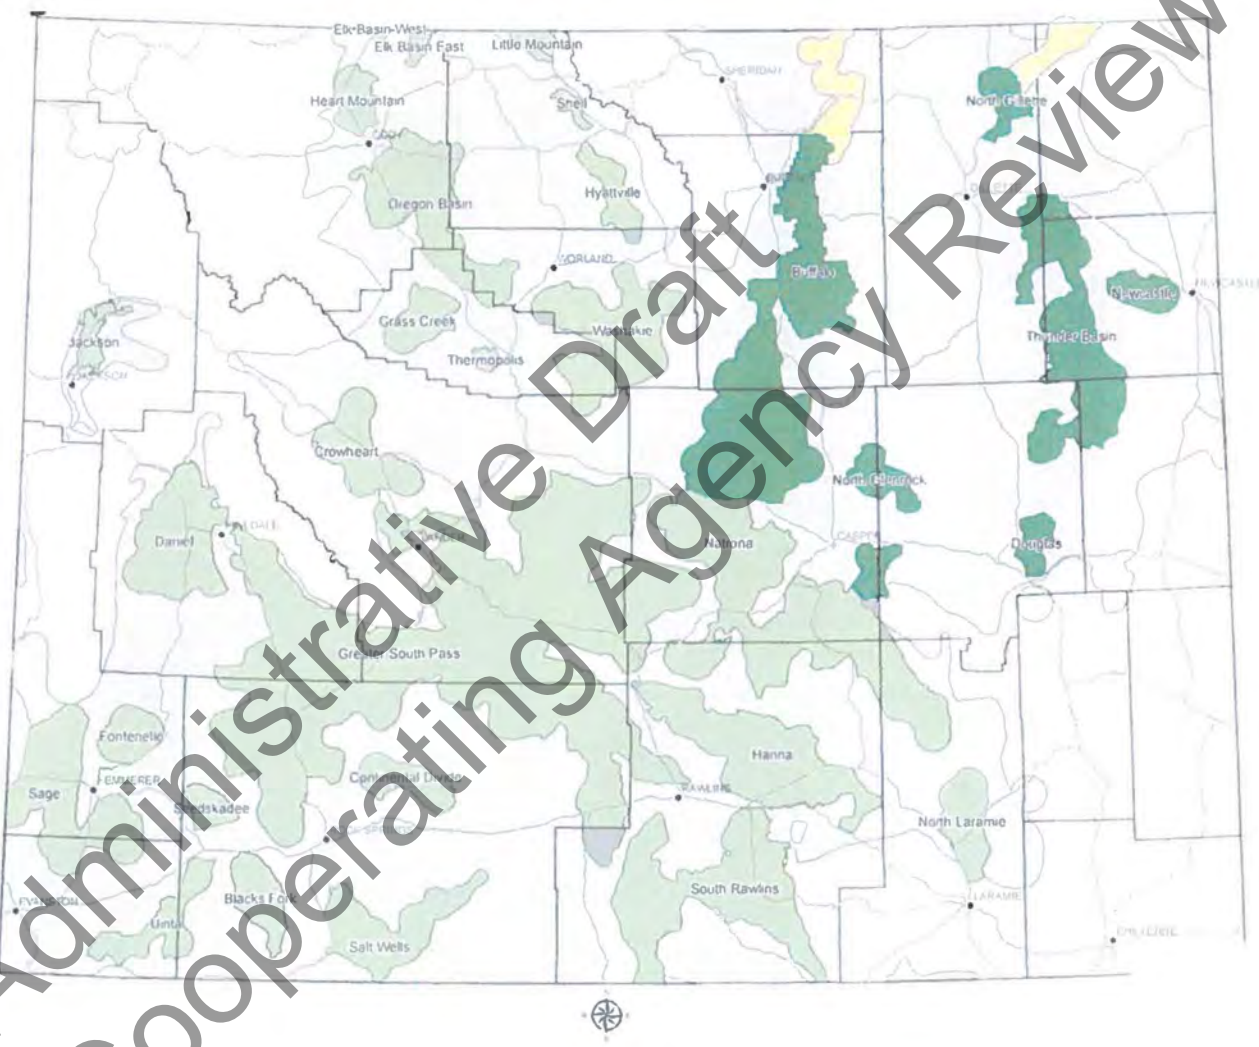

will occur between July 1 and March 14 in areas that are within 4 miles of an occupied lek. Initial disturbance in unsuitable habitat between March 15 and June 30 may be approved on a case-by-case basis.

8. **Sagebrush Treatment:** Sagebrush eradication is considered disturbance and will contribute to the 5% disturbance factor. Northeast Wyoming, as depicted in Figure 1, is of particular concern because sagebrush habitats rarely exceed 15% canopy cover and large acreages have already been converted from sagebrush to grassland or cropland. Absent some demonstration that the proposed treatment will not reduce canopy cover to less than 15% within the treated area, habitat treatments in northeast Wyoming (Figure 1) should not be conducted. In stands with less than 15% cover, treatment should be designed to maintain or improve sagebrush habitat. Sagebrush treatments that maintain sagebrush canopy cover at or above 15% total canopy cover within the treated acres will not be considered disturbance. Treatments that reduce sagebrush canopy cover below 15% will be allowed, excluding northeast Wyoming (Figure 1), if all such treated areas make up less than 20% of the suitable sagebrush habitat within the DDCT, and any point within the treated area is within 60 meters of sagebrush habitat with 10% or greater canopy cover. Treatments to enhance sagebrush/grassland will be evaluated based upon the existing habitat quality and the functional level post-treatment.
9. **Monitoring/adaptive response:** Proponents of new projects are expected to coordinate with the permitting agency and local WGFDD biologist to determine which leks need to be monitored and what data should be reported by the proponent. Certain permits may be exempted from monitoring activities pending permitting agency coordination. If declines in affected leks (using a three-year running average during any five year period relative to trends on reference leks) are determined to be caused by the project, the operator will propose adaptive management responses to increase the number of birds. If the operator cannot demonstrate a restoration of bird numbers to baseline levels (established by pre-disturbance surveys, reference surveys and taking into account regional and statewide trends) within three years, operations will cease until such numbers are achieved.
10. **Reclamation:** Reclamation should re-establish native grasses, forbs and shrubs during interim and final reclamation to achieve cover, species composition, and life form diversity commensurate with the surrounding plant community or desired ecological condition to benefit sage-grouse and replace or enhance sage-grouse habitat to the degree that environmental conditions allow. Seed mixes should include two native forbs and two native grasses with at least one bunchgrass species. Where sagebrush establishment is prescribed, establishment is defined as meeting the standard prescribed in the individual reclamation plan. Landowners should be consulted on desired plant mix on private lands. The operator is required to control noxious and invasive weed species, including cheatgrass. Rollover credit, if needed, will be outlined in the individual project reclamation plan.

Credit may be given for completion of habitat enhancements on bond released or other minimally functional habitat when detailed in a plan. These habitat enhancements may be used as credit for reclamation that is slow to establish in order to maintain the disturbance cap or to improve nearby sage-grouse habitat.

Figure 1. Wyoming Core Area with northeast Wyoming core (dark green) and connectivity areas (yellow).

11. **Existing Activities:** Areas already disturbed or approved for development within Core Areas prior to August 1, 2008 are not subject to new sage-grouse stipulations with the exception existing operations may not initiate activities resulting in new surface occupancy within 0.6 mile of the perimeter of a sage-grouse lek. Any existing disturbance will be counted toward the calculated disturbance cap for a new proposed activity. The level of disturbance for existing activity and rollover credit may exceed 5%.
12. **Exceptions:** Any exceptions to these general or specific stipulations will be considered on a case by case basis and must show that the exception will not cause declines in sage-grouse populations.

#### **SPECIFIC STIPULATIONS (To be applied in addition to general stipulations)**

1. **Oil and Gas:** Well pad densities not to exceed an average of one pad per square mile (640 acres) and suitable habitat disturbed not to exceed 5% of suitable habitat within the DDCT. As an example, the number of well pads within a two mile radius of the perimeter of an occupied sage-grouse lek should not exceed 11, distributed preferably in a clumped pattern in one general direction from the lek.
2. **Mining**
  - a. For development drilling or ore body delineation drilled on tight centers, (approximately 100'X100') the disturbance area will be delineated by the external limits of the development area. Assuming a widely-spaced disturbance pattern, the actual footprint will be considered the disturbance area.
  - b. Monitoring results will be reported annually in the mine permit annual report and to WGFD. Pre-disturbance surveys will be conducted as required by the appropriate regulatory agency.
  - c. The number of active mining development areas (e.g., operating equipment and significant human activity) are not to exceed an average of one site per square mile (640 acres) within the DDCT.
  - d. Surface disturbance and surface occupancy stipulations will be waived within the Core Area when implementing underground mining practices that are necessary to protect the health, welfare, and safety of miners, mine employees, contractors and the general public. The mining practices include but are not limited to bore holes or shafts necessary to: 1) provide adequate oxygen to an underground mine; 2) supply inert gases or other substances to prevent, treat, or suppress combustion or mine fires; 3) inject mine roof stabilizing substances; and 4) remove methane from mining areas. Any surface disturbance or surface occupancy necessary to access the sites to implement these mining practices will also be exempt from any stipulation.
  - e. Coal mining operations will be allowed to continue under the regulatory and permit-specific terms and conditions authorized under the federal Surface Mining Control and Reclamation Act.
3. **Connectivity:**
  - a. The suspension of federal and state leases in connectivity corridors (Figure 1) is encouraged where there is mutual agreement by the leasing agency and the operator. These suspensions should be allowed until additional information

clarifies their need. Where suspensions cannot be accommodated, disturbance should be limited to no more than 5% (up to 32 acres) per 640 acres of suitable sage-grouse habitat within connectivity corridors.

- b. For protection of connectivity corridors (Figure 1), a controlled surface use (CSU) buffer of 0.6 miles around leks or their documented perimeters is required. In addition, a March 15 to June 30 timing limitation stipulation is required within nesting habitat within 4 miles of leks.

- 4. Process Deviation or Undefined Activities: Development proposals incorporating less restrictive stipulations or development that is not covered by these stipulations may be considered depending on site-specific circumstances and the proponent must have data demonstrating that the alternative development proposal will not cause declines in sage-grouse populations in the core area. Proposals to deviate from standard stipulations will be considered by a team including WGFD and the appropriate land management and permitting agencies, with input from the U.S. Fish and Wildlife Service. Project proponents need to demonstrate that the project development would meet at least one of the following conditions:

- a. No suitable habitat is present in one contiguous block of land that includes at least a 0.6 mile buffer between the project area and suitable habitat;
- b. No sage-grouse use occurs in one contiguous block of land that includes at least a 0.6 mile buffer between the project area and adjacent occupied habitat, as documented by total absence of sage-grouse droppings and an absence of sage-grouse activity for the previous ten years;
- c. Provision of a development/mitigation plan that has been implemented and demonstrated by previous research not to cause declines in sage-grouse populations. The demonstration must be based on monitoring data collected and analyzed with accepted scientific based techniques.

- 5. Wind Energy Development: Wind development is not recommended in sage-grouse core areas, but will be reevaluated on a continuous basis as new science, information and data emerges.

## Appendix I Suitable Sage-Grouse Habitat Definition

Sage-grouse require somewhat different seasonal habitats distributed over large areas to complete their life cycle. All of these habitats consist of, are associated with, or are immediately adjacent to, sagebrush. If sage-grouse seasonal habitat use maps do not exist for the project site the following description of suitable habitat should be used to determine areas of unsuitable sage-grouse habitat for development siting purposes. An abbreviated description of a complex system cannot incorporate all aspects of, or exceptions to, what habitats a local sage-grouse population may or may not utilize.

**Suitable sage-grouse habitat** (nesting, breeding, brood-rearing, or winter) is within the mapped occupied range of sage-grouse, and:

- 1) has 5% or greater sagebrush canopy cover as measured by the technique developed by interagency efforts. "Sagebrush" includes all species and sub-species of the genus *Artemisia* except the mat-forming sub-shrub species: *frigida* (fringed) and *pedatifida* (birdfoot); or
- 2) is riparian, wet meadow (native or introduced) or areas of alfalfa or other suitable forbs (brood rearing habitat) within 60 meters of sagebrush habitat with 10% or greater canopy cover and the early brood rearing habitat does not exceed 20% of the suitable sagebrush habitat present within the DDCT, Larger riparian/wet meadow, and grass/forb producing areas may be considered suitable habitat as determined on a case by case basis.

**Transitional sage-grouse habitat** is land that has been treated or burned prior to 2011 resulting in <5% sagebrush cover but is actively managed to meet a minimum of 5% sagebrush canopy cover with associated grasses and forbs by 2021 (by analysis of local condition and trend) and may or may not be considered disturbed. Land that does not meet the above vegetation criteria by 2021 should be considered disturbed.

Land treatments post 2010 must meet sagebrush vegetation treatment guidelines or the treatment will be considered disturbed. Following wildfire, lands shall be treated as disturbed pending an implementation management plan with trend data showing the area returning to functional sage-grouse habitat.

To evaluate the 5% disturbance cap per average 640 acres using the DDCT, suitable habitat is considered disturbed when it is removed and unavailable for immediate sage-grouse use.

The following items are guidelines for determining suitable habitat:

- a. Long-term removal occurs when habitat is physically removed through activities that replace suitable habitat with long term occupancy of unsuitable habitat such as a road, well pad or active mine.
- b. Short-term removal occurs when vegetation is removed in small areas, but restored to suitable habitat within a few years of disturbance, such as a successfully reclaimed pipeline, or successfully reclaimed drill hole or pit.
- c. There may be additional suitable habitat considered disturbed between two or more long term (greater than 1 year) anthropogenic disturbance activities with a footprint greater than 10 acres each if the activities are located such that sage-grouse use of the suitable habitat between these activities is significantly reduced due to the close proximity (less than 1.2 miles apart, 0.6 miles from each activity) and resulting in cumulative effects of these large scale activities. Exemptions may be provided.

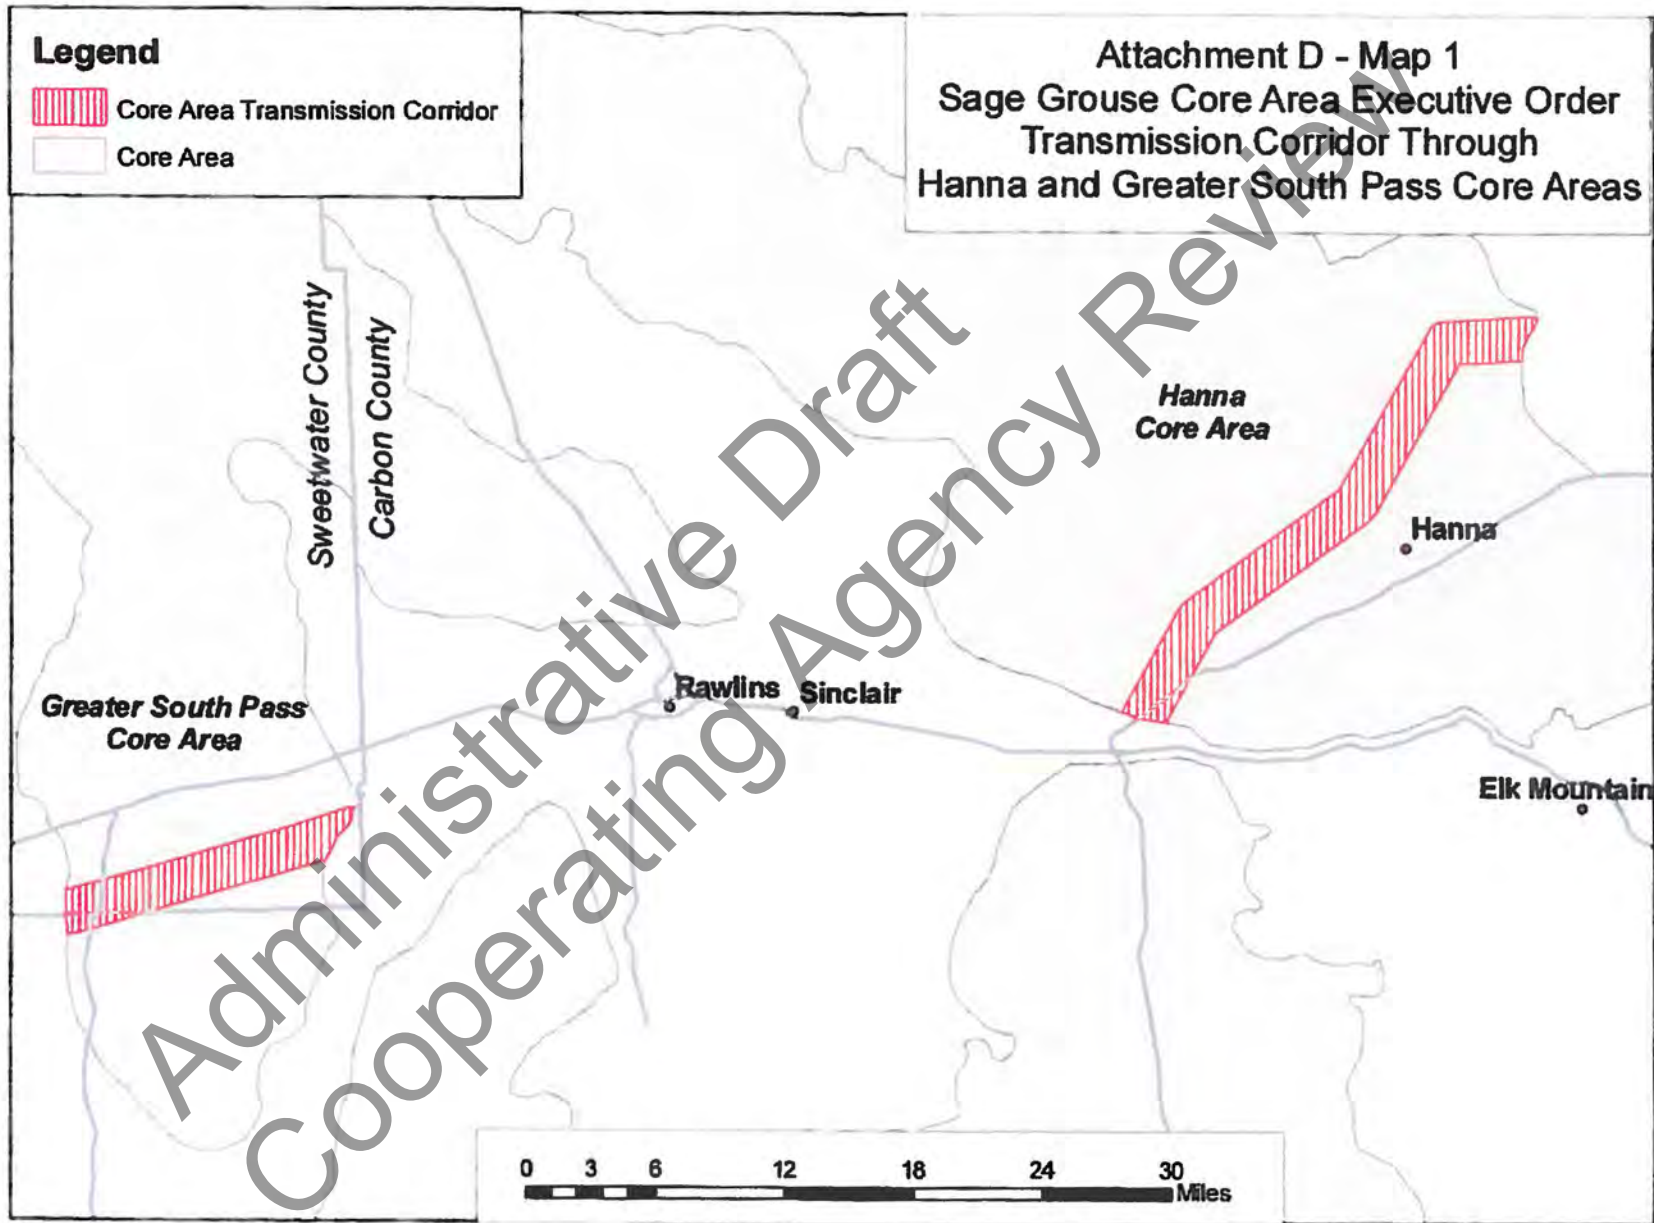

- d. Land in northeast Wyoming (Figure 1 of Attachment B) that has had sagebrush removed post-1994 (based on Orthophoto interpretation) and not recovered to suitable habitat will be considered disturbed when using the DDCT.

Administrative Draft  
Cooperating Agency Review

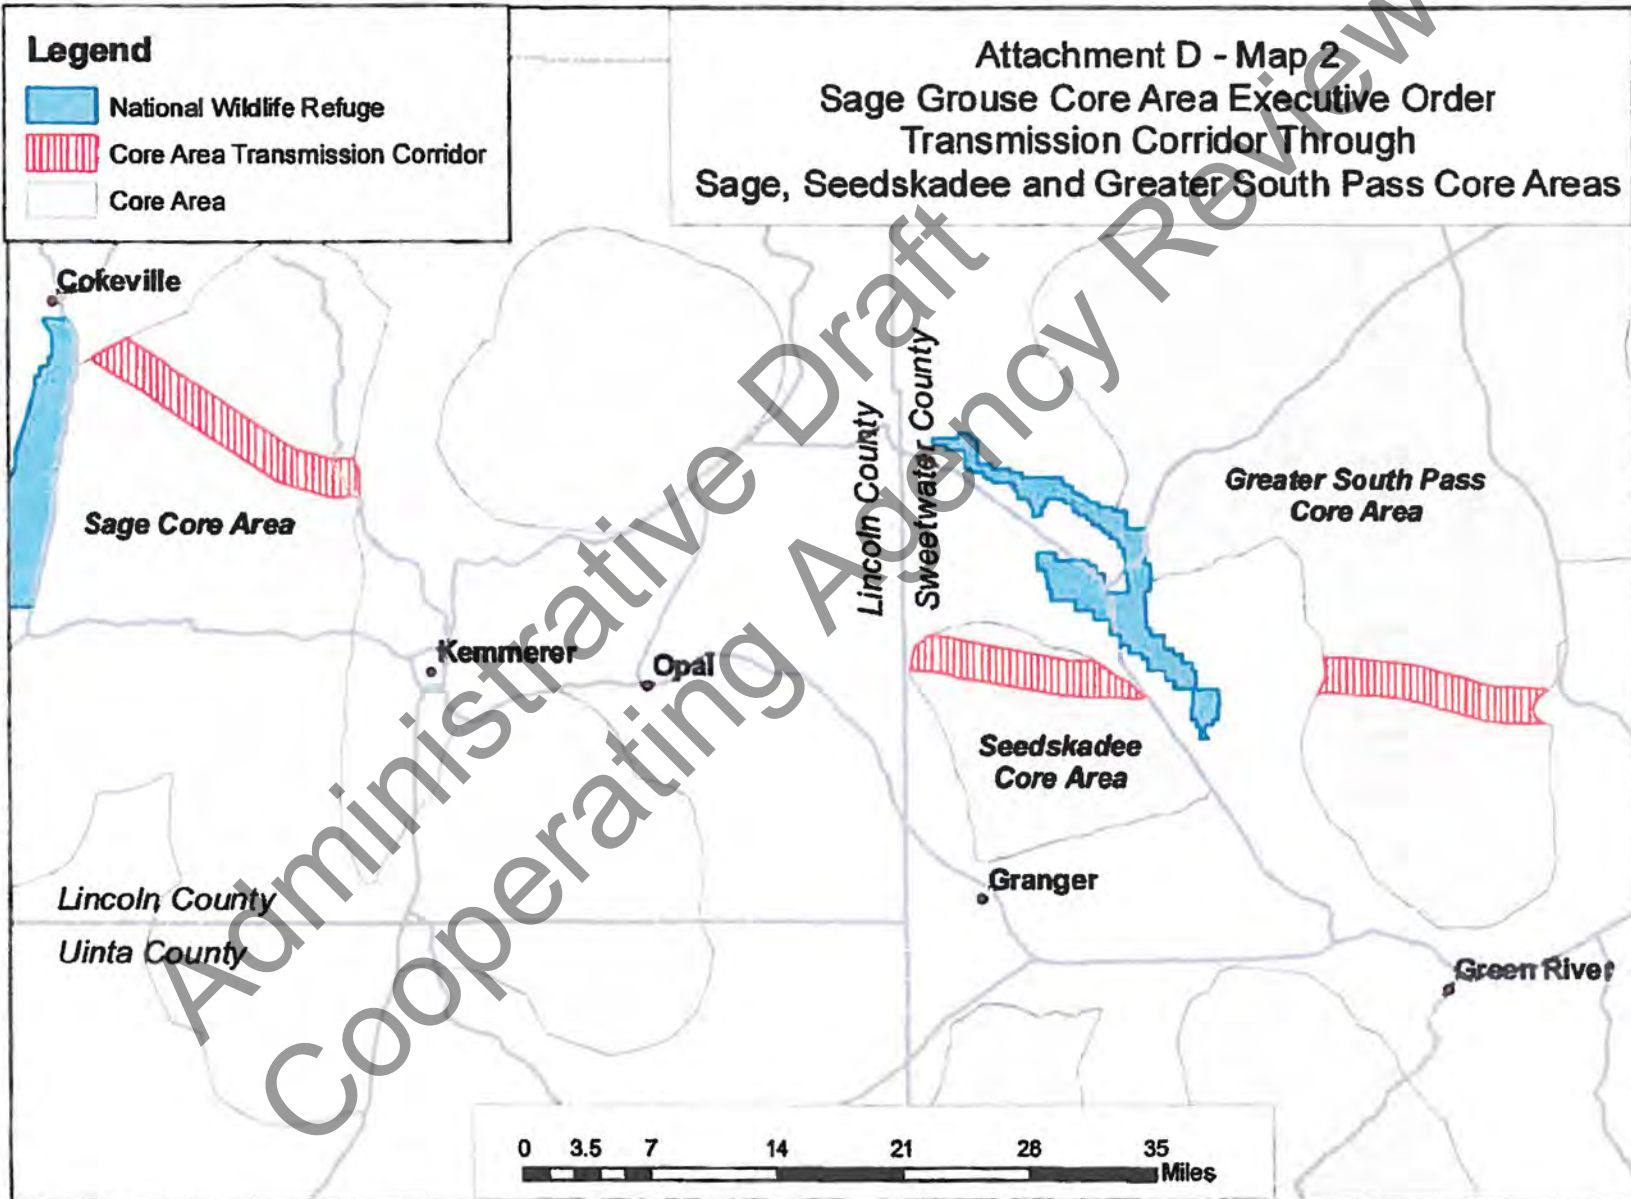

**ATTACHMENT C**  
**Exempt (“de minimus”) Activities**

**Existing Land Uses and Landowner Activities in Greater Sage-Grouse Core Population  
Areas That Do Not Require State Agency Review for Consistency  
With Executive Order No. 2011-02**

1. Existing animal husbandry practices (including branding, docking, herding, trailing, etc).
2. Existing farming practices (excluding conversion of sagebrush/grassland to agricultural lands).
3. Existing grazing operations that utilize recognized rangeland management practices (allotment management plans, NRCS grazing plans, prescribed grazing plans, etc).
4. Construction of agricultural reservoirs and habitat improvements less than 10 surface acres and drilling of agriculture and residential water wells (including installation of tanks, water windmills and solar water pumps) more than 0.6 miles from the perimeter of the lek. Within 0.6 miles from leks no review is required if construction does not occur March 15 to June 30 and construction does not occur on the lek. All water tanks shall have escape ramps.
5. Agricultural and residential electrical distribution lines more than 0.6 miles from leks. Within 0.6 miles from leks no review is required if construction does not occur March 15 to June 30 and construction does not occur on the lek. Raptor perching deterrents shall be installed on all poles within 0.6 miles from leks.
6. Agricultural water pipelines if construction activities are more than 0.6 miles from leks. Within 0.6 miles from leks no review is required if construction does not occur March 15 to June 30 and construction is reclaimed.
7. New fencing more than 0.6 miles from leks and maintenance on existing fence. For new fencing within 0.6 miles of leks, fences with documented high potential for strikes should be marked.
8. Irrigation (excluding the conversion of sagebrush/grassland to new irrigated lands).
9. Spring development if the spring is protected with fencing and enough water remains at the site to provide mesic (wet) vegetation.
10. Herbicide use within existing road, pipeline and power line rights-of-way. Herbicides application using spot treatment. Grasshopper/Mormon cricket control following Reduced Agent-Area Treatments (RAATS) protocol.
11. Existing county road maintenance.
12. Cultural resource pedestrian surveys.
13. Emergency response.

C.L. "BUTCH" OTTER  
GOVERNOR

March 14, 2013

Brian Kelly  
State Director  
U.S. Fish and Wildlife Service  
Idaho State Office  
1387 South Vinnell Way  
Boise, ID 83709-1657

Dear Brian,

This letter continues our discussion and collaboration on Idaho's contribution to Greater Sage-Grouse (GSG) management and conservation in order to avoid its listing under the Endangered Species Act (ESA). I greatly appreciate the personal attention and leadership you dedicated to this issue.

On December 18, 2012, Interior Secretary Ken Salazar responded to a series of questions posed by several western members of Congress about the Department of Interior's National Greater Sage-Grouse Land Use Planning Strategy (GSG Strategy). I was pleased that Secretary Salazar reiterated his commitment that "the BLM has every intention of taking actions to conserve the Greater Sage-Grouse in a manner that is *consistent with its multiple use mission* and with due regard for site specific on-the-ground considerations." (emphasis added).

I also noted with great interest that Secretary Salazar outlined the process for a Bureau of Land Management (BLM) state office to be exempted from Instruction Memorandum (IM) No. 2012-043 dated December 22, 2011. I believe IM No. 2012-043 coupled with the National Technical Team Report (NTT Report) represents a one-size-fits-all management scheme that fails to account for the site-specific information contained in my management plan. Secretary Salazar's response indicates that such an exemption can occur where "a state or local conservation mechanism has been developed with concurrence of the Fish and Wildlife Service." In short, I write to pursue the "concurrence" option for Idaho as a necessary precondition for state exemption from the national IM.

Moreover, I believe that a state-based solution for public land management – similar to Idaho's effort on roadless areas – will be a win-win for the species and the Idahoans who economically depend on access to lands managed by the federal government.

Concurrence by the Service on the Idaho approach is particularly important as your agency will carefully weigh all conservation commitments by my State and others in determining whether listing of the species is warranted under the ESA.

To briefly summarize where we are in the process, I sent you a letter in July 2012 requesting preliminary feedback on Idaho's draft Sage-Grouse Alternative. Specifically, I posed two questions fundamental to the overall structure of the plan:

- (1) Whether the management framework – based on a thematic habitat continuum and population metrics – outlined in my Draft Alternative represents sound policy that should move forward; and
- (2) Whether the habitat zones, especially the Core Habitat Zone and Important Habitat Zone, are consistent with the U.S. Fish and Wildlife Service's understanding of the most important sage-grouse habitats in the state.

Your written response was especially encouraging and signaled that the State of Idaho was moving in the right direction in developing a sound GSG strategy. Based on this early feedback, the State took public comment, refined the draft Alternative and submitted it to the BLM for incorporation into its Strategy. *See* Governor C.L. "Butch" Otter's Greater Sage-Grouse Management Alternative, Sept. 5, 2012. ("Idaho Alternative").

Following submission to the BLM, you reaffirmed that the Service still had confidence with the aforementioned components in particular, but needed additional clarification and targeted revisions for the remainder of the Idaho management plan. Your point was taken in the spirit of collaboration, and I believe that in addition to the September 2012 Idaho Alternative, the attachment below resolves these outstanding issues, and thus provides the path for Service concurrence consistent with Secretary Salazar's policy directive. For the sake of completeness, the Idaho Alternative is adopted herein by reference, and only where specifically noted below should the Idaho Alternative be construed as revised or modified.

I have sincerely appreciated your leadership in helping the State of Idaho develop a collaborative, science-based management plan that meets the needs of the species and Idaho citizens. Of course, the Service's concurrence is a necessary and foundational part of this process, but the State of Idaho is mindful that further clarification may be beneficial as part of the Department's ongoing GSG Strategy consistent with the National Environmental Policy Act and the ESA in coordination with the State. Please let me know if you have any questions during your review. I look forward to the Service's concurrence and our continued discussions on this critically important issue.

As Always – Idaho, "Esto Perpetua"

C. L. "Butch" Otter  
Governor of Idaho

## Request for U.S. Fish and Wildlife Service Concurrence:

### 1. Thematic Conservation Approach

An effective plan for managing the greater sage-grouse must include both population and habitat metrics. The Idaho Alternative accomplishes both.<sup>1</sup> As to the habitat component, the Idaho Alternative at 2-3 identifies a Sage-Grouse Management Area (SGMA) that is divided into four conservation areas (CA) across the known range of sage-grouse in southern Idaho. These CAs are important for achieving Idaho's population objectives as well as to properly tailor adaptive management responses where necessary and appropriate.

There are two CAs north of the Snake River and two CAs south of the Snake River. The first CA north of the Snake River is the Mountain Valley CA, which starts at Rexburg and extends west, including sage-grouse habitat north and west of Highway 33 to Howe, Highway 33/22 to Arco, Highway 26/20/93 to Carey, Highway 20 west to Mountain Home, south from Mountain Home on Highway 51 to the Snake River. The second is the Desert CA, which is south of the Mountain Valley CA.

South of the Snake River is the West Owyhee CA, which is west of the Jarbidge River. The Southern CA is east of the Jarbidge River, and includes the East Idaho Uplands and Bear Lake Plateau. See Idaho Alternative at 6.

Each CA is divided into three management zones: Core Habitat Zone (CHZ), Important Habitat Zone (IHZ) and the General Habitat Zone (GHZ). Idaho Alternative at 24. These management zones were the result of the Idaho Department of Fish and Game's (IDFG) on-the-ground information provided by Dr. Jack Connelly and Don Kemner based on decades of research and monitoring data. As mentioned above, you indicated that Idaho's thematic approach *based on conservation objectives that are monitored in an adaptive management construct are fundamental attributes of the Service's own approach to strategic conservation.*<sup>2</sup> (emphasis added).

These management zones outline a suite of basic management activities that may or may not occur within a given area. Idaho Alternative at 3, 24-29. The thematic approach represents a management continuum that includes a relatively restrictive approach at one end in the CHZ and a relatively flexible approach in the GHZ. These three zones provide an array of permitted and prohibited activities. Idaho Alternative at 33-47.

---

<sup>1</sup> The Idaho Alternative is attached as Appendix I.

<sup>2</sup> "The thematic approach based on conservation objectives that are monitored in an adaptive management construct that your framework incorporates, are fundamental attributes of the Service's own approach to strategic conservation (USFWS and USGS 2006)." Letter from Brian Kelly (U.S. Fish and Wildlife Service) to Governor Otter re: "Draft Federal Alternative of Governor C. L. 'Butch' Otter for Greater Sage Grouse Management in Idaho," August 1, 2012.

At the outset of the Governor’s Task Force deliberations, the group noted the initial BLM mapping proposal (i.e., preliminary priority habitat/general habitat) as well as the National Technical Team (NTT Report) needed to be refined to reflect the state-specific concerns and the on-the-ground monitoring information. The Alternative notes, “[t]he State believes this [BLM’s] mapping approach does not adequately take advantage of the opportunity to provide better and more precise management direction based on the quality and location of sage-grouse populations and habitats in Idaho.” Idaho Alternative at 20.

Moreover, in developing these management zones, population objectives, and regulatory mechanisms, Idaho carefully considered the collaborative recommendations of the Governor’s Task Force, current Resource Management Plans, the NTT Report, the recently published volume on greater sage-grouse (*Greater Sage-Grouse: Ecology and Conservation of a Landscape Species and its Habitats*) (co-editors Drs. Steven T. Knick and John W. Connelly), and other current and relevant scientific information. The State of Idaho did not adopt or endorse any of these sources to the exclusion of the others. To put a finer point on this issue, the state believes that all of these sources, to some degree, constitute the best available science for sage-grouse, and must be considered in our effort to preclude the need to list the species under the ESA.

Furthermore, dividing the current range into four CAs with three distinct management zones provides several important conservation benefits for the species:

- The management themes and adaptive management triggers provide a critical part of the needed direction and flexibility to address wildfire—the most significant threat to the species.
- The management themes also ensure that precious resources are directed toward dealing with the most important threats in stronghold areas.
- In conjunction with the threat of wildfire, the state adopted the Task Force’s recommendations to expand the CHZ beyond the 25% breeding bird density to include areas that may not currently meet that benchmark, but could offer solid opportunities for habitat restoration in the future. Idaho Alternative at 25.
- Using three management zones facilitates opportunities for collaboration as resource considerations can be more appropriately tailored across the range of the species.
- This thematic approach is not without precedent. The Idaho Alternative is based largely on Idaho’s successful model for managing and conserving inventoried roadless areas. In fact, the Idaho Roadless Rule has been affirmed by both the District of Idaho and the Ninth Circuit Court of Appeals.

## 2. State of Idaho Population Objectives

These population indicators are critical to gauging the effectiveness of the state's conservation efforts. In conjunction with the management zones, the population indicators ensure there is an appropriately tailored response to significant fluctuations in habitat and population.

The first objective is to implement regulatory mechanisms that maintain and enhance sage-grouse habitats, populations, and connectivity within the CHZ. Recognizing the impact of wildfire, the IHZ provides both important management flexibility and a strategic conservation buffer. Through the implementation of the state's proposed regulatory mechanisms, Idaho will be well-positioned to maintain a viable population of at least 65% of the sage-grouse leks for the foreseeable future. It is important to note that IDF&G estimates that approximately 95% of Idaho's known sage-grouse population is encompassed in the CHZ and IHZ themes. *See generally* Idaho Alternative at 7-9. By contrast, the GHZ only accounts for 5% of the state's total population.

The second objective is to stabilize sage-grouse habitats and populations by monitoring the effectiveness of the regulatory measures over time. A significant component of this objective is to minimize habitat loss within Core Habitat Zone (CHZ), and to a lesser extent, the Important Habitat Zone (IHZ). For more detail see Idaho's Alternative.

## 3. Adaptive Regulatory Triggers

The Adaptive Regulatory Triggers have been clarified and refined since the September 5<sup>th</sup> version. Idaho Alternative 9-11.<sup>3</sup> The adaptive triggers provide a regulatory backstop to prevent further loss and stabilize habitats and populations in the CHZ, and to a lesser extent in the IHZ, where a demonstrated significant loss has either occurred over time or unexpectedly (i.e., Murphy Complex Fire). These adaptive triggers are employed when dramatic shifts in population or habitat occurs based on an average over a three year period compared to 2011 values. Additionally, these adaptive triggers place the primary and secondary threats to the species in proper context to appropriately evaluate the cause(s) of the decline.

In addition to the below description, Idaho's Alternative utilizes two types of triggers to help determine whether changes in management are necessary. This is a refinement from the September 5<sup>th</sup> version of the Idaho Alternative. The triggers are broken down into a "soft" trigger and a "hard" trigger. The "soft" trigger becomes operative when one of the following occurs:

- 10% decline in maximum number of males counted and a finite rate of change below 1.0 but not significantly on CHZ over a period of three years; or
- 10% loss of nesting and wintering habitat in a Conservation Area over a period of three years.

---

<sup>3</sup> Not only do the revisions apply to the referenced narrative portions of the Idaho Alternative, but also where relevant and applicable to the regulatory language beginning on page 30.

When the monitoring information indicates that the “soft trigger” may be tripped, an Implementation Team – aided by the technical expertise of IDF&G – will assess the factor(s) leading to the decline and identify potential management actions. *See Idaho Alternative at 7.* The Implementation Team may consider possible changes in management to the CHZ. As to the IHZ, the Implementation Team may review the causes for decline and potential management changes only to the extent those factors significantly impair the state’s ability to meet the overall management objective. It is anticipated IDF&G will collect data annually and will make recommendations to the Implementation Team by August 31st for population triggers and January 15th for habitat triggers.

The “hard” trigger becomes operative when one of the following occurs:

- 20% loss in CHZ nesting wintering habitat over a period of three years; or
- 20% decline in maximum number of males counted and a finite rate of change significantly below 1 within a Conservation Area over a period of three years.

If the hard trigger becomes operative according to the monitoring information, management changes are no longer discretionary and will be implemented in the following manner:

First, the IHZ will be managed according to the CHZ provisions primarily impacting the ability to consider infrastructure projects. Like the “soft trigger”, the Implementation Team will analyze the actual cause(s) of the decline. The flow chart (Appendix II) illustrates the process used to determine which threat(s) caused the habitat or population loss.

As the illustration denotes, the Service identified wildfire, invasive species, and infrastructure as the primary threats and West Nile Virus, improperly managed grazing, and recreation as secondary threats. This adaptive trigger strategy focuses the analysis on mitigating the primary threats to the species in the CHZ. Only where the monitoring information indicates the cause(s) of the decline is not a primary threat will the Implementation Team analyze the secondary threats to the species and determine whether further management actions are needed.

Population and habitat objectives are measured against baselines are illustrated in the tables below. The baseline for habitat within each CA is the 2011 nesting and wintering habitat for the CHZ and IHZ. (See Tables 1 and 2). The population baseline is the maximum number of males counted on lek routes in 2011 within the CHZ and the average finite rate of change of population for 2009-2011 within the CHZ. It is measured the same way in IHZ. CHZ and IHZ triggers are analyzed separately. The habitat triggers are also analyzed separately from the population triggers. The foregoing represents additional clarification from Idaho’s Alternative.

Table 1. Population Trigger (for illustrative purposes only).

Conservation Area	Population Baseline	Soft Trigger ( 10%)	Hard Trigger (20%)
Desert			
Mountain Valley			
Southern			
Western Owyhee			

Table 2. Habitat Triggers

Conservation Area	Breeding & Wintering (acres) (baseline)	10% loss (acres) (soft trigger)	20% loss (acres) (hard trigger)
Desert	840,291	84,029	168,058
Mountain Valleys	1,640,415	164,042	328,083
Southern	568,921	56,892	113,784
West Owyhee	1,416,135	141,614	283,227

#### 4. Wildfire/Invasive Species

This section has been refined since the September 5th version. As mentioned above, the Idaho Alternative utilizes conservation areas, management zones and adaptive triggers to maintain and enhance sage-grouse populations in the CHZ to mitigate the impacts of wildfire. This approach provides stability in the short-term to enable the more proactive measures (i.e., fuel breaks, habitat restoration) the time necessary to demonstrate positive change on the landscape.

Additionally, the Idaho Alternative organizes its regulatory measures into three categories: Prevention, Suppression, and Restoration. This change reflects the state's intent to provide BLM with a method to prioritize wildfire management and resources, while providing flexibility to make adjustments when necessary.

During the 2013 Idaho Legislative session, Governor Otter made it a priority to provide ranchers and landowners in rural areas with the necessary tools and training to allow them to play an active role in fire prevention and suppression, especially in sage-grouse habitat. Idaho Code § 38-104B amends existing law to provide for the creation of non-profit Rangeland Fire Protection Associations (Appendix III).

In conjunction with this change in Idaho Code, the Idaho Legislature also provided the Idaho Department of Lands with additional funding to assist in the creation of four protection associations in southwest Idaho, modeled from the Mountain Home Rural Fire Protection

Association. Appendix IV provides a preliminary map depicting areas in sage-grouse habitat that are considered “no man’s lands” where these associations can help in early fire detection, suppression and prevention efforts.

## **5. Infrastructure**

This section remains unchanged from the Idaho Alternative. The state recognizes that more detail in the mitigation policy and its implementation may be needed to achieve the overall conservation objectives. *See* Section G of the Idaho Alternative and pages 33-34, 40, 43-45.

## **6. Livestock Grazing on Lands Managed by the Federal Government**

The State Alternative only applies to those lands managed by the Federal government that are part of the GSG Strategy. It is important, especially in the context of livestock grazing management, that the following management framework is applicable only to the extent it involves the BLM’s administration of Standard 8 of the Idaho Rangeland Health Standards (IRHS) with respect to sage-grouse. An important footnote, the IRHS do not apply to the U.S. Forest Service, and this management framework should in no way be construed as imposing those standards on the Forest Service. While this framework may benefit other sage-steppe species, those species-specific or other resources issues are not addressed herein.

### **Management Framework:**

There are two pathways where this management framework is applicable: (1) in conjunction with scheduled term grazing permit renewals; and (2) where the adaptive regulatory trigger has been tripped (as described in section 3 above) and livestock grazing is identified as a potential causal factor.

Under the first path, this management plan provides a framework for BLM to assess Standard 8 with respect to sage-grouse as grazing permits are scheduled for renewal. As described in more detail below, if no trigger has been tripped across a CA, then the Standard 8 analysis for sage-grouse is a straightforward process. Under the second path, this adaptive framework aids in determining whether improperly managed livestock grazing may be a causal factor that potentially requires adaptive change to existing permits within a CA.

The first step in this process is to inform and educate permittees within the SGMA regarding sage-grouse habitat needs and conservation measures. These habitat needs or characteristics, as applicable, are outlined in Tables 3-5 of the Idaho Alternative (14-17).

Second, Standard 8 of the IRHS establishes a “maintain a viable population” threshold for listed species. 43 C.F.R. Subpart 4160. Consistent with the overall approach of the Idaho Alternative – namely, an outcome-based conservation strategy within an adaptive construct – the State of Idaho has identified an overall population target buttressed by regulatory mechanisms and adaptive regulatory triggers. Where these population and habitat triggers are being maintained, there is a rebuttable presumption that current grazing systems within that CA are adequate to

maintain viable sage-grouse populations. Therefore, absent compelling information, no further changes to grazing permits will be required pursuant to the Standard 8 analysis insofar as it relates to sage-grouse. In sum, if no trigger has been tripped within a CA, the allotments and pastures are presumed to have met Standard 8 with respect to sage-grouse.

This rebuttable presumption does not preclude adaptive change to grazing permits based on the other standards contained in the IRHS. Again, it is important to note that the Forest Service is not subject to the IRHS; however, the conservation objectives established in the Idaho's Alternative should meet the applicable standards in National Forest Management Act (NFMA).

If an adaptive regulatory trigger is tripped consistent with the process outlined above, and livestock grazing is identified as a potential limiting factor, the presumption that the current grazing operations within the Conservation Area have met Standard 8 with respect to sage-grouse will no longer be applicable.

Following such a determination, the following process will be utilized:

BLM will individually analyze those allotments and pastures within the relevant Conservation Area. Given limited agency resources, prioritization will be given to areas that have the potential to provide the greatest benefit to sage-grouse. Allocation of resources should be concentrated on allotments within the CHZ that have declining sage-grouse populations. Following those permits within the CHZ, resources will be further prioritized to allotments within the IHZ with breeding habitats that have decreasing lek counts. (See Flow Chart, Appendix V). Sage-grouse populations that are stable or trending upward will be a lower priority for permit renewal and the adaptive assessment process.

The assessment/determination process for sage-grouse pursuant to Standard 8 must rely on published characteristics of sage-grouse habitat and the Ecological Site Descriptions, existing vegetation, habitat inventories/assessments (Stiver et al. 2010), and where available, state and transition models that describe vegetation and other physical attributes for sage-grouse. The related characteristics within the categories shown below will also be included. These characteristics indicate the ability of a given area to provide sage-grouse habitat.

Category 1: The grazing allotment (or any pasture/significant area therein) has the existing vegetation and existing ecological condition (seral state) to provide sage-grouse habitat

Category 2: The grazing allotment (or any pasture/significant area therein) has the ecological potential to provide sage-grouse habitat.

Where an allotment or pasture meets one of these Categories above, Tables 3-5 (Idaho Alternative at 14-16) will be incorporated into relevant resource management plans as the desired conditions with the understanding that these desired conditions may not be achievable: (a) due to the existing ecological condition, ecological potential or the existing vegetation; or (b) due to causal events unrelated to existing livestock grazing. Allotments will only be managed for

the primary seasonal habitat that it has the potential to support. Typically, summer habitats will be managed to provide the conditions described in Table 3; winter Table 4; and breeding habitats in Table 5.

Based on these habitat characteristics, BLM will conduct fine and site scale-habitat assessments to help inform grazing management. Where necessary, a determination of factors causing any failure to achieve the habitat characteristics (Tables 3-5) will be conducted at a resolution sufficient to document the habitat condition. This determination will include consideration of local spatial and inter-annual variability. A determination of issues attributable to livestock grazing management shall not result from one year of data at a specific location within an allotment.

If the process and conditions outlined above demonstrate that livestock grazing is limiting achievement of the habitat characteristics (Tables 3-5), renewed permits will include measures, including but not limited to the actions outlined in (Idaho Alternative, Section J at 46-48) to achieve desired habitat conditions. These measures must be tailored to address the specific management issues associated with seasonal habitat limitations identified in the fine-scale assessments.

Additionally, adaptive management changes related to existing grazing permits should only be undertaken if improper grazing is determined to be the causal factor in not meeting habitat characteristics, specific to site capability, based upon monitoring over time with appropriate site variability.

The Implementation Team will maintain oversight capabilities throughout the process and will be given the ability to review proposed management changes, the implementation of conservation measures, and the on-the-ground monitoring to ensure the measures are appropriately applied.

IN THE HOUSE OF REPRESENTATIVES

HOUSE BILL NO. 93

BY RESOURCES AND CONSERVATION COMMITTEE

AN ACT

RELATING TO FOREST AND RANGE FIRES; AMENDING CHAPTER 1, TITLE 38, IDAHO CODE,  
BY THE ADDITION OF A NEW SECTION 38-104B, IDAHO CODE, TO PROVIDE FOR NON-  
PROFIT RANGELAND FIRE PROTECTION ASSOCIATIONS, TO DEFINE A TERM AND TO  
PROVIDE PROCEDURES.

Be It Enacted by the Legislature of the State of Idaho:

SECTION 1. That Chapter 1, Title 38, Idaho Code, be, and the same is hereby amended by the addition thereto of a NEW SECTION, to be known and designated as Section 38-104B, Idaho Code, and to read as follows:

38-104B. NONPROFIT RANGELAND FIRE PROTECTION ASSOCIATIONS. (1) "Non-profit rangeland fire protection association" means a nonprofit corporation or nonprofit unincorporated association, that has entered into an agreement for the detection, prevention or suppression of forest and range fires with the state of Idaho or any agency of the state of Idaho pursuant to title 38, Idaho Code.

(2) A group of rangeland owners wishing to establish a rangeland fire protection association shall petition the director of the department of lands. The director may accept petitions where:

(a) Petitioners meet the requirements established by the director concerning the legal status of the association, liability insurance and governing and managing structure; and

(b) Petitioners demonstrate financial ability to form a rangeland fire protection association; or

(c) Adequate state funding exists, as determined by the director, to assist in the initial establishment of the association.

(3) Prior to entering into an agreement, and annually thereafter, the director shall review and inspect the association for the following:

(a) The governing and managing structure of the association;

(b) The adequacy of liability insurance; and

(c) The training of all association personnel.

Governor C.L. "Butch" Otter  
Idaho State Capitol Building  
Boise, Idaho 83720

Dear Governor Otter,

We would like to reiterate our appreciation for your leadership with respect to the conservation of Greater sage-grouse in Idaho and, in particular, your work forming and supporting the collaborative work of the Idaho sage-grouse task force. The commitment of the task force, your staff, the Idaho Office of Species Conservation and the Idaho Department of Fish and Game to conserve Greater sage-grouse in a manner that respects multiple use of the land and contributes to a future where listing the species under the Endangered Species Act (ESA) is unnecessary, is a commitment we share. We write today to reassure you of this commitment with respect to the revisions you have made to the State of Idaho Alternative that was transmitted to the U.S. Fish and Wildlife Service (FWS) on March 14, 2013.

The FWS and Bureau of Land Management (BLM) each have a separate and distinct role to play in the review of the State's plan. Although FWS has been working closely with the State on specific revisions, the formal review for concurrence that you have requested will allow FWS to determine whether the State alternative or parts thereof are consistent with and will meet the conservation objectives outlined in the Conservation Objectives Team report. Such a determination will provide a basis for BLM to consider potential interim measures based on the State alternative that can be implemented in a manner consistent with the bureau's multiple-use mandate and organizational capacity.

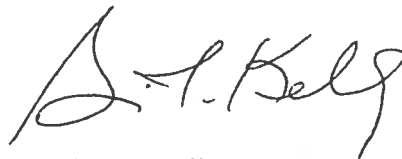

At this time, the FWS and BLM have not completed their respective detailed analysis of the State's revisions to determine adequacy and implementation/capacity possibilities, respectively. At first glance, much of the State's plan contains direction consistent with the FWS's long-term needs to ensure the conservation of sage-grouse and BLM's multiple-use mandate. There are also some aspects of the plan which both BLM and the FWS in Idaho believe need clarification and refinement.

The FWS and the BLM are jointly committed to work in partnership with the State to achieve such clarity and refinement. We look forward to convening with your team and hope to do so early next week. It is our intent that through this partnership the Idaho BLM, consistent with organizational capacity, would be able to adopt those portions that are aligned with current policy/regulations as interim direction for Greater sage-grouse management on Idaho's public lands. Idaho BLM also commits to continue to fully analyze the State alternative in their subregional Sage Grouse EIS to be completed by December, 2014.

Sincerely,

Steven A. Ellis  
BLM Idaho State Director

The Honorable C.L. "Butch" Otter  
Governor of Idaho  
State Capitol  
Boise, Idaho 83702

**APR 10 2013**

Dear Governor Otter:

Thank you for your letter of March 14, 2013 requesting U.S. Fish and Wildlife Service (Service) "concurrence" in regards to Idaho's Greater sage-grouse (GRSG) conservation strategy (Strategy). Before the Service responds to this request, we would like to express our continued appreciation for your leadership in guiding the collaborative approach in which your staff in the Governor's Office, the Office of Species Conservation and the Idaho Department of Fish and Game has worked with us to refine the State's approach to conserving GRSG in Idaho.

The Service remains impressed with and supportive of the science-based adaptive conservation strategy for GRSG you have crafted collaboratively in Idaho, for Idaho-specific needs. In brief, the foundation of the Strategy and most of the specific elements that complete it, are solid and are grounded in scientific concepts and approach important to both the Service and Department of the Interior. While there is much about the current draft that the Service supports; there remain elements that need refinement, clarification, or need to be incorporated into the Strategy for the Service to conclude the entire strategy is consistent with the Service's Greater sage-grouse Conservation Objectives Team (COT) report.

A detailed response to your inquiry is attached. In summary, the integrated nature of the Strategy makes it difficult to "concur" with specific elements as most are interrelated and depend on other elements of the Strategy to function effectively. Nonetheless, our review revealed that the 4 foundational elements of the Strategy (Habitat Zones, Conservation Areas, Population Objective and Adaptive Triggers) are consistent with the COT as is the Livestock Grazing Management element. Therefore, this determination of consistency with the COT reflects "concurrence" for these elements, with the necessary elements noted in our detailed comments (see attachment), for the purpose of BLM IM 2012-043. This "concurrence" should not be construed as being automatically implementable by the BLM. The Service looks forward to working with your Task Force, and BLM as appropriate, to refine, clarify and add aspects of the Strategy as needed for similar support of, for example, the Wildfire Management and Infrastructure elements; and the Implementation Team/Commission. The latter, while an element of the Strategy that that

C.L. "Butch" Otter, Governor  
State of Idaho  
Request for State sage-grouse plan concurrence

needs clarity and refinement is an issue the Service believes is easily addressed. There are numerous examples of such bodies, including as the State has verbally referenced, the process used on the Idaho Roadless Rule. The Service looks forward to assisting the State craft such a process for the Strategy.

Conservation of GRSG is a challenge. It is a challenge due to the geographic scale of the issue; the need of the species for large intact undisturbed geographies of habitat; the difficult nature of the threats in the Great Basin portion of the range; and the relevance of the habitat in questions to myriad conservation and economic needs and interests. Long-term conservation of GRSG will require a strong and sustained commitment by stakeholders across multiple jurisdictions to work together collaboratively. It is for these reasons that the Service commends the State of Idaho for acknowledging and crafting a Strategy that on one hand details proactive conservation actions to address the threats on the landscape, but equally important embraces the uncertainty of how those threats will play out on the landscape and how they will affect GRSG over time by crafting a robust, outcome based scientific strategy that is collaborative and adaptive. This balance between proactive conservation design/actions based on empirical data and assumptions, with a feedback loop from monitoring to inform adaptation in design/action, with stakeholders in the decision loop as an integral part of that process, is a fundamental component of the both the Strategic Habitat Conservation approach the Service employs, and Adaptive Management that the Department of the Interior employs.

We hope this review is helpful. The Service looks forward to continuing our role in this process of on-going refinement of the Strategy, its implementation over time, and as part of the adaptive process it embraces.

Sincerely,

Brian T. Kelly  
Idaho State Supervisor

## ATTACHMENT

### Purpose of the Service's Comments

We want to be clear regarding the purpose of our comments. First, our comments serve to continue the collaborative and iterative process we have been engaged in with you. We see this review as an important "check-in" and continuation of that process to ensure the Strategy is ultimately best positioned to contribute to a future where listing GRSG under the ESA is unnecessary.

Our comments also provide the requested feedback regarding "concurrence" as referenced in BLM Instructional Memorandum 2012-043. While the Service and BLM are both Department of the Interior Agencies, and we together with the State of Idaho and other partners, are collaborating in the conservation of GRSG; the BLM and Service have different legal authorities and policy requirements. As such, any "concurrence" we may offer on elements of the Strategy should not be construed a priori as being implementable by the BLM. That is a determination BLM must make. The Service acknowledges and respects BLM authority in this regard. The Service stands ready to assist the State and BLM in BLM's approval process where appropriate (e.g., Service review of elements of the Strategy that are modified to be implementable by BLM). Our comments on the Strategy at this juncture are not part of the on-going BLM process to amend and or revise various Resource Management Plans across the range of GRSG. That review process will be completed separately.

Service support of the Strategy in part or whole should not be interpreted as a decision by the Service commensurate with a listing decision under the Endangered Species Act (ESA). That determination will be made when the Service formally reviews the status of the species in 2015. However, our purpose in developing the COT report was to guide the States in the development of conservation actions and strategies so that when we review those efforts in 2015 they would contribute to the conservation of the species in a manner that collectively would address threats such that listing would not be necessary. It is for this reason, our review of the Strategy herein is provided in the context of the COT report.

### Components of the Strategy

We frame our review in the context of the three primary elements of the strategy: (1) Foundational Elements, (2) Specific Elements, and (3) Implementation Team/Commission. Foundational elements of the Strategy are those that transcend specific management and conservation actions or reactive adaptive processes once population or habitat triggers are tripped. We refer to four Foundational Elements: Thematic Approach, Conservation Areas, Adaptive Triggers, and Population Objective. Specific Elements identified in the Strategy are those that target specific threats including: wildfire, invasive species, and infrastructure, as primary threats; and recreation, West Nile virus, improper livestock grazing management, and livestock grazing infrastructure as secondary threats. The Implementation Team/Commission

referenced in the Strategy is meant to ensure proper action is taken when a trigger is tripped. As such, for the purposes of our review, we will evaluate the Implementation Team/Commission as a separate operational element of the strategy.

### **Foundational Elements**

Our review of the Strategy revealed a thoughtful, science-based and outcome-driven adaptive management approach to the conservation of GRSG in Idaho. This approach is consistent with the COT report. The Thematic Approach, Conservation Areas, Adaptive Triggers, and Population Objectives are consistent with the COT report and the Service strongly supports these aspects of the State's Strategy.

Examples of how the four Foundational Elements of the Strategy are consistent with the General Conservation Objectives and Specific Conservation Objectives related to Priority Areas for Conservation (PACs) in the COT report include:

1. The designation of a Core Habitat Zone (CHZ) of approximately 5.5 million acres which by itself is currently home to approximately 73% of the male GRSG in Idaho. The CHZ captures the COT report intent of avoiding development in priority areas for conservation (PACs). The Strategy reflects that the development of infrastructure (a primary threat to GRSG) is prohibited in CHZ; with a process for limited exceptions. The Service commends the State for ensuring that any exceptions to the prohibition to infrastructure in CHZ, must meet the conservation standard in the Important Habitat Zone (IHZ; see discussion in next paragraph). While we support the configuration and intent of the CHZ, we look forward to working with the State to clarify how exceptions are determined and specific mitigation strategies if exceptions occur are implemented (see Specific Elements and Implementation Team/Commission headings, below).
2. The designation of an Important Habitat Zone (IHZ), of approximately 4 million acres which by itself is currently home to 22% of the male GRSG in Idaho. The IHZ also captures the COT report intent of stopping the population decline in that while infrastructure is permitted; it is permitted in a way that must demonstrate it will not affect the population trend for the Conservation Area in question. IHZ serves an equally important role in the Strategy as it can serve to buffer loss of habitat due to fire (see #5).
3. The Strategy's use of a measureable population objective, and utilizing monitoring to ensure that objective is met; and setting metrics that trigger changes in practices or review of current practices to ensure the Strategy's conservation objective is met long-term.
4. The use of four separate Conservation Areas in which the adaptive triggers are individually applied adds an increased level of sensitivity to change, that we expect to translate to more timely changes in management if necessary, which will translate to an enhanced ability to ensure the population objective of the

Strategy is met state-wide (the Service appreciates and concurs with the State's desire to have additional peer review of the adaptive triggers).

5. The use of a "hard trigger" that, if tripped, requires IHZ be managed as CHZ, with infrastructure development subject to the same standards in both zones. In essence, if applied to all Conservation Areas, the CHZ would almost double in size. This would add the conservation benefit of CHZ to IHZ until no longer necessary.
6. The COT report also references the importance of incentive-based conservation actions in developing a conservation strategy. The foundational elements of the Strategy provide a context for incentivizing actions to maintain population numbers and intact habitat; and help ensure the conservation and restoration of GRSG in Idaho. The structure of these foundational elements of the Strategy (and specific elements consistent with the COT report and others as they are refined) will help provide stakeholders predictability with regard to GRSG conservation needs.

### Specific Elements

*Livestock Grazing Management:* This specific element of the Strategy is consistent with the COT report. The Service supports this aspect of the Strategy because it requires Idaho Rangeland Health Standards (IRHS) be met and it does so in the context of the Strategy. The COT report identifies that if the riparian (IRHS 2) and upland (IRHS 4) rangeland health standard is met, that is the minimum needed to address the threat of grazing on GRSG based on our expertise under the ESA. To achieve this, the Strategy provides an adaptive management process by which adjustments in grazing based on ecological site potential and habitat characteristics would be prioritized as needed outside of normally scheduled permit renewals based on population triggers and cause of declines within each Conservation Area in the Strategy. Additionally, the adaptive management approach the Strategy provides an important framework for deciding what, in addition to IRHS 2 and 4, might be required under IRHS 8 (Threatened, Endangered or Sensitive Species) for GRSG conservation.

As noted above, the COT also references the importance of incentive-based conservation actions in developing a conservation strategy. The Service believes the Livestock Grazing Management Element address the conservation needs of GRSG while providing an important incentive to permittees to be good stewards.

An additional important benefit to the Service of the Livestock Grazing Management element is that the regulation of improper grazing as a threat to GRSG when permits had not yet been analyzed by BLM to meet IRHS for GRSG (IRHS 2, 4; and 8 as needed) would be accomplished through the Strategy on an as needed basis based on population status. This approach is in contrast to requiring all individual permits be conditioned to meet IRHS 2, 4 and 8 (as needed), by the time the Service makes its listing determination—a goal that is likely not achievable. To be clear, the Service supports

adherence to IRHS. Our support for the approach of this element is due to it being a wise approach for regulating the appropriate conservation action for the secondary threat of improper grazing to GRSG where needed, until IRHS necessary for GRSG conservation are achieved at the management area scale. This adequacy of regulatory mechanisms under ESA is an important consideration. Pending more clarity in how the Implementation Team/Commission is staffed and operates once a trigger is tripped; the Service would expect to fully support this element of the Strategy. While we would defer to the BLM on their permit-specific application of these triggers in the context of requirements to enhance and restore rangelands under Federal Lands Policy and Management Act (FLPMA), the Service supports the Livestock Grazing Element in the interim as long as no triggers have been tripped within a Conservation Area.

*Infrastructure:* The specific actions in the infrastructure element are consistent with the COT pending a clearer understanding how the Implementation Team/Commission operates to determine exceptions to CHZ development, development in IHZ, and how referenced mitigation of impacts will work.

*Mitigation:* Mitigation is referenced in multiple elements in the Strategy but there is no explanation of the how mitigation for impacts in CHZ, IHZ and potentially GHZ will work. The Service is aware of preliminary work by your Task Force and the work of the Idaho Sage-grouse Advisory Council and this element and encourages the State to build on these efforts for this element of the Strategy.

*Restoration:* The Service recognized in our letter of August 1, 2012, that one of the many strengths of the Strategy is that habitat in need of restoration was included in and adjacent to CHZ as a priority commitment for restoration and to expand Core habitat. However, the Strategy is largely silent on the important relationship between mitigation and restoration for restoration to occur; what constitutes habitat that is lost versus gained back; and restoration monitoring. The need for how direct and indirect loss of habitat is quantified and what constitutes restored habitat is a missing component of the habitat trigger as well.

*Wildfire Management:* Wildfire and invasive species associated with fire are the greatest threat to long-term persistence of GRSG in the Great Basin and the threat most difficult to manage. The Strategy has been refined to help manage this threat in a significant way. The addition of legislative changes and funding to support the creation of Rural Fire Districts (RFDs) is a significant addition to the Strategy and one the Service supports and that is consistent with the COT report. Viewing wildfire management in the context of Prevention, Response and Restoration and tailoring actions within each is likewise an important refinement. The Service looks forward to working with the State and other partners to help establish more RFDs; and to identify more specific actions under each category of Prevention, Response and Restoration.

One aspect of the strategy that is not a specific fire management action but that the Strategy notes and the Service likewise acknowledges as one of the strongest attributes of the Strategy is how the overarching construct of the Strategy is designed with fire in

mind. The conservation objective of maintaining between 95% and 73% of the males on leks, the establishment of refined habitat triggers that catch declines and adapt practices earlier and by Conservation Area, the identification of areas in need of restoration, the commitment to IRHS are all mechanisms to reduce fire, buffer the effects of fire, and provide for refinement in management in an adaptive construct to reduce the effects of fire in the long term.

*Management on non-Federal Property:* The Strategy to date has focused on Federal properties. This is understandable due to the ongoing Resource and Land Use Management Plan revisions and amendments underway by BLM and the U.S. Forest Service. The Service looks forward to working with the State to ensure the Strategy applies where necessary and appropriate to all properties with adequate state or local regulatory mechanisms.

### **Implementation Team/Commission**

Many of the specific elements of the Strategy are in the Service's view conditionally consistent with the COT pending more clarity how the Implementation Team/Commission is staffed and operates; and how it interacts with scientific support. Because the Strategy is an outcome-based, adaptive strategy, its efficacy is achieved through a balance between proactive actions and reactive steps to adapt and or change actions if necessary. Therefore, the Service needs to understand in more detail how the Implementation Team/Commission functions to evaluate data and inform decisions to adapt management that ensure the Strategy objective is met (e.g., see Infrastructure, above).

### **Summary**

In summary the Strategy is a robust approach to conserving GRSG in the Great Basin. Many components of the Strategy are strong, in particular the underlying foundational elements and grazing management; with wildfire and infrastructure similarly strong pending additional clarity and refinement as noted. The State of Idaho and the stakeholders on the Governor's Task Force have done remarkable work in a compressed timeframe as these aspects of the plan address threats to GRSG in the Great Basin in a way that gives the Service more regulatory certainty, stakeholders more operational certainty, and provides for the conservation of GRSG and sage-brush in Idaho that helps ensure more resiliency to large wildfires. The elements of the Strategy that the Service would welcome more conversations with the State to refine, add or clarify in the Strategy include non-federal properties, restoration, mitigation, and the operation of the Implementation Team/Commission.

Administrative Draft  
Cooperating Agency Review

United States Department of the Interior  
BUREAU OF LAND MANAGEMENT  
Idaho State Office  
1387 South Vinnell Way  
Boise, Idaho 83709-1657

In Reply Refer To:

MAY 06 2013

The Honorable C.L. "Butch" Otter  
Governor of Idaho  
P.O. Box 83720  
Boise, Idaho 83720

Dear Governor Otter:

I appreciate the continued coordination and partnership with the State of Idaho in conserving sage-grouse. The purpose of this letter is to describe Idaho Bureau of Land Management's (BLM) progress in considering the State of Idaho's Sage-grouse Plan (the Idaho Plan) as submitted to the U.S. Fish and Wildlife Service (FWS) on March 14, 2013. This letter will address consideration of Idaho's Plan as both an alternative in the Idaho/S.W. Montana Sub-regional Environmental Impact Statement (EIS) and as potential interim guidance to supplant BLM IM 2012-043.

First and foremost, I share your goal of a science-based approach to amending resource management plans in Idaho by 2014 so that it becomes unnecessary to list the sage-grouse under the Endangered Species Act. It is essential that we accomplish the EIS and associated resource management plan (RMP) amendments on schedule so that the FWS can fully consider BLM's amended RMPs as it assesses threats to the species and adequacy of regulatory mechanisms in 2015.

There are two pathways for considering Idaho's Plan for BLM administered lands: 1) through the sub-regional EIS and RMP amendment process planned for completion in 2014, and 2) as potential interim management as outlined in IM 2012-043.

Idaho's Plan & the Sub-Regional EIS and RMP Amendment Effort

As noted in my letter of August 30, 2012, Idaho's Plan is one of six alternatives being fully analyzed in the Draft EIS (DEIS) to be released for public comment this fall. Our regulations for implementing the National Environmental Policy Act (NEPA) require federal agencies to "rigorously explore and objectively evaluate all reasonable alternatives." Our EIS planning team continues to work closely with staff from the Office of Species Conservation and Idaho Department of Fish and Game as cooperating agencies to incorporate State input into development of the DEIS.

An immediate priority for our EIS effort is to ensure that Idaho's Plan is fully understood by our analysis team, accurately analyzed as an alternative in the DEIS, and fully disclosed to facilitate public comment. Our review of the March 14 version of Idaho's Plan has identified several elements for which we are seeking additional clarification, including the sections describing the adaptive management triggers, the wildfire suppression and emergency clause, and the direction for infrastructure development. We are in the process of clarifying those issues with your staff at this time.

As we conduct our cumulative effects analysis of past, present, and reasonably foreseeable actions, we will need to analyze activities on both federal and non-federal lands. This requires our understanding of Idaho's existing and proposed management of state lands intermingled within and adjacent to federal public lands. At this time, BLM still needs more assistance on that front so that we can complete the DEIS on schedule.

In order to insure that Idaho's Plan is properly considered and analyzed as an alternative in the DEIS planned for release this fall, Idaho BLM must receive any clarifications/additional details no later than June 30, 2013.

#### Idaho's Plan & its Potential to Inform Interim Guidance

As noted in my letter to you dated March 22, 2013, upon concurrence by the FWS, Idaho BLM will consider adopting Idaho's Plan as interim guidance so long as the proposed interim measures can be implemented in a manner consistent with our multiple use mandate, current policy and regulations, and consistent with organizational capacity (current funding and staffing).

Our preliminary review of Idaho's Plan has identified elements that fit within existing regulations and policy, would not require new NEPA, and are within our current funding and staffing capability to implement. These include: 1) some of the Best Management Practices for infrastructure and wildfire suppression/restoration, 2) parts of the invasive species direction, 3) the general characteristics of habitat as indicators, and 4) identification of a sage-grouse management area divided into four conservation areas. We have initiated discussions with your staff regarding these potential interim management measures with the goal of reaching closure this summer.

Our preliminary review of Idaho's Plan has also identified portions of the Plan which are not consistent with direction in our current RMPs and would require new analysis under NEPA before they could be considered for implementation as interim guidance. These portions include the adaptive management triggers (population and habitat thresholds), the livestock grazing management framework and standards, and the infrastructure direction and exemption process. We are unable to dedicate staffing to complete the new NEPA necessary for adopting these portions as interim management without impacting our ability to complete the EIS and RMP amendments by 2014. We remain committed to analyzing all of these potential management solutions and corresponding actions as part of the EIS.

We are very appreciative of the State's support for the Rangeland Fire Protection Associations and are committed to close coordination between Idaho BLM and the State of Idaho in reducing the threat of wildfire, the primary threat to sage-grouse habitat in Idaho. We are actively working with the Idaho Department of Lands and the Rangeland Fire Protection Associations to leverage our collective effectiveness in preventing, suppressing, and reducing the impacts of wildfire on sage-grouse habitat. We continue to work closely with Idaho Department of Fish and Game when taking emergency stabilization and rehabilitation actions following wildfire.

Thank you for your leadership in advancing conservation of sage-grouse and close coordination with Idaho BLM regarding public land management in Idaho.

Sincerely,

Steven A. Ellis  
State Director

Administrative Draft  
Cooperating Agency Review

The following questions were posed to the State of Idaho during a coordination meeting on April 30<sup>th</sup>, 2013. At a subsequent follow-up meeting on May 2<sup>nd</sup>, 2013 attended by Don Kemner (IDF&G); Cally Younger (OSC); Dustin Miller (OSC); and Brent Ralston (BLM), many of these questions were discussed and answered – see noted answers within table; others required additional follow-up and were part of the overall state response received by BLM on July 1<sup>st</sup>, 2013, and subsequently incorporated into the State Alternative (Alternative E).

State Plan Language		BLM/FS Questions for Analysis
<p>Manage sage-grouse habitats to achieve the conditions described in Tables 3, 4 &amp; 5 of the Governors Alternative, where appropriate, recognizing these conditions may not be achievable in all areas due to the existing ecological condition, ecological potential or the existing vegetation; or to causal events unrelated to existing livestock grazing.</p>		<ol style="list-style-type: none"> <li>1. Are these desired conditions or standards? <b>These are desired conditions to help guide management; they are not standards or requirements.</b></li> <li>2. Apply when and where achievable? If so curtail management stressors until achieved? Or only allow management that does not impede achievement? Or apply management as long as progress toward achievement is being made? <b>As desired conditions management would continue with the potential to adjust management where necessary to achieve or move towards achievement of these conditions.</b></li> </ol>
<p>Develop a consistent wildfire suppression plan that improves on the wildfire suppression baseline by twenty-five percent (25%) through: a. Ensuring close coordination with Federal and State firefighters, local fire departments and local expertise to create the best possible network of strategic fuel breaks and road access to minimize and</p>		<ol style="list-style-type: none"> <li>3. What is the wildfire suppression baseline derived from?</li> <li>4. Is there specific rationale for 25% or 15%? Do these</li> </ol>

State Plan Language		BLM/FS Questions for Analysis
<p>reduce the size of a wildfire following ignition;</p> <p>b. Developing consistent fire response plans and mutual aid agreements necessary to achieves a 25% improvement in the fire suppression baseline;</p> <p>c. Requesting and placing additional firefighting resources and establish new Incident Attack Centers, with particular emphasis in the West Owyhee Conservation Area;</p> <p>d. Creating and maintaining effective fuel breaks in strategic locations that will modify fire behavior and increase fire suppression effectiveness according to the following criteria:</p> <ul style="list-style-type: none"> <li>• Targeting establishment of fuel breaks along existing roads or other disturbances.</li> <li>• Identifying and targeting higher-risk roads for fuel break construction and maintenance based on fire history maps.</li> <li>• Implementing a strategic approach to using these roads for rapid fire response.</li> <li>• Analyzing the benefits of the fuel break against the additional loss of sagebrush cover and risk on invasive weeds.</li> <li>• Maintaining fire breaks to meet objectives.</li> </ul> <p>e. Requesting the necessary federal appropriations to achieve this objective.</p>		<p>represent environmental thresholds related to wildfire?</p> <p>5. How would the 15% or 25% be measured? Is this an improvement in response time or an increase in chains per hour of firefighter capability?</p> <p>6. Is there some measurable way to determine higher risk roads for fuel breaks?</p>
<p>Utilize and employ more aggressive wildfire and invasive species management practices to prevent further encroachment of these two primary threats into the CHZ on Federal lands.</p>		<p>7. Are there specific techniques or approaches in mind here?  There are no specific actions in mind presently but the advent of new practices and techniques which better address the threat are valid for consideration as they are developed.</p>
<p>Decrease wildfire response time by twenty-five percent (25%) through:</p> <p>a. Prioritizing, maintaining and improving a high initial attack success</p>		<p>8. Is this referring to average response time?</p>

State Plan Language		BLM/FS Questions for Analysis
<p>rate in suppression response and staging decisions;</p> <p>b. Utilizing available Sage-Grouse Management Area maps and spatial data depicting sage-grouse habitats within this zone in accordance with action # 31;</p> <p>c. Redeploying firefighting resources not being fully utilized outside the SGMA to the extent such redeployment will not cause harm to human safety and structure protection; and</p> <p>d. Requesting the necessary federal appropriations to achieve this objective.</p>		<p>9. How is this measured? Data available to measure this?</p> <p>10. Redeployment of resources not needed occurs all the time - is there some measurable way to describe this?</p>
<p>Develop more aggressive strategies to reduce fuel loads, where appropriate.</p>		<p>11. Specific techniques or practices in mind? <i>See #7.</i></p> <p>12. Is there some target amount? <i>There is no specific target identified.</i></p>
<p>Prioritize permit renewal and land health assessment processes for allotments with declining sage-grouse populations.</p>		<p>13. Is this within the 10-year schedule or in addition to the 10-years schedule? For example permit in place for 4 years and GRSG populations declining does this reinitiate permit evaluation or does existing permit run the course of 10-year authorization and then become high priority for renewal in year 10? <i>This would apply when adaptive regulatory triggers have been tripped and where the Implementation Task Force has determined that grazing</i></p>

State Plan Language		BLM/FS Questions for Analysis
		<p>is a causal factor.</p> <p>14. How does evaluation of causal factors figure in to Permit Renewal NEPA priorities?</p>
<p>Establish strategically located forage reserves focusing on areas unsuitable for sage-grouse habitat restoration or lower priority habitat restoration areas when feasible.</p>		<p>15. Since most BLM land is under permit are there State lands under consideration for these areas or is this contingent on BLM permit revocation or voluntary relinquishment? There are no specific state lands under consideration at this point.</p>
<p>Objective 1: Implement the regulatory mechanisms to maintain and enhance sage-grouse habitats, populations and connectivity in areas within the CHZ, buffered by strategic areas within IHZ, dominated by sagebrush.</p>		<p>16. How are strategic areas defined/identified? This implies a subset of IHZ and that the entire IHZ would not be the strategic buffer area. The strategic areas are the IHZ within the same CA as the CHZ.</p>
<p>Designate CHZs as ROW avoidance areas with limited exemptions permissible.</p>		<p>17. What is the exemption process?</p>
<p>Prohibit the development of infrastructure, except if developed pursuant to valid existing rights or incremental upgrade and/or capacity increase of existing development (authorized prior to the record of decision) subject to best management practices in Gov. Alt Section G.</p> <p>a. Limit impacts of proposed actions to the existing authorized footprint with no more than a fifty percent (50%), depending on industry practice, increase in footprint size and associated impacts;</p>		<p>18. How is this footprint measured? Includes only the acres physically disturbed (tower footings) or includes area of impact (some sort of buffer area)? There is a tie to the COT Report – is this suggesting something other</p>

State Plan Language		BLM/FS Questions for Analysis
<p>and b. Include compensatory mitigation if new significant and unavoidable impacts are demonstrated to be associated with the project."</p>		<p>than COT approach? This approach is similar to the COT and would include the defined ROW width – not the potentially broader impact area.</p>
<p>Increase resiliency of the habitat to disturbances, such as wildfire, and limit habitat fragmentation and loss only to projects pursuant to valid existing rights or incremental upgrades and/or that demonstrate, among other things, a significant high value benefit to the State of Idaho as well as provide compensatory mitigation consistent with the guiding principles in coordination with Federal, State and local partners.</p>		<p>19. Is there a process for assigning and assessing compensatory mitigation?</p>
<p>Co-location of new transmission lines occurs when construction falls between July 1 and March 14 (or between July 1 and November 30 in winter concentration areas) and within one kilometer either side of existing 115-kilovolt (kV) or larger transmission lines to create a corridor no wider than two kilometers.</p>		<p>20. Co-location seems to address a long term impact of presence whereas seasonal restrictions seem to address construction activities? Do these need separated? These are separate and can be separated retaining both the co-location aspect and the timing restriction aspect.</p>
<p>Evaluate areas affected by fluid mineral development in accordance with the process outlined in the State of Wyoming's Executive Order 2011-5.</p>		<p>21. Is this process applicable in Idaho? 22. Are the definitions of suitable habitat the same? If so how much CHZ, IHZ and GHZ are considered suitable? The definitions would follow those identified by Connelly 2000.</p>

What is the difference or relation between a causal factor and a potential limiting factor? <b>They are the same.</b></p> <p>30. How does the Implementation Team concept fit in with BLM management responsibilities?</p>
<p>Adaptive Regulatory Triggers are broken down into a “soft” trigger and a “hard” trigger. The “soft” trigger becomes operative when one of the following occurs:</p> <ul style="list-style-type: none"> <li>• 10% decline in maximum number of males counted and a finite rate of change below 1.0 but not significantly on CHZ over a period of three years; or</li> <li>• 10% loss of nesting and wintering habitat in a Conservation</li> </ul>		<p>31. What is meant by “but not significantly on CHZ” <b>Should read ‘not significantly below 1.0’.</b></p> <p>32. Who is the Implementation Team? How do BLM and USFS staff and managers</p>

State Plan Language		BLM/FS Questions for Analysis
<p>Area over a period of three years</p> <p>When the monitoring information indicates that the “soft” trigger may be tripped, an Implementation Team – aided by the technical expertise of IDF&amp;G – will assess the factors leading to the decline and identify potential management actions. The Implementation Team may consider possible changes in management to the CHZ. As to the IHZ, the Implementation Team may review the causes for decline and potential management changes only to the extent those factors significantly impair the state’s ability to meet the overall management objective. It is anticipated that IDF&amp;G will collect data annually and will make recommendations to the Implementation Team by August 31<sup>st</sup> for population triggers and January 15<sup>th</sup> for habitat triggers.</p> <p>The “hard” trigger becomes operative when one of the following occurs:</p> <ul style="list-style-type: none"> <li>• 20% loss in CHZ nesting wintering habitat over a period of three years; or</li> <li>• 20% decline in maximum number of males counted and a finite rate of change significantly below 1.0 within a Conservation Area over a period of three years.</li> </ul> <p>If the “hard” trigger becomes operative according to the monitoring information, management changes are no longer discretionary and will be implemented in the following manner:</p> <ol style="list-style-type: none"> <li>1) The IHZ will be managed according to the CHZ provisions primarily impacting the ability to consider infrastructure projects. Like the “soft” trigger, the Implementation Team will analyze the actual causes of the decline.</li> <li>2) The adaptive trigger strategy focuses the analysis on mitigating the primary threats to the species in the CHZ. Only where the monitoring information indicates the cause(s) of the decline is</li> </ol>		<p>participate on, interface with, and make decisions for the Implementation Team?</p> <p>33. What happens if appropriate data is not available or collected for a period of time?</p> <p>34. What are the management changes as a result of “soft” triggers being tripped – these are important for description in the Draft EIS.</p> <p>35. Is the habitat “hard” trigger referring to nesting or (and?) wintering habitat? <b>Both habitat types.</b></p> <p>36. When a “hard” trigger is tripped will only the primary cause be addressed? What about other contributing factors? For example fire causes the “hard” trigger to be tripped; according to the flow chart only fire regulatory mechanisms would be evaluated. When would the cumulative impacts of other activities, i.e. development be considered?</p> <p>37. Table 1 does not include regulatory trigger</p>

State Plan Language		BLM/FS Questions for Analysis
<p>not a primary threat will the Implementation Team analyze the secondary threats to the species and determine whether further management actions are needed.</p>		<p>thresholds? When will these be defined?            38. Table 2 – defined acres of habitat within the various Conservation Areas – what is the data source and are these mapped?</p>
<p>Objective 2: Initiate a management review of the regulatory approach to assess causal factors for declines if a 10% loss of habitat loss occurs within the first three years of implementation. IDFG would lead the review in coordination with the Governor’s Office of Species Conservation and other relevant State and Federal agencies. The review would include a determination of whether the loss is based on a population-related decline (e.g., West Nile virus, drought) or is driven by habitat loss. If the loss is habitat-driven, the review team will assess the effectiveness of current best management practices, funding levels and restoration efforts in order to preclude the triggering of the adaptive regulatory triggers.</p>		<p>39. How is this process defined and executed?</p>
		<p>40. How does monitoring and assessment determine management changes?            41. Who is responsible for collection?            42. What data will be collected? The cycle of responsibilities and monitoring with regard to the adaptive management strategy needs fully described.</p>

July 1, 2013

Steve Ellis  
State Director  
Bureau of Land Management  
Idaho State Office  
1387 South Vinnell Way  
Boise, ID 83709

Dear Steve,

This letter is in response to your May 6, 2013 request for further clarification of certain components of the September 2012 draft of the Governor Otter's Sage-Grouse Conservation Alternative (Governor's Alternative) for purposes of the Bureau of Land Management's (BLM) and US Forest Service's (USFS) analysis under the National Sage-Grouse Planning Effort. As you are aware, over the past two months the State of Idaho has worked diligently to clarify and refine components of the Governor's Alternative to better assist the BLM and USFS in their analysis under the National Environmental Policy Act (NEPA).

As you know, in December 2011 Secretary of the Interior Ken Salazar invited western governors to create state-specific sage-grouse conservation plans that could be implemented as interim management, provided that "concurrence" is granted from the Service, and incorporated as alternatives in the federal land-use planning effort. In response, Governor Otter created a Sage-grouse Task Force through Executive Order 2012-02. This Task Force began meeting in March 2012 and developed recommendations on actions needed to preclude a listing of greater sage-grouse in Idaho while maintain predictable levels of land-use activity. From those recommendations, the Governor's Alternative was drafted and submitted to the BLM and USFS for consideration in the Idaho and Southwest Montana Sub-regional EIS. In accordance with Secretary Salazar's December 2011 request, the Governor began seeking concurrence from the Fish and Wildlife Service. In March 2013, the Governor submitted a concurrence request to Brian Kelly, Idaho State Director for the Service. In April, 2013, Brian Kelly responded very positively to the Governor's Alternative and was willing to "concur" with the Governor's

Conservation Areas, the three zone habitat structure, the conservation objectives, the adaptive trigger strategy, and the grazing strategy. He stated the Governor's approach would provide needed benefits for sage-grouse and sage-grouse habitat.

In our continuing commitment to multi-agency collaboration, we have attached thorough explanations to the questions you asked us in May 2013. Some measures that may have appeared vague or incomplete have been refined and clarified along with additional actions needed to proactively deal with wildfire within sage-grouse habitat.

For the purposes of the NEPA analysis, the State requests BLM to consider the Governor's Alternative dated September 5, 2012, the Governor's March 13, 2013 request for concurrence, the concurrence letter from the Service to Governor Otter dated April 8, 2013 and the following attachments. The September 2012 Alternative is adopted herein by reference, and only where specifically noted in the March 2013 Concurrence request and in this letter should the Governor's Alternative be construed as revised or modified. Additionally, please refer to Idaho's Mitigation Framework, attached, for further explanation of the Governor's Compensatory Mitigation Strategy.

Sincerely,

Dustin T. Miller

Request for clarification or refinement of Governor Otter's Alternative for Sage-Grouse  
Management  
07/01/13

Proposed Implementation of Governor Otter's Management Plan

In addition to the description of this implementation scheme in the Governor's Alternative at 7, 19 and 27, and Governor Otter's March 2013 request for concurrence at 4, 7 (Appendix II), the below narrative provides more detail for the implementation of Governor Otter's Sage-grouse Conservation Alternative (Governor's Alternative). As mentioned previously, this process is modeled after the Idaho Roadless Rule implementation framework.

Should the Bureau of Land Management (BLM) select the Governor's Alternative as the final decision, the State of Idaho is proposing the following steps:

- Enter into a Memorandum of Understanding (MOU) between the BLM, U.S. Forest Service, and the State of Idaho establishing the State as a cooperating agent to implement the final decision.
- As part of the state's responsibility under the MOU, Governor Otter would issue an Executive Order (under state law, an EO has the force and effect of law) establishing an Implementation Task Force to meet the state's role and responsibilities under the MOU. This task force would be similar in composition to Governor Otter's Sage-Grouse Task Force pursuant to Executive Order 2012-02.
- The Implementation Task Force would be tasked with providing Governor Otter advice and counsel on at least the following issues: (1) analyzing the annual sage-grouse monitoring data to determine whether an adaptive response is appropriate and necessary given the population and habitat objectives provided in the Governor's Alternative; (2) providing input during the National Environmental Policy Act (NEPA) process for on-the-ground infrastructure projects; and (3) prioritizing habitat restoration opportunities. The Implementation Task Force would submit these recommendations to the Governor, and based on his review and concurrence, will transmit these recommendation to the appropriate agency as part of the underlying NEPA analysis. The ultimate decision involving public land management would fall to the appropriate agency.
- The Implementation Task Force will make recommendations based on the data and recommendations provided by a science subcommittee led by the Idaho Department of Fish and Game (IDFG). The Implementation Task Force may solicit outside experts if necessary.

## Process for Determining Whether an Adaptive Response is Necessary

As the U.S. Fish and Wildlife Service (Service) stated in its Concurrence Letter in April 2013, one of the most significant components of the Governor's Alternative is the adaptive management construct. The "trigger" approach makes this component work through monitoring habitat and population data and allowing for changes in management when necessary. The trigger strategy has been amended since the September 5<sup>th</sup>, 2012 draft and those changes are noted in the Governor's March 2013 concurrence request. As is discussed in further detail below, population and habitat data are collected and analyzed by the IDFG and presented to the Implementation Task Force. "Tripping a trigger," whether at the lower "soft" trigger, or the "hard" trigger will lead the Implementation Task Force to initiate potential management changes.

### 1. Data Collection by Idaho Fish and Game

The IDFG has been collecting sage-grouse population data since at least 1951. The lek routes referenced in the Alternative are all routes that were conducted during the 2011 baseline year. Leks on these routes represent 21% of all known leks. In addition, individual leks not associated with routes but counted in two consecutive years (e.g. 577 leks in 2013 equals 26% of all known leks) are combined with lek routes counts to calculate population growth (finite rate of change) for a habitat management zone. These counts combined represent approximately half of the known leks in Idaho and are distributed across the bird's range.

Population Data Collection: For purposes of determining whether an adaptive regulatory trigger is necessary, the Governor's Alternative identifies two primary methods:

- Number of males counted on lek routes as identified on page 8 of the Governor's Alternative.
- Number of males counted on individual leks not assigned to a lek route in the Governor's Alternative (as resources allow). This information is useful in the lambda population trigger.

Population data is collected by counting male sage-grouse attending leks per protocols for weather conditions, time of day, time of year, what constitutes a lek, time between counts (e.g. 7-10 days), etc. Maximum number of males observed on lek route(s) over 3-4 counts during the spring is used to monitor sage-grouse population trend in a habitat management zone. Lek data can be used to assess population trends over time (Garton et al. 2011) but counts for a single year may not reflect trends very well because of variation of male attendance at leks caused by severity of the previous winter, weather, timing of counts during spring, and a variety of other factors (Emmons and Braun 1984, Hupp 1987, Baumgart 2011). Therefore, maximum number

of males counted is averaged over three consecutive years and compared to the 2011 baseline.

#### Habitat Data Collected

- Acres of nesting and wintering habitat lost (due to wildfire, invasive species expansion, infrastructure development, and/or other secondary threats).
- Acres of nesting and wintering habitat gained (due to restoration or natural succession).

#### Habitat and Population Restoration Data Collection

- Acres protected (e.g. conservation easements or Phase 1 juniper treated).
- Feet of fence marked.
- WNV mosquito habitats treated or eliminated.

IDFG will continue to be responsible for collecting sage-grouse population data and compiling habitat data into useable forms (e.g. maps and/or tables of annual wildfire, juniper removal, and other habitat changes). This information will be collected throughout the year and will be presented to the Implementation Task Force on at least an annual basis. Further discussion between the State, BLM, and USFS is necessary to determine who will collect necessary habitat data.

#### 2. Determination of Adaptive Response

Based on the annual report and the recommendations of the subcommittee, the Implementation Task Force will consider whether an adaptive regulatory trigger is necessary to maintain a viable population of the species. (See Alternative and Concurrence Request defining “soft” and “hard triggers”). Of particular note, the September Alternative proposed an “Emergency Wildfire Clause”. This clause has been removed as the better defined triggers will likely lead to the same management response.

If the annual report indicates that a “soft trigger” has been tripped within a particular conservation zone there is no required adaptive response. The “soft trigger” is an early warning system that permits the Task Force the discretion to identify and recommend best management practices before an adaptive regulatory response becomes necessary. By contrast, if the information indicates that a “hard trigger” has been tripped within a particular conservation zone, the decision to recommend the appropriate adaptive regulatory response is no longer discretionary.

In the process of determining whether a trigger has been tripped, the Implementation Task Force will attempt to identify the cause(s) for the decline. This analysis will first examine the primary threats to the species (e.g., wildfire, invasive species and infrastructure); and only where the primary threats are not responsible for the decline will the Implementation Task Force analyze the secondary threats to the species.

### 3. Consequences of an Adaptive Trigger

If a soft trigger trips in the Core Habitat Zone, the Implementation Task Force may consider making the following recommendation to the Governor. Recommendations could be, but not limited to:

- Increase monitoring and evaluation of sage-grouse populations in Core Habitat Zone.
- Implement Core Habitat Zone management strategy in corresponding Important Habitat Zone of the same Conservation Area.
- Implement Core Habitat Zone BMPs in corresponding Important Habitat Zone of the same Conservation Area.
- Not allow any new (large) infrastructure development within the Core Habitat Zone (no exceptions allowed).
- Reallocate resources to focus on primary threats in the Core Habitat Zone (e.g. direct resources from other parts of the state to the area of concern).
- Reallocate resources to focus on secondary threats in the Core Habitat Zone (e.g. direct resources from other parts of the state to the area of concern).

If a soft trigger trips in the Important Habitat Zone, the Implementation Task Force may consider making the following recommendations to the Governor. Recommendations could be, but not limited to:

- Increase monitoring and evaluation of sage-grouse populations in area of concern.
  - Implement Core Habitat Zone management strategy in the Important Habitat Zone.
  - Implement Core Habitat Zone BMPs in the Important Habitat Zone.
  - Not allow any new (large) infrastructure development in Core Habitat Zone (no exceptions allowed) of the same Conservation Area.
  - Apply Core Management Zone criteria for all primary threats, and/or all secondary threats to the Important Habitat Zone.
  - Reallocate resources to focus on primary threats in the Important Habitat Zone (e.g. direct resources from other parts of the state to the area of concern).
  - Reallocate resources to focus on secondary threats in the Important Habitat Zone (e.g. direct resources from other parts of the state to the area of concern).
- If a “hard trigger” becomes operative in particular Conservation Area, the following consequences are no longer discretionary:

- First, the IHZ within that Conservation Zone will be managed according to the CHZ regulations primarily impacting the ability to consider infrastructure projects. See Concurrence Response at 5 noting the benefit to the species should this action be required.
- Second, if the cause is related to wildfire or invasive species, the Implementation Task Force will consider additional best management practice to prevent further loss of core habitat within that Conservation Zone.
- Third, only if a primary threat is not the cause(s) for the decline will the Implementation Task Force analyze secondary threats and determine the appropriate management response. The Service identified wildfire, invasive species, and infrastructure as the primary threats and West Nile Virus, improperly managed grazing, and recreation as secondary threats. This adaptive trigger strategy focuses the analysis on mitigating the primary threats to the species.

### Wildfire

Under the wildfire section within the Governor's Alternative for the CHZ, IHZ and GHZ, the State of Idaho desires to replace reference to the incorporation of BLM WO IM 2011-138 with BLM's updated Instruction Memorandum referenced as BLM WO IM 2013-128.

The original intent of the State of Idaho through the Governor's Alternative was to decrease the wildfire response time from the current baseline of response time by 25%. This measure was an effort to arrive at an adequate regulatory mechanism necessary for precluding a listing.

However, recognizing the difficulty in measuring this, and based on further conversations with the Service, BLM and Forest Service, the State wishes to remove that objective and replace it with the below refinement.

Wildfire is a difficult threat to prevent and control. However, the adaptive construct of Governor's Alternative provides a mechanism to prevent sage-grouse from any likelihood of becoming endangered in the foreseeable future. The short-term use of triggers and zones will provide the time to develop more proactive measures that demonstrate long-term success on the landscape.

Attached to this letter is a spreadsheet that will aid in developing a consistent wildfire suppression plan that improves upon the current baseline. Close coordination with federal, state, and private firefighting personnel, local fire departments and local expertise including Rangeland Fire Protection Associations (RFPAs) is crucial to continually improving strategies for initial attack and developing comprehensive fuel break strategies to minimize and reduce the size of wildfires threatening the CHZ and IHZ following ignition.

The employment of specific, more aggressive wildlife and invasive species management practices to prevent further encroachment into the CHZ and IHZ should be driven by local planning efforts at the field office and ranger district level. As referenced above, the creation of RFPAs throughout the Sage-Grouse Management Area (SGMA) is a regulatory mechanism that

will ensure better and faster initial attack on wildfires threatening the CHZ and IHZ through the employment of additional trained firefighters and resources in rural parts of the SGMA. From a regulatory mechanism standpoint, Idaho Code Chapter 1, Title 38 was recently amended to allow for the creation of Rural Fire Protections Associations (RFPAs). Additionally, this spring the Idaho Legislature authorized funding to help cover start-up costs for 4 RFPAs in southwest Idaho.

The emphasis for fuel break prioritization should be in areas within the Wildland-Urban Interface (WUI) where human life and safety are at risk. For instance, the Boise District BLM is currently in the planning phase of a fuel-break project within the Interstate-84 corridor between Boise and Mountain Home, Idaho referred to as the “Paradigm Project”. The idea behind the project is to strategically place and improve upon fuel breaks within this corridor, therefore keeping wildfires to more manageable sizes thus requiring fewer firefighting resources. The State of Idaho supports this project, as well as other similar fuel-break projects designed to secure the WUI and free up firefighting resources to be focused on providing initial attack on wildfires in areas that have the potential to impact greater sage-grouse habitat within the CHZ and IHZ. After securing the WUI, prioritization of fuels breaks should go to areas of high human ignition based upon ignition data and maps produced by BLM districts and field offices. The attached spreadsheet provides conservation measures to be incorporated into the Governor’s Alternative regarding prevention, suppression, and restoration activities. One crucial component of this is the utilization of grazing as an effective management tool in reducing fuel loading on BLM and Forest Service lands. The State of Idaho encourages the BLM and the Forest Service to employ this effective fuels management tool, particularly within areas of high fuel loading that are at high risk of wildfire threatening the CHZ and IHZ.

### Infrastructure Development

Exemptions for ROW avoidance areas within CHZ will be analyzed by the Implementation Task Force as part of that site-specific NEPA analysis. The Task Force will assess project proposals and their mitigation packages, if required, to determine whether to recommend an exemption for the governor’s consideration. The Task Force will use the following criteria to make these assessments, which are outlined on page 33 of the Governor’s Alternative:

- Is the project developed pursuant to a valid existing right?
- Is the project an incremental upgrade/capacity increase of existing development ? (authorized prior to the record of decision) subject to best management practices, outlined in G, pgs 43-45).
- For new development, can the project be reasonably accomplished outside the CHZ? Can the development co-locate with existing infrastructure to the maximum extent practicable?

- Can the project proponent demonstrate the population trend for the species within the relevant Conservation Area is stable or increasing over a three year period?
- Will this project benefit the state of Idaho?
- Compensatory mitigation will be assessed according to Idaho's Mitigation Framework, which is attached to this document.

If the project proponent responds satisfactorily, the Implementation Task Force will recommend to the Governor that the project should be permitted. The Governor will consult with the BLM or USFS on the Implementation Task Force's recommendation, which BLM or USFS must use in its consideration of the project's permit application. All other questions outlined on page 33-34 of the Governor's Alternative will be included in the more in depth NEPA analysis of the project.

### Livestock Grazing

The Livestock Grazing Framework was amended for the Governor's March 2013 Concurrence Request, to ensure this component remains consistent with the Idaho Rangeland Health Standards (IRHS) and the Conservation Objectives Team (COT) Report. In the Service's April 2013 response to the Governor's Concurrence Request, Brian Kelly expressed his support for this component because of its consistency with the COT report as well as the requirement that IRHS be met within the context of the Governor's overall adaptive management strategy.

There are two pathways where this management framework is applicable: (1) in conjunction with scheduled term grazing permit renewals; and (2) where the adaptive regulatory trigger has been tripped (as described in section 3) and livestock grazing is identified as a potential causal factor. See Concurrence Request at 6.

Under the first path, the Governor's Alternative provides a framework for BLM to assess Standard 8 and Standards 2 and 4 based on the Conservation Objectives Team Report (COT Report) with respect to sage-grouse. As described in more detail below, if no trigger has been tripped across a Conservation Area, the Standard 8 analysis for sage-grouse should be a straightforward process.

Standard 8 of the IRHS establishes that the habitat important to threatened and endangered plants and animals meet a "maintain a viable population" threshold with respect to livestock grazing. 43 C.F.R. Subpart 4160. Consistent with the overall approach of the Governor's Alternative, utilizing an outcome-based conservation strategy within an adaptive construct, the State of Idaho has identified an overall population target buttressed by regulatory mechanisms and adaptive regulatory triggers. Where these population and habitat triggers are being maintained within a Conservation Area, there is a rebuttable presumption that current grazing systems are adequate to maintain viable sage-grouse populations; and therefore, absent compelling information, no further changes to the grazing systems will be required pursuant to the Standard 8 analysis with respect to sage-grouse.

This rebuttable presumption *only relates* to sage-grouse management; it does not extend to other relevant issues in the Standard 8 analysis. Moreover, it does not preclude adaptive change to grazing permits based on the other standards contained in the IRHS. Again, it is important to note that the Forest Service is not subject to the IRHS; however, the conservation objectives established in the Governor's Alternative meets the applicable standards in NFMA.

If an adaptive regulatory trigger is tripped consistent with the process outlined above, and livestock grazing is identified as the potential limiting factor, the presumption that the current grazing operations within the Conservation Area have met Standard 8 with respect to sage-grouse will no longer be applicable. Following such a determination, the process outlined in the Governor's Alternative at 12-18, and as described below, for Standard 8 as well as Standards 2 and 4 will be implemented.<sup>1</sup> BLM will individually analyze those allotments and pastures within the relevant Conservation Area. Given limited agency resources, prioritization will be given to areas that have the potential to provide the greatest benefit to sage-grouse. Allocation of resources should be concentrated on allotments within the CHZ that have declining sage-grouse populations. Following those permits within the CHZ, resources will be further prioritized to allotments within the IHZ with breeding habitats that have decreasing lek counts. (*See* Flow Chart, Appendix V). Sage-grouse populations that are stable or trending upward will be a lower priority for permit renewal and the assessment process.

The assessment/determination process for sage-grouse and Standard 8 compliance must rely on published characteristics of sage-grouse habitat and the Ecological Site Descriptions, existing vegetation, habitat inventories/assessments (Stiver et al. 2010), and where available, state and transition models that describe vegetation and other physical attributes for sage-grouse. The related characteristics within the categories shown below will also be included. These characteristics indicate the ability of a given area to provide sage-grouse habitat.

Category 1: The grazing allotment (or any pasture/significant area therein) has the existing vegetation and existing ecological condition (seral state) to provide sage-grouse habitat

Category 2: The grazing allotment (or any pasture/significant area therein) has the ecological potential to provide sage-grouse habitat.

Where an allotment or pasture meets one of these Categories above, Tables 3-5 (pages 14-17) will be incorporated into relevant resource management plans as the desired conditions with the understanding that these desired conditions may not be achievable: (a) due to the existing ecological condition, ecological potential or the existing vegetation; or (b) due to causal events unrelated to existing livestock grazing. Allotments will only be managed for the primary seasonal habitat that it has the potential to support. Typically, summer habitats will be managed to provide the conditions described in Table 3; winter Table 4; and breeding habitats in Table 5.

---

<sup>1</sup> Where inconsistencies arise between the grazing framework described on pages 12-18 of the Governor's Alternative and this document, defer to this document.

Based on these habitat characteristics, BLM will conduct fine and site scale-habitat assessments to help inform grazing management. Where necessary, a determination of factors causing any failure to achieve the habitat characteristics (Tables 3, 4 and 5, pages 14-16) will be conducted at a resolution sufficient to document the habitat condition. This determination will include consideration of local spatial and inter-annual variability. A determination of issues attributable to livestock grazing management should not result from one year of data at a specific location within an allotment.

If the process and conditions outlined above demonstrate that livestock grazing is limiting achievement of the habitat characteristics (Tables 3-5), renewed permits will include measures, including but not limited to the actions outlined in (J, pages 46-48), to achieve desired habitat conditions. These measures must be tailored to address the specific management issues associated with seasonal habitat limitations identified in the fine-scale assessments.

Additionally, adaptive management changes related to existing grazing permits should only be undertaken if improper grazing is determined to be the causal factor in not meeting habitat characteristics, specific to site capability, based upon monitoring over time with appropriate site variability.

The Implementation Task Force will maintain oversight capabilities throughout the process and will be given the ability to review proposed management changes and the implementation of conservation measures to ensure that the measures are being appropriately applied.

Under the second path, this adaptive framework aids in determining whether improperly managed livestock grazing may be a causal factor potentially requiring adaptive change prior to permit renewal to existing permits within a Conservation Area. This adaptive process is tied solely to Standard 8 and will rely on the preceding process as outlined above.

Fire Actions

Idaho Governor's Sage Grouse Alternative 7/1/13

Goal: Maintain adequate habitat to support 73% (core) to 95% (core and important) of the 2011 breeding males.

Objective: Implement actions necessary to manage fire within the normal range of fire activity and maintain and restore healthy, native sagebrush plant communities within Core and Important management zones.

PREVENTION						
What:	Fuel Breaks	Fuels Reduction	Fuels Reduction	Fuels Reduction	Fuels Reduction	Fire Restrictions/Closures
Where:	Complete and implement a strategy that identifies the location and extent of fuel breaks that provides adequate defensible space for firefighters. Priority should go to areas within the wildland-urban interface (WUI) to eventually allow for fewer resources to be allocated to the WUI, thus freeing up resources to combat	Identify and prioritize areas of R2 - Annual grasslands within the IHZ and GHZ based on an overlay analysis with the key habitat map (prioritize the CA's).	R2 - Annual grasslands	Identify and prioritize areas of R1 - Perennial grasslands within Core and Important habitat zones based on an overlay analysis with the Key Habitat map (prioritize the CA's).	Identify and prioritize areas of R3 (conifer encroached areas) for restoration by Conservation Area, then within CHZ and IHZs.	Identify roads, trails, and recreational use areas with high frequency of human caused fires.

	wildfire that have the potential to impact the CHZ or IHZ. Consider 300ft wide "green strips" as well as targeted grazing for fuel breaks.

# FRAMEWORK FOR MITIGATION OF IMPACTS FROM INFRASTRUCTURE PROJECTS ON SAGE-GROUSE AND THEIR HABITATS

## Sage-Grouse Mitigation Subcommittee of the Idaho Sage-Grouse State Advisory Committee

December 6, 2010

### INTRODUCTION

The Conservation Plan for Greater Sage-grouse in Idaho (Idaho Sage-Grouse Advisory Committee 2006; as amended in 2009) calls for the development of a “proposal for a mitigation and crediting program for sagebrush steppe habitats in Idaho and recommendations for policy consideration” (Measure 6.2.4.). In early 2010, the Idaho Sage-grouse Advisory Committee (SAC) established the Mitigation Subcommittee to complete this task.<sup>1</sup> The Mitigation Subcommittee met several times from the late spring, through the fall of 2010 and found broad areas of agreement among its diverse participants.

This report presents the Mitigation Subcommittee’s consensus recommendations for the creation of an Idaho-based program to compensate for the impacts of infrastructure projects on sage-grouse and their habitats. This program – called the Mitigation Framework – would serve as a science-based “mitigation module” that project developers and government regulators could use to achieve compensatory mitigation objectives called for in project plans and permits. While compensatory mitigation may help offset certain impacts arising from infrastructure projects, mitigation should not be considered a substitute for first avoiding and then minimizing impacts. In addition, it is important to recognize that federal and state regulatory or land-management agencies, and county or local governments may also require additional stipulations, conditions of approval or other requirements as well as on-site mitigation, in accordance with applicable law, regulation or policy.

This document proposes a general outline or “skeleton” of policies and procedures for such a program. The Mitigation Framework is designed to be transparent, inclusive, and accountable to defined objectives. The Subcommittee’s purpose is to describe the program in enough detail to foster a dialogue among SAC members, spot important issues and points of agreement, and assess the level of support for developing a functioning mitigation program for Idaho sage-grouse and their habitats.

---

<sup>1</sup> Subcommittee participants: John Robison and Lara Rozzelle, Idaho Conservation League; Brett Dumas, Idaho Power Company; Paul Makela and Tom Rinkes, BLM; Don Kemner, Idaho Department of Fish and Game; Will Whelan and Trish Klahr, The Nature Conservancy; Rich Rayhill, Ridgeline Energy, LLC; Lisa LaBolle and Kirsten Sikes, Idaho Office of Energy Resources; Nate Fisher, Idaho Office of Species Conservation; John Romero, Citizen at Large.

## EXECUTIVE SUMMARY

The state of Idaho is seeing an increasing number of infrastructure projects, such as transmission lines and wind energy facilities, proposed in the state's sagebrush steppe ecosystems. Where federal permits are required, the environmental review process for these projects will analyze how these projects affect sage-grouse and will consider a range of potential mitigation measures to avoid, minimize, or offset any impacts. It is likely that the environmental review process will lead at least some developers and agencies to implement compensatory mitigation.

Compensatory mitigation consists of compensating for residual project impacts that are not avoided or minimized by providing substitute resources or habitats, often at a different location than the project area. For sage-grouse, this would include, among other things, protecting and restoring sagebrush habitats to offset habitat losses and other effects of infrastructure projects.

This framework describes the general outline for a sage-grouse compensatory mitigation program in Idaho. This program would employ an "in-lieu fee" approach to compensatory mitigation through which a project developer would pay funds into an account managed by the mitigation program for performance of mitigation actions that provide measureable benefits for sage-grouse and their habitats within Idaho.

The Mitigation Framework does not alter the legal standards or procedures for review and approval of infrastructure projects. Rather, it offers an option that project developers and/or regulators may choose for implementing mitigation plans and agency permit conditions. It should be emphasized that this program would not relieve project developers and permitting agencies of their obligation to avoid and minimize environmental impacts through appropriate project siting, design and implementation.

Although the initial focus is on sage-grouse, the Mitigation Framework can be readily adapted to provide compensatory mitigation for other sagebrush obligate and associated species. The suitability of the Framework for other species and natural features has not been evaluated.

The objectives of the Mitigation Framework include:

- Provide a credible, efficient, transparent, and flexible mechanism to implement compensatory mitigation;
- Ensure that sage-grouse impacts are offset by actions that benefit the affected species and habitats;
- Provide increased certainty for developers and agencies;
- Involve private and public partners in crafting solutions;
- Provide developers the opportunity to offset the impacts of project development and operation on sage-grouse and sage-grouse habitat, and provide a consistent mechanism to offset impacts to the species that can be evaluated in future reviews of the species' status; and

- Evaluate issues based on best available scientific information, while acknowledging and responding to scientific uncertainty.

The Mitigation Framework would be established through a memorandum of agreement (MOA) among entities that have the capacity and commitment to assist in its implementation. Such parties may include land and wildlife management agencies, counties, tribes, participating private infrastructure development companies, and non-governmental organizations. The MOA would define the specific roles and responsibilities, procedures, and tasks needed to operate an Idaho-based compensatory mitigation program.

The Mitigation Framework envisions a program with the following attributes: (1) a Mitigation Team and program administrator to steer the mitigation program and ensure strong oversight; (2) technically sound and transparent guidelines for estimating compensatory mitigation costs; (3) a science-based statewide strategy to guide the selection of mitigation actions that will receive funding; (4) provisions that the costs of operating the program will be borne by infrastructure developers that use the Mitigation Framework to deliver compensatory mitigation; (5) monitoring the implementation and effectiveness of mitigation actions funded by the Mitigation Framework program; (6) a system to track benefits provided by the Mitigation Framework to sage-grouse habitat in Idaho; and (7) periodic evaluation and adaptation of the Mitigation Framework program.

This framework provides only a general outline of a proposed Idaho-based compensatory mitigation program. It is intended to assess the level of support for crafting the agreements and completing the technical tasks needed to bring the Mitigation Framework into being.

## DISCUSSION

### I. **The Role of Compensatory Mitigation in Infrastructure Development and Sage-grouse Conservation**

#### A. Mitigation Basics

Broadly defined, “mitigation” refers to a wide range of measures that are taken to avoid, minimize, rectify, reduce, or compensate for the adverse impacts of actions affecting the environment. *See* 40 C.F.R. § 1508.20 (definition of “mitigation” in National Environmental Policy Act (NEPA) rules). In this general sense, mitigation should be an integral part of all phases of project planning and implementation.

#

The focus of this report is on compensatory mitigation – also known as “biodiversity offsets” or “offsite mitigation.” Compensatory mitigation consists of compensating for residual project impacts that are not avoided or minimized by providing substitute resources or habitats, often at a different location than the project area. For instance, a project developer may fund the restoration of a particular type of habitat in order to replace or “offset” similar habitat that is lost as a result of project construction.

#

This Framework adopts an “in-lieu fee” approach to compensatory mitigation. Under this approach, a project developer provides funding to a compensatory mitigation program administrator who then distributes the funds to the appropriate government agency, foundation or other organization for performance of mitigation actions. In an in-lieu fee program, the responsibility for actually delivering the compensatory mitigation is transferred from the developer to the program administrator once the developer provides the necessary funds to the in-lieu fee program.

It is important to emphasize that compensatory mitigation does not relieve project developers and permitting agencies of their obligation to avoid and minimize environmental impacts. This Framework endorses the principle known as the “mitigation hierarchy,” which holds that decision makers should consider the elements of environmental mitigation in the following order of priority:

1. Avoid environmental impacts through project siting and design;
2. Minimize the impacts during construction, operation, maintenance, and decommissioning by implementing appropriate conservation measures related to timing and conduct of project activities;
3. Restore areas that have been disturbed or otherwise rectify on-site project-related impacts to the greatest extent practicable; and
4. Compensate for residual impacts (direct and indirect effects that are not mitigated on-site) by providing replacement habitats or other benefits.

This means that compensatory mitigation is addressed only after efforts to avoid, minimize, and mitigate the impacts have been addressed. It also should be noted that significant impacts to habitat areas that support special functions and values for sage-grouse may simply not be replaceable through mitigation and therefore the best course may be to avoid those areas altogether.

#### B. Need for an Idaho Compensatory Mitigation Program

In recent years, the state of Idaho has seen an increase in the number of major infrastructure projects proposed in the state’s sagebrush steppe ecosystems. Several current proposals involve high voltage transmission lines that would cross over hundreds of miles of sage-grouse habitat. Large scale energy infrastructure projects such as wind farms may also affect large areas of sage-grouse habitat.

Where these projects are located at least partially on federally managed public lands they will be required by federal law to go through an extensive environmental review process under NEPA before relevant federal permits are issued. The NEPA process requires the permitting agencies to consider the projects’ environmental effects (both positive and negative), alternatives, and potential mitigation measures. Impacts on sage-grouse will be one of the topics analyzed in the NEPA process.

Even after efforts are taken to avoid and minimize impacts, it is possible that some of these infrastructure projects will degrade some sage-grouse habitat, cause direct sage-grouse mortality, or lead to indirect effects such as avoidance of previously occupied habitat. The extent to which project developers and regulators adopt compensatory mitigation as a means to offset these impacts is not fully known. However, it is likely that at least some developers and regulators will seek to implement compensatory mitigation to benefit sage-grouse and their habitats.

Energy companies and other developers face daunting challenges in carrying out compensatory mitigation for sage-grouse habitat. Just identifying specific mitigation actions requires a major effort. Actually implementing sagebrush restoration and enhancement projects is even more difficult and expensive – typically involving years of effort and a significant risk of failure. Delivering this type of technically complex environmental mitigation may be well outside the core business of many infrastructure developers.

### C. Advantages of the Mitigation Framework

The Mitigation Framework proposes to respond to these challenges by creating a statewide program to deliver scientifically sound compensatory mitigation for multiple projects. Project developers and regulators would no longer have to design, fund and implement their own mitigation programs. Instead, they would have the option of contributing money to a central fund overseen by agencies with expertise in habitat management and non-governmental partners with similar experience.

This approach to compensatory mitigation offers three major advantages. The first advantage stems from the increased efficiency of an Idaho-wide mitigation program compared with fragmented, project-by-project mitigation programs. Mitigation efforts require a significant investment in planning, administration, project oversight, and monitoring. The Mitigation Framework would consolidate these functions, thus avoiding needless duplication.

The second advantage is that a state mitigation fund can be used for sage-grouse conservation more strategically and at a greater scale than project-by-project mitigation. As described in more detail below, the Mitigation Framework would fund sage-grouse habitat protection and restoration projects in accordance with a statewide strategy that uses landscape-scale analyses to identify the specific measures and habitats that will provide the greatest benefit for Idaho sage-grouse populations. This Idaho-based mitigation strategy will be integrated with other conservation strategies throughout the range of sage-grouse to ensure that actions taken in Idaho benefit the species as a whole.

Third, this method can engage the capacity and competence of natural resources agencies, local governments, private companies, and non-governmental organizations. The Mitigation Framework proposes to enlist these entities in shaping Idaho's strategy, developing criteria for use of the fund, and proposing and implementing habitat protection and restoration projects.

The benefits of the Mitigation Framework can be summarized as follows:

#### *Benefits for Project Developers:*

An efficient and reliable mechanism for meeting compensatory mitigation objectives and permit conditions; and

Increased certainty regarding project costs.

*Benefits for Regulatory Agencies:*

Increased certainty that in-lieu fees will result in strategic “on-the-ground” mitigation actions that benefit sage-grouse.

*Benefits for Sage-Grouse:*

Increased certainty that scientifically sound mitigation actions that benefit sage-grouse and offset impacts and habitat losses associated with infrastructure development will be implemented.

D. Ensuring Accountability

In-lieu fee compensatory mitigation does pose one potentially significant drawback that must be acknowledged and addressed: a poorly designed program may lack accountability for delivering meaningful on-the-ground benefits for sage-grouse. Simply having a project developer contribute to an in-lieu fee mitigation account does not by itself compensate for the sage-grouse impacts caused by the project. Actual mitigation is possible only after well-conceived habitat protection and restoration projects are planned, funded, implemented, monitored, and successful in achieving stated objectives.

The Mitigation Framework seeks to ensure accountability by adopting a series of rigorous and transparent procedures. As described below, the Framework would: (1) ensure that program administration and monitoring functions are adequately funded; (2) provide technically sound guidelines for estimating the costs of delivering compensatory mitigation; (3) establish a science-based statewide strategy to guide the program; (4) develop project selection criteria and a request for proposals based on the strategy; (5) require monitoring of the implementation and effectiveness of mitigation actions funded by the program; (6) track benefits the Mitigation Framework program provides to sage-grouse in Idaho; and (7) require periodic evaluation of the program. Taken together, these procedures provide a high degree of certainty that the Mitigation Framework will be able to turn in-lieu fee payments into tangible, lasting compensatory mitigation for sage-grouse.

As described in greater detail in Section E, below, project developers that seek to use the Mitigation Framework will need to show two things. First, they will need to show that their projects’ impacts on sage-grouse and their habitats have been evaluated using a scientifically sound process. Second, they will need to show that their contributions to the mitigation fund reflect the Mitigation Framework’s compensation guidelines to ensure that funding will be adequate to offset project impacts. Having demonstrated those things, the project developers should then be able to rely on their in-lieu fee contribution to the mitigation account as satisfying their compensatory mitigation objectives or obligations.

## II. Core Elements of Idaho Sage-Grouse Mitigation Program

### A. Program Objectives

- Provide a credible, efficient, transparent, and flexible mechanism to implement compensatory mitigation;
- Ensure that sage-grouse impacts are offset by mitigation actions that benefit the sage-grouse and their habitats;
- Provide increased certainty for developers and agencies;
- Involve private and public partners in crafting solutions;
- Provide developers the opportunity to offset project impacts on sage-grouse and sage-grouse habitat, and provide a consistent mitigation mechanism that can be evaluated in future reviews of the species' status; and
- Evaluate issues based on best available scientific information while acknowledging and responding to scientific uncertainty.

### B. Scope

The Mitigation Framework proposes to mitigate for impacts to Idaho sage-grouse and their habitats in Idaho.

The initial focus of the Mitigation Framework is on sage-grouse. However, this program can be readily adapted to provide compensatory mitigation for other sagebrush obligate and associate species, such as pygmy rabbits, if project developers and regulators call for such mitigation. Whether this Framework is suited for mitigation of impacts to a broader suite of species or natural features has not been evaluated. It should be noted that some subcommittee members expect to advocate in other forums that compensatory mitigation should extend beyond sage-grouse.

The Mitigation Framework focuses on infrastructure projects because this type of development is the most likely to give rise to compensatory mitigation under existing environmental policies. As used here, the term “infrastructure” refers to building structures that significantly disturb sage-grouse habitat, including but not limited to projects for electricity transmission, energy generation, pipeline conveyance, transportation, communications, and similar purposes.

The Mitigation Framework is not intended to apply to existing projects that are not changing in scope or to the renewal of on-going activities, such as grazing permits. In addition, the Framework is not suited to projects with minor impacts because their contributions to the mitigation program would be too small to justify the effort needed to establish and administer in-lieu fee payments.

### C. Integration with Environmental Review Procedures

The Mitigation Framework does not alter the legal standards or procedures for review and approval of infrastructure projects. Rather, the Framework offers an option that project developers and/or regulators may choose for implementing mitigation plans and agency permit conditions.

The Mitigation Framework is intended to complement the environmental review process conducted pursuant to NEPA and other federal environmental laws as well as county land use planning authorities.

Many energy and other infrastructure projects undergo review and approval at the county level. The issues examined and the level of environmental analysis varies widely among individual counties and individual developers. If a county or developer decides to address sage-grouse impacts, it will be able to use the Mitigation Framework as a mechanism for meeting compensatory mitigation objectives that may arise from the county permitting process.

### D. Mitigation Strategy

The next step focuses on the Mitigation Team's task of developing a statewide, science-based strategy that will guide the use of the mitigation fund.

The mitigation program strategy would establish priorities for the use of compensatory mitigation funding based on factors/risks identified in the U.S. Fish and Wildlife Service's 12-Month Findings for Petitions to List Greater Sage-Grouse (*Centrocercus urophasianus*) as Threatened or Endangered (USFWS 2010) and in the Conservation Plan for Greater Sage-grouse in Idaho (2006). The strategy sets mitigation priorities with a landscape view of sage-grouse needs and highlights mitigation opportunities in Idaho based on best available science. In setting priorities, the strategy considers species and community size, landscape condition, and regional context. The strategy is responsive to the threats and risks described in the sage-grouse 12-month findings. The strategy will also generally describe the types of mitigation actions, project specifications, and best practices that are likely to produce measureable benefits for sage-grouse habitat. Finally, the strategy addresses both implementation and effectiveness monitoring requirements for mitigation actions funded through the program.

The Mitigation Framework's strategy will draw heavily from the State of Idaho's sage-grouse conservation plan but has a narrower focus. It is intended to provide the specific guidance on program priorities, accepted mitigation measures, and geographic areas of emphasis that potential mitigation project sponsors will need to know when they apply for funds. The strategy plays a crucial role in steering mitigation funding to those activities and places that can provide the most effective benefits for Idaho sage-grouse populations consistent with strategies to increase the viability of the species throughout its range.

To this end, the strategy will address one of the major policy questions that arise in the design of compensatory mitigation systems: how closely should the mitigation actions be linked to the type and location of the habitat that was originally affected by the infrastructure project. Stated in the alternative, does removal of the mitigation action from the area of impact improve the effectiveness of or benefit from the action. Some compensatory mitigation systems place a heavy emphasis on this link by favoring "in-kind" and "on-site" compensatory mitigation over

“out-of-kind” and “off-site” compensatory mitigation. The subcommittee members generally favor an approach that allows funding to flow to the projects and locations within Idaho that will provide the greatest overall positive impact on sage-grouse populations. The Mitigation Framework calls for a monitoring program that would assess habitat gains provided by mitigation actions and compare them with the mitigation objectives of the participating infrastructure projects. The nature and purpose of this monitoring is described more fully in Mitigation Program Step 4, below.

Once the strategy is complete, the Mitigation Team will develop project ranking criteria and procedures that will guide the selection of the mitigation actions that will receive funding. The goal is to fund projects that provide high quality, lasting benefits based on landscape scale analyses that actually compensate for project impacts.

#### E. Compensation Guidelines

The Mitigation Framework Program will develop guidelines that may be used by developers and/or regulators to determine the cost of meeting their compensatory mitigation objectives. These compensatory mitigation objectives determine the extent of compensatory mitigation for each project and are generally incorporated into project plans or permits.

The compensation guidelines will provide transparent, technically sound principles for determining how much it costs to deliver habitat mitigation for sage-grouse. In other words, the guidelines will represent best estimates of the true cost of implementing the mitigation actions needed to meet each project’s compensatory mitigation objectives. The guidelines may be used by the project developer and the Mitigation Framework Program Administrator to establish the in-lieu fee that the developer will contribute to the mitigation fund.

Specific valuation methods will be developed at a later time and will likely draw from compensatory mitigation systems used elsewhere in the West. Although the details have yet to be worked out, the following outline illustrates the core concepts and principles (shown in bold lettering) that are likely to be employed by the MOA parties in setting the Mitigation Framework’s in-lieu fee structure.

- A **common unit of measurement** would be established for describing and tracking both the project impacts and the benefits of any compensatory mitigation actions. This unit of measurement can be a physical unit such as “acres impacted” or more specifically “acres of summer brood rearing habitat impacted” or “habitat units” lost.
- While the “common unit of measurement” noted above addresses the area of habitat impacted and mitigated, **habitat compensation ratios** are used to address the **quality** of the habitat affected by the infrastructure project. These ratios could specify the number of acres of mitigation required per acre of impacted habitat based on the size, habitat quality/condition and function of the impacted habitat; for more critical or important habitat, more mitigation acres might be required. Thus, habitats with higher quality and importance could have higher compensation ratios.
- Several factors are taken into account in calculating how much it will cost to actually compensate for the acres or habitat units. The recommended approach is to evaluate on

the costs of implementing a conceptual **portfolio of potential mitigation actions** or offset activities that provide benefits for sage-grouse. This portfolio of model projects would include a balanced mix of accepted habitat protection and restoration measures reflecting the types of projects expected to be funded by the mitigation program (in accordance with the strategy discussed above). Examples of projects in this portfolio may include such actions as restoring sagebrush canopy and a native understory on recently burned land, improving riparian areas and wet meadows in early brood-rearing habitat, conservation easements to prevent habitat loss, and land management practices that improve sage-grouse habitat. Project costs include the full range of expenses needed to complete all phases of the mitigation action, including administration and monitoring. The average costs of these model mitigation actions per acre or habitat unit is the foundation of the in-lieu fee calculation.

- In addition, the in-lieu fee should also be adjusted to take into consideration the issue of **lag time** –the time between when habitat is lost at the impacted site relative to when habitat functions are gained at the compensation site.
- The fee also needs to account for **contingencies** associated with delivering compensatory mitigation, including an estimate of the **risk of failure** (i.e., the probability that offsite mitigation will not result in any measureable conservation outcomes) for each mitigation site or project.
- In addition to the fee calculated above, costs for establishing and operating the program, including travel, technical consultation and monitoring of program effectiveness must be included. This overhead fee could range from 5-15% depending on the size and complexity of the proposed mitigation program.

#### F. Program Structure and Oversight

The Mitigation Framework would be established through a memorandum of agreement (MOA) among the entities that would participate in its implementation. The MOA would define the specific roles and responsibilities, procedures, and tasks needed to operate an Idaho-based compensatory mitigation program. The MOA would serve as a joint powers agreement for state and local government parties.

The MOA would establish the following administrative structure for the Mitigation Framework:

1. **Core Team:** A core group would oversee the Mitigation Framework program and provide policy-level guidance for the Science Team and Fund Administrator, described below. The Core Team would be composed of three to seven representatives of diverse perspectives among the MOA signatories.
2. **Science Team:** A team of experts drawn from MOA signatories and other targeted organizations will administer the science-based and technical aspects of the program. The Science Team would consist of several individuals with expertise in relevant areas such as habitat protection and restoration, landscape ecology/spatial analysis, wildlife biology, sage-grouse ecology, project development, and mitigation policy.

The Team would focus on developing the policies and statewide strategy that will guide the program, making requests for mitigation project proposals (RFPs), ranking mitigation proposals that will receive funding, tracking monitoring reports and project benefits, and evaluating program success.

3. **Program Administrator:** A program administrator will be responsible for fund management and administrative tasks. The program administrator will provide administrative support for the Mitigation Team, manage the mitigation account, and administer grants, contracts, and other agreements.
4. **Advisory Committee:** A broader advisory committee consisting of agencies, companies and organizations with the skills and commitment that will provide useful advice to the Core Team regarding the implementation of the Mitigation Framework.

The specific make up of each of these groups will be determined at a later time. Potential participants in the Mitigation Framework include but are not limited to representatives of:

State of Idaho:

Department of Fish and Game  
Office of Energy Resources  
Office of Species Conservation  
Idaho Department of Lands

United States:

Bureau of Land Management  
U.S. Fish and Wildlife Service  
U.S. Forest Service  
Natural Resources Cons. Service

Energy Companies:

Idaho Power  
Ridgeline Energy

Non-Governmental Organizations:

Idaho Conservation League  
The Nature Conservancy

Idaho Tribes

Idaho Sage-Grouse Advisory Committee  
Sage-Grouse Local Working Groups

Idaho Counties

Public Land Users (e.g., grazing interests)

G. Funding the Mitigation Program

The costs of administering the program will be sustained by the project developers that seek compensatory mitigation. Therefore, a portion of the in-lieu fee that project developers contribute to the mitigation account will be applied for program administration. As noted above, protecting and restoring sagebrush habitats are time consuming and expensive undertakings. Ensuring that these activities are conducted with strong oversight should be viewed as an exceptionally wise investment.

**III. Mitigation Program Steps**

The Mitigation Framework envisions a five-step process for developing, implementing, and monitoring compensatory mitigation.

#### A. Step 1 – Assessment of Project Impacts and Development of Mitigation Objectives

Assessment of project impacts should be undertaken by the project developers proposing new infrastructure projects and the government agencies that conduct environmental reviews of those projects. Although the Mitigation Framework process is not responsible for this step, it is nevertheless crucial to the integrity of the mitigation program. Specifically, the Framework's success in achieving its goal of offsetting major infrastructure project impacts on sage-grouse depends on an accurate accounting of those impacts.

For many projects, this analysis will be done as part of the environmental review procedures required by NEPA. As noted above, NEPA requires federal agencies to address the full range of direct, indirect and cumulative impacts of the proposed project, alternatives to the proposed action, and potential mitigation before they act on permit applications.

Once impacts have been assessed and compensatory mitigation objectives set, the project developer is ready to engage the Mitigation Framework, starting with determining the developer's in-lieu fee contribution.

#### B. Step 2 – Determine the In-lieu Fee Contribution

The goal of Step 2 is to use valuation techniques, such as the guidelines presented above, to convert the complex range of project impacts, including direct, indirect and cumulative impacts, into monetary terms that become the basis for the in-lieu fee payment. The accepted in-lieu fee compensatory mitigation plan could be a condition of the instrument approving the project (FONSI, ROD, right-of-way grant, conditional use permit, etc.) and thus legally requires the project developer comply with the approved mitigation plan.

#### C. Step 3 – Commitment of Mitigation Funds by Project Developer

Infrastructure project developers can employ the Mitigation Framework by entering into an agreement with the program administrator with regard to a specific infrastructure project. This project agreement sets forth the parties' respective responsibilities, including the project developer's commitment to pay the in-lieu fee. Importantly, the agreement provides that the project developer's funds can only be used for the purposes set forth in the Mitigation Framework. The agreement may also include "conditions" as requested by regulatory agencies or project developers. For instance, the agreement might provide that the in lieu fee will be used to fund mitigation actions in specific geographic areas in order to meet permit requirements. The program administrator, based on consultation with the MOA parties, may decline to enter into an agreement that is inconsistent with the Mitigation Framework principles or includes conditions that are burdensome or unworkable.

Once the agreement specifying the payment structure and schedule is signed, the project developer makes the required in-lieu fee deposits to an interest bearing account managed by the program administrator.

After the completion of this step, the project developer is no longer engaged in the Mitigation Framework – unless it has decided to participate as a MOA party.

D. Step 4 – Issue Request for Proposals (RFP) and Select, Implement, and Monitor Mitigation Actions

At least at annual intervals, the Mitigation Team will issue an RFP that invite private companies, non-governmental organizations, and agencies to submit proposals for sage-grouse habitat protection, restoration, and/or enhancement actions. The RFP will provide guidance to mitigation project sponsors on program priorities and criteria. These priorities and criteria will be drawn from the mitigation program strategy including identification of geographic areas where mitigation might provide the greatest benefits as well as identification of the threats that present the highest risk to the species or its core habitat. The Mitigation Team should also reach out to federal, state, and local agencies, non-governmental organizations and the general public in order to facilitate discussion, engage stakeholders, raise awareness of the program and generate responses to the RFP.

The RFP will solicit project proposals that contain an operation or implementation plan and address at least the following elements:

- Geographic area;
- Threats addressed and how the mitigation action project will offset impacts resulting from those threats;
- An analysis of current sage-grouse conditions in the area;
- Resource goals and objectives the mitigation action project will seek to provide;
- A description of any coordination with federal, state, tribal and local resource management and regulatory authorities or other stakeholder involvement required to complete the mitigation action (e.g., requirement for NEPA compliance or county permit);
- A description of recent or proposed projects and events in the vicinity of the proposed project, if any, such as fire rehabilitation treatments, restoration or enhancement treatments or other activities that complement the effectiveness or intent of the proposed, mitigation action;
- A description of the long term protection, management, stewardship for the project being implemented, and the entity responsible for these activities; and
- A commitment to periodic evaluation and reporting on the progress of the project in meeting stated goals and objectives, including a process for adaptively redirecting the project if necessary.

When selecting projects, the Mitigation Team will estimate the biological benefits of the projects activities, the likely success of those activities, the duration of benefit expected and measure those benefits in relation to the strategy and RFP objectives.

Mitigation Team and the program administrator will work together on continuing program administration and oversight including annual reporting of program activities, expenditures, and benefits. An annual program report will describe program activities, budget, and assessment of whether the mitigation strategy and associated projects are benefitting sage-grouse and at what level or scale.

The Mitigation Team and/or Program Administrator should implement a monitoring program to measure and validate whether project-specific objectives have been met. Monitoring is required of all compensatory mitigation actions to determine if the project is meeting its performance standards and objectives. As mentioned above, at regular intervals, the total habitat and/or population gains provided by the programs will be compared with the habitat/population losses associated with the participating infrastructure projects. The purpose of this comparison is to evaluate the mitigation program and make any necessary program adjustments – particularly if the monitoring shows that the mitigation benefits are not compensating for habitat losses. This comparison will not be a basis for imposing new, unexpected requirements on the infrastructure project developers.

#### **CONCLUSION**

The framework of policies, principles and procedures outlined above are meant to start a dialogue among parties engaged in sage-grouse conservation and infrastructure development. If these parties agree with the Mitigation Subcommittee that there is great value in establishing an Idaho-based compensatory mitigation program, then this framework will mark the beginning of an inclusive effort to fill in the details and complete the tasks needed to bring such a program into being. We have confidence in our collective ability to create a compensatory mitigation program that will benefit infrastructure developers, agencies, conservation interests, and – not least – Idaho's sage-grouse.

# Adaptive Regulatory Trigger Framework

## Population & Habitat Trigger Justification

### Triggers

Because unexpected events (e.g., wildfire, West Nile Virus) may result in a substantial loss of habitat or decline in sage-grouse populations, adaptive management triggers have been developed. These triggers are intended to improve sage-grouse population trends, protect the overall baseline population, preserve a buffer population, and conserve sage-grouse habitat.

The triggers have both population and habitat components. Population components consider population growth and change in lek size. The habitat component considers loss of breeding and/or winter habitat. Lek size has been related to population change in numerous studies (Connelly and Braun 1997, Connelly et al. 2004, Baumgart 2011, Garton et al. 2011). Garton et al. (2011) used both characteristics as well as number of active leks to assess change for sage-grouse populations throughout the west. A variety of researchers (Swensen et al. 1987, Connelly et al. 2000a, Miller et al. 2011) have shown that loss of winter or breeding habitats resulted in decreased sage-grouse populations. The adaptive management triggers set at a lambda value less than one, a 20% decline in males counted on lek routes, and a 20% loss of breeding or winter habitat as break points that would initiate a population or habitat trigger.

### Population Growth (Finite Rate of Change)

Although populations cannot be accurately estimated, lek counts of males provide a robust method for assessing population trend and estimating population growth ( $\lambda$ ) in an unbiased fashion. Calculating  $\lambda$  (finite rate of change) between successive years for a sage-grouse population is described in Garton et al. (2011). The ratio of males counted in a pair of successive years estimates the finite rate of change ( $\lambda_t$ ) at each lek site in that one-year interval. These ratios can be combined across leks within a population for each year to estimate  $\lambda_t$  for the entire population (or Conservation Zone) or combined across all leks to estimate  $\lambda_t$  for the state between successive years as:

$$\lambda(t) = \frac{\sum_{i=1}^n M_i(t+1)}{\sum_{i=1}^n M_i(t)}$$

where  $M_i(t)$  = number of males counted at lek  $i$  in year  $t$ , across  $n$  leks counted in both years  $t$  and  $t+1$ . Ratio estimation under classic probability sampling designs—simple random, stratified, cluster, and probability proportional to size (PPS)—assumes the sample units (leks counted in two successive years in this case) are drawn according to some random process but the strict requirement to obtain unbiased estimates is that the ratios measured represent an unbiased sample of the ratios (i.e., finite rates of change) from the population or other area sampled. This assumption seems appropriate for leks and the possible tendency to detect (or count) larger leks than smaller leks does not bias the estimate of  $\lambda_t$  across a population or region (Garton et al. 2011), but makes it analogous to a PPS sample showing dramatically increased precision over simple random samples (Scheaffer et al. 1996). Also precision can be estimated for  $\lambda$ .

Because small game populations (including sage-grouse) typically fluctuate among years due to weather and other environmental variables, a  $\lambda_t$  for any given year is not very meaningful. However, a series of years where  $\lambda_t$  remains at or above 1.0 indicates a stable to increasing population. Moreover, this situation would also provide strong evidence of the effectiveness of conservation actions that may have been employed.

#### Males Counted on Leks

Lek attendance by males has been used as an indicator of population trend in some areas since at least the early 1950s. For many years it was the only indicator used to assess status of sage-grouse populations. However, recent research has shown that male attendance at leks can be affected by severity of the previous winter, weather, timing of counts during spring, and a variety of other factors (Emmons and Braun 1984, Hupp 1987, Baumgart 2011). Baumgart (2011) indicated the probability of male sage-grouse attending leks in south-central Idaho varied among years and appeared to be tied to winter severity. Although lek data provide a powerful data set for assessing population trends over time (Garton et al. 2011), counts for a single year may not reflect trends very well. Thus using lek counts as a trigger must consider the inherent variation in these counts. Moreover, males counted on leks appear to have the most value for

assessing population change when used in conjunction with other indicators of population status (e.g., finite rate of change).

Emmons and Braun (1984) reported that lek attendance rates varied from 86% for yearling males to 92% for adult males. These rates were pooled over 5 day periods and may have overestimated attendance (Connelly et al. 2011). In contrast, Walsh et al. (2004) reported average daily male attendance rates of 42% (range = 7-85%) and 19% (range = 0-38%) for adult and yearling sage-grouse, respectively but these rates were not adjusted for detection rate and were likely biased low (Connelly et al. 2011). Moreover, this study involved very small sample sizes (17 adult males, 9 yearling males over 15 leks) and only one breeding season and it was not clear whether all leks in the study area were known and sampled. Preliminary data from Utah (D. Dahlgren, personal communication) indicated that in a study area about 30 miles south of Idaho male sage-grouse lek attendance rates varied from roughly 60% at the beginning of April to about 90% at the end of the month. Recent findings in Idaho (Baumgart 2011) predicted the probability of lek attendance for an adult male following an “average” winter would range from 0.894 (SE = 0.025) on week 3 (~1 April) to 0.766 (SE = 0.040) on week 8 (~ 5 May). Published information suggests that a change in maximum number of males counted on leks of say 10-15% cannot confidently be considered a reflection of population status. However, a 20% decline in maximum number of males counted on leks would likely not be related to lek attendance patterns but instead would reflect a population decline. Thus, the trigger was set at 20%.

#### Habitat Trigger

Numerous studies have documented the negative effects of habitat loss including fire and energy development on sage-grouse (Connelly et al. 2000b, Fischer et al. 1996, Nelle et al. 2000, Doherty et al. 2008), but few studies have related the amount of sagebrush habitat lost to population change. In a Montana study area with a non-migratory sage-grouse population, there was a 73% decline in breeding males after 16% of the study area was plowed (Swenson et al. 1987). Walker et al. (2007) indicated that the lowest probability for lek persistence within a landscape occurred where, within 6.4 km of a lek center, the area has < 30% sagebrush. Similarly, Wisdom et al. (2011) reported sage-grouse occupying landscapes with <27% sagebrush as dominant cover would have a low probability of persistence. Connelly et al. (2000a) showed that a fire in 1989 that removed 58% of the sagebrush cover in sage-grouse

breeding and winter habitat led to an almost 95% decline in the breeding population a few years later. Similarly, a fire that removed about 30% of breeding/winter habitat resulted in substantial population declines over the next few years (J. W. Connelly, unpublished data; Table 1). A 30% loss of breeding and winter habitat is thus far the lowest amount of habitat loss for which a population response could be detected and landscapes with < 30% area in sagebrush within 6.4 km of lek center have the lowest probability of lek persistence. Idaho is taking a more conservative approach than suggested by the literature. A soft trigger is set at a 10% loss of breeding or winter habitat in Core or Important management zones of a Conservation Area, which initiates a review of the management approach. A hard trigger is set at a 20% loss of breeding or winter habitat within a Core Habitat Zone of a Conservation Area, which automatically causes a change in management status of the corresponding Important Habitat Zone.

Table 1. Nest success (%) in SE Idaho study areas before and after a fire in the Table Butte study area. The fire occurred in August 2000.

Year	Area	
	Table Butte	Upper Snake
1999	54	
2000	45	61
2001 <sup>a</sup>	18	56
2002	20	65

## Mapping of Breeding and Winter Use Areas

### Breeding

We used the Idaho Department of Fish and Game (IDFG) sage-grouse telemetry database, dating back to the early 1990's, to investigate distances between leks and nests. Within the telemetry database, we identified each time a nest location was recorded for a radio-collared female but removed duplicate telemetry locations for each nest, so there was only 1 location for each nest. Next, we assured that each nesting hen had a corresponding capture location recorded. We only included hens that were captured during the breeding season (March 1-June 30). We assumed that the lek closest to the point of capture represented the lek where the hen was bred. We also removed second nest attempts and nests recorded in subsequent years for that hen after her initial capture because we did not know what lek the hen may have visited following her initial nest attempt.

For each nest, we used Geospatial Modeling Environment© Version 0.7.2.0 (GME; Beyer 2012) to calculate the distance from the lek to the nest. We divided distances into 1-km categories (i.e. 0-1 km, 1.1-2 km, etc.) and summed the number of nests in each 1-km category. These data were used to calculate cumulative density curves. We also separated nests by the four Conservation Areas to investigate potential geographic variation within the state.

Statewide, 302 nests qualified for the analysis (Desert n = 34, Mountain Valleys n = 143, Southern n = 85, West Owyhee n = 39). A cumulative density histogram indicates that 80% of nests are within 10 km of the capture lek (Figure 1). Histogram results did not differ appreciably among Conservation Areas.

Based on these data, we assumed that we would capture 80% of the potential nesting areas within 10 km of active leks. Therefore, we buffered all leks active in 2011 (n = 510) by 10 km to encompass the breeding use areas. We also included 18 additional leks that were surveyed in both 2010 and 2012 (but not 2011) that had  $\geq 10$  males in at least one of those years and  $\geq 2$  males in the other year.

### Winter

We used a combination of sage-grouse radio-telemetry data and reported winter observations to guide mapping of winter use areas. Winter was defined as December 1–February 28. Observations included 1) observations recorded by IDFG biologists during big game aerial surveys; 2) observations reported in IDFG's Animal Conservation Database; and 3) GPS data collected from Idaho falconers.

We used the resulting winter locations (n = 2,691) to model winter use area. We used likelihood cross-validation in GME to calculate fixed kernel density estimates (Horne and Garton 2006). The resulting density contours provide a depiction of winter use areas.

### Combined Breeding and Winter Polygon and Management Zones

The breeding and winter use polygons were merged in ArcMap™, then overlaid on Core, Important, and General Management Zones (Figure 2). Next we clipped the breeding and winter polygon to Core and

Important Management Zones. We clipped out fires in Core and Important zones (1997-2011) (Figure 3). We also searched for older fires (1987-1996) in Wyoming big sagebrush habitats that LANDFIRE (2010) did not map as sagebrush and removed those fire areas when applicable. The resulting areas were divided into the 4 Conservation Areas and acreage calculated (Table 1). We also calculated the number of acres of 2012 in breeding and winter use areas.

## GUIDELINES FOR CONDUCTING SAGE-GROUSE LEK ROUTES

Counts of male sage grouse attending leks are used to provide an index to population trends. Routes have been designed to survey grouse populations throughout the region. It is important these routes be conducted annually following standardized guidelines to ensure useful, quality data.

1. The starting and ending point for each route must remain the same each year. Do not change a route without consulting with the regional wildlife staff.
2. Always count all leks encountered along the route. Make an entry on the data sheet for each lek site encountered on the route. If no birds are present record a zero.
3. In years of high or increasing grouse numbers, satellite leks may be attended or new leks may form. Stop periodically to look and listen for new leks in likely areas.
4. A lek may have more than one activity center (i.e. distinct groups of males). If groups of birds are visible to each other but separated by a relatively long distance (e.g. 200 yards), you are still looking at a single lek.
5. Make all counts from ½ hour before sunrise to 1½ hours after sunrise. Do not drive more than 25 mph.
6. Count and report all males observed; numbers of females are recorded in a separate column.
7. Count each lek at least 4 times between 20 March and 30 April (dates may vary with elevation) with approximately 1 week between counts.
8. Avoid making counts during rainy, inclement weather.

OCWG Sage-Grouse Management Plan BLM RMP/MFP Consistency Review – J.Beck – 4/25/2013

Owyhee County Sage-Grouse Management Plan Direction	Owyhee RMP Direction	Owyhee RMP Compliance	Bruneau MFP Direction	Bruneau MFP Compliance	Jarbidge RMP Direction	Jarbidge RMP Compliance	Inclusion in Amendment EIS
Summary of the direction of the Owyhee County Sage-Grouse Management Plan							
Management actions described in the Owyhee County Plan are largely consistent with the existing Bruneau, Jarbidge and Owyhee RMP management direction, with some minor exceptions regarding seeded species, and could be implemented in conformance with those RMPs.							
<b>SAGE-GROUSE HABITAT INVENTORY ACTION PLAN</b>							
<b>A. Map locations of all known active and historical sage-grouse leks in Owyhee County by the end of 2001.</b>	SPSS1. MA 9. Identify, protect and enhance key sage grouse habitats and populations. Guidance for enhancement and protection is addressed in the Memorandum of Agreement in the 1997 Idaho Sage Grouse Management Plan (March 1998). Subsequent guidance may become available through development of plans by local sage grouse working groups or similar efforts.	Yes	Silent	Yes	Silent	Yes	Each action alternative within the LUPA describes a mapping convention for GRSG habitat which is based on lek locations. IDFG maintains information regarding lek locations and population monitoring which is described and utilized in the adaptive management strategies described in Alternatives D & E.
<b>B. Identify and map sage-grouse breeding (nesting and early brood) habitat associated with active leks by the end of 2004</b>	SPSS1. MA 9. Identify, protect and enhance key sage grouse habitats and populations. Guidance for enhancement and protection is addressed in the Memorandum of Agreement in the 1997 Idaho Sage Grouse Management Plan (March 1998). Subsequent guidance may become available through development of plans by local sage grouse working groups or similar efforts.	Yes	Silent	Yes	Silent	Yes	See above. The adaptive management strategy in Alternative E utilizes IDFG information with regard to nesting and brood-rearing habitat.
<b>C. Identify and map known sage-grouse wintering habitat by the end of 2001.</b>	SPSS1. MA 9. Identify, protect and enhance key sage grouse habitats and populations. Guidance for enhancement and protection is addressed in the Memorandum of Agreement in the 1997 Idaho Sage Grouse Management Plan (March 1998). Subsequent	Yes	Silent	Yes	Silent	Yes	IDFG also maintains mapping of winter habitat that has been utilized in developing the GRSG mapping designations in the LUPA.

	guidance may become available through development of plans by local sage grouse working groups or similar efforts.						
<b>D. Perform a qualitative assessment of the sage-grouse breeding (nesting and early brood) habitat associated with active leks.</b>	Silent	Yes	Silent	Yes	Silent	Yes	This is not specifically addressed within the sub regional LUPA and would be more appropriate at the site specific scale.
<b>E. Map undesirable disturbance and habitat.</b>	Silent	Yes	Silent	Yes	Silent	Yes	As part of the evaluation for the LUPA, USGS and BLM mapped and quantified regional impacts and disturbances to GRSG that has been included in the evaluation. This report is USGS Open-file Report 2013-1098: Summary of Science, Activities, Programs, and Policies that influence the rangewide conservation of Greater Sage-grouse.
<b>SAGE-GROUSE HABITAT IMPROVEMENT ACTION PLAN</b>							
<b>A. Grazing Management.</b> <i>Sage-grouse habitat condition will be assessed through quantitative assessments conducted in accordance with the SAGE-GROUSE HABITAT INVENTORY ACTION PLAN (Paragraph D) on state and private land. Sage-grouse habitat conditions on lands managed by the Bureau of Land Management will be assessed through the Idaho Standards for Rangeland Health and Guidelines for Livestock Grazing Management. Standard 8 addresses threatened and endangered plants and animals and sensitive animals including sage-grouse. If the assessment concludes, relative to sage-grouse, that the standard is not being met due to livestock grazing, the Local Working Group will establish an interdisciplinary review (ID) team at the request of an affected party. The ID team will normally consist of a wildlife biologist, range scientist, livestock management specialist, livestock operator(s) and other affected interests who wish to participate. The ID team structure may be modified by agreement of the affected interests if specific participants are not reasonably available. Upon review of all quantitative data and other available information and following a site visit, the ID team will make grazing management recommendations to the Local Working Group. This team will consider both short and long-term benefits to sage-grouse and impact</i>	VEGE1. MA 7. Implement grazing practices designed to meet Idaho Standards for Rangeland Health and conform to the Guidelines for Livestock Grazing Management (See Appendix L V ST-1).	Yes	Silent	Yes	<u>Livestock Grazing Management Objectives:</u>  The overall objective of the range program is to maintain or improve the soil, vegetation and watershed conditions within the resource area and to provide forage for livestock, wildlife, and wild horses.  <u>Wildlife Management Objectives:</u>  Wildlife habitat will be managed to maintain or increase wildlife numbers over the long term, and the total acres of unsatisfactory crucial habitat will be reduced over the long term.  <i>Management Unit Area 13 (East Devil) Objectives</i>  Maintain present areas of sage-grouse habitat.	Yes	Alternatives A, B, D, E & F would address grazing through application of the Idaho Standards for Rangeland Health and Guidelines for Livestock Grazing Management for lands in Idaho. Alternative B, D, E & F also include specific GRSG management objectives for vegetation and livestock that would be considered and included within the evaluations. Alternative E also includes adjustments to livestock grazing as a result of adaptive management triggers when grazing is determined to be a causal factor.

<b>E. Juniper Encroachment.</b> <i>Using the maps created by the Habitat Inventory Action Plan, identify existing and potential loss of sage-grouse habitat due to juniper encroachment. The areas of greatest benefit to sage-grouse will be prioritized so that juniper control activities can be scheduled. Suitable methods of juniper eradication such as prescribed burning, chemical control, woodland harvest, chaining, and other mechanical means should be evaluated and employed where appropriate. Treat and eradicate juniper on a minimum of 500 acres of state land (IDL Plan) and 12,000 acres of federal land (Owyhee RMP) annually to enhance sage-grouse habitat by restoring healthy sagebrush-grassland communities. (Lead: Appropriate land management agency/ authority).</i>	RIPN 1. MA 5. Implement a juniper abatement plan for appropriate sites on which juniper is invading.  SOIL 1. MA6. Implement a juniper abatement plan for appropriate sites on which juniper is invading.	Yes	Silent	Yes	sage-grouse. Silent	Yes	Alternatives A, B, D, E & F all identify conifer encroachment and the need to remove, to varying levels, conifers from GRSG habitat. Alternative C does not support the removal of junipers.
<b>F. Juniper Treatment on Private Land.</b> <i>Funding will be identified to develop a 50/50 cost share program to assist private landowners in the reduction or eradication of seral juniper stands on their lands. (Lead: Owyhee LWG) (January 2005 and will be ongoing). These projects were demonstrations near leks affecting 5,000 acres as of 2012. This work is continuing through the Sage-Grouse Initiative (See "Program Funding Action Plan").</i>	Outside BLM's Jurisdiction						Not Applicable
<b>G. Juniper Treatment Grazing Policy.</b> <i>Initiate discussions with the BLM to review and seek change of the livestock grazing policy for prescribed burn programs that prohibits fall grazing use after a burn program has been completed. (Lead: Owyhee LWG) (Initiated January 2005 and ongoing).</i>	LVST 1. MA 7. Prescribed burning practices will be used in areas where it is determined that burning would improve rangeland health and increase biodiversity in big sagebrush and western juniper vegetation communities. Livestock grazing will be adjusted to ensure successful prescribed burns. Areas prescribed to be burned may require rest prior to burning and will require rest after burning for a minimum of two (2) growing seasons. Mechanical and chemical methods may also be used but in very limited areas	No	Silent	No	<u>Fire Management Resource Guidelines:</u>  All grazing licenses issued that include areas recently burned and/or seeded areas will include a statement concerning the amount of rest needed in the seedings or burn area. Normally two years of rest will be necessary to protect these areas.	No	This is not a LUP decision.

Custer County Sage-Grouse Management Plan, BLM Challis RMP Consistency Review and Inclusion in GRS G Amendment

Custer County Sage-Grouse Management Plan Direction – Plan Implementation	Challis RMP Direction	Challis RMP Compliance	Inclusion in Amendment EIS
<p>Summary of the direction of the Custer County Sage-Grouse Management Plan: Management actions described in the Custer County Plan are consistent with the existing Challis RMP management and direction and could be implemented in conformance with the Challis RMP.</p> <p>The County Plan requires the federal agencies (BLM &amp; Forest Service) to coordinate and maintain communication with the county and the counties' Natural Resources Advisory Committee. As part of this coordination the county requests documentation and research be available to support management decisions.</p> <p>The county plan uses different terms to designate habitat than described in the EIS (p. 10); however, the geographical designations, while not exact, are similar to those described in Alternative E.</p> <p>The county plan identifies predation as the primary threat in the county (p. 14). This threat is not shown as a primary threat on other threat descriptions (BLM, State, USFWS, Local Working Group). Predator control is not under the jurisdiction or authority of the BLM or FS and a specific alternative to address predator control has been eliminated from detailed analysis – see Chapter 2.</p>			
<p><b>Chapter 3: Plan Area and Habitat Characteristics</b></p>			
<p>Focus “conservation measures ... on the primary threats as they exist in Custer County...” Threats identified in Chapter 4 Threat Assessment – E. Custer Board of County Commissioners – primary threats are identified as 1. Excessive predation; 2. Improper management of public lands; 3. Wild horse and burro and other wildlife impacts.</p>	<p>Silent</p>	<p>Yes</p>	<p>Threats identified by the Custer Board of County Commissioners are different than those identified by the USFWS 2010 Finding, the 2006 Idaho Sage Grouse Plan, and the 2007 Challis Local Working Group Plan.</p>
<p>“Occupied sage-grouse habitat is categorized into a single delineation in Custer County. This will be known as suitable habitat... [this includes] All habitat that has been identified as either having lek's present or having the characteristics necessary to support the</p>	<p>Silent</p>	<p>Yes</p>	<p>Alternative C of the Draft Idaho and Southwest Montana Greater Sage-Grouse EIS (DEIS) combines all occupied habitat into one single category for management. Alternative E identifies Core and Important Habitat Zones most closely aligned</p>

Custer County Sage-Grouse Management Plan Direction – Plan Implementation	Challis RMP Direction	Challis RMP Compliance	Inclusion in Amendment EIS
<p>sage-grouse ... There is no good estimate of total acres of suitable habitat currently available. For purposes of discussion the areas identified in Appendix D1-D10 as it relates to Custer County in the Challis Sage-grouse LWG Conservation Plan as adopted in 2007 and Figure 3 in the 2009 amendment to the same plan will be used as points of reference.”; “Suitable habitat includes all seasonal habitats, including breeding habitats, early breeding habitats, summer late brood-rearing habitats and winter habitats.”</p>			<p>with the maps referenced from the LWG plan.</p>
<p><b>Chapter 4: Threat Assessment</b></p>			
<p>“...the BOCC has determined that the primary threats to the Greater Sage-Grouse in Custer County are the following: 1. Excessive Predation; 2. Improper management of public lands (i.e. failure to adapt grazing systems and uses in a timely manner consistent with weather and seasonal changes); 3. Wild Horse and Burro and other wildlife impacts.</p>		<p>Yes</p>	<p>See discussion above regarding threats.</p>
<p><b>Chapter 5: Plan Implementation</b></p>			
<p>“The BOCC shall be responsible for managing and implementing the Plan.”</p>	<p>Silent</p>	<p>No, Outside Scope of Plan</p>	<p>BLM maintains final authority or plans and implementation actions on public lands and described in the Federal Land Policy and Management Act; Forest Service maintains final authority for plans and implementation actions on national forest system lands as described in the National Forest</p>

Custer County Sage-Grouse Management Plan Direction – Plan Implementation	Challis RMP Direction	Challis RMP Compliance	Inclusion in Amendment EIS
			Management Act.
<p><b>A. Implementation on Public Lands:</b> The principles and policies contained with this Plan shall be required for the management of sage-grouse and its habitat on public lands that contain suitable habitat as described in B. Habitat Characteristics.</p>	Silent	<p>The principles and policies of the Custer County GRS G Plan, while consistent with the Challis RMP, are not currently required under that plan.</p>	<p>Requirement on BLM and Forest Service administered lands would require a land use plan amendment to incorporate that guidance.</p>
<p><b>B. Implementation on Private Lands:</b> For private lands in the Plan Area, the principles and policies contained within this Plan are voluntary and encouraged to be implemented through Best Management Practices (BMP's) and conservation measures for the management of sage-grouse and its habitat as defined as suitable habitat and depicted in B Habitat Characteristics.</p>	Silent	<p>Implementation of activities on private lands is typically outside the scope of BLM planning.</p>	<p>Outside the scope of decisions within the EIS.</p>
<p><b>C.</b> "...require federal agencies to coordinate their plans and policies with the County, and ability to coordinate with state agencies, therefore, ensuring that all entities with responsibilities for the species and habitat are working together..."; "Implementation of this plan will be conducted through a formal coordination</p>	Silent	Yes	<p>BLM's obligation to coordinate land use inventory, planning and management activities is described under FLPMA Sec. 202 (c)(9)-(9) to the extent consistent with the laws governing the administration of the public lands, coordinate the land use inventory, planning, and management</p>

Custer County Sage-Grouse Management Plan Direction – Plan Implementation	Challis RMP Direction	Challis RMP Compliance	Inclusion in Amendment EIS
<p>process with all agencies that have jurisdiction and/or responsibility for the sage-grouse and/or its habitat.”</p>			<p>activities of or for such lands with the land use planning and management programs of other Federal departments and agencies and of the States and local governments within which the lands are located ...In implementing this directive, the Secretary shall, to the extent he finds practical, keep apprised of State, local, and tribal land use plans; assure that consideration is given to those State, local, and tribal plans that are germane in the development of land use plans for public lands; assist in resolving, to the extent practical, inconsistencies between Federal and non-Federal Government plans, and shall provide for meaningful public involvement of State and local government officials, both elected and appointed, in the development of land use programs, land use regulations, and land use decisions for public lands, including early public notice of proposed decisions which may have a significant impact on non-Federal lands ...Land use plans of the Secretary under this section shall be consistent with State and local plans to the maximum extent he finds consistent with Federal law and the purposes of this Act.</p>

Custer County Sage-Grouse Management Plan Direction – Plan Implementation	Challis RMP Direction	Challis RMP Compliance	Inclusion in Amendment EIS
<p>D. 1. Annual Review: Annual Coordination review, annual meeting, updates to the Plan as needed. The input shall be considered and incorporated where appropriate into a formal written Plan update to be approved by the BOCC within 120 days of the submittal date of the requested change.</p>	<p>Silent</p>	<p>Yes</p>	<p>See coordination responsibilities above. Updates to the plan may require land use plan amendments to incorporate into public land management if and when those changes affect land use planning level decisions.</p>
<p>D.2. New Scientific Information: If at any time between the annual review period with federal or state agencies, or private entities with property interests in the Plan Area become aware of or acquire new science regarding the species or its habitat in the Plan Area within Custer County that may warrant changes to the BMP's, conservation measures or policies within this Plan, then they shall submit a written report to the County, including the scientific review and supporting data, for the County's consideration. If the BOCC finds changes to the Plan are warranted, then it can initiate a formal review of the Plan in coordination with all entities.</p>	<p>Silent</p>	<p>Yes</p>	<p>Yes, see above for description of plan changes.</p>
<p>Chapter 6: Principles</p>			
<p>C. Custer County has a population of approximately 4,333, and therefore is considered a "small local jurisdiction" as defined by the Regulatory Flexibility Act (5 USC 601). All proposed rules for the purpose of managing the sage-grouse or its habitat by federal agencies requires an economic analysis and consideration of that analysis prior to the finalization of the</p>	<p>Silent</p>	<p>Yes</p>	<p>The Social and Economic Analysis has been shared with Custer County and the County has provided comments to the BLM. These comments have been incorporated into the social and economic analysis as appropriate.</p>

Custer County Sage-Grouse Management Plan Direction – Plan Implementation	Challis RMP Direction	Challis RMP Compliance	Inclusion in Amendment EIS
proposed rule. This analysis shall be prepared in Coordination with Custer County.			
E. Sage-grouse management decisions shall be made based on the best available scientific information that is applicable to sage-grouse habitat in Custer County. The scientific information used will be consistent with standards of the Information Quality Act (44 USC 3516) (see definitions of Quality, Objectivity, Utility and Integrity), as verified by the County.	Silent	Yes	Comments on the Administrative Draft EIS identified specific concerns over cited and referenced scientific literature.
F. Land management plans of all government agencies that have ownership or management responsibilities for the lands or species within Custer County shall be consistent with the policies set forth in this plan subject to valid existing rights.	Silent	Yes	Guidance from the county plan is incorporated into one or more alternatives analyzed in detail within the DEIS.
H. No policies shall infringe on the private property rights of any landowner within Custer County. All species and land coverage information gathered on private property shall be treated as the property of the landowner and shall not be used by any private or government entity for any purpose unless express, written permission has been obtained from the landowner.	Silent	Implementation of activities on private lands is typically outside the scope of BLM planning.	Outside the scope of decisions within the EIS.

Custer County Sage-Grouse Management Plan Direction – Plan Implementation	Challis RMP Direction	Challis RMP Compliance	Inclusion in Amendment EIS
<p>I. All sage-grouse habitat and species management programs that impact the County, administered by federal and state agencies, shall be coordinated with Custer County, and the data collected by state and federal agencies will be shared with the County in a timely manner and be provided to the County regardless of completeness.</p>	<p>Silent</p>	<p>Yes</p>	<p>See coordination discussion above.</p>
<p>J. All public lands within the Plan Area containing suitable habitat for sage-grouse shall be managed to continue the multiple-uses of the lands as required by 43 USC 1707(a)(7). No policies shall be implemented that prescribe the management of lands for a single purpose, but all functions of the land, including providing habitat for wildlife and supporting the productive uses of its resources, shall be considered with the objective of balancing and continuing all uses of the land. Unlike public owned land where there are many property interest holders and the multiple uses must be maintained, private land owners have more discretion to manage their property for the primary purpose of conserving sage-grouse, if so desired.</p>	<p>Silent</p>	<p>Yes</p>	<p>As part of the planning criteria the DEIS must follow applicable laws. In this case FLPMA directs land use planning for resources associated with public lands. FLPMA Section 202 (c) In the development and revision of land use plans, the Secretary shall– (1) use and observe the principles of multiple use and sustained yield set forth in this and other applicable law;</p>
<p>K. The ability of wildlife, including sage-grouse, to habituate to inanimate manmade structures and changes to the landscape shall be acknowledged.</p>	<p>Silent</p>	<p>Yes</p>	<p>Incorporation of applicable scientific references – see previous discussion regarding use of science.</p>

Custer County Sage-Grouse Management Plan Direction – Plan Implementation	Challis RMP Direction	Challis RMP Compliance	Inclusion in Amendment EIS
<p>L. All sage-grouse conservation measures enacted on public land or through a federal nexus shall be for the purpose of directly benefiting the species and its verified habitats. These measures shall be scientifically defensible. All data and information used to produce conservation measures shall be made available to the public and the County and shall be coordinated with the County. Additionally, the balance of impacts to other species and to human welfare must be weighed prior to approval and implementation. All planning efforts shall be governed through adaptive management principles to ensure that use of the latest scientific research on sage-grouse and their habitat, BMP's, technological advances, and incorporation of impact avoidance, minimization, and mitigation opportunities are vetted and utilized.</p>	<p>Silent</p>	<p>Yes</p>	<p>The purpose and need of the DEIS is to address greater sage-grouse habitats. See also discussion above regarding scientific information. See also discussion above regarding coordination. The DEIS contains an analysis of the social and economic environment. Implementation activities on Federal lands incorporate adaptive management principles as described in the Custer County Plan, this would apply to all alternatives addressed in the EIS, including Alternative A. In addition to these principles each action alternative (Alts B-F) contains a specific adaptive management strategy complete with adaptive management thresholds (triggers) and response.</p>
<p><b>Chapter 7: Policies</b></p>			
<p>A. Predation 1. Prior to implementing any conservation measures that decrease the productive use of the land for the benefit of the sage-grouse, the impact of predation must be considered. Measures must be put in place to control predation to the satisfaction of the BOCC, if found to be the cause of the impact. 2. The BOCC will coordinate with the</p>	<p>Silent</p>	<p>Yes</p>	<p>Direct predator control is outside the authority of BLM and outside the scope of potential decisions for the DEIS. Alternative E contains an adaptive management approach which includes identification of specific causes, where ascertainable, and appropriate management changes based on the identified cause(s). Alternatives B, C, D &amp; F include anti perch devices</p>

Custer County Sage-Grouse Management Plan Direction – Plan Implementation	Challis RMP Direction	Challis RMP Compliance	Inclusion in Amendment EIS
<p>Idaho Fish and Game to determine appropriate predator control measures.</p> <p>3. Encourage private landowners and citizens to document predator occurrences and provide these to the BOCC so that the proper agencies can be notified and appropriate control measures implemented.</p> <p>4. Anti-perch devices will be encouraged, but not required, for all existing and future transmission lines and structures that may have a deleterious affect on sage-grouse in suitable habitat.</p>			<p>as required design features. Alternative E does not require anti perching devices although they can be implemented as best management practices.</p>
<p><b>B. Livestock Grazing</b></p> <p>1. Maintain sustainable grazing consistent with historic land use and ranching practices.</p> <p>2. Livestock grazing is an important tool to properly manage sage-grouse habitat, and should not be removed from the Plan Area.</p> <p>3. Any grazing restrictions or conservation measures that are implemented through a grazing permit shall be based solely on the conditions and activities specific to that permitted grazing allotment.</p> <p>4. Annual precipitation measurements should become a part of annual operating plans. Although the County contains the states highest mountain ranges, it receives the least amount of precipitation of any county in Idaho, and therefore has a climate, topography and ecology that is unlike any other area with sage-grouse</p>	<p><u>Livestock Grazing</u></p> <p>Goal 1 - Rationale 1: Manage livestock grazing activities to ensure achievement and maintenance of, or significant progress toward achieving, fundamentals of rangeland health, and standards for rangeland health and guidelines for livestock grazing management (per 43 CFR 4180).</p> <p>Goal 2 - Rationale 2: Prescribed burns and seedings would be done to promote a variety of resource objectives including ecosystem health and diversity. See Rangeland Vegetation Treatment Projects Goal 1, #2 (p. 51) for further criteria).</p> <p>Goal 2 – Rationale 3: Use land treatments, range improvements, and improved grazing management as tools to achieve multiple use objectives. Evaluate existing seedings for retreatment before</p>	<p>Yes</p>	<p>Alternatives B, D &amp; E all continue to allow for livestock management. These alternatives also recognize proper livestock grazing as a potential tool to utilize in moving towards desired vegetation conditions that support greater sage-grouse habitat. Alternatives B, D, E &amp; F all continue to implement Standards for Rangeland Health which address conditions at the allotment level. All these alternatives also incorporate sage-grouse habitat management objectives (such as the Connelly guidelines) .</p> <p><b>4. How does present drought management protocol include or incorporate precipitation?</b></p> <p>Actions 6-11 are all included as components of Alternative E.</p>

Custer County Sage-Grouse Management Plan Direction – Plan Implementation	Challis RMP Direction	Challis RMP Compliance	Inclusion in Amendment EIS
<p>habitat. This uniqueness also contributes to areas with above average precipitation while areas just over the hill are receiving below average precipitation. If the monitoring data shows there is an increase in forage that supports additional livestock in a suitable habitat area, then increased grazing should be considered. If monitoring data shows a decrease in forage in a suitable habitat area, then a reduction in livestock can be considered as long as it is demonstrated that failure to do so would cause a deleterious effect on the sage-grouse.</p> <p>5. Add sage-grouse guidelines into management plans as desired conditions, recognizing livestock grazing may not always be a causal factor (State Alternative)</p> <p>6. Prioritize completion of land (range) health assessments and grazing permit NEPA analysis on allotments with declining sage-grouse populations, as verified by Custer County.</p> <p>7. Allotment Assessments will use published Characteristics of sage-grouse habitat and comply with 43 CFR 4180.2(c).</p> <p>8. Allotment management changes must be tailored to address specific problems when the cause of that problem has been determined using the best available science including the flexibility to change time on a unit, the number of livestock for</p>	<p>any new seedings are done within a given allotment. Authorize permanent increases in livestock preference as a result of range improvement projects only after an ID team has performed an allotment analysis and determined that resource objectives have been met.</p>		

Custer County Sage-Grouse Management Plan Direction – Plan Implementation	Challis RMP Direction	Challis RMP Compliance	Inclusion in Amendment EIS
<p>a designated period of time and season of use.</p> <p>9. Changes in grazing management should only occur when monitoring indicates sage-grouse objectives are not being met as a result of grazing practices.</p> <p>10. Management changes, when needed, must be tailored to specifically address habitat objectives that need improvement, but should not adversely affect the habitat of other species.</p> <p>11. Altering grazing schemes in allotments, where needed and appropriate, may be facilitated by enhanced grazing opportunities with introduced seeding or areas with lower values to sage-grouse. The unintended consequences of altering grazing use, such as possible increased risk of wildfire, must be carefully considered in any management proposal.</p> <p>(State Alternative)</p>			
<p><b>C. Wild Horse, Burro and Wildlife Management</b></p> <p>1. The BLM Challis Field Office shall follow herd management plans for wild horses and stay within appropriate management levels</p> <p>2. If it is determined, utilizing the best available science and monitoring data, including private data, that over grazing is causing a deleterious effect on suitable habitat, then the impact of wild horses, burros and wildlife must be considered first before any conservation measures are</p>	<p>Wild Horses and Burros</p> <p>Goal 1: Maintain a viable population of wild horses so as to achieve a thriving natural ecological balance in the Herd Management Area.</p> <p>Rationale: Required by the Wild Horse and Burro Act.</p> <p>1. Manage the wild horse herd for an appropriate management level of 185 animals in accordance with the 1985 U.S. District Court Consent Judgment and the current activity plan for the wild horse Herd Management Area. The herd would</p>	<p>Yes</p>	<p>The DEIS maintains existing guidance described in the Challis RMP with regard to wild horse herd management plans and appropriate management levels. Alternative E contains an adaptive management approach which includes identification of specific causes, where ascertainable, and appropriate management changes based on the identified cause(s).</p>

Custer County Sage-Grouse Management Plan Direction – Plan Implementation	Challis RMP Direction	Challis RMP Compliance	Inclusion in Amendment EIS
<p>taken to reduce domestic livestock grazing. Only after reductions in wild horses, burros and wildlife have been taken and not found to sufficiently reduce the impact can the reduction of domestic livestock be considered.</p> <p>3. If wildlife grazing is determined to be the cause of inadequate sagebrush form and cover, modifications of herd objectives shall be prioritized by the appropriate agencies.</p>	<p>vary from 185 to about 253 animals between roundups. Adjust horse numbers to a lower level if monitoring data show that the current appropriate management level is causing unacceptable levels or resource degradation.</p> <p><u>Wildlife Habitat</u> Goal 1 - Rationale 3: Monitor key habitat sites to ensure that big game populations do not exceed proper levels or damage important habitat components. Design monitoring to determine whether big game are adversely affecting progress toward the riparian and aquatic habitat conditions described in Attachment 15. (p. 127 of the Challis RMP)</p>		
<p><b>D. Mineral Development</b></p> <p>1. Mineral development can occur in suitable habitat utilizing best management practices and taking all reasonable measures to reduce impacts and avoid impacts to suitable habitat where possible.</p> <p>2. Conservation measures designed to protect suitable habitat shall not affect access to any existing or future mining claim.</p> <p>3. No federal land mineral withdrawals shall be made as an effort to conserve suitable habitat. Full access to all resources must be maintained in order to ensure a productive economy and the</p>	<p><u>Minerals</u> Goal 1: Manage the Federal mineral estate in the resource Area for oil, gas, and geothermal exploration and development, while minimizing adverse impacts to other resource values. Goal 2: Provide saleable and non-energy leasable minerals to meet local demand, while minimizing adverse impacts to other resources values. Goal 3: Maintain the availability of public lands for locatable mineral exploration and development. Minimize adverse effects of locatable mineral development. Minimize adverse effects of locatable mineral</p>	Yes	Alternative D & E allow for mineral development in GRS habitat with application of best management practices.

Custer County Sage-Grouse Management Plan Direction – Plan Implementation	Challis RMP Direction	Challis RMP Compliance	Inclusion in Amendment EIS
health, safety and welfare of the citizens of Custer County.	development activity on other resources.		
<p><b>E. Recreation</b></p> <p>1. Any plan for creating new or additional recreational opportunities on federal lands in suitable habitat must provide Custer County a sage-grouse impact analysis for review.</p> <p>2. Limit motorized recreational use to existing roads, primitive roads, and trails, as verified by Custer County in suitable habitat.</p> <p>3. Any road, primitive road and trail closures must comply with Custer County’s Transportation Plan and must be coordinated with the BOCC.</p>	<p><u>Recreation Opportunities and Visitor Use</u></p> <p>Goal 3: Provide recreational opportunities for the remainder of the Resource Area not included in the SRMA, including areas specifically for unstructured outdoor experiences, trails, (e.g., hiking, horseback riding, bicycling), recreational mineral collecting, and OHV use.</p> <p>Goal 4: Enhance recreational opportunities through designation of additional existing roads into the BLM national Backcountry Byways program.</p> <p>Attempted to obtain a copy of the BOCC Transportation Plan and was told the final document has not been released.</p>	Yes	<p>Alternatives within the DEIS identify all GRS G habitat areas (Alts. B, C, E, F) as limited to existing roads and trails. Alternative D identifies all lands within the Challis Field Office as limited to existing roads and trails, where explicit decisions RMP have been made to manage an area as open, those areas will remain open. After the land use plan amendment is completed comprehensive travel and transportation management plans would be completed to identify designated roads and trails and the areas would then be managed as limited to designated roads and trails. Coordination with Custer County would occur as described previously.</p>
<p><b>F. Infrastructure and Roads</b></p> <p>1. Limit motorized travel to existing roads, primitive roads and trails as verified by Custer County in suitable habitat.</p> <p>2. Any road, primitive road, or trail closures must comply with Custer County’s Transportation Plan and must be coordinated with the BOCC.</p> <p>3. New infrastructure can be placed in suitable habitat, as long as, reasonable measures are taken to ensure there will be no deleterious effect on the sage-grouse, as determined by Custer County. Best Management Practices, as defined in the</p>	<p><u>Transportation</u></p> <p>Goal 1: Consistent with other resource objectives and values, provide an adequate road and trail system on the Challis Resource Area’s public lands to (a) satisfy the public needs for recreation, commodity production, access, and safety, and (b) facilitate management of BLM resources and programs.</p> <p>The Challis Travel Management Plan was approved in 2008 and has been implemented.</p>	Yes	<p>See travel and transportation discussion above. Infrastructure development is allowed with restrictions and/or conservation measures in Alternatives D &amp; E. The best management practices identified are included as a component of Alternative E.</p>

Custer County Sage-Grouse Management Plan Direction – Plan Implementation	Challis RMP Direction	Challis RMP Compliance	Inclusion in Amendment EIS
State's Alternative (pg 43) shall be followed.			
<p><b>G. Fire Management and Wildfire</b></p> <p>1. During fuels management project design, consider the utility of using livestock to strategically reduce fine fuels (Diamond et al. 2009), and implement grazing management that will accomplish this objective (Davies et al. 2011 and Launchbaugh et al 2007).</p> <p>2. Prior to prescribed controlled burns near suitable habitat, all other fuel reduction methods shall be considered.</p> <p>3. In the event of a wildfire, coordinate with appropriate agencies in developing and implementing rehabilitation plans.</p> <p>4. When pursuing habitat restoration or rehabilitation, use native plant species, based on availability, and probability of successful establishment.</p>	<p><b>Fire Management</b></p> <p>Goal 1: Protect human life, property, and valuable resources from wildfire, and reduce the impacts of suppression activities. Use prescribed fire to protect property and valuable resources, improve range and timber resource conditions, and perpetuate the natural ecosystem.</p>	Yes	All actions described are included in Alternatives B, C, D, E & F. In addition Alternative C does not allow for prescribed burning as a tool to manage GRS habitat.
<p><b>H. Invasive Species</b></p> <p>1. The Cooperative Weed Management Areas (CWMA), in cooperation with all land managers, shall encourage the continuing inventory for invasive species.</p> <p>2. Areas of suitable habitat, where non-natives have invaded, shall be prioritized for treatment in coordination with the BOCC and the CWMA.</p> <p>3. The County's Invasive Species Plan shall be followed when any treatment, reseeding or restoration projects occur in</p>	<p>Goal 1: Reduce potential for new infestations of noxious weeds.</p> <p>Goal 2: Develop an active weed inventory program by training public land users and BLM personnel in weed identification.</p> <p>Rationale: 1 – coordinate with Federal, State, and local agencies and private landowners in the identification of weed treatment areas.</p>	Yes	All actions described are included within all of the analyzed alternatives.

Custer County Sage-Grouse Management Plan Direction – Plan Implementation	Challis RMP Direction	Challis RMP Compliance	Inclusion in Amendment EIS
or around suitable habitat.			
<p><b>I. Areas of Critical Concern and Wilderness Study Areas</b> There shall be no new designations of ACEC's or WSA in Custer County. If such designations are being considered by federal land managers, then the county is to be informed immediately and the consideration of the designation coordinated with the County</p>	<p><b>Goal 1:</b> Maintain and protect important biological, cultural, scenic, and other natural systems or processes by highlighting management of areas containing these resources.</p>	No	<p>Alternatives B, D &amp; E do not include new designations of ACECs. While there are alternatives which do not identify the designation of new ACECs, the FEIS is consistent with FLPMA and inconsistent with the Custer County ACEC policy, which is inconsistent with federal law. This inconsistency cannot be resolved at the planning scale.</p>
<p><b>J. Monitoring and Habitat Category Changes</b>  <b>A.</b> All federal and state agencies, with management responsibilities in the plan area for the species and/or its habitat, shall provide the County with an annual update of the monitoring programs they have in place, data collected and specifics about their collection protocols. These agencies will inform the County of proposed research projects and allow for the County's input and collaboration prior to implementation.  <b>B.</b> All data shall be collected and studies prepared using protocols that will ensure the quality, utility, objectivity and integrity of the information as required under the Information Quality Act.  <b>C.</b> All data that is gathered in the Plan Area shall be shared with the County in a timely manner, and supplied to the County regardless of its state of completion.  <b>D.</b> Private landowners are also encouraged</p>	Silent	Yes	<p>See coordination discussion above. Alternative B, C, D, E &amp; F all include monitoring approaches and protocols that are accepted as appropriately collecting information within acceptable parameters to provide information to assess management activities described in the DEIS.</p>

Custer County Sage-Grouse Management Plan Direction – Plan Implementation	Challis RMP Direction	Challis RMP Compliance	Inclusion in Amendment EIS
<p>to monitor and share data collected on private property with the County.</p> <p>E. All data that is shared with the County that is not public information will be treated as confidential and used by the County only to help inform its policies and best management practices.</p>			

Administrative Draft  
Cooperating Agency Review

## BLM Areas of Critical Environmental Concern Evaluation and Forest Service Zoological Areas

This Page Intentionally Blank

Administrative Draft  
Cooperating Agency Review

## **S. BLM ACEC Evaluation and Forest Service Zoological Areas**

### **S.1 Introduction**

During the scoping process for this LUPA/EIS the BLM invited the public to nominate or recommend areas on public lands for GRSG and their habitat to be considered as ACECs. In response to this invitation, the BLM received ACEC nominations from a number of interested organizations. In addition to nominating ACECs on BLM-administered lands, during scoping, interested organizations also identified potential GRSG-related RNAs for National Forest System lands.

FLPMA Section 103 (a) defines ACECs as public lands for which special management attention is required (when such areas are developed or used or when no development is required) to protect and prevent irreparable damage to important historic, cultural, or scenic values; fish and wildlife resources; or other natural systems or processes or to protect life and safety from natural hazards. Section 202(c)(3) of the Federal Land Policy and Management Act (FLPMA) requires that priority be given to the designation and protection of areas of critical environmental concern (ACEC).

Research Natural Areas are areas with valuable ecological resources. These areas are protected and maintained in natural conditions, for the purposes of conserving biological diversity, conducting non-manipulative research and monitoring, and fostering education.

The identification and establishment of a national network of RNAs is Congressionally mandated in the National Forest Management Act (NFMA) (36 CFR Sec. 219.25; 36 CFR 251.23). The need for, and value of, research natural areas has a fundamental basis, as well, in NFMA which states that land and resource management plans will include a plan to monitor and evaluate the effects of implementing the management plan (36 CFR Sec. 219.11(d))

### **S.2 ACEC Nominations**

During the scoping process for this LUPA/EIS the BLM received specific ACEC nominations in scoping letters submitted by Western Watersheds Project, Wild Earth Guardians and the Greater Yellowstone Coalition. The Wild Earth Guardians letter represented a consortium of environmental organizations. Nominated ACECs identified by Western Watersheds Project contained various amounts and extents of sage-grouse habitat and non-habitat. Both Wild Earth Guardians and the Greater Yellowstone Coalition nominated areas within identified preliminary priority habitat. The boundary of the and GYC externally nominated ACECs were developed through identifying preliminary priority habitat within southwestern Montana and the Upper Snake areas, as described in their scoping letter. Wild Earth Guardians proposed two separate scenarios: 1) all preliminary priority habitat areas excluding significantly impacted lands near active oil and gas wells; and 2) a system of ACECs to provide for habitat needs of GRSG. Both of these scenarios were evaluated. Under the first scenario all PPH areas were delineated and evaluated and this resulted in 16 separate areas in Idaho, Utah and southwestern Montana, grouped by local working group area. Under the second scenario BLM evaluated PPH areas to describe a system of nominated ACECs which, in addition occurring with PPH areas, also contain

relatively intact and high quality habitat. This evaluation resulted in 18 separate areas throughout Idaho.

Using the above mentioned criteria, nearly all identified preliminary priority sage-grouse habitat in Idaho and Southwestern Montana was included within an ACEC nomination.

### **S.3 ACEC Evaluation Process**

Based on the nominations received, all identified PPH was taken through the evaluation process.

In compliance with BLM Manual 1613-Areas of Critical Environmental Concern, a BLM interdisciplinary team conducted an initial evaluation of all GRSG mapped occupied habitat to decide which if any areas should be carried forward for further evaluation in the land use planning process. The ACEC evaluations were conducted by the BLM's GRSGS core team, which included wildlife biologists and land use planners assigned to the project. Additional input was provided by specialists from each Field and District Office that has GRSG habitat within their respective boundaries. The BLM's multi-step evaluation process consisted of:

1. BLM core team evaluated external ACEC nominations to determine relevance and importance.
2. Habitat was broken down between southwestern Montana and Idaho, and within Idaho further delineated according to local working group boundaries.
3. Draft evaluation tables and maps were created that were reviewed by the full BLM IDT and ad hoc IDT members (which includes representatives from each field office).

### **S.4 Relevance and Importance Criteria**

As mentioned in the introduction, to be considered for designation as an ACEC, an area must meet the requirements of relevance and importance as described in the Code of Federal Regulations (43 CFR 1610.7.2). The definitions for relevance and importance are as follows:

#### **S.4.1 Relevance**

An area is considered relevant if it contains one or more of the following:

1. A significant historic, cultural, or scenic value (for example, rare or sensitive archaeological resources and religious or cultural resources important to Native American Indians).
2. A fish and wildlife resource (for example, habitat for endangered, sensitive, or threatened species or habitat essential for maintaining species diversity).
3. A natural process or system (for example, endangered, sensitive, or threatened plant species; rare, endemic, or relict plants or plant communities; and rare geologic features).

4. A natural hazard (for example, areas of avalanche, dangerous flooding, landslides, unstable soils, seismic activity, or dangerous cliffs). A hazard caused by human action could meet the relevance criteria if it is determined through the resource management planning process that it has become part of the natural process.

#### S.4.2 Importance

The value, resource, system, process, or hazard described above must have substantial significance to satisfy the importance criteria, which generally means it is characterized by one or more of the following:

1. Has more than locally significant qualities that give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared with any similar resource.
2. Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to change.
3. Has been recognized as warranting protection to order to satisfy national priority concerns or to carry out the mandates of FLPMA.

As part of the ACEC evaluation process the BLM determined that the mere presence of GRSG or GRSG habitat does not constitute a significant wildlife resource (43 CFR 1610.7.2). Direction associated with the BLM's National GRSG planning strategy asked each State to identify preliminary priority habitat (PPH). PPH comprises areas that have been identified as having the highest conservation value to maintaining sustainable GRSG populations. It was determined that areas nominated for ACEC Designation did not meet the relevance criteria if they were outside identified preliminary priority habitat. Therefore potential ACEC boundaries were identified based on PPH delineated areas.

As part of the external nominations, proposed ACECs extend across State boundaries. In addition Wild Earth Guardians and GYC's proposals included all PPH independent of administrative boundaries, for the purposes of this evaluation proposed ACECs include both BLM-administered and National Forest System lands. Forest Service does not designate ACECs and therefore any identification of special areas on Forest Service administered lands would be referred to as Zoological Areas.

As a result of the evaluation process, it was determined that 7,272,100 BLM-acres delineated into 16 areas met the relevance criteria.

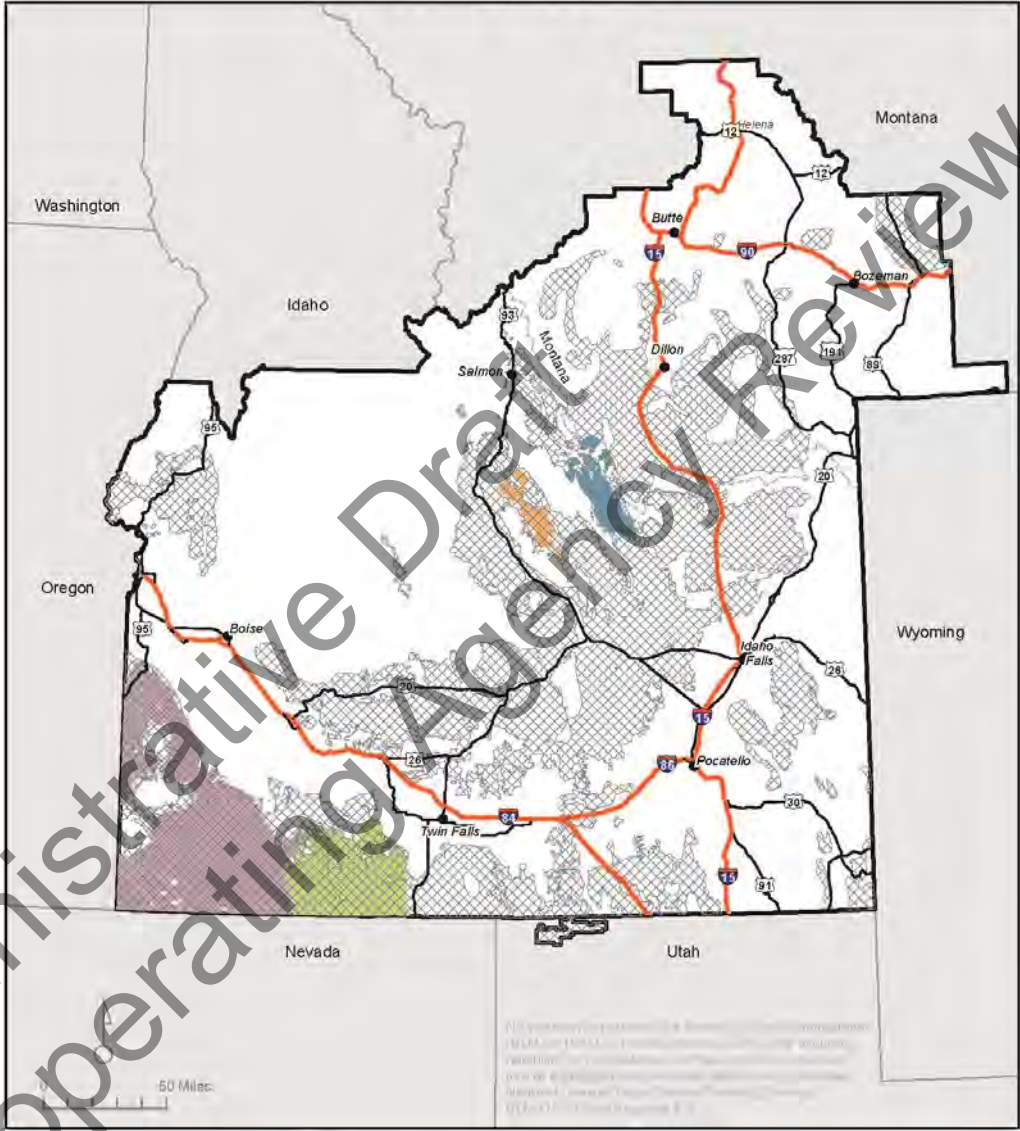

All areas that met the relevance criteria were determined to have importance because protection of GRSG is a national priority for BLM. **Table H.1**, Potential ACEC and Zoological Areas, includes information on each of the individual areas evaluated by the BLM and Forest Service. Nominations that met relevance and importance criteria are displayed on Maps H.1 – Western Watersheds; H.2 – Greater Yellowstone Coalition and Wild Earth Guardians All PPH Areas; H.3 – Wild Earth Guardians System of ACECs.

## S.5 Zoological Areas

After the BLM completed its ACEC evaluation process, the Forest Service evaluated GRSG habitat adjacent to potential ACECs found to have relevance and importance. The Forest Service is considering designating these areas as Zoological Areas to ensure consistent management across the landscape. When considering Zoological Areas, the Forest Service is not required to go through the same screening criteria that the BLM is required to go through when considering ACEC designation. In addition to considering zoological areas that are contiguous to BLM-administered lands, the Forest Service is considering designating some disconnected GRSG habitat as a zoological area.

# Appendix T

## Public Comment Response Report

This Page Intentionally Blank

Administrative Draft  
Cooperating Agency Review

## Appendix T: Response to Comments on the Draft Land Use Plan Amendment/Environmental Impact Statement

### Introduction

After publishing the Draft LUPA/EIS, the BLM and Forest Service held a 90-day public comment period to receive comments on the Draft LUPA/EIS. The BLM and Forest Service received written comments on the Draft LUPA/EIS by mail, email, and submissions at the public meetings and oral comments transcribed at public meetings. Comments covered a wide spectrum of thoughts, opinions, ideas, and concerns. The BLM and Forest Service recognize that commenters invested considerable time and effort to submit comments on the Draft LUPA/EIS and developed a comment analysis methodology to ensure that all comments were considered, as directed by NEPA regulations.

According to NEPA, the BLM and Forest Service are required to identify and formally respond to all substantive public comments. The BLM and Forest Service developed a systematic process for responding to comments to ensure all substantive comments were tracked and considered. Upon receipt, each comment letter was assigned an identification number and logged into the BLM's comment analysis database, CommentWorks, which allowed the BLM and Forest Service to organize, categorize, and respond to comments. Substantive comments from each letter were coded to appropriate categories based on the content of the comment, retaining the link to the commenter. The categories generally follow the sections presented in the Draft LUPA/EIS, though some relate to the planning process or editorial concerns.

Comments similar to each other were grouped under a topic heading, and the BLM and Forest Service drafted a statement summarizing the issues contained in the comments. The responses were crafted to respond to the comments, and, if warranted, a change to the EIS was made.

Although each comment letter was diligently considered, the comment analysis process involved determining whether a comment was substantive or nonsubstantive in nature. In performing this analysis, BLM and Forest Service relied on the CEQ's regulations to determine what constituted a substantive comment.

A substantive comment does one or more of the following:

- Questions, with a reasonable basis, the accuracy of the information and/or analysis in the Draft LUPA/EIS
- Questions, with a reasonable basis, the adequacy of the information and/or analysis in the Draft LUPA/EIS
- Presents reasonable alternatives other than those presented in the Draft LUPA/EIS that meet the purpose and need of the proposed action and addresses significant issues
- Questions, with a reasonable basis, the merits of an alternative or alternatives
- Causes changes in or revisions to the proposed action

- Questions, with a reasonable basis, the adequacy of the planning process itself

Additionally, the BLM's NEPA Handbook (H-1790-1) identifies the following types of substantive comments:

Comments on the Adequacy of the Analysis: Comments that express a professional disagreement with the conclusions of the analysis or assert that the analysis is inadequate are substantive in nature but may or may not lead to changes in the Proposed LUPA/Final EIS. Interpretations of analyses should be based on professional expertise. Where there is disagreement within a professional discipline, a careful review of the various interpretations is warranted. In some cases, public comments may necessitate a reevaluation of analytical conclusions. If, after reevaluation, the manager responsible for preparing the EIS (Authorized Officer) does not think that a change is warranted, the response should provide the rationale for that conclusion.

Comments That Identify New Impacts, Alternatives, or Mitigation Measures: Public comments on a Draft EIS that identify impacts, alternatives, or mitigation measures that were not addressed in the draft are substantive. This type of comment requires the Authorized Officer to determine whether it warrants further consideration. If it does, the Authorized Officer must determine whether the new impacts, new alternatives, or new mitigation measures should be analyzed in the Final EIS, a supplement to the Draft EIS, or a completely revised and recirculated Draft EIS.

Disagreements with Significance Determinations: Comments that directly or indirectly question, with a reasonable basis, determinations regarding the significance or severity of impacts are substantive. A reevaluation of these determinations may be warranted and may lead to changes in the Final EIS. If, after reevaluation, the Authorized Officer does not think that a change is warranted, the response should provide the rationale for that conclusion.

Comments that failed to meet the above description were considered nonsubstantive. Many comments received throughout the process expressed personal opinions or preferences, had little relevance to the adequacy or accuracy of the Draft LUPA/EIS, represented commentary regarding resource management and/or impacts without any real connection to the document being reviewed, or were considered out of scope because they dealt with existing law, rule, regulation, or policy. These comments did not provide specific information to assist the planning team in making changes to the alternatives or impact analysis in the Draft LUPA/EIS and are not addressed further in this document. Examples of nonsubstantive comments include the following:

- The best of the alternatives is Alternative D (or A, B, or C).
- The preferred alternative does not reflect balanced land management.
- More land should be protected as wilderness.
- BLM needs to change the Taylor Grazing Act and charge higher grazing fees.
- I want the EIS to reflect the following for this area: no grazing, no logging, no drilling, no mining, and no OHVs.

*Idaho and Southwestern Montana Greater Sage-Grouse Proposed LUPA/Final EIS*

June 2015

- More areas should be made available for multiple uses (e.g., drilling, OHVs, and ROWs) without severe restrictions.

Opinions, feelings, and preferences for one element or one alternative over another, and comments of a personal and/or philosophical nature, were all read, analyzed, and considered. However, because such comments are not substantive in nature, the BLM and Forest Service did not include them in the report and did not respond to them. While all comments were reviewed and considered, comments were not counted as “votes.” The NEPA public comment period is neither considered an election, nor does it result in a representative sampling of the population. Therefore, public comments are not appropriate to be used as a democratic decision-making tool or as a scientific sampling mechanism.

Comments citing editorial changes to the document were reviewed and incorporated. The Proposed LUPA/Final EIS has been technically edited and revised to fix typographic errors, missing references, definitions, and acronyms, and other clarifications as needed.

Copies of all comment documents received on the Draft LUPA/EIS are available by request from the BLM’s Idaho State Office. Comments received by mail, email, and at meetings, or delivered orally during the public meetings are tracked by commenter name and submission number.

### Campaign Letters

Several organizations and groups held standardized letter campaigns for the GRSG effort through which their constituents were able to submit the standard letter or a modified version of the letter indicating support for the group’s position on the BLM and Forest Service LUPA actions. Individuals who submitted a modified standard letter generally added new comments or information to the letter or edited it to reflect their main concern(s). Modified letters with unique comments were given their own letter number and coded appropriately. All commenters who used an organization’s campaign letter were tracked in the BLM and Forest Service commenter list and are available from the BLM and Forest Service upon request.

### How This Appendix is Organized

This appendix is divided into three main parts. The first part, Introduction, provides an overview of the comment-response process. The second part, Issue Topics, Responses, and Comments, is organized by the primary topic and then by specific issue subtopics that relate to an aspect of NEPA, the BLM and Forest Service planning processes, or specific resources and resource uses. The topics are labelled Sections 1 through 25. For example, all comment summaries that relate to aspects of the alternatives fall under the heading, “Section 1.3, Range of Alternatives.” Comments summaries and responses for baseline information (such as the information found in **Chapter 3**, Affected Environment) and impact analysis (**Chapter 4**) are found under the respective resource topic. For example, comment summaries and responses related to the affected environment and impact analysis on Fire and Fuels are under the “Section 7 – Fire and Fuels” heading. Each topic or subtopic contains a statement that summarizes all substantive comments received on that topic or subtopic and the BLM’s and Forest Service’s response to the summary statement. Excerpts of all substantive comments are posted on the project website: [http://www.blm.gov/ut/st/en/prog/planning/SG\\_RMP\\_rev.html](http://www.blm.gov/ut/st/en/prog/planning/SG_RMP_rev.html).

The terms preliminary priority management area (PPMA) and preliminary general management area (PGMA) were used in the Draft EIS to describe the relative prioritization of areas for GRSG

conservation. These are BLM and Forest Service terms used to differentiate the degree of managerial emphasis a given area would have relative to GRSG. As the BLM and Forest Service moved from a Draft EIS to a Proposed LUPA/Final EIS, such prioritizations are necessarily no longer “preliminary” in nature. As such, they have been replaced with the terms Priority Habitat Management Area (PHMA) and General Habitat Management Area (GHMA). Comments on the Draft LUPA/EIS referred to PPMA and PGMA. As such, the summary statements also use these terms. However, responses use the terminology used in the Proposed LUPA/Final EIS (PHMA and GHMA).

The third part, Commenter Lists, provides the names of individuals who submitted unique comment letters (not campaign letters) on the Draft LUPA/EIS. Commenters are listed alphabetically by the organization name or commenter’s last name.

Administrative Draft  
Cooperating Agency Review

## Issue Topics, Responses, and Comments

### Section 1 – NEPA

---

#### Summary

The FEIS needs to identify an Environmentally Preferred Alternative, evaluate the plan according to the USFWS's Evaluation Criteria for Conservation Plans, and provide a summary comparison of the population effects under each alternative.

---

#### Response

1. Section 1505.2(b) requires that, in cases where an EIS has been prepared, the Record of Decision (ROD) must identify all alternatives that were considered, ". . . specifying the alternative or alternatives which were considered to be environmentally preferable." This alternative(s) will be identified in the ROD.
2. The Policy for the Evaluation of Conservation Efforts (PECE) is the USFWS responsibility and will be used by USFWS during their evaluation of BLM/FS land use plans as appropriate.
3. The FEIS includes discussion of population effects in **Section 4.2**.

### Section 1.1 - Public Notification

---

#### Summary

BLM needs to publish the statistics for people that provided comment letters on the Draft EIS, as well as the comments, their responses, and changes made to the document in the FEIS.

---

#### Response

All substantive comments received on the Draft EIS were considered and reviewed for information that would result in changes to the document. Comments simply stating a preference for or against a specific alternative or opinions without reasonable basis were considered non-substantive since they do not meet the substantive comment requirement of BLM Handbook H-1790-1, Section 6.9.2.1. See **Chapter 6** for additional details on the comment analysis process.

Form letters, or identical letters submitted by different commenters, were identified as part of the DLUPA/DEIS comment response effort. Since these submissions are identical in nature, it is adequate for only one "master" form letter to be included as part of the comment response effort and reviewed

*Idaho and Southwestern Montana Greater Sage-Grouse Proposed LUPA/Final EIS*

June 2015

for substantive comments. All form letters will be entered into the project decision file and all commenters will be entered into the project decision file as having submitted a comment during the DLUPA/DEIS comment period.

Index of parties, comments, and responses are provided in the FEIS. Changes made to the EIS are summarized in the beginning of each chapter.

## Section 1.2 - Cooperating Agency Relationships

---

### Summary

The BLM did not coordinate with state and local agencies that would be affected by the actions considered in the EIS, as required by NEPA and FLPMA. Several commenters requested additional coordination for BLM to consider.

---

### Response

Cooperating agency relationships are described in the Final EIS in **Section 6.3.1**, Cooperating Agencies. In December 2011, the BLM sent letters to five tribal governments within the Idaho and Southwestern Montana Sub-region inviting them to be cooperating agencies. The BLM also sent letters to over 60 local, state, and federal agencies inviting them to participate as cooperating agencies for the LUPA/EIS. To date, 29 agencies agreed to participate on the EIS as designated cooperating agencies, and have signed Memoranda of Understanding with the BLM's Idaho State Office (**Table 6-5**, Idaho and Southwestern Montana Sub-region Cooperating Agency Participation).

## Section 1.3 - Range of Alternatives

---

### Summary

1. The alternatives fail to meet NEPA adequacy because:
  - a. they (individually or collectively) do not meet the purpose and need for the action
  - b. alternatives were all largely the same, and that the BLM needed to provide more distinction (range) between them
  - c. BLM needs to consider the alternatives presented by Cooperating Agencies and Environmental Organizations, including the County alternatives, the Conservation Groups' alternative, and alternatives for the listing of the species or not listing the species.
  - d. specifically that Alternative D needed to include the Ecological Site Descriptions to provide adequate understanding of the current management
  - e. and the BLM and Forest Service failed to adequately define the No Action Alternative.

2. Commenters also suggested that BLM and Forest Service did not provide adequate rationale for the

need of the project.

---

## Response

1. a. In accordance with NEPA, the BLM and Forest Service have discretion to establish the purpose and need for action (40 CFR 1502.13). CEQ regulations direct that an EIS "...shall briefly specify the underlying purpose and need to which the agency is responding in proposing the alternatives including the proposed action" (40 CFR 1502.13). Also, under the CEQ regulations, the BLM and the Forest Service are required to "study, develop, and describe appropriate alternatives to recommended courses of action in any proposal which involves unresolved conflicts concerning alternative uses of available resources as provided by section 102(2)(E) of the Act [NEPA]." (40 CFR 1501.2(c)). The breadth or narrowness of the purpose and need statement has a substantial influence on the scope of the subsequent analysis. The purpose and need statement provides a framework for issue identification and will inform the rationale for alternative selection. The range of alternatives developed are intended to meet the purpose and need and address the issue; thereby providing a basis for eventual selection of an alternative in a decision (BLM NEPA handbook and Forest Service Handbook 1909.15 – National Environmental Policy Act Handbook Chapter 10 – Environmental Analysis). As stated in the DLUPA/EIS, the BLM and the Forest Service prepared the Idaho LUP amendment with an associated EIS to be applied to lands with GRSG habitat.

b. The BLM and the Forest Service considered a reasonable range of alternatives during the GRSG planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM and the Forest Service consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and GRSG in the planning area, the BLM and the Forest Service fully considered the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As a result, six alternatives were analyzed in detail in the DLUPA/EIS that best addressed the issues and concerns identified by the affected public. The range of alternatives in the DLUPA/EIS represented a full spectrum of options including a no action alternative (current management, Alternative A).

Additionally, the resulting action alternatives offer a range of possible management approaches for responding to planning issues and concerns identified through public scoping, and to maintain or increase GRSG abundance and distribution in the planning area. While the goal is the same across alternatives, each alternative contains a discrete set of objectives and management actions and constitutes a separate LUPA with the potential for different long-range outcomes and conditions.

The relative emphasis given to particular resources and resource uses differs as well, including allowable uses, restoration measures, and specific direction pertaining to individual resource programs. When resources or resource uses are mandated by law or are not tied to planning issues, there are typically few or no distinctions between alternatives. Meaningful differences among the six alternatives are described

in the FEIS in **Table 2-9**, Comparative Summary of Allocation Decisions of the Proposed Plan Amendment and Draft Alternatives, and in **Section 2.8**, Draft LUPA/EIS Alternatives.

c. Based on this alternative development process, the BLM and Forest Service considered input from cooperating agencies, environmental organizations, and the public. As described in **Section 2.8.3**, Alternative B, the BLM used the GRSG conservation measures in A Report on National Greater Sage-Grouse Conservation Measures (NTT 2011) to form BLM and Forest Service management direction under Alternative B. This is consistent with the direction provided in BLM Washington Office Instruction Memorandum 2012-044, which states that the BLM must consider all applicable conservation measures developed by the NTT in at least one alternative in the land use planning process.

During scoping for the Idaho and Southwestern Montana Greater Sage-Grouse LUPA/EIS, individuals and conservation groups submitted management direction recommendations for protection and conservation of GRSG and their habitat, including the Sage-grouse Recovery Alternative and proposed disturbance cap. The recommendations, in conjunction with resource allocation opportunities and internal sub-regional BLM and Forest Service input, were reviewed in order to develop BLM and Forest Service management direction for GRSG under Alternatives C and F.

Alternative D incorporates adjustments to the NTT report (NTT 2011) to provide a balanced level of protection, restoration, enhancement, and use of resources and services to meet ongoing programs and land uses, and was developed in full cooperation with the Cooperating Agencies taking note of the agencies' concerns with socioeconomic issues.

Alternative E was based on inputs from the Idaho and Utah Governors' Offices for lands in each state in the sub-region.

Whether the GRSG is determined for listing by the USFWS is outside the jurisdiction of the BLM and Forest Service and beyond the scope of this EIS. As noted in the Purpose and Need, the BLM was to consider regulatory mechanisms that would protect the species and its habitat. As such, the BLM and Forest Service did not develop alternatives should the USFWS choose to list or not list the GRSG.

e. Ecological Site Descriptions are not necessary to describe the affected environment, but will be considered on a site-specific basis during project implementation as appropriate.

f. As clarified by the CEQ, the "no action alternative" for a land use plan amendment or revision means "no change" from current management or level of management intensity (CEQ 40 Questions, Question 3). The no action alternative may be thought of in terms of continuing with the present course of action. The No Action Alternative is described in Alternative A, and includes the current management for the programs within the scope of the analysis. However, the FWS determined that the current regulatory mechanisms were not "adequate" in their 2010 warranted but precluded for listing decision. Therefore, the No Action Alternative provides a baseline for comparison of the five action alternatives to the existing planning decisions.

2. The purpose and need is provided in **Chapter 1**. Under FLPMA, the Secretary of the Interior, acting

through the BLM has the discretion to engage in land use planning whenever appropriate for management of the public lands.

## Section 1.4 - Best Available Info Baseline Data

---

### Summary

The EIS fails to meet NEPA adequacy for baseline data because the scale of baseline data used is too broad, the EIS failed to include the State and Transition models as part of the baseline information, and the No Action management actions, as presented, do not explain the regulatory mechanisms that are currently available to preserve GRSG habitat.

---

### Response

The CEQ regulations require an EIS to "succinctly describe the environment of the area(s) to be affected or created by the alternatives under consideration. The description shall be no longer than is necessary to understand the effects of the alternatives. Data and analyses in a statement shall be commensurate with the importance of the impact, with less important material summarized, consolidated, or simply referenced. Agencies shall avoid useless bulk in statements and shall concentrate effort and attention on important issues" (40 CFR 1502.15). Additionally, the Idaho and Southwestern Montana Greater Sage-Grouse LUPA/EIS is a programmatic NEPA effort to conserve GRSG and its habitat across a broad geographic area. As such, the BLM and the Forest Service described the current conditions and trends in the affected environment broadly, across a range of conditions, appropriate to program-level land use planning actions.

The BLM and the Forest Service complied with these regulations in describing the affected environment. The requisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The affected environment provided in **Chapter 3** and related appendices including **Appendices Y** through **CC** in the Idaho and Southwestern Montana Greater Sage-Grouse LUPA/EIS is sufficient to support, at the general land use planning-level of analysis, the environmental impact analysis resulting from management actions presented in the DLUPA/EIS. For example, listing every water quality-impaired stream within the planning area by name would not provide useful information at this broad-scale analysis, particularly where the proposed plan alternatives did not vary the level of riparian protections to provide reduced levels for non-impaired streams. The riparian protections within each alternative were applied to all streams, whether or not they were water quality-impaired.

As specific actions come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. Site-specific concerns and more detailed environmental descriptions will be addressed when project-level reviews are tied to the analysis in this EIS (40 CFR 1502.20, 40 CFR 1508.28). In addition, as required by NEPA, the

public will be offered the opportunity to participate in the NEPA process for any site-specific actions.

## Section 1.5 - GIS Data and Analysis

---

### Summary

Commenters noted several issues with the GIS data and analysis conducted in the Draft EIS:

- The maps and data layers do not provide enough detail to address "local ecological site variability". The data are too coarse and do not provide assurances to more localized decision making; some habitat areas are inaccurately identified in the maps.
  - BLM used old data layers to develop maps; BLM should use the newer data layers.
  - The BLM needs to be consistent in their edge-mapping across state boundaries when there are different data sets used.
- 

### Response

Before beginning the Idaho and Southwestern Montana Greater Sage-Grouse LUPA/EIS and throughout the planning effort, the BLM and the Forest Service considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The data needed to support broad-scale analysis of the planning area are substantially different than the data needed to support site-specific analysis of projects. The LUPA/EIS data and information is presented in map and table form and is sufficient to support the broad scale analyses required for land use planning.

Additionally, the BLM and the Forest Service consulted with, collected, and incorporated data from other agencies and sources, including but not limited to the U.S. Fish and Wildlife Service and Idaho and Montana state wildlife agencies. These data were used throughout the EIS, including **Chapters 2, 3, and 4**. The Draft EIS notes that the BLM and Forest Service would incorporate any refinements or updates if or when the data were made available.

As a result of these actions, the data gathered by the BLM and the Forest Service is of the appropriate scale and provided an adequate analysis that led to an adequate disclosure of the potential environmental consequences of the alternatives.

A land use planning-level decision is broad in scope and, therefore, does not require an exhaustive gathering and monitoring of baseline data. The baseline data provides the necessary basis to make informed land use plan-level decisions. Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The BLM and the Forest Service will conduct subsequent project-specific NEPA analyses for projects proposed for implementation under the land use plan, which may include but are not limited to fuels treatment, habitat restoration, and conifer removal. The subsequent NEPA analyses for project-specific actions will tier to the land-use planning analysis and evaluate project impacts at the appropriate site-specific level (40 CFR 1502.20, 40 CFR 1508.28). As required by NEPA, the public will have the opportunity to participate in the NEPA process for site-specific actions.

Between the Draft and Final EIS, the BLM and Forest Service worked closely to resolve differences between GRSG habitats across state boundaries. These refinements are reflected in the Final EIS maps and GIS calculations.

## Section 1.6 - Indirect Impacts

---

### Summary

BLM's overall impact analysis is deficient in the following areas:

1. Lack of discussion for where, when, and how BLM will have sufficient funding to implement the actions
2. The analysis does not distinguish between the effects of each alternative
3. The BLM and Forest Service did not fully analyze the No Action alternative by not acknowledging the existing laws and actions already in place that would manage the habitat

### Response

1. As a landscape level planning effort, none of the alternatives authorize site-specific activities on public lands. The agencies' selection of an alternative does not authorize funding to any specific project or activity nor does it directly tie into the agencies' budgets as appropriated annually through the Federal budget process. As a consequence, agencies' costs and differences in program costs across alternatives have not been quantified. Information has been presented in several resource impact sections on the types of costs that might be associated with various GRSG conservation measures.
2. **Tables 2-12 and 2-13** in the FEIS, when combined with the effects analysis in **Chapter 4**, adequately compares the effects between alternatives.
3. All alternatives, including the No Action Alternative, are subject to existing laws as described in **Sections 1.6 and 1.7**. The no action was fully analyzed; however, the Purpose and Need for this effort responds to the FWS's 2010 finding that existing regulatory mechanisms in existing land use plans are inadequate to protect the species; therefore, the no action is not sufficient to meet this Purpose and Need.

## Section 1.7 - Cumulative Impacts

---

### Summary

The EIS cumulative impacts analysis is inadequate because it does not adequately identify the reasonably foreseeable future actions, present a comprehensive listing of the effects across all sub-regions, nor analyze how the alternatives' actions would affect actions and decisions in neighboring states/jurisdictions.

## Response

The BLM and the Forest Service thoroughly explained its consideration and analysis of cumulative effects in the Draft and Final LUPA/EIS in **Chapter 5** and has augmented this analysis for the FEIS. The Draft and Final LUPA/EISs considered the present effects of past actions, to the extent that they are relevant, and present and reasonably foreseeable (not highly speculative) Federal and non-Federal actions, taking into account the relationship between the proposed alternatives and these reasonably foreseeable actions. This discussion summarizes CEQ guidance from June 24, 2005, stating that "[g]enerally, agencies can conduct an adequate cumulative effects analysis by focusing on the current aggregate effects of past actions without delving into the historical details of individual past actions." This is because a description of the current state of the environment inherently includes the effects of past actions. Information on the current conditions is more comprehensive and more accurate for establishing a useful starting point for cumulative effects analysis. The BLM and the Forest Service explicitly described their assumptions regarding proposed projects and other reasonably foreseeable future actions. On Forest Service-administered lands, reasonably foreseeable actions are those that would occur under their current land use plans from a broad-scale perspective.

The BLM and the Forest Service have complied fully with the requirements of 40 CFR 1508.7 and prepared a cumulative impact analysis to the extent possible based on the broad nature and scope of the proposed management options under consideration at the land use planning level.

The DLUPA/EISs contains a qualitative discussion of cumulative effects at the WAFWA Management Zone scale to set the stage for a more quantitative analysis to be contained in the Proposed Land Use Plan Amendment/FEIS. Additional quantitative cumulative analysis was added to the Final EIS in **Chapter 5**, Cumulative Impacts.

---

## Section 1.9 - Mitigation Measures

---

### Summary

1. The BLM needs to include a monitoring, mitigation, and adaptive management plan/framework in the FEIS that will include specific criteria for determining GRSG conservation success and how the disturbance percentages will be calculated.
2. BLM needs to clarify the relationship between the disturbance thresholds and the monitoring framework.
3. The BLM needs to release the mitigation strategy for public review.

---

## Response

Mitigation and monitoring frameworks were introduced in the DEIS in **Chapter 2** and in **Appendices F** and **E**, respectively. An Adaptive Management strategy was also introduced in **Chapter 2** of the DEIS. A more detailed mitigation framework, monitoring framework, and adaptive

management strategy has been incorporated into **Chapter 2** of the FEIS and **Appendices J, E, and G**, respectively.

Mitigation will be applied to all implementation actions/decisions that take place on Federal lands within GRSG habitat during the life of this plan. Mitigation has been further defined as Regional Mitigation and the Framework is in **Appendix J**. The Regional Mitigation Framework was developed to follow the BLM's Regional Mitigation Manual MS-1794, Forest Service Handbook FSH 1909.15, and CEQ 40 CFR 1508.20.

The Mitigation Framework, through the mitigation hierarchy, guides the BLM and Forest Service. The hierarchy direction is to first, avoid impacts entirely by not taking a certain action or parts of an action, second, if unable to avoid, minimize impacts by limiting the degree or magnitude of an action or parts of an action, and lastly, if avoidance or minimizing is not possible, compensate impacts associated with future implementation actions. If residual impacts to GRSG from implementation-level actions remain after applying avoidance or minimization measures, then compensatory mitigation projects will be used to offset the residual impacts in an effort to achieve the land use plan goals and objectives. As articulated in **Appendix J**, compensatory mitigation will occur on sites that have the potential to yield the greatest conservation benefit to GRSG, regardless of land ownership. These sites should be sufficiently "durable." According to BLM Manual Section 1794, durability is defined as "the administrative, legal, and financial assurances that secure and protect the conservation status of a compensatory mitigation site, and the ecological benefits of a compensatory mitigation project, for at least as long as the associated impacts persist.

Specific mitigation strategies, based on the Framework, will be developed by regional teams (at the WAFWA Management Zone level) within one year of the issuance of the Record of Decision. These strategies will guide the application of the mitigation hierarchy to address GRSG impacts within that WAFWA Management Zone. The WAFWA Management Zone Regional Mitigation Strategy will be applicable to BLM and Forest Service lands within the zone's boundaries. Subsequently, the BLM's and Forest Service's NEPA analyses for implementation-level decisions that might impact GRSG will include analysis of mitigation recommendations from the relevant WAFWA Management Zone Regional Mitigation Strategy(ies).

The Monitoring Framework in **Appendix E** outlines the methods that the BLM and Forest Service will use to monitor and evaluate the implementation and effectiveness of the planning strategy and the land use plans to conserve the species and its habitat. The regulations for the BLM (43 CFR 1610.4-9) and the Forest Service (36 CFR 219.12) require that land use plans establish intervals and standards, as appropriate, for monitoring and evaluations, based on the sensitivity of the resource to the decisions involved.

Implementation monitoring results will provide information to allow the BLM and Forest Service to evaluate the extent that the decisions from the BLM and Forest Service LUPs to conserve GRSG and their habitat have been implemented. Effectiveness monitoring will provide the information to evaluate whether BLM and Forest Service actions achieve the objective of the planning strategy (BLM IM 2012-

044) and the conservation measures contained in the land use plans to conserve GRSG populations and their habitats.

Monitoring efforts will include data for measurable quantitative indicators of sagebrush availability, anthropogenic disturbance levels, and sagebrush conditions. This information will assist the BLM and the Forest Service with identifying whether or not they are achieving their land use plan goals and objectives, reaching an adaptive management soft or hard trigger, as well as providing information relative to the disturbance cap. Specifically, habitat degradation (percent of human activity in a biologically significant unit), habitat availability (percent of sagebrush in a biologically significant unit), and habitat degradation intensity (density of energy facilities and mining locations) will be gathered to inform the disturbance cap measurement (Proposed Plan action AD-1).

Adaptive management is a systematic approach for improving resource management by learning from management outcomes. An adaptive approach involves exploring alternative ways to meet management objectives, anticipating the likely outcomes of alternatives based on the current state of knowledge, implementing one or more of these alternatives, monitoring to learn about the impacts of management actions, and then using the results to update knowledge and adjust management actions accordingly.

Incorporating adaptive management into the Idaho and Southwestern Montana Greater Sage-Grouse LUPA/EIS will ensure a degree of certainty that the decisions in the plan will effectively contribute to the elimination or adequate reduction of one or more threats to the GRSG and its habitat. The adaptive management approach incorporates a set of triggers in the plan, a soft and hard trigger. These triggers were developed to inform the BLM and Forest Service as to when the Federal agency needs to respond (take action) to address a declining trend in GRSG or GRSG habitat figures.

Soft triggers represent an intermediate threshold indicating that management changes are needed at the project/implementation level to address habitat and population losses. Hard triggers represent a threshold indicating that immediate action is necessary to stop a severe deviation from GRSG conservation goals and objectives as set forth in the BLM and Forest Service plans. The adaptive management soft and hard triggers and land use planning responses to these triggers are described and analyzed fully in this EIS (Proposed Plan actions AM-1 through AM-16).

The agencies will use the data collected from monitoring (**Appendix E**) to identify any changes in habitat conditions related to the goals and objectives of the plan. The BLM and Forest Service will use the information collected through monitoring to determine when adaptive management triggers are met.

## Section 2 – FLPMA

---

### Summary

The DLUPA/EIS has failed to comply with the multiple-use mandates found in the BLM's FLPMA and the Forest Service's Multiple Use Sustained Yield Act because it has put protecting GRSG and GRSG habitat above legal requirements for balanced management.

---

## Response

FLPMA (Section 103(c)) defines "multiple use" as the management of the public lands and their various resource values so that they are utilized in the combination that will best meet the present and future needs of the American people. Accordingly, the BLM is responsible for the task of striking a balance among the many competing uses to which public lands can be put. The BLM's multiple-use mandate does not require that all uses be allowed on all areas of the public lands. The purpose of the mandate is to require the BLM to evaluate and choose an appropriate balance of resource uses which involves tradeoffs between competing uses. The FLPMA also directs the BLM to develop and periodically revise or amend its Resource Management Plans (RMPs), which guide management of BLM-administered lands, and provides an arena for making decisions regarding how public lands would be managed and used.

Consistent with the Multiple-Use Sustained-Yield Act of 1960 (16 U.S.C. 528–531), the Forest Service manages National Forest System land to sustain the multiple use of its renewable resources in perpetuity while maintaining the long-term health and productivity of the land. Resources are managed through a combination of approaches and concepts for the benefit of human communities and natural resources. Land management plans guide sustainable, integrated resource management of the resources within the plan area in the context of the broader landscape, giving due consideration to the relative values of the various resources in particular areas. The Forest Service is required by statute to have a national planning rule: the Forest and Rangeland Renewable Resources Planning Act of 1974, as amended by the National Forest Management Act of 1976, requires the Secretary of Agriculture to issue regulations under the principles of the Multiple-Use Sustained-Yield Act of 1960 for the development and revision of land management plans.

The Idaho and Southwestern Montana Greater Sage-Grouse LUPA/EIS is a targeted amendment specifically addressing goals, objectives, and conservation measures to conserve GRSG and to respond to the potential of its being listed (see **Section 1.2**, Purpose and Need). Both, the Forest Service's and BLM's planning processes allow for analysis and consideration of a range of alternatives in the DLUPA/EIS that identified and incorporated conservation measures to conserve, enhance, and restore GRSG habitat and to eliminate, reduce, or minimize threats to this habitat to ensure that a balanced management approach was recommended. The DLUPA/EIS included alternatives (**Section 2.8**) that provided a greater and lesser degree of restrictions in various use programs, but would not eliminate or invalidate any valid existing development rights.

Additionally, the BLM and the Forest Service developed the Idaho and Southwestern Montana Greater Sage-Grouse LUPA/EIS with involvement from cooperating agencies, including the USFWS, NRCS, and Idaho Department of Fish and Game, to ensure that a balanced multiple-use management strategy to address the protection of GRSG while allowing for utilization of renewable and nonrenewable resources on the public lands.

## Section 2.2 - Consistency with other state, county, or local plans

---

### Summary

The BLM's actions considered in the alternatives conflict with local and state agency plans and policies; furthermore, the BLM did not review all of the county and state plans to ensure that conservation measures are as consistent as possible with other planning jurisdictions.

---

### Response

To the extent possible under existing law, the BLM's land use plans must be consistent with officially approved or adopted resource-related plans of Indian tribes, other Federal agencies, and State and local governments (see 43 CFR 1610). The BLM has worked closely with State and local governments during preparation of the Draft LUPA/EIS. The LUPA/EIS lists the cooperating agencies actively involved in the planning process in **Section 6.3**. The BLM requested the state, county, and tribal government cooperating agencies assist in the consistency reviews by reviewing the range of alternatives associated with the Draft LUPA/EIS and identify potential inconsistencies between the alternatives and each agency's applicable plans. This allows the state, local, and tribal cooperating agencies to use their special expertise regarding the familiarity with their own state, local, or tribal plans. On the local level, it is a county's responsibility to accurately identify and communicate any inconsistencies between that county's plan and the proposed alternative.

The BLM works to find a balance among uses and needs as reflected in these local government plans and has done so in the preparation of the LUPA/EIS; a list of these plans can be found in **Section 1.7**, Relationship to Other Policies, Plans, and Programs. The BLM is aware that there are specific State or local laws relevant to aspects of public land management that are discrete from, and independent of, Federal law. However, BLM is bound by Federal law. As a consequence, there may be inconsistencies that cannot be reconciled. The FLPMA requires that BLM's land use plans be consistent with State and local plans "to the extent practical". In a situation where State and local plans conflict with Federal law, there will be an inconsistency that cannot be resolved. Thus, while State County and Federal planning processes, under FLPMA, are required to be as integrated and consistent as practical, the Federal agency planning process is not bound by or subject to County plans, planning processes, or planning stipulations. Clarification has been added in the FEIS in **Section 6.3.1**.

The BLM coordinates with cooperating agencies commensurate with each agency's recognized jurisdiction or expertise. In areas where the States of Idaho and Montana has clear jurisdiction, such as wildlife populations, the BLM has worked closely with that State agency. In cases where a county or agency has expertise, such as local county socioeconomic information, the BLM has worked closely with the group to incorporate the information into the EIS.

## Section 2.4 - Planning Regs 43 CFR 1600

---

## Summary

The BLM did not provide an explanation for how and why they defined the planning area as they did.

---

## Response

The framework for the scope of analysis for the project is based upon the BLM and the Forest Service Planning and NEPA manual and handbooks definitions of the planning, decision, and analysis areas. Specifically, Forest Service Manual 1900-Planning Chapter, Zero Code defines the Area of Analysis as “The geographic area within which ecosystems, their components, or their processes are evaluated during analysis and development of one or more plans, plan amendments, or plan revisions. This area may vary in size depending on the relevant planning issue. For a plan, an area of analysis may be larger than a plan area. For development of a plan amendment, an area of analysis may be smaller than the plan area and include multiple ownerships.”

The definition of a Planning Area is the geographic area within which the BLM will make decisions during a planning effort. A planning area boundary includes all lands regardless of jurisdiction; however the BLM will only make decisions on lands that fall under the BLM’s jurisdiction (including subsurface minerals). Unless the State Director determines otherwise, the planning area for a RMP is the geographic area associated with a particular field office (43 CFR 1610.1(b)). State Directors may also establish regional planning areas that encompass several field offices and/or states, as necessary. For this EIS, decision area includes those BLM and Forest Service lands and mineral estates within the sub-region boundaries.

Further details regarding delineation of the planning area and the GRSG habitats within it are presented in **Section 1.1**, **Section 2.6**, **Section 2.8**, and **Appendix N**.

## Section 3 - Other Laws

---

### Summary

The BLM has failed to document how the EIS and/or actions considered in the EIS comply with other laws, including all Onshore Orders regulating oil and gas development, the Energy Policy Act of 2005 and Energy Policy and Conservation Act of 2000, the Taylor Grazing Act, the Mining and Minerals Policy Act, the Information Quality Act, the Wild Horse and Burro Act, other multiple use mandates (e.g., Multiple-Use Sustained Yield Act of 1960, Forest and Rangeland Renewable Resources Planning Act of 1974, National Forest Management Act of 1976), and compliance with other federal agency regulations.

## Response

The Final EIS **Section 1.7**, Relationship to Other Policies, Plans and Programs, states that the BLM and Forest Service will seek to be consistent with or complementary to other ongoing programs, plans, and policies. Additionally, in **Section 1.6**, Development of Planning Criteria, the BLM has a criterion stating that all BLM alternatives would comply with existing laws, regulations, and policies. The BLM and Forest Service have reviewed all actions in the Proposed LUPA and found them to be consistent and within the bounds of all required laws, regulations, and policies.

## Section 4 - Sage Grouse

*No comments are associated with this issue.*

---

### Section 4.1 - NTT report/findings

---

#### Summary

Commenters contended that the National Technical Team (NTT) report is not based on the best available science, contains technical and methodological errors, is not based on local conditions, and has not undergone adequate peer review. Commenters questioned why the NTT report was used when the IM requiring its use has expired.

---

#### Response

The NTT was formed as an independent, science-based team to ensure that the best information about how to manage the GRSG is reviewed, evaluated, and provided to the BLM and the Forest Service in the planning process. The group produced a report in December 2011 that identified science-based management considerations to promote sustainable GRSG populations. The NTT report (NTT 2011) used the best current scientific knowledge to guide the BLM and Forest Service planning efforts through management considerations to ameliorate threats, focused primarily on priority GRSG habitats on public lands. The NTT report cited 122 references including published papers from the formal scientific literature such as Journal of Wildlife Management, Conservation Biology, Biological Conservation, Wildlife Biology, BioScience and others, as well as graduate theses and dissertations, conservation strategies, FWS 2010 finding, and others representing the best available science. The NTT report was intended to be used at a programmatic scale and may not reflect local conditions.

The BLM used the NTT report per BLM IM 2012-044 to construct an alternative that would meet the purpose and need. This report was not the only source of information for developing a range of alternatives (see Section 4.5, Range of Alternatives, in this report). BLM is implementing IM 2012-044 through the GRSG planning effort. When an IM expires without being superseded, it can still be applicable and provide guidance to the BLM. The fact that IM 2012-044 expired does not mean the BLM has no authority to continue to analyze the conservation measures identified in the NTT

Report. The BLM is appropriately considering and evaluating the measures in the NTT Report, in addition to any other relevant science, through the GRSG planning process.

## Section 4.2 – BER

---

### Summary

The BER contains outdated baseline literature and the EIS should be updated with suggested literature.

---

### Response

A baseline environmental report, titled Summary of Science, Activities, Programs, and Policies That Influence the Rangeland Conservation of Greater Sage-grouse (*Centrocercus urophasianus*) (referred to as the BER), was released on June 3, 2013, by the U.S. Geological Survey. The peer-reviewed report summarizes the current scientific understanding about the various impacts to GRSG populations and habitats and addresses the location, magnitude, and extent of each threat. The data for this report were gathered from BLM, Forest Service, and other sources and were the best available at the range-wide scale at the time collected. The report provides a framework for considering potential implications and management options, and demonstrates a regional context and perspective needed for local planning and decision-making.

The BLM and Forest Service reviewed the literature sources provided by commenters to determine if there were new or updated sources that should be considered in the EIS. As appropriate, **Chapters 3 and 4** were updated in the FEIS with additional information and analysis.

## Section 4.3 – COT

---

### Summary

Commenters had two distinct views regarding the COT report. One group considered the report overly biased and not representative of the best available information. The other group suggested the DEIS was not fully consistent with the COT report habitat mapping and therefore requires revision to address those deficiencies.

---

### Response

In March 2012, the FWS initiated a collaborative approach to develop range-wide conservation

*Idaho and Southwestern Montana Greater Sage-Grouse Proposed LUPA/Final EIS*

June 2015

objectives for GRSG to inform the 2015 decision about the need to list the species and to inform the collective conservation efforts of the many partners working to conserve the species. In March 2013, this team released the Conservation Objectives Team (COT) report based upon the best scientific and commercial data available at the time that identifies key areas for GRSG conservation, key threats in those areas, and the extent to which they need to be reduced for the species to be conserved. The report serves as guidance to Federal land management agencies, State GRSG teams, and others in focusing efforts to achieve effective conservation for this species.

**Table 2-12** demonstrates how the BLM and Forest Service management actions under each alternative address the threats to the populations in the Idaho and southwestern Montana sub-region. In Idaho, Core and Important Habitat Zones under Alternative E were used to derive the PACs in the COT. The BLM and Forest Service have continued to work with the USFWS and State agencies to develop a proposed plan.

#### Section 4.4 - Policy Guidance

---

##### Summary

The BLM and Forest Service should include additional information to improve consistency with USFWS's Policy for Evaluation of Conservation Efforts.

---

##### Response

The BLM and Forest Service are working closely with the USFWS to ensure certainty of implementation and effectiveness to the extent possible. However, certain management actions, such as restoration activities, are contingent on funding availability and thus some uncertainty remains.

#### Section 4.5 - Range of Alternatives

---

##### Summary

Commenters proposed revisions or requested additional details and clarifications to the alternatives related to GRSG. Topics of concern included:

- The size of lek buffers
- Need for and size of disturbance cap
- Restrictions on wind energy development
- Noise restrictions
- Livestock grazing management changes
- Inadequate description of adaptive management and monitoring
- Need for an improved definition of no net unmitigated loss
- Leasable mineral restrictions
- Juniper removal

- Existing and new fencing as they relate to sage-grouse strikes and mortality
- Lack of active habitat restoration
- Habitat monitoring

Commenters were concerned about greater sage-grouse habitat mapping, including suggesting clarifications or revisions to the habitat map and concerns about using the map for site-scale projects. Commenters were also concerned that Manual 6840 was not used as the baseline policy governing present GRSG conservation in the No Action alternative.

---

## Response

As noted above in the response in Section 1.3, Range of Alternatives, of this report, **Section 2.4** of the FEIS describes how the Idaho and Southwestern Montana Greater Sage-Grouse LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA and worked closely with the State with assistance from the USFWS.

Meaningful differences among the six alternatives are described in the FEIS in **Table 2-9**, Comparative Summary of Allocation Decisions of the Proposed Plan Amendment and Draft Alternatives, and in **Section 2.8**, Draft LUPA/EIS Alternatives. The issues below have been addressed in management actions and associated appendices prepared for the proposed plan and analyzed in **Chapter 4**.

Regarding the following issues:

- Lek buffers have been revised in the FEIS; in undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will apply the lek buffer-distances identified in the USGS Report “Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review” (Open File Report 2014-1239) in accordance with **Appendix B**.
- Additional specificity regarding the disturbance cap has been further explained in the FEIS; per the original April 2014 NPT guidance on disturbance, the Proposed LUPA/Final EIS would use the 3 percent disturbance cap at the Biologically Significant Unit (BSU) and project scale. Specific language has been included in the Proposed LUPA alternative (see **Chapter 2**, Proposed Plan action AD-1), as well as additional guidance for how they would be implemented and accounted for and what data is appropriate for determining disturbance (see **Appendix G**).
- Restrictions on wind energy development are described in the Proposed Plan, action LR-2.
- Noise and seasonal stipulations for both construction and long-term implementation of land use activities have been included in the FEIS (**Appendices B** and **C**).
- Livestock grazing management changes are described in the Proposed Plan actions RM-1 through RM-19 and include additional guidance provided for incorporating GRSG decisions into livestock grazing authorizations.
- Additional detail regarding adaptive management is provided in the Proposed Plan actions AM-1 through AM-16 and **Appendix G**. Monitoring is described in the Proposed Plan actions MON-1 through MON-7 and **Appendix E**. In the Proposed LUPA, additional clarifications are provided for the mitigation, monitoring, and adaptive management. See also response to comments in Section 1.9, Mitigation Measures, of this report.
- Additional specificity regarding the no net habitat loss objectives has been further explained in the FEIS in MIT-4 and **Appendix J**. Additionally, the Proposed LUPA/Final EIS includes guidance for net

*Idaho and Southwestern Montana Greater Sage-Grouse Proposed LUPA/Final EIS*

June 2015

conservation gain when mitigating adverse impacts on GRSG.

- Leasable mineral restrictions are described in the Proposed Plan actions FLM-1 through FLM-7 and NEL-1 through NEL-3.
- Juniper removal is described in VEG-8.
- The BLM and Forest Service used the latest science in developing management actions related to fences that adequately address collision risk. No change has been made to the document regarding this issue in the FEIS (see Proposed Plan action RM-14).
- Site-specific projects are not identified in the broad-scale plan, but there are a number of restoration actions described in the Proposed Plan in the wildfire and vegetation management actions.
- The BLM and Forest Service, in coordination with the state, have clarified monitoring and mapping expectations in the FEIS (**Appendices E and F**).

A description of the habitat mapping process for each alternative was presented in **Section 2.6** of the DEIS, Detailed Description of Alternatives. The Proposed Plan describes updates to the map in MA-5 through MA-8 and **Appendix F**.

**Section 1.6.1** states that the LUPA would comply with all applicable BLM policies and guidance. Though not explicitly stated, this includes BLM Manual 6840.

#### Section 4.6 - Best Available Info Baseline Data

---

##### Summary

Commenters suggested new or additional literature for the BLM and Forest Service to consider in the DLUPA/EIS related to:

- Determination of GRSG population size and trends
  - Effects of livestock grazing, predation, drought, noise, and anthropogenic development
  - Appropriate lek buffers and disturbance cap to incorporate
  - Mitigation
  - Hunting
  - Accuracy of the habitat mapping
  - Infrastructure
  - West Nile virus
- 

##### Response

As described in Section 1.4 of this comment report, the BLM and the Forest Service used the most recent and best information available that was relevant to a land-use planning-level analysis including the Baseline Environmental Report (BER; Manier et al. 2013), NTT report (NTT 2011), and COT report (USFWS 2013). Additionally, the BLM and the Forest Service consulted with, collected, and incorporated data from other agencies and sources, including but not limited to the U.S. Fish and Wildlife Service, Idaho Department of Fish and Game, scientific literature, field and district office data.

Of the suggested studies and references put forth by the commenters, the BLM and Forest Service reviewed them to determine if they presented new information that would need to be incorporated into

the FEIS, were references already included in the Draft EIS, or if the references provided the same information as already used or described in the Draft EIS. Where relevant and applicable, the BLM and Forest Service included additional suggested literature in **Chapters 3** and **4** of the FEIS to supplement the analysis.

A description of the habitat mapping process for each alternative was presented in the DEIS in **Section 2.6**, Detailed Description of Alternatives.

## Section 4.7 - Impact Analysis

---

### Summary

The BLM and Forest Service should conduct additional, more comprehensive analysis of the impacts on GRSG to provide more substantiated conclusions.

Commenters provided suggestions on how to improve or modify the impact analysis for GRSG in several topic areas including:

- Hunting
- Predation
- Anthropogenic disturbance, disturbance caps, and lek buffers
- Expanding on beneficial effects on GRSG from range improvements
- GRSG population size and trend
- Livestock grazing, fences, and trailing
- Noise as related to low-level military overflights
- Success of habitat improvement projects
- Prescribed fire
- Herbicides
- West Nile virus
- More detailed analysis of Alternative A
- Climate change
- Need to identify areas for restoration
- Coal suitability

The EIS fails to provide justification as to why “withdrawal from mineral entry” is necessary to protect GRSG and its habitat when the same objective can be achieved through avoidance, minimization of impacts, and mitigation of impacts within the designated areas.

---

### Response

The LUPA/FEIS provides an updated and expanded discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As described in **Section 2.12.1**, coal was

*Idaho and Southwestern Montana Greater Sage-Grouse Proposed LUPA/Final EIS*

June 2015

not an issue for analysis. As required by 40 CFR 1502.16, the LUPA/FEIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources should the proposal be implemented. The LUPA/FEIS provided sufficiently detailed information to aid in determining whether to proceed with the proposed plan in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. Therefore, effects on GRSG population levels are not required to be quantified as part of the impact analysis. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

Impacts from the alternatives on GRSG are described in **Section 4.2** of the FEIS. While a land use planning-level action is broad in scope and, therefore, does not require site-specific impact analysis, a thorough review of the EIS's impact analysis relevant to GRSG was found to need additional information and support for the conclusions/findings. The BLM and the Forest Service have updated this information in the Proposed LUPA/FEIS to provide the necessary information to make informed land use plan-level decisions (**Section 4.2**).

The facts that sagebrush takes decades to re-establish and that disturbance from light and noise affect GRSG mean that avoidance, minimization of impacts and mitigation of impacts from locatable mineral development are not sufficient methods of protecting GRSG and sagebrush habitat. Additionally, this concept was considered within the range of alternatives; Alternative D does not withdraw lands from mineral entry. No change to the EIS has resulted from this comment.

## Section 4.8 - Cumulative Impact Analysis

---

### Summary

The BLM and Forest Service need to provide additional analysis regarding the cumulative effects of livestock grazing and land treatments. In addition, the agencies should predict GRSG population changes based on expected cumulative actions.

---

## Response

As described in Section 1.7 of this comment report, the BLM and Forest Service analyzed cumulative effects to GRSG in the DLUPA/EIS in **Chapter 5** of the FEIS. The BLM and Forest Service expanded and quantified cumulative impacts for the proposed LUPA/FEIS. Section 4.7 of this comment report describes how land treatments and domestic livestock were addressed in the Environmental Consequences section of the DEIS. The DLUPA/EIS considered the present effects of past actions, to the extent that they are relevant, and present and reasonably foreseeable (not highly speculative) Federal and non-Federal actions, taking into account the relationship between the proposed alternatives and these reasonably foreseeable actions. This discussion summarizes CEQ guidance from June 24, 2005, stating that "[g]enerally, agencies can conduct an adequate cumulative effects analysis by focusing on the current aggregate effects of past actions without delving into the historical details of individual past actions." This is because a description of the current state of the environment inherently includes the effects of past actions. Information on the current conditions is more comprehensive and more accurate for establishing a useful starting point for cumulative effects analysis. The CEQ interpretation was accepted by the Ninth in *NW Env'tl. Advoc. v. Nat'l Marine Fisheries Serv.*, 460 F.3d 1125, 1141 (9th Cir. 2006). The BLM and the Forest Service explicitly described their assumptions regarding proposed projects and other reasonably foreseeable future actions. On National Forest System lands, reasonably foreseeable actions are those that would occur under their current land use plans from a broad-scale perspective.

The BLM and Forest Service have complied with the requirements of 40 CFR 1508.7 and prepared a cumulative impact analysis to the extent possible based on the broad nature and scope of the proposed management options under consideration at the land use planning level. Therefore, effects on GRSG population levels are not required to be quantified as part of the cumulative impact analysis.

## Section 4.9 - Mitigation Measures

---

### Summary

The BLM and Forest Service mitigation strategy is inadequate or needs clarifications. Topics of concern include:

- Certainty that mitigation will be implemented
- Lack of scientific evidence that mitigation and habitat restoration results in greater sage-grouse population increases
- Adequacy of the monitoring program
- Effectiveness of compensatory mitigation
- How mitigation proposals will be evaluated
- Siting of mitigation actions
- Durability of mitigation investments
- Consideration of using mitigation banks
- Creation of a mitigation program
- Framework behind exceptions and associated mitigation, e.g., science behind allowing exceptions;

*Idaho and Southwestern Montana Greater Sage-Grouse Proposed LUPA/Final EIS*

June 2015

offsetting losses and prove mitigation is successful

- Need for mitigation given the restrictive management in the alternatives
- Link between compensatory mitigation and adaptive management

---

## Response

A more detailed mitigation framework, monitoring framework, and adaptive management strategy have been incorporated into the Proposed LUPA/Final EIS, **Section 2.7**, Adaptive Management, Monitoring, and Mitigation and **Appendices J, E, and G**.

Further detailed descriptions of the mitigation, monitoring, and adaptive management frameworks are available in Section 1.9, NEPA Mitigation Measures, of this report.

## Section 5 – ACECs

---

### Section 5.1 - Range of Alternatives

---

#### Summary

Issue 1: In the Draft EIS/LUPA, the BLM and Forest Service did not accurately or consistently represent the number of ACECs being proposed under each alternative, particularly Alternative C.

Issue 2: Alternatives in the Draft EIS/LUPA do not provide an adequate range of management actions for ACECs by only considering new ACECs under two of the action alternatives (Alternatives C and F).

Issue 3: Whether through ACECs or another administrative designation, the BLM and Forest Service must ensure any administrative designation established for the protection of sage-grouse habitat will provide adequate non-discretionary protections.

---

#### Response

Response 1: The FEIS has been revised to ensure consistent representation of proposed ACECs under Alternatives C and F.

Responses 2 and 3: As noted in Section 1.3, NEPA Range of Alternatives, of this report, the alternatives, including the management actions for the ACEC program, meet the purpose and need for the EIS. Alternatives within the EIS have established that not all protective management for the GRSG is limited to ACEC designation. Only Alternatives C and F proposed to establish ACECs for the protection and management of the GRSG. While the other alternatives do not propose such designations, they still contain similarly specific management prescriptions to manage and protect the GRSG and its habitat that would be equivalent to protections afforded via an ACEC or other

designations.

## Section 6 - Climate Change

### Section 6.4 - Cumulative Impact Analysis

---

#### Summary

The EIS does not adequately address the cumulative effects of climate change on GRSG or GRSG habitat, including the cumulative effects of livestock grazing on vegetation communities and the likelihood of a changing climate to result in an increase in invasive weeds.

---

#### Response

Assessing the impacts of grazing on climate change is outside the scope of this document, except as it pertains to reducing impacts on GRSG and GRSG habitat within the planning area and in consideration of valid existing rights and the BLM's multiple use mandate under FLPMA. The PRMP/FEIS does disclose the potential effects associated with global climate change on GRSG habitats in **Section 4.2**. However, pursuant to 40 CFR 1500.1(b), information must be "of high quality" in order to be considered in the analysis. As explained in **Section 4.1** of the EIS, it is speculative to attempt to predict the specific nature or magnitude of such changes.

## Section 7 - Fire and Fuels

### Section 7.1 - Range of Alternatives

---

#### Summary

The BLM and Forest Service should examine the location and size of proposed fuel breaks in further detail as fuel breaks in large areas of intact sagebrush limit fire and related habitat destruction. Specifically, one commenter requests use of green-strips, including non-native species, for fuel breaks. Use of prescriptive fire as a management tool should be further examined.

Timelines for long-term fire management measures should be established in the FEIS. One commenter recommends that measures be implemented one year after the ROD. Implementation details of fire control measures should be specified. The BLM and Forest Service should acknowledge the importance of flexibility in fire management plans in the FEIS and allow for on-the-ground decision-making for effective fire management. Language within alternatives should be revised for clarity.

---

## Response

Before using prescribed fire, the BLM assesses local conditions for potential invasive plant invasion. **Section 4.6.2**, Nature and Types of Effects, notes that while prescribed fire does have beneficial uses, the presence of invasive plants and the potential for invasive plants to spread after a prescribed fire would need to be evaluated on a site-specific basis. Alternatives B and E specifically note that prescribed burns should occur at higher elevation in the absence of cheatgrass. If the BLM were to use prescribed fire, the area would be evaluated on a site-specific basis with the intention of preventing cheatgrass invasion.

---

### Section 7.2 - Best available information baseline data

---

#### Summary

The FEIS should include citations indicating that implementation of fuel breaks in sagebrush systems reduces the rate of fire spread. In addition, citations should be provided to support the use of prescribed fire to improve GRSG habitat. The BLM and Forest Service should recognize livestock grazing as an effective fire management tool due to its role in controlling invasive plants and decreasing fuel loads.

---

#### Response

The EIS affected environment section provides the appropriate information for the scope and scale of the project (see Section 1.4, NEPA Baseline Information of this report). However, upon BLM and Forest Service reviews and public comment suggestions, some sections in **Chapter 3** have been updated and revised to include clarifications or new information. The BLM and Forest Service could not find literature to support the use of prescribed fire in GRSG habitat. **Section 4.2.2**, Nature and Type of Effects, has been updated to include information about fuel breaks and prescribed fire, and to clarify the relationship between livestock grazing and fire.

---

### Section 7.3 - Impact Analysis

---

#### Summary

The DEIS does not contain sufficient analysis of indirect impacts of reduced grazing on fuel loads and related wildfire risk. Additionally, the analysis of impacts of fire suppression activities should be reexamined. It is particularly important that this analysis is clarified as lack of sufficient regulatory mechanisms for wildland fire was cited as a primary threat to GRSG in the FWS listing decision.

---

## Response

The impact analysis provides the appropriate information for the scope and scale of the project (see Section 1.6, NEPA Impact Analysis, of this report). Upon BLM and Forest Service reviews and public comment suggestions, some sections in **Chapter 4** have been updated and revised to include clarifications to the text. **Section 4.2.2** in the FEIS has been revised to clarify the impacts of reduced grazing on fuel loads.

In addition, impacts analysis discussion has been modified to clarify the impacts of different suppression measures proposed by the alternatives.

Close coordination with federal, state, and private firefighting personnel, local fire departments and local expertise, such as RFPAs, will improve strategies for initial attack and developing comprehensive suppression strategies to minimize and reduce the size of wildfires threatening PHMA and IHMA following ignition. The creation of RFPAs will ensure better and faster initial attack on wildfires threatening PHMA and IHMA through the employment of additional trained firefighters and resources in rural parts of the GRSG Management Area.

## Section 8 - Fish and Wildlife

### Section 8.1 - ESA Consultation

---

#### Summary

The BLM fails to address avoiding the potential to list the GRSG under the Endangered Species Act (ESA) and that the bird does not meet the criteria to be listed under the ESA.

---

#### Response

As stated in **Chapter 1, Section 1.1**, Background, in the FEIS, this plan amendment effort is the result of the July 2011, BLM National Greater Sage-Grouse Planning Strategy (BLM 2011). The Strategy responds to the March 2010, US Fish and Wildlife Service (USFWS) 12-Month Finding for Petitions to List the Greater Sage-Grouse (*Centrocercus urophasianus*) as Threatened or Endangered (75 Federal Register 13910, March 23, 2010) (2010 Finding). In the 2010 Finding, the USFWS concluded that GRSG was “warranted, but precluded” for listing as a threatened or endangered species.

## Section 9 - Lands and Realty

---

### Summary

The BLM should prohibit the construction of new permanent infrastructure within lands specially designated for GRSG protection, because studies show GRSG avoid areas with development.

---

### Response

The alternatives consider a range of alternatives regarding ROW avoidance and exclusion as presented in **Table 2-11** of the FEIS. Additionally, the Proposed LUPA Priority Habitat Management Areas (PHMAs) and General Habitat Management Areas (GHMAs) are designated as avoidance areas for high voltage transmission line ROWs, except for the transmission projects specifically identified in the Proposed LUPA alternative. All authorizations in these areas, other than the excepted projects, must comply with the conservation measures outlined in this proposed plan, including the RDFs and avoidance criteria presented in the Proposed Plan actions AD-3 and AD-4 of the Final EIS. The BLM is currently processing applications for Gateway West and Boardman to Hemingway Transmission Projects and the NEPA review for this project is well underway. The BLM is analyzing GRSG mitigation measures through the project's NEPA review process, which will include analysis of conservations measures (see **Section 4.8**).

## Section 9.1 - Range of Alternatives

---

### Summary

Commenters requested clarification regarding: types of exclusions, valid existing rights, aboveground fiber optic lines, and disposal under current land use plans.

Commenters also suggested additions to the range of alternatives considered and provided information on the feasibility of the alternatives (e.g., co-location, perch diverters, and burying lines).

Commenters noted that the document has contradicting management actions regarding geothermal development between lands and minerals sections.

Commenters noted that Alternative E did not adequately address the purpose and need.

---

### Response

The BLM and the Forest Service considered a reasonable range of alternatives during the GRSG planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM and the Forest Service consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and GRSG in the planning area, the BLM and the Forest Service fully

considered the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As a result, six alternatives were analyzed in detail in the DLUPA/EIS that best addressed the issues and concerns identified by the affected public. The range of alternatives in the DLUPA/EIS represented a full spectrum of options including a no action alternative (Alternative A).

Proposed avoidance and exclusion area designations vary by alternative, as presented in **Tables 2-9 and 2-11** of the FEIS. Under Alternative D, all new ROWs, unless specifically excluded, would be avoided, whenever possible, see D-LR-3. Required design features that would apply to specific types of facilities in GRSG habitat are located in **Appendix B**.

The Draft LUPA/EIS included an alternative that allows for placement of fiber optic lines on existing infrastructure (Alternative D, Actions LR-6 and LR-7 in **Table 2-11** of the FEIS).

Under Alternative D, LR-9 (see **Table 2-11**), new power lines outside of existing ROWs, would be buried, where feasible. Reclamation of lands, once facilities are removed, are part of standard BMPs, shown in **Appendix B** of the FEIS. Amendments to existing facilities that are otherwise excluded may be allowed under Alternative D, LR-6. Under Alternative D, lands currently identified for retention within priority GRSG habitat would be retained unless disposal of those lands would increase the extent or provide for connectivity of priority habitat (D-LR -19 and D-LR-21). Alternatives A through F propose retention of all utility corridors (**Table 2-11** of the FEIS).

Lands and minerals management actions did contradict on the topic of geothermal development (D-LR-3, page 2-162 of the DEIS and D-MLM-1, page 2-180 of the DEIS) and the FEIS corrects this contradiction.

The first of the assumptions under Lands and Realty Assumptions, **Section 4.8**, is that BLM and the Forest Service will recognize valid existing rights, as long as those ROWs comply with the terms and conditions of their ROW grant. The agencies will consider all safety concerns into all decisions to authorize a pipeline, including burying a transmission line.

See also Section 9, Lands and Realty, of this report, which further explains changes made to the Proposed LUPA alternative for allocations and management actions.

#### [Section 9.2 - Best available information baseline data](#)

---

### Summary

Commenters raised concerns with the baseline assumption (as noted in Ellis 1984 and Connelly et al. 2000) that power lines and other vertical structures increase perching opportunities for raptors and increase the potential for GRSG to abandon leks.

Commenters suggested that the BLM and the Forest Service should have considered several additional references in their analysis, related to the relationship between GRSG and transmission lines. For example, commenters noted the DEIS did not include studies that found underground powerlines have

*Idaho and Southwestern Montana Greater Sage-Grouse Proposed LUPA/Final EIS*

June 2015

more environmental impacts than overhead powerline placement.

Commenters questioned the data in **Table 3-36** of the DEIS, which includes the acreage of transmission lines within GRSG habitat.

---

## Response

Many reports have been prepared for the development of management recommendations, strategies, and regulatory guidelines. The National Technical Team report (NTT 2011), Conservations Objectives Team (COT; FWS 2013), and the Summary of Science, Activities, Programs and Policies that Influence the Rangeland Conservation of Greater Sage-Grouse (also referred to as the Baseline Environmental Report [BER]; Manier et al. 2013) are the most widely used reports that have been incorporated in BLM and Forest Service EISs that address the effects of implementing GRSG conservation measures on lands they manage. Additionally, the BLM and the Forest Service developed the Idaho and Southwestern Montana Greater Sage-Grouse LUPA/EIS with involvement from cooperating agencies, including Idaho Department of Fish and Game to ensure that a balanced multiple-use management strategy to address the protection of GRSG while allowing for utilization of renewable and nonrenewable resources on the public lands.

Management actions included in the Draft LUPA/EIS for the underground placement of powerlines are intended to reduce the potential for long-term impacts on GRSG habitat and species viability. Literature referenced in the FEIS demonstrates that overhead powerlines provide perching opportunities for ravens and other avian predators.

The BLM and Forest Service has reviewed scientific literature provided by commenters regarding the effects of powerlines on GRSG, buffers, perch diverters, and overhead versus burying lines, and the EIS has been revised, as appropriate in **Section 4.2**.

Transmission acreages came from the peer-reviewed Baseline Environmental Report (Manier et al. 2013).

## Section 9.3 - Impact Analysis

---

### Response

As described in Section 1.6 of this report, the DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Impacts to wind energy were discussed in the Draft LUPA/EIS **Chapter 4**, page 4-331. BLM groups Alternative A and Alternative E together in regards to impacts on wind energy. Under Alternative E, the BLM and the Forest Service would limit impacts from wind and solar energy development through the use of triggers in addition to the general stipulations identified in the GRSG section, as well as required design features. This is clarified in the FEIS (see **Section 4.2.5**).

Management actions included in the Draft LUPA/EIS for the co-location of new infrastructure in existing ROWs are intended to reduce the amount of surface disturbance in GRSG habitat and concentrate new development in habitat areas already affected by anthropogenic activities. The BLM and Forest Service recognize that co-location is not feasible in all circumstances, particularly for new powerlines. Requirements for colocation have been clarified in the proposed plan (AD-3 through AD-5).

## Section 10 - Leasable Minerals

### Section 10.1 - Range of alternatives

---

#### Summary

The DEIS needs a better explanation on how valid existing rights are defined and how they will be protected, including fringe or preference right leases. The alternatives need to follow the NTT report recommendations more closely, as well as reflect current USFWS policy recommendations.

The BLM needs to clarify the location of non-leased Known Phosphate Areas in relation to GRSG habitat. The plan is potentially more restrictive to phosphate leasing than a listing under the ESA and did not properly define the environmental baseline for leasable minerals. Without prohibiting new phosphate mining in GRSG habitat, the LUPA does not protect GRSG from the potential impacts of selenium being released to the environment and poisoning wildlife, including GRSG, through transport in air and water and subsequent bioaccumulation. The EIS fails to explain or discuss the authority that the BLM has to close public lands to leasable mineral prospecting and leasing under the LUPA process under Alternatives B, C and D.

The reliance upon vague RDFs under Alternative D is a failure of the BLM to adopt best science that calls for specific restrictions based on observed GRSG response to surface disturbances.

---

#### Response

The BLM and the Forest Service considered a reasonable range of alternatives during the GRSG planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM and the Forest Service consider reasonable alternatives that would avoid or minimize adverse

*Idaho and Southwestern Montana Greater Sage-Grouse Proposed LUPA/Final EIS*

June 2015

impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and GRSG in the planning area, the BLM and the Forest Service fully considered the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As a result, six alternatives were analyzed in detail in the DLUPA/DEIS that best addressed the issues and concerns identified by the affected public. The DLUPA/DEIS includes alternatives that provide a greater and lesser degree of restrictions in various use programs, but would not eliminate or invalidate any valid existing development rights. BLM agrees that it cannot impose an NSO on an existing lease. A definition of valid and existing rights has been added to the glossary in the FEIS.

**Figure 3-13** has been improved to show phosphate lease status and KPLAs relative to GRSG habitat. There is no PHMA in the "phosphate patch" and IHMA only in the KPLA west of Bear Lake. There is some GHMA, northwest of Soda Springs, but not within KPLAs.

There are no existing leases in the ACECs proposed by Alternative C in the DEIS. In Alternative F (**Figures 2-45** and **2-46** in the DEIS), there are existing geothermal leases in the Raft River Valley, in the South Magic Valley ACEC (ID-04). There is moderate oil and gas potential in the Bear Lake part of the East Idaho Uplands proposed ACEC (ID-12). There are geothermal leases in the West Central proposed ACEC (ID-11).

Selenium bioaccumulation is not identified by the US Fish and Wildlife Service or the NTT Report as a major threat to GRSG and is not part of the conservation strategy being applied by the BLM. No change to the EIS has resulted from this comment.

According to 43 CFR 3501.17 and H-1601-1, Land Use Planning, the BLM has the authority to close areas to non-energy leasable mineral prospecting and leasing. The regulations providing this authority do not need to be described in the EIS because they are outlined in the CFR and describing all governing regulations in the EIS would be impracticable.

KPLAs are areas known to contain a valuable deposit of phosphate. Their only significance is that those lands must be leased competitively. A person can obtain a non-competitive phosphate lease on lands outside KPLAs, but only through a successful prospecting program.

Upon review of the preferred alternative, public comments, and coordination with project cooperating agencies, the Proposed LUPA includes allocations for PHMA to be closed for non-energy leasable minerals, while IHMA and GHMA would be open.

The RDFs were adopted from BMPs in Appendix D of the NTT report. In that appendix, it states that "BMPs are continuously improving as new science and technology become available and therefore are subject to change. Include from the following BMPs those that are appropriate to mitigate effects from the approved action." Wording from NNT report has been added to the discussion of RDFs in the FEIS.

## Section 10.2 - Best available information baseline data

---

## Summary

The oil and gas conditions in the Payette area are different than those studied in the NTT report and should not be used as baseline data. The impacts described by Johnson et al. 2011 are overstated and should be replaced by information from Coates et al. 2013.

---

## Response

The reasonably foreseeable development scenario for oil and gas assumes a conventional oil and gas field, as unconventional fields have not been discovered nor are they anticipated to be discovered in Idaho. The current development occurring in the Payette area of Idaho is not within GRSG habitat.

Under the Proposed LUPA, areas within SFAs would be open to fluid mineral leasing and development and geophysical exploration subject to NSO without waiver, exception, or modification. Areas within PHMA and IHMA would be open to mineral leasing and development and geophysical exploration subject to NSO with a limited exception (FLM-3). GHMA would be open to mineral leasing and development and geophysical exploration subject to CSU which includes buffers, seasonal timing restrictions and standard stipulations. Additionally, the Proposed LUPA would incorporate required design features and best management practices appropriate to the management area as COAs when post leasing activity is proposed into any post-lease authorizations.

## Section 10.3 - Impact Analysis

---

### Summary

The analysis in the DEIS describing impacts on leasable mineral development is insufficient.

---

### Response

The acres of unleased KPLA land unavailable for development by alternative has been corrected in the Chapter 4 tables in the FEIS. The section describing the impacts from leasable minerals management for Alternative E has been revised. The impacts of non-energy leasable minerals management actions to socio-economics have been included in the FEIS and the impacts with respect to disturbance caps have been analyzed in more detail.

## Section 10.4 - Cumulative impact analysis

---

### Summary

The DEIS did not adequately analyze cumulative impacts of management actions on leasable mineral

development, including impacts to the Western Phosphate Field, the American agriculture industry, and national food security.

---

## Response

The BLM and the Forest Service thoroughly explained their consideration and analysis of cumulative effects in the LUPA/FEIS in **Section 5.2.8**. The LUPA/FEIS considered the present effects of past actions, to the extent that they are relevant, and present and reasonably foreseeable (not highly speculative) Federal and non-Federal actions, taking into account the relationship between the proposed alternatives and these reasonably foreseeable actions. This discussion summarizes CEQ guidance from June 24, 2005, stating that "[g]enerally, agencies can conduct an adequate cumulative effects analysis by focusing on the current aggregate effects of past actions without delving into the historical details of individual past actions." This is because a description of the current state of the environment inherently includes the effects of past actions. Information on the current conditions is more comprehensive and more accurate for establishing a useful starting point for cumulative effects analysis. The CEQ interpretation was accepted by the Ninth in *NW Env'tl. Advoc. v. Nat'l Marine Fisheries Serv.*, 460 F.3d 1125, 1141 (9th Cir. 2006). The BLM and the Forest Service explicitly described their assumptions regarding proposed projects and other reasonably foreseeable future actions. On National Forest System lands, reasonably foreseeable actions are those that would occur under their current land use plans from a broad-scale perspective.

Additional information on the cumulative impacts on the Western Phosphate Field, unleased KPLAs, socio-economic impacts from loss of phosphate resources, reasonably foreseeable actions, and proposed conservation measures have been added to **Sections 5.2.8** and **5.2.14** (minerals and socio-economics cumulative impacts, respectively).

## Section 11 - Livestock Grazing

---

### Summary

Commenters noted that retirement of grazing permits is not necessarily permanent and highlighted several effects of permit retirement. Further, there is a limit to BLM's ability to devote grazing districts to purposes other than grazing.

---

### Response

FLPMA grants the Interior Secretary the authority to make land use planning decisions, taking into consideration multiple use and sustained yield, present and potential uses of the land, relative scarcity of values, and long-term and short-term benefits, among other resource values (43 USC 1711 Sec 201 (a)). BLM land use planning regulations, found at 43 CFR § 4100.0-8 provides that the BLM shall manage livestock grazing on public lands in accordance with applicable land use plans. The BLM may designate

*Idaho and Southwestern Montana Greater Sage-Grouse Proposed LUPA/Final EIS*

June 2015

lands as "available" or "unavailable" for livestock grazing through the land use planning process (H-1601, Land Use Planning Handbook, Appendix C). A decision to make lands unavailable for livestock grazing is not permanent. It is subject to reconsideration, modification and reversal in subsequent land use plan decisions. BLM land use plans may make some, or all, of the land within grazing districts unavailable for grazing during the life of the plan. Further, land use plans may impose restrictions and limitations on grazing or any other grazing management related action intended to achieve the land use planning goals and objectives (H-1601, Land Use Planning Handbook, Appendix C).

A "chiefly-valuable-for-grazing" determination was originally made for most of the public lands pursuant to the Taylor Grazing Act ("TGA," see, 43 USC § 315a). This determination need only be revisited when the Secretary is considering creating or changing grazing district boundaries. Such a determination is neither required nor appropriate when establishing grazing levels within a district during FLPMA land use planning. (*See* USDI Solicitor Opinion, "Clarification of M-37008, May 13, 2003"). This RMP is not considering creating or changing grazing district boundaries. Although lands have been identified as "chiefly-valuable-for-grazing" per the TGA for purposes of establishing grazing districts within the public domain. This TGA determination does not contradict the BLM's authority or responsibility to manage those lands to achieve resource condition goals and objectives identified during land use planning as required by FLPMA's multiple use and sustained yield mandate.

## Section 11.1 - Range of alternatives

---

### Summary

Multiple commenters requested that the alternatives require closure of voluntarily relinquished allotments. Commenters questioned why changes to grazing management are needed when livestock grazing is not listed as a primary threat to GRSG. More than one commenter noted that grazing should only be restricted where it can be shown that grazing is directly related to the failure to meet GRSG habitat objectives. Additionally, commenters stated that the DEIS failed to consider increased grazing and question the rationale behind this decision. Some commenters also requested additional consideration of reduced grazing levels and utilization levels, as well as temporary or permanent closure of all or some GRSG habitat to grazing.

Several commenters requested that the LUPA/EIS provide specifics regarding habitat assessment schedules and application of standards, use ecological site descriptions, require immediate application of certain terms and condition to permits, and impose grazing restrictions for priority or general habitat.

### Response

The Idaho and Southwestern Montana Greater Sage-Grouse LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA. See response in Section 1.3 NEPA Range of Alternatives of this report. The DEIS analyzed a range of alternatives including no grazing and a 25 percent reduction in grazing. Reduction in AUMs under

*Idaho and Southwestern Montana Greater Sage-Grouse Proposed LUPA/Final EIS*

June 2015

Alternative F would be specified in site specific decisions at the permit renewal level. Language in the FEIS for Alternative F reduction has been clarified.

Livestock grazing is identified by USFWS as a threat to GRSG in the March 23, 2010 Federal Register Notice, and therefore it is addressed in this LUPA. Existing regulatory mechanisms, including the fundamentals for rangeland health, would continue to provide the basis for managing grazing in GRSG habitat. However, the proposed plan would provide additional consistency in application of BLM rangeland health standards and guidelines relative to GRSG habitat, and would provide additional guidance for prioritizing land health assessments and review of grazing permits to ensure that grazing management is compatible with attainment of GRSG habitat objectives within the planning area. In addition, RDFs and best management practices would be adopted to reduce effects of range improvements and livestock trailing across public lands. Grazing use would be modified when it is identified as the cause for not meeting GRSG objectives. The intent of the land use plan amendment is to change management under all resource programs, where necessary, to benefit GRSG habitat. Standards and Guidelines assessments result in a determination of causal factors for non-achievement of any applicable standard, including standards for wildlife habitat. Where livestock management is determined to be a causal factor for non-achievement of a standard, management must be modified to conform with applicable guidelines.

The BLM is required to follow the grazing regulations, including the decision process at 43 CFR 4160, when modifying permit or leases. Upon BLM review of the public comments and input from cooperating agencies, the grazing management actions has been revised and clarified in the Proposed LUPA (see management actions RM-1 through RM-19), and includes additional guidance as to how the BLM will incorporate GRSG decisions from the amendment into grazing permits and leases.

## Section 11.2 - Best available information baseline data

---

### Summary

Multiple commenters asserted and presented citations supporting their position that grazing has the potential to benefit GRSG by controlling cheatgrass and reducing wildfire risk. Other commenters presented citations supporting the position that grazing damages GRSG habitat and increases cheatgrass risk.

Several commenters requested more detailed information about current grazing management and habitat conditions in the planning area.

Other commenters noted the importance of ranching in the local economy, and also that ongoing collaboration between private ranchers and federal agencies has helped preserve GRSG habitat and should be acknowledged in the EIS.

### Response

---

Before beginning the LUPA/EIS and throughout the planning effort, the BLM and the Forest Service considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of

data necessary to support informed management decisions at the land-use plan level. The BLM and the Forest Service also used the most recent and best information available that was relevant to a land-use planning-level analysis (refer to response in Section 1.4, NEPA Baseline data- Best Available Science, in this report for additional information).

**Section 3.3**, discusses the current level of grazing in the planning area and management systems in place. Impacts of current and historic grazing on other resource and resource uses are discussed under the appropriate resource and resource use headings (i.e. **Section 3.2**, Special Status Species - Greater Sage-Grouse). **Section 4.2.2** in the DEIS provides an overview of the ecological impacts of livestock grazing. The DEIS analyzed the effects of no grazing and reduced grazing on components of sage-grouse habitat, including changes in wildfire risk and cheatgrass incursion. See changes to **Section 3.7**, Wildland Fire Management, for additional discussion of cheatgrass-wildfire dynamics. Discussion of socioeconomic impacts of current grazing operations in the planning area is discussed in **Section 3.23**, Socioeconomics.

Additional language has been added to the FEIS (**Section 4.5**) recognizing the role of Rural Fire Protection Associations and other collaboration efforts

### Section 11.3 - Impact Analysis

---

#### Summary

Some comments detailed beneficial impacts of grazing, and the adverse impacts of grazing restrictions to livestock operations, Rangeland Fire Protection Associations, and the local economy.

One commenter notes that limitations on water developments can have impacts on grazing management and need to be clarified and analyzed in greater detail.

---

#### Response

Impacts to livestock grazing from current livestock grazing management are addressed in **Section 4.6** of the DEIS. Impacts to the socioeconomic aspect of livestock grazing are discussed in **Section 4.15** of the DEIS.

While a land use planning-level action is broad in scope and, therefore, does not require site-specific impact analysis, a thorough review of the EIS's impact analysis relevant to grazing and indirect socioeconomic impacts and was found to need additional information and support for the conclusions/findings. The BLM and the Forest Service have updated this information in the Proposed Land Use Plan Amendment/FEIS to provide the necessary information to make informed land use plan-level decisions (see changes in **Section 4.15**). Impacts to Rangeland Fire Protection Associations

are discussed in **Section 4.5**, Wildland Fire Management. BMPs for livestock developments including water have been revised in the FEIS and related impacts on livestock grazing management have been clarified.

## Section 12 - Locatable Minerals

### Section 12.4 - Cumulative impact analysis

---

#### Summary

The DLUPA/DEIS fails to adequately analyze the cumulative impact of locatable mineral withdrawals across the GRSG range.

---

#### Response

Due to the variation in types of minerals and occurrence and development potential across the range, and the types of data available for the planning area compared to the entire GRSG range, cumulative impact analysis across the entire GRSG range would not provide meaningful, appropriate analysis. The total number of acres proposed for withdrawal under certain alternatives is included in each of the Great Basin sub-region Draft LUPA/EISs. The Draft LUPA/EIS has met the NEPA/CEQ requirements for cumulative impacts analysis in each of the respective sub-regional EISs. Information explaining the rationale behind the chosen geographic extent of the cumulative impact analysis area has been added to **Section 5.3.8**, Locatable Minerals, of the Final EIS.

## Section 13 - Recreation

### Section 13.1 - Range of alternatives

---

#### Summary

In the LUPA/EIS, the BLM and Forest Service should incorporate additional management actions (e.g. Special Recreation Permit/Special Use Permit stipulations, OHV noise regulations, seasonal restrictions on OHV events near leks, rerouting of OHV events away from leks, and hunting) to limit the potential for impacts on GRSG from recreation activities. Any management actions limiting recreation activities in GRSG habitat should be based on the best available science with proven habitat conservation results.

---

#### Response

The EIS considers an adequate range of alternatives to protect GRSG, including varying levels of restriction on recreational activities and Special Recreation Permits/Special Use Permits (see **Table 2-11** and proposed plan management REC-1 and REC-2). During subsequent implementation-level travel management planning, new travel management plans would evaluate vehicle routes and determine the need for permanent or seasonal road closures, and mode of travel (e.g. motorcycle, ATV, and UTV) restrictions, including speed. New travel management plans would evaluate vehicle routes and determine the need for permanent or seasonal road closures, and mode of travel (e.g. motorcycle, ATV, and UTV) restrictions during subsequent implementation level travel management planning. 43 CFR 8340 requires all OHVs to comply with state laws including noise and spark arrester requirements (see proposed plan management TM-3, TM-4, and **Appendix L**).

Contemporary hunting seasons in the Idaho and Southwest Montana Sub-region are very conservative with respect to their length and bag limits. **Sections 1.5.3** and **2.11.2** of the FEIS describe why detailed analysis of hunting and elimination of hunting are outside the scope of this planning effort.

## Section 14 - Socioeconomics and Environmental Justice

### Section 14.3 - Impact Analysis

---

#### Summary

The socioeconomic analysis in the DEIS is overly broad and does not provide sufficient analysis of impacts to individuals, local communities or counties. The DEIS should also expand analysis of the restrictive management actions on planning area operators, communities and services including but not limited to grazing operators and mining.

Finally, the analysis methodology is inadequate to provide a comprehensive analysis of direct, indirect, and cumulative analysis of the socioeconomic impacts on the planning area communities.

---

#### Response

As described in Section 1.6, of this report, the DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that

the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Impacts were considered on numerous resources, resource uses, and socioeconomic conditions, which included grazing, recreation, and mineral development, among others (**Section 4.15** of the FEIS). A county by county IMPLAN analysis is less desirable or not feasible for those resources analyzed with IMPLAN, as the input data is often not available at the county level. In addition, a discussion of impacts at the county level does not capture the indirect and induced impacts that occur beyond county borders.

The DLUPA/EIS describes the methodology and assumptions used for conducting the impact analysis (see **Section 4.15.1** of the FEIS). The methodology and assumptions provide an adequate starting point for discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.24, the DLUPA/EIS identified methodologies used and made reference to the scientific and other sources relied upon for conclusions in the analysis. Based on these methodologies and assumptions, the DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

## Section 15 - Soil

### Section 15.2 - Best available information baseline data

---

#### Summary

One commenter notes that the DEIS lacks references to support discussion of macrobiotic crusts.

---

#### Response

Chapters 3 and 4 in the FEIS have been revised to include additional references to support the discussion of macrobiotic crusts.

## Section 16 - Travel Management

### Section 16.1 - Range of alternatives

---

#### Summary

The Draft LUPA/EIS failed to consider a full suite of travel management-related management actions that would protect GRSG habitat while allowing for continued administrative access, particularly for existing livestock grazing permittees. Commenters proposed that management actions should be

included in the proposed plan to prohibit and reclaim/restore roads in GRSG habitat, limit motorized events, close PPH to OHV use, apply additional seasonal travel restrictions, and apply a maximum route density within proximity of leks in PPH and PGH. Commenters also requested that proposed management actions preserve motorized access on existing routes per the 3-State OHV and National Route Designation decisions and maintain administrative access in grazing allotments.

---

## Response

**Section 1.4** of the FEIS describes how the Idaho and Southwestern Montana Greater Sage-Grouse LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA. The BLM and Forest Service complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this Draft LUPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions from the field office RMPs are acceptable and reasonable. In these instances, there was no need to develop alternative management prescriptions.

During subsequent implementation-level travel management planning new travel management plans would evaluate vehicle routes and determine the need for permanent or seasonal road closures, and mode of travel (e.g. motorcycle, ATV, and UTV) restrictions, including noise levels and speed. The route designation process will be completed as subsequent implementation level planning using current travel management policies and will include public and local agency involvement. Addressing these issues at the implementation level allows the BLM and Forest Service to take new information into account as it becomes available.

Needs for administrative access to valid existing rights, grandfathered uses, or permitted activities would be taken into consideration during site-specific NEPA analysis. Restrictions applied to recreational OHV use may not apply to permitted administrative uses.

The BLM and Forest Service have not added a restriction that would limit road densities to less than 0.09 km per km<sup>2</sup> (Wisdom et al. 2011) in GRSG habitat because the threshold established by Wisdom used coarse road data. When taking into consideration actual road density information, use of this threshold is not appropriate. Based on the GRSG Monitoring Framework, the Proposed LUPA includes surface disturbance direct areas of influence when calculating acreage for the disturbance cap, which would include consideration of existing disturbance (e.g., existing roads) when determining whether a project should be deferred or permitted.

## Section 16.2 - Best available information baseline data

## Summary

**Chapter 3** of the Draft LUPA/EIS does not depict the number of acres designated as open to cross-country motorized travel.

---

## Response

Current travel management designation acres have been added to **Section 3.10** of the FEIS.

## Section 16.3 - Impact Analysis

---

### Summary

For various reasons, commenters asserted that the Draft LUPA/EIS did not adequately analyze the impacts of proposed management actions on travel management. For example, commenters contend that the analysis is not based on sound science or is narrowly focused and uses studies that only demonstrate the negative effects from OHV use; does not adequately describe the magnitude of OHV vs. “naturally occurring” impacts across alternatives; and does not distinguish between motorized and non-motorized impacts. Commenters further request the BLM and Forest Service consider conducting site-specific studies to support proposed management and assert that there would be indirect effects (e.g., ban on new road construction) incurred by existing ROW authorization holders by deferring travel management planning.

---

### Response

As described in Section 1.6 of this comment report, the LUPA/FEIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. Further, as described in Section 1.4 of this comment report, the BLM used the most recent and best available information that was relevant to a land use planning-level analysis.

The mechanism being used to determine landscape-level travel area designations (open/limited/closed) is 43 CFR 8340 which regulates OHV travel on public lands. BLM does not have a similar regulation for non-motorized travel. Non-motorized travel can be regulated through supplementary rules. Supplemental rules and site specific route designations will be addressed at the implementation level in the future.

New construction related to power line access would be exempted under 43 CFR 8340.05 (3).

While multiple studies on OHV use have been cited, BLM is using the BLM Travel Management Manual and Handbook (M-1626 & H-83421) to address travel planning in the EIS and will continue to

use the same policy for future implementation and planning.

## Section 16.5 - Mitigation measures

---

### Summary

The LUPA/EIS should adopt additional travel-related mitigation measures to educate the public and prevent the spread of invasive species from travel-related sources through mitigation measures such as those described at [playcleango.org](http://playcleango.org).

---

### Response

The BLM and Forest Service reviewed the measures provided by commenters on [playcleango.org](http://playcleango.org). The measures were found to be similar to those already provided in **Appendix B**, RDFs, of the Proposed LUPA/FEIS. Results from reviewing the impact analysis confirmed that the outcomes from the suggested mitigation measures would be the same as those described in the Draft LUPA/EIS, therefore no change is needed.

## Section 17 - Tribal Interest

### Section 17.1 - Consultation requirements

---

#### Summary

The BLM should consider additional areas for ACEC designation and should consult with the Shoshone-Bannock Tribes about these designations.

---

#### Response

The BLM and Forest Service recognize their responsibility to ensure that meaningful consultation and coordination concerning GRSG planning is conducted with federally recognized tribes, including the Shoshone-Bannock Tribes, to consider tribal treaty rights and trust resources. Tribal consultation is described in **Chapter 6** of the FEIS.

### Section 17.4 - Impact Analysis

---

## Summary

The BLM must ensure tribes, in particular the Shoshone-Bannock Tribe, maintain opportunities to access the public domain, exercise off-reservation treaty rights, and continue their traditional customs and practices.

---

## Response

The BLM and Forest Service recognize their responsibility to consider potential impacts to Tribal resources.

Article 4 of the Fort Bridger Treaty, signed in 1868, retains the Eastern Band Shoshone and Bannock Tribes' rights to hunt, fish, gather natural resources, and provide other associative right necessary to effectuate these rights. Other treaties ensure similar rights for other tribes. These rights will be respected throughout the planning and implementation processes.

## Section 18 - Vegetation Sagebrush

### Section 18.1 - Range of alternatives

---

## Summary

Commenters recommended that the preferred alternative include:

- Specific vegetation treatment acreage objectives
- Passive sagebrush restoration
- Limitations on vegetation treatments in sagebrush areas. To meet COT report objectives, include regulatory mechanisms to avoid sagebrush removal or manipulation in sage-grouse breeding or wintering habitats with minor exceptions.
- Establish priorities for pinyon-juniper removal including reduced grazing in conjunction with pinyon-juniper treatment.
- Restore non-native seedings to increase GRSG habitat
- Apply additional restrictions for herbicide application in GRSG habitat
- Commit to a program to plan, fund, execute and monitor large scale integrated invasive species infestation and eradication projects in a measurable timeframe.
- Include specific objectives to measure success in invasive species eradication

---

## Response

As described in Section 1.3 of this comment report, the Idaho and Southwestern Montana Greater Sage-Grouse LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA.

Some of the recommended components were addressed in the DEIS and additional information has

*Idaho and Southwestern Montana Greater Sage-Grouse Proposed LUPA/Final EIS*

June 2015

been included in the FEIS as detailed below.

- Specific vegetation treatment acreage objectives are presented in the vegetation modeling results (**Table 2-5**). Additionally, the Proposed LUPA includes a vegetation objective stating that in all SFAs and PHMAs, the desired condition is to maintain a minimum of 70 percent of lands capable of producing sagebrush with 10 to 30 percent sagebrush canopy cover. The attributes necessary to sustain these habitats are described in *Interpreting Indicators of Rangeland Health* (BLM Tech Ref 1734-6).
- Passive sagebrush restoration is included in Alternative C of the DEIS. In some areas passive restoration may not be sufficient to improve GRSG habitat and active restoration may be necessary (Davies et al. 2011) (see pp 4-8, 4-9, 4-54, and 4-101 of the DEIS).
- Limitations on vegetation treatments (e.g., prescribed fire) in sagebrush areas, including winter range, is included in Alternative D (See FM-2, FM-6, FM-13, and VEG-2 in **Table 2-11** of the FEIS). To meet COT report objectives, include regulatory mechanisms to avoid sagebrush removal or manipulation in sage-grouse breeding or wintering habitats with minor exceptions. In addition, VEG-2 states: Implement vegetation rehabilitation or manipulation projects to enhance sagebrush cover or to promote diverse and healthy grass and forb understory to achieve the greatest improvement in GRSG habitat based on Wildfire and Invasive Species Assessments, HAF assessments, other vegetative assessment data and local, site specific factors that indicate sagebrush canopy cover or herbaceous conditions do not meet habitat management objectives (i.e. is minimal or exceeds optimal characteristics). This may necessitate the use of prescribed fire as a site preparation technique to remove annual grass residual growth prior to the use of herbicides in the restoration of certain lower elevation sites (e.g., Wyoming big sagebrush) but such efforts will be carefully planned and coordinated to minimize impacts to GRSG seasonal habitats.
- Priorities for pinyon-juniper removal are addressed in the DEIS. BLM and Forest Service would remove standing and encroaching trees within at least 3 km of occupied sage-grouse leks and other habitats (e.g., nesting, wintering and brood rearing) to reduce the availability of perch sites for avian predators, as resources permit (see **Appendix B**). Management changes to grazing could be considered under proposed plan management action VEG-4.
- Alternative C in the DEIS supports restoration of native vegetation to areas that have been seeded with non-native species (C-VG-7, **Table 2-11** of the FEIS). The proposed plan provides direction for restoring non-native seedings (see VEG-7).
- Herbicide/Pesticide BMPs are covered under the Vegetation Treatment PEIS (BLM 2007). The Idaho and Southwestern Montana Greater Sage-Grouse LUPA/EIS tiers to the analysis in this document.
- This EIS is intended to provide guidance regarding treatment methods, priorities, objectives, and the conditions under which these treatment objectives would occur. Specifics regarding treatment effectiveness, funding and implementation would be covered in site-specific management actions. BLM and Forest Service would follow agency-specific monitoring requirements.

## Section 18.2 - Best available information baseline data

---

### Summary

The DEIS fails to provide adequate baseline information related to sagebrush vegetation. Commenters questioned the source of BLM data and requested the FEIS utilize additional baseline data on cheatgrass

extent and evaluate effectiveness of continuing programs against weeds and juniper encroachment. Commenters provided additional literature to consider. Commenters also advocated an adaptive approach to vegetation management based on site-specific habitats.

---

## Response

As described in Section 1.4 of this comment report, the BLM and Forest Service considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land use plan-level.

Adaptive management has been incorporated into the Proposed LUPA, as noted above in Section 1.9, Mitigation Measures. The Proposed LUPA incorporates hard and soft triggers, and were developed to inform the BLM and Forest Service as to when the Federal agency needs to respond (take action) to address a declining trend in GRSG or GRSG habitat. Adaptive management would allow BLM increased flexibility to adjust programs based on data collected during operation, to respond to changing conditions and improve effectiveness of vegetation management programs.

The BLM and Forest Service has clarified the vegetation modeling and data sources in **Appendix X**.

## Section 18.3 - Impact Analysis

---

### Summary

Commenters express concern about unintended or undesirable impacts of vegetation management programs to control weeds or restore sagebrush habitat. The DEIS inadequately analyzes impacts from vegetation restoration.

---

### Response

As described in Section 1.6 of this comment report, the DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives.

## Section 18.4 - Cumulative impact analysis

---

### Summary

BLM's cumulative impacts analysis for vegetation failed to consider the impacts of limited resources on GRSG protection.

---

## Response

Funding and availability of resources is outside the scope of this EIS.

## Section 18.5 - Mitigation measures

---

### Summary

Commenters requested detailed plans of action and clarification on mitigation and monitoring, including timing of re-seeding and restoration after fire.

---

### Response

Mitigation is detailed in **Appendix J**. The Mitigation Framework is incorporated in the Idaho and Southwestern Montana Greater Sage-Grouse LUPA/EIS and was developed to achieve a net conservation gain to the species by implementing conservation actions. Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can help achieve the greatest conservation benefit for GRSG and its habitats.

If impacts to GRSG or its habitat from authorized land uses remain after applying avoidance and minimization measures, then compensatory mitigation projects will be used to fully offset impacts to achieve conservation benefits. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation.

Specific mitigation strategies, based on the Mitigation Framework, will be developed by regional teams within one year of the issuance of the Record of Decision and be consistent with the BLM's Regional Mitigation Manual MS-1794, Forest Service Handbook FSH 1909.15, and CEQ regulations at 40 CFR 1508.20.

Mitigation measures for specific projects are implementation-level decisions and will be included in site-specific analysis which is outside the scope of this EIS.

## Section 19 - Vegetation Riparian

### Section 19.1 - Range of Alternatives

---

#### Summary

The BLM and Forest Service should consider additional management approaches for riparian vegetation, including removal of invasive tamarisk, limitations on or removal of livestock grazing, and maintenance of GRSG habitat objectives.

---

#### Response

As described in Section 1.3 of this comment report, the Idaho and Southwestern Montana Greater Sage-Grouse LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA. Habitat objectives for riparian areas are described in HM-Obj-2 and **Table 2-3**. A reasonable range of management for riparian areas is presented in **Table 2-11**, LG/RM-29 through LG/RM-33.

### Section 19.2 - Best Available Info Baseline Data

---

#### Summary

The BLM should disclose baseline data related to Proper Functioning Condition (PFC) of riparian areas in GRSG habitat and the BLM should address whether PFC protects stability of riparian habitat for GRSG.

The BLM should also modify current PFC assessment methods to address GRSG needs, and should focus on site-specific management of riparian habitat to balance competing uses.

---

#### Response

Comprehensive PFC data is not available on a sub-regional level but is displayed when available. PFC of riparian systems according to BLM Manual 1737 includes stabilization of streambanks, maintenance of ponding, reduction in erosion, and other features beneficial to GRSG. Modifications to PFC methods and descriptions of site-specific management are outside the scope of this planning effort.

### Section 19.5 - Mitigation Measures

---

## Summary

The BLM should modify current PFC assessment methods to address GRSG needs. In addition, the BLM should focus on site-specific management of riparian habitat to balance competing uses.

---

## Response

PFC of riparian systems according to BLM Manual 1737 includes stabilization of streambanks, maintenance of ponding, reduction in erosion, and other features beneficial to GRSG.

Adaptive management has been incorporated into the Proposed LUPA, as noted above in Section 1.9, Mitigation Measures. The Proposed LUPA incorporates hard and soft triggers, and were developed to inform the BLM and Forest Service as to when the Federal agency needs to respond (take action) to address a declining trend in GRSG or GRSG habitat. Adaptive management would allow BLM increased flexibility to adjust programs based on data collected during operation, to respond to changing conditions and improve effectiveness of vegetation management programs. Site-specific management is outside the scope of this effort.

## Section 20 - Water

### Section 20.3 - Impact Analysis

---

## Summary

The EIS fails to address impacts on the soil and watershed conditions resulting from grazing-sourced manure, soil erosion and pathogen contamination under each alternative and to provide appropriate mitigation measures. Such an analysis should include a list of impaired waters and the sources of contamination for those waters. The EIS also fails to address the negative impact on GRSG of restricting or removing water developments under Alternative D.

---

## Response

During preparation of the EIS, it was determined that impacts on soil and water from management actions in the LUPA would be negligible or beneficial and thus did not warrant an extensive analysis in **Chapter 4**. Analysis of impacts on soil and water would be conducted during the NEPA review of implementation-level projects.

**Section 4.2.2** has been revised to include impacts from restriction/removal of water developments.

## Section 21 - Wild Horse and Burros

---

### Summary

Livestock and wild horses were inappropriately grouped together in management actions. Some commenters were also concerned with the 25 percent proposed reduction of AML under Alternative F and the basis for reduction; they requested reevaluation of reduction based on the fact that wild horse habitat overlaps a minimal percentage of GRSG habitat.

The proposed management should provide flexibility to increase AML/AUM and/or open HAs if data becomes available demonstrating that genetic viability of wild horses and burros is threatened.

Commenters also stated that the preferred alternative would give the BLM too much discretion to reduce AMLs or zero out HMAs which would violate the BLM's legal mandate to protect WHB.

---

### Response

The BLM and the Forest Service considered a reasonable range of alternatives during the GRSG planning process in full compliance with the NEPA. See Section 1.3, NEPA Range of Alternatives, in this report for an expanded explanation on what constitutes a reasonable range of alternatives.

The BLM protects, manages, and controls wild horses in accordance with the Wild Free-Roaming Horses and Burros Act of 1971 (Public Law 92-195, as amended), the purpose of which is to "manage wild horses and burros within herd management areas (HMAs) designated for their long-term maintenance, in a manner designed to achieve and maintain a thriving natural ecological balance (TNEB) and multiple use relationships." The FLPMA directs the BLM to manage wild horses and burros as one of numerous multiple uses including mining, recreation, domestic grazing, and fish and wildlife. It also required a current inventory of wild horses and burros. Additional guidance is found in 43 CFR 4700, Protection, Management, and Control of Wild Free-roaming Horses and Burros.

Adjusting AML and/or opening HAs is outside the scope of this project. However, adjusting AML does fall within the legal mandate of the BLM to protect WHB and other resources. Through the BLM's program of monitoring and analysis of data, AMLs have been established and will continue to be adjusted based on available data. AMLs can be adjusted based on the limitations and capability of the range, including the four habitat components (forage, water, cover, and space), while managing for healthy populations of WHBs in balance with other uses and resources (including GRSG). An explanation of the relationship between AMLs and AUMs has been included in the FEIS in **Section 3.6**.

### Section 21.1 - Best available information baseline data

---

## Summary

The BLM should provide documentation of critical genetic data on each of the wild horse and burro herds in the planning area. This will provide BLM basis for identifying which HMAs would not be feasible to place AML reductions on while maintaining genetically viable herds. The BLM should also provide exact population data for all wild horse populations in HMAs and HAs and clearly defined maps of HMAs and HAs. Finally, any land policy changes resulting from the GRSG plan must be in conformance with the National Academy of Sciences 2013 recommendations for reform of the federal wild horse management program.

---

## Response

The prerequisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The baseline data provided in **Chapter 3** and various appendixes in the Draft LUPA/DEIS is sufficient to support, at the general land use planning-level of analysis, the environmental impact analysis resulting from management actions presented in the Draft LUPA/DEIS. A land use planning-level decision is broad in scope and, therefore, does not require an exhaustive gathering and monitoring of baseline data (see response to Section 1.4 in this report for more details).

Much of the data in the DLUPA/EIS is presented in qualitative and map form, and is sufficient to support the coarse-scale analyses required for land use planning. The FEIS includes a map of HMAs and HAs (**Figure 3-2**). Population data is included in **Table 3-19** of the DEIS. These maps and tables have been reviewed for accuracy prior to inclusion in the FEIS.

Genetic documentation of WHB is an ongoing implementation level process used to monitor the genetic health of BLM's wild horse and burro populations (see BLM IM 2009-061).

The National Academy of Sciences report has been considered in the development of the FEIS and actions appropriate to the land management planning level included as appropriate. Findings of the National Academy of Sciences would also be considered under separate site-specific NEPA actions.

## Section 21.2 - Impact Analysis

---

## Summary

The impacts on GRSG from wild horses and burros are not distinguished from livestock which inaccurately portrays the threat from wild horses and burros.

The DEIS contains contradictions, such as where the DEIS states that "Under all alternatives, no direct change would occur to areas allocated as HMAs/WHBTs for wild horses and burros", then the report proceeds to summarize how every single alternative would restrict wild horse and burro usage in their own federally designated habitats.

---

## Response

The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives for a land use planning effort (see detailed response in Section 1.6, NEPA Impacts Analysis of this comment report).

The USFWS identified grazing as a threat in the NTT and COT report but did not specifically distinguish between livestock and WHB grazing. However, within the DEIS, the BLM and Forest Service did analyze impacts on WHB and domestic livestock grazing separately and also analyzed the impacts on GRSG from WHB and domestic livestock grazing separately. Impacts on GRSG from WHB and domestic livestock grazing are identified in **Section 4.2** of the DLUPA/DEIS. Impacts on WHB from GRSG management strategies are identified in **Section 4.4** of the Proposed LUPA/FEIS.

BLM appropriately analyzed the impacts to WHB from actions not related to changes in AML.

Text in the WHB impact section has been reviewed and relationship between allocation and management actions clarified in the FEIS.

## Section 22 – Lands with Wilderness Characteristics

### Section 22.1 - Range of Alternatives

---

## Summary

All lands with wilderness characteristics that overlap with GRSG habitat represent good opportunities for GRSG conservation and should be analyzed to see how managing those lands to protect wilderness characteristics would coincide with GRSG conservation. The BLM should consider lands with wilderness protection as an alternative to ACEC protection for some areas.

The BLM should complete lands with wilderness characteristics inventories and the DEIS should consider potential lands with wilderness characteristics in the scope of this process.

---

## Response

Per BLM Manual 6320, Considering Lands with Wilderness Characteristics in the BLM Land Use Planning Process, "In some circumstances, consideration of management alternatives for lands with

*Idaho and Southwestern Montana Greater Sage-Grouse Proposed LUPA/Final EIS*

June 2015

wilderness characteristics may be outside the scope of a particular planning process (as dictated by the statement of purpose and need for the planning effort). For example, a targeted amendment to address a specific project or proposal may not in all circumstances require consideration of an alternative that would protect wilderness characteristics. In these situations, the NEPA document associated with the plan amendment must still analyze effects of the alternatives on lands with wilderness characteristics.” Therefore, analysis in this planning document regarding lands with wilderness characteristics will not be completed.

## Section 22.2 - Best Available Info Baseline Data

---

### Summary

The BLM should work with Upper Snake Field Office staff to ensure lands with wilderness characteristics inventories and management are consistent between this EIS/LUPA and the Upper Snake RMP.

The BLM must provide a map of the lands with wilderness characteristics and where it overlaps with priority habitat. If the BLM does not complete lands with wilderness characteristics inventories, the BLM should use GIS to inventory roadless areas and consider these as potential lands with wilderness characteristics for planning purposes.

The FEIS should explain how the BLM will comply with the 2014 appropriations bill for the Department of the Interior, Environment and Related Agencies and with Secretary Salazar’s Secretarial Order No. 3310.

---

### Response

BLM Upper Snake Field Office continues to evaluate lands with wilderness characteristics within the planning area. Decisions related to lands with wilderness characteristics will be addressed in the Upper Snake LUP/FEIS.

Per BLM Manual 6320, Considering Lands with Wilderness Characteristics in the BLM Land Use Planning Process, “In some circumstances, consideration of management alternatives for lands with wilderness characteristics may be outside the scope of a particular planning process (as dictated by the statement of purpose and need for the planning effort). For example, a targeted amendment to address a specific project or proposal may not in all circumstances require consideration of an alternative that would protect wilderness characteristics. In these situations, the NEPA document associated with the plan amendment must still analyze effects of the alternatives on lands with wilderness characteristics.” Therefore, analysis in this planning document related to lands with wilderness characteristics will not be completed.

The BLM is not making decisions on lands with wilderness characteristics in this planning effort. Doing so is outside the purpose and need and scope of this EIS. As noted in Section 1.3, NEPA Range of

Alternatives, of this report, the alternatives meet the purpose and need for the EIS. Alternatives within the EIS have established that not all protective management for the GRSG is limited to identification of lands with wilderness characteristics and can be accomplished through other means.

Secretarial Order 3310 (issued in December of 2010) was never implemented, the Department of Defense and Full-Year Continuing Appropriations Act of 2011 (PL112-10) prohibited the use of funds to implement the Secretarial Order during fiscal year 2011. The primary direction under S.O. 3310 was the designation of "Wild Lands" that were to be derived from wilderness characteristics inventories. Since that time BLM has provided additional policy in 2012 in the form of Manuals 6310 and 6320 which excludes any designation of "Wild Lands" but continues to provide direction for the inventory of public lands for wilderness resources under FLPMA sections 201 and 202 which is considered appropriate under the Appropriations Act of 2014.

## Section 23 - Predation

---

### Summary

Some commenters state that the BLM does not adequately address the threat of predation or fully analyze the direct, indirect, and cumulative impacts of predation on GRSG populations; predation was identified as a threat by the state of Idaho. Others question the analysis of impacts from anthropogenic structures on predation of GRSG, given that the USFWS did not identify predation as a primary threat to GRSG.

### Response

As stated in **Section 2.11.3** in the Proposed LUPA/FEIS, predator removal is outside the scope of LUPA. The threat of predation is described in **Section 3.2.1** and the potential effects of predation on GRSG populations are addressed in **Section 4.2**.

The BLM and the Forest Service have authority to manage the habitat and have provided an updated analysis in **Section 4.2** of the FEIS to describe how the numerous management actions across the range of alternatives could affect the habitat and indirectly the effects of predation. Altering the sagebrush habitat of the GRSG can create an influx of predators into an area and lead to a population decline. Roads, fences, power lines, and other infrastructure as well as the development of trails and other disturbances may improve access for potential predators near GRSG habitat and increase risks to the species.

## Section 24 – Noise

---

## Summary

Noise studies cited in the DEIS are not public and therefore the results are not reproducible; alternative data should be utilized.

---

## Response

Blickley et al.'s research on noise and GRSG has since been published :

Blickley J.L, D. Blackwood, and G.L. Patricelli. 2012. Experimental evidence for the effects of chronic anthropogenic noise on abundance of greater sage-grouse at leks. Conservation Biology Vol 26. No 3. 461-471

This literature has been added to **Section 4.2** in the FEIS.

## Section 25 - Weeds

---

### Summary

Issue 1: The BLM and Forest Service should analyze past vegetation treatment programs and commenters recommended scientific literature on effects of vegetation treatments.

Issue 2: The EIS should include baseline data on cheatgrass in planning area.

Issue 3: Partnerships with private landowners to control cheatgrass should be considered in the FEIS.

---

### Response

Response 1: As described in Section 1.4 of this comment report, the BLM and Forest Service considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land use plan-level.

As a result of these actions, the BLM and Forest Service gathered the necessary data essential to make a reasoned choice among the alternatives analyzed in detail in the DLUPA/EIS. The BLM and Forest Service utilized the available data to provide an adequate analysis that led to an adequate disclosure of the potential environmental consequences of the alternatives in **Sections 4.2** and **4.3** of the EIS.

Analysis of proposed weed treatment methods tiers off of analysis in the Final Vegetation Treatments Using Herbicides on Bureau of Land Management Lands in 17 Western States Programmatic Environmental Impact Statement (PEIS) [BLM 2007].

Response 2: Potential occurrence of cheatgrass has been modeled (**Section 3.3.5** of the FEIS), and

*Idaho and Southwestern Montana Greater Sage-Grouse Proposed LUPA/Final EIS*

June 2015

acres of cheatgrass potential in GRSG habitat are shown in the DEIS based on Manier et al. 2013 (see **Table 3-15, Acres of Cheatgrass Potential within GRSG Habitat**) Information presented is appropriate for the planning level actions and analysis and accurate, comprehensive data across the sub-region are not readily available. Further analysis will occur on a site-specific basis at the implementation level.

Response 3: Cooperation with all landowners would be undertaken as feasible and is included in the range of alternatives.

## Detailed Description of the No Action Alternative

This Page Intentionally Blank

Administrative Draft  
Cooperating Agency Review

U. Detailed No Action Alternative

U.1 Existing GRSG Guidance in Land Use Plans

U.1.1 Introduction

Nearly all LUPs within the Idaho and southwestern Montana sub-region have some guidance regarding GRSG and/or sagebrush habitats. These goals, objectives, and actions for BLM and objectives, standards, and guidelines for the Forest Service are presented by LUP in Table G-1 below.

**Table G-1**  
**GRSG and Sagebrush Habitat Guidance in Land Use Plans**

<b>Bureau of Land Management</b>
<b>Bruneau Field Office – Bruneau MFP</b>
<i>Special Status Species – Wildlife, Sage-grouse</i>
<b>Objective (WL-4):</b> Manage upland game and waterfowl habitats in the BPU to increase populations of the highly desired species.
Action (WL-4.4): Manage 520,000 acres of sage grouse range in the BPU including those areas under Wilderness IMP classification and within IMP management guidelines to improve nesting, brood rearing and winter habitats.
Action (WL-4.4(1)): To improve the quality of sage grouse nesting and brood rearing habitats, all poor and fair big sagebrush, meadow, and riparian ecological sites should be improved and managed for good ecological condition, based on the SCS ecological site classification system.
Action (WL-4.4(2)): When making management decisions affecting areas used by sage grouse in the BPU, refer to and address the “Guidelines for Habitat Protection in Sage Grouse Range” as published by the Western States Sage Grouse Committee, June, 1974. Significant among these are: <ul style="list-style-type: none"> <li>a) Manage sage grouse habitat by maintaining the density of sagebrush canopy cover at 20-30% within nesting habitats and at least 20% in present wintering habitats and in areas known to have supported wintering concentrations within the previous ten years. Canopy cover should not be confused with hiding cover.</li> <li>b) Designate sage grouse nesting and wintering habitat as “active” wildfire suppression areas wherein fire suppression activities are geared to fire behavior and the potential resource threat from any fire after it has been initially evaluated. If significant sage grouse cover is destroyed by any fire, sagebrush seed will be included in any mixture used in fire rehabilitation projects, seeded at a rate sufficient to reestablish suitable cover for sage grouse.</li> <li>c) In brood rearing areas where the big sagebrush canopy cover is 20% or greater, improve herbaceous vegetation by sagebrush manipulation and seeding of small irregular areas. These manipulations must not however, reduce the existing sagebrush canopy below 10%. Carefully evaluate the sage grouse response of these habitat manipulations before expanding the program to a large scale. Prescribed burning in most cases will be used for the cover alteration.</li> <li>d) No rehab projects will be implemented where live sagebrush crown cover is less than 20%, or on steep upper slopes (20% + gradient) where big sagebrush is 12 inches or less in height.</li> <li>e) Range vegetal control/rehab projects within two miles of known strutting grounds will be limited to practices which also enhance sage grouse habitat since this area constitutes the breeding complex for sage grouse.</li> <li>f) No vegetal control using herbicides will be conducted along streams, meadows, or secondary dry/intermittent drainages. A minimum of a 100 yard strip of living sage will be retained on each edge of meadows and drainages.</li> <li>g) Restrict during March-May any intensive disturbance activities such as gravel pit operation or ORV</li> </ul>

**Table G-1  
GRSG and Sagebrush Habitat Guidance in Land Use Plans**

<p>aces within 2 miles of sage grouse strutting grounds and avoid the establishment of major roads within 1/2 mile.</p> <p>h) Restrict vehicular traffic to existing roads from November 1 to February 28 in sage grouse wintering habitats.</p> <p>i) Retain in public ownership all tracts of land on which strutting grounds are located and all lands within a two-mile radius of those strutting grounds, but allow exchanges if higher quality habitat can be acquired and such exchanges are in the public interest.</p> <p>j) Prescribed burning shall be the primary tool for habitat improvement.</p>
<p><i>Livestock Grazing</i></p> <p>Action (RM1.1): Implement AMPs on 14 allotments and less-intensive management on 5 allotments (Overlay RM-4). Allotments are listed in priority order. Adjust management or exclude grazing on sage grouse brood-rearing areas to improve habitat. Design grazing management to improve crucial antelope winter/early spring ranges. Establish grazing systems and seasons to meet bighorn sheep requirements.</p>
<p><b>Burley Field Office - Cassia RMP</b></p>
<p><i>Special Status Species – Wildlife, Sage-grouse</i></p> <p>Objective: Management Areas 2, 4, 7, 10: Maintain or improve sage grouse winter habitat and sage grouse strutting/brood-rearing habitat. (# of acres of habitat is identified in each Management Area in the LUP)</p> <p>Action: Management Areas 9, 11, 13: Maintain or improve sage grouse brood-rearing habitat. (# of acres of habitat is identified in each Management Area in the LUP)</p> <p>Action: Allow for limited vegetation manipulation in areas of known sage-grouse brood-rearing areas and winter areas. Refer to Sage-grouse Management in Idaho, Wildlife Bulletin Number 9, Idaho Department of Fish and Game 1981, for habitat requirements for sage-grouse.</p>
<p><i>Livestock grazing</i></p> <p>Action: Implement livestock grazing systems that will provide a 20-40% canopy cover of brush, an average plant height of 20" and 50% average utilization of grass understory in upland game habitat areas.</p>
<p><i>Fluid Minerals (Oil and Gas, Tar Sands, and Geothermal Resources)</i></p> <p>Action: Management Area 4: Open to leasing subject to the following stipulation: No exploration/development work in sage grouse strutting/brood-rearing habitat from April 11 through June 15.</p> <p>Action: Management Areas 2, 7, 9, 10, 11, 13: Open to leasing subject to the following stipulation: No exploration/development work in sage grouse strutting/brood-rearing habitat from April 1 through June 15.</p>
<p><b>Burley Field Office - Twin Falls MFP</b></p>
<p><i>General Wildlife</i></p> <ol style="list-style-type: none"> <li>1. Through the use of intensive grazing management systems maintain and enhance nesting-brood rearing complexes and wintering areas for sage grouse.</li> <li>2. Limited work will be permitted along streams, meadows or secondary drainages (dry and intermittent). A 100-yard strip (minimum) of living sagebrush will be retained on each edge of meadows and drainages for protection of sage grouse habitat. Install protective fencing on selected springs, seeps, meadows, and well overflow areas, as they become identified, to protect succulent forage and improve sage grouse habitat.</li> <li>3. Give sage grouse nesting, brood-rearing, and winter habitat needs priority consideration in these habitat areas. The guidelines developed by IDFG will guide the habitat management of these areas. Maintain existing range improvement practices that exist within these habitat areas. The key in determining the nesting-brood rearing habitat sites will be the location of leks relative to the 2-mile radius rule. Multiple use management of these areas will aim at maintaining adequate nesting cover. Brood-rearing needs in these are will strive to maximize succulent forbs and insects. management of wintering areas will be to maintain adequate sagebrush cover in identified winter areas.</li> </ol>

**Table G-1**  
**GRSG and Sagebrush Habitat Guidance in Land Use Plans**

4. Provide improved upland game bird habitat by planting vegetation which will out compete noxious weeds, are non-spreading in nature but will provide the same benefits as many of the noxious weeds. Until this can be accomplished, herbicide and pesticide use will have to be selective.
5. Enhance upland game habitat by developing the following wildlife enclosures.
6. Implement the following cooperative farm agreements to enhance upland game bird habitat.
7. All land treatment proposals affecting brushy islands or buffer strips, should receive multiple resource input to assure consideration of the wildlife habitat needs and keep the needed patches and islands of brush habitat. The existing islands and leave areas from the initial projects will remain leave areas in future maintenance unless wildlife input indicates that the areas are not critical habitat, in which case treatment can be done in a manner that benefits the wildlife values.
8. Improve upland game habitat by making all existing and future water developments available to all upland game birds. Improve the Chukar habitat by installing permanent water sources in Chukar range. Construct and install bird guzzlers along Salmon Falls Creek Rim for Chukar and near the juniper trees by Mule Creek for quail. Install additional guzzlers as locations become identified.
9. Provide upland game habitat, primarily pheasants and public hunting areas, by: maintaining small isolated parcels of public land which are surrounded by private land in public ownership (these tracts must be in legal subdivision); in all future desert land entries, Carey Act, public sales, land exchanges, etc.; retain a minimum of 15 percent of the land in public ownership; retain the following isolated parcels in public ownership and maintain them in their present condition until such time when the surrounding private land goes in to agriculture.
10. Improve and maintain terrestrial, aquatic and wetland-riparian habitat for upland games species throughout the planning unit.
11. Acquire the following parcel of land to provide additional upland game habitat: T 10 S, R 18 E, Section 11 N 1/2 N1/2 SE 1/4
12. Maintain and enhance habitat for sharptailed grouse through the use of intensive grazing management systems. Maintenance of a 12 inch high grass understory is important. Maintain present cover on public lands adjacent to dry land grain fields. Protect grass areas intermixed with bitterbrush and sagebrush in draws and small canyons with dense stands of berry producing vegetation.
13. Allow vehicular use and oil and gas exploration without restriction except during the period from March 15 through June 15 in critical sage grouse nesting-brood rearing complexes. During this period, vehicular use will be limited to existing roads and trails.
14. Close critical sage grouse wintering areas to snowmobiling.
15. Determine the boundary of each agricultural trespass, determine the party in violation, settle the damages due the government based on fair market value: 1.) Terminate the unauthorized use by one of the following actions. Restore the land to its prior stat for multiple resource management. 2.) Enter into cooperative wildlife farming agreement. Use the Sieks Act authority where applicable. 3.) Enter into an agricultural lease with multiple resource values identified and collect fair market value rental for the government. 4.) Dispose of the farmed land to the private sector through public sale. Sites containing any of the following criteria will be retained in public ownership for multiple use resource management: a. cultural or archeological b. natural history values c. threatened or endangered plant species d. threatened or endangered animal species and their habitats e. critical wildlife habitat such as mule deer winter, sage grouse winter, pheasant winter, pheasant nesting, etc.
16. Modify multiple-use recommendation to finalize the Twin Falls Off-Road Vehicle Designation Plan based on the Step recommendations. Complete the designation plan and an EA through public review as needed local motorcycle and 4-wheel clubs. Change the ORV limitation in mule deer critical winter range from the date November 1 to November 15. Designate area between powerline and Salmon Falls Creek as limited to existing roads and trails (Accept CRM-1.5 WL-4.2). Limit ORV use in sage grouse nesting and strutting areas (Accept WL-2.12).

**Table G-1  
GRSG and Sagebrush Habitat Guidance in Land Use Plans**

<p>17. Practice limited fire suppression on the existing seedings and proposed seedings with modifications as shown in RM-2.3 RM2.4 and RM-2.5 Multiple Use Recommendations that provide for normal fire suppression on sage grouse ranges antelope and mule deer winter ranges, mule deer critical summer range and isolated tracts</p> <p>18. Do not use aerial retardant on resource value Class II lands except when needed to protect or ensure the safety of private property, structures, livestock, general public and fire suppression personnel. Do not use aerial retardant on any open waters such as reservoirs ponds, streams and springs. Aerial retardant can be used to aid in protecting identified sage grouse, antelope and mule deer winter areas, mule deer critical summer range and isolated tracts.</p> <p>19. Modify the multiple use recommendation to include all the identified area and to agree with the range multiple use recommendation RM-2.7 RM2.7 says practice limited fire suppression on existing seedings and proposed seedings with the modifications shown in RM-2.3 RM-2.4 and RM2.5. Aggressive fire suppression will be initiated to protect wildlife values on sage grouse strutting grounds, antelope and mule deer winter range, mule deer critical summer range and on the Twin Falls-Cassia Isolated Sikes Act Tracts. Fire management will consult closely with the area manager on actions in these areas.</p>
<b>Twin Falls District - Fire Management Direction Amendment</b>
<i>Wildland Fire Management</i>
GOAL: Maintain, protect, and expand sage grouse source habitats.
Action: Suppress wildland fires in source habitats (Figure 3-3), except where WFU would benefit habitat.
Action: Allow WFU in sage grouse source habitats for the benefit of the habitat only after site specific project level coordination with IDFG (Figure 3-3).
Action: Conduct vegetation treatments in areas that pose a wildland fire risk to source habitats.
Action: Treat areas within source habitats that have low resiliency (i.e., areas characterized by low species diversity, undesirable composition, and dead or decadent sagebrush).
Action: When multiple wildland fire ignitions occur, the criteria for establishing suppression priorities would follow the two prioritization criteria described under Section 2.4.4.1, followed by the following prioritization:
<ul style="list-style-type: none"> <li>• Minimize risks to sage-grouse source, key, and restoration habitats.</li> <li>• Minimize risks to habitats occupied by T&amp;E species.</li> <li>• Minimize risks to resources where changes in fuel accumulation and fire occurrence have occurred (i.e., FRCC 2 and FRCC 3 areas).</li> </ul>
Action: Use AMR to wildland fire in all sage grouse restoration and key habitats and healthy wildlife habitats.
GOAL: Treat sage grouse key and restoration habitats to expand source habitats. Improve and maintain sage grouse Restoration (R1-3) and key habitats.
Action: Use appropriate management response to wildland fire in all sage grouse restoration and key habitats and healthy wildlife habitats.
Action: WFU may be allowed in historically frequent fire regimes to restore fire's natural role and in sage grouse restoration and key habitats for the benefit of the habitat only after site specific project level consultation/collaboration with IDFG (Figure 3-3).
Action: Conduct vegetation treatments in restoration and key habitats to reduce risk of wildland fire and reconnect restoration and key habitats.
Action: Treat areas of restoration and key habitats that have low resiliency characterized by low species diversity.
Action: T&E and Candidate species with recovery plans, conservation agreements, and conservation strategies will be protected as specified in their respective plans/agreements/strategies. These protections include such measures as adequate habitat and range for a given species, including mitigation measures for

**Table G-1  
GRSG and Sagebrush Habitat Guidance in Land Use Plans**

multiple land use activities authorized by the BLM.
Action: R.1 PRESCRIBED FIRE: Leave adequate untreated sagebrush areas for loafing/hiding cover near leks for sage-grouse.
Action: R.1 PRESCRIBED FIRE: Avoid the use of prescribed fire or other sagebrush treatments in habitats prone to the expansion or invasion of cheatgrass or other invasive species unless adequate measures are taken to control the invasive species and ensure subsequent dominance by desirable perennial species. In many—if not most—cases, this will likely require chemical treatments and reseeding.
Action: R.2 ANNUAL GRASSLANDS Seed used in sage-grouse habitat restoration seedings, burned area rehabilitation projects, and hazardous fuels/wildland urban interface projects will be tested and certified as weed-free, based on prevailing agency policy and protocol. Private landowners are encouraged to use only certified seed, as well.
Action: R.2 ANNUAL GRASSLANDS Design vegetation treatments in areas of high fire frequency to facilitate firefighter safety; reduce the risk of extreme fire behavior; reduce the risk and rate of fire spread to stronghold, key, and restoration habitats(sic sage-grouse); reduce fire frequencies; and shorten the fire season.
Action: R.2 ANNUAL GRASSLANDS Human activities such as fence and pipeline maintenance or construction, facility maintenance, utility maintenance, or any project or related work at or within 1 km (0.6 miles) of occupied leks that results in or will likely result in disturbance to lekking birds should be avoided from approximately 6:00 PM to 9:00 AM. In general, this guideline should be applied from March 15 through May 1 in lower elevation habitats and March 25 through May 15 in higher elevation habitats.
Action: R.4 CONIFER ENCROACHMENT Remove Douglas fir or other conifers where they are encroaching on wet meadows, riparian areas, or sagebrush stands that provide potential sage-grouse habitat.
Action: R.4 CONIFER ENCROACHMENT Remove juniper, Douglas fir, pinyon pine, or other trees within at least 100 m (330 ft) or an 8-acre area of occupied sage-grouse leks. The purpose of this procedure is to reduce perching opportunity for raptors or other avian predators within view of leks. Techniques could include chainsaw, chipper, or other suitable mechanical means. Ensure cutting and slash disposal is completed between approximately July 15 and January 30 to minimize disturbance to grouse that may be in the vicinity (e.g., males at leks, nesting females, and young broods). This practice serves to reduce raptor predation on sage-grouse by eliminating potential perches, thereby improving survival, recruitment, and productivity. It may be particularly valuable where avian predation may be of greater concern such as in areas with fragmented habitat, nearby infrastructure features, and/or in the case of small, isolated sage-grouse populations.
Action: R.4 CONIFER ENCROACHMENT Where juniper or other conifer species have encroached upon sagebrush communities at larger scales, employ prescribed fire, chemical, mechanical (e.g., chaining, chipper, chainsaw, or commercial sale), or other suitable methods to reduce or eliminate juniper. Priority should be given to areas where there is a strong likelihood for recovery of perennial herbaceous vegetation or where preparatory and follow-up actions (e.g., control of invasive species and seeding) are likely to be successful. Whenever possible, but especially if sagebrush habitat is limited locally, use juniper-control techniques that are least disruptive to the affected stand of sagebrush. For example, if junipers are only scattered, and the associated sagebrush community is otherwise relatively healthy, cutting junipers with chainsaws will remove the encroachment threat while allowing for immediate use of the sagebrush by sage-grouse. In all cases, control efforts should be planned using interdisciplinary expertise.
GOAL: Protect and enhance sage grouse stronghold habitats.
Action: Suppression Priorities: Minimize risk to source, key, and restoration sage grouse habitat. Minimize risk to threatened, endangered, and candidate species habitat. Minimize risk to resources where changes in

**Table G-1**  
**GRSG and Sagebrush Habitat Guidance in Land Use Plans**

fuel accumulation and fire occurrence have occurred.
Action: Design vegetation treatments potentially affecting Greater sage-grouse (in Low-elevation Shrub, Mid-elevation Shrub, and Mountain Shrub), conservation measures identified in Appendix R would be considered.
Action: Manage fuels and fire across the sagebrush steppe landscape to provide habitat for a variety of sagebrush-obligate wildlife species as well as other resource benefits. Progress made toward DFC would result in improved habitat for sagebrush steppe obligate species.
<b>Challis Field Office – Challis RMP</b>
<i>Special status species</i>
Goal: Maintain populations of special status species and/or their habitat over the range of natural distribution and habitat conditions. Eliminate the need for listing of sensitive and candidate species and contribute to recovery of listed species by increasing the number or size of populations or by removing threats to species and their habitats.
Objective: Within 10 years, develop BLM Species Management Plans or other types of conservation plans for at least five of the species inventoried under Special Status Species, Goal 1, #4 and 5 above.
<i>Wildlife Habitat</i>
Objective: In the following wildlife habitat areas, unless NEPA analysis and consultation with the IDFG determine that restrictions on a permitted activity are not necessary, BLM permitted activities (other than permitted livestock use, unless restricted elsewhere) would be (1) restricted to prevent disturbance during the specified crucial periods, and (2) designed to eliminate adverse effects (in consultation with the IDFG and other interested publics): Habitat Area Restricted Period Sage Grouse Strutting Grounds 3/1-5/15 Sage Grouse Nesting/Brood-rearing Areas 4/15-6/30
<b>Dillon Field Office – Dillon RMP</b>
<i>Travel and Transportation</i>
See Appendix X pg. 214 Roads and Motorized Vehicles <i>Issue: Roads may increase sage grouse mortality through collisions with vehicles, displacement because of human disturbance, or other factors.</i> 1. Identify, map, quantify, and evaluate impacts of existing roads, including 2-tracks, in relation to known lek locations and sage grouse winter ranges. 2. Consider impacts to sage grouse when designing new roads and modifying existing roads. 3. Consider seasonal use restrictions or signing to avoid disturbance of critical times, such as winter and nesting periods.
<i>Issue: Roads and their associated disturbances and cumulative effects contribute to the loss of habitat and declining sage grouse populations.</i> 1. Develop a transportation management plan across ownership boundaries in critical sage grouse habitats. 2. Participate in travel planning efforts and educate the general public about the impacts of roads on sage grouse and critical habitat. 3. Consider buffers, removal, realignment, or seasonal closures where appropriate to avoid degradation of habitat. 4. Re-vegetate closed roads with plant species beneficial to sage grouse. 5. Close and re-vegetate travel ways in sage grouse habitats where appropriate. 6. Provide sage grouse habitat information during the planning phases of transportation development, working with MDOT, FHWA, industry, counties, etc.
<i>Recreation and Visitor Services</i>

**Table G-1**  
**GRSG and Sagebrush Habitat Guidance in Land Use Plans**

<p>Appendix X pp. 214 Recreational Disturbance of Sage Grouse</p> <p><i>Issue: Management of lek viewing may be necessary.</i></p> <p>Action 5. Issue special use permits for certain activities with distance and timing restrictions to maintain the integrity of breeding habitat.</p>
<p><i>Lands and Realty</i></p> <p>See appendix X pg. 213</p> <p>Powerlines and Generation Facilities</p> <p><i>Issue: Existing power lines near a lek, brood-rearing habitat, or winter habitat increases the risk of predation on sage grouse by raptors.</i></p> <ol style="list-style-type: none"> <li>1. Document the segment(s) of line causing problems.</li> <li>2. Determine by cooperative action- agencies, utilities, and landowners- whether or not modification of poles to limit perching will prevent electrocution of raptors and decrease predation on sage grouse.</li> <li>3. Emphasize the following if perch prevention modifications do not work to protect sage grouse and sagebrush habitat:             <ol style="list-style-type: none"> <li>a) reroute the line using distance, topography, or vegetative cover; or</li> <li>b) bury the line.</li> </ol> </li> <li>4. Explore opportunities for technical assistance and funding.</li> <li>5. Remove power line when use is completed.</li> </ol> <p><i>Issue: Existing power line is causing consistent or significant collision mortality on sage grouse.</i></p> <ol style="list-style-type: none"> <li>1. Document the segment(s) of line causing consistent or biologically significant mortality- with agencies, utilities, and landowners cooperating in the effort.</li> <li>2. Initiate collision prevention measures using guidelines (Avian Power Line Action Committee 1994) on identified segments. Measures are subject to restriction or modification for wind and ice loading or other engineering concerns, or updated collision prevention information.</li> <li>3. Remove power lines that traverse important sage grouse habitats when facilities being serviced are no longer in use or when projects are completed.</li> </ol>
<p><i>Range Management</i></p> <p>Pg. 69 Action 3 - identifies SG habitat as priority habitat.</p> <p>3 Consider the following habitats priority wildlife habitats:</p> <ul style="list-style-type: none"> <li>• all listed and special status species habitats, with grizzly bear and lynx receiving the most emphasis in coniferous forest habitats, and sage grouse receiving the most emphasis in sagebrush steppe habitats</li> <li>• coniferous forest and sagebrush habitats that provide important big game winter habitat</li> <li>• sagebrush habitats that provide bighorn sheep year-long or seasonal habitats</li> <li>• sagebrush habitats that provide sage grouse breeding, early brood rearing, or winter habitat</li> <li>• mountain mahogany and sagebrush steppe habitat associations in the Lima Sweetwater Breaks key raptor management area</li> <li>• all riparian and wetland habitats</li> </ul> <p>4 Consider the following species priority wildlife species:</p> <ul style="list-style-type: none"> <li>• all listed and special status species, with grizzly bear, lynx, and sage grouse receiving the most emphasis</li> <li>• bighorn sheep</li> </ul> <p>Pg. 73 Actions 42, 43, 44</p> <p><i>Sagebrush Steppe Wildlife Habitats</i></p> <ol style="list-style-type: none"> <li>42. Use the National and Montana sage grouse conservation strategies (see Appendix X) as the basis to address habitat management in the watershed planning process and in project level analysis.</li> <li>43. Manage sagebrush habitats so that mid-scale level shrub cover includes a mix of height classes with herbaceous understory adequate for meeting seasonal habitat requirements for sage grouse and other</li> </ol>

**Table G-1  
GRSG and Sagebrush Habitat Guidance in Land Use Plans**

<p>wildlife species that use sagebrush habitat including wintering antelope and mule deer.</p> <ul style="list-style-type: none"> <li>• In habitats with predominately mountain big sage-brush, manage sites with the potential to support sagebrush in a manner that maintains &gt; 70 percent of those areas in canopy closure of 5 to 25 percent.</li> <li>• In habitats that include predominately Wyoming big sagebrush, manage sites with ecological potential to maintain sagebrush over at least 60 per-cent of those areas in a canopy closure of 5 to 25 percent.</li> <li>• Maintain an herbaceous understory emphasizing multiple species of native forbs and grasses, recognizing that herbaceous productivity decreases at &gt;10-15 percent canopy cover.</li> <li>• Emphasize restoration and rehabilitation of sage-brush in areas that are capable of supporting sage-brush and contribute to the distribution and connectivity of patches.</li> </ul> <p>44. When making project decisions located in sage grouse habitats, objectives for sage grouse habitats and relevant information about sage grouse seasonal habitat will be considered when determining the desired resource condition. If specific issues regarding sage grouse are identified, applicable conservation actions or guidelines will be reviewed by interdisciplinary teams and considered in the decision-making process. None of the conservation actions or guidelines in the Management Plan and Conservation Strategies for Sage Grouse in Montana will be construed as mandatory or standards.</p> <p>Appendix X – pg. 208 Grazing Management <i>Issue: Conflicting priorities for land uses, species, and habitats.</i></p> <ol style="list-style-type: none"> <li>1. Use scientific data and historic information to establish baseline information when evaluating soil conditions and ecological processes and when monitoring seasonal sage grouse habitats.</li> <li>2. Set specific habitat objectives and implement appropriate grazing management to achieve those objectives and maintain or improve vegetation condition and trends.</li> </ol>
<p>Appendix X pg. 208 action 3 Grazing Management <i>Issue: Conflicting priorities for land uses, species, and habitats.</i></p> <ol style="list-style-type: none"> <li>3. Offer private landowners incentives when and where appropriated to achieve sage grouse objectives.</li> </ol>
<p>Appendix X pg. 208 <i>Issue: Some sagebrush communities may have been significantly altered by past grazing management practices.</i></p> <ol style="list-style-type: none"> <li>1. Implement appropriate grazing management strategies and range management practices where soil conditions and ecological processes will support sage grouse and desired commodities and societal values.</li> <li>2. Establish suitable goals for sagebrush communities that have deteriorated to such an extent that livestock management alone may not contribute to habitat objectives.</li> </ol>
<p>Pg. 55 <i>Goal</i> Restore and maintain riparian wetland areas so that at least 955 miles of streams and 2,050 acres of wetlands are in proper functioning condition. Design management to achieve objectives (Desired Future Conditions) or initiate an upward trend in 20 years.</p> <p>Appendix X - Grazing Mngmt pg. 209 <i>Issue: Riparian areas (wet meadows, seeps, streams) are important resources for sage grouse and livestock.</i></p> <ol style="list-style-type: none"> <li>1. Design and implement livestock grazing management practices (riparian pastures, seasonal grazing, development of off-stream water facilities, etc.) to achieve riparian management objectives.</li> <li>2. Modify or adapt pipelines and natural springs, where practical, to create small wet meadows as brood habitat.</li> <li>3. ensure the sustainability of desired soil conditions and ecological processes within upland plant</li> </ol>

**Table G-1**  
**GRSG and Sagebrush Habitat Guidance in Land Use Plans**

<p>communities following implementation of strategies to protect riparian areas. This can be achieved by:</p> <ul style="list-style-type: none"><li>• protecting natural wet meadows and springs from over-use while developing water for livestock, and</li><li>• plan the location, design, and construction of new fences to minimize impacts on sage grouse.</li></ul>
<p>Pg 51 Action 14</p> <p>Improve existing seedings that are not meeting range-land health standards for plant vigor and density by implementing grazing management systems or re-seeding with appropriate species of natives or cultivars. Focus restoration of any existing seedings on areas containing high resource values and/or priority habitats and species. Allow the use of all available tools.</p> <p>Appendix X pg. 215</p> <p><i>Issue: The age distribution of sagebrush may have been altered by management, such as a young stand recovering from disturbance or a mature stand with poor regeneration.</i></p> <ol style="list-style-type: none"><li>1. Map and inventory areas believed to be deficient in quality of habitat or exhibiting poor health.</li><li>2. Evaluate the site potential and desired condition, and develop specific objectives accordingly within specific landscapes.</li><li>3. If sagebrush is lacking:<ol style="list-style-type: none"><li>a) develop and implement grazing practices that influence sagebrush growth,</li><li>b) inter-seed historical breeding and winter habitats with the appropriate sagebrush species,</li><li>c) identify and promote seed sources for habitat restoration efforts,</li><li>d) encourage the voluntary use of sagebrush in habitat incentive programs, such as the Conservation Reserve Program, and work to develop additional funding sources for such programs,</li><li>e) reclaim and/or re-seed areas disturbed by treatments when necessary, and</li></ol></li><li>f) promote sage plantings, where appropriate, on project areas occurring within sage grouse habitats.</li></ol> <p><i>Issue: The plant community has been altered and lack a diverse herbaceous understory.</i></p> <ol style="list-style-type: none"><li>1. Map and inventory areas believed to be important sage grouse breeding habitats.</li><li>2. Evaluate the site potential and desired condition within the context of a larger landscape.</li><li>3. Develop and implement techniques to increase herbaceous diversity and density in sagebrush-steppe within ecological limits.</li><li>4. Ensure that grazing practices allow plants to grow to seed ripe on a rotational basis.</li><li>5. Adjust livestock grazing management when necessary, such as the season of use/projects, to promote forb establishment and recruitment.</li><li>6. Identify large areas of introduced plant species, such as crested wheat, and determine if restoration efforts are deemed appropriate.</li><li>7. Inter-seed appropriate breeding habitats with forbs as identified by the specialists and affected interests.</li></ol>
<p>Pg. 73 Action 44</p> <p>44. When making project decisions located in sage grouse habitats, objectives for sage grouse habitats and relevant information about sage grouse seasonal habitat will be considered when determining the desired resource condition. If specific issues regarding sage grouse are identified, applicable conservation actions or guidelines will be reviewed by interdisciplinary teams and considered in the decision-making process. None of the conservation actions or guidelines in the Management Plan and Conservation Strategies for Sage Grouse in Montana will be construed as mandatory or standards.</p> <p><i>Issue: It is important to maintain viable sagebrush habitat and populations of sage grouse while eradicating infestations of noxious weeds.</i></p> <ol style="list-style-type: none"><li>1. Employ integrated weed management treatment methods such as a combination of biological and cultural, such as grazing, mowing, or seeding treatments in conjunction with herbicides to manage weeds in sage grouse habitat.</li></ol>

**Table G-1  
GRSG and Sagebrush Habitat Guidance in Land Use Plans**

<p>2. Use the most selective herbicides where chemical treatment is appropriate, to minimize loss of non-target plant species.</p> <p>3. Restore plant communities with desired species adapted to the site, using proven management techniques where biologically feasible. A restoration program may be necessary if conditions prevent natural plant species.</p>
<p>Appendix X pg. 211 <i>Issue: Water discharge and impoundments can degrade or inundate breeding, nesting, and winter habitat.</i></p> <p>1. Design impoundments and manage discharge so as not to degrade or inundate leks, nesting sites, and wintering sites.</p> <p>2. Protect natural springs from any source of disturbance or degradation from energy-related activities.</p>
<p>Appendix X pg 209 <i>Issue: Potential for sage grouse to be disturbed or displaced by concentrations of livestock near leks or winter habitat.</i></p> <p>1. Discourage concentration of livestock on leks or other key sage grouse habitats.</p> <ul style="list-style-type: none"> <li>• Avoid placement of salt or mineral supplements near leks during the breeding season (March-June), and</li> <li>• Avoid supplemental winter feeding of livestock, where practical, on sage grouse winter habitat and around leks</li> </ul> <p><i>Issue: Existing fences near breeding, brood-rearing, or winter habitats can increase the risk of collision mortalities and / or predation on sage grouse by hawks, eagles, and ravens by providing perches.</i></p> <p>1. If portions of existing fences are found to pose a significant threat to sage grouse as strike sties or raptor perches, mitigate through moving or modifying posts, implementation of predator control programs, etc. Actions may include increasing the visibility of the fences by flagging or by designing “take-down” fences.</p> <p>2. Offer private landowners incentives when and where appropriate to achieve sage grouse objectives.</p>
<p><i>Fluid Minerals</i></p> <p>RMP Final EIS Alt. C Pg. 53 Table 6 lists stipulations that were analyzed. Winter/Spring habitat – NL Leks – NL ½ mile buffer Breeding habitat – NSO</p> <p>NL = no lease NSO = no surface occupancy</p> <p>Under Alternative C, 80 percent (1,086,596 acres) of the planning area would not be available for oil and gas leasing. This includes all the lands identified in Alternative B, plus lands in these additional locations:</p> <ul style="list-style-type: none"> <li>• Sage Grouse Winter/Spring Range</li> <li>• Lands within 1/2 mile of Sage Grouse Strutting Grounds (leks)</li> </ul>
<p>Appendix X, pg 210-211 Mining and Energy Development <i>Issue: Energy development may adversely affect sage grouse.</i></p> <p>1. Work cooperatively – agencies, utilities, and landowners – to identify and map important seasonal ranges for sage grouse.</p> <p>2. Complete a broad scale assessment to identify important areas that require additional protection or conservation during land use planning and leasing of energy reserves.</p> <p>3. Prioritize areas relative to their need for protection – ranging from complete protection to availability for</p>

**Table G-1**  
**GRSG and Sagebrush Habitat Guidance in Land Use Plans**

<p>moderate to high levels of energy development.</p> <ol style="list-style-type: none"><li>4. Encourage development in incremental stages to stagger disturbance (federal leases range from 3-10 years); design schedules that include long-term strategies to localize disturbance and recovery within established zones over a staggered time frame.</li><li>5. Provide technical assistance to private landowners who lease privately owned fee minerals.</li><li>6. Use off-site mitigation, such as the creation of sage-brush habitat, or purchase conservation easements with industry dollars to offset habitat losses.</li><li>7. Remove facilities and infrastructure when use is completed.</li><li>8. Enhance our understanding of the effects of energy development through:<ol style="list-style-type: none"><li>a) pre-activity inventory,</li><li>b) monitoring over the life of the development, and</li></ol></li></ol> <p>c) Annual evaluations.</p> <p><i>Issue: Increased roads, pipelines, and power lines can fragment sagebrush habitats.</i></p> <ol style="list-style-type: none"><li>1. Develop a comprehensive infrastructure plan prior to energy development activities to minimize road densities.</li><li>2. Avoid locating roads and power lines in crucial sage grouse breeding, nesting, and wintering areas.</li><li>3. See conservation actions for siting and constructing power lines.</li></ol> <p>4. Use minimal surface disturbance to install roads and pipelines and reclaim site of abandoned wells to natural communities.</p> <p><i>Issue: Energy-related facilities located within 2 miles of a sage grouse lek can degrade habitat quality within existing leases.</i></p> <ol style="list-style-type: none"><li>1. Locate storage facilities, generators, and holding tanks outside the line of sight and sound of important breeding habitat.</li><li>2. Minimize ground disturbance in sagebrush stands with documented use by sage grouse:<ol style="list-style-type: none"><li>a) breeding habitat – the lek and associated stands of sagebrush,</li><li>b) nesting habitat – stands of sagebrush within 2 miles of a lek, and</li><li>c) wintering habitat – sagebrush stands with documented winter use by sage grouse with portions that would remain above the snow even during years of deep-snow conditions.</li></ol></li><li>3. Concentrate energy-related facilities when practicable.</li></ol>
<p><i>Wildland Fire Management</i></p> <p>Appendix X pg.207 Conservations measures for Fire Management</p> <p><i>Issue: Reduction of sagebrush by prescribed fire.</i></p> <ol style="list-style-type: none"><li>1. Sites should not be burned unless:<ol style="list-style-type: none"><li>a) biological and physical limitations of the site and impact on sage grouse are identified and considered,</li><li>b) management objectives for the site, including those for wildlife, are clearly defined,</li><li>c) potential for weed invasion and successional trends are well understood, and</li><li>d) capability exists to manage the post-burn site properly, including a funded monitoring schedule, to achieve a healthy sagebrush community.</li></ol></li><li>2. Develop local or regional guidelines, such as the Beaverhead-Deer Lodge Forest/FWP guidelines in the intermountain valleys, or consider the following guide-lines if fire is used as a tool elsewhere:<ol style="list-style-type: none"><li>a) analyze cumulative effects of sagebrush treatment by considering ecological units, evaluate the degree of fragmentation, and maintain a good representation of mature sagebrush,</li><li>b) predict effects for the length of time necessary for sagebrush to return to desired condition for deter-mine treatment types and intervals,</li></ol></li></ol>

**Table G-1**  
**GRSG and Sagebrush Habitat Guidance in Land Use Plans**

<p>c) identify suitable patch size based on site-specific characteristics of the natural community and treat patches in a mosaic pattern that provides sagebrush cover for snow capture, hiding cover, and a seed source,</p> <p>d) use available literature to research the effects of fire on sagebrush communities,</p> <p>e) use caution in reducing sagebrush cover in and following drought periods,</p> <p>f) work cooperatively with public agencies, academia, and private landowners to establish conservation objectives for the project area, and</p> <p>g) map all burns within one year of treatment, monitor vegetative response, and develop a GIS layer of burn history.</p> <p>3. Develop treatments to improve habitats over the long term if sagebrush stands do not meet objectives for sage grouse, such as confining treatments to small patches.</p> <p>4. Consider mechanical treatment as the primary method and prescribed fire as a secondary method to remove conifers that encroach on sage grouse habitat, except where forested habitat is limited.</p> <p>5. Avoid treatments to sage grouse habitat in areas that are susceptible to invasion by cheatgrass or other invasive plant species. Treatment will be accompanied by restoration, and reseeded if necessary, to re-establish native vegetation.</p> <p>6. Protect sagebrush along riparian zones, meadows, lakebeds, and farmlands that include important sage grouse habitat:</p> <ul style="list-style-type: none"><li>a) winter habitat,</li><li>b) breeding habitat, and</li><li>c) nesting habitat.</li></ul> <p>7. Wash vehicles and heavy equipment for fires prior to arrival at a new location to avoid introduction for noxious weeds.</p> <p>Livestock Grazing Pg 43 Action 16</p> <p>16. Rest vegetation treatment areas (e.g., prescribed burns) from livestock grazing up to one year prior to treatment (if necessary) to maintain fine fuels for burning, and for a minimum of two growing seasons following treatment to promote recovery of vegetation. Livestock rest for less than two growing seasons could be justified on a case-by-case basis.</p>
<p>Appendix X pg.208 Conservations measures for Fire Management <i>Issue: Reduction of sagebrush by wildfire.</i></p> <p>1. Schedule annual coordination meetings – with appropriate resource staff including fire specialists, wildlife biologists, and range ecologists – to incorporate new sage grouse habitat and other wildlife habitat information needed to set wildfire suppression priorities related to resources. Distribute updates to fire dispatchers for initial attack planning.</p> <p>2. Identify the location of know sage grouse habitat and other wildlife habitats of concern, such as latitude and longitude with a polygon and radius, to avoid disturbance or degradation by temporary facilities, such as fire camps, staging areas, and helibases.</p> <p>3. Incorporate known sage grouse habitat information into each Wildfire Situation Analysis to help determine appropriate suppression plans and prioritize multiple fires.</p> <p>4. Retain unburned areas of sage grouse habitat, such as interior islands and patches between roads and fire perimeter, unless compelling safety, resource protection, or control objectives are at risk.</p> <p>Appendix X pg.208</p>

**Table G-1  
GRSG and Sagebrush Habitat Guidance in Land Use Plans**

<p><i>Issue: Rehabilitation and restoration of sagebrush grass-lands.</i></p> <ol style="list-style-type: none"> <li>1. Assure that long-term wildfire rehabilitation objectives are consistent with the desired natural plant community.</li> <li>2. Re-vegetate burned sites in sage grouse habitat within one year unless natural recovery of the native plant community is expected. Areas disturbed by heavy equipment will be given priority consideration.</li> <li>3. Emphasize native plant species adapted to the site that are readily available and economically and biologically feasible.</li> <li>4. Monitor the site and treat for noxious weeds.</li> <li>5. Allow a minimum of two growing seasons of rest from grazing by domestic livestock unless there are specific restoration objectives using livestock.</li> </ol> <p>WAFWA guidelines are incorporated in Appendix X and include restoration guidelines.</p>
<p><b>Four Rivers Field Office - Cascade RMP</b></p>
<p><i>Wildlife – Sage-grouse</i></p>
<p>Action: No sagebrush control work would be allowed on sage grouse nesting and wintering habitat where live sagebrush canopy cover is less than 20%.</p>
<p>Action: Treatment measures should be applied in irregular patterns using topography and other ecological considerations to minimize adverse effects to the sage grouse resource.</p>
<p>Action: Where fire is used as a habitat management tool, it should be used in such manner as to result in a mosaic pattern of shrubs and open areas, with openings, optimally from 1 to 10 acres in size.</p>
<p>Action: Maintain the density of sagebrush canopy coverage at 20-30% within nesting habitats and at least 20% in wintering habitats.</p>
<p>Action: No control of sagebrush would be considered in any area known to have supported important wintering populations of sage grouse in the past 10 years.</p>
<p>Action: Seed mixtures for range improvement projects and fire rehabilitation projects will include a mixture of grasses, forbs and shrubs that benefit sage grouse.</p>
<p>Action: Improve sage grouse brood rearing habitat where sagebrush canopy cover is greater than 20% by removing sagebrush in small irregular areas and then reseeding.</p>
<p>Action: Sage Grouse Winter Range Occupancy Restrictions for Oil, Gas, Geophysical Exploration and Development and Major Construction 12/1 to 2/15 Entire Habitat Area</p>
<p>Action: Sage Grouse Breeding Grounds Occupancy Restrictions for Oil, Gas, Geophysical Exploration and Development and Major Construction 2/15 to 6/30 Entire Habitat Area</p>
<p>Action: Sage Grouse Nesting/Brood Rearing Occupancy Restrictions for Oil, Gas, Geophysical Exploration and Development and Major Construction 4/15/6/30 2-mile radius from lek</p>
<p><i>Special Status Species – Wildlife, Sage-grouse</i></p>
<p>Objective: Manage 185,860 acres of sage grouse habitat to improve brooding and nesting habitat.</p>
<p><b>Four Rivers Field Office – Kuna MFP</b></p>
<p>Wildlife</p>
<p>Objective WL-1: Protect and/or improve endangered species habitat within the Kuna Planning Unit.</p>
<p>Objective WL-2: Manage sensitive species habitat in the KPU to maintain or increase existing and potential populations.</p>
<p>WL-4.4 Manage 83,600 acres of sage grouse range to improve nesting, brood rearing, and winter habitats by: (1) improving all poor and fair big sagebrush, meadow, and riparian ecological sites to good ecological condition, and (2) referring to and addressing the "Guidelines for Habitat Protection in Sage Grouse Range" as published by the Western States Sage Grouse Committee, June 1974, when making management decisions affecting areas used by sage grouse in the KPU.</p>
<p><i>Livestock Grazing</i></p>

**Table G-1  
GRSG and Sagebrush Habitat Guidance in Land Use Plans**

RM1.1 Implement AMPs on 7 allotments and less-intensive management on 19 allotments (Overlay RM-4). Allotments are listed in priority order. Adjust management or exclude grazing on sage grouse brood-rearing areas to improve habitat. Design grazing management to improve crucial antelope winter/early spring ranges.
RM-1.8 Treat an estimated 4,600 acres (2,900 acres brush control and 1,700 acres brush control and reseeded) to reduce invasion of less desirable species, improve range condition, and increase grazing capacity, subject to the following conditions: a. If sprays are used, maintain a buffer of 150 feet around perennial streams and riparian habitat. b. Allow for a sufficient forage-to-cover ratio to meet wildlife needs in winter ranges for mule deer, antelope, and sage grouse. c. Design projects with irregular control lines, feathered edges, and natural contours. On sites treated by mechanical means, drainages and occasional brush islands will be left untreated.
<b>Four Rivers Field Office - Morley Nelson Snake River Birds of Prey National Conservation Area</b>
<i>Vegetation - General</i>
Goal: The uplands would provide habitats to increase the populations of shrub obligate animals.
Goal: Sagebrush and salt desert shrub communities would be the dominant vegetation type and would include a mosaic of multi-aged shrubs, forbs, and native and adapted non-native perennial grasses.
Objective: Limit further loss of existing native shrub habitat to no more than 30,000 acres and increase the acres of restored shrub habitat.
<i>Wildlife</i>
Goal: The distribution, abundance, and quality of wildlife habitats would be maintained or improved to provide food, cover, and space for healthy populations of game and nongame wildlife through the seasons, as well as through various life stages.
Goal: Distribution and condition of habitats would contribute to the long-term viability of federally listed and BLM sensitive species and to their resilience to environmental change.
Convert approximately 100,000 acres of annual grasslands to a perennial plant community through a combination of biological, chemical, and mechanical fuels management projects. This is in addition to habitat restoration projects.
<b>Jarvis Field Office - Jarvis RMP</b>
<i>Vegetation - Rangeland</i>
Action: No chemical control of sagebrush will be allowed.
Goal: Manage all ecological sites on mule deer, pronghorn, elk, bighorn sheep and sage grouse habitat currently in fair or poor ecological condition, for good ecological condition.
<i>Special Status Species – Wildlife, Sage-grouse</i>
Goal: Protect and enhance endangered, threatened, and sensitive species habitats in order to maintain or enhance existing and potential populations within the planning area.
Objective: Where applicable, “Guidelines for Habitat Protection in Sage Grouse Range” and “Sage Grouse Management Practices” (Technical Bulletin No. 1) – Western States Sage Grouse Committee, June 1974, and 1982 respectively, will be followed.
Action: No control work would be allowed where live sagebrush cover is less than 20%.
Action: Treatment measures should be applied in irregular patterns using topography and other ecological considerations to minimize adverse effects to the sage grouse resource.
Action: Maintain the density of sagebrush canopy coverage at 20-30% within nesting habitats and at least 20% in wintering habitats.
Action: No control of sagebrush would be considered in any area known to have supported important wintering populations of sage grouse in the past 10 years.
Action: Seed mixtures for range improvement projects and fire rehabilitation projects will include a mixture

**Table G-1  
GRSG and Sagebrush Habitat Guidance in Land Use Plans**

of grasses, forbs, and shrubs that benefit sage grouse.
Action: Improve sage grouse brood rearing habitat where sagebrush canopy cover is greater than 20% by removing sagebrush in small irregular areas and then reseeded.
Action: Wildlife Habitat Occupancy Restrictions: No occupancy in sage grouse winter range (entire habitat area) from December 1 through February 15.
Action: Wildlife Habitat Occupancy Restrictions: No occupancy in sage grouse breeding grounds (entire habitat) from February 15 through June 30.
Action Wildlife Habitat Occupancy Restrictions: No occupancy in sage grouse nesting/brood rearing habitat within 2 miles radius from a lek from April 15 through June 30.
Goal: Priority for habitat management will be given to habitat for listed and candidate threatened or endangered species and sensitive species.
<i>Livestock Grazing</i>
Objective: Maintain present levels of upland game bird nesting and cover habitat.
<i>Lands and Realty</i>
Action: Any public lands where rare, endangered, threatened, or sensitive species of plant or animal are known to live (or nest) would be found unsuitable for disposal, unless mitigation is possible.
<i>Fluid Minerals</i>
Action: Occupancy for oil and gas activities will be restricted in crucial wildlife habitats as shown in Table 1. (see sage-grouse section for occupancy restrictions).
<b>Owyhee Field Office – Owyhee RMP</b>
<i>Soil and Water</i>
Action: Implement a juniper abatement plan for appropriate sites on which juniper is invading.
<i>Wildlife</i>
Action: Design and implement vegetation treatments to improve habitat where juniper or shrub density is contributing to unsatisfactory habitat conditions. All treatments will be designed to protect scarce, unique and highly productive wildlife habitat types, retain large interconnected blocks of more common habitat types and accommodate specific wildlife habitat requirements including migration corridors for big game. Reseed burns with a variety of shrubs, forbs and grasses. Rest all burns and seedings from livestock grazing for a minimum of two growing seasons following treatment.
Action: Retain all public land within crucial and other high quality wildlife habitats unless exchanging for land of equal or higher value and acquire additional high quality habitat through purchase or exchange with willing landowners. These include but are not limited to wetland/riparian habitats, crucial big game winter habitat and isolated tracts and shrublands adjacent to agricultural areas that provide important cover for upland game. Isolated tracts will be grazed only if needed to maintain or improve wildlife habitat.
<i>Special Status Species – Wildlife, sage-grouse</i>
Objective (SPSS 1): Manage special status species and habitats to increase or maintain populations at levels where their existence is no longer threatened and there is no need for listing under the Endangered Species Act of 1973, as amended. See Tables SPSS-1 and SPSS-2.
Action (9): Identify, protect, and enhance key sage grouse habitats and populations. Guidance for enhancement and protection is addressed in the Memorandum of Agreement in the 1997 Idaho Sage Grouse Management Plan (March 1998). Subsequent guidance may become available through the development of plans by local sage grouse working groups or similar efforts.
Action (1): Prepare, revise, and implement Habitat Management Plans (HMPs) and other resource activity plans and cooperate in the development and implementation of Recovery Plans, Conservation Agreements and Strategies and species management plans to ensure that objectives for special status plant and animal species are incorporated and met.
Action (4): Acquire additional high quality habitat for special status species through purchase or exchange

**Table G-1**  
**GRSG and Sagebrush Habitat Guidance in Land Use Plans**

with willing landowners.
<i>Wildland Fire Management</i>
Objective (FIRE 5): Modify standard suppression techniques to protect sensitive resource values.
Action (2): Use any and all available fire suppression techniques to protect the Silver City area, cultural ACECs, and unique wildlife habitat areas.
<b>Pocatello Field Office - Pocatello RMP and Malad MFP</b>
<i>Wildlife - Malad</i>
Objective: Improve and maintain the sage grouse habitat to support current sage grouse population numbers (1200 birds on public lands) through 1985.
Decision: At least 20% of live vegetation left within land treatment projects will be composed of sagebrush where sage grouse needs have been identified. A 100 yard sage brush buffer will be retained along meadows and perennial drainages.
Decision: Vegetative control will exclude known sage grouse winter areas.
<i>Wildlife - Pocatello</i>
Objective: Improve 3,126 acres of sage grouse and sharp-tailed grouse seasonal ranges from fair to good ecological range condition.
<i>Wildland Fire Management – Malad &amp; Pocatello</i>
Goal: Protect and enhance sage grouse source habitats as well as enhance key ecological components in plant and animal communities.
Objective: Maintain, protect, and expand sage grouse source habitats.
Action: Suppress wildland fires in source habitats, except where WFU would benefit habitat.
Action: Allow WFU in sage grouse habitats for the benefit of the habitat only after site-specific project level coordination with IDFG.
Action: Conduct vegetation treatments in areas that pose a wildland fire risk to source habitats.
Action: Treat areas with source habitats that have low resiliency (i.e., areas characterized by low species diversity, undesirable composition, and dead or decadent sagebrush)
Action: Following wildland fire, WFU and prescribed fire treatments, use chemical, mechanical, and seeding treatments with appropriate plant materials to attempt to stabilize sites and prevent dominance of invasive, annual vegetation, and noxious weeds.
Action: Use native plant materials where determined to be appropriate and practical at the project-implementation level.
Objective: Treat sage grouse key and restoration habitats to expand source habitats. Improve and maintain sage grouse Restoration (R1-3) and key habitats.
Action: Use AMR to wildland fire in all sage grouse restoration and key habitats and healthy wildlife habitats.
Action: WFU may be allowed in historically frequent fire regimes to restore fire's natural role and in sage grouse restoration and key habitats for the benefit of the habitat only after site-specific project level consultation/collaboration with IDFG.
Action: Conduct vegetation treatments in restoration and key habitats to reduce risk of wildland fire and reconnect restoration and key habitats.
Action: Treat areas of restoration and key habitats that have low resiliency characterized by low species diversity.
Objective: Apply Greater sage-grouse conservation measures and management restrictions for fire suppression and fire and non-fire vegetation treatments for the following disciplines:
Action: Implement the following Greater sage-grouse conservation measures:
Conservation Measures Considered in Developing Vegetation Treatments Potentially Affecting Greater Sage-

**Table G-1**  
**GRSG and Sagebrush Habitat Guidance in Land Use Plans**

<p>Grouse</p> <p>Prescribed Fire</p> <ul style="list-style-type: none"><li>• Prior to planning prescribed burns or other vegetation management treatments in sagebrush communities, ensure that sage-grouse seasonal habitats have been mapped (see 5.3.2 for additional discussion of mapping).</li><li>• Once seasonal habitats have been mapped, ensure that proposed project areas have been evaluated on the ground in the context of the appropriate seasonal habitat characteristics (see 5.3.2).</li><li>• Avoid the use of prescribed fire and other sagebrush-reduction projects in areas where sagebrush is limiting on the landscape or in habitats that currently meet, or are trending toward meeting, breeding or winter habitat characteristics.</li><li>• If the analysis shows that a vegetation treatment may still be advisable, design habitat-manipulation projects to achieve the desired objectives, considering the following:<ul style="list-style-type: none"><li>▪ Where prescribed burning, or other treatments, in sage-grouse habitats may be warranted (e.g., sagebrush cover exceeds desired breeding or winter habitat characteristics; understory does not meet seasonal habitat characteristics and restoration is desired; there is a need to restore ecological processes; or a proposed treatment site is in an exotic seeding being managed for overall sage-grouse benefits on the surrounding landscape).</li><li>▪ Project design should be done with interdisciplinary input and in cooperation with IDFG.</li><li>▪ Ensure that any proposed sagebrush treatment acreage is conservative in the context of surrounding seasonal habitats and landscape.</li><li>▪ Where appropriate, ensure that treatments are configured in a manner that promotes use by sage-grouse (see Connelly 2000 for additional discussion).</li><li>▪ Leave adequate untreated sagebrush areas for loafing/hiding cover near leks for sage-grouse.</li></ul></li><li>• Evaluate and monitor prescribed burns, and other treatments, as soon as possible after treatment and periodically thereafter to determine whether the project was successful and is meeting or trending toward desired objectives.</li><li>• Avoid the use of prescribed fire or other sagebrush treatments in habitats prone to the expansion or invasion of cheatgrass or other invasive species unless adequate measures are taken to control the invasive species and ensure subsequent dominance by desirable perennial species. In many—if not most—cases, this will likely require chemical treatments and reseeded.</li><li>• Plan, execute, and monitor prescribed fires in a manner that provides for adequate control and provision for contingency resources.</li><li>• Ensure that burn plans address the importance of preventing escaped fires when prescription fires are planned in the vicinity of stronghold and key habitat.</li></ul> <p>Annual Grasslands</p> <ul style="list-style-type: none"><li>• Local working groups (LWG), land management agencies, IDFG, and other partners should work closely together to identify and prioritize annual grassland areas for restoration. Work cooperatively to identify options, schedules, and funding opportunities for specific projects.</li><li>• In general, the priority for implementation of specific sage-grouse habitat restoration projects in annual grasslands should be given first to:<ul style="list-style-type: none"><li>▪ Sites adjacent to or surrounded by sage-grouse stronghold habitats, then</li><li>▪ Sites outside stronghold habitats but adjacent to or within approximately two miles of key habitat, and</li><li>▪ Sites beyond two miles of key habitat. The intent here is to focus restoration outward from existing, intact habitat.</li></ul></li></ul>
---

**Table G-1**  
**GRSG and Sagebrush Habitat Guidance in Land Use Plans**

- All seeding project designs should include measures for noxious weed control and monitoring for at least 3 years following implementation.
- Seed used in sage-grouse habitat restoration seedings, burned area rehabilitation projects, and hazardous fuels/wildland urban interface projects will be tested and certified as weed-free, based on prevailing agency policy and protocol. Private landowners are encouraged to use only certified seed, as well.
- In designing rehabilitation and restoration projects, use the best available science relative to seeding technology and plant materials. Use of NRCS's "VegSpec" website may be helpful. VegSpec is a web-based decision support system that assists land managers in the planning and design of vegetation establishment practices. VegSpec uses soil, plant, and climate data to select plant species that are site-specifically adapted, suitable for the selected practice, and appropriate for the purposes and objectives for which the planting is intended. (See <http://plants.usda.gov>).
- Design vegetation treatments in areas of high fire frequency to facilitate firefighter safety; reduce the risk of extreme fire behavior; reduce the risk and rate of fire spread to stronghold, key, and restoration habitats; reduce fire frequencies; and shorten the fire season.
- Where rangelands are dominated by annuals (such as cheatgrass) or where they border farmlands or railroad right-of-ways, convert cheatgrass areas to perennials, or establish buffers of perennial species to reduce the risk of fire spread from railroad or agriculture-related activities (e.g., sparks from trains, field burns, burn barrels), where appropriate and feasible.
- To discourage the spread of invasive annuals and noxious weed seed, require the washing of fire vehicles (including undercarriage) prior to deployments and prior to demobilization from wildfire incidents.
- Human activities such as fence and pipeline maintenance or construction, facility maintenance, utility maintenance, or any project or related work at or within 1 km (0.6 miles) of occupied leks that results in or will likely result in disturbance to lekking birds should be avoided from approximately 6:00 PM to 9:00 AM. In general, this guideline should be applied from March 15 through May 1 in lower elevation habitats and March 25 through May 15 in higher elevation habitats.

#### Perennial Grasslands

- LWGs, land management agencies, IDFG, and other partners should work closely together to identify and prioritize perennial grasslands (exotic versus native) where plant species diversity or sagebrush is limiting on the landscape. Further, they should work cooperatively to identify options, schedules, and funding opportunities for reestablishing sagebrush in higher priority areas.
- When seeding sagebrush, source-identified, tested seed adapted to local conditions should be used.
- One or more of the following approaches for restoring sagebrush should be considered to improve likelihood of success (see Dalzell 2004 and Monsen et al. 2004):
  - Use of the "Oyer" compact row seeder, which compacts soil and presses seed into the surface.
  - Use of the Brillion cultipacker seeder, where seed is broadcast over the surface followed by cultipacking.
  - Transplant bare-root or containerized stock in small critical areas to establish a seed source.
  - Use the "mother plant" technique, and transplant bare-root or containerized stock in select locations throughout the area to establish a seed source.
- For large areas (e.g., large wildland fires), aerial seed onto a rough seedbed (Monsen et al. 2004) coupled with one or more of the above options.

**Table G-1**  
**GRSG and Sagebrush Habitat Guidance in Land Use Plans**

- In established stands of introduced perennial grasses, transplant sagebrush into strategic patches or strips in critical sites or throughout the area. Scalp spots or strips to reduce grass competition prior to planting. Or, as an alternative to scalps, consider the use of herbicides (see Monsen et al. 2004, Volume 3).
- Where the diversification of crested wheatgrass or similar seedings with native species of grasses, forbs, and/or shrubs is desired, Pellant and Lysne (2005) recommend a three-step process:
- Reduce competition of crested wheatgrass to facilitate the establishment and persistence of the desired species. Possibilities include use of livestock, capitalizing on drought episodes that reduce grass vigor, herbicides such as glyphosate, and mechanical treatments.
  - Introduce desired, site-adapted species through drill seeding; aerial seeding followed by harrow, cultipacker or churning; livestock trampling; or transplanting container stock, bareroot stock, or individual plants from native sources ("wildings"). Lambert (2005) provides descriptions, recommended seeding rates, and other useful information for nearly 250 species of native and non-native grasses, forbs, and shrubs.
  - As part of post-treatment management, ensure that livestock grazing and rest intervals are matched with the phenology and life history characteristics of the desired/seeded/transplanted species. Implement monitoring to clearly document how, what, when, and where treatments were implemented. Follow up with suitable effectiveness monitoring to document success of the treatments relative to project objectives.

#### Conifer Encroachment

- LWGs, land management agencies, IDFG, and other partners should work closely together to identify and prioritize conifer encroachment areas for further management action. Work cooperatively to identify options, schedules, and funding opportunities for specific projects. For western juniper, Miller et al. (2005) provide *Guidelines for Selecting the Most Appropriate Management Actions*, pages 54–57.
- IDFG, land management agencies, LWGs, and other partners should work closely together to identify leks where conifer encroachment may be affecting lek attendance or nearby habitat quality.
- Remove Douglas fir or other conifers where they are encroaching on wet meadows, riparian areas, or sagebrush stands that provide potential sage-grouse habitat.
- Remove juniper, Douglas fir, pinyon pine, or other trees within at least 100 m (330 ft) or an 8-acre area of occupied sage-grouse leks. The purpose of this procedure is to reduce perching opportunity for raptors or other avian predators within view of leks. Techniques could include chainsaw, chipper, or other suitable mechanical means. Ensure cutting and slash disposal is completed between approximately July 15 and January 30 to minimize disturbance to grouse that may be in the vicinity (e.g., males at leks, nesting females, and young broods). This practice serves to reduce raptor predation on sage-grouse by eliminating potential perches, thereby improving survival, recruitment, and productivity. It may be particularly valuable where avian predation may be of greater concern such as in areas with fragmented habitat, nearby infrastructure features, and/or in the case of small, isolated sage-grouse populations.
- Where juniper or other conifer species have encroached upon sagebrush communities at larger scales, employ prescribed fire, chemical, mechanical (e.g., churning, chipper, chainsaw, or commercial sale), or other suitable methods to reduce or eliminate juniper. Priority should be given to areas where there is a strong likelihood for recovery of perennial herbaceous vegetation or where preparatory and follow-up actions (e.g., control of invasive species and seeding) are likely to be successful. Whenever possible, but especially if sagebrush habitat is limited locally, use juniper-control techniques that are least disruptive to the affected stand of sagebrush. For example, if junipers are only scattered, and the associated sagebrush community is otherwise relatively healthy, cutting junipers with chainsaws will remove the

**Table G-1**  
**GRSG and Sagebrush Habitat Guidance in Land Use Plans**

<p>encroachment threat while allowing for immediate use of the sagebrush by sage-grouse. In all cases, control efforts should be planned using interdisciplinary expertise.</p> <p>Where juniper control around leks is planned, monitor leks for at least three consecutive years post-treatment to document effects on lek attendance. Ideally, two to three years of pre-treatment monitoring is also recommended, but this may not always be feasible.</p>
<p>Suppression Restrictions</p> <p><u>Fire Management</u></p> <ul style="list-style-type: none"><li>• A Wildland Fire Situation Analysis will be initiated as per the Redbook (Interagency Standards for Fire and Aviation Operations).</li><li>• Interagency cooperation will be maintained to facilitate coordinated fire management activities across administrative boundaries.</li><li>• Wildland fire suppression activities will continue to exercise Tribal trust responsibilities.</li><li>• In the event a wildland fire escapes initial attack, a BLM resource advisor will be assigned to ensure that resource management concerns are adequately addressed and that necessary mitigation occurs. If one of the following is being threatened or has the potential to be threatened, the appropriate manager will be notified with the following information and a resource advisor will be dispatched: 1) Public health and safety, 2) WUI, 3) Sage grouse habitat and, 4) Any ACEC, Resource Natural Area (RNA), congressionally delegated watershed or any other area of significant concern.</li><li>• Prior to wildland fire season potential areas of conflict between archeological resources and wildland fire suppression activities should be identified.</li></ul> <p><u>Noxious Weeds</u></p> <ul style="list-style-type: none"><li>• To minimize spread of noxious weeds, equipment used for extended attack or Type I/II incidents should be cleaned before arriving on-site and prior to leaving the incident. Staging areas and fire camps should avoid sites with noxious weed infestations.</li></ul> <p><u>Vegetation</u></p> <ul style="list-style-type: none"><li>• Blading should occur on existing roads where possible. Blading through undisturbed areas, especially those supporting native cover types, should be avoided unless necessary to protect life, property, or resource values.</li></ul> <p><u>Wildlife</u></p> <ul style="list-style-type: none"><li>• When conducting fire suppression actions, species with recovery plans, conservation agreements, Partners in Flight species, and Birds of Conservation Concern will be protected as specified in their respective plans and or agreements.</li><li>• Establishment of control lines, base camps, and support facilities in known SSS habitat will be avoided unless life and property are threatened.</li></ul> <p><u>Threatened, Endangered, and Candidate Species</u></p> <p>The following restrictions apply to Proposed, Threatened, Endangered and Candidate species and to “designated” critical habitat.</p> <ul style="list-style-type: none"><li>• Fire fighter safety and public safety are top priorities in response to fire suppression. At no time will the activities described in this EIS compromise fire fighter safety and public safety.</li></ul>

**Table G-1**  
**GRSG and Sagebrush Habitat Guidance in Land Use Plans**

- The BLM will coordinate annually with the USFWS to update species status in the planning area.
- Field Managers will ensure resource staff initiates emergency consultation with the USFWS whenever suppression activities may impact listed species habitat and, more specifically, during emergency suppression actions to protect life and property.
- Control lines, base camps, support facilities, and other suppression-related facilities should not be established within:
  - 1/2 mile of known bald eagle or yellow-billed cuckoo nests (February 1-August 15)
  - 1 mile of occupied gray wolf den sites (April 15 - June 30)
  - 300 feet of occupied Ute ladies'-tresses habitat
  - 300 feet of all water bodies and springs occupied by T & E and Candidate species
  - Secure habitat within designated grizzly bear management unit (BMU).
- Minimum Impact Suppression Techniques (MIST) guidelines will be followed in occupied T&E and Candidate species habitat where appropriate (Appendix T in Interagency Standards for Fire and Aviation Operations, 2005). MIST guidelines direct suppression techniques, procedures, tools, and equipment that least impact the environment. Wet-lining (using water to soak/saturate fuels) is the preferred fireline construction tactic.
- Field Managers will assign a Resource Advisor or other designated representative as per the current Red Book guidance.
  - BLM will notify USFWS when appropriate to discuss T&E species mitigation within the suppression area to assure conservation practices are being followed to avoid adverse effects.
  - When Incident Management Teams (IMTs) are required, the Resource Advisor will brief the IC about conservation measures needed to avoid adverse effects.
- Where grizzly bears may reasonably occur:
  - The BLM Resource Advisor will brief all fire crews on general operating procedures including proper bear safety, sanitation, and food storage.
  - Incident Commanders, Fire Management Officers, and Scouts should be equipped with and trained to use bear deterrent spray.
  - Garbage should be disposed of in bear-proof containers when possible and removed from camps daily, preferably in the evening.
- No water-dipping by helicopters will occur within 1/2 mile of any occupied bald eagle nest.
- Fuel storage, fuel trucks, and refueling activities will not occur within 300 feet of live waters containing T&E and Candidate species. The current Planning Area Hazardous Material plan will be followed to ensure T&E and Candidate species and habitat will not be adversely affected in the event of a spill.
- Dozer blading should not occur within 300 feet of perennial streams or their tributaries occupied by T&E and Candidate species.
- Drafting equipment for pumps will be properly screened to prevent entrapment of T&E fish species. Maximum screen mesh size shall be 3/32-inch diameter.
- Any sump created by blocking flow in any occupied T&E habitat will be performed in coordination with a natural resource specialist to prevent dewatering.
- If chemical products will be injected into the system, water will not be pumped directly from the streams. If chemicals are needed, water will be pumped from a portable tank, or a backflow check valve will be used.
- Application of retardant or foam (aerial or ground) will be avoided within 300 feet of perennial streams or their tributaries occupied by T&E and Candidate species pursuant to the current Red Book guidance.
- To minimize spread of noxious weeds, equipment used for extended attack or Type I/II incidents

**Table G-1  
GRSG and Sagebrush Habitat Guidance in Land Use Plans**

should be cleaned before arriving on-site and prior to leaving the incident. Staging areas and fire camps will avoid sites with noxious weed infestations.

TES Reporting Requirements

Because of the programmatic nature of this EIS process, the exact timing, site-specific suppression methods, location, and size of fires are currently unknown. In order to monitor the impacts of wildland fire-suppression activities, the Level I team will meet immediately after the fire season to review a summary of activities (fire suppression) that may have occurred in or adjacent to T&E and Candidate habitat. If the Level I team identifies fire-suppression activities for which more information is needed to ascertain potential effects to the environmental baseline for a particular listed or candidate species, BLM will provide a report providing the necessary information identified by the Level I team to the USFWS Snake River Fish and Wildlife Office or the Eastern Idaho Field Office no later than December 31 for the preceding 12-month period. The types of information that may be needed include:

- The location, timing, size, intensity, and suppression activities used for each fire.
- Any mitigations used during fire-suppression activities to avoid effects to T&E and Candidate species and habitat, any T&E and Candidate species or habitat affected, and the estimated extent of effects.
- Results of post-fire reviews and monitoring.

Fire and Non-Fire Vegetation Treatment Restrictions

Fire and non-fire vegetation treatment restrictions will be applied to site-specific restoration and hazardous fuels reduction treatment actions for the following disciplines:

- |   |   |
|---|---|
| <ul style="list-style-type: none"> <li>• Vegetation</li> <li>• Air Quality</li> <li>• Cultural Resources and Historic Trails</li> <li>• Hazardous Materials and Abandoned Mine Sites</li> <li>• Livestock Grazing</li> <li>• Placeholder Species</li> </ul> | <ul style="list-style-type: none"> <li>• Recreation</li> <li>• Riparian Areas</li> <li>• Special Designations (WSAs, ACECs)</li> <li>• Visual Resources</li> <li>• Wildlife</li> <li>• Threatened, Endangered, and Candidate Species</li> </ul> |
|---|---|

The following fire and non-fire vegetation treatment restrictions will be applied to site-specific restoration and hazardous fuels reduction treatment actions occurring throughout the Planning Area, consistent with NFP policy and LUP direction.

Vegetation Management

- No chemical treatment would conflict with existing or future national vegetative treatment guidance. To reduce potential resource impacts from chemical treatments, herbicide use would conform to application criteria described in the 1991 document, Environmental Impact Statement for Vegetation Treatment on BLM Lands in Thirteen Western States or in subsequent revisions and/or replacements of this document. Use would conform to instructions from BLM Manual 9011 Chemical Pest Control, as well as label restrictions and current policies and state statutes. In addition, the prescription for herbicide application (desired, optimum environmental conditions) would evaluate off-site migration and non-target species by assessing wind speed and direction, temperature, precipitation forecast, soil

**Table G-1**  
**GRSG and Sagebrush Habitat Guidance in Land Use Plans**

infiltration potential, constraints on overland water transport due to precipitation or flooding, establishment of riparian buffer strips, and risk to special status species. Fishery and/or wildlife biologists would assist project planners in selecting appropriate herbicides for use among or near terrestrial and aquatic flora and fauna sensitive to herbicides.

- The economic effects of alternative fuels management practices would be considered. Local involvement and economic benefits from fuels reduction projects would be promoted.
- Collaboration with local partners to assess WUI areas would be continued, and existing mitigation plans would be updated to implement fuels treatments.
- There would be no Healthy Forest Restoration Act treatments in old-growth forests.
- Vegetation treatment activities would continue to exercise Native American Tribal trust responsibilities.
- Fuels treatments would be utilized to reduce the overall threat of the establishment and spread of noxious/invasive plant species.
- The economic effects of alternative fuels management practices would be considered. Local involvement and economic benefits from fuels reduction projects would be promoted.
- Collaboration with local partners to assess WUI areas and to update existing County Wildfire Protection Plans (CWPPs) would continue.

Wildlife

- Seasonal guidelines may be applied if needed to mitigate the impacts to big game species from planned fuels management and vegetation treatments as specified in the LUPs identified in Table 1.2.
- Restrictions may be imposed on fuels management and vegetation treatment projects in areas supporting nesting raptors as per amended LUPs (Table 1.2). Treatment proposals would be coordinated with IDFG.
- Species with recovery plans, conservation agreements, Partners in Flight species, and Birds of Conservation Concern will be protected as specified in their respective plans/agreements.
- Habitat Conservation Assessment and Conservation Strategies have been prepared and are currently being implemented for the following BLM sensitive species: Townsend's big-eared bat, wolverine, spotted bat, white headed woodpecker, trumpeter swan, northern goshawk, Columbian sharp-tailed grouse, greater sage grouse (Idaho plan pending), mountain quail, Idaho dunes tiger beetle, Bonneville cutthroat trout, bull trout, Yellowstone cutthroat trout, red band trout and leather sided chub.
- Vegetation treatments proposed in areas supporting sage grouse and sharp-tailed grouse would be coordinated with IDFG and would be implemented under LUP guidance or restrictions.
- Seasonal guidelines may be applied to mitigate the impacts to big game species from planned vegetation treatments as specified in LUPs.
- During implementation, the Proposed Plan Amendment directs collaboration with the appropriate local, state, and federal agencies to promote public education on species at risk, including their importance to the human and biological community and the rationale behind the protective measures that would be applied to their habitats.

Threatened, Endangered, and Candidate Species

The following restrictions apply to proposed habitats occupied by T&E and Candidate species and designated critical habitat.

- Treatment activities may occur near or adjacent to T&E and Candidate species habitat and will be designed to minimize or mitigate impacts to habitat occupied by T&E and Candidate species and designated critical habitat so that the species or their habitats will not be adversely affected. All related

**Table G-1**  
**GRSG and Sagebrush Habitat Guidance in Land Use Plans**

fire and non-fire vegetation treatment activities in areas that may affect T&E and Candidate species would be conducted in consultation with USFWS. Further, all such activities would be designed and implemented in such a manner that potential impacts to T&E and Candidate species from disturbance or habitat modification would be extremely unlikely to occur or would be so small as to not be meaningfully measured, detected, or analyzed.

- T&E and Candidate species with recovery plans, conservation agreements, and conservation strategies will be protected as specified in their respective plans/agreements/strategies. These protections include such measures as adequate habitat and range for a given species, including mitigation measures for multiple land use activities authorized by the BLM.
- Herbicide applicators will obtain a weather forecast for the area prior to initiating a spraying project to ensure no extreme precipitation or wind events could occur during or immediately after spraying. Aerial application of herbicides will not occur during periods of inversion. Spraying will follow label instructions.
- Fuels management and vegetation treatment activities would be conducted according to standards and guidelines in The Pacific Bald Eagle Recovery Plan, 1986. The planning area within the Greater Yellowstone Ecosystem would conduct fuels management and vegetative treatments according to standards and guidelines in the Greater Yellowstone Bald Eagle Management Plan (Greater Yellowstone Bald Eagle Working Group 1996). No vegetation treatment activities would occur within a one-half-mile radius of bald eagle nesting zones from February 1 to July 31. No activities would occur within one half mile (direct line of site) or one quarter mile of winter bald eagle concentration sites from November 1 to March 1.
- Riparian cottonwood forests with willow understories that may be impacted by fuels management and vegetation treatments would be surveyed for yellow-billed cuckoos prior to initiating project activities. When developing vegetation treatment projects, no ground-based application of herbicides would occur from May 1 to August 31 within 200 feet of occupied yellow-billed cuckoo habitat.
- Aerial application of chemicals would not occur from May 1 to August 31 within one-half mile of occupied yellow-billed cuckoo habitat.
- Fuels management and vegetation treatment areas within the BMUs would be coordinated with U.S. Forest Service activities to comply with road density restrictions and number and juxtaposition of management activities with BMUs, as provided for in the Grizzly Bear Recovery Plan (USFWS 1993) or the Final Conservation Strategy for the Grizzly Bear in the Yellowstone Area (USFWS 2003).
- When developing vegetation treatment projects, open and total motorized access routes or trail density within BMUs would not increase. When developing vegetation treatment projects within BMUs, the Bureau will coordinate with the Interagency Grizzly Bear Committee to develop/implement sanitation guidelines.
- Gray wolf (*Canis lupus*) populations in the area, which includes portions of the Planning Area, have been designated as experimental/nonessential. Presence or absence of gray wolf dens or rendezvous sites in fuels management or vegetation treatment areas would be determined prior to initiating projects. In the event active den or rendezvous sites are established within the planning area, vegetation treatments would be designed and implemented to minimize noise disturbance or habitat modifications within one mile of the den or rendezvous sites from April 15 to June 30.
- Fuels management and vegetation treatments that may occur within the Little Lost River drainage would be conducted according to standards and guidelines developed for bull trout (*Salvelinus confluentus*) Riparian Habitat Conservation Areas on BLM lands within the geographic range of bull trout (U.S. Fish and Wildlife Service 1999a, 2002).

**Table G-1  
GRSG and Sagebrush Habitat Guidance in Land Use Plans**

<ul style="list-style-type: none"> <li>• No aerial application of herbicides would occur within one half mile of all water bodies and springs containing listed snails, Columbia spotted frog, and bull trout.</li> <li>• No ground-based applications of herbicides, surfactants, or adjuvants would occur within 100 feet of perennial streams or their live water tributaries occupied by listed snails, Columbia spotted frog, and bull trout.</li> <li>• Dozer blading would not occur within 300 feet of streams that have habitat occupied by T&amp;E or Candidate Species.</li> <li>• Ground-disturbing activities other than tree and shrub planting will not occur within 300 feet of all water bodies and springs containing listed snails, Columbia spotted frog and bull trout.</li> <li>• No aerial application of herbicides would occur within one-half mile of all water bodies and springs containing listed snail, Columbia spotted frog and bull trout species.</li> <li>• Treatments will follow PACFISH/INFISH guidelines in bull trout habitat.</li> <li>• For those portions of the Snake River drainages where fuels management and vegetation treatments have the potential to effect populations of T&amp;E Snake River mollusks, the Bureau will consult with the Service to ensure mitigation measures are adequate to avoid adverse effects to Snake River mollusks.</li> </ul>
<b>Salmon Field Office – Lemhi RMP</b>
<i>Vegetation – General</i>
<p>Action:</p> <ol style="list-style-type: none"> <li>1. The Idaho Department of Fish and Game shall be given at least two years notice prior to any vegetation manipulation project.</li> <li>2. Brush control projects will be designed to maximize edge effect to the extent possible. Islands of untreated sagebrush will be incorporated into project design as necessary to provide cover for sage grouse and other species.</li> <li>3. Proposed brush manipulation projects on sage grouse winter and/or nesting range or antelope winter and/or fawning range must have a predicted neutral or beneficial effect on these species.             <ol style="list-style-type: none"> <li>a. The sagebrush canopy cover will not be reduced below 10 percent on sage grouse brood rearing areas.</li> <li>b. The sagebrush canopy cover will not be reduced below 20 percent on sage grouse nesting and wintering areas.</li> <li>c. The sagebrush canopy cover will not be reduced below 10 percent on general antelope ranges. Winter ranges and spring fawning areas will not be treated unless overall benefits to antelope will result.</li> </ol> </li> <li>4. Brush control proposals within 2 miles of known strutting grounds will be subject to on-site inspection by BLM and Idaho Department of Fish and Game personnel to determine prohibited areas.</li> <li>5. As a rule, no brush control will be allowed within 100 yards of streams, meadows, or secondary drainages (dry and intermittent). The desirability of increasing or decreasing the width on specific areas will be determined via on-site evaluation by BLM and Idaho Department of Fish and Game personnel.</li> <li>6. A mixture of grasses, forbs, and shrubs (if appropriate) will be used in all range rehabilitation or improvement projects.</li> </ol>
<i>Wildlife</i>
<p>Objective: Provide forage for 9,350 deer, 2,194 elk, 2,950 antelope, and 200 bighorn sheep. Improve 4,000 acres of elk winter/spring range; 17,000 acres of deer, antelope, and sage grouse seasonal ranges; and 22,000 acres of non—game habitat from fair to good ecological range condition to good. Improve 7,320 acres of seasonal elk and bighorn sheep ranges. Provide a more consistent water supply on 81,000 acres of antelope, sage grouse, and non-game habitat in the Gilmore and Muddy Creek area. Preserve habitat values of 30 small isolated seeps and wet meadows created by livestock water developments. Enhance big game movement and safety. Protect the future integrity of the elk breeding area in McDevitt Creek and antelope migration corridor near Center Ridge. Enhance the integrity and availability of 69,057 acres of crucial habitat of raptors, waterfowl, elk, and other wildlife. Improve the quality of 10,400 acres of crucial elk and bighorn habitat.</p>

**Table G-1**  
**GRSG and Sagebrush Habitat Guidance in Land Use Plans**

Action: Crucial habitat will be enhanced through adoption of no surface occupancy restrictions on 69,057 acres available for mineral leasing. The quality of 8,800 acres of big game habitat will be improved through restrictions on livestock use and timber management and harvest.
Action: Seasonal restrictions will continue to be applied where they are needed to mitigate the impacts of human activities on important seasonal wildlife habitat. Approximately 60 percent (226,000 acres) of the resource area lies within areas potentially subject to restriction. During any given year, the authorized officer may waive seasonal restrictions if actual conditions do not warrant them. Seasonal wildlife restrictions related to GRSG: Sage Grouse Strutting Grounds 03/01 — 04/30 Sage Grouse Nesting & Brood-rearing 04/30 — 06/30
<i>Livestock Grazing (Range Management)</i>
Action: All new fence construction will comply with the Lemhi Resource Area fencing policy dated May 20, 1983 which is as follows:  It shall be standard policy for the Lemhi Resource Area that:  A. All wire fences constructed subsequent to this policy statement shall be 3 wire only. B. Wire spacing shall be as follows: a. Top wire shall be set no higher than 38” from ground level. b. Bottom wire shall be smooth and set at a minimum of 18” from ground level. c. Midwire shall be set at 26” from ground level unless: 1. Bighorn sheep are involved (34”) 2. Fence is adjustable for antelope (29”) C. All new fences shall be flagged (e.g. cloth strips, survey flagging) between every other post.
<b>Shoshone Field Office - Craters of the Moon National Monument RMP</b>
<i>Vegetation - General</i>
Goal: There is no net loss, and preferably a net gain, of sagebrush steppe communities over the life of the plan.
Goal: Continuity of habitat for special status species and general wildlife are emphasized.
Action: VEG-2: Existing sagebrush steppe communities will be protected to prevent loss of shrub cover and managed to promote a diverse, desirable grass and forb understory.
Action: VEG-3: Annual grasslands and highly degraded sagebrush steppe communities will be restored to achieve a mosaic of shrubs, forbs, and grasses capable of sustaining native animal populations
Action: VEG-4: Restoration projects will be prioritized relative to locations of key Greater sage-grouse habitats and population strongholds. Emphasis will be on projects that restore annual grasslands and degraded sagebrush steppe communities, as well as enlarging and connecting habitats in good condition.
Action: VEG-5: National and Idaho state habitat guidelines for Greater sage-grouse and sagebrush steppe obligates developed by interagency working groups regarding composition and structure of sagebrush habitats on a landscape scale will be adopted to guide sagebrush steppe management.
Action: VEG-8: Aggressive protection of existing sagebrush steppe communities and proactive restoration of areas with poor to fair biotic integrity through both active and passive means (see Figure 6) will be emphasized.
Action: VEG-9: Approximately 80,000 acres of BLM-administered land (11% of the entire Monument) will

**Table G-1  
GRSG and Sagebrush Habitat Guidance in Land Use Plans**

<p>be restored. About 31,000 acres of annual grassland and 49,000 acres of highly degraded low elevation sagebrush steppe (poor to fair biotic integrity) will be treated to control cheatgrass and restore big sagebrush cover with a perennial understory.</p>
<p>Action: VEG-10: All special status species in the Monument will be inventoried with monitoring plans established, particularly when and where adverse impacts may occur.</p>
<p>Action: VEG-11: Actions and stipulations necessary to protect special status species and their habitats will be made part of land use authorizations (e.g., limiting fragmentation of special status species populations when considering road maintenance) and fire planning.</p>
<p>Action: VEG-12: Use of native plants will be emphasized in rehabilitation and restoration projects, and only native plants will be used for rehabilitation or restoration projects within the Pristine Zone. Integrated weed management principles will be used to:</p> <ul style="list-style-type: none"> <li>• detect and eradicate all new infestations of noxious weeds;</li> <li>• control existing infestations; and</li> <li>• prevent the establishment and spread of weeds within and adjacent to the planning area.</li> </ul>
<p>Action: Restoration treatments in areas supporting sage-grouse wintering habitats would be limited from December 1 through March 1.</p>
<p>Action: Restoration treatments in areas supporting sage-grouse breeding habitat would be limited from March 1 through April 30, and grouse nesting habitat April 30 through June 15.</p>
<p>Action: Sage-grouse Key and Source habitats would be maintained and enhanced when possible within Low- and Mid-Elevation Shrub types. Restoration treatments would generally be limited in habitats supporting live sagebrush communities. Treatments to enhance and restore habitat would be focused in areas where the sagebrush component is lost or dead and the understory degraded.</p>
<p><i>Wildlife</i></p>
<p>Goal: High-quality habitats for sagebrush obligate species are provided.</p>
<p>Action: WLIFE-7: Actions and stipulations necessary to protect special status species and their habitats will be made part of land use authorizations (e.g., limiting fragmentation of special status species populations when considering road maintenance) and fire planning.</p>
<p><i>Special Status Species – Wildlife, Sage-grouse</i></p>
<p>Goal: Greater sage-grouse restoration habitat (R1 &amp; R2) will achieve significant progress towards reclassification as Key habitat.</p>
<p>Goal: Species composition in key Greater sage grouse habitat will reflect site potential.</p>
<p>Action: WLIFE-8: Active and historic leks will be protected from disturbance during the Greater sage-grouse breeding season. Some examples of potential protective measures as presented in the Idaho Sage-grouse Advisory Committee's 2006 Conservation Plan for the Greater Sage-grouse in Idaho include the following:</p> <ul style="list-style-type: none"> <li>• Apply use restrictions where needed and appropriate on existing roads or trails near occupied leks to minimize nonessential activity between 6:00 PM to 9:00 AM (in general this guideline should be applied from approximately March 15 through May 1).</li> <li>• Avoid human activities such as fence maintenance or construction or any project or related work at or near (1 km or 0.6 mile) occupied leks that results in or will likely result in disturbance to lekking birds, between 6:00 PM to 9:00 AM (in general this guideline should be applied from approximately March 15 through May 1).</li> <li>• Avoid creating unnecessary disturbances related to livestock management activities near occupied leks whenever possible.</li> <li>• Improve the dissemination of information to elementary and high school students, hunters, resource user groups, and others to increase their understanding of Greater sage-grouse and sagebrush steppe conservation issues.</li> <li>• Monitor leks in a manner that minimizes disturbance to Greater sage-grouse following established protocol</li> </ul>

**Table G-1**  
**GRSG and Sagebrush Habitat Guidance in Land Use Plans**

(Idaho Sage-grouse Advisory Committee 2006, Sections 5.2.1.1 and 5.2.1.2).
Note: Road closures or restrictions during the Greater sage-grouse breeding season will not apply to agency (BLM and NPS) vehicles, including Idaho Department of Fish and Game vehicles and personnel who conduct necessary Greater sage-grouse inventory.
Action: WLIFE-9: Consistent with Idaho Standards for Rangeland Health and Guidelines for Livestock Grazing Management (USDI BLM 1997) determinations, livestock grazing management will be modified as necessary to ensure that key Greater sage-grouse habitat achieves site potential.
<i>Wildland Fire Management</i>
Action: VEG-16: Wildland fire will be suppressed to protect life and property, healthy sagebrush steppe communities, recent rehabilitation and restoration projects, cultural sites, and the Little Cottonwood Creek watershed.
Action: VEG-17: Fire will be managed to maximize protection and restoration of sagebrush steppe in the Passage and Primitive Zones.
Action: VEG-20: In the event of wildland fire, burned areas will be rehabilitated when necessary to restore the appropriate mosaic of sagebrush species and subspecies, along with a diverse perennial understory, and to suppress invasive and noxious weeds.
<i>Comprehensive Trails and Travel Management</i>
Action: The NEPA Analysis which accompanies the Comprehensive TMP will include, at a minimum, cumulative effects assessments of road density and fragmentation of sage-grouse habitat.
<b>Shoshone Field Office - Magic MFP</b>
<i>Special Status Species – Wildlife, Sage-grouse</i>
Goal: Habitat Improvement
Objective: Establish vegetation... in conjunction with existing brush along Magic Reservoir.
Action: Provide adequate forage for sage grouse broods.
Goal: Habitat Maintenance
Objective: Determine winter use and strutting areas for maintenance of habitat.
Action: Inventory to determine if there is winter sage-grouse use within close proximity to their strutting grounds. If winter use is identified, adequate sagebrush should be maintained within the use areas.
Action: All sagebrush control projects that lie within 2-mile radius of sage-grouse strutting grounds will be designated... to not have any adverse impacts on nesting grouse.
Action: Maintain sagebrush within the 2-mile radius of sage-grouse strutting grounds.
Goal: Habitat Expansion
Objective: Establish a 10-15% density of summer succulent forbs approximately 14,000 acres.
Action: Sage-grouse summer habitat would be expanded.
<i>Wildland Fire Management</i>
Goal: Control big sagebrush only with chemicals or fire where it will not impair adequate nesting success of Sage grouse.
Objective: Maintain sagebrush within 2-mile radius of known grouse strutting grounds.
Goal: Control big sagebrush using chemicals or fire.
Objective: Maintain sagebrush outside of the 2-mile radius of known grouse strutting grounds.
Action: Strive for about 50% reduction in the amount of big sagebrush.
<i>Livestock Grazing</i>
Goal: Artificial Treatment (Brush Control)

**Table G-1**  
**GRSG and Sagebrush Habitat Guidance in Land Use Plans**

Objective: Improved forage and range conditions.
Action: Coordination/Planning on brush control within areas inside the identified primary nesting areas for sage grouse.
Action: Brush control designed such that they will not have any adverse impacts on nesting grouse.
<b>Shoshone Field Office - Sun Valley MFP</b>
<i>Vegetation – Rangeland</i>
Goal: (NC, BW, & M) Appendix 1 of MFP Decision Number 6, Habitat Management – Vegetation Manipulation
Objective: Maintain crucial habitat
Action: Every effort should be made to delay sheep bands from utilizing known sage grouse nesting areas until about the first week in June, or until young sage grouse have hatched in the particular locality.
Action: Livestock should not be permitted to heavily use known important sage grouse wintering areas.
Action: No sagebrush should be treated or removed until a comprehensive multiple-use management plan (MFP) has been formulated for the area.
Action: Sagebrush control should include provisions for long-term quantitative and qualitative measurements of vegetation before and after control to acquire data on the effects of wildlife habitat.
<i>Special Status Species – Wildlife, Sage-grouse</i>
Goal: (NC, BW, & M) Appendix 1 of MFP, Habitat Management – Vegetation Manipulation
Objective: Maintain crucial habitat
Action: No control work should be considered where live sagebrush cover is less than 20%, or on steep upper slopes with skeletal soils where big sagebrush is 12 in. or less in height.
Action: Control of vegetation within the breeding complex should not be undertaken within 2 miles of leks, or on nesting and brood areas.
Action: No control of sagebrush should be considered in any area known to have supported important wintering concentrations of sage grouse within the past 10 years.
Action: When sagebrush control is found to be unavoidable in sage grouse range, all treatment measures should be applied in irregular patterns using topography and other ecological considerations to minimize adverse effects to the sage grouse resource.
<i>Wildland Fire Management</i>
Goal: (NC, BW, & M) Appendix 1 of MFP, Habitat Management – Vegetation Manipulation
Action: No winter burns of sagebrush habitat in identified important wintering sites.
Action: Fire should be avoided during spring/summer when it could destroy ... young sage grouse.
<b>Shoshone Field Office - Bennett Hills/Timmerman Hills MFP</b>
<i>Soil &amp; Water - WATERSHED in MFP</i>
Objective: Selectively control heavy stands of brush which are competing with or have replaced herbaceous vegetation desirable for watershed protection in the following delineated areas. (W 1.4.)
Action: Selective brush control may be undertaken within two-mile radius of sage grouse strutting grounds, sage grouse wintering areas, and deer winter range subject to coordinated assessment by the Area Manager and Wildlife Biologist.
<i>Vegetation – General</i>
Action: Forbs composition at the desired level of 20-25% is the accepted Wildlife Recommendations for the entire area. This goal puts additional constraints on spraying of sagebrush with chemicals which also reduce forbs. It may be that some reduction could be accepted for the short term if long term benefits in forb production could be attained. Another possible mitigating measure might be to aerial seed some forbs following sagebrush spray project.
<i>Vegetation – Rangeland</i>
Dempsey Allotment: Action: Coordinate land treatment proposal in the allotment where critical deer winter

**Table G-1  
GRSG and Sagebrush Habitat Guidance in Land Use Plans**

range sage grouse range and lands potentially valuable for agriculture have not been identified to assure all multiple use conflicts are mitigated prior to project implementation Criteria to be used in mitigating conflicts are found in Appendix I MFP Step II, See Step II Overlay for coordinated control areas.
Indian Allotment: Action: Allow coordinated land treatment on sage grouse winter range.
Clover Creek Allotment: Action: Allow coordinated land treatment on sage grouse winter range.
Davis Mountain Allotment: Action: Allow coordinated land treatment on sage grouse winter range. See Appendix I, MFP Step II.
Black Canyon Allotment: Action: Allow coordinated land treatment on sage grouse winter range and strutting grounds. See Appendix 1, MFP Step II.
Rattlesnake Allotment: Action: Allow coordinated land treatment on sage grouse winter range and nesting areas. See criteria in Appendix I, MFP Step II.
North Shoshone Allotment: Action: Allow coordinated land treatment on sage grouse winter range and nesting grounds. Refer to criteria in Appendix 1, MFP Step II.
Kinzie Butte Allotment: Action: Allow selective brush control within two mile radius of sage grouse strutting grounds.
Marsh Spring Allotment: Action: Allow coordinated land treatment within 2 mile radius of sage grouse strutting grounds. See criteria referred to in 2 above.
Macon Flat Allotment: Action: Allow coordinated land treatment on sage grouse winter range and nesting grounds. Refer to criteria in #2 above.
Picabo Cattle Allotment - Action: Selectively control sagebrush to increase livestock forage, improve watershed conditions, and improve species composition for sage grouse brood rearing within the accepted guidelines (RM Appendix II) for sagebrush control.
Tikura Allotment - Action: Selectively control sagebrush to increase livestock forage, improve watershed conditions, and improve species composition for sage grouse brood rearing within the accepted guidelines (RM Appendix II) for sagebrush control.
Richfield Allotment - Action: Selectively control sagebrush to increase livestock forage, improve watershed conditions, and improve species composition for sage grouse brood rearing within the accepted guidelines (RM Appendix II) for sagebrush control.
Tack Allotment - Action: Selectively control sagebrush to increase livestock forage, improve watershed conditions, and improve species composition for sage grouse brood rearing within the accepted guidelines (RM Appendix II) for sagebrush control.
Timmerman Hills Sheep Allotment - Action: Selectively control sagebrush to increase livestock forage, improve watershed conditions, and improve species composition for sage grouse breed rearing within the accepted guidelines (RM Appendix I) for sagebrush control.
<i>Wildlife – Sensitive Species – Sage-grouse</i>
Goal: Sage grouse are an important wildlife resource within the planning area in which most of the birds live their entire life cycle. The objective is to increase the huntable population of this species within the area. (p. 4)
Objective: The three key habitat requirements of this species are strutting and nesting areas brood rearing areas and winter areas. The strutting grounds should not be disturbed and adequate sagebrush cover should be maintained within the nesting areas to provide for nesting sage grouse. (p. 4)
Objective: In the brood rearing areas the key factor is wet meadow areas which provide succulent forage during the summer months. These areas should be maintained and improved.(p. 4)

**Table G-1  
GRSG and Sagebrush Habitat Guidance in Land Use Plans**

Objective: Since the primary ingredient in the sage grouse winter diet is sagebrush it will be necessary to maintain adequate brush within the winter areas to provide for the anticipated population of sage grouse.(p. 4)
Objective: Improve 283,000 acres of sage grouse brood rearing habitat in the Bennett Hills and Timmerman Hills Planning Units in order to provide adequate food, cover, and water for pre hunting season population of 20,000 sage grouse by 1990. (WL 6.)
Action: Selectively reduce sagebrush throughout those portions of sage grouse brood rearing habitat that does not encompass either critical deer winter range or winter sage grouse habitat. (WL 6.1.)
Objective: Manage the existing sagebrush on 283,000 acres of nesting habitat and 38,000 acres of winter habitat in order to provide the necessary nesting cover and winter forage and cover for pre hunting season population of 20,000 sage grouse in the two planning units. (WL 7.)
Action: Selectively control sagebrush within 2-mile radius of strutting grounds in a manner that will not adversely impact present and future nesting sage grouse populations.
Action: Selective brush control may be under taken on sage grouse wintering areas only after careful consideration that remaining sagebrush habitat will be adequate for projected sage grouse populations. (WL 7.1.)
<i>General wildlife</i>
Objective: Manage the upland game bird habitat throughout the two planning units and provide diversity of vegetative species in order to provide variety of habitats for the five species of upland game birds. (WL 8.)
Action: Establish livestock grazing systems in order to establish diverse vegetative composition 15-20 percent shrubs, 20-25 percent forbs, and 50-65 percent grasses throughout the upland game bird habitat. (WL 8.3.3)
Objective: Upland Game Birds: An important part of their (sic upland game birds) habitat requirements can be provided on the National Resource Land by maintaining sagebrush for escape and winter cover. (pp. 4-5)
Action: Small parcels of National Resource Land identified as having important upland game habitat and situated adjacent to private land will be retained in public ownership and managed for upland game birds.
Objective: Forbs and grasses are also an important component of the life cycle of the upland game bird species. Consideration of this need should be part of the development of the allotment management plans in those areas which lie adjacent to the developed agricultural lands. (p. 5)
<b>Shoshone and Burley Field Offices - Monument RMP</b>
<i>Vegetation - Rangeland</i>
Action: "Sage Grouse Management in Idaho" (Autenrieth 1981) will be used as a reference to assist in the design of proposed projects in sage grouse habitat.
Action: Where wildlife habitat is a major consideration, areas will be burned to create a mosaic of shrubby and herbaceous vegetation. Burned areas will be rested from livestock grazing for two growing seasons following treatment.
<i>Special Status Species – Wildlife – Sage-grouse</i>
Objective: Protection of brush pockets will be important in maintaining or enhancing habitat for sage grouse, pronghorn, mule deer, and non-game wildlife.
Action: Maintain and enhance sage grouse habitat by maintaining adequate, suitable areas of brush and providing additional forbs for brood rearing.
Action: A Sage Grouse Habitat Management Plan will be prepared to guide management in the sage-grouse winter habitat area covering about 67,000 acres in Laidlaw Park, Little Park, and Paddleford Flat west of Carey.
Action: Suitable forbs will be included in range seedings in this area.
Goal: Monitoring and evaluation will be conducted to determine whether the RMP decisions are being implemented, whether the objectives of the RMP are being accomplished, and whether the RMP continues to be consistent with related plans. If a variation warranting management concern is found, the reasons for the variation will be examined and corrective actions will be taken as appropriate.

**Table G-1  
GRSG and Sagebrush Habitat Guidance in Land Use Plans**

Objective: Variation From RMP Warranting Management Concern - Any decrease below 1982 sage-grouse population levels.								
Action: Monitoring lek trends annually.								
Objective: Variation From RMP Warranting Management Concern - More acres of brush burned than planned for brush control.								
Action: Monitor nesting and winter habitats through analysis of fire reports.								
Objective: Variation From RMP Warranting Management Concern - 20 percent decrease in key species.								
Action: Monitor nesting and winter habitats by measuring frequency of key forbs.								
Action: Priority will be given to habitat for listed candidate, threatened and endangered species and sensitive species.								
<i>Wildland Fire Management</i>								
Objective: Protection of brush pockets will be important in maintaining or enhancing habitat for sage grouse, pronghorn, mule deer, and non-game wildlife.								
Upper Snake Field Office – Upper Snake RMP								
<i>Vegetation - General</i>								
Action: Use chemical, mechanical, seeding, and prescribed fire treatments as appropriate to achieve DFC. In perennial grass, invasive annual grasses, and juniper-invaded cover types, restore the sagebrush steppe with an aggressive sagebrush seeding effort, using the appropriate sagebrush subspecies for the treatment area.								
Action: Conduct fire/non-fire vegetation treatments in non-WUI areas with the following goals: <ul style="list-style-type: none"> <li>• Diversify perennial grass to speed reestablishment of sagebrush cover.</li> <li>• Enhance structural and species diversity in degraded low-elevation sagebrush steppe.</li> <li>• Reduce shrub and juniper density in mid-elevation shrub.</li> <li>• Reduce invasive species or noxious weeds in all vegetation types.</li> <li>• In mountain shrub, rejuvenate old, decadent shrubs and increase cover and density of desirable herbaceous species.</li> </ul>								
Action: Design vegetation treatments in concert with wildlife species and their season of use (e.g., winter, lekking, transitional, nesting, hibernation) while maintaining required habitat characteristics such as but are not limited to: <ul style="list-style-type: none"> <li>• Providing cover for wildlife</li> <li>• Maintaining diversity</li> <li>• Treating in a mosaic pattern</li> <li>• Providing travel corridors</li> <li>• Mimicking natural historic disturbances (e.g., fingering, uneven patches).</li> </ul>								
Action: As appropriate, to move vegetation cover types towards the DFC, use various methods (e.g., prescribed fire, mechanical, chemical, WFU) to treat on an <i>annual</i> basis the following footprint acres.								
<table border="1"> <thead> <tr> <th>Cover Type</th> <th>Acres treated</th> </tr> </thead> <tbody> <tr> <td>Wyoming/Basin Big Sagebrush</td> <td>45,010–49,750</td> </tr> <tr> <td>Mountain Big Sagebrush</td> <td>8,165–9,025</td> </tr> <tr> <td>Low Sagebrush</td> <td>95–105</td> </tr> </tbody> </table>	Cover Type	Acres treated	Wyoming/Basin Big Sagebrush	45,010–49,750	Mountain Big Sagebrush	8,165–9,025	Low Sagebrush	95–105
Cover Type	Acres treated							
Wyoming/Basin Big Sagebrush	45,010–49,750							
Mountain Big Sagebrush	8,165–9,025							
Low Sagebrush	95–105							

**Table G-1  
GRSG and Sagebrush Habitat Guidance in Land Use Plans**

<i>Vegetation - Rangeland</i>
Objective: Control invasive species/noxious weeds and poisonous plants to decrease the overall number of areas occupied. Minimize the likelihood of introduced new species of invasive species/noxious weeds and prevent weeds from becoming established.
Action: Priority treatment areas include: <ul style="list-style-type: none"> <li>• Wilderness study areas/areas of critical environmental concern/research natural areas</li> <li>• Special status species (SSS) habitats</li> </ul>
<i>Special Status Species – Wildlife - Sage-grouse</i>
Goal: Ensure public lands are managed to conserve species and their habitats, while providing for favorable conditions that support their continued existence.
Objective: Maintain, improve, or increase habitat for sensitive species to prevent them from becoming listed species (i.e. Federal T&E).
Action: Maintain existing partnerships and establish new partnerships (e.g., Greater sage-grouse working groups, IDFG, local cave groups) that help manage sensitive species habitat on BLM-administered public lands. Coordinate with state and other federal agencies to support research efforts, develop partnerships, and develop outreach and educational opportunities to inform the public about sensitive species habitats and populations.
Action: Pursue conservation easements, land acquisitions, cooperative management efforts, and other programs to support conservation of sensitive species and linkage corridors to improve habitat connectivity.
Action: Reduce impacts to sensitive species habitat by implementing measures such as but not limited to: <ul style="list-style-type: none"> <li>• Implement distance and timing stipulations.</li> <li>• Consider placement of, rerouting, modifying, or removing infrastructure (e.g., facilities, powerlines, pipelines, fence lines) or project location.</li> <li>• Consider placement of range improvements.</li> </ul>
Action: Inventory potential habitat and monitor population trends.
Action: Permitted/authorized activities (mining, recreation, land use authorizations, grazing, etc.) within sensitive species habitat may be modified (e.g., closed, limited or restricted access, season of use) to reduce potential conflicts or impacts (e.g., disturbance, habitat degradation).
Action: Manage livestock grazing in special status species habitat according to Standard 8 (Special Status Species) under Idaho Standards for Rangeland Health.
Objective: Maintain, improve, or increase habitat for sensitive species to preclude them from becoming listed species (i.e., federally threatened or endangered).
Action: Manage Greater sage-grouse habitat consistent with appropriate conservation plans (e.g., Conservation Plan for the Greater Sage-grouse in Idaho [ISAC 2006]), local working group (e.g., Upper Snake, Challis, Eastern Idaho Uplands, Big Desert, and Magic Valley) and IDFG conservation strategies (e.g., Idaho Comprehensive Wildlife Conservation Strategy [IDFG 2005a]), including future revisions or amendments, and current BLM guidance, by: <ul style="list-style-type: none"> <li>• Reducing/controlling invasive species/noxious weeds</li> <li>• Reducing/limiting disturbance during breeding, nesting, and early brood rearing</li> <li>• Establishing setbacks or buffers</li> <li>• Maintaining/improving habitats through proactive vegetation treatments</li> <li>• Maintaining nesting habitat</li> </ul>

**Table G-1**  
**GRSG and Sagebrush Habitat Guidance in Land Use Plans**

<ul style="list-style-type: none"> <li>Applying livestock management techniques (e.g., sheep-bedding, herding, salting, water hauling, varying season of use, adjusting livestock numbers, developing alternative sources of water, and converting spring developments to a closed system).</li> </ul>
Action: Limit physical, mechanical, and audible disturbance within 0.5 miles of active leks from March through June (Sharp-tailed Grouse)
<i>Wildland Fire Management</i>
Action: In designing vegetation treatments in Low- and Mid-elevation Shrub and Mountain Shrub that could potentially affect Greater Sage-grouse, conservation measures would be implemented.
Objective: Maintain, protect, and expand Greater sage-grouse stronghold/source habitats.
Action: Conduct vegetation treatments in areas that pose a wildland fire risk to Greater sage-grouse Key habitat.
Action: Strategically place treatments on a landscape scale to prevent wildland fire from spreading into intact sagebrush steppe habitat (e.g., leks, breeding or brood rearing area) or WUI.
Action: WFU may be allowed in historically frequent fire regimes to restore fire's natural role and in Greater sage-grouse habitat for the benefit of the habitat only after site-specific project-level coordination with the Idaho Department of Fish and Game.
Action: Suppress wildland fires in stronghold/source habitats, except where WFU would benefit habitat.
Goal: Protect and enhance sage grouse source habitats as well as enhance key ecological components in plant and animal communities.
Objective: Make progress towards DFC in the low-elevation shrub, perennial grass, invasive annual grass, mid-elevation shrub, mountain shrub, and juniper vegetation types.
Action: In perennial grass, invasive grass, and juniper invaded cover types, restore sagebrush steppe with an aggressive sagebrush seeding effort, using the appropriate sagebrush subspecies for the treatment area.
Objective: Maintain, protect, and expand sage grouse source habitats.
Action: Allow WFU in sage grouse habitats for the benefit of the habitat only after site-specific project level coordination with IDFG.
Objective: Treat sage grouse key and restoration habitats to expand source habitats. Improve and maintain sage grouse Restoration (R1-3) and key habitats.
Action: Use AMR to wildland fire in all sage grouse restoration and key habitats and healthy wildlife habitats.
Action: WFU may be allowed in historically frequent fire regimes to restore fire's natural role and in sage grouse restoration and key habitats for the benefit of the habitat only after site-specific project level consultation/collaboration with IDFG.
Action: Conduct vegetation treatments in restoration and key habitats to reduce risk of wildland fire and reconnect restoration and key habitats.
Objective: Apply Greater sage-grouse conservation measures and management restrictions for fire suppression and fire and non-fire vegetation treatments.
Action: Implement the following suppression restrictions:
<p><i>Fire Management</i></p> <ul style="list-style-type: none"> <li>In the event a wildland fire escapes initial attack, a BLM resource advisor will be assigned to ensure that resource management concerns are adequately addressed and that necessary mitigation occurs. If one of the following is being threatened or has the potential to be threatened, the appropriate manager will be notified with the following information and a resource advisor will be dispatched: 1) Public health and safety, 2) WUI, 3) Sage grouse habitat and, 4) Any ACEC, Resource Natural Area (RNA), congressionally delegated watershed or any other area of significant concern.</li> </ul>
<i>Noxious Weeds</i>

**Table G-1**  
**GRSG and Sagebrush Habitat Guidance in Land Use Plans**

<ul style="list-style-type: none"><li>• To minimize spread of noxious weeds, equipment used for extended attack or Type I/II incidents should be cleaned before arriving on-site and prior to leaving the incident. Staging areas and fire camps should avoid sites with noxious weed infestations.</li></ul> <p><u>Special Designations (WSAs, ACECs)</u></p> <ul style="list-style-type: none"><li>• Fire camps and staging areas should be placed outside of special management areas.</li><li>• Use of natural firebreaks and existing roads and trails to contain a wildland fire would be encouraged.</li><li>• The resource values, hazards present, and management prescriptions within specific areas would be evaluated when applying guidelines to ACECs.</li></ul> <p><u>Vegetation</u></p> <ul style="list-style-type: none"><li>• Blading should occur on existing roads where possible. Blading through undisturbed areas, especially those supporting native cover types, should be avoided unless necessary to protect life, property, or resource values.</li></ul> <p><u>Wildlife</u></p> <ul style="list-style-type: none"><li>• When conducting fire suppression actions, species with recovery plans, conservation agreements, Partners in Flight species, and Birds of Conservation Concern will be protected as specified in their respective plans and or agreements.</li><li>• Establishment of control lines, base camps, and support facilities in known SSS habitat will be avoided unless life and property are threatened.</li></ul> <p><u>Threatened, Endangered, and Candidate Species</u></p> <p>The following restrictions apply to Proposed, Threatened, Endangered and Candidate species and to “designated” critical habitat.</p> <ul style="list-style-type: none"><li>• The BLM will coordinate annually with the USFWS to update species status in the planning area.</li><li>• Field Managers will ensure resource staff initiates emergency consultation with the USFWS whenever suppression activities may impact listed species habitat and, more specifically, during emergency suppression actions to protect life and property.</li><li>• Minimum Impact Suppression Techniques (MIST) guidelines will be followed in occupied T&amp;E and Candidate species habitat where appropriate (Appendix T in Interagency Standards for Fire and Aviation Operations, 2005). MIST guidelines direct suppression techniques, procedures, tools, and equipment that least impact the environment. Wet-lining (using water to soak/saturate fuels) is the preferred fireline construction tactic.</li><li>• Field Managers will assign a Resource Advisor or other designated representative as per the current Red Book guidance.<ul style="list-style-type: none"><li>○ BLM will notify USFWS when appropriate to discuss T&amp;E species mitigation within the suppression area to assure conservation practices are being followed to avoid adverse effects.</li><li>○ When Incident Management Teams (IMTs) are required, the Resource Advisor will brief the IC about conservation measures needed to avoid adverse effects.</li></ul></li><li>• To minimize spread of noxious weeds, equipment used for extended attack or Type I/II incidents should be cleaned before arriving on-site and prior to leaving the incident. Staging areas and fire camps will avoid sites with noxious weed infestations.</li></ul>
<p>Action: Implement the following fire and non-fire vegetation restrictions:</p> <p><u>Vegetation Management</u></p> <ul style="list-style-type: none"><li>• No chemical treatment would conflict with existing or future national vegetative treatment guidance. To reduce potential resource impacts from chemical treatments, herbicide use would conform to application criteria described in the 1991 document, Environmental Impact Statement for Vegetation Treatment on BLM Lands in Thirteen Western States or in subsequent revisions and/or replacements of this document. Use would conform to instructions from BLM Manual 9011 Chemical Pest Control, as well as</li></ul>

**Table G-1**  
**GRSG and Sagebrush Habitat Guidance in Land Use Plans**

label restrictions and current policies and state statutes. In addition, the prescription for herbicide application (desired, optimum environmental conditions) would evaluate off-site migration and non-target species by assessing wind speed and direction, temperature, precipitation forecast, soil infiltration potential, constraints on overland water transport due to precipitation or flooding, establishment of riparian buffer strips, and risk to special status species. Fishery and/or wildlife biologists would assist project planners in selecting appropriate herbicides for use among or near terrestrial and aquatic flora and fauna sensitive to herbicides.

- Fuels treatments would be utilized to reduce the overall threat of the establishment and spread of noxious/invasive plant species.

Livestock Grazing

- All treatment areas would be rested from livestock grazing until project-specific monitoring identified in site-specific project plans and/or NEPA documents show that resource objectives have been met. Resumption of grazing would be determined on a case-by-case basis.

Placeholder Species

- Plant materials used in re-vegetation actions would be native when appropriate and practical. However, desirable non-native species may be used in re-vegetation actions on harsh or degraded sites, when native seed is not available, or where they would structurally mimic the natural plant community and prevent soil loss and invasion by exotic annual grasses and noxious weeds. The species used would be those that have the highest probability of establishment on these sites. These "placeholders" would maintain the area for potential future native restoration. Native seed would be used more frequently and at larger scales as species adapted to local areas become more available.

Wildlife

- Species with recovery plans, conservation agreements, Partners in Flight species, and Birds of Conservation Concern will be protected as specified in their respective plans/agreements.
- Habitat Conservation Assessment and Conservation Strategies have been prepared and are currently being implemented for the following BLM sensitive species: Townsend's big-eared bat, wolverine, spotted bat, white headed woodpecker, trumpeter swan, northern goshawk, Columbian sharp-tailed grouse, greater sage grouse (Idaho plan pending), mountain quail, Idaho dunes tiger beetle, Bonneville cutthroat trout, bull trout, Yellowstone cutthroat trout, red band trout and leather sided chub.
- Vegetation treatments proposed in areas supporting sage grouse and sharp-tailed grouse would be coordinated with IDFG and would be implemented under LUP guidance or restrictions.

Threatened, Endangered, and Candidate Species

The following restrictions apply to proposed habitats occupied by T&E and Candidate species and designated critical habitat.

- Treatment activities may occur near or adjacent to T&E and Candidate species habitat and will be designed to minimize or mitigate impacts to habitat occupied by T&E and Candidate species and designated critical habitat so that the species or their habitats will not be adversely affected. All related fire and non-fire vegetation treatment activities in areas that may affect T&E and Candidate species would be conducted in consultation with USFWS. Further, all such activities would be designed and implemented in such a manner that potential impacts to T&E and Candidate species from disturbance or habitat modification would be extremely unlikely to occur or would be so small as to not be meaningfully measured, detected, or analyzed.
- T&E and Candidate species with recovery plans, conservation agreements, and conservation strategies will be protected as specified in their respective plans/agreements/strategies. These protections include such measures as adequate habitat and range for a given species, including mitigation measures for

**Table G-1**  
**GRSG and Sagebrush Habitat Guidance in Land Use Plans**

<p>multiple land use activities authorized by the BLM.</p> <ul style="list-style-type: none"><li>• Herbicide applicators will obtain a weather forecast for the area prior to initiating a spraying project to ensure no extreme precipitation or wind events could occur during or immediately after spraying. Aerial application of herbicides will not occur during periods of inversion. Spraying will follow label instructions.</li></ul>
<p>Action: Implement the following Greater sage-grouse conservation measures:</p> <p>Prescribed Fire</p> <ul style="list-style-type: none"><li>• Prior to planning prescribed burns or other vegetation management treatments in sagebrush communities, ensure that sage-grouse seasonal habitats have been mapped (see 5.3.2 for additional discussion of mapping).</li><li>• Once seasonal habitats have been mapped, ensure that proposed project areas have been evaluated on the ground in the context of the appropriate seasonal habitat characteristics (see 5.3.2).</li><li>• Avoid the use of prescribed fire and other sagebrush-reduction projects in areas where sagebrush is limiting on the landscape or in habitats that currently meet, or are trending toward meeting, breeding or winter habitat characteristics.</li><li>• If the analysis shows that a vegetation treatment may still be advisable, design habitat-manipulation projects to achieve the desired objectives, considering the following:<ul style="list-style-type: none"><li>○ Where prescribed burning, or other treatments, in sage-grouse habitats may be warranted (e.g., sagebrush cover exceeds desired breeding or winter habitat characteristics; understory does not meet seasonal habitat characteristics and restoration is desired; there is a need to restore ecological processes; or a proposed treatment site is in an exotic seeding being managed for overall sage-grouse benefits on the surrounding landscape).</li><li>○ Project design should be done with interdisciplinary input and in cooperation with IDFG.</li><li>○ Ensure that any proposed sagebrush treatment acreage is conservative in the context of surrounding seasonal habitats and landscape.</li><li>○ Where appropriate, ensure that treatments are configured in a manner that promotes use by sage-grouse (see Connelly 2000 for additional discussion).</li><li>○ Leave adequate untreated sagebrush areas for loafing/hiding cover near leks for sage-grouse.</li></ul></li><li>• Evaluate and monitor prescribed burns, and other treatments, as soon as possible after treatment and periodically thereafter to determine whether the project was successful and is meeting or trending toward desired objectives.</li><li>• Avoid the use of prescribed fire or other sagebrush treatments in habitats prone to the expansion or invasion of cheatgrass or other invasive species unless adequate measures are taken to control the invasive species and ensure subsequent dominance by desirable perennial species. In many—if not most—cases, this will likely require chemical treatments and reseeding.</li><li>• Plan, execute, and monitor prescribed fires in a manner that provides for adequate control and provision for contingency resources.</li><li>• Ensure that burn plans address the importance of preventing escaped fires when prescription fires are planned in the vicinity of stronghold and key habitat.</li></ul> <p>Annual Grasslands</p> <ul style="list-style-type: none"><li>• Local working groups (LWG), land management agencies, IDFG, and other partners should work closely together to identify and prioritize annual grassland areas for restoration. Work cooperatively to identify options, schedules, and funding opportunities for specific projects.</li><li>• In general, the priority for implementation of specific sage-grouse habitat restoration projects in annual grasslands should be given first to:<ul style="list-style-type: none"><li>○ Sites adjacent to or surrounded by sage-grouse stronghold habitats, then</li></ul></li></ul>

**Table G-1**  
**GRSG and Sagebrush Habitat Guidance in Land Use Plans**

- Sites outside stronghold habitats but adjacent to or within approximately two miles of key habitat, and
  - Sites beyond two miles of key habitat. The intent here is to focus restoration outward from existing, intact habitat.
  - All seeding project designs should include measures for noxious weed control and monitoring for at least 3 years following implementation.
  - Seed used in sage-grouse habitat restoration seedings, burned area rehabilitation projects, and hazardous fuels/wildland urban interface projects will be tested and certified as weed-free, based on prevailing agency policy and protocol. Private landowners are encouraged to use only certified seed, as well.
  - In designing rehabilitation and restoration projects, use the best available science relative to seeding technology and plant materials. Use of NRCS's "VegSpec" website may be helpful. VegSpec is a web-based decision support system that assists land managers in the planning and design of vegetation establishment practices. VegSpec uses soil, plant, and climate data to select plant species that are site-specifically adapted, suitable for the selected practice, and appropriate for the purposes and objectives for which the planting is intended. (See <http://plants.usda.gov>).
  - Design vegetation treatments in areas of high fire frequency to facilitate firefighter safety; reduce the risk of extreme fire behavior; reduce the risk and rate of fire spread to stronghold, key, and restoration habitats; reduce fire frequencies; and shorten the fire season.
  - Where rangelands are dominated by annuals (such as cheatgrass) or where they border farmlands or railroad right-of-ways, convert cheatgrass areas to perennials, or establish buffers of perennial species to reduce the risk of fire spread from railroad or agriculture-related activities (e.g., sparks from trains, field burns, burn barrels), where appropriate and feasible.
  - To discourage the spread of invasive annuals and noxious weed seed, require the washing of fire vehicles (including undercarriage) prior to deployments and prior to demobilization from wildfire incidents.
  - Human activities such as fence and pipeline maintenance or construction, facility maintenance, utility maintenance, or any project or related work at or within 1 km (0.6 miles) of occupied leks that results in or will likely result in disturbance to lekking birds should be avoided from approximately 6:00 PM to 9:00 AM. In general, this guideline should be applied from March 15 through May 1 in lower elevation habitats and March 25 through May 15 in higher elevation habitats.
- Perennial Grasslands
- LWGs, land management agencies, IDFG, and other partners should work closely together to identify and prioritize perennial grasslands (exotic versus native) where plant species diversity or sagebrush is limiting on the landscape. Further, they should work cooperatively to identify options, schedules, and funding opportunities for reestablishing sagebrush in higher priority areas.
  - When seeding sagebrush, source-identified, tested seed adapted to local conditions should be used.
  - One or more of the following approaches for restoring sagebrush should be considered to improve likelihood of success (see Dalzell 2004 and Monsen et al. 2004):
    - Use of the "Oyer" compact row seeder, which compacts soil and presses seed into the surface.
    - Use of the Billion cultipacker seeder, where seed is broadcast over the surface followed by cultipacking.
    - Transplant bare-root or containerized stock in small critical areas to establish a seed source.
    - Use the "mother plant" technique, and transplant bare-root or containerized stock in select locations throughout the area to establish a seed source.
  - For large areas (e.g., large wildland fires), aerial seed onto a rough seedbed (Monsen et al. 2004) coupled

**Table G-1**  
**GRSG and Sagebrush Habitat Guidance in Land Use Plans**

with one or more of the above options.

- In established stands of introduced perennial grasses, transplant sagebrush into strategic patches or strips in critical sites or throughout the area. Scalp spots or strips to reduce grass competition prior to planting. Or, as an alternative to scalps, consider the use of herbicides (see Monsen et al. 2004, Volume 3).
- Where the diversification of crested wheatgrass or similar seedings with native species of grasses, forbs, and/or shrubs is desired, Pellant and Lysne (2005) recommend a three-step process:
- Reduce competition of crested wheatgrass to facilitate the establishment and persistence of the desired species. Possibilities include use of livestock, capitalizing on drought episodes that reduce grass vigor, herbicides such as glyphosate, and mechanical treatments.
  - Introduce desired, site-adapted species through drill seeding; aerial seeding followed by harrow, cultipacker or chaining; livestock trampling; or transplanting container stock, bareroot stock, or individual plants from native sources ("wildings"). Lambert (2005) provides descriptions, recommended seeding rates, and other useful information for nearly 250 species of native and non-native grasses, forbs, and shrubs.
  - As part of post-treatment management, ensure that livestock grazing and rest intervals are matched with the phenology and life history characteristics of the desired/seeded/transplanted species. Implement monitoring to clearly document how, what, when, and where treatments were implemented. Follow up with suitable effectiveness monitoring to document success of the treatments relative to project objectives.

#### Conifer Encroachment

- LWGs, land management agencies, IDFG, and other partners should work closely together to identify and prioritize conifer encroachment areas for further management action. Work cooperatively to identify options, schedules, and funding opportunities for specific projects. For western juniper, Miller et al. (2005) provide *Guidelines for Selecting the Most Appropriate Management Actions*, pages 54–57.
- IDFG, land management agencies, LWGs, and other partners should work closely together to identify leks where conifer encroachment may be affecting lek attendance or nearby habitat quality.
- Remove Douglas fir or other conifers where they are encroaching on wet meadows, riparian areas, or sagebrush stands that provide potential sage-grouse habitat.
- Remove juniper, Douglas fir, pinyon pine, or other trees within at least 100 m (330 ft) or an 8-acre area of occupied sage-grouse leks. The purpose of this procedure is to reduce perching opportunity for raptors or other avian predators within view of leks. Techniques could include chainsaw, chipper, or other suitable mechanical means. Ensure cutting and slash disposal is completed between approximately July 15 and January 30 to minimize disturbance to grouse that may be in the vicinity (e.g., males at leks, nesting females, and young broods). This practice serves to reduce raptor predation on sage-grouse by eliminating potential perches, thereby improving survival, recruitment, and productivity. It may be particularly valuable where avian predation may be of greater concern such as in areas with fragmented habitat, nearby infrastructure features, and/or in the case of small, isolated sage-grouse populations.
- Where juniper or other conifer species have encroached upon sagebrush communities at larger scales, employ prescribed fire, chemical, mechanical (e.g., chaining, chipper, chainsaw, or commercial sale), or other suitable methods to reduce or eliminate juniper. Priority should be given to areas where there is a strong likelihood for recovery of perennial herbaceous vegetation or where preparatory and follow-up actions (e.g., control of invasive species and seeding) are likely to be successful. Whenever possible, but especially if sagebrush habitat is limited locally, use juniper-control techniques that are least disruptive to the affected stand of sagebrush. For example, if junipers are only scattered, and the associated sagebrush community is otherwise relatively healthy, cutting junipers with chainsaws will remove the encroachment threat while allowing for immediate use of the sagebrush by sage-grouse. In all cases, control efforts should be planned using interdisciplinary expertise.

**Table G-1  
GRSG and Sagebrush Habitat Guidance in Land Use Plans**

<ul style="list-style-type: none"> <li>Where juniper control around leks is planned, monitor leks for at least three consecutive years post-treatment to document effects on lek attendance. Ideally, two to three years of pre-treatment monitoring is also recommended, but this may not always be feasible.</li> </ul>
<p><i>Livestock Grazing</i></p> <p>Action: Manage livestock grazing consistent with the Conservation Plan for the Greater Sage-grouse in Idaho (ISAC 2006) and local working group plans (e.g., Big Desert Plan), implementing conservation measures such as, but not limited to:</p> <ul style="list-style-type: none"> <li>Implementing grazing management systems (e.g., herding, rest rotation, deferred rotation) to ensure adequate nesting habitat within the breeding landscape</li> <li>Adjusting grazing use distribution to benefit occupied Greater sage-grouse breeding habitat, through herding, salting, and water source management (e.g., turning troughs/pipelines on/off, extending pipelines/moving troughs)</li> <li>Identifying and/or developing strategically located forage reserves</li> <li>Moving sheep bedding grounds away from Greater sage-grouse leks</li> <li>Placing salt/mineral supplements in existing disturbed sites, areas with reduced sagebrush cover, seedings, or cheatgrass sites</li> <li>Considering the impact of range improvement placement on Greater sage-grouse</li> <li>Modifying fences when impacts to Greater sage-grouse are identified.</li> </ul>
<p><i>Fluid Minerals (Oil and Gas, Tar Sands, and Geothermal Resources)</i></p> <p>Action: Identify the following lands as open to leasing, subject to seasonal and controlled surface use restrictions (≈560,560 acres). These restrictions would be changed only by waiver, exception, or modification as outlined by the criteria listed in Appendix Process for Fluid Mineral Leasing.</p> <p>Seasonal wildlife guidelines (Approximately 456,560 acres):</p> <ul style="list-style-type: none"> <li>Greater sage-grouse strutting and nesting areas—activity allowed 6/16 to 1/30 (lands in the Big Lost MFP [BLM 1983])</li> <li>Sharp-tailed grouse and Greater sage-grouse strutting grounds—activity allowed 5/1 to 3/1 (lands in the Medicine Lodge RMP)</li> <li>Sharp-tailed grouse and Greater sage-grouse nesting and brood rearing areas—activity allowed 7/1 to 5/1 (lands in the Medicine Lodge RMP)</li> <li>Sharp-tailed grouse and Greater sage-grouse winter range—activity allowed 4/1 to 12/1 (lands in the Medicine Lodge RMP)</li> <li>Sharp-tailed and Greater sage-grouse nesting and brood rearing areas within the Tex Creek Wildlife Management Area—activity allowed 7/1 to 3/31</li> </ul>
<p><i>Mineral Materials</i></p> <p>Action: Develop conditions of approval that require operators to comply with mineral material regulations to protect the following surface resource values:</p> <ul style="list-style-type: none"> <li>Sharp-tailed grouse and Greater sage-grouse strutting, nesting, and brood rearing areas</li> <li>Sharp-tailed grouse and Greater sage-grouse winter range</li> <li>Special status species habitats.</li> </ul>
<p><b>Forest Service</b></p>
<p><b>Beaverhead-Deerlodge National Forest – Beaverhead-Deerlodge National Forest Plan</b></p>

**Table G-1  
GRSG and Sagebrush Habitat Guidance in Land Use Plans**

<i>Vegetation – Forest &amp; Woodlands</i>	
Objective: Grassland/Shrubland/Riparian: Reduce conifer encroachment on 74,000 acres of riparian areas, shrublands, and grasslands.	
<i>Wildlife</i>	
Goal: Sage Grouse: Sagebrush habitat supports sage grouse and pygmy rabbit populations by providing suitable sage grouse brood-rearing habitat on at least 40% of the sagebrush habitat within 18 kilometers of documented active or inactive sage grouse leks and the area mapped as potential pygmy rabbit habitat.	
Objective: Sage Grouse: Maintain or improve sagebrush height, and canopy and grass-forb canopy of sagebrush habitat, emphasizing habitat within 18 kilometers of documented active or inactive sage grouse leks and the area mapped as potential pygmy rabbit habitat.	
Sensitive and Federally Listed Species: Information in the following sources should be considered when designing projects that may affect sensitive species or federally listed species. <ul style="list-style-type: none"> <li>• Management Plan and Conservation Strategies for Sage Grouse in Montana</li> </ul>	
Standard 8: Within 18 kilometers of documented active or inactive sage grouse leks, do not remove sagebrush within 300 meters of riparian zones, meadows, lakebeds or farmland, unless site specific analysis indicates such removal promotes achievement of the sagebrush habitat goal. Springs developed for livestock water in these areas must be designed to maintain free water and wet meadows.	
<b>Boise National Forest – Boise National Forest Plan</b>	
<i>Vegetation – General</i>	
Desired Condition - Grassland and Shrubland Vegetation: Chapter 3, p. III-29 (Vol. 1, FLRMP) Grasslands and shrublands exhibit variable patterns of multiple-aged shrubs, grasses, and forbs. Shrublands are found in mosaics of canopy closures across the landscape, reflecting a combination of successional development, disturbance regimes and management activities. Some mid- to high-elevation grasslands are primarily meadow complexes that are dominated by sedges, rushes, grasses, and forbs.	
Appendix A - Vegetation, p. 17 (Vol. 2, FLRMP) Shrublands: Shrublands occur on areas not classified as forestland and where shrub cover has the potential to be >10 percent. Desired conditions have been developed for some shrubland communities that occur on the Forest. The shrubland groups reflect the LANDFIRE Environmental Site Potentials (ESPs) (refer to the Vegetation Classification section for descriptions of shrubland types). Like the forested vegetation, these groupings reflect similar environmental characteristics, site productivity, and disturbance regimes. Table A-9 displays the fire regimes for the shrubland communities.	
Table A-9. Shrubland environmental site potential groups by fire regime	
<b>Fire Regime</b>	<b>Shrubland Environmental Site Potential Group</b>
Mixed1	Low Sagebrush
Mixed1-Mixed2	Mountain and Wyoming Big Sagebrush
	Montane Shrub
Desired Condition Ranges for Sagebrush Species: Mt. Big Sagebrush: Grass/Forb = <10% Canopy Cover over 13-33% of area. Low = 10-25% Canopy Cover over 27-47% of area. Moderate = 26-35% Canopy Cover over 12-32% of area	

**Table G-1  
GRSG and Sagebrush Habitat Guidance in Land Use Plans**

<p>High = &gt;36% Canopy Cover over 8-28% of total area Wyoming Big Sagebrush: Grass/Forb = &lt;10% Canopy Cover over 25-30% of area. Low = 10-25% Canopy Cover over 20-35% of area. Moderate = 26-35% Canopy Cover over 13-33% of area High = &gt;36% Canopy Cover over 12-32% of total area Low Sagebrush: Grass/Forb = &lt;10% Canopy Cover over 0-20% of area. Low = 10-25% Canopy Cover over 80-100% of area. Moderate = 26-35% Canopy Cover over 0% of area High = &gt;36% Canopy Cover over 0% of total area</p>
<p>Guideline: VEGU06 - When sagebrush cover types are determined to need rest from livestock grazing following a wildfire, areas should be rested for a minimum of two growing seasons. Evaluate whether additional rest is needed after two growing seasons. Base this determination on the following factors: a) The ecological status of the sagebrush community prior to the wildfire, b) How long the sagebrush community had a density or canopy closure greater than 15 percent prior to the wildfire, c) The severity and intensity of the fire, d) The amount, diversity, and recovery of forbs, grasses and palatable shrubs that are present after 2 years of rest in relation to desired conditions. In areas other than sagebrush cover types, an appropriate rest period should be determined. Base this determination on the following factors: soil conditions, the amount, diversity and recovery of forbs, grasses, and palatable shrubs in relation to the desired condition that are present after the 2 years of rest.</p>
<p>Guideline: BTGU03 - When available and not cost-prohibitive, seeds and plants used for seedings and plantings in revegetation projects should originate from genetically local sources of native species. When project objectives justify the use of non-native plant materials, documentation explaining why non-natives are preferred should be part of the project planning process.</p>
<p><i>Special Status Species – Wildlife – Sage-grouse</i></p>
<p>Objective: TEOB07 - During fine-scale analyses, identify practices or facilities that are adversely affecting TEPC species or their habitats, and prioritize opportunities to mitigate, through avoidance or minimization, adverse effects to TEPC species.</p>
<p>Objective: TEOB19 - During fine-scale analyses in areas where TEPC species occur, identify opportunities to maintain desired habitat conditions or restore degraded habitat for TEPC species.</p>
<p>Objective: TEOB28 - During fine-scale analyses in areas where dispersed and developed recreation practices or facilities are identified as a potential concern or problem contributing to adverse effects to TEPC species or degradation of their habitats, evaluate and document where the problems are and prioritize opportunities to mitigate, through avoidance or minimization, adverse effects to TEPC species.</p>
<p>Standard: TEST04 - Management actions that have adverse effects on Proposed or Candidate species or their habitats, shall not be allowed if the effects of those actions would contribute to listing of the species as Threatened or Endangered under the ESA.</p>
<p>Standard: TEST05 - For management actions that include application of insecticides, herbicides, fungicides, or rodenticides, mitigation shall avoid or minimize adverse effects on TEPC species or their habitats.</p>
<p>Standard: TEST06 - Management actions shall be designed to avoid or minimize adverse effects to listed species and their habitats. For listed fish species, use Appendix B for determining compliance with this standard.</p>
<p>Standard: TEST12 - Mitigate, through avoidance or minimization, management actions within known nest or</p>

**Table G-1  
GRSG and Sagebrush Habitat Guidance in Land Use Plans**

denning sites of TEPC species if those actions would disrupt reproductive success during the nesting or denning period. During project planning, determine sites, periods, and appropriate mitigation measures to avoid or minimize effects.
Standard: TEST13 - Mitigate, through avoidance or minimization, management actions within known winter roosting sites of TEPC species if those actions would adversely affect the survival of wintering or roosting populations. During project planning, determine sites, periods, and appropriate mitigation measures to avoid or minimize effects.
Standard: TEST29 - Avoid or minimize adverse effects from locatable mineral operations to TEPC animal species or their habitats.
Guideline: TEGU03 - Management actions in occupied Proposed or Candidate species habitat should be modified or relocated if the effects of the actions would contribute to a trend toward ESA listing for these species.
Guideline: TEGU05 - The Forest should cooperate with USFWS and NMFS as appropriate by providing information, data, and assistance for the evaluation of species that are petitioned, or proposed, or candidates to be listed under the ESA, and for evaluation of proposed critical habitat.
Guideline: TEGU06 - Coordinate with Forest resource specialists to consider TEPC habitat needs when designing and implementing management activities that may affect TEPC species and their habitats.
Guideline: TEGU08 - Fire Resource advisors should be trained in techniques to mitigate, through avoidance or minimization, adverse effects to TEPC species.
Guideline: TEGU10 - Land exchanges that would result in a net loss of quality or quantity of habitat for TEPC species should not be considered unless benefits of the exchange outweigh the benefits to those species in the long term.
Guideline: TEGU12 - Where the authority to do so was retained, proposed or existing special use authorizations should be issued, re-issued, or amended upon expiration, only if adverse effects of the authorizations on TEPC species can be minimized.
<i>Management Area Direction</i>
The Lower South Fork Boise River MA on the Mountain Home Ranger District:
<ul style="list-style-type: none"> <li>• Vegetation Objective 0133 - Within the 1992 Foothills Fire area, maintain existing and newly established shrub stands in the Mountain Big Sagebrush and Bitterbrush vegetation groups to improve shrub diversity.</li> <li>• Wildlife Resources Guideline 0140 - Management actions in sage grouse habitat should be designed to meet the desired conditions for sagebrush described in Appendix A. Where greater than 40 percent of the sage grouse habitat in the management area has less than 10 percent canopy cover, management actions should be designed to maintain or restore canopy cover conditions.</li> <li>• Rangeland Resources Guideline 0156 - When constructing or reconstructing fences, design or relocate them to avoid potential sage grouse mortality near leks.</li> <li>• Rangeland Resources Guideline 0157 - Whenever possible, modify developed springs and other water sources to restore free-flowing water and wet meadows in sage grouse habitat.</li> <li>• Fire Management Objective 0159 - Limit the use of prescribed fire in existing and newly established stands of mountain big sagebrush and bitterbrush within the 1992 Foothills Fire area in order to restore canopy closure, and restore or maintain shrub diversity.</li> </ul>
<b>Caribou-Targhee National Forest – Caribou National Forest Revised Forest Plan</b>
<i>Special Status Species – Wildlife - Sage-grouse</i>
Objective: Sage Grouse: Within five years of signing the ROD, map functional and degraded sage grouse nesting and winter habitat within 5 miles of known leks. Identify opportunities to increase quality or quantity of that habitat
Action: Standard: In project analyses affecting the habitats listed below, assess impacts to habitat and populations for the following management indicator species:

**Table G-1**  
**GRSG and Sagebrush Habitat Guidance in Land Use Plans**

<ul style="list-style-type: none"> <li>• Grassland and open canopy sagebrush habitats--Columbian Sharp-tailed Grouse</li> <li>• Sagebrush habitats--Sage Grouse</li> <li>• Mature and old forest habitats--Northern Goshawk</li> </ul>
Action: Standard: Cooperate with other state and federal agencies and private landowners to survey, inventory, and manage habitats for sage grouse and Columbian sharp-tailed grouse
Action: Guideline: Current guidelines for sage and sharp-tailed grouse management, such as Connelly et al. (2000), should be used as a basis to develop site-specific recommendations for proposed sagebrush treatments
Action: Guideline: Management activities should consider proximity to active lek locations during site-specific project planning. Those within 10 miles of an active sage grouse lek and 2 miles of active sharp-tailed grouse leks should be considered further for suitability as grouse habitat
Action: Guideline: If management activities would impact courtship, limit physical, mechanical, and audible disturbances in the breeding complex during the breeding season (March to May) within three hours of sunrise and sunset each day.
Action: Guideline: Where management actions will disturb nesting grouse, avoid manipulation or alteration of vegetation during the nesting period (May to June)
Action: Guideline: In sagebrush habitats, manage herbaceous cover to conceal nests through the first incubation period for ground and low shrub-nesting birds. It is assumed that proper use of rest-rotation or deferred-rotation grazing should meet these conditions, although not every year on every area (Idaho Partners in Flight 2000)
<b>Caribou-Targhee National Forest - Curlew National Grassland Management Plan</b>
<i>Vegetation - Rangeland</i>
Grassland-wide Goal: Sagebrush is managed to maintain current levels of sagebrush in the >15% canopy cover class--about 60% of the Grassland. Emphasis will be on creating and maintaining areas suitable for sage grouse nesting habitat over the long term.
Grassland-wide Standard: Conduct a risk assessment for all sagebrush herbicide treatments, including aerial applications, using the most current Multi-Regional Risk Assessment.
Grassland-wide Standard: Areas where threetip sagebrush ( <i>Artemisia tripartita</i> ), rabbitbrush, and horsebrush have canopy cover values of greater than 5 percent will be carefully evaluated before treatment due to their ability to sprout after disturbance.
Grassland-wide Guideline: Emphasize native plant species where they would meet the desired resource conditions. Introduced species may be used in project seedings: (1) where native species would not meet the objectives of erosion control, such as in high use or impact areas, and where the effects on local, native flora is minimal; (2) on sites that are currently dominated by introduced species and the use of non-native species has not degraded the adjacent native flora; (3) on sites where the management objective is to use non-native species in one area to prevent degradation of other natural areas; or (4) when native seed is unavailable or cost prohibitive.
Grassland-wide Goal: Manage sagebrush community habitats to reduce fragmentation and maintain or restore connectivity at the Grassland level.
Grassland-wide Objective: Assess the changes to sagebrush habitats in the Greater Curlew Valley, including canopy cover, adjacent land use, understory conditions, every five years. Coordinate this effort with the Natural Resource Conservation Service and Greater Curlew Valley Sage Grouse Local Working Group.
Grassland-wide Guideline: Identify and maintain those habitats that have sagebrush with native understory vegetation.
Grassland-wide Guideline: Manage for a mosaic of age and structural sagebrush communities across the Grassland in patches of at least 320 acres.

**Table G-1  
GRSG and Sagebrush Habitat Guidance in Land Use Plans**

Guidelines: Prescription 6.5 – Rangeland Vegetation And Upland Bird Habitat Management, Vegetation Consider maintaining dense (>15%) sagebrush cover adjacent to private land that has less sagebrush than is desirable for quality sage grouse habitat.
Grassland-wide Goal: Habitat conditions on the Grassland contribute to sustaining populations of sage and Columbian sharp-tailed grouse in the Greater Curlew Valley.
<i>Special Status Species – Wildlife - Sage-grouse</i>
Grassland-wide Goal: Continue coordination with the Greater Curlew Valley Sage Grouse Local Working Group and other interested parties to manage sage grouse populations on the Curlew National Grassland.
Grassland-wide Goal: Maintain and increase, where possible, the distribution and abundance of sage grouse.
Grassland-wide Objective: Develop a map in cooperation with Idaho Department of Fish and Game to identify functional and degraded breeding habitat and winter habitat within two years of signing the Record of Decision.
Grassland-wide Standard: The habitat requirements of management indicator species (MIS) will be considered in all resource development projects. The MIS for sagebrush habitat is sage grouse and for riparian/wetland areas is a breeding bird complex.
Grassland-wide Guidelines: Management activities will consider proximity to active lek locations during site-specific project planning.
Grassland-wide Guidelines: If management actions would impact courtship, limit physical, mechanical and audible disturbances within the breeding complex during the breeding season (March – May) within three hours of sunrise or sunset.
Grassland-wide Guidelines: Where management actions may disturb nesting grouse, avoid manipulation or alteration of vegetation during the nesting period (May-June).
Standard: Prescription 6.5 – Rangeland Vegetation And Upland Bird Habitat Management, Wildlife Do not treat sagebrush within 0.25 miles of an active sage grouse lek.
Guideline: Prescription 6.5 – Rangeland Vegetation And Upland Bird Habitat Management, Wildlife Time treatment practices to provide the least impact to wildlife with emphasis on upland game birds.
Guideline: Prescription 6.5 – Rangeland Vegetation And Upland Bird Habitat Management, Wildlife Current guidelines for sage and sharp-tailed grouse management will be used as a basis to develop site-specific recommendations for proposed sagebrush treatments. Lek buffers as described in the most current guidelines do not apply to the Grassland, because of the highly fragmented nature of the area and the distance that hens are known to move to nest (Biologist Meeting 10/24/01). Rationale for deviation from the other guidelines will be identified in the site-specific project analysis.
Guideline: Prescription 6.5 – Rangeland Vegetation And Upland Bird Habitat Management, Wildlife When implementing vegetation seeding treatments, provide for a seed mix with species that are preferred by native upland birds during the pre-nesting, nesting and brood-rearing periods, where possible. See Appendix C.
<i>Cultural Resources and Tribal Coordination</i>
Goal: Grassland-wide Desired Future Conditions: Functional restoration of the ecosystem provides the capability to support harvestable levels of species of interest to the tribes.
<i>Recreation and Visitor Services</i>
Grassland-wide Guidelines: Manage dispersed recreation use such that activities do not adversely impact wildlife species such as upland game birds during critical periods of the annual life cycle.
<i>Other Administrative Designations</i>
Standards: Prescription 3.4.1 – Special Wildlife Areas, Vegetation: Native and non-native grass, forb and shrub species will be used in the composition for revegetation after disturbance and reflect those species preferred by native grouse for pre-nesting, nesting and brood rearing.
<b>Salmon-Challis National Forest – Salmon National Forest Plan</b>

**Table G-1**  
**GRSG and Sagebrush Habitat Guidance in Land Use Plans**

<i>Wildlife</i>
Goal: Provide habitat of sufficient quantity and quality to sustain populations of management indicator species (p. IV-1)
Action: Habitat for each vertebrate wildlife species on the Forest will be managed to insure viable or target populations (p. IV-19).
<i>Livestock Grazing</i>
General Direction: Coordinate range improvement and management activities with wildlife habitat needs, especially on key habitat areas such as winter ranges, calving areas, riparian areas, and sage-grouse leks (p. IV-22).
<b>Salmon-Challis National Forest – Challis National Forest Plan</b>
<i>Wildlife and Fish</i>
Goal 1: Provide habitat to ensure viability and recovery of threatened and endangered and Forest Service sensitive plants and animals.
Objective 1 – Implement the T&E Recovery Plans as they are approved
Goal 2 – Maintain or improve the current productivity level of wildlife and fish habitat
Objective 4 – Place priority on improving essential wildlife and fish habitats (e.g., aspen, mahogany, riparian, aquatic) and seasonal ranges.
Objective 5 – Manage Forest vegetation to provide habitat diversity for all species
Emphasize habitat improvement for Threatened and Endangered Species, Forest Service Sensitive, and economically and socially important species
The Elk Habitat Relationships for Central Idaho, Guidelines for Management of Pronghorn Antelope and the Western State Sage Grouse Guidelines will be used as guides.
Management Area Direction – East Fork: Maintain or improve quality of wet meadows, springs, mule deer and elk winter range, elk calving and sage grouse brood-rearing areas.
Inventory wildlife habitat with emphasis on refining winter ranges, key sage grouse seasonal ranges, riparian areas, wet meadows, aspen types and on identifying improvement needs
Within key sage grouse habitat, manage to increase forbs and provide adequate sagebrush cover
Management Area Direction – South Lost River: Cooperate with Idaho Department Of Fish and Game in transplant of Bighorn sheep and sage grouse. Use Sage Grouse Workshop Guidelines in identifying criteria for Habitat evaluation.
Management Area Direction – Sawmill Canyon: Maintain quality and use of MIS big game and grouse summer forage areas, emphasizing complexes comprising moist habitats. Protect moose and elk calving and grouse brood-rearing areas.
Management Area Direction- Antelope Creek: Improve quality and use of big-game winter range and other critical habitat; emphasize complexes comprising moist habitats. Sage-grouse Workshop Guidelines should be used as a guideline.
<b>Sawtooth National Forest – Sawtooth National Forest Revised Forest Plan</b>
<i>Vegetation - General</i>
Shrubland desired conditions are represented by canopy cover of shrubs based on the following groupings:
<ul style="list-style-type: none"> <li>▪ Grass/Forb = &lt;10% canopy cover</li> <li>▪ Low = 10–25% canopy cover</li> <li>▪ Moderate = 26–35% canopy cover</li> <li>▪ High = ≥36% canopy cover</li> </ul>

**Table G-1**  
**GRSG and Sagebrush Habitat Guidance in Land Use Plans**

Table A-11. Desired Condition Ranges for Low Sagebrush Environmental Site Potential Groups

Canopy Cover	Percent of Area
Grass/Forb	0–20
Low	80–10
Moderate	0
High	0

Table A-12. Desired Condition Ranges for Mountain Big Sagebrush and/or Basin Big Sagebrush ESP Groups

Canopy Cover	Percent of Area
Grass/Forb	13–33
Low	27–47
Moderate	12–32
High	8–28

Table A-13. Desired Condition Ranges for Wyoming Big Sagebrush

Canopy Cover	Percent of Area
Grass/Forb	25–30
Low	20–35
Moderate	13–33
High	12–32

Table A-14. Desired Condition Ranges for Montane Shrub Environmental Site Potential Groups

Canopy Cover	Percent of Area
Grass/Forb	0
Low	5–25
Moderate	5–25
High	60–80

*Special Status Species – Wildlife – Sage-grouse*

Desired Condition: The amount, distribution, and characteristics of source habitat are present at levels necessary to support persistence of native and desired non-native wildlife species within their respective ranges across the planning unit. For Region 4 Sensitive species, management actions retain desired source habitat conditions, or lead to restoration of those conditions. Habitat conditions contribute to the persistence of species and do not lead to listing under the ESA or as a Region 4 Sensitive Species. Human activities do not affect source environments in a manner that prevents wildlife populations from attaining desired distribution and abundance during critical life stages. Habitat conditions support sustainability of species of socio-economic and tribal interest.

**Table G-1  
GRSG and Sagebrush Habitat Guidance in Land Use Plans**

Goal: TEGO02 - Habitat within the respective ranges of Proposed or Candidate species contributes to keeping them from becoming listed under ESA.
Goal: TEGO04 - Environmental conditions and habitat components support reproductive needs important to sustainable populations of Threatened, Endangered, Proposed, and Candidate (TEPC) species.
Goal: TEGO05 - Well-distributed habitat capable of maintaining self-sustaining, complex interacting groups of TEPC species exists within their respective ranges across the planning unit.
Goal: TEGO06 - Habitat capable of maintaining stable or increasing trends in abundance of TEPC species in all recovery units within the planning unit exists.
Objective: TEOB01 - Continue to map and update locations of species occurrence and habitat for TEPC species during fine- or site/project-scale analyses. Incorporate information into a coordinated GIS database and coordinate with the Idaho Conservation Data Center.
Objective: TEOB02 - Cooperate with USFWS and NMFS to develop an Information and Education program for special use authorizations within TEPC habitat.
Objective: TEOB03 - Identify and reduce road-related effects on TEPC species and their habitats using the Watershed and Aquatic Recovery Strategy (WARS), <i>the Vegetation and Wildlife Habitat Restoration Strategy and Source Environment Restoration Strategy</i> , and other appropriate methodologies.
Objective: TEOB05 - Coordinate with research for TEPC species to determine basic life history requirements and potential effects from management activities. Coordinate efforts and information with the Idaho Conservation Data Center, universities, Forest Service Research Stations, etc.
Objective: TEOB07 - During fine-scale analyses, identify practices or facilities that are adversely affecting TEPC species or their habitats, and prioritize opportunities to mitigate, through avoidance or minimization, adverse effects to TEPC species.
Objective: TEOB11 - Update appropriate NRIS database modules for TEPC species and their habitats on a biennially basis to incorporate latest field data.
Objective: TEOB14 - During mid- or project-scale analysis, identify and prioritize opportunities for restoration of habitat linkage zones for terrestrial TEPC species to promote genetic integrity and species distribution (refer to Wildlife Source Environment Restoration Strategy Map in Appendix E).
Objective: TEOB18 - During fine-scale analyses in areas where TEPC species occur, identify opportunities to maintain desired habitat conditions or restore degraded habitat for TEPC species.
Objective: TEOB21 - Develop Integrated Weed Management plans to maintain or restore habitats for TEPC plants and other native species of concern where they are threatened by noxious weeds or non-native invasive plants.
Objective: TEOB22 - Develop operational resources (maps, keys, desk guides, etc.) within 1 year of signing the ROD, to coordinate TEPC species concerns and practical mitigations, and include those resource tools in the Fire Management Plan. Consult with NMFS and USFWS on operational resources on an annual basis. As part of this process consider the following relative to initial attack: <ul style="list-style-type: none"> <li>a) How these resource tools will be provided to initial attack personnel.</li> <li>b) Locations or identification of occupied TEPC plant habitat, TEPC fish-bearing streams, surface water with direct delivery to TEPC fish bearing streams and associated RCAs.</li> <li>c) Criteria and potential mitigation concerning decisions to place incident bases, camps, helibases, helispots, and other centers for incident activities within occupied TEPC plant habitat or RCAs.</li> <li>d) Criteria and potential mitigation concerning decisions to use draft hoses in TEPC fish-bearing streams that do not have appropriate screening.</li> <li>e) Criteria and potential mitigation concerning decisions to use chemical retardant, foam or other additives in RCAs where surface waters have direct delivery to TEPC fish-bearing streams.</li> <li>f) Criteria and potential mitigation concerning decisions to use heavy equipment in RCAs.</li> </ul>

**Table G-1  
GRSG and Sagebrush Habitat Guidance in Land Use Plans**

Objective: TEOB25 - Use land acquisition, exchange, and conservation easements, where appropriate, to meet riparian and aquatic goals and objectives, and to facilitate restoration of TEPC species habitat.
Objective: TEOB26 - Where the authority to issue special-use authorizations and agreements was not retained (i.e., FERC, mineral leases), work with permit holders to negotiate changes to meet TEPC species desired habitat conditions.
Objective: TEOB27 - During fine-scale analyses in areas where dispersed and developed recreation practices or facilities are identified as a potential concern or problem contributing to adverse affects to TEPC species or degradation of their habitats, evaluate and document where the problems are and prioritize opportunities to mitigate, through avoidance or minimization, adverse effects to TEPC species.
Standard: TEST04 - Management actions that have adverse effects on Proposed or Candidate species or their habitats, shall not be allowed if the effects of those actions would contribute to listing of the species as Threatened or Endangered under the ESA.
Standard: TEST05 - For management actions that include application of insecticides, herbicides, fungicides, or rodenticides, mitigation shall avoid or minimize adverse effects on TEPC species or their habitats.
Standard: TEST12 - Mitigate, through avoidance or minimization, management actions within known nest or denning sites of TEPC species if those actions would disrupt reproductive success during the nesting or denning period. During project planning, determine sites, periods, and appropriate mitigation measures to avoid or minimize effects.
Standard: TEST13 - Mitigate, through avoidance or minimization, management actions within known winter roosting sites of TEPC species if those actions would adversely affect the survival of wintering or roosting populations. During project planning, determine sites, periods, and appropriate mitigation measures to avoid or minimize effects.
Standard: TEST29 - Avoid or minimize adverse effects from locatable mineral operations to TEPC animal species or their habitats.
Guideline: TEGU02 - For proposed actions that may affect potential habitat of TEPC species, identify potential habitat and determine species presence within or near the project area. Document the rationale for not identifying potential habitat and determining species presence for TEPC species in the project record.
Guideline: TEGU03 - Management actions in occupied Proposed or Candidate species habitat should be modified or relocated if the effects of the actions would contribute to a trend toward ESA listing for these species.
Guideline: TEGU05 - The Forest should cooperate with USFWS and NMFS as appropriate by providing information, data, and assistance for the evaluation of species that are petitioned, or proposed, or candidates to be listed under the ESA, and for evaluation of proposed critical habitat.
Guideline: TEGU06 - Coordinate with Forest resource specialists to consider TEPC habitat needs when designing and implementing management activities that may affect TEPC species and their habitats.
Guideline: TEGU08 - Fire Resource advisors should be trained in techniques to mitigate, through avoidance or minimization, adverse effects to TEPC species.
Guideline: TEGU10 - Land exchanges that would result in a net loss of quality or quantity of habitat for TEPC species should not be considered unless benefits of the exchange outweigh the benefits to those species in the long term.
Guideline: TEGU12 - Where the authority to do so was retained, proposed or existing special use authorizations should be issued, re-issued, or amended upon expiration, only if adverse effects of the authorizations on TEPC species can be minimized.
<i>Rangeland Resources</i>
Guideline: RAGU05 - Where rangeland facilities or practices have been identified as potentially contributing to the degradation of water quality, aquatic species, wildlife species of concern, or occupied sensitive or watch plant habitat, facilities and practices causing degradation should be considered for relocation, closure, or

**Table G-1**  
**GRSG and Sagebrush Habitat Guidance in Land Use Plans**

changes in management strategy, alteration, or discontinuance.
<i>Recreation and Visitor Services</i>
Objective: REOB01 During fine-scale analyses in areas where recreation facilities are identified as a potential concern or problem contributing to degradation of water quality, aquatic species, wildlife species of concern or occupied sensitive or Watch plant habitat, evaluate and document the location of the facilities causing degradation and prioritize opportunities to mitigate effects. (REOB01).
Objective: REOB20 - During fine-scale analyses in areas where recreational trails are identified as a potential concern or problem contributing to degradation to other resources, evaluate and document the location of the trail degradation and prioritize opportunities to mitigate effects.
Guideline: REGU07 Where recreation facilities or practices have been identified as potentially contributing to degradation of water quality or aquatic species, wildlife species of concern or occupied sensitive and watch plant habitat, facilities and practices causing degradation should be considered for relocation, closure, changes in management strategy, alteration, or discontinuance.
<i>Lands and Realty</i>
Guideline: LSGU01 - Acquisitions of land and interest in lands should be guided by the following criteria: Priority 1 Acquisitions: (not listed in any order of priority) a) Lands and associated riparian ecosystems on water frontage such as lakes and major streams. b) Critical habitat lands needed for protection of TEPC fish, wildlife, or plant species. c) Other environmentally sensitive lands, such as important wetland and riparian areas. d) Lands needed for the protection of significant historical or cultural resources when these resources are threatened or when management may be enhanced by public ownership. e) Lands that enhance recreation opportunities, public access, and protection of aesthetic values. f) Lands needed for protection and management of administrative and Congressionally designated areas. g) Lands needed to reduce expenses of both the Forest Service and the public in administration and utilization. Consolidation of split estates. h) Lands with water rights that can be used to accomplish purposes for which the National Forest was created, or related resource obligations. Priority 2 Acquisitions: (not listed in any order of priority) a) Key tracts of an ecosystem that are not urgently needed, but will promote more effective management of the ecosystem and will meet specific needs for vegetative management, watershed management, research, public recreation, or other defined management objectives. Generally, these tracts will support consolidation objectives. b) Buffer lands needed for protection of lands acquired for purposes listed above. c) Lands needed to protect resource values by eliminating or reducing fire risks, soil erosion and occupancy trespass. Priority 3 Acquisitions: All other lands desirable for inclusion in the National Forest System.
<i>Locatable Minerals</i>
Objective: MIOB08 - During fine-scale analyses in areas where mine facilities are identified as a potential concern or problem contributing to degradation of water quality, aquatic species, wildlife species of concern or occupied sensitive or Watch plant habitat, evaluate and document where the contributing mine facilities are and prioritize opportunities to mitigate effects.
Guideline: MIGU11 - Where mine facilities or practices have been identified as potentially contributing to degradation of water quality, aquatic species, wildlife species of concern, or occupied sensitive and watch plant habitat, facilities and practices causing degradation should be considered for relocation, closure, changes

**Table G-1  
GRSG and Sagebrush Habitat Guidance in Land Use Plans**

in management strategy, alteration, or discontinuance.
<i>Travel and Transportation</i>
Objective: FROB12 - During fine-scale analyses in areas where roads and facilities are identified as a potential concern or problem contributing to degradation of water quality, aquatic species, wildlife species of concern or occupied sensitive or Watch plant habitat, evaluate and document where the contributing facilities are and prioritize opportunities to mitigate effects.
<i>Management Area Direction</i>
Management Areas on the Minidoka District: MA-11 – Rock Creek (Sawtooth LRMP, Volume 1 pages III-228-237)
<ul style="list-style-type: none"> <li>• Vegetation Objective 1116 - Restore and maintain sagebrush and bitterbrush composition, age class, and canopy cover components (as described in Appendix A) in the Low Sage, Basin Big Sage, and Mountain Big sagebrush vegetation groups, with emphasis on improving wildlife winter ranges and sage grouse habitat near the Forest Service boundary.</li> <li>• Wildlife Resources Guideline 1124 - Management actions in sage grouse habitat should be designed to meet the desired conditions for sagebrush, as described in Appendix A. Where greater than 40 percent of the sage grouse habitat in the management area has less than 10 percent canopy cover, management actions should be designed to maintain or restore canopy cover conditions.</li> <li>• Rangeland Resources Objective 1141 – When possible, modify developed springs and other water sources to restore natural free-flowing water and wet meadows in sage grouse habitat.</li> <li>• Rangeland Resources Guideline 1142 - When constructing or reconstructing fences, design or relocate them to avoid potential sage grouse mortality near leks.</li> </ul>
MA-12 – Cottonwood Creek (Sawtooth LRMP, Volume 1 pages III-238-245)
<ul style="list-style-type: none"> <li>• Vegetation Objective 1215 - Restore shrub composition in the Low Sage, Basin Big Sage, and Mountain Big Sagebrush cover types; with emphasis on improving wildlife winter ranges in areas degraded by increasing juniper cover.</li> <li>• Wildlife Resources Guideline 1225 - Management actions in sage grouse habitat should be designed to meet desired conditions for sagebrush, as described in Appendix A. Where greater than 40 percent of the sage grouse habitat in the management area has less than 10 percent canopy cover, management actions should be designed to maintain or restore cover conditions.</li> <li>• Rangeland Resources Guideline 1233 - When constructing or reconstructing fences, design or relocate them to avoid potential sage grouse mortality near leks.</li> </ul>
MA-13 – Trapper Creek/Goose Creek (Sawtooth LRMP, Volume 1 pages III-246-255)
<ul style="list-style-type: none"> <li>• Vegetation Objective 1321 - Restore canopy covers to desired conditions, as described in Appendix A, within the Basin Big Sagebrush, Low Sage, and Mountain Big Sagebrush vegetation groups where these groups have been altered.</li> <li>• Non-native Plants Objective 1327 - Reduce cheatgrass by restoring native perennial grass/forb composition of plant communities in the Low Sage, Basin Big Sage, Pinyon-Juniper, and Mountain Big Sagebrush vegetation groups below 6,000 feet elevation.</li> <li>• Wildlife Resources Guideline 1329 - Management actions in sage grouse habitat should be designed to meet the desired conditions for sagebrush, as described in Appendix A. Where greater than 40 percent of the sage grouse habitat in the management area has less than 10 percent canopy cover, management actions should be designed to maintain or restore canopy cover conditions.</li> <li>• Rangeland Resources Objective 1342 - Whenever possible, modify developed springs and other water sources to restore natural free-flowing water and wet meadows in sage-grouse habitat.</li> <li>• Rangeland Resources Guideline 1344 - When constructing or reconstructing fences, design or relocate them to avoid potential sage grouse mortality near leks.</li> </ul>
MA-14 – Shoshone Creek (Sawtooth LRMP, Volume 1 pages III-256-262)

April 2012

## Executive Summary

In September 2011, Idaho BLM completed initial efforts to model greater sage-grouse (sage-grouse) priority areas and general areas (PAs and GAs) for Idaho, using Western Association of Fish and Wildlife Agencies' Sage-grouse Management Zone IV for the analysis boundary, to provide regional context. This initial effort mapping effort is referred to hereinafter as Version 1, and is described in detail in Chapter 1. The delineation of PAs in Version 1 was based solely on sage-grouse breeding bird (lek) density and lek connectivity models described in the literature. Sage-grouse GAs were modeled using BLM's Currently Occupied Habitat map and a sage-grouse population persistence model, which is essentially an index of sagebrush cover on the landscape. Version 1 was used during winter 2012 for public scoping for BLM and U.S. Forest Service (FS) sage-grouse planning strategy effort.

While the Version 1 map provided a repeatable means for displaying sage-grouse preliminary priority areas based on lek information, additional internal discussions and input from local and regional sage-grouse experts and others identified a need for refinements. This led to an update, referred to hereinafter as Version 2, described in detail in Chapter 2. In Version 2, the terms Preliminary Priority Habitat and Preliminary General Habitat (PPH/PGH) were formally adopted, to provide consistency with terminology in BLM national policy. New information incorporated into Version 2, includes 1) additional lek data, 2) seasonal habitat information, 3) identified movement and migration corridors, 4) addition of local sage-grouse priority areas of the Challis Local Working Group, 5) areas of habitat connectivity, 6), incorporation of refinements suggested by the U.S. Forest Service, and 7) exclusion of modeled agricultural and timber lands.

In addition to refining the sagebrush components of PPH and PGH in greater detail in Version 2, we also incorporated certain potential restoration habitats as a subset of PPH. Many of these areas, currently characterized as perennial grasslands or conifer encroachment areas, have recently undergone (or may, in the foreseeable future) various efforts to enhance or restore habitat extent or improve connectivity. The final, overall map for PPH/PGH Version 2 is shown in Chapter 2, Figure 8. Figure 9 provides additional detail regarding the various vegetation categories of PPH including sagebrush, perennial grassland and conifer encroachment.

To facilitate future discussions of possible conservation actions or activities within PPH and PGH, Chapter 3 provides general suggestions for consideration. Depending on the nature and extent of sage-grouse habitat conditions locally and on the broader landscape, conservation efforts in some PPH or PGH areas may require more of a focus on habitat maintenance, to retain current habitat values. Conversely, other areas may require more of a focus on habitat improvement or restoration. Alternative approaches or strategies for management of PPH/PGH may also be identified as BLM and conservation partners move forward with sage-grouse conservation efforts.

## Introduction

In March 2010, U.S. Bureau of Land Management (BLM) Washington Office Instruction Memorandum (IM) 2010-071 (Bureau of Land Management 2010) directed field office managers to implement appropriate conservation actions in priority sage-grouse habitat. Subsequent guidance (Washington Office IM 2012-043) provided interim conservation measures for use within preliminary priority habitat (PPH) and preliminary general habitat (PGH) areas, while BLM is amending land use plans. PPH is defined as areas that have been identified as having the highest conservation value to maintaining greater sage-grouse populations; PGH is defined as areas of occupied seasonal or year-round habitat outside of priority habitat.

The purpose of this paper is 1) to document the background, rationale and processes used in identifying greater sage-grouse (sage-grouse) PPH and PGH for Idaho; and, 2) to describe preliminary considerations for use of this information in conservation planning.

Many areas of sage-grouse habitat in Idaho are contiguous with habitats in the neighboring states of Utah, Nevada, Oregon, and Montana. Therefore we chose to use the Western Association of Fish and Wildlife Agencies (WAFWA) Sage-grouse Management Zone IV (MZ IV; Figure 1) as the primary analysis boundary, to provide a regional context for Idaho's PPH and PGH. While MZ IV encompasses the vast majority of the sage-grouse habitat in Idaho, it excludes habitat in the Bear Lake Plateau area located in the extreme southeastern portion of the state. This area is associated with WAFWA MZ II (Wyoming Basin) so PPH/PGH in that part of Idaho was identified separately.

It should be noted that due to the regional scale of the analysis and nature of the modeling techniques used, PPH and PGH may encompass inclusions of non-habitat especially at finer, more local scales. Consequently, additional information including local knowledge will be necessary when planning more site specific conservation efforts and in interpreting PPH/PGH.

The process leading to the most current (April 2012) PPH/PGH map involved two versions. Version 1 was completed in September 2011, and relied solely on sage-grouse breeding bird density and lek connectivity information for delineating priority areas. Early in the process we assigned the terms "Priority Area" (PA) and "General Area" (GA) for simplicity. These labels are retained in the forthcoming discussion and associated map figures for Version 1 to maintain the integrity of the original documentation, metadata and map labels. Version 1 also was used as the basis for Idaho's PPH/PGH map shown during public scoping for BLM's sage-grouse planning strategy in winter 2012.

Version 2 was completed in April 2012, following scoping, and incorporated additional important information provided by Idaho Department of Fish and Game, BLM, US Forest Service and others, including sage-grouse seasonal habitats, movement corridors, habitat connectivity, locally important leks and telemetry data. Version 2 also incorporates filters for agriculture and timber lands, excluding those areas from PPH/PGH, and more closely aligns with Idaho's "Sage-grouse Habitat Planning Map" which has been in use since 2000, for general conservation planning purposes. Overall, Version 2 provides a more detailed and comprehensive

portrayal of preliminary PPH/PGH in the state, and is intended to replace Version 1 in its entirety.

## **Background-Related Mapping Efforts**

Other sage-grouse habitat mapping efforts over the past decade have guided sage-grouse conservation planning in Idaho, and provide important context for the sage-grouse habitat mapping/modeling efforts described in this document.

Idaho Sage-grouse Habitat Planning Map: In 2000, Idaho BLM drafted “*A Framework to Assist in Making Sensitive Species Habitat Assessments for BLM-Administered Public Lands in Idaho-Sage-grouse*” (Sather-Blair et al. 2000). This document, released to Idaho BLM field offices via Idaho BLM IM 2000-059 (Bureau of Land Management, 2000) outlined recommended field protocols for assessing sage-grouse habitats and also described a process for mapping sage-grouse habitat and potential restoration areas at the broad scale, to aid in conservation planning in the state. The resulting *Idaho Sage-grouse Habitat Planning Map* (sometimes referred to informally as the “Key habitat map”) has been updated annually since that time, based primarily on wildfire polygons, expert opinion and/or other new information. However, this map displays only general habitats (i.e., key habitat, defined as areas of generally in-tact sagebrush that provide sage-grouse habitat during some portion of the year, and potential restoration areas comprised of perennial grasslands, annual grasslands and conifer encroachment areas.). It does not reflect the relative importance or priority of those habitat areas with respect to sage-grouse population characteristics.

Sage-grouse Strongholds and Isolated Populations: Additional state and federal agency collaborative mapping efforts in Idaho during the past decade identified sage-grouse population areas assumed to be “strongholds” or “isolated populations”, based on local biological expertise and lek information. This map was briefly utilized by Idaho BLM and conservation partners as a means to identify potentially important population areas as well as several presumed isolated populations. However, this map was never updated from the original version (c.a. 2002) due to a lack of adequate sage-grouse population-level information, and has since been abandoned pending the availability of more suitable and defensible population data and analytical techniques.

Seasonal Habitat Models: In 2006, the Idaho Sage-grouse Advisory Committee (SAC) completed the “*Conservation Plan for the Greater Sage-grouse in Idaho*” (State Plan; Idaho Sage-grouse Advisory Committee 2006), which incorporated recent science and conservation measures into a more comprehensive state-level sage-grouse conservation plan. Recognizing the limitations of the Idaho Sage-grouse Habitat Planning Map, the SAC recommended in a 2009 update to Chapter 6 of the State Plan, that Idaho “continue to explore and review emerging remote-sensing tools and products that would have the capability and accuracy to refine or replace the Sage-grouse Habitat Planning Map.” As a follow-up to that recommendation, Idaho BLM and Idaho Department of Fish and Game (IDFG) embarked on a Challenge Cost Share project in 2010 to model sage-grouse general habitat and seasonal habitats using telemetry, observational, land cover and climatic data. These spatial models (Knetter et al., *in progress*) may be useful in future refinements to sage-grouse habitat maps and models.

Breeding Bird Density: To provide a more consistent analytical foundation and to further promote the mapping of sage-grouse priority habitats at the state level, the BLM Washington Office in 2010 entered into an Assistance Agreement with the U.S. Fish and Wildlife Service (FWS) to model sage-grouse “breeding bird density”, or “BBD” at three scales: 1) across the range of the species; 2) by WAFWA sage-grouse management zone; and 3) by individual state, following Doherty et al. (2011).

Administrative Draft  
Cooperating Agency Review

## Chapter 1: Version 1- September 2011- Modeling Sage-grouse Priority and General Areas (PAs and GAs)

**Study Area:** Stiver et al. (2006) identified seven “sage-grouse management zones” (Figure 1) within the geographic distribution of the greater sage-grouse, based on sage-grouse populations and subpopulations occurring within seven floristic provinces (Connelly et al. 2004). These zones reflect ecological issues and similarities conducive to more effective and efficient conservation planning.

Idaho is almost entirely within MZ IV with the exception of a small corner of southeastern Idaho. Zone IV also includes portions of southwestern Montana, northwestern Utah, northern Nevada and southeastern Oregon. While Idaho comprises the majority of MZ IV, numerous sage-grouse leks and potentially important habitats and populations/subpopulations occur in proximity to Idaho’s border in the adjoining MZ IV states. Therefore, Idaho BLM chose to expand its priority area analysis to incorporate available sage-grouse and habitat information for those adjoining states. This approach has important conservation implications in that it incorporates aspects of interstate population and habitat connectivity that would be overlooked if we limited the scale of analysis to Idaho. A regional approach to sage-grouse conservation planning such as this warrants consideration by other states that are a part of multi-state WAFWA management.

**Methods and Results:** A primary goal in modeling draft PAs and GAs was to integrate currently available population and habitat data and current modeling techniques into a transparent and repeatable framework. A second goal was to ensure that the draft PAs and GAs were driven by the biology and ecology of sage-grouse. Lek data were acquired, with permission, from state wildlife agencies within MZ IV. For habitat data, BLM Idaho used the BLM currently occupied habitat (COH) model (Durtsche et al. 2009) and assumed for purposes of this analysis that the COH product provides a reasonable portrayal of occupied sage-grouse habitat across the range of the species. Other seamless sage-grouse habitat models were not available however new habitat models can be considered and incorporated into the PA analysis as they become available.

In modeling sage-grouse PAs, BLM Idaho used 1) a Breeding Bird Density (BBD) index of sage-grouse abundance based on male attendance at leks, and 2) lek connectivity to inform the broader spatial distribution of leks. BLM Idaho assumed that BBD adequately informs the PA model as to the relative “importance” of areas with respect to recent breeding bird numbers. Lek connectivity informs the PA model as to the likely, longer-term connectedness between leks, assuming that leks in proximity to one another are more “connected” than those farther apart (Knick and Hanser 2011). Spatial data on sage-grouse late brood-rearing, fall or winter habitats were not readily available, and therefore not included in the model. However, given the buffers (6.4 km and 8.5 km) used in the BBD component and the 18 km window of the lek connectivity analysis, a significant portion of these non-breeding habitats are likely included.

**Breeding Bird Density:** BBD analyses involve ranking leks by attendance (e.g. highest to lowest numbers of males) and summing the number of males until a desired percent-population threshold is met (e.g., the top 25%, 50%, 75% etc., of the population). With lek locations and

abundance being large drivers in the model, BBD results are, by definition, highly correlated with breeding habitat.

We evaluated two BBD methods: 1) the original Doherty et al. (2011) model which uses a 10-year time period (2001-2010), the most recent average annual maximum lek counts, and a minimum male count =1 to identify high male abundance areas and 2) a modified Doherty version using a more restricted rule set of a 5 year time period (2006-2010), maximum lek count over the 5-yr period, and minimum male count of 2. This modified rules et incorporates the assumptions currently used to designate “occupied leks” in Idaho by IDFG. In both methods we followed the Doherty et al. (2010) lek buffering approach (add 74.6 – 76.0). Specifically, leks in the 1-75% BBD percentiles were buffered by 6.4 km (4 miles) to account for a majority of nesting areas and 76-100% BBD percentiles were buffered by 8.5 km (5.3 miles) (Doherty et al. 2010 citing Holloran and Anderson 2005), since leks in those classes tend to be farther apart, in lower densities, and potentially in more fragmented habitat.

We compiled 2001 – 2010 male Sage-grouse lek attendance data within MZ IV from state fish and wildlife agencies in Idaho, Nevada, Utah, Oregon, and Montana. A total of 1,655 leks were analyzed to evaluate the original Doherty et al. (2010) method and n=1,481 leks for the modified version (Figure 2). Summary statistics for both datasets were evaluated based on the average and range of male lek counts by lek and the total maximum male lek counts across all leks. While the modified Doherty method identified fewer total leks, the average male counts and total males were highest of the two datasets, better reflecting current populations. In addition, we had concerns with the longer term, ten-year dataset regarding lek location reliability, and variable survey efforts or techniques (i.e., ground vs. aerial) across MZ IV. As a result, we selected the modified Doherty method for the subsequent BBD analysis.

To allow incremental examination of the entire BBD profile, we developed a Python-based model to spatially delineate BBD at 1 percent intervals. We then quantified the amount of greater sage-grouse COH using a modification of Durtsche et al. (2009) at each BBD percent to identify potential patterns or thresholds of COH and non-habitat across the entire BBD profile (Figure 3). The Durtsche et al. (2009) COH map likely underestimates habitat since COH in recent wildfires (since 2006) was omitted from this dataset. Therefore, we used burn severity data from the USGS Monitoring Trends in Burn Severity site ([www.mtbs.gov](http://www.mtbs.gov)) to update the COH map (Figure 4). Fire polygons (30m pixels) classified as 1=no burn, or 2=low severity were reclassified to the pre-fire land cover type and identified as either COH or not. These areas were then added to the original Durtsche et al. (2009) map. For this exercise, we assumed that areas of low burn severity retained largely the same habitat as before the burn (i.e. patchy burn with small unburned areas). Due to our limited ability to effectively characterize “burn severity” in shrub ecosystems, it is likely that COH in the low severity category is overestimated.

Our results indicate no significant pattern or threshold in COH across the BBD percentage profile (Figure 3). Therefore, we examined two potential thresholds: 1) the BBD 75% value and associated proportion of COH and 2) the associated BBD percent that encompasses 80% of the COH. The 75% BBD captures approximately 60% of the available COH (~40% of available non-habitat) in MZ IV. The remaining 40% habitat (which occurs outside the 75% BBD) is likely the more fragmented habitat (Doherty et al. 2011). The 90% BBD is required to capture

80% of available COH; however, there is a much higher proportion (70%) of non-habitat included, suggesting that the use of the 90% BBD would lead to overstating priority area boundaries. Since BBD is highly correlated with breeding habitat and the BBD 75% class captures the “top” 75% of males along with 60% of the COH, we recommend that the BBD 75% threshold be used as the “high abundance” (or “population”) component of our priority area mapping effort. This threshold provides a meaningful baseline population component for the PA analysis, by conservatively encompassing the least fragmented breeding habitats that are of greatest importance for conservation.

Lek Connectivity: We used the more inclusive Doherty et al. (2010) rule set (i.e., 10 year timeframe, 1 male minimum) to identify lek points for the lek connectivity analysis. We assumed that this more comprehensive, ten-year dataset would yield a more realistic connectivity extent since the sage-grouse is a relatively long-lived bird, and the modified 5-year dataset may not be sufficient for this purpose. We used a kernel density analysis to create a utilization distribution surface. We modified Hagen (2011) and populated a 1 km grid with lek presence and analyzed kernel density using a neighborhood of 18 km. Knick and Hanser (2011) found an 18 km area to be a reliable connectivity threshold for greater sage-grouse (GSG; i.e., leks within 18 km of one another tend to be more connected than those farther out). The resulting “surface” was used to categorize 2 levels of connectivity: 75% (local connectivity) and 90% (seasonal/migratory connectivity) utilization distributions (Figure 5 A and B). Local lek connectivity (75% utilization contour) appears to encompass the “general” lek distribution patterns across MZ IV; therefore, we recommend that local connectivity be used to represent the “lek connectivity” component of our priority area mapping effort.

The connectivity analysis assumed straight-line distances among lek points. Therefore, similar to the BBD analysis, some areas of non-habitat are encompassed within the resulting polygons. In addition, the connectivity analysis does not account for topography, thus overestimating connectivity results in linear basin and range systems (e.g., the Challis/Salmon area). For example, applying the 18 km connectivity neighborhood to leks occurring within narrow valley bottoms, that average only 12 km in width, likely captures some adjacent areas of nonhabitat on nearby steep, timbered or rocky slopes.

MZ IV Sage-grouse Priority Area Delineation: For PA delineation, we integrated aspects of “population” and “habitat”. To portray a population context, we intersected the 75% breeding density polygons with the 75% utilization local connectivity polygon (Figure 6). For context, the resulting PAs are also shown overlapping the 2010 version of the Idaho age-grouse Habitat Planning Map (Figure 7; BLM 2010b).

For each PA polygon within MZ IV, we then assigned a unique alpha identification code and calculated summary statistics. Summary statistics included total polygon area, total number of leks, maximum male attendance, average maximum male attendance and standard deviation, as well as total area and percent of COH within the polygon (Table 1). We then used total maximum male attendance to rank the 30 priority area polygons. In aggregate, the PA polygons capture approximately 94% of the identified MZ IV male lek population. Additional statistics found in Table 1 are also reported to help inform future PA and GA evaluations.

MZ IV Sage-grouse General Area Delineation: We used sage grouse population persistence methods (modified Aldridge et al., 2008) to inform GSG General Area delineations within MZ IV. We evaluated long-term sage-grouse population persistence as a function of sagebrush cover on the landscape. We analyzed sage-grouse population persistence based on the availability of sagebrush within a defined area, under the assumption that the modified COH model served as an adequate representation of sage-grouse habitat/sagebrush within the analysis area. Based on recent lek connectivity work (Knick and Hanser 2011), 18 km was assumed to be an effective distance for characterizing local lek connectivity over most of MZ IV. However, in the linear basin and range systems (e.g., the Challis/Salmon region in Idaho) general valley floor width was less than 18 km (range 8 – 16 km) and could potentially overestimate persistence. Therefore, we selected a smaller 12 km distance to more accurately reflect available area. We used the USGS National Hydrologic Dataset 4<sup>th</sup> order hydrologic units to identify the linear basin and range systems within MZ IV (Figure 8 A). We resampled the modified 2009 COH model (30m) to 1 km (with an inclusion threshold of 50% COH). The resulting 1 km grid cells (value 1, 0) were then analyzed using a moving window analysis and separate 12 km and 18 km neighborhoods (Figure 8 B). The resulting combined map “surface” was then used to categorize persistence probability. Areas of 25-65% probability represent *Low* sage-grouse population persistence over the long-term, and areas > 65% probability represent *High* sage-grouse population persistence (Aldridge et al. 2008) (Figure 8 B).

We used a persistence threshold of  $\geq 25\%$  to identify the General Area polygons within MZ IV (Figure 8 C). All or portions of certain GA polygons may be important to sage-grouse in terms of connectivity between PA polygons or as refugia in the event of stochastic events in PAs. In some cases, areas are designated as GAs because lek data are lacking due to limited surveys, resulting in BBD or connectivity values that are too low to be captured by the PA model.

Management Zone IV PAs and GAs shown in Figure 9 spatially depict those areas in the MZ IV landscape where sage-grouse conservation efforts might be focused to greater or lesser degrees, depending on management and policy objectives. Given limited resources, conservation efforts generally should focus first on habitats occurring within the PA areas. It must be recognized though, that given the population-centric nature of the PA model and associated analysis buffers, areas of sage-grouse habitat as well as non-habitat are included in those polygons. Consequently, finer-scale habitat information will be necessary at the local, site-specific level. It is also important to recognize that depending on the area of the map or specific PA or GA under consideration, there may be differing management opportunities, strategies, and decision-space for the conservation of sage-grouse. Portions of some PAs or GAs are likely very crucial to local or regional sage-grouse populations or for maintaining connectivity. To identify these areas, additional information is required and is discussed below,

To further refine our understanding of the spatial context of PAs and GAs across MZ IV, and to facilitate discussions of potential management activities within or among these areas, we examined the contribution of a suite of variables to assist in identifying important conservation areas. We combined our continuous persistence, connectivity, and BBD model surfaces to create a single, composite view of the MZ IV landscape. We combined the full range of persistence probability (1-100%) information with lek connectivity (1-100%) and finally the BBD data (with lek counts normalized from 1-100). The resulting map (Figure 10) displays the full range of

surface values to help provide additional spatial context, inform conservation efforts within PA polygons, and to assist in the development of subsequent finer-scale management strategies. In Figure 10, “hotspots” of blue colors indicate those areas of greater relative “importance”, to sage-grouse in MZ IV, where the combination of lek connectivity, BBD and population persistence on the landscape appears to be comparatively high relative to other areas of the map.

*Priority Area and General Area Delineation for the Bear Lake Plateau (MZ II):* The Bear Lake Plateau area of extreme southeastern Idaho occurs outside of the MZ IV analysis area discussed above. Due to floristic similarities and a closer association with populations and habitats in adjacent areas within Utah and Wyoming, this portion of Idaho is encompassed by the adjacent Wyoming Basin MZ II. While available sage-grouse population and habitat information for this portion of Idaho are somewhat limited, the area nonetheless contains potentially important sage-grouse habitats and populations that should be considered by conservation planners and managers in Idaho.

Logistical and time limitations precluded us from developing a full MZ II analysis; therefore, we incorporated other available data to develop the PA map for this portion of southeastern Idaho. We examined BBD results (Doherty et al. 2011) for MZ II and Key Habitat data from Idaho’s 2010 Sage-grouse Habitat Planning Map. Specifically, we selected the 75% BBD polygons occurring within the Bear Lake Plateau area and merged them with the Idaho Key Habitat data. We then applied a 1 km buffer to the 75% BBD to assist in aggregating the polygons. Any Key Habitat polygons intersecting and extending beyond the 75% BBD polygon were included as part of the final Bear Lake Plateau PA (Figure 11). Remaining key habitat areas not intersected by the 75% BBD and associated 1 km buffer were designated as sage-grouse GAs. Figure 12 displays the full, composite map of MZ IV and Bear Lake Plateau PAs and GAs.

#### **Initial Delineation of Preliminary Priority and Preliminary General Habitat:**

On December 9, 2011, the BLM and US Forest Service published a Notice of Intent (NOI) in the Federal Register inviting the public to participate in public scoping meetings to evaluate greater sage-grouse conservation measures in land use plans throughout Idaho and Southwestern Montana, and elsewhere within the general range of the species. A sixty-day scoping period for this effort commenced on January 9, 2012. In conjunction with scoping, Idaho BLM made available to the public a map of PPH/PGH for the Idaho/SW Montana planning subregion (Figure 13). The Idaho portion of this map was derived by clipping the Idaho “PA and GA” areas of the Sage-grouse MZ IV map developed during the Version 1 mapping effort and joining them to Montana’s sage-grouse core areas. The subsequent revision of the Version 1 map is described in the Version 2 discussion later in this document.

---

## Chapter 1 Tables and Figures:

Table 1. Summary statistics for area, lek attributes 2006-2010 and currently occupied habitat (COH) information associated with sage-grouse Priority Areas. Priority areas are sorted by total max male count.

<sup>1</sup>Data represents total of max counts 2006-2010 for leks identified using the modified Doherty 2010 method.

<sup>2</sup>Modified Durtsche 2009 GSG Currently Occupied Habitat was resampled from 30m to 90m for computational purposes

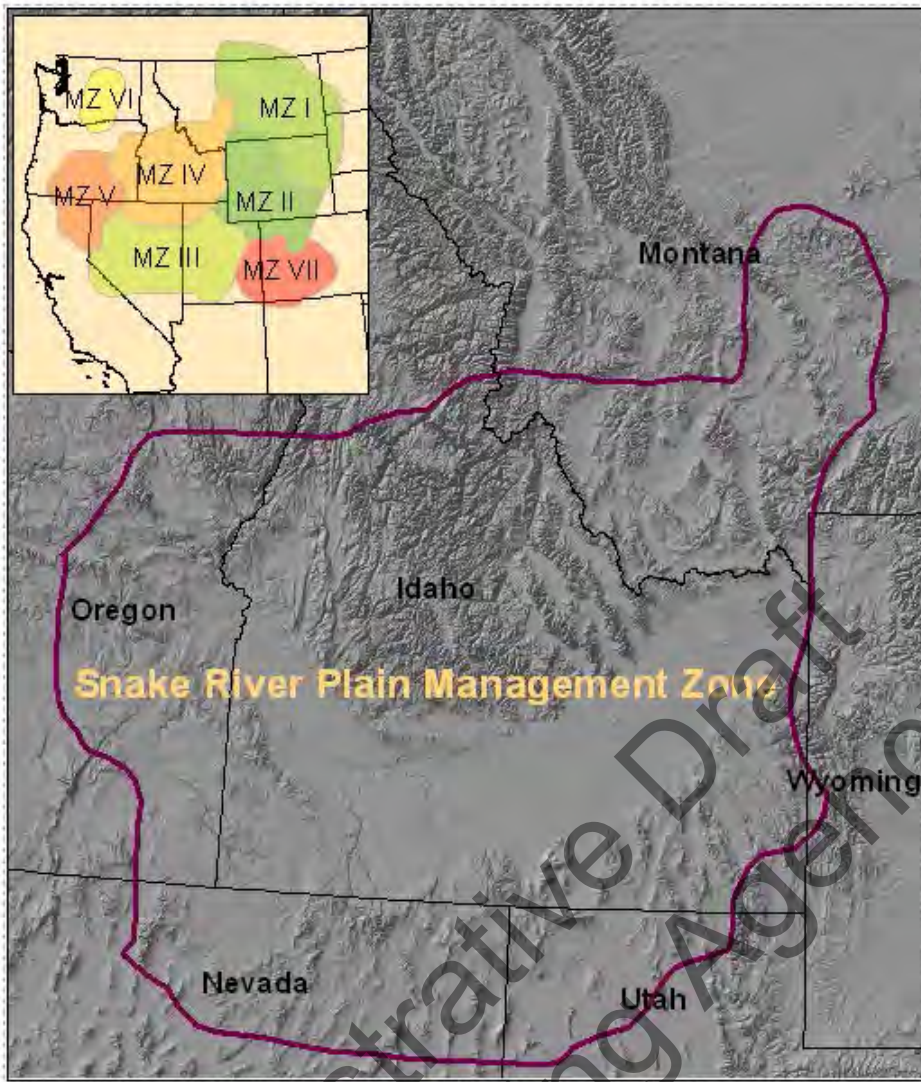

Figure 1. Sage-grouse management zones (Stiver et al. 2006) within the geographic distribution of the greater sage-grouse, based on sage-grouse populations and subpopulations occurring within seven floristic provinces, as described in Connelly et al. (2004). The Management Zone IV analysis area includes portions of southern Idaho, southwestern Montana, northwestern Utah, northern Nevada and southeastern Oregon

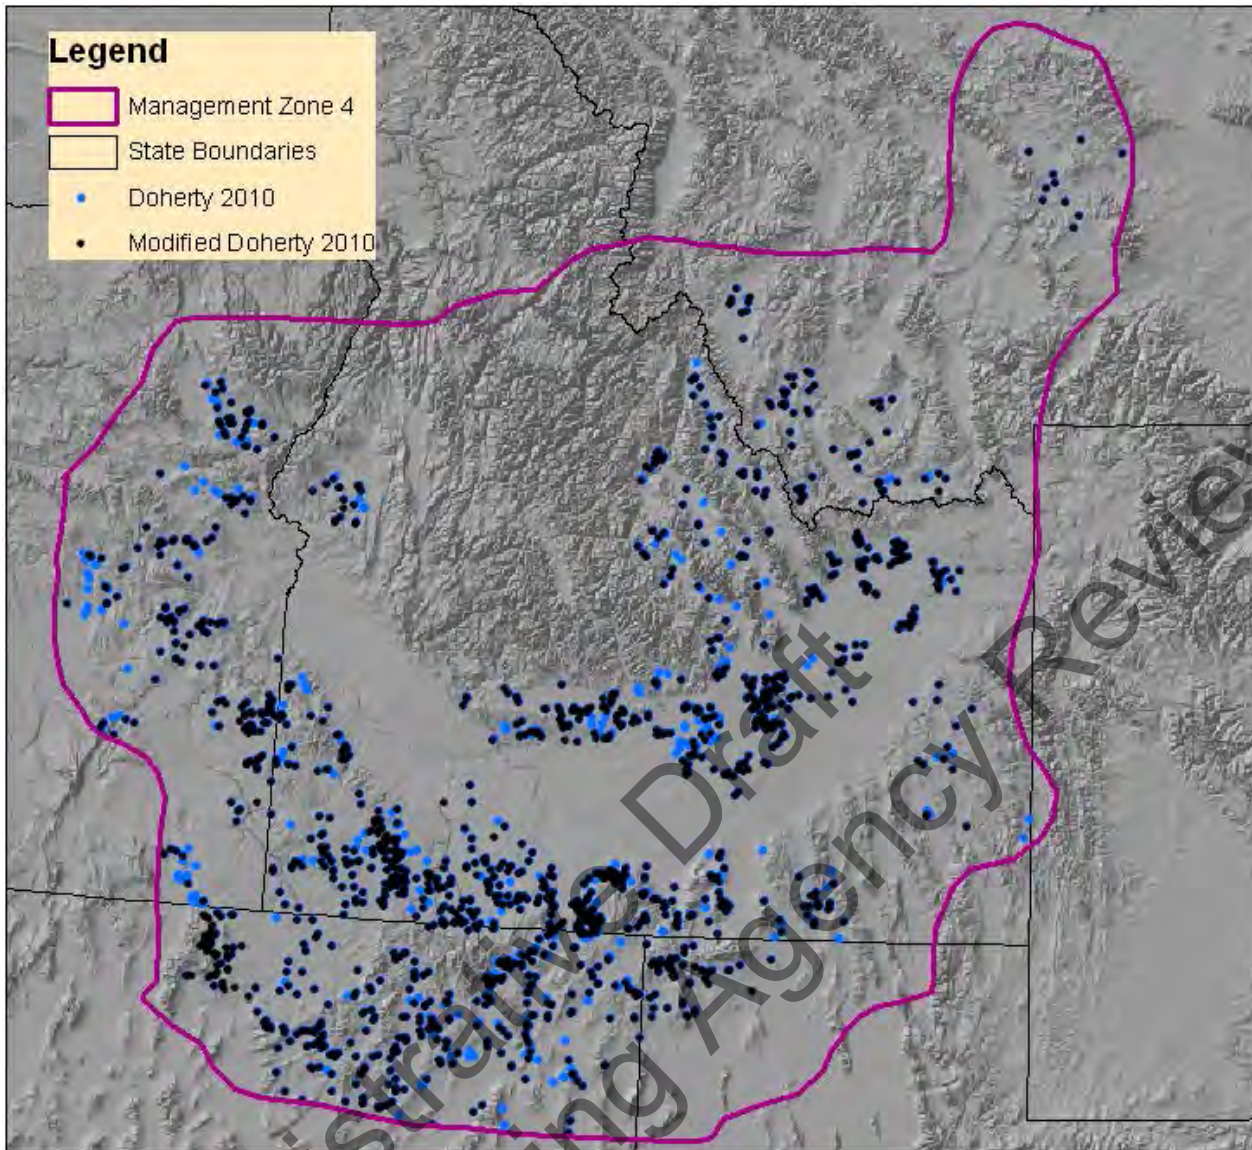

Figure 2. Management zone IV sage-grouse lek location data (2001 – 2010) used to evaluate high male abundance areas using the Doherty 2010 method (n = 1,655 leks; blue symbols) and the modified rule set version (2006-2010) (n = 1,481 leks; black symbols).

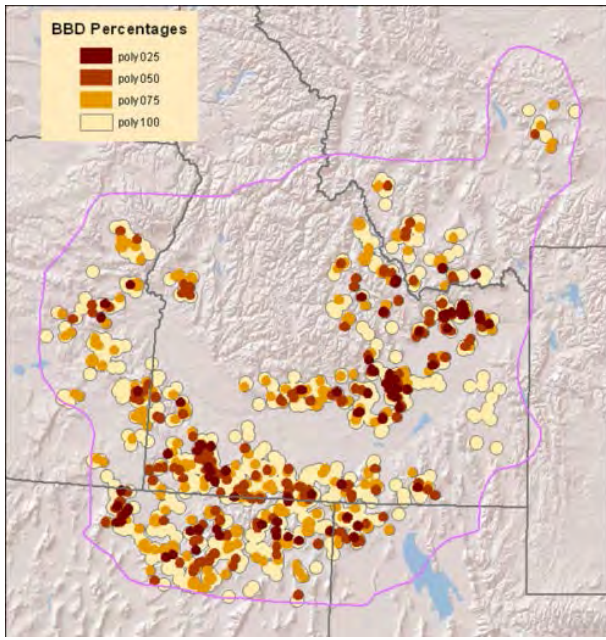

Figure 3. BBD percentiles (left) ranging from dark red to light brown. The dark areas essentially show the “best of the best” areas, based on maximum count data at leks 2006–2010. The darkest areas capture the top 25% of the leks and breeding habitat; darker brown to light brown areas capture 50, 75 and 100% of the data, respectively. The graphs on the right show the relationship between Breeding Bird Density (BBD)

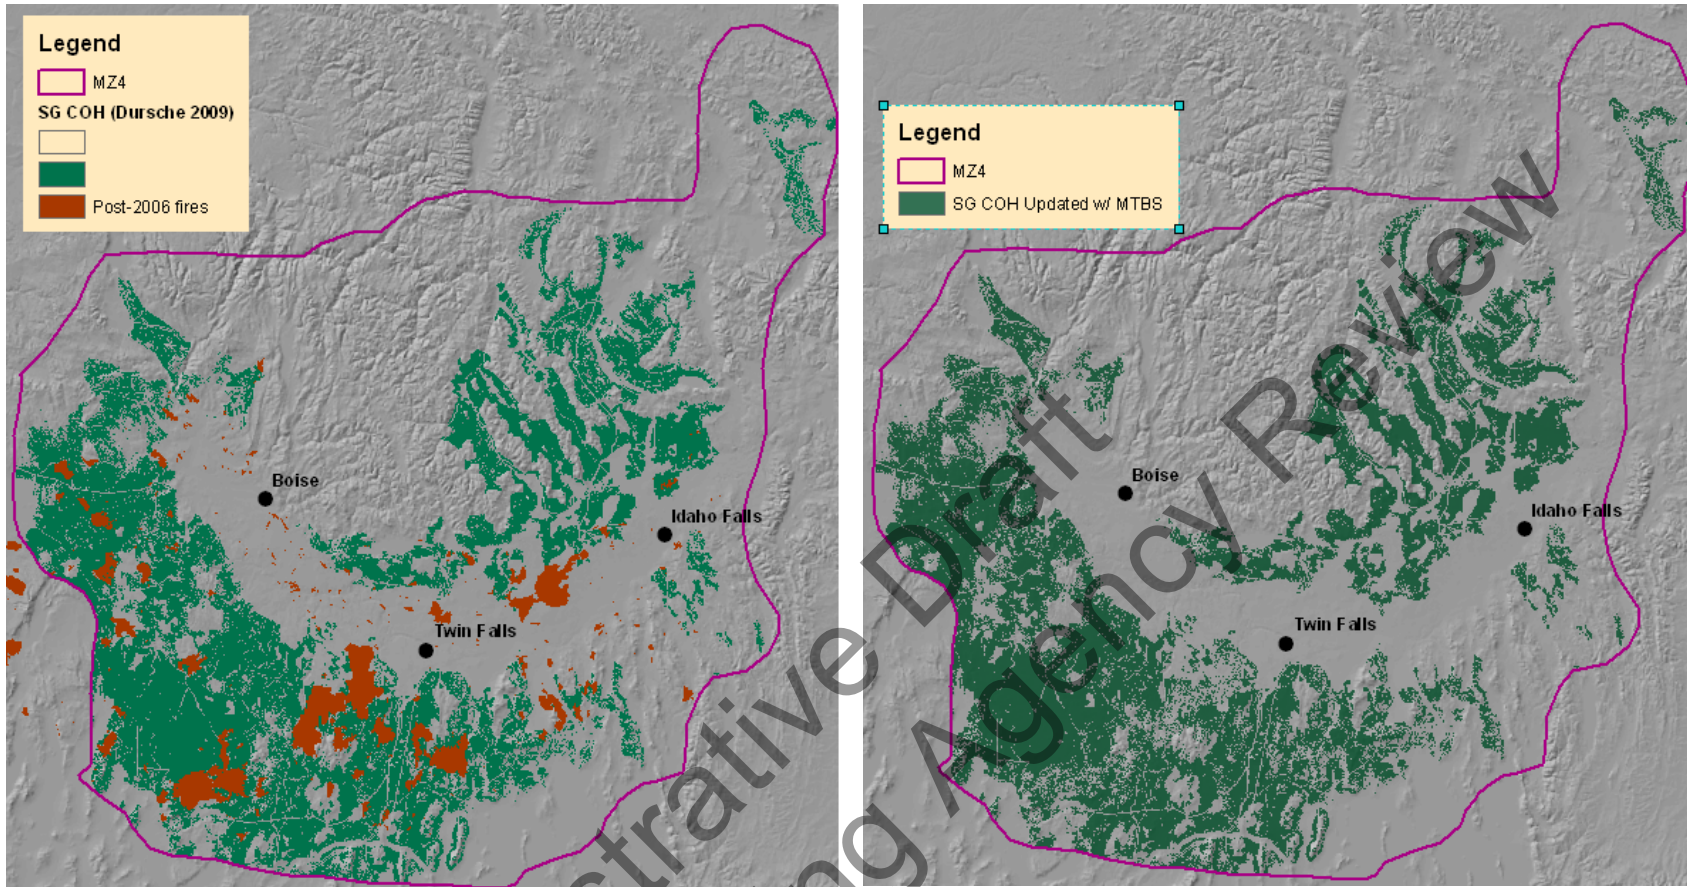

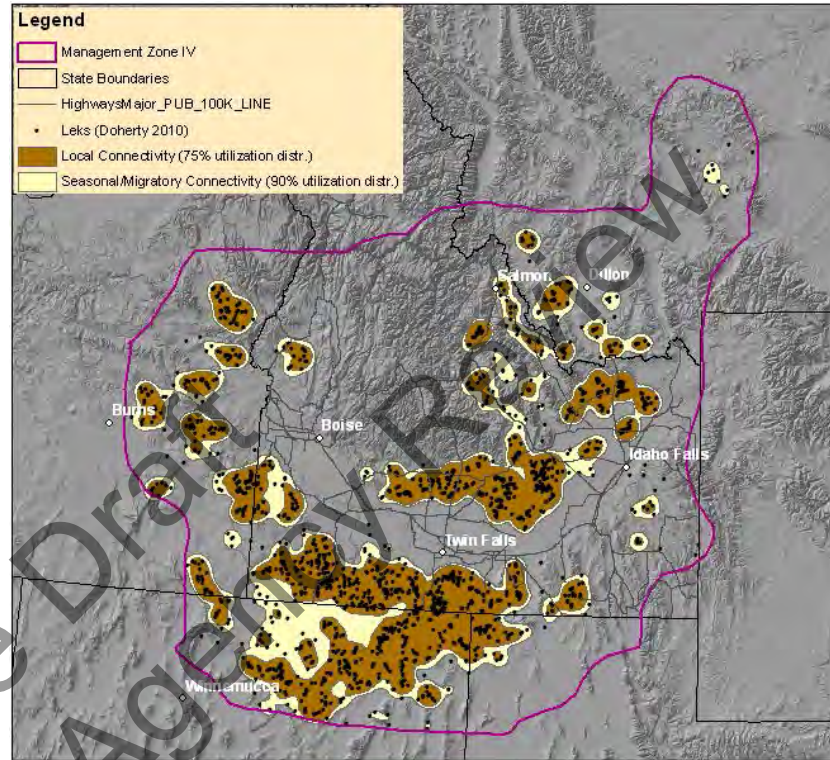

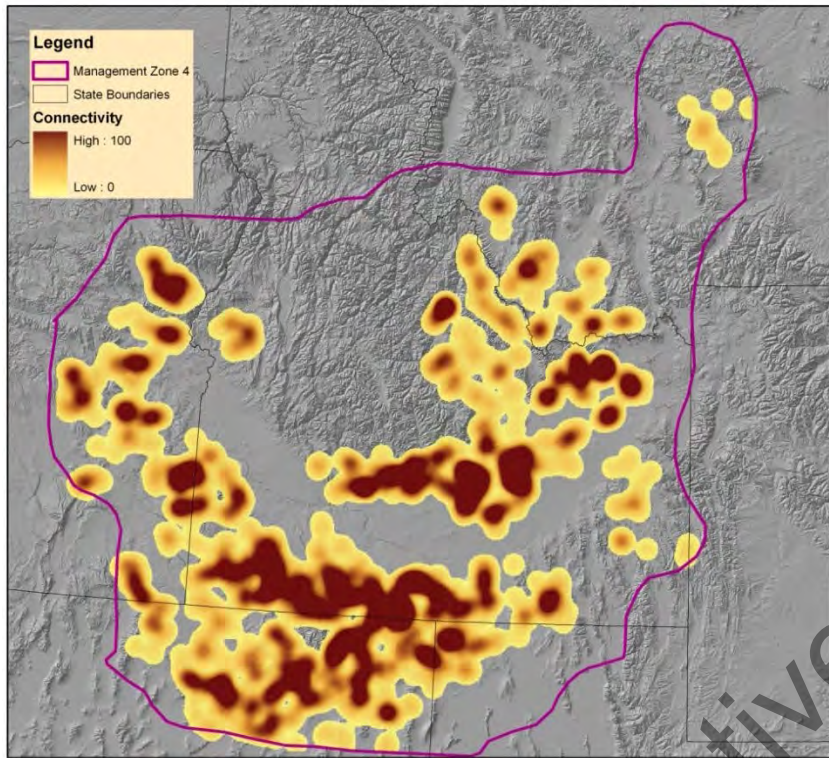

Figure 4. The Durtsche et al. (2009) Greater Sage-grouse Currently Occupied Habitat (COH) map did not include any areas of recent fire (since 2006) (red polygons). Therefore, we used Burn Severity data from USGS Monitoring Trends in Burn Severity ([www.mtbs.gov](http://www.mtbs.gov)) to update the map. Within fire polygons, areas (30m pixels) classified as 1=no burn, or 2=low severity were reclassified to the pre-fire land cover type and identified as either GSG COH or not. These areas were then added to the original Durtsche et al. 2009 map. Note that due to our limited ability to effectively characterize ‘burn severity’ in shrub ecosystems, it is likely that we are overestimating COH in the low severity category. But for this exercise, we assumed that areas of low burn severity retained largely the same habitat as before the burn (i.e. patchy burn).

## Chapter 2: Version 2 -April 2012- Refinements to Sage-grouse Preliminary Priority Habitat (PPH) and Preliminary General Habitat ( PGH) in Idaho

**Introduction:** In response to additional input from local and regional sage-grouse and habitat experts, new spatial data, and public comments, we initiated a refinement of the Version 1 analysis. Specifically, our refinements focused on 1) further evaluation of the *population* components (leks and lek counts) in the original analysis and 2) incorporation of additional data to inform the sagebrush component of PPH, including: i) seasonal habitat information (e.g., fall, winter, late brood), ii) identified movement and migration corridors, iii) addition of local sage-grouse priority areas, iv) incorporation of additional areas of habitat connectivity, v) incorporation of recommendations arising from FS review, and vi) exclusion of modeled agricultural and timber lands.

In addition to revising PPH/PGH in Version 2 as described above, we also incorporated certain perennial grassland and conifer encroachment “potential restoration areas” as a subset of PPH. Many of these potential restoration habitat types have recently (or may in the foreseeable future) undergone various efforts to enhance or restore habitat extent or improve connectivity. Since these potential restoration habitats are typically intermixed with or in proximity to preliminary priority *sagebrush* areas, and since the potential restoration areas themselves may be used in varying degrees by grouse, managing these areas as a component of PPH may be important to the long-term sustainability of sage-grouse populations in the state. The importance of these potential restoration habitats is also underscored by the fact that Idaho appears to have lost approximately two-thirds of its sage-grouse habitat since pre-settlement times, thus emphasizing the need for ongoing restoration efforts (especially to recover sagebrush) and appropriate management of remaining habitats.

**Additional population information:** BLM and IDFG Field staff identified a subset (n=10) of “important” high male attendance leks that were not previously captured in the Version 1 PA designations (Figure 1). All of these leks occurred within the 75% BBD coverage, however were not captured in the initial analysis because they did not intersect w/ the 75% utilization lek connectivity surface. The revised 2011PA polygons were then used to provide the foundation for the following integration of additional available sage-grouse habitat and related information, described below.

**Additional habitat information:** A combination of Key Habitat (Sather-Blair et al., 2000; ISAC 2006; BLM 2012), recently mapped winter and/or breeding habitat (Burak and Moser 2009; NMV LWG 2011), local sage-grouse priority areas previously identified spatially by the Challis Local Working Group, known migration movement corridors, and the revised 2011PA polygons were used to further refine the Preliminary Priority Habitat (PPH) and Preliminary General Habitat (PGH) boundaries. The following criteria were used:

- a. Any Key Habitat (Sather-Blair et al., 2000; ISAC 2006; BLM 2012) inclusions or portions extending beyond the revised 2011 PA polygon boundaries were identified as PPH: 1) if the extension connected to an adjacent revised 2011 PA polygon and/or 2) extended out to the intersection of the Persistence boundary, to exclude areas of low (<25%) persistence (see Chapter 1 - MZ IV Sage-grouse *General Area Delineation* for Persistence discussion, and Figure 2, this chapter).
- b. Any identified sage-grouse winter or breeding (Spring) habitat areas within or extending beyond the revised 2011 PA boundary were identified as PPH (Figure 3).
- c. Priority Areas identified by the Challis Sage-grouse Local Working Group within or extending beyond the revised 2011 PA boundary were identified as PPH (Figure 4).
- d. Sage-grouse movement and migration areas were identified using a combination of expert opinion (primarily discussions with Dr. Jack Connelly) and telemetry location information. Telemetry data spanned a 15 - 20 year period representing targeted local sage-grouse studies and was used to

provide “general” support of sage-grouse movement patterns. Migration and movement areas were identified that connected revised 2011 PPH polygons as well as any identified Key habitat, crucial winter, breeding, or Local Working Group identified priority areas (Figure 5)

- e. Any Key Habitat (Sather-Blair et al., 2000; ISAC 2006; BLM 2012) not connected to the revised 2011 PPH (polygons) or extending beyond the Persistence model’s 25% boundary was identified as Preliminary General Habitat (PGH).
- f. Any PGH (from >25% Persistence model) occurring within the revised 2011 PA polygons was retained as PGH.

**Incorporation of Potential Restoration Areas into PPH:** In addition to refinement of the sagebrush component of PPH as described above, we also included certain “potential restoration” habitat types into PPH (Figure 6). These were restricted to identified perennial grasslands and areas of conifer encroachment and correspond to those areas shown in BLM 2012 (and as defined in Sather-Blair et al 2000 and ISAC 2006). The following criteria were used:

- a. Any Potential Restoration area Type R1 (perennial grassland) or R3 (conifer encroachment) occurring within the revised 2011 PA polygons was identified as PPH.
- b. Any R1 or R3 Habitat occurring outside the revised 2011 PA polygons was identified as Preliminary General Habitat (PGH).

**Incorporation of U.S. Forest Service edits:** National Forests within Idaho reviewed draft revised PPH/PGH data during April 2012. Suggested edits, based on local seasonal habitat information were provided to BLM in a geodatabase format by the FS Geospatial Technology Service Center. Polygons were attributed by the FS as either 1) breeding habitat, 2) breeding/summer/early fall habitat, 3) breeding/summer/early fall/ fall/winter habitat; 4) summer/early fall habitat or 5) summer/early fall/fall/winter habitat. We then applied the following rule set to allow for incorporation of FS edits without otherwise compromising other important components of the PPH/PGH analysis.

- a. An initial assumption was made that polygons containing the terms “breeding” and/or “winter” habitat in the “season” data field, were relatively more important than other seasonal habitats, and therefore constituted PPH. Polygons with no reference to breeding or winter habitats in the “season” field and polygons where seasonal descriptors were lacking (n=3; acre total ~500) constituted PGH. Following this initial characterization, we then applied the following rule set:
  - i. Polygons identified as “breeding” and/or “winter” habitat were attributed as PPH. Remaining seasonal habitats were attributed as PGH.
  - ii. Polygons identified as PGH that intersected existing PPH were attributed as PPH.
- b. If Forest Service polygons occurred within areas of migration/movement/connectivity concern, they were attributed as PPH.

**Incorporation of Agriculture and Conifer Filters to Refine PPH and PGH:** The final step in refining the PPH areas involved applying both an agricultural and conifer filter to exclude those areas from the final PPH product (Figure 7). Agricultural and conifer land cover types were mapped using the Landfire v1.01 land cover dataset. For computational purposes the 30m land cover data was resampled to 90m. Separate 1 km moving window analyses were used to sum agriculture and conifer occurrence, respectively across Idaho. A 25% threshold value (representing 25% occurrence in the 1 km<sup>2</sup> window) was used as the agricultural filter. Aldridge et al. (2008) reported that sage-grouse extirpations were more likely to occur in areas where cultivated

crops exceeded 25% of a 30 km landscape. A 50% threshold value (representing 50% occurrence in the 1 km<sup>2</sup> window) was used as the conifer filter. Doherty et al. (2008) reported that sage-grouse avoided coniferous habitats at a 0.65-km<sup>2</sup> scale.

Any areas of sagebrush, perennial grass, or conifer that were contained within the above agriculture or conifer filters were incorporated into PGH to provide additional context at more local scales and to acknowledge that these edge areas or inclusions, while influenced by conifer or agriculture, may still be utilized by sage-grouse to some degree.

**Summary:** The Version 2, April 2012 Preliminary Priority Habitat designation encompasses three subcategories of habitat including 1) sagebrush, 2) perennial grassland potential restoration areas, and 3) conifer encroachment potential restoration areas that are assumed to be relatively important for sage-grouse conservation planning efforts based on the above analysis and assumptions. Summary statistics for habitat acreages, land status, and leks are provided in Tables 1 and 2. Figure 8 displays PPH with the three subcategories merged, for simplicity, along with PGH. Figure 9 displays the three subcategories of PPH separately, in addition to PGH.

## Chapter 3: Management Approaches for Consideration

The information presented in this paper should not be construed as policy. It is primarily intended to complement and provide spatial context for interim national BLM sage-grouse policy and a framework for further conservation planning efforts. Specifically, this information can provide helpful context for analyses and decisions associated with future project-level work, authorizations, activity planning or land-use planning that may affect sage-grouse or sage-grouse habitat on BLM lands in Idaho. To inform future discussions of possible management actions for the various PPH or PGH (or portions thereof), we suggest considering two general approaches, as a starting point.

*Habitat Maintenance Focus:* In some areas, the focus of sage-grouse habitat conservation may best be achieved by an effort to maintain or protect the current extent and health of sagebrush landscapes and sage-grouse population connectivity. These areas might include PPH or portions of PPH that currently provide relatively important, intact sage-grouse habitat and are therefore important for sustaining sage-grouse populations into the future. Examples of management actions could include: 1) the establishment of exclusion zones for certain types of actions (e.g., energy development), or sage-grouse “conservation areas”, Areas of Critical Environmental Concern, or other protective designations to minimize or reduce anthropogenic impacts; 2) application of more stringent project stipulations or protective buffers; and 3) provide aggressive and proactive approaches to wildfire suppression, establishment of strategic fuel breaks, implementation of juniper/conifer control activities, or other protective or maintenance measures appropriate for the landscape.

*Habitat Improvement Focus:* In some areas, the focus of sage-grouse habitat conservation may best be achieved by an effort to restore the extent and ecological health of sagebrush landscapes to improve sage-grouse habitat quality, quantity and population connectivity. These would be comprised of PPH and/or PGH that currently are constrained due to concerns with habitat quality, fragmentation or other factors that could be ameliorated with restoration activities or other approaches. Management actions could focus on efforts to restore sagebrush and/or the herbaceous components of the habitat, reduce conifer expansion, and protection of restoration investments (i.e., aggressive wildfire suppression).

**Future Modeling Opportunities:** Given the repeatable and transparent analytical framework described in earlier chapters, we can readily incorporate other geospatial landscape metrics, threat information, or other data as they become available. For example, we could incorporate information on the Human Footprint (Leu et al. 2008), or Core Patch Size Distribution using Patch Analyst for ArcGIS. Other class or landscape metrics (e.g., habitat connectivity, fragmentation or aggregation indices, edge density, etc.) could also be explored to further characterize the nature and context of our connectivity polygons.

In the near future, we will have the opportunity to incorporate sage-grouse seasonal habitat models currently under development for Idaho and MZ IV by IDFG (Knetter and Svancara, in progress) using a Maximum Entropy (MAXENT) climate envelope characterization of sage-grouse habitat. We anticipate these will be helpful in further informing sage-grouse conservation at multiple scales.

**Acknowledgements:** Many individuals provided helpful comments the various phases of this project. We would like to especially thank the following for their input: Cameron Aldridge (US Geological Survey), Jack Connelly (Idaho Dept. Fish & Game), Shawn Espinosa (Nevada Dept. Wildlife), Christian Hagen (Oregon Dept. Fish & Wildlife), Steve Hanser (US Geological Survey), Nick Hardy (US Fish & Wildlife Service), Don Kemner (Idaho Dept. Fish & Game), Sonya Knetter (Idaho Dept. Fish & Game), Steve Madsen (Utah BLM), Rick Northrup (Montana Dept. Fish, Wildlife, & Parks), Tom Rinkes (Idaho BLM), Frank Quamen (BLM National Operation Center), Robin Sell (Colorado BLM), and Kendra Womack (US Fish & Wildlife Service).

# Greater Sage-Grouse Core Areas Designation for Montana Version 1.0

## Appendix 1 to Greater Sage-Grouse Habitat Conservation Strategy

Definition, Methods, and Numerical Results  
Montana Fish, Wildlife and Parks

Jan 13, 2009

**Objective:** Designate sage-grouse core areas in Montana that support the greatest sage-grouse abundance or are important for maintaining sage-grouse distribution.

**Definition:** Sage-grouse core areas are habitats associated with 1) Montana's highest densities of sage-grouse (25% quartile), based on male counts and/or 2) sage-grouse lek complexes and associated habitat important to sage-grouse distribution.

### Methods and Criteria for #1 in the Definition

1. **Identifying Highest Density:** Two different point density estimation methods (noted below) were used to identify the highest densities of displaying male sage-grouse based upon lek locations. Both techniques identified the same lek complexes as having the highest densities at the 25% quartile.
  - a. Audubon (K. Doherty) used a 6440-m circular neighborhood analysis (Spatial Analyst Tools ArcGIS 9.2) at 1-km grid cell size. The maximum male count available between 2005 and 2007 was used to evaluate male density. The resulting surface was randomly sampled using 50,000 points to determine the quartile breakpoints.
  - b. Montana Fish, Wildlife and Parks (FWP) used a Fixed Kernel Density Estimator (Hawths Tools, ArcGIS 9.2) with a bivariate normal kernel and a smoothing factor of 10,000 at a 500-m cell size. The kernel was weighted based upon the average of the highest male count for each year from 1998 through 2008. The quartile boundaries are provided by the program.
2. **Focus Area:** Lek complexes and associated habitats, typically within a 10-km search radius of leks in the complex, defined the outside boundaries of this analysis. In some instances, habitat associated with a core lek complex may have extended beyond 10 km.

*Idaho and Southwestern Montana Greater Sage-Grouse Proposed LUPA/Final EIS*  
June 2015

Overlaying documented seasonal habitats connected to and extending beyond these areas and manual editing were necessary to incorporate these exceptions.

3. **Habitat Suitability Analysis:** For the purposes of this analysis, unsuitable habitats and suitable habitats within or adjacent to core areas were generally defined as follows:

a. **Unsuitable Habitat**

- Cultivated row-crop parcels >600 acres
- Areas where 75% or more of the surrounding 1,000 acres are cultivated land\*
- Areas where 20% or more of the surrounding 1,000 acres are forested habitat\*
- Areas where 75% or more of the surrounding 1,000 acres exceeded a terrain ruggedness threshold of 13.\*\*

Note: This criteria was not included for intermountain valleys of southwestern Montana because of the unique topographic features and demonstrated habitat use by sage-grouse.

\* Land cover values were obtained from the National Land Cover Dataset (NLCD). Analyses were based upon a 30-m grid cell. Percentages are based on a 2-km x 2-km search window (1,000 acres).

\*\* Terrain ruggedness is the standard deviation of elevation surrounding an area based upon a 30-m grid cell. The threshold was chosen based on 95% of leks having a value of 13 or lower.

b. **Suitable Habitat**

- Areas where 75% or more of the surrounding 1,000 acres had a 10% or greater probability of supporting a sage-grouse lek.
  1. The majority of core area boundaries were based upon this delineation.
  2. The probability used is based upon a habitat suitability model that used lek locations to identify suitable habitat. This model was produced by the Montana Natural Heritage Program. See "Surveys for Grassland Birds of the Malta Field Office-BLM, including a Seven-year Study in North Valley County, April 2008" at the Montana Natural Heritage Program, Publications, [Birds](#) webpage.

## Methods and Criteria for #2 in the Definition

1. Key areas for maintaining sage-grouse distribution in Montana are among the highest 50% density (50% quartile, using methods described above) occurring in the outer boundaries of the sage-grouse's range in Montana.
2. Key habitat corridors important for conductivity and sage-grouse distribution beyond Montana are also included under this definition (e.g., portions of northern Valley County).
3. Non-habitats and habitat boundaries within or adjacent to core areas follow the same criteria as under #3 above.

### Refinement Process:

1. Field biologists from FWP and Bureau of Land Management (BLM) reviewed printed maps showing the habitat parameters described above to identify outer boundaries of core areas and determined general accuracy of designated non-habitats. Printed maps were at a scale of 1:200,000.
2. Based upon those biologists expert opinion, refinements were made to the core area boundaries. This allowed for inclusion of nesting and brood rearing areas not captured by the lek driven model.
3. Telemetry data was utilized to refine core area boundaries in southwestern Powder River and southeastern Bighorn counties and Beaverhead and Madison counties to help refine mapping of core habitats in these areas. Data from Powder River and Bighorn counties was obtained from research done by Dr. Dave Naugle, University of Montana. Data from Beaverhead and Madison counties was obtained from research done by the BLM.
4. The mapped habitat, refinements based upon biological expert opinion and integration of existing research data were incorporated to develop Version 1.0.
5. As additional information becomes available, Core Area designations will be refined.

### Numerical Results:

Core Areas mapped as Version 1.0 include 56% of the state's sage-grouse leks (953 of 1,693 leks) and 71% of displaying males based on average male counts over the last 10 years (13,439 of 18,910 sum of average males).

## Forest Service Alternative D Language

This Page Intentionally Blank

Administrative Draft  
Cooperating Agency Review

Version 1 - Revised as of 8/15/13

**Draft Standards and Guidelines for GRSG Amendment for the Land and  
Resource Management Plans in Idaho and Southwest Montana for the  
Preferred Alternative - Alternative D**

**Boise National Forest**

**Beaverhead-Deerlodge National Forest**

**Caribou-Targhee National Forest**

**Curlew National Grassland**

**Salmon-Challis National Forest Service**

**Sawtooth National Forest**

Note – all of the following standards and guideline apply to all GRSG habitat unless a specific Management Area is identified.

**D-SSS-1: Greater Sage-grouse Management Area Designation**

Designate Preliminary Priority Management Areas (PPMA), Preliminary Medial Management Areas (PMMA), and Preliminary General Management Areas (PGMA) (see Table 2-18).

PPMA includes areas that have the highest conservation value to GRSG. Key characteristics include areas of higher lek attendance and lek connectivity, lower habitat fragmentation, important movement corridors and winter habitat. PMMA includes areas of moderate to high conservation value to GRSG that are generally adjacent to PPMA but reflect reduced GRSG population and/or habitat characteristics. PGMA is occupied (seasonal or year-round) habitat outside of PPMA and PMMA.

**D-WFM-1: Wildfire Suppression Standard**

Having provided for firefighter and public safety, property protection, and threatened and endangered species habitat protection, PPMA is the highest priority for conservation during fire suppression decision making, followed by PMMA and then PGMA. Suppress wildland fires in intact GRSG habitats and utilize appropriate management response where needed to restore, enhance, maintain and improve GRSG habitat.

**D-LG/RM-16: Livestock Grazing Standard**

Manage grazing permits to maintain vegetation composition (including riparian and lentic areas) and structure consistent with appropriate GRSG seasonal habitat objectives relative to site potential.

**D-LG/RM-35: Fence Construction Guideline**

Avoid building new permanent fences within 2 km of occupied leks, high density fence areas or winter concentration areas. If this is not feasible, ensure that high risk segments are marked with collision diverter devices or as latest science indicates. Utilize temporary fencing (e.g., ESR, drop down fencing) where applicable and appropriate to meet management objectives.

**D-LG/RM-43: New Livestock Water Developments Standard**

New water developments must benefit, maintain, or have a neutral effect on PPMA and PMMA (such as by shifting livestock use away from critical areas). New developments that divert surface water in PPMA, PMMA and PGMA must be designed to maintain integrity and functionality of riparian or wetland vegetation and hydrology.

**D-RC-3: Recreation Special Use Permit Seasonal Restrictions Standard**

Incorporate seasonal restrictions for authorized activities to minimize impacts to GRSG and/or their habitat.

**D-RC-4: Recreation Sites and Activities Standard**

Design and manage recreation activities and developed recreation sites and facilities within lands not designated as a recreation management area to minimize adverse effects to GRSG by directing use away from sensitive areas.

**D-TM-10: Winter Travel Restriction Standard**

Limit snow machine travel to existing routes in GRSG wintering areas from November 1 through March 31.

**D-LR-1: Solar and Wind Energy Development Restriction Standard**

In PPMA - Do not authorize solar and wind energy development in PPMA. In PMMA - Do not allow solar and wind energy development where adverse effects cannot be mitigated. Ancillary facilities such as roads, electric lines, etc. may be authorized provided there is no net loss of GRSG habitat through mitigation. In PGMA - Avoid authorizing solar and wind energy development.

**D-LR-3: New ROW, Easement, and Land Special Use Permit Restriction Standard**

In PPMA, do not authorize new transmission facilities greater than 50kV, wind energy testing and development, commercial solar development, commercial geothermal development, nuclear development, oil and gas development, mineral development, airports, ancillary facilities associated with any of the aforementioned development, paved roads and graded gravel roads, landfills or hydroelectric projects.

In PPMA, PMMA and PGMA, unless otherwise restricted, avoid authorizing new permanent ROW, easement and land special uses. Land authorizations that are temporary in nature (e.g., film permits,

apiaries), that do not result in loss of GRSG habitat are exempt from mitigation requirements regarding habitat loss (except for timing restrictions). Site new authorizations or facilities, not otherwise excluded, outside the 3 km (1.86 miles) occupied lek avoidance buffer areas unless a greater or lesser distance is required, based on topographic features or other mitigating factors. If new distribution lines cannot be sited outside the 3 km buffer, they should be buried or designed to minimize use by avian predators.

In PPMA and PMMA, new ROW, easement, and land use authorizations may not result in a net loss of GRSG habitat.

#### **D-LR-17: Land Ownership Adjustment Guideline**

Retain public ownership of GRSG habitat. Allow consideration of Federal land sale or exchange where there is mixed ownership and land exchanges would allow for additional or more contiguous federal ownership patterns within GRSG habitat.

Allow consideration of land exchanges containing historically low-quality GRSG habitat in exchange for lands of higher quality habitat, lands that connect seasonal GRSG habitats or lands providing for threatened and endangered species. These potential exchanges should lead to an increase in the extent or continuity of or provide for improved connectivity of GRSG habitat. Higher priority will be given to exchanges for those intact areas of sagebrush that will contribute to the expansion of PPMA sagebrush areas currently in public ownership. Lower priority will be given to those lands that will promote enhancement in PPMA and PGMA areas.

#### **D-MLS-12: Fluid Minerals Lease Restrictions Standard**

In PPMA and PMMA, do not allow new leases in areas of no and low potential for the discovery of fluid minerals (see Table 2-18). In areas of moderate and high potential for the discovery of fluid minerals, allow leasing and require CSU, timing restrictions in breeding and winter habitat, disturbance density not to exceed 1/640 acres, maximum 3% disturbance/section, and NSO within 0.6 mile of occupied or undetermined status leks.

In PGMA, allow leasing and require:

- Timing limitations in breeding and winter habitat,
- 0.6 mile NSO near occupied and undetermined status leks, and
- Implementation of appropriate BMPs.

#### **D-MLS-13: Fluid Minerals Geophysical Exploration Timing Restriction Standard**

Apply seasonal timing restrictions to exploration activities.

#### **D-MLM-3: Locatable Minerals Mitigation Standard**

In PMMA, require off-site mitigation if effects to GRSG PPMA habitat are unavoidable.

**D-MSM-1: Common Variety Mineral Materials Standard**

Do not authorize new common variety mineral pits within 3 km of an occupied lek (see Table 2-18). Require seasonal timing restrictions on both new and existing community pits.

**D-MNL-1: Non-Energy Minerals New Lease Restrictions Standard**

In PPMA and PMMA – Do not allow prospecting or new leases (see Table 2-18) except for lease modifications and fringe leases where valid existing rights may be affected. In PPMA, PMMA and PGMA where leasing is allowed, require CSU, timing restrictions and CSU.

**D-MNL-2: Non-Energy Minerals New Lease Restrictions Standard**

For existing (undeveloped) and new non-energy mineral leases, require timing restrictions (seasonal and daily) when exploration activities or initial mine development is proposed, as appropriate. Also require restoration of habitat or off-site mitigation, if on-site restoration is not feasible.

**D-MSE-2: Surface Disturbance Standard for Non-federal Subsurface Minerals**

In PPMA, where the federal government owns the surface, and the mineral estate is in non-federal ownership, require the mineral estate owner to apply a timing restriction stipulation, COAs, and restrict activities within 3 km (1.86 miles) of an occupied lek, when concurring to the approval of authorizations for mineral-related surface disturbance.

# Appendix X

## Vegetation Dynamics Development Tool

This Page Intentionally Blank

Administrative Draft  
Cooperating Agency Review

## **X. Great Basin Vegetation Modeling using Vegetation Dynamics Development Tool**

### **X.1 Introduction**

Numerous factors influence sagebrush dynamics in the Great Basin. Each year acres of sagebrush increase in density, or are burned, grazed, converted to invasive annual grass, damaged by insects and disease, encroached by conifers, or altered by various management treatments. Due to the importance of sagebrush cover for greater sage-grouse, a process to account for all of these changes in sagebrush communities is important in evaluating trends of greater sage-grouse habitat. The greater sage-grouse land use plan amendments being developed and analyzed in each sub-regional EIS in the Great Basin each have different alternative approaches to management of greater sage-grouse habitat. Alternatives propose actions that will influence the extent and distribution of sagebrush. In order to evaluate and compare the estimated effects of each alternative, a team of vegetation ecologists representing each sub-regional EIS in the Great Basin was assembled. The team used the Vegetation Dynamics Development Tool (VDDT, copyright 1995-2003, ESSA Technologies, Vancouver, BC) to accomplish this task. This modeling effort does not include changes in habitat conditions associated with permitted activities such as infrastructure development, travel management, or mineral development.

### **X.2 Methods**

The Great Basin Region planning area was divided into Analysis Areas based upon the Population/subpopulation areas from the *Conservation Assessment of Greater Sage-Grouse and Sagebrush Habitats* (Connelly et al. 2004). These polygons were overlaid on the PPH/PGH layers identified by each state to ensure all habitat was included. The acreage calculations were based on the underlying PPH/PGH. Attachment A shows this base map.

Existing vegetation was determined using a combination of LANDFIRE, local knowledge, GAP analysis, SENS Map in Nevada, and ILAP in Oregon (each state process is described in Attachment B). These acres were estimated for each vegetation class in each vegetation model in each analysis area. Five models were developed to characterize the vegetation:

- Low Sagebrush (shallow, dry)
- Wyoming Big Sagebrush (warm, dry)
- Mixed Sagebrush
- Mountain Big Sagebrush with conifer(cool, moist)
- Mountain Big Sagebrush without conifer (cool, moist)

Each model has different states or conditions of the vegetation, which are called classes. The classes were designed to best represent both the available vegetation data for the planning area, as well as the sage-grouse habitat requirements. The following are the classes for each Model:

Low Sagebrush

1. Early Seral: <10% sagebrush cover
2. Late Seral: >10% sagebrush cover
3. Late Seral with conifer: >10% sagebrush with >10% conifer
4. Annual Grass

Wyoming Big Sagebrush

1. Early Seral: <10% sagebrush cover
2. Mid Seral: 10-30% sagebrush cover
3. Late Seral: >30% sagebrush cover
4. Late Seral with conifer: >30% sagebrush cover with >10% conifer cover
5. Annual Grass
6. Exotic Perennial Grass

Mixed Sagebrush

1. Early Seral: <10% sagebrush cover
2. Mid Seral: 10-30% sagebrush cover
3. Late Seral: >30% sagebrush cover
4. Late Seral with conifer: >30% sagebrush cover with >10% conifer cover

Mountain Big Sagebrush with conifer

1. Early Seral: <10% sagebrush cover
2. Mid Seral: 10-30% sagebrush cover
3. Late seral: >30% sagebrush cover
4. Late Seral with conifer: >30% sagebrush cover with >10% conifer cover
5. Annual Grass

Mountain Big Sagebrush without conifer

1. Early Seral: <10% sagebrush cover
2. Mid Seral: 10-30% sagebrush cover
3. Late seral: >30% sagebrush cover
4. Annual Grass

The following natural and background disturbances were applied to the models: stand replacement wildfire, mosaic wildfire, overgrazing, insects and disease, and conifer encroachment. The rates of occurrence of these disturbances varied by model in order to reflect the variable rates for each of the vegetation types represented by these models. Several web meeting/conference calls were conducted to gain consensus among the team members on which models to develop, what disturbances/succession processes to include and determine what amount should be included in each model. The initial foundation was the Biophysical Settings for applicable sagebrush sites from LANDFIRE. Each team member had the opportunity to bring their local knowledge and experience to the discussion and changes were made to reflect that experience.

After agreement was reached on these rates, a review of the models and disturbance rates was conducted by the Science Review Team. This team made several suggestions that were incorporated into the models.

Wildfire history data (1980-2012) was used from the National Interagency Fire Center to determine the average annual acreage burned in each area, magnitude of extreme fire years, and frequency of extreme years. The size and extent of fires vary significantly from year to year, with most acres burned occurring on few years that represent extreme conditions; therefore using an average fire size would not accurately represent the influence of fire on the landscape. Due to the short time period in the fire history data (32 years) the data was reviewed and the most extreme year (most acres burned) and the smallest fire year (fewest acres burned) were dropped. The presence of only 1 extreme year in the data set does not indicate the interval between extreme events unless 2 data points are found within the fire history range. Therefore it is not accurate to make assumptions about an extreme event occurring every 32 years. Annual wildfire probability for each class in each model was estimated based on mean fire return interval (MFRI) information gained from LANDFIRE and adjusted based on team members' experience. The variability in year-to-year fire totals did not alter the long term fire probabilities derived from MFRI.

### X.3 Model Outputs

**Alternative A** in each Sub-Regional EIS is the No-Action or Current Management Alternative. This alternative represents the existing rates of conifer treatment, sagebrush mechanical treatment, prescribed fire, herbicide treatment, grass seeding, sagebrush seeding, and firebreak utilization. In order to display current vegetation conditions, acres of each type of treatment were collected from the field and input into VDDT. Field monitoring data was used to determine the success rates for grass seeding, herbicide application, and sagebrush seeding. These treatments are all considered as one package of restoration treatments in the models to avoid double counting acres and thereby overestimating their positive benefit to vegetation. Firebreak utilization was not directly input to the model, but was assumed to be correlated to the existing rates of wildfire in areas where the firebreaks are used.

Upon completion of the Current Management Alternative, the model output reports were reviewed by the team as well as field staff from BLM and FS to ensure the results reflected existing levels of treatment, current vegetation and results of treatment. This review resulted

in re-running the models four times in order to capture changes suggested by the reviewers. Changes made included: modification of treatment success rates to reflect field monitoring, removal of double counted acres of treatment when multiple treatment occurred, and errors found within models estimating rates of vegetation change.

An interdisciplinary team conference call/meeting was held with vegetation and wildlife staff to determine the Desired Conditions that would be applied to each analysis area. We determined that 70% of an area should be in 10-30% sagebrush canopy cover. This determination was made after a discussion of the *Guidelines to Manage Sage-Grouse Populations and Their Habitats* (Connelly et al. 2000) and the National Technical Team Report (NTT 2011). Connelly et al. suggested 80% of an area should have 10-30% sagebrush cover and the National Technical Team Report suggested 50-70% of an area should have 10-30% sagebrush cover.

The modeling team then reviewed the amount of each analysis area that currently has 10-30% sagebrush cover. Vegetation treatment projects were then modeled to determine the amount of a particular treatment necessary to move the vegetation conditions to the Desired Conditions. The amount of treatment varied by the amount of departure of the area from Desired Conditions and the vegetation dynamics of the area. The team reviewed amounts of acres available for treatment when developing these treatments to avoid the error of proposing treating acres that did not exist. When analysis areas had Current Conditions at or above 70% no additional treatment projects were proposed. The model outputs for this phase of the analysis are called Proposed Action. These treatment acres may be used to develop objectives in the Sub-regional Alternative D such as:

- “In the North Snake Population area, treat 10,000 acres annually of annual grass.”
- “In the North Snake Population area, treat 1000 acres annually of phase 1 conifer encroachment.”

Alternatives will be compared by the amount of each Population Area in suitable habitat condition (10-30% sagebrush cover) projected to occur in 50 years.

#### X.4 Model Assumptions:

**Alternative A: No Action:** Natural and background disturbances equal to historical averages, vegetation treatments equal to current management rates.

**Alternative B – NTT:** The modeling team reviewed any actions proposed by this alternative and attempted to quantify the effect of implementation of these actions in order to model the effects of these actions on vegetation. The following are actions found within the NTT that were included in the modeling for Alternative B:

- Natural and background disturbances same as Alt A except 50% less wildfire in Wyoming sage model to estimate the effect of fuels projects.

- No Prescribed Fire in <12” precipitation areas Wyoming sagebrush.
- Desired Condition to maintain 70% of area in 10-30% shrub cover
- Conifer encroachment treatment included
- Annual grass restoration included: Herbicide treatment, grass and sagebrush seeding

**Alternative C:** The modeling team reviewed actions proposed and modeled the following:

- Natural and background disturbances
- No Prescribed Fire in <12” precipitation areas
- Restore all crested wheatgrass seedings to native vegetation
- Maintain 80% of area in 10-30% shrub cover
- No livestock grazing
- Wildfire increased 25% due to lack of maintenance of existing fuel breaks, and no additional constructed
- Invasive annual grass would increase due to minimal use of herbicide for treatments resulting in a 50% decline in restoration treatment success

**Alternative D:** The modeling team reviewed actions proposed and modeled the following:

- Maintain 70% of area in 10-30% sagebrush cover
- Natural and background disturbances same as Alt A except 50% less wildfire in Wyoming sage model to estimate the effect of fuels projects.
- Desired Condition to maintain 70% of area in 10-30% shrub cover
- Conifer encroachment treatment included
- Annual grass restoration included: Herbicide treatment, grass and sagebrush seeding

**Alternative E:** The modeling team reviewed actions proposed and modeled the following:

- Each Sub-regional EIS has a different Alt E. Modeling was changed by Sub-region to reflect those differences.
- In general, this alternative was modeled similar to Alternative D

**Alternative F:**

- Natural and background disturbances same as Alt A except 50% less wildfire in Wyoming sage model to estimate the effect of fuels projects.

- No Prescribed Fire in <12” precipitation areas Wyoming sagebrush.
- Livestock grazing reduced by 50%.
- Desired Condition to maintain 70% of area in 10-30% shrub cover
- Conifer encroachment treatment included
- Annual grass restoration included: Herbicide treatment, grass and sagebrush seeding

**Team Members:**

### Greater Sage-grouse Habitat Characterization for Use in Non-Spatial Vegetation Modeling in the Idaho/Southwestern Montana Analysis Area

#### Vegetation Data

We evaluated available vegetation information to identifying the sagebrush habitat types and associated vegetation cover classes required by the modeling effort. These included Landfire (v115), ReGAP, and a site potential based evaluation of Idaho's Priority and General Sage-grouse Habitat (D. Major pers com). Upon evaluation and acknowledgment of the numerous limitations of available data, we determined the most effective approach would incorporate the following criteria: 1) dataset covers the entire sub-regional project area, 2) the vegetation data has an associated accuracy assessment, and 3) data provides appropriate resolution of sagebrush habitat types and associated cover classes for the VDDT models. The Landfire raster data sets (Existing Vegetation Type, Biophysical Site Type, and Existing Vegetation Cover) best met our criteria and the general objective of the modeling effort. The above Landfire datasets were clipped to the combined Priority and General Habitat data for Idaho and Montana to serve as our vegetation basemaps for subsequent analysis.

#### GSG Habitat Characterization

To facilitate characterization of sage-grouse habitat classes we developed a crosswalk from Landfire Existing Vegetation Type (EVT) to a NVCS Macro-group characterization of Tall Sagebrush and Dwarf Sagebrush (See Table 1). For the purposes of this effort, the Semi-Desert Macro-group was included and merged into the Tall Sage Group. In addition we also identified the need for a Shallow/Dry Low Sagebrush Group. We used NRCS Soils Data (SSURGO) to identify a select group of ecological site types and associated soil conditions (shallow soils, precipitation zone  $\leq 12$  inches, small statured native grass spp)(Table 2). The process involved reclassifying any Tall Sage/Dwarf Sage pixels contained within the Shallow/Dry Low sage polygons to Shallow/Dry Low Sage. The resulting Macrogroup raster was combined (raster calculator) with the Landfire Existing Vegetation Cover data to categorize the following cover classes within the Tall Sage, Dwarf Sage, and Shallow/Dry Low sage groups (Class A = herbaceous cover 0-100%; Class B = shrub cover 10 – 30%; Class C = shrub cover  $>30\%$ ).

Conifer encroachment (Class D = tree cover  $>10\%$ ) was determined using 2 analyses: 1) identification of any Tall Sage, Dwarf Sage, or Shallow/Dry Low Sage occurring within the GSG Priority Habitat – Conifer Encroachment Category. The process involved reclassifying any Tall Sage/Dwarf Sage pixels contained within the Conifer Encroachment Category polygon to Class D; and 2) identification of pixels classified as Juniper and/or conifer in the Landfire EVT raster (see Table 2 for select types) that were also classified as a sagebrush habitat type in the Landfire Biophysical Site Potential (BPS)raster(See Table 3 for select types). The resulting rasters were combined, reclassified and added back to the base Macrogroup raster.

Soil temperature regime was selected as the primary filter to separate the lower productivity warm/dry sagebrush characterized by soil temperature regime-mesic (WYO Model) from the higher productivity cool moist sagebrush soil temperature regime – frigid (MTN Model). Specifically, we characterized NRCS SSURGO soil mapunits into 2 soil temperature groups, mesic and frigid/cryic

and converted the resulting polygon into a raster dataset. The resulting soil temperature raster was then combined (raster calculator) with the base Macrogroup raster to provide the habitat base for our WYO and MTN and MIX VDDT models. No soil temperature regime was evaluated for the Shallow/Dry Low sagebrush (LOW) model. Soil temp regime was used as it represents a finer-scale soils-based attribute important to ecological site characterization and is less variable than available precipitation information (PRISM). Soil temp regime information was not available on most USFS lands and a few smaller areas. In these locations, we used general elevation and precipitation information to describe general proportions of the soil temperature regimes.

Annual Grass – Landfire has a designated Invasive Annual Grass vegetation type (999), however subsequent updates (“refreshes”) had resulted in incorrect classification of numerous large fires as Invasive Annual Grass (999) within our vegetation analysis extent. Therefore, we reclassified any Landfire Invasive Annual Grass as Class A <10% cover and used the Landfire BPS to determine Tall or Dwarf sagebrush group assignment. To more accurately reflect Annual Grass (Class E) for our models we opted to use the Annual Grass (R2 Category) information available in the 2011 Idaho Sage-grouse Key Habitat data. R2 Areas represented in the Key Habitat data typically represent past fires in sagebrush habitat and associated multi-year monitoring of annual grass establishment in these areas. Annual Grass polygons were identified within our Sage-grouse Population boundaries and/or adjacent (out to 2 kilometers) to the GSG Priority/General habitat polygons. The resulting polygons were used as a mask to extract areas classified as a sagebrush habitat type in the Landfire Biophysical Site Potential (BPS) raster (See Table 3 for select types). The resulting raster was reclassified to appropriate VDDT Model and exported to excel for calculation of acreages for model Class E = Annual Grass. Environmental conditions across most of the Montana portion of the sub region afford limited suitability for annual grass establishment, and were not examined.

## Attachment B-Utah

### Development of Data for VDDT Sage Grouse Habitat Models

LANDFIRE data were used to define the vegetation cover types that occupy sage grouse population areas in Utah. In order to do this the LANDFIRE Existing Vegetation Type (EVT), Biophysical Setting (BPS), and/or BPS Groups were used as the basis to determine which cover types would be included in which models. Especially because Wyoming and mountain big sagebrush species are mapped at all elevations in LANDFIRE, it was felt that steps needed to be taken to separate these species on an ecological basis. Goodrich and others (1999) found that annual precipitation for **Wyoming big sagebrush** populations was **between 6.8 and 12.6 inches**. The authors found that **mountain big sagebrush** occurred in zones where annual precipitation was between **11.8 and 27.7 inches**. According to these authors, **plants intermediate to Wyoming and mountain big sagebrush** occur in areas with precipitation that ranges from **8.1 to 14.6 inches**. Their data suggested that the pinyon-juniper belt in Utah was between 9 and 15 inches of annual precipitation. Payne (1980) suggested that the Intermountain pinyon-juniper zone fell between 10 and 14 inches annual precipitation. The Utah BLM State Office has a precipitation GIS layer<sup>1</sup> that breaks the landscape into 0-2, 2-4, 4-6, etc. inch breaks, which didn't allow us to use the 9 or 15 inch levels in our analysis. For this reason, the following rules were established.

- ✓ Below 10 inches annual precipitation, all sagebrush was considered to be Wyoming big sagebrush;
- ✓ Anything between 10 inches (about 2 inches less than the minimum amount listed for mountain big sagebrush) and 14 inches (about 2 inches more than the maximum precipitation for Wyoming big sagebrush), was considered to be a transition zone where either species could possibly occur;
- ✓ Within that 10-14 inch zone, the LANDFIRE EVT (Existing Vegetation Type), BPS (Biophysical Setting), and/or Group types were used to make the determination regarding species that occur;
- ✓ Any sagebrush that occurred in the zones above 14 inches was considered to be mountain big sagebrush; and finally
- ✓ Low sagebrush was low sagebrush, regardless of the precipitation zone if occurred in.

Following these rules, the following sagebrush zones were established:

- ✓ Zone 1 – Precipitation  $\leq$  10 inches. Non-Seral Zone in which there is insufficient precipitation for juniper to grow. Wyoming big sagebrush is the only *big* sagebrush that can occur with this low amount of precipitation

---

<sup>1</sup> blm\dfs\ut\loc\GisData\ut\so\data\AirClimate\precip\_ut250

- ✓ Zone 2 – Precipitation 10-14 inches. Seral Zone in which there is sufficient precipitation for juniper to grow. In this transition zone, both Wyoming and mountain big sagebrush species can occur.
- ✓ Zone 3 – Precipitation 14-28 inches. Non-Seral Zone in which there is too much precipitation for juniper to be considered as a universal late seral species that replaces sagebrush. Only where juniper is the existing vegetation (EVT), what is considered a seral community. This zone is above where Wyoming big sagebrush is likely to occur, so all big sagebrush communities are considered to be mountain big sagebrush.
- ✓ Zone 4 – Precipitation  $\geq$  28 inches. Non-Seral Zone in which there is too much precipitation for juniper to be a late seral species. Only where juniper is the existing vegetation (EVT), what is considered a seral community. This is considered to be the cool, moist mountain big sagebrush zone.

Members of our GIS staff were able to combine (union) our EVT, BPS, and SClass (Cover Class) layers so that each polygon had the attributes needed to make the determinations needed for sage grouse habitat modeling. Then, the occupied habitat was selected from the layers that came out of this process, and were again unioned with a precipitation layer that broke the State into the zones listed above ( $\leq$ 10, 10-14, 14-28,  $\geq$ 28 inches). It was the combination of all this information that was used to determine which models to develop and apply for the VDDT habitat modeling process used in the sage grouse EIS.

## Attachment B-Nevada-California

### VDDT Modeling Procedures for Nevada

#### Vegetation Data

The Nevada team considered available vegetation layers to determine which would be most effective in identifying the sagebrush habitat types pertinent to the modeling effort. These included xxxxx The Nevada Heritage synthesis vegetation map (raster data) was selected as it provided the best resolution of sagebrush habitat types pertinent to the required model inputs. The plant cover report for the Humboldt Toiyabe National Forest Land Use Plan Revision (2005) served as a relevant proxy for distributing crown cover classes among the sagebrush types. Subpopulation areas were derived from the Western Association of Fish and Wildlife Agencies (Connelly et al 2004). Other BLM data included polygon data showing areas above 6,500 feet elevation, and fire history data which also included other sources.

The vegetation map was clipped using the sub population areas and the raster data converted to polygons. Vegetation types that didn't include Low Sage, Mountain Sage, Wyoming Sage, Pinyon pine, or juniper were deleted. All vegetation types that contained Mountain sage were merged into the Mountain sage classification. All vegetation types containing Wyoming sagebrush (minus any that had mountain sage) were merged into the Wyoming sagebrush classification. Low sage was handled the same (minus Wyoming and mountain sagebrush). All Pinyon and Juniper types were merged together..

All the fires since 2000 were combined. All the fires above 6,500 feet elevation were "erased" using the 6,500 foot elevation database under the assumption that habitat at these elevations would recover following fire. The remaining fires were used to "erase" any vegetation type under the fire perimeters. To define possible sage grouse habitat that had been burned, a lower elevation (1500 meters, or approx. 4,900 feet) was selected and all fire perimeters below this elevation were erased under the assumption that habitat conversion was occurring at these lower elevations. The fire perimeters were then inserted into the vegetation types as annual grasses. Total acres of all vegetation type was calculated using GIS. A dbase file type was exported for the next step.

Using the USFS crown cover report, percentages of crown cover by vegetation type were developed for each of the ranger districts. The adjacent or otherwise appropriate ranger district values were used for the subpopulation areas. In the absence of adjacent USFS crown cover information, fire histories, elevation, precipitation, and landform were considered to match similar USFS areas for the Montana Mountain and the CA/NV/OR subpopulation areas.

Low crown cover (<10%) for pinyon-juniper woodlands was considered as invasive conifer.

Total acres of low, mountain, and Wyoming sagebrush vegetation types were multiplied by the percentage of the low, medium, or high crown cover from the USFS crown cover report to develop crown class acreage starting points for the model, yielding total acres for each vegetation and crown cover classification.

Additionally, total acres of conifer invasion and annual grass conversion for each sagebrush vegetation type were calculated, based on the percent of each sagebrush type in each subpopulation area.

**Point Fire data**

Fire data was obtained from BLM Western Great Basin weather prediction meteorologist. Lat/long data were converted to decimal degree lat/long. Fires without spatial information were deleted. Fires with locational information outside of Nevada were removed. Locational data were spatially joined to sub population areas. The total sub population acres field was added and wildfire acres calculated for each subpopulation. The dbase file was imported into excel.

Administrative Draft  
Cooperating Agency Review

## Attachment B-Oregon

### Determining Acres of Each Sagebrush Group by Subpopulation

Vegetation data used came from the Integrated Landscape Assessment Project (ILAP), an American R and Recovery Act (ARRA)-funded project that, among other deliverables, provided a vegetation map of the semi-arid lands in Oregon and Washington. Louisa Evers and GIS staff Jeanne Keyes and Maria Fiorella in the Oregon State Office compared ILAP, LANDFIRE, and ReGAP vegetation layers to NAIP imagery to determine which layer best captured juniper and annual grasses. While all vegetation layers had relatively significant problems in identifying these two key vegetation types and the four layers compared at relatively low agreement between them, we determined that ILAP best captured the general extent of juniper encroachment and annual grasses.

Ideally, each sagebrush modeling group could be identified on the basis of soil moisture and temperature regime and ecological site description. However, lack of a complete soils layer and ecological site descriptions for eastern Oregon and the nature of the ILAP data table necessitated a non-spatial approach to determining which ILAP polygons belonged to which sagebrush modeling group and which successional class/community phase. The ILAP data table listed the four most common species and approximate canopy cover, although how these data were determined is not known. Certain species were used as indicators for which sagebrush group a given polygon belonged in and canopy cover was used to determine successional stage. Occasionally the indicators were ambiguous, requiring the use of professional judgment based on all four species. In a few cases, either the species or the canopy cover for that species was erroneous; either 1) it was not possible to determine which was in error or 2) it was clear that both were in error. For example, stiff sagebrush cannot reach >20% canopy cover given the type of sites it is associated with, so either the sagebrush species was misidentified or the canopy cover was.

### Sagebrush Groups

Cool-Moist sagebrush group indicators – mountain big sagebrush, antelope bitterbrush, Idaho fescue, Idaho fescue-bluebunch wheatgrass, cool and moist site indicator forbs

Warm-Dry sagebrush group indicators – Wyoming big sagebrush, basin big sagebrush, Thurber's needlegrass, needle-and-thread, bluebunch wheatgrass, bluebunch wheatgrass-Idaho fescue, crested wheatgrass

Shallow-Dry sagebrush group indicators – low sagebrush, stiff sagebrush, black sagebrush, bluegrass species

Because the sagebrush groups in Oregon are tied to site productivity, the sagebrush species was used in combination with the herbaceous species to determine group membership. For example, a polygon with either low sagebrush or Wyoming big sagebrush and Idaho fescue as the first and second species were assigned to the Cool-Moist group. Mountain big sagebrush and Thurber's needlegrass as the first and second species were assigned to the Warm-Dry group. Wyoming big sagebrush and Sandberg's bluegrass as the first and second species was assigned to the Shallow-Dry group.

Polygons with western juniper as the first or second species could be assigned to any sagebrush group, but the bias was to assign it to the Cool-Moist group. Juniper would be assigned to either of the other two groups based on the herbaceous layer (lack of high productivity indicators).

Polygons with annual grass as the first or second species could be assigned to any sagebrush group, but the bias was to assign it to the Warm-Dry group unless higher or lower productivity indicators were the first, second, or third species listed.

Polygons with salt-tolerant or halophytic species, willow, cottonwood, other conifer species, and wet meadow species were excluded.

### **Successional Classes**

Early Seral Class Indicators: sagebrush cover is <10% or sagebrush is not listed. Rabbitbrush may be the first or second species listed. Juniper and annual grasses either not listed or present only in trace amounts.

Mid-seral Class Indicators: sagebrush cover is 10-30%, juniper not listed or present only in trace amounts. Annual grasses the third or fourth species listed. This class includes at-risk community phases for annual grasses.

Late Seral Class Indicators: sagebrush cover >30% in the Cool-Moist and Warm Dry Sagebrush groups, >10% in the Shallow-Dry group. Juniper and annual grasses either not listed or the third or fourth species listed. This class includes Phase I juniper and at-risk community phases for annual grasses.

Late Seral with Conifer Class Indicators: Juniper the first or second species listed; sagebrush may or may not be present and cover is variable. Annual grasses may or may not be present. This class includes Phase II and Phase III juniper encroachment and old growth juniper.

Annual Grass Class Indicators: Annual grasses the first or second species listed.

Exotic Perennial Grass Class Indicators: Crested wheatgrass the first or second species listed. This class not used in the final models.

## Greater Sage-grouse Habitat Characterization for Use in Non-Spatial Vegetation Modeling across the Great Basin

<sup>1</sup>Sundance Consulting Inc., Boise, Idaho

<sup>2</sup>USFS

<sup>3</sup>USFS

### Vegetation Data

We evaluated available vegetation information developed for the Greater Sage-grouse Regional and Sub-regional efforts to identify the sagebrush habitat types and associated vegetation cover classes required in our modeling effort. We determined the most effective approach would incorporate the following criteria: 1) dataset covers the entire western region, 2) the vegetation data has an associated accuracy assessment, and 3) data provides appropriate resolution of sagebrush habitat types and associated cover classes for the VDDT models. The baseline vegetation data sets developed for the region-wide Disturbance Monitoring and Vegetation Basemap Team (\*\*\*) met these criteria. The datasets were developed using Landfire v12 (updated through 2010) data products and consisted of 1) existing sagebrush base, 2) conifer base, 3) potential sagebrush base (for details on methodology see Appendix – Vegetation Basemap in Disturbance Monitoring Report). In addition, we used Landfire v12 Existing Vegetation Type to identify Invasive Annual grass and Introduced Crested Seedings. Existing Vegetation Cover was used to identify sage-grouse cover class characteristics required for the modeling effort. The above datasets were combined and clipped to BLM and USFS ownership within each Sub-regional Area (Oregon, Idaho/Montana, Utah, Nevada/California) to serve as our sagebrush modeling basemaps for subsequent analysis.

### GSG Habitat Characterization for Vegetation Models

We modified the sagebrush modeling basemap to facilitate characterization of sage-grouse habitat and associated development classes identified in our models. We modified the Soil Moisture and Temperature Regime data (Chambers et al 2014, Fire and Invasives Team Report, 2014) to identify 4 Vegetation Model Types – Warm/Dry sagebrush, Mixed sagebrush, Mountain sagebrush w/conifer, and Mountain sagebrush no conifer (Table 1). In addition we identified the need for a Low Sagebrush Group. We used the Landfire v12 Biophysical Settings dataset and selected low sagebrush vegetation groups (Table 2). The resulting Model Group raster was combined (raster calculator) with the Landfire Existing Vegetation Cover data to categorize the following cover classes within the Low sage [LOW], Warm/Dry Sage[WARM/DRY], Mixed Sage[MIX], Mountain Sage w/ conifer[MTN7], and Mountain sage no conifer[MTN8] (Class A = herbaceous cover 0-100%; Class B = shrub cover 10 – 30%; Class C = shrub cover >30%). To identify Annual Grass and Crested Seeding, we assigned any Landfire Introduced Upland Vegetation -Annual Grassland (evt code 3181) or – Perennial Grassland Forbland (evt code 3182) that had a sagebrush site potential to Class Invasive Annual and Class CWG Seeding, respectively. Conifer encroachment (Class D = tree cover >10%) was determined using the Conifer base dataset subset to areas with

sagebrush site potential. The resulting rasters were combined, reclassified and added back to the base Model Group raster.

Soil Moisture Temperature information was limited in some higher elevation areas or shrubland-forest transitional areas. Therefore we incorporated 30 year average annual precipitation data (PRISM ppt 30yr normal 800mm annual) to inform any unclassified sagebrush pixels in our Model Group dataset. Specifically, we set the following criteria: Average annual precipitation 14 – 28 inches = MTN7; Average annual precipitation  $\geq$  28 inches = MTN8. Results were reclassified and added back to the base Model Group raster.

### **Additional Filters**

To provide a biologically meaningful geographic extent, we filtered the final sagebrush modeling basemap to Greater sage-grouse population Areas and associated Priority Areas for Conservation (PACs) from the Conservation Objectives Team Report (USFWS, 2014). The above datasets were combined and clipped to BLM and USFS ownership within each Sub-regional Area (Oregon, Idaho/Montana, Utah, Nevada/California) to serve as our sagebrush modeling basemaps for subsequent acreage reporting and analysis.

Administrative Draft  
Cooperating Agency Review

Table 1 – VDDT Model Groups associated with predominant sagebrush ecological types in Sage-Grouse Management Zones III, IV, V, and VI based on soil temperature and soil moisture regimes, typical characteristics, and resilience to disturbance and resistance to invasive annual grasses (modified from Chambers et al. 2014, Miller et al. 2014 a,b).

Ecological type	Characteristics	VDDT Model
Cold and Moist (Cryic/Xeric)	Ppt: 14 inches + Typical shrubs: <i>Mountain big sagebrush, snowfield sagebrush, snowberry, serviceberry, silver sagebrush, and/ or low sagebrushes</i>	MTN8, LOW
Cool and Moist (Frigid/Xeric)	Ppt: 12-22 inches Typical shrubs: <i>Mountain big sagebrush, antelope bitterbrush, snowberry, and/ or low sagebrushes</i> Piñon pine and juniper potential in some areas	MTN7, LOW
Warm and Moist (Mesic/Xeric)	Ppt: 12-16 inches Typical shrubs: <i>Wyoming big sagebrush, mountain big sagebrush, Bonneville big sagebrush, and/ or low sagebrushes</i> Piñon pine and juniper potential in some areas	MIX, LOW
Cool and Dry (Frigid/Aridic)	Ppt: 6-12 inches Typical shrubs: <i>Wyoming big sagebrush, black sagebrush, and/ or low sagebrushes</i>	WARM/DRY, LOW
Warm and Dry (Mesic/Aridic, bordering on Xeric)	Precipitation: 8-12 inches Typical shrubs: <i>Wyoming big sagebrush, black sagebrush and/ or low sagebrushes</i>	WARM/DRY, LOW

Table 2 – Landfire 120 Potential Vegetation Types identified for the Greater Sage-grouse LOW Sagebrush model.

BPS Value	Landfire Potential Vegetation Type
10640	Colorado Plateau Mixed Low Sagebrush Shrubland
10650	Columbia Plateau Scabland Shrubland
10790	Great Basin Xeric Mixed Sagebrush Steppe
11240	Columbia Plateau Low Sagebrush Steppe
11262	Inter-Mountain Basins Montane Sagebrush Steppe - Low

### Datasets Used in the Vegetation Analysis

*From Disturbance Monitoring and Baseline Vegetation Teams (Spring 2014)*

*Landfire 18 Class EVT* (Current) related to sagebrush systems [dataset:  
lf\_evt\_v12\_sagebrush\_recode]

*Landfire BPS* (Potential) Associated with the 18 Class EVT above [dataset:  
lf\_bps\_v12\_sagebrush\_recode]

Binary Landfire 18 Class informed w Dev/Ag/Fires/Conif-sage [dataset:  
2010\_existing\_sagebrush\_base]

Binary Conifer in Sage (near neighbor analysis w/ State bio acceptance) [dataset:  
lf\_evt\_v12\_conifers\_binary]

### **Data from Fire/Invasives (FIAT) Team**

SSURGO Soil Temperature/Moisture Regimes (Chambers et al 2014)

[dataset: SGMZ\_SSURGO\_temp\_moist\_regimes\_v2.gdb]

### **Additional spatial data**

Landfire Annual Grass Only [dataset: ]

Landfire EVC (Cover) associated w/ the above Landfire Binary Sagebrush Basemap [dataset:

<sup>1</sup> Non-labor income includes dividends, interest, and rent and personal current transfer receipts.

<sup>2</sup> Personal current transfer receipts are benefits received by persons for which no current services are performed. They are payments by government and business to individuals and institutions, such as retirement and disability insurance benefits.

<sup>3</sup> Residence adjustment represents the net inflow of the earnings of inter-area commuters. A positive number indicates that, on balance, area residents commute outside to find jobs; a negative number indicates that, on balance, people from outside the area commute in to find jobs.

<sup>4</sup> Contributions for government social insurance consist of payments by employers, employees, the self-employed, and other individuals who participate in the following government programs: Old-age, Survivors, and Disability Insurance; Medicare; unemployment insurance; railroad retirement; pension benefit guarantee; veterans' life insurance; publicly-administered workers' compensation; military medical insurance; and temporary disability insurance.

<sup>5</sup> Earnings by place of work differs from total personal income by the exclusion of dividends, interest, and rent, as well as adjustments to account for net transfer payments (e.g., unemployment benefits and Social Security taxes and payments) and the residential adjustment.

<sup>6</sup> (D) Not shown to avoid disclosure of confidential information, but the estimates for this item are included in the totals.

<sup>7</sup> (L) Less than \$50,000, but the estimates for this item are included in the totals.

<sup>8</sup> "Related activities" includes hunting and trapping, as well as agricultural services such as custom tillage.

<sup>1</sup> Fremont County includes Yellowstone Park.

<sup>2</sup> Non-labor income includes dividends, interest, and rent and personal current transfer receipts.

<sup>3</sup> Personal current transfer receipts are benefits received by persons for which no current services are performed. They are payments by government and business to individuals and institutions, such as retirement and disability insurance benefits.

<sup>4</sup> Residence adjustment represents the net inflow of the earnings of inter-area commuters. A positive number indicates that, on balance, area residents commute outside to find jobs; a negative number indicates that, on balance, people from outside the area commute in to find jobs.

<sup>5</sup> Contributions for government social insurance consist of payments by employers, employees, the self-employed, and other individuals who participate in the following government programs: Old-age, Survivors, and Disability Insurance; Medicare; unemployment insurance; railroad retirement; pension benefit guarantee; veterans' life insurance; publicly-administered workers' compensation; military medical insurance; and temporary disability insurance.

<sup>6</sup> Earnings by place of work differs from total personal income by the exclusion of dividends, interest, and rent, as well as adjustments to account for net transfer payments (e.g., unemployment benefits and Social Security taxes and payments) and the residential adjustment.

<sup>7</sup> (D) Not shown to avoid disclosure of confidential information, but the estimates for this item are included in the totals.

<sup>8</sup> (L) Less than \$50,000, but the estimates for this item are included in the totals.

<sup>9</sup> "Related activities" includes hunting and trapping, as well as agricultural services such as custom tillage.

<sup>1</sup> Fremont County includes Yellowstone Park.

<sup>2</sup> Non-labor income includes dividends, interest, and rent and personal current transfer receipts.

<sup>3</sup> Personal current transfer receipts are benefits received by persons for which no current services are performed. They are payments by government and business to individuals and institutions, such as retirement and disability insurance benefits.

<sup>4</sup> Residence adjustment represents the net inflow of the earnings of inter-area commuters. A positive number indicates that, on balance, area residents commute outside to find jobs; a negative number indicates that, on balance, people from outside the area commute in to find jobs.

<sup>5</sup> Contributions for government social insurance consist of payments by employers, employees, the self-employed, and other individuals who participate in the following government programs: Old-age, Survivors, and Disability Insurance; Medicare; unemployment insurance; railroad retirement; pension benefit guarantee; veterans' life insurance; publicly-administered workers' compensation; military medical insurance; and temporary disability insurance.

<sup>6</sup> Earnings by place of work differs from total personal income by the exclusion of dividends, interest, and rent, as well as adjustments to account for net transfer payments (e.g., unemployment benefits and Social Security taxes and payments) and the residential adjustment.

<sup>7</sup> (D) Not shown to avoid disclosure of confidential information, but the estimates for this item are included in the totals.

<sup>8</sup> (L) Less than \$50,000, but the estimates for this item are included in the totals.

<sup>9</sup> "Related activities" includes hunting and trapping, as well as agricultural services such as custom tillage.

Administrative Draft  
Cooperating Agency Review

<sup>1</sup> Ada, Bannock, Boise, and Canyon Counties in Idaho and Gallatin and Silver Bow Counties in Montana constitute a secondary study area, as documented in the Chapter 3 text.

## Appendix XXX

### Greater Sage-Grouse (GRSG) Disturbance Caps

In the USFWS's 2010 listing decision for sage-grouse, the USFWS identified 18 threats contributing to the destruction, modification, or curtailment of the sage-grouse's habitat or range (75 FR 13910 2010). The 18 threats have been aggregated into three measures:

- Sagebrush Availability (percent of sagebrush per unit area)
- Habitat Degradation (percent of human activity per unit area)
- Density of Energy and Mining (facilities and locations per unit area)

Habitat Degradation and Density of Energy and Mining will be evaluated under the Disturbance Cap and Density Cap respectively and are further described in this appendix. The three measures, in conjunction with other information, will be considered during the NEPA process for projects authorized or undertaken by the BLM.

#### Disturbance Cap:

This land use plan has incorporated a 3% disturbance cap within Greater Sage-Grouse (GRSG) Priority Habitat Management Areas (PHMAs) and the subsequent land use planning actions if the cap is met:

*If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSG Priority Habitat Management Areas (PHMA) in any given Biologically Significant Unit (BSU), then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.) will be permitted by BLM within GRSG PHMAs in any given BSU until the disturbance has been reduced to less than the cap.*

*If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a PHMA, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain the area under the cap (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.).*

The disturbance cap applies to the PHMA within both the Biologically Significant Units (BSU) and at the project authorization scale. For the BSUs, west-wide habitat degradation (disturbance) data layers (Table 1) will be used at a minimum to calculate the amount of disturbance and to determine if the disturbance cap has been exceeded as the land use plans (LUP) are being implemented. Locally collected disturbance data will be used to determine if the disturbance cap has been exceeded for project authorizations, and may also be used to calculate the amount of disturbance in the BSUs.

Although locatable mine sites are included in the degradation calculation, mining activities under the 1872 mining law may not be subject to the 3% disturbance cap. Details about locatable mining activities will be fully disclosed and analyzed in the NEPA process to assess impacts to sage-grouse and their habitat as well as to BLM goals and objectives, and other BLM programs and activities.

Formulas for calculations of the amount of disturbance in the PHMA in a BSU and or in a proposed project area are as follows:

- For the BSUs:

$$\text{\% Degradation Disturbance} = (\text{combined acres of the 12 degradation threats}^1) \div (\text{acres of all lands within the PHMAs in a BSU}) \times 100.$$

- For the Project Analysis Area:

$$\text{\% Degradation Disturbance} = (\text{combined acres of the 12 degradation threats}^1 \text{ plus the 7 site scale threats}^2) \div (\text{acres of all lands within the PHMA in the project analysis area}) \times 100.$$

<sup>1</sup> see Table 1. <sup>2</sup> see Table 2

The denominator in the disturbance calculation formula consists of all acres of lands classified as PHMA within the analysis area (BSU or project area). Areas that are not sage-grouse seasonal habitats, or are not currently supporting sagebrush cover (e.g., due to wildfire), are not excluded from the acres of PHMA in the denominator of the formula. Information regarding sage-grouse seasonal habitats, sagebrush availability, and areas with the potential to support sage-grouse populations will be considered along with other local conditions that may affect sage-grouse during the analysis of the proposed project area.

#### Density Cap:

This land use plan has also incorporated a cap on the density of energy and mining facilities at an average of one facility per 640 acres in the PHMA in a project authorization area. If the disturbance density in the PHMA in a proposed project area is on average less than 1 facility per 640 acres, the analysis will proceed through the NEPA process incorporating mitigation measures into an alternative. If the disturbance density is greater than an average of 1 facility per 640 acres, the proposed project will either be deferred until the density of energy and mining facilities is less than the cap or co-located it into existing disturbed area (subject to applicable laws and regulations, such as the 1872 Mining Law, valid existing rights, etc.). Facilities included in the density calculation (Table 3) are:

- Energy (oil and gas wells and development facilities)

- Energy (coal mines)
- Energy (wind towers)
- Energy (solar fields)
- Energy (geothermal)
- Mining (active locatable, leasable, and saleable developments)

Project Analysis Area Method for Permitting Surface Disturbance Activities:

- Determine potentially affected occupied leks by placing a four mile boundary around the proposed area of physical disturbance related to the project. All occupied leks located within the four mile project boundary and within PHMA will be considered affected by the project.
- Next, place a four mile boundary around each of the affected occupied leks.
- The PHMA within the four mile lek boundary and the four mile project boundary creates the project analysis area for each individual project. If there are no occupied leks within the four-mile project boundary, the project analysis area will be that portion of the four-mile project boundary within the PHMA.
- Digitize all existing anthropogenic disturbances identified in Table 1 and the 7 additional features that are considered threats to sage-grouse (Table 2). Using 1 meter resolution NAIP imagery is recommended. Use existing local data if available.
- Calculate percent existing disturbance using the formula above. If existing disturbance is less than 3%, proceed to next step. If existing disturbance is greater than 3%, defer the project.
- Add proposed project disturbance footprint area and recalculate the percent disturbance. If disturbance is less than 3%, proceed to next step. If disturbance is greater than 3%, defer project.
- Calculate the disturbance density of energy and mining facilities (listed above). If the disturbance density is less than 1 facility per 640 acres, averaged across project analysis area, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than 1 facility per 640 acres, averaged across the project analysis area, either defer the proposed project or co-locate it into existing disturbed area.
- If a project that would exceed the degradation cap or density cap cannot be deferred due to valid existing rights or other existing laws and regulations, fully disclose the local and regional impacts of the proposed action in the associated NEPA.

Table 1. Anthropogenic disturbance types for disturbance calculations. Data sources are described for the west-wide habitat degradation estimates (Table copied from the GRSG Monitoring Framework)

<b>Degradation Type</b>	<b>Subcategory</b>	<b>Data Source</b>	<b>Direct Area of Influence</b>	<b>Area Source</b>
<b>Energy (oil &amp; gas)</b>	Wells	IHS; BLM (AFMSS)	5.0ac (2.0ha)	BLM WO-300

## Attachment IV

### **Greater Sage-Grouse (GRSG) Land Use Plans Disturbance Caps Guidance**

#### **Purpose**

- I. Provide the planning units with land use planning actions that need to be incorporated into the administrative draft proposed plans to respond to the 3% disturbance cap once it is exceeded in either the Biologically Significant Units (BSU) or at the project scale.
- II. Provide guidance on the use of the west-wide habitat degradation (disturbance) data layers as well as the use of locally collected disturbance data for BSUs to determine if the disturbance cap has been exceeded as the land use plans (LUP) are being implemented.
- III. Provide guidance on the use of locally collected disturbance data for project authorizations to determine if the disturbance cap has been exceeded as the LUPs are being implemented.
- IV. Provide guidance on the inclusion of fire in disturbance calculations.
- V. Provide guidance on the use of the density of energy and mining facilities during authorizations
- VI. Provide guidance on the use of the BER analysis in the land use plans (Chapter 2, Affected Environment) and the use of the “west-wide” sagebrush availability and habitat degradation data/estimates for the Priority Habitat Management Areas in each population for monitoring and management purposes as the LUPs are being implemented.
- VII. Provide guidance on what is considered in the disturbance calculations versus what is considered for the disturbance cap.

#### **Guidance**

- I. Planning units will include the following land use plan actions within their administrative draft proposed land use plans (ADPPs) that states:
  - a. *If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.) will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.*
  - b. *If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a Priority Habitat Management Areas, then no further anthropogenic disturbance will be permitted by BLM until*

*disturbance in the proposed project analysis area has been reduced to maintain the area under the cap (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.).*

- II. Use of west-wide habitat degradation data as well as the use of locally collected disturbance data to determine the level of existing disturbance:
  - a) In the GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, use the west-wide data at a minimum and/or locally collected disturbance data as available (e.g., DDCT) for the anthropogenic disturbance types listed in Table 1.
- III. Use of locally collected disturbance data for project authorizations:
  - a) In a proposed project analysis area, digitize all existing anthropogenic disturbances identified in the GRSG Monitoring Framework and the 7 additional features that are considered threats to sage-grouse (Table 2). Using 1 meter resolution NAIP imagery is recommended. Use local data if available.
- IV. Fire-burned and habitat treatment areas will not be included in the project scale degradation disturbance calculation for managing sage-grouse habitat under a disturbance cap. These areas will be considered part of a sagebrush availability when rangewide, consistent, interagency fine- and site-scale monitoring has been completed and the areas have been determined to meet sage-grouse habitat requirements. These and other disturbances identified in Table 3 will be part of a sagebrush availability evaluation and will be considered along with other local conditions that may affect sage-grouse during the analysis of the proposed project area.
- V. Planning units are directed to use a density cap related to the density of energy and mining facilities (listed below) during project scale authorizations. If the disturbance density in a proposed project area is on average less than 1/ 640 acres, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than an average of 1/ 640 acres, either defer the proposed project or co-locate it into existing disturbed area (*subject to applicable laws and regulations, such as the 1872 Mining Law, valid existing rights, etc.*).
  - Energy (oil and gas wells and development facilities)
  - Energy (coal mines)
  - Energy (wind towers)
  - Energy (solar fields)
  - Energy (geothermal)
  - Mining (active locatable, leasable, and saleable developments)

- VI. Planning units are directed to continue using the baseline data from the 2013 USGS Baseline Environmental Report (BER) in the Affected Environment section of the proposed plans/ FEISs. West-wide sagebrush availability and habitat degradation data layers will be used for the Priority Habitat Management Areas in each population for monitoring (see the GRSG Monitoring Framework in the Monitoring Appendix of the EIS) and management purposes as the LUPs are being implemented. The BER reported on individual threats across the range of sage-grouse while the west-wide disturbance calculation consolidated the anthropogenic disturbance data into a single measure using formulas from the GRSG Monitoring Framework. These calculations will be completed on an annual basis by the BLM's National Operation Center. Planning units will be provided the 2014 baseline disturbance calculation derived from the west-wide data once the RODs are signed that describe the Priority Habitat Management Areas.
- VII. Planning units are directed to use the three measures (sagebrush availability, habitat degradation, density of energy and mining) in conjunction with other information during the NEPA process to most effectively site project locations, such as by clustering disturbances and/or locating facilities in already disturbed areas. Although locatable mine sites are included in the degradation calculation, mining activities under the 1872 mining law may not be subject to the 3% disturbance cap. Details about locatable mining activities should be fully disclosed and analyzed in the NEPA process to assess impacts to sage-grouse and their habitat as well as to BLM goals and objectives, and other BLM programs and activities.

### **Additional Information/Formulas**

A collaborative effort in Idaho developed a disturbance calculation method that includes the 3% disturbance cap plus a modifier that includes effective habitat and is described in Appendix G of their ADPP. The formulas below are excerpted from that Appendix.

Disturbance Calculations for the BSU-BSUs and for the Project Analysis Areas:

$$\begin{aligned}
 & \text{Disturbance Percentage} \\
 & = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}^1}{\text{Acres within the BSU} * \left( \frac{\text{Acres of Effective Habitat within the BSU}}{\text{Acres within the BSU}} + 0.3 \right)} \right) \times 100
 \end{aligned}$$

Disturbance Calculations for Project Analysis Areas:

*Disturbance Percentage*

$$= \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}^{1,2}}{\text{Acres within the Project Area} * \left( \frac{\text{Acres of Effective Habitat within the BSU}}{\text{Acres within the BSU}} + 0.3 \right)} \right) \times 100$$

- ~~For the BSUs: % Degradation Disturbance = (combined acres of the 12 degradation threats\*) ÷ (acres of all lands within the PHMAs in a BSU) x 100.~~
- ~~For the Project Analysis Area: % Degradation Disturbance = (combined acres of the 12 degradation threats<sup>1</sup> plus the 7 site scale threats<sup>2</sup>) ÷ (acres of all lands within the project analysis area in the PHMA) x 100.~~

~~<sup>1</sup> see Table 3. <sup>2</sup> see Table 2~~

~~<sup>1</sup> see Table 3. <sup>2</sup> see Table 2.~~

Project analysis area method for permitting surface disturbance activities:

- Draw the project analysis area polygon which consists of a 4 mile buffer around the proposed project footprint ~~plus plus~~ all of the areas within a 4 mile buffer from nearby leks if those lek buffers intersected the project buffer by any 4 mile buffers from nearby leks. In areas with or mapped or modeled seasonal-nesting habitats, the areas to be included in the project analysis area are the mapped/modeled habitat within 4 miles beyond the project 4 mile buffer.
- Map disturbances or use locally available data. Use of NAIP imagery is recommended.
- Calculate percent existing disturbance using the formula above. If existing disturbance is less than 3%, proceed to next step. If existing disturbance is greater than 3%, defer the project.
- Add proposed project disturbance footprint area and recalculate the percent disturbance. If disturbance is less than 3%, proceed to next step. If disturbance is greater than 3%, defer project.
- Calculate the disturbance density of energy and mining facilities (listed above). If the disturbance density is less than 1 facility per 640 acres, averaged across project analysis area, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than 1 facility per 640 acres, averaged across the project analysis area, either defer the proposed project or co-locate it into existing disturbed area.
- If a project that would exceed the degradation cap or density cap cannot be deferred due to valid existing rights or other existing laws and regulations, fully disclose the local and regional impacts of the proposed action in the associated NEPA.

## **Background**

In the USFWS's 2010 listing decision for sage-grouse, the USFWS identified 18 threats contributing to the destruction, modification, or curtailment of the sage-grouse's habitat or range (75 FR 13910 2010). In April 2014, the Interagency GRSG Disturbance and Monitoring Sub-Team finalized the Greater Sage-Grouse Monitoring Framework (hereafter, framework) to track these threats. The 18 threats have been aggregated into three measures to account for whether the threat predominantly removes sagebrush or degrades habitat. The three measures are:

Measure 1: Sagebrush Availability (percent of sagebrush per unit area)

Measure 2: Habitat Degradation (percent of human activity per unit area)

Measure 3: Density of Energy and Mining (facilities and locations per unit area)

The BLM is committed to monitoring the three disturbance measures and reporting them to the FWS on an annual basis. However, for the purposes of calculating the amount of disturbance to provide information for management decisions and inform the success of the sage-grouse planning effort, the data depicting the location and extent of the 12 anthropogenic types of threats will be used at a minimum in the BSUs and those same 12 anthropogenic and the additional 7 types of features that are threats to sage-grouse will be used in the project analysis areas.

		Scales

**ACRONYMS**

PHMA = Priority Habitat Management Area      BSU = Biologically Significant Unit  
 EVT = Existing Vegetation Type                BpS = Areas of Biotic Potential

<sup>1</sup> Only mines with a Plan of Operation (>5 acres of disturbance) will be included.  
<sup>2</sup> Westwide data will be used only if state or local data are not available.  
<sup>3</sup> A 5% disturbance cap will be allowed in Wyoming.  
<sup>4</sup> This may be one of several variables used to inform Adaptive Management. The BSU is the scale at which Adaptive Management will be applied.  
<sup>5</sup> A moving window analysis will be conducted at this scale by the NOC using westwide data. If available, state and local data/analysis should be used for Adaptive Management  
<sup>6</sup> The analysis area will be based on a 4-mile project area, 4-mile buffers around leks/lek complexes, or other seasonal habitat, and clipped to sage-grouse habitat and PHMA (DDCT methodology).  
<sup>7</sup> See Table 2

*For Idaho BLM*

Attachment IV

**Greater Sage-Grouse (GRSG) Land Use Plans  
Disturbance Caps Guidance**

**Purpose**

- I. Provide the planning units with land use planning actions that need to be incorporated into the administrative draft proposed plans to respond to the 3% disturbance cap once it is exceeded in either the Biologically Significant Units (BSU) or at the project scale.
- II. Provide guidance on the use of the west-wide habitat degradation (disturbance) data layers as well as the use of locally collected disturbance data for BSUs to determine if the disturbance cap has been exceeded as the land use plans (LUP) are being implemented.
- III. Provide guidance on the use of locally collected disturbance data for project authorizations to determine if the disturbance cap has been exceeded as the LUPs are being implemented.
- IV. Provide guidance on the inclusion of fire in disturbance calculations.
- V. Provide guidance on the use of the density of energy and mining facilities during authorizations
- VI. Provide guidance on the use of the BER analysis in the land use plans (Chapter 2, Affected Environment) and the use of the “west-wide” sagebrush availability and habitat degradation data/estimates for the Priority Habitat Management Areas in each population for monitoring and management purposes as the LUPs are being implemented.
- VII. Provide guidance on what is considered in the disturbance calculations versus what is considered for the disturbance cap.

**Guidance**

- I. Planning units will include the following land use plan actions within their administrative draft proposed land use plans (ADPPs) that states:
  - a. *If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.) will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.*
  - b. *If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a Priority Habitat Management Areas, then no further anthropogenic disturbance will be permitted by BLM until*

*disturbance in the proposed project analysis area has been reduced to maintain the area under the cap (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.).*

- II. Use of west-wide habitat degradation data as well as the use of locally collected disturbance data to determine the level of existing disturbance:
  - a) In the GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, use the west-wide data at a minimum and/or locally collected disturbance data as available (e.g., DDCT) for the anthropogenic disturbance types listed in Table 1.
- III. Use of locally collected disturbance data for project authorizations:
  - a) In a proposed project analysis area, digitize all existing anthropogenic disturbances identified in the GRSG Monitoring Framework and the 7 additional features that are considered threats to sage-grouse (Table 2). Using 1 meter resolution NAIP imagery is recommended. Use local data if available.
- IV. Fire-burned and habitat treatment areas will not be included in the project scale degradation disturbance calculation for managing sage-grouse habitat under a disturbance cap. These areas will be considered part of a sagebrush availability when rangewide, consistent, interagency fine- and site-scale monitoring has been completed and the areas have been determined to meet sage-grouse habitat requirements. These and other disturbances identified in Table 3 will be part of a sagebrush availability evaluation and will be considered along with other local conditions that may affect sage-grouse during the analysis of the proposed project area.
- V. Planning units are directed to use a density cap related to the density of energy and mining facilities (listed below) during project scale authorizations. If the disturbance density in a proposed project area is on average less than 1/ 640 acres, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than an average of 1/ 640 acres, either defer the proposed project or co-locate it into existing disturbed area (*subject to applicable laws and regulations, such as the 1872 Mining Law, valid existing rights, etc.*).
  - Energy (oil and gas wells and development facilities)
  - Energy (coal mines)
  - Energy (wind towers)
  - Energy (solar fields)
  - Energy (geothermal)
  - Mining (active locatable, leasable, and saleable developments)

- VI. Planning units are directed to continue using the baseline data from the 2013 USGS Baseline Environmental Report (BER) in the Affected Environment section of the proposed plans/ FEISs. West-wide sagebrush availability and habitat degradation data layers will be used for the Priority Habitat Management Areas in each population for monitoring (see the GRSG Monitoring Framework in the Monitoring Appendix of the EIS) and management purposes as the LUPs are being implemented. The BER reported on individual threats across the range of sage-grouse while the west-wide disturbance calculation consolidated the anthropogenic disturbance data into a single measure using formulas from the GRSG Monitoring Framework. These calculations will be completed on an annual basis by the BLM's National Operation Center. Planning units will be provided the 2014 baseline disturbance calculation derived from the west-wide data once the RODs are signed that describe the Priority Habitat Management Areas.
- VII. Planning units are directed to use the three measures (sagebrush availability, habitat degradation, density of energy and mining) in conjunction with other information during the NEPA process to most effectively site project locations, such as by clustering disturbances and/or locating facilities in already disturbed areas. Although locatable mine sites are included in the degradation calculation, mining activities under the 1872 mining law may not be subject to the 3% disturbance cap. Details about locatable mining activities should be fully disclosed and analyzed in the NEPA process to assess impacts to sage-grouse and their habitat as well as to BLM goals and objectives, and other BLM programs and activities.

### **Additional Information/Formulas**

A collaborative effort in Idaho developed a disturbance calculation method that includes the 3% disturbance cap plus a modifier that includes effective habitat and is described in Appendix G of their ADPP. The formulas below are excerpted from that Appendix.

Disturbance Calculations for the BSU:

$$\begin{aligned}
 & \text{Disturbance Percentage} \\
 & = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}^1}{\text{Acres within the BSU} * \left( \frac{\text{Acres of Effective Habitat within the BSU}}{\text{Acres within the BSU}} + 0.3 \right)} \right) \times 100
 \end{aligned}$$

Disturbance Calculations for Project Analysis Areas (PAAs):

$$\text{Disturbance Percentage} = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}^{1,2}}{\text{Acres within the PAA} * \left( \frac{\text{Acres of Effective Habitat within the PAA}}{\text{Acres within the PAA}} + 0.3 \right)} \right) \times 100$$

<sup>1</sup> see Table 3. <sup>2</sup> see Table 2.

Project analysis area (PAA) method for permitting surface disturbance activities:

1. Determine potentially affected occupied leks by placing a four-mile buffer around the project boundary as defined by the proposed area of physical disturbance related to the project. All occupied leks within this buffer will be considered affected by the proposed project.
2. Next place a four mile boundary around each of the occupied leks identified in item 1, above.
3. The polygon formed by the merging and dissolving of polygons from step 1 and 2 creates the Project Analysis Area (PAA) for surface disturbance activities.
4. Map existing disturbances within the analysis area or use locally available spatial data. Use of digitized NAIP imagery is recommended.
5. Calculate percent existing disturbance using the formula above. If existing disturbance is less than 3%, proceed to next step. If existing disturbance is greater than 3%, defer the project.
6. Add proposed project disturbance footprint area and recalculate the percent disturbance. If disturbance is less than 3%, proceed to next step. If disturbance is greater than 3%, defer project.
7. Calculate the disturbance density of energy and mining facilities (listed above). If the disturbance density is less than 1 facility per 640 acres, averaged across project analysis area, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than 1 facility per 640 acres, averaged across the project analysis area, either defer the proposed project or co-locate it into existing disturbed area.
8. If a project that would exceed the degradation cap or density cap cannot be deferred due to valid existing rights or other existing laws and regulations, fully disclose the local and regional impacts of the proposed action in the associated NEPA.

Table 1. Anthropogenic disturbance types for disturbance calculations. Data sources are described for the west-wide habitat degradation estimates (Table copied from the GRSG Monitoring Framework)

## **Background**

In the USFWS's 2010 listing decision for sage-grouse, the USFWS identified 18 threats contributing to the destruction, modification, or curtailment of the sage-grouse's habitat or range (75 FR 13910 2010). In April 2014, the Interagency GRSG Disturbance and Monitoring Sub-Team finalized the Greater Sage-Grouse Monitoring Framework (hereafter, framework) to track these threats. The 18 threats have been aggregated into three measures to account for whether the threat predominantly removes sagebrush or degrades habitat. The three measures are:

Measure 1: Sagebrush Availability (percent of sagebrush per unit area)

Measure 2: Habitat Degradation (percent of human activity per unit area)

Measure 3: Density of Energy and Mining (facilities and locations per unit area)

The BLM is committed to monitoring the three disturbance measures and reporting them to the FWS on an annual basis. However, for the purposes of calculating the amount of disturbance to provide information for management decisions and inform the success of the sage-grouse planning effort, the data depicting the location and extent of the 12 anthropogenic types of threats will be used at a minimum in the BSUs and those same 12 anthropogenic and the additional 7 types of features that are threats to sage-grouse will be used in the project analysis areas.

Same as SR minus 3% threshold. NEED TO DETERMINE HOW TO ADDRESS THE 3% DISTURBANCE THRESHOLD. If the 3% disturbance is analyzed under the NTT alternative, does it have to be here?

Same as Sub Regional PPH and PGH  
DFO PPH same as sub-region Core and DFO PGH same as SR PGH

Current RMP Pg. 64 Actions 2,3,7 and 8 Note:

Actions described under the lands and realty section and not repeated here still apply to utility and communications corridors and related authorizations.

2. Analyze requests for land use authorizations on a case-by-case basis and apply mitigation measures as necessary in compliance with the NEPA process.

3. Locate new right-of-way facilities within or adjacent to existing rights-of-way, to the extent practical, in order to minimize adverse environmental impacts and the proliferation of separate rights-of-way.

7. Where avoidance areas and designated corridors overlap (e.g. the Lewis and Clark Trail and the designated corridor through the Beaverhead River Canyon), issuance of new right-of-way and upgrade/expansion of existing rights-of-way will be allowed if mitigated measures can reduce impacts to resources of concern to an appropriate level.

8. Provide access across public lands to and along right-of-way corridors and use areas necessary to construct new facilities, except in avoidance areas where access would be considered on a case-by-case basis.

Current DFO RMP - appendix X pg. 213 Powerlines and Generation Facilities Issue: Existing power lines near a lek, brood-rearing habitat, or winter habitat increases the risk of predation on sage grouse by raptors. 1. Document the segment(s) of line causing problems. 2. Determine by cooperative action-agencies, utilities, and landowners- whether or not modification of poles to limit perching will prevent electrocution of raptors and decrease predation on sage grouse. 3. Emphasize the following if perch prevention modifications do not work to protect sage grouse and sage-brush habitat: a) reroute the line using distance, topography, or vegetative cover; or b) bury the line. 4. Explore opportunities for technical assistance and funding. 5. Remove power line when use is completed. Issue: Existing power line is causing consistent or significant collision mortality on sage grouse. 1. Document the segment(s) of line causing consistent or biologically significant mortality- with agencies, utilities, and landowners cooperating in the effort. 2. Initiate collision prevention measures using guidelines (Avian Power Line Action Committee 1994) on identified segments. Measures are subject to restriction or modification for wind and ice loading or other engineering concerns, or updated collision prevention information. 3. Remove power lines that traverse

Same as #90 above from Current DFO RMP - appendix X pg. 213

Same as SR PPH and PGH

Same as #90 above from Current DFO RMP - appendix X pg. 213 RMP also referenced to use Avian Powerline Action Committee guidelines (1994) which were updated in 2006, also Avian Protection Plan Guidelines published by APLIC and USFWS 2005 is available.

Same as SR PPH and PGH also refer to Appendix E pg. 118 NATURAL REVEGETATION

Current RMP Pg 64, Action 2. Analyze requests for land use authorizations on a case-by-case basis and apply mitigation measures as necessary in compliance with the NEPA process. Appendix X. pg 213 Issue: New power lines proposed in areas that provide sage grouse habitat can pose threat to sage grouse. # 6. Restrict construction to prevent disturbance during critical periods: a)breeding - March 15-May 15 b)winter - Dec 1 - March 15.

Same as SR

Acquisition Criteria - Appendix H pg.129 Lands would be considered for acquisition if one of more of the following criteria is met and acquisition would:

- Facilitate access to public lands and resources
- Maintain or enhance the manageability of public lands and resources
- Maintain or enhance important public values and uses, especially
  - o Special Status Species plant, animal and fish habitats

acres retained; acres of habitat Action: No Similar Action

acres identified for acquisition Action: No Similar Action

Current RMP - Withdrawals Pg 41 Actions 1,2,3,5  
1. Review existing withdrawals on a case-by-case basis prior to the end of the withdrawal period or as other-wise required by law to determine whether the withdrawals should be extended, revoked, or modified. Withdrawals no longer needed, in whole or in part, for the purpose for which they were withdrawn will be revoked or modified. Appendix J describes the existing withdrawals in the planning area as shown on Map 16 (oversized). 2. Consider other agency requests for withdrawal relinquishments, extensions or modifications on a case-by- case basis. 3. Consider new withdrawal proposals on a case-by-case basis where the public land would transfer from one federal agency to another or where resource values or agency investments are best protected by withdrawal. Lands proposed to be withdrawn should be the minimum area required for the intended use and where applicable alternative prescriptions such as the use of rights-of-way, leases, permits, or cooperative agreements are inadequate to protect the resource values. 5. Review any additional existing land classifications on a case-by-case basis to determine if they should be continued or terminated.

acres withdrawn

Same as NA?

Acres closed/withdrawn

Current RMP - Acquisition Criteria - Appendix H pg.129 Lands would be considered for acquisition if one of more of the following criteria is met and acquisition would:

- Facilitate access to public lands and resources
- Maintain or enhance the manageability of public lands and resources
- Maintain or enhance important public values and uses, especially
  - o Special Status Species plant, animal and fish habitats

Acres/miles of corridors

Land Ownership Adjustment Pg. 38 In considering whether an exchange is in the public interest, consideration is given to the opportunity to:

- achieve better management of Federal lands,
- meet the needs of state and local residents and their economies,
- secure important objectives, including but not limited to, protection of fish and wildlife habitats, cultural re-sources, watersheds, wilderness and aesthetic values; enhancement of recreation opportunities and public access; consolidation of lands and/or interests in lands; consolidation of split estate; expansion of communities; accommodation of land use authorizations; pro-motion of multiple-use values; and fulfillment of public needs.

Goal 2 pg. 39 Retain public lands with high resource values in public ownership. Adjust land ownership to consolidate public land holdings, acquire lands with high public resource values, and meet public and community needs.

Acres

Appendix X pg 213 Issue: Wind generation may impact sage grouse and sage grouse habitat. 1. Consult with USFWS Ecological Services for site selection evaluation information.

2. Use the best available information to:
  - a) identify important sage grouse breeding, brood-rearing, and winter habitat in an appropriate vicinity of a proposed facility and associated infra-structure; and
  - b) site wind generation facilities – with agencies, utilities, and landowners cooperating – using topography, vegetative cover, site distance, etc. to effectively protect identified sage grouse habitat.
3. Identify and avoid both local (daily) and seasonal migration routes.
4. Restrict timing of construction to minimize disturbance during critical periods:
  - a) breeding – March 15 – May 15
  - b) winter – December 1 – March 15
5. Take appropriate measures to prevent introduction or dispersal of noxious weeds during construction, maintenance, and operation as required by federal and state laws.
6. Develop offsite mitigation strategies in situations in which fragmentation or degradation of sage grouse habitat is unavoidable.

Acres available for renewable  
acres  
acres available for wind

Same as sub -region

2. Use the best available information to:
4. Restrict timing of construction to minimize disturbance during critical periods:

Appendix X. pg 208 Issue: Some sagebrush communities may have been significantly altered by past grazing management practices. 1. Implement appropriate grazing management strategies and range management practices where soil conditions and ecological processes will support sage grouse and desired commodities and societal values. 2. Establish suitable goals for sagebrush communities that have deteriorated to such an extent that livestock management alone may not contribute to habitat objectives. 3. Offer private landowners incentives when and where appropriate to achieve sage grouse objectives. Rangeland Veg pg. 51 Action 14 14. Improve existing seedings that are not meeting rangeland health standards for plant vigor and density by implementing grazing management systems or re-seeding with appropriate species of natives or cultivars. Focus restoration of any existing seedings on areas containing high resource values and/or priority habitats and species. Allow the use of all available tools. also refer to Appendix E pg. 118

NATURAL REVEGETATION

See above↑ - WAFWA guidelines are incorporated in Appendix X and include restoration guidelines, also refer to Appendix E pg. 118 NATURAL

REVEGETATION Rangeland Veg pg. 51 Action 14  
14. Improve existing seedings that are not meeting range-land health standards for plant vigor and density by implementing grazing management systems or re-seeding with appropriate species of natives or cultivars. Focus restoration of any existing seedings on areas containing high resource values and/or priority habitats and species. Allow the use of all available tools. Sagebrush Steppe Wildlife Habitats Pg. 73 Actions 42, 43, 44

42. Use the National and Montana sage grouse conservation strategies (see Appendix X) as the basis to address habitat management in the watershed planning process and in project level analysis.

43. Manage sagebrush habitats so that mid-scale level shrub cover includes a mix of height classes with herbaceous understory adequate for meeting seasonal habitat requirements for sage grouse and other wildlife species that use sagebrush habitat including wintering antelope and mule deer.

- In habitats with predominately mountain big sagebrush, manage sites with the potential to support sagebrush in a manner that maintains > 70 percent of those areas in canopy closure of 5 to 25 percent.

Action: No Similar Action

Rangeland Veg pg. 51 Action 14 14. Improve existing seedings that are not meeting range-land health standards for plant vigor and density by implementing grazing management systems or re-seeding with appropriate species of natives or cultivars. Focus restoration of any existing seedings on areas containing high resource values and/or priority habitats and species. Allow the use of all available tools. also refer to Appendix E pg. 118 NATURAL REVEGETATION

Action: No Similar Action

Livestock Grazing Pg. 42 Actions 1,2 and 4

1. Authorize an average of between 101,183 and 113,219 Animal Unit Months (AUMs) on about 425 allotments, subject to lands meeting the Western Montana Standards for Rangeland Health and make adjustments to allotments for management efficiency.
2. Use watershed evaluations (see Map 20 for watershed areas) when authorizing livestock grazing to assess whether the Western Montana Standards for Rangeland Health (Appendix A) are being met or if changes in livestock grazing are necessary.
3. Incorporate the Guidelines for Livestock Grazing as described in Appendix A into livestock grazing permits, as well as strategies outlined in Best Management Practices for Grazing (MT DNRC 1999), when applicable.
4. Follow the procedures outlined in the Rangeland Health Standards Handbook (H-4180) for areas that do not meet the Western Montana Standards for Rangeland Health due to livestock grazing.

Appendix X pg.208 Conservations measures for Fire Management Issue: Reduction of sagebrush by wildfire.

1. Schedule annual coordination meetings – with appropriate resource staff including fire specialists, wildlife biologists, and range ecologists – to incorporate new sage grouse habitat and other wildlife habitat information needed to set wildfire suppression priorities related to resources. Distribute updates to fire dispatchers for initial attack planning.
2. Identify the location of known sage grouse habitat and other wildlife habitats of concern, such as latitude and longitude with a polygon and radius, to avoid disturbance or degradation by temporary facilities, such as fire camps, staging areas, and helibases.
3. Incorporate known sage grouse habitat information into each Wildfire Situation Analysis to help determine appropriate suppression plans and prioritize multiple fires.
4. Retain unburned areas of sage grouse habitat, such as interior islands and patches between roads and fire perimeter, unless compelling safety, resource protection, or control objectives are at risk.

NOXIOUS WEEDS, INVASIVE AND NON-NATIVE SPECIES pg 49 Actions:

- 1 Manage Montana State designated noxious weeds according to the principles of integrated pest management found in Partners Against Weeds: An Action Plan for the Bureau of Land Management (USDI-BLM 1996b), the Montana Weed Management Plan (Duncan 2001), and the Montana Noxious Weed Act.
- 2 Participate in education and awareness programs for staff, cooperators, and the public.
- 3 Continue inventory of public lands for noxious weeds.
- 4 Monitor treatment areas
- 5 Continue cooperative agreements with Beaverhead and Madison counties for Integrated Weed Management.
- 6 Encourage development of Cooperative Weed Management Areas where all the landowners are cooperatively working to contain or eradicate noxious weeds within designated areas.
- 7 Control noxious weeds by various methods that include chemical, cultural, physical, mechanical, and biological treatments or other land practices.
- 8 Evaluate treatment and control of invasive species such as cheatgrass in site-specific projects associated with the watershed analysis.
- 9 Reestablish perennial vegetation in a timely manner

See above↑ - WAFWA guidelines are incorporated in Appendix X and include restoration guidelines, also refer to Appendix E pg. 118 NATURAL

REVEGETATION Rangeland Veg pg. 51 Action 14  
14. Improve existing seedings that are not meeting range-land health standards for plant vigor and density by implementing grazing management systems or re-seeding with appropriate species of natives or cultivars. Focus restoration of any existing seedings on areas containing high resource values and/or priority habitats and species. Allow the use of all available tools. Sagebrush Steppe Wildlife Habitats Pg. 73 Actions 42, 43, 44

42. Use the National and Montana sage grouse conservation strategies (see Appendix X) as the basis to address habitat management in the watershed planning process and in project level analysis.

43. Manage sagebrush habitats so that mid-scale level shrub cover includes a mix of height classes with herbaceous understory adequate for meeting seasonal habitat requirements for sage grouse and other wildlife species that use sagebrush habitat including wintering antelope and mule deer.

- In habitats with predominately mountain big sagebrush, manage sites with the potential to support sagebrush in a manner that maintains > 70 percent of those areas in canopy closure of 5 to 25 percent.

Same as NA - under current management public is involved in planning during watershed assessments and MTFWP is consulted on all projects and BLM is actively involved in the local sage grouse working group and has a local Resource Advisory Council (RAC), consisting of landowners and other local interests.

Appendix E pg. 118 NATURAL REVEGETATION In many cases, successful reestablishment of native species occurs if the perennial plant species are not killed as a result of the fire, or if viable and desirable seed or root mass is present. Generally, in these areas it would be necessary to rest the burned area from livestock grazing for at least two growing seasons. In some situations, the area may be closed to vehicles by issuing a temporary emergency closure. The only rehabilitation that may be necessary is repairing damaged fencing and/or construction of temporary fencing around the burned area until the native vegetation is successfully re-established. Seeding guidelines:

- Native species will be utilized over nonnative species as appropriate and based on seed availability.
- A project inspector will monitor all phases of implementation.
- The area to be seeded will be rested from grazing for at least two growing seasons or until vegetation is successfully established. Livestock will be excluded by using fencing, closing specific pastures, or closing en-tire allotments.
- Only native species will be seeded in WSAs.
- Monitoring will determine the effectiveness of seeding and to indicate when grazing will resume.
- Use only certified weed-free sources and collect seed samples for an All States Noxious Weed Test. Seed nonnatives only in areas of the burn where high

WILDLIFE including SPECIAL STATUS BIRDS AND MAMMALS - pg 73 Monitoring Support and assist FWP in monitoring wildlife habitat and population goals through the Montana Comprehensive Fish and Wildlife Conservation Strategy. Assess changes in sagebrush, coniferous forest and riparian/wetland habitat distribution, canopy, composition and condition on a landscape and watershed basis during watershed evaluations (see Map 20 for watershed areas). Where vegetation treatments have been implemented, or natural events have occurred, monitor changes in species composition and structure compared to pre-treatment conditions. Continue to monitor known populations of special status species, in conjunction with Federal, state and private agencies or organizations (bald eagle, peregrine falcon, sage grouse, pygmy rabbit, trumpeter swan, raptors). Monitoring may use intensive research projects or periodic population/habitat inventories to determine habitat extent or population status. This monitoring may be accomplished through contracts and/or with the aid of partnership funding sources in support of individual species conservation strategies. Participate in Intermountain Joint Venture efforts for all-bird monitoring at mid- and fine-scale.

Proposed RMP/Final EIS Ch 2 pg. 55 Coal and Oil Shale Management Common to All Alternatives

Under all alternatives, BLM would consider proposals for coal and oil shale leasing on a case-by-case basis for mineral resources under the administration of the federal government. To date, no areas have been identified with economic reserves to support future leasing analysis. Site-specific environmental analysis and a plan amendment would be required to lease for coal or oil shale. There are currently no regulations governing the leasing of oil shale. Any leases issued would be issued under the authority of 30 U.S.C. Chapter 3A, Subchapter V, Sec. 241 which authorizes the Secretary of the Interior to lease deposits of oil shale. Unsuitability criteria described in 43 CFR 3461 would be applied to coal lands determined to have development potential on a case-by-case.

ROD/RMP pg45 - Action 9 Consider proposals for coal and oil shale leasing on a case-by-case basis. A plan amendment would be necessary to lease, along with the appropriate level of environmental analysis.

- Issue any oil shale leases under the authority of 30 U.S.C. Chapter 3A, Subchapter V, Sec. 241 which authorizes the Secretary of the Interior to lease deposits of oil shale
- Apply unsuitability criteria described in 43 CFR Part 3461 to coal lands determined to have development potential on a case-

Proposed RMP/Final EIS Ch 2 pg. 57- LOCATABLE MINERALS Goal – Encourage and facilitate development of locatable minerals in the manner to prevent unnecessary or undue degradation. Management Common to All Alternatives Standard management practices in the public land administration of locatable minerals would continue across all alternatives. BLM would coordinate with MT DEQ during the review, approval, inspection and reclamation of mining operations. At a minimum, conduct annual compliance inspections on each active notice. Requirements of all state and federal laws would be met in the management of mining operations. Administration of locatable minerals on public lands would continue as required by law and regulation (43 CFR 3809) by taking the following steps: Review and process notices to ensure the proposed action does not create unnecessary or undue degradation of the environment. Review and process plans of operation to ensure the proposed action does not create unnecessary or undue degradation of the environment. Conduct at a minimum annual compliance inspections on each active notice and plan of operation. Allow casual use where work is done by hand and no explosives are used. Refer inquiries to appropriate agencies for further guidance on other permit requirements.

Salable Minerals (Mineral Materials) pg 49. Goal: Provide for the extraction of mineral materials to meet public demand, while minimizing adverse impacts to other resource values.

#### Allocations

Manage 136,226 acres as closed to mineral material disposal in the following areas (see Map 22):

- Bear Trap Wilderness
- All nine Wilderness Study Areas
- Centennial Sandhills
- Christnot Mill
- Developed recreation sites
- Lewis's Lookout
- Sheep Creek Common Use Area
- Lands within one-quarter mile either side of the Big Sheep Creek Road, except in sections 26 and 35 in T14S, R10W and section 2 in T15S, R10W

Manage the remainder of the planning area as open to mineral material disposal, subject to the provisions described in the Action section below.

#### Actions:

1 Maintain current mineral material sites (see Map 22) until material is exhausted or other circumstances warrant closure.

2 Encourage extraction of mineral materials from previously disturbed sites rather than opening new sites.

Pg. 45 Action 3 Manage oil and gas leases existing prior to the Record of Decision for the Dillon RMP according to the existing lease stipulations. When the lease expires, manage those lands according to the oil and gas decisions and required stipulations outlined in the ROD/Approved Plan. All stipulations for fluid mineral development apply to geophysical explorations as well. All leased parcels have stipulations applied consistent with DFO RMP as outlined in Table 5 on pg 44 of RMP. (Did not attempt to paste table in here for formatting reasons)

RMP Final EIS Alt. C Pg. 53 Table 6 lists stipulations that were analyzed. Winter/Spring habitat – NL  
Leks – NL ½ mile buffer Breeding habitat – NSO NL  
= no lease NSO = no surface occupancy Under Alternative C, 80 percent (1,086,596 acres) of the planning area would not be available for oil and gas leasing. This includes all the lands identified in Alternative B, plus lands in these additional locations:

- Sage Grouse Winter/Spring Range
- Lands within 1/2 mile of Sage Grouse Strutting Grounds (leks)

DFO RMP Appendix M pg. 156, pp 5 The BLM planning process is the mechanism used to evaluate and determine where and how federal oil and gas resources will be made available for leasing. In areas where oil and gas development may conflict with other resources, the areas may be closed to leasing.

RMP Final EIS Alt. C Pg. 53 Table 6 lists stipulations that were analyzed. Winter/Spring habitat – NL Leks – NL ½ mile buffer Breeding habitat – NSO NL = no lease NSO = no surface occupancy Under Alternative C, 80 percent (1,086,596 acres) of the planning area would not be available for oil and gas leasing. This includes all the lands identified in Alternative B, plus lands in these additional locations:

- Sage Grouse Winter/Spring Range
- Lands within 1/2 mile of Sage Grouse Strutting Grounds (leks)

Final RMP Pg. 46 Goal 2 Allow environmentally responsible geophysical exploration for energy resources in the Dillon Field Office on lands administered by the BLM. Actions: 1 Review Notices of Intent to Conduct Geophysical Exploration (NOI) in the planning area and develop appropriate mitigation measures so as not to create undue and unnecessary degradation. 2 Prepare a site-specific environmental analysis for each NOI filed. Develop mitigation measures using the oil and gas lease stipulations approved in this plan as the starting point.

- The transient nature of geophysical exploration and the short-term impacts of the exploration may provide an opportunity for operations to occur in seasonal wildlife areas during the time of closure under lease stipulations without creating detrimental effects on wild-life. As such the proposed exploration will be

DFO ROD/RMP pg. 44 Allocations Make the remainder of federal mineral estate in the planning area (approximately 1,209,278 acres) available for leasing, subject to the stipulations specified in Table 5 or under Standard Lease Terms. • Approximately 433,797 acres are available for oil and gas leasing, subject to No Surface Occupancy stipulations. • Approximately 632,061 acres are available for oil and gas leasing, subject to Timing Limitations and/ or Controlled Surface Use stipulations. • Approximately 143,420 acres are available and subject to standard lease terms (and to the CSUs listed on Table 5 that apply to the entire planning area) Appendix M - Split Estate, pg. 167 On split estate lands where the surface ownership is private, the BLM places necessary restrictions and requirements on its leases and permit approvals and works in cooperation with the surface owner. BLM has established policies for the management of federal oil and gas resources in accordance with federal laws and regulations. The BLM does not have the legal authority to regulate how private surface is managed. BLM does have the statutory authority to require measures by lessees to avoid or minimize adverse impacts that may result from federally authorized mineral lease activities. These measures, in the form of lease stipulations or permit

Same as SR

RMP pg. 60 Wheeled Motorized Use/Non-Motorized Use Manage no areas as "open" under the regulations at 43 CFR Part 8340-8342. Manage 826,876 acres as "limited" to designated routes for OHV use under the regulations at 43 CFR Part 8340-8342. • Designate approximately 1,342 miles of road on BLM lands as open to public travel as shown on Maps 26 and 27 (oversized). • Make 159 miles of the 1,342 miles of road subject to seasonal restrictions Appendix X pg. 214 Roads and Motorized Vehicles Issue: Roads may increase sage grouse mortality through collisions with vehicles, displacement because of human disturbance, or other factors. 1. Identify, map, quantify, and evaluate impacts of existing roads, including 2-tracks, in relation to known lek locations and sage grouse winter ranges. 2. Consider impacts to sage grouse when designing new roads and modifying existing roads. 3. Consider seasonal use restrictions or signing to avoid disturbance of critical times, such as winter and nesting periods.

Action: No Similar Action

Pg. 61 Action 9 9. Evaluate "new roads" on a case-by-case basis through an environmental assessment process to determine whether they will be open to public travel. "New roads" means roads that do not presently exist but are necessary for access to timber sales, mining activities, to provide general access, or to facilitate other authorized uses of public lands. Designate routes determined to enhance public access opportunities that do not conflict with management of other resources as open and add them to the travel management map through routine plan maintenance.

Same as NA- Travel Management plan is complete for DFO

Pg. 59 Action 1 TRANSPORTATION AND FACILITIES MAINTENANCE Goal 1 Manage facilities, including roads and trails, to provide for public access or administrative needs, while maintaining or protecting resource values and in coordination with other federal agencies, state and local governments, and private landowners. Actions 1 Inventory and maintain transportation system roads and trails under BLM jurisdiction in accordance with assigned maintenance levels as outlined in Appendix O to meet public health and safety requirements, but also in consideration of resource issues including but not limited to proliferation of weeds and disturbance of cultural resources. Appendix O pg. 171 Transportation system roads and trails are classified by maintenance levels specified in BLM Manual Handbook H-9113- 2. Any changes or updates to maintenance levels will be incorporated into this planning guidance.

Action: No Similar Action

Appendix X pg 215 Issue: Roads and their associated disturbances and cumulative effects contribute to the loss of habitat and declining sage grouse populations.

1. Develop a transportation management plan across ownership boundaries in critical sage grouse habitats.
2. Participate in travel planning efforts and educate the general public about the impacts of roads on sage grouse and critical habitat.
3. Consider buffers, removal, realignment, or seasonal closures where appropriate to avoid degradation of habitat.
4. Re-vegetate closed roads with plant species beneficial to sage grouse.

Same as above ↑ also covered in Appendix X under Vegetation pg 215 and Rangeland Vegetation, Invasive Species, Travel management and any other place re-vegetation is discussed

Same as SR

Not really a Concern, but can use same wording as SR.

Appendix X pp. 215 Roads and Motorized Vehicles

Issue: Roads and their associated disturbances and cumulative effects contribute to the loss of habitat and declining sage grouse populations. Action 3. Consider buffers, removal, realignment, or seasonal closures where appropriate to avoid degradation of habitat. Action 5. Issue special use permits for certain activities with distance and timing restrictions to maintain the integrity of breeding habitat.

Appendix X pp. 214 Roads and Motorized Vehicles

Issue: Roads may increase sage grouse mortality through collisions with vehicles, displacement because of human disturbance or other factors. 1. Identify, map, quantify, and evaluate impacts of existing roads, including 2-tracks, in relation to known lek locations and sage grouse winter ranges. 2. Consider impacts to sage grouse when designing new roads and modifying existing roads. 3. Consider seasonal use restrictions or signing to avoid disturbance of critical times, such as winter and nesting periods. 4. Consider the use of speed bumps where appropriate to reduce vehicle speeds near leks, such as during oil and gas development. 5. Manage on-road travel and OHV use in key grouse areas to avoid disturbance during critical times such as winter and nesting periods. 6. Plan or permit organized events to avoid increased traffic and impacts to sage grouse

RMP pg. 60 Wheeled Motorized Use/Non-Motorized Use Manage no areas as "open" under the regulations at 43 CFR Part 8340-8342. Manage 826,876 acres as "limited" to designated routes for OHV use under the regulations at 43 CFR Part 8340-8342. • Designate approximately 1,342 miles of road on BLM lands as open to public travel as shown

Appendix X pp. 214 Recreational Disturbance of Sage Grouse Issue: Management of lek viewing may be necessary.

1. Establish viewing guidelines, i.e., distance, timing, approach methods, signage, parking areas, and area closures.
2. Consider sage grouse needs when developing roads and OHV management plans.
3. Develop and provide educational materials to the public describing effects of concentrated recreational activities and the importance of seasonal ranges to sage grouse.
4. Encourage recreationists to avoid continuous or concentrated use within 1.5 miles of leks from March 15 to May 15.
5. Issue special use permits for certain activities with distance and timing restrictions to maintain the integrity of breeding habitat.
6. Discourage concentration of hunters on critical seasonal habitats, such as during late big game seasons, when sage grouse are present.

Same as NA - Appendix B pg. 105 - Montana BMP's for grazing incorporated by reference.

Appendix X pg 208

Issue: Improper grazing or lack of grazing can change the composition and/or structure of the native plant community and thereby reduce or eliminate food and cover for sage grouse.

1. Monitor the response of forbs (kinds, vigor, and production), and the compositional diversity of native species with respect to livestock grazing, evaluate the data, and make necessary adjustments.
2. Identify reasons for lack of grass and forb cover in sage-brush communities and recommend practices to increase the native herbaceous understory.
3. Identify critical sage grouse areas, and adjust grazing to minimize conflict among the production of commodities and protection of societal values.
4. Use monitoring methods that are best suited to the type of grazing management being incorporated at a site.
5. Adjust stocking levels (up or down) within the carrying capacity of the pasture or range. Adjustments should be based on monitoring program evaluating plant and soil response with respect to actual livestock use, weather, wildlife use, insects, and other environmental factors.

Pg. 42 Action 7. Modify grazing schedules and livestock management practices as necessary during drought conditions. Appendix X, pg 208 Issue: Drought may result in the degradation of native plant communities, and reduces forage production and sage grouse habitat.

1. Livestock managers should have drought management strategies or plans, e.g. water facilities; forage sources formulated for implementation during periods of drought.

Riparian Wetland Veg pg. 55 Objectives (Desired Future Condition after 20- 50 years of management)

Riparian and wetland vegetation supports the biological, hydrologic, and physical components of streams and wetlands based on site-specific capabilities. Deciduous woody and coniferous communities are present with diverse composition, density, and age structure within site potential. Herbaceous plant communities are dominated by deep- rooted native species that support streambank and shore-line stability, floodplain development, and nutrient cycling. Stream channels display the dimensions, pattern, and profile that are representative of site potential (Rosgen).

Emphasize maintenance of riparian communities on approximately 415 miles of stream dominated by a tall deciduous shrub or aspen/cottonwood habitat types and on approximately 500 miles of stream dominated by herbaceous and coniferous habitat types (based on 2002 inventory summary).

Action: 3 Implement the Western Montana Standards for Range-land Health (see Appendix A) to achieve proper functioning condition in riparian and wetland habitats. Incorporate the Guidelines for Livestock Grazing, as well as strategies outlined in Best Management Practices for Grazing (MT DNRC 1999), when applicable. Appendix X pg 208 Issue: Riparian

Action: No Similar Action

Action: No Similar Action

Action: No Similar Action

Pg 69, Action 7. Install functional wildlife access ramps on all water tanks on public lands. Pg. 56

Action 13 Analyze water developments on a case-by-case basis, considering the following:

- Available water flow. In general, no water developments that remove more than 50% of average summer daily flows from a water source will be constructed unless systems can be designed for return flows back into the drainage within a 1/4 mile of the diversion.
- Protection of source water riparian and wet-land habitat. Where isolated springs are developed, associated riparian habitat will be protected, usually through fencing.
- Protection of other resource values from direct and indirect impacts from construction and use of the water source. Measures to protect riparian habitats and other resource values including but not limited to sensitive plant species and cultural resources will be implemented based on site-specific needs. Only off- stream water developments and/or armored water gaps will be considered on streams where fencing has excluded the riparian area to prevent impacts to various resources.
- Location of water tanks in relation to other resource values. Measures to protect resource values in proximity to tank locations will be implemented based on site-specific needs. In general, water tanks will be placed at least 1/4 mile from

Pg 69 Actions 7, 8, 9, 16 7. Install functional wildlife access ramps on all water tanks on public lands. 8. Modify existing fences on public land identified as barriers to wildlife movement to accommodate wildlife passage. 9. Follow "wildlife friendly" fence specifications in BLM Manual H1741-1 for new fences. 16. Coordinate when new roads are proposed for construction and/or when changes are proposed regarding travel restrictions on existing roads to determine if concerns with wildlife displacement and/or habitat fragmentation exist. See the Travel Management section for additional details.

Pg. 73 Action 44 44. When making project decisions located in sage grouse habitats, objectives for sage grouse habitats and relevant information about sage grouse seasonal habitat will be considered when determining the desired resource condition. If specific issues regarding sage grouse are identified, applicable conservation actions or guidelines will be reviewed by interdisciplinary teams and considered in the decision-making process. None of the conservation actions or guidelines in the Management Plan and Conservation Strategies for Sage Grouse in Montana will be construed as mandatory or standards. Also see fencing below

Action: No Similar Action

Pg 51 Action 14 Improve existing seedings that are not meeting range-land health standards for plant vigor and density by implementing grazing management systems or re-seeding with appropriate species of natives or cultivars. Focus restoration of any existing seedings on areas containing high resource values and/or priority habitats and species. Allow the use of all available tools. Appendix X pg. 215 Issue: The age distribution of sagebrush may have been altered by management, such as a young stand recovering from disturbance or a mature stand with poor regeneration. 1. Map and inventory areas believed to be deficient in quality of habitat or exhibiting poor health. 2. Evaluate the site potential and desired condition, and develop specific objectives accordingly within specific landscapes. 3. If sagebrush is lacking: a) develop and implement grazing practices that influence sagebrush growth, b) inter-seed historical breeding and winter habitats with the appropriate sagebrush species, c) identify and promote seed sources for habitat restoration efforts, d) encourage the voluntary use of sagebrush in habitat incentive programs, such as the Conservation Reserve Program, and work to develop additional funding sources for such programs, e) reclaim and/or re-seed areas disturbed by treatments when necessary, and f) promote sage plantings,

Pg 69 Actions 8 and 9 8. Modify existing fences on public land identified as barriers to wildlife movement to accommodate wildlife passage. 9. Follow "wildlife friendly" fence specifications in BLM Manual H1741-1 for new fences. Appendix X pg 209 Issue: Potential for sage grouse to be disturbed or displaced by concentrations of livestock near leks or winter habitat. 1. Discourage concentration of livestock on leks or other key sage grouse habitats. • Avoid placement of salt or mineral supplements near leks during the breeding season (March-June), and • Avoid supplemental winter feeding of livestock, where practical, on sage grouse winter habitat and around leks Issue: Existing fences near breeding, brood-rearing, or winter habitats can increase the risk of collision mortalities and /or predation on sage grouse by hawks, eagles, and ravens by providing perches. 1. If portions of existing fences are found to pose a significant threat to sage grouse as strike sties or raptor perches, mitigate through moving or modifying posts, implementation of predator control programs, etc. Actions may include increasing the visibility of the fences by flagging or by designing "take-down" fences. 2. Offer private landowners incentives when and where appropriate to achieve sage grouse objectives. Appendix X Pg 211- 212 Noxious Weed Mgmnt Issue: Weed infestations

Same as SR? Adapt the BMP's

Pg 69 Actions 7, 8, 9, 16 7. Install functional wildlife access ramps on all water tanks on public lands. 8. Modify existing fences on public land identified as barriers to wildlife movement to accommodate wildlife passage. 9. Follow "wildlife friendly" fence specifications in BLM Manual H1741-1 for new fences. 16. Coordinate when new roads are proposed for construction and/or when changes are proposed regarding travel restrictions on existing roads to determine if concerns with wildlife displacement and/or habitat fragmentation exist. See the Travel Management section for additional details.

Pg. 73 Action 44 44. When making project decisions located in sage grouse habitats, objectives for sage grouse habitats and relevant information about sage grouse seasonal habitat will be considered when determining the desired resource condition. If specific issues regarding sage grouse are identified, applicable conservation actions or guidelines will be reviewed by interdisciplinary teams and considered in the decision-making process. None of the conservation actions or guidelines in the Management Plan and Conservation Strategies for Sage Grouse in Montana will be construed as mandatory or standards.

Action: No Similar Action

Action: No Similar Action

pg. 42 Allocations Manage approximately 47,837 acres of public land as un-available for livestock grazing (see Map 19, oversized). No term grazing permits or leases would be issued for these areas. These areas could be grazed with livestock on a temporary nonrenewable basis to meet resource objectives of the area. Lands that are not available include: • Unalloted areas • Blue Lake • Eli Springs area Maintain the Cross and Exchange Allotments as Resource Reserve Allotments. (A Resource Reserve Allotment is a unit of public land that will not have term grazing permits issued. Such an allotment will only be grazed on a temporary nonrenewable basis. The use of these allotments will be to provide temporary grazing to rest other areas following wildfire, habitat treatments, or to allow for more rapid attainment of rangeland health. The allotment must be of sufficient size to be managed as a discrete unit. Resource Reserve Allotments should be distributed throughout the planning area). Designate Resource Reserve Allotments on a case-by-case basis following watershed evaluations as described in Livestock - Maintain all current riparian exclosures as un-leased for livestock grazing.

Pg. 43 Grazing Actions 20, 21, and 22. 20. Evaluate currently unleased/unpermitted lands during the watershed assessment process to determine if they

Action: No Similar Action  
Action: No Similar Action  
Same as NA - See Above↑  
Same as NA - This is analyzed during our watershed assesments by working with our fuels specialists.

Pg 43 Livestock Grazing Actions 12, 18 and 19.

12. Implement the "Revised Guidelines for Management of Domestic Sheep and Goats in Native Wild Sheep Habitats" when allowing grazing in bighorn sheep habitat. 18. Maintain cattle as the primary class of livestock on mountain mahogany habitat. Sheep grazing on mountain mahogany habitat will be mitigated through site specific management treatments, changed to cattle use, or eliminated where monitoring data indicates it is necessary. 19. Authorize no new domestic sheep permits or conversion of cattle permits to sheep within areas depicted on Map 33 that contain suitable grizzly bear and wolf habitat (also known as the wildlife dispersal/migration corridors in the Centennial Mountains, Snowcrest Mountains, Gravelly Range, Greenhorn Mountains, Axolotl Lakes area, and along the Continental Divide from Monida to Lemhi Pass).

Same as SR with reference to the "Western Montana S and G for Livestock Grazing" rather than ID

NEED TO DETERMINE HOW TO ADDRESS THE 3%  
DISTURBANCE THRESHOLD. Are we still waiting on  
guidance from the NTT or RMT?

Same as NA? Need more discussion for subregion, not sure what "see above " is in reference to.

0  
0

0  
0  
0

Same as NA. Dillon utilizes Watersheds Assessments and has a sage-grouse assessment process in place. All allotments in the DFO have been assessed in the last 10 years.

DFO has a very aggressive noxious weeds program

DFO is also monitoring sage grouse habitat following guidelines set forth in the Management Plan and Conservation Strategies for Sage Grouse in Montana.

All prescribed fire units are designed to improve habitat conditions and discussed with local FWP biologists to reduce conflicts with wildlife use, Did not paste it here, but also refer to Rangeland Vegetation pg. 51 Actions 4,5,6,7,8,9,12,13 All identify habitat considerations for fire management.

All projects are coordinated with FWP biologists to meet wildlife habitat needs.

Same as NA - Also addressed in grazing management, habitat restoration and noxious weeds

Climate change is not currently considered for re-seeding under current RMP guidelines

Appendix E BMP's could be amended to the DFO RMP  
– MOST if not all are already used when site specific  
NEPA is done.

Appendix E BMP's could be amended to the DFO RMP  
– MOST if not all are already used when site specific  
NEPA is done.

This was common to all alternatives and therefore incorporated into the Final RMP on pg 46 and 47 under Locatable minerals. Also refer to Appendix N Standard operating procedures for Mineral material sites in DFO ROD/RMP pg. 169. I MAY JUST RECOMMEND USING WORDING FROM SUB-REGION ALTERNATIVE.

also Appendix N pg 169 of DFO RMP has SOP for Mineral Material Sites

No Lease was analyzed under alt C in draft RMP. See below for Final Decision I feel this is adequate as we have no active drilling/wells and no APD's in DFO Online link to BMP's for Fluid Minerals located in Appendix B Also see Washington Office IM No. 2004-194. Also refer to Appendix M Procedures in oil and gas recovery. In DFO ROD/RMP Any geophysical exploration would require site specific NEPA.

DFO currently does not have any level of development. Last geophysical exploration was in 2008. Nothing has been developed on those leases  
May need plan amendment to update the ¼ mile NSO currently in DFO RMP to 4m NSO if warranted.  
Can add Appendix D BMP's from NTT  
←← See scenario analyzed in RMP for full field development. max of ten wells could be drilled over the life of the RMP RMP plan amendment would be needed to exceed this over the life of the plan.

0  
0

Need to update NSO distance around active leks.

0  
0

Same as NA, All motorized travel in DFO is limited to designated routes. All of these actions listed under travel require an EA to be completed if we make any changes to the TMP.

Same as NA Would require an EA anyway Should this be under Travel Management?

Same as NA - Should this be under Travel Management?

Same as NA - Should this be under Travel  
Management?

Is this a Recreation/travel issue or Mineral Split  
Estate??

Is this a Recreation/travel issue or Mineral Split  
Estate??

Is this a Recreation/travel issue or Mineral Split  
Estate??

SRP in sage grouse habitat are not specifically addressed in RMP, however most if not all our SRP are outfitter /guides for fishing or big game hunting, not likely to impact sage grouse.

Same as NA

Most of our winter snow machine travel is not in gsg winter habitat. Do we even need to address this?

No Concern All allotments in DFO have had health assessments completed and ESD were used to determine Function. Changes have been made to improve sage grouse habitat conditions where standards were not met.

Same as NA - DFO is active in Local gsg working group, and works with landowners during permit renewal to benefit all wildlife species.

Same as NA, All allotments in DFO have been assessed in the past ten years and changes have been made where not meeting the standards or sagebrush habitat requirements.

Currently being done during Watershed Assesments.

Sams as NA - Not going to paste the whole thing here.  
No Concern. Monitoring and habitat objectives are outlined in WA EA's

addressed in multiple locations in RMP, and already pasted into multiple actions in this matrix.

This is all considered during Watershed assessments when AMP's are renewed.

Same as NA - Reductions were made during drought periods around 2003-2004 and post drought management was allotted for. We are currently talking to Permittees regarding possible reductions for 2013.

Same as NA - new water developments are analyzed during watershed assessments.

Same as NA - Currently evaluated during watershed analysis process, most historic seedings have converted back to sagebrush habitat.

Same as NA - the DFO has been modifying fences, marking fences around leks and has has an aggressive weeds management program for the past 10 years.

West nile has not been identified as an issue in DFO possibly due to elevation and the species of mosquito that is a carrier does not survive here.

These are all analyzed during Watershed assessments.  
The DFO has been actively removing, modifying and marking fences around leks.

If warranted no grazing is analyzed on specific parcels or pastures/allotments during Watershed assessments.

This is analyzed under Watershed Assesments.  
0

Same as NA - This is analyzed during our watershed assessments

Not really an issue in MT to reduce threat of fire in annual grasslands.

**Alternative B – Priority Areas****Alternative B - General Areas**

§ Action: In priority habitat, propose withdrawal from mineral entry based on risk to the sage-grouse and its habitat from conflicting locatable mineral potential and development. Make any existing claims within the withdrawal area subject to validity exams or buy out. Include claims that have been subsequently determined to be null and void in the proposed withdrawal. In plans of operations required prior to any proposed surface disturbing activities, include the following: Additional, effective mitigation in perpetuity for conservation (In accordance with existing policy, WO IM 2008-204). Example: purchase private land and mineral rights or severed subsurface mineral rights within the priority area and deed to US Government). Consider seasonal restrictions if deemed effective.

No Action

1. Action: In priority habitat, apply the following nine conservation measures through Resource Management Plan (RMP) implementation decisions (e.g., approval of an Application for Permit to Drill, Sundry Notice, etc.) and upon completion of the environmental record of review (43 CFR 3162.5), including appropriate documentation of compliance with NEPA. In this process evaluate, among other things: Whether the conservation measure is “reasonable” (43 CFR 3101.1-2) with the valid existing rights; and Whether the action is in conformance with the approved RMP.

No Action

Action (Alternative 1): Allow geophysical exploration within priority sage-grouse habitat areas to obtain exploratory information for areas outside of and adjacent to priority sage-grouse habitat areas. Allow geophysical operations only by helicopter-portable drilling methods and in accordance with seasonal timing restrictions and/or other restrictions that may apply.

No Action

Action (Alternative 1): Close priority sage-grouse habitat areas to fluid mineral leasing. Upon expiration or termination of existing leases, do not accept nominations/expressions of interest for parcels within priority areas. No Action

Action (Alternative 2): Allow geophysical exploration within priority sage-grouse habitat areas to obtain exploratory information for areas outside of and adjacent to priority sage-grouse habitat areas. Only allow geophysical operations by helicopter-portable drilling methods and in accordance with seasonal timing restrictions and/or other restrictions that may apply. No Action

Action (Alternative 2): Close priority sage-grouse habitat areas to fluid mineral leasing. Consider an exception when there is an opportunity for the BLM and FS to influence conservation measures where surface and/or mineral ownership is not entirely federally owned (i.e., checkerboard ownership). In this case, a plan amendment may be developed that opens the priority area for new leasing. The plan must demonstrate long-term population increases in the priority area through mitigation (prior to issuing the lease) including lease stipulations, off-site mitigation, etc., and avoid short-term losses that put the sage-grouse population at risk from stochastic events leading to extirpation. No Action

Action: Analyze springs, seeps and associated pipelines to determine if modifications are necessary to maintain the continuity of the predevelopment riparian area within priority sage-grouse habitats. Make modifications where necessary, considering impacts to other water uses when such considerations are neutral or beneficial to sage-grouse. No Action

Action: Authorize new water development for diversion from spring or seep source only when priority sage-grouse habitat would benefit from the development. This includes developing new water sources for livestock as part of an AMP/conservation plan to improve sage-grouse habitat. Same as Priority Areas.

Action: Close priority habitat to mineral material sales. No Action

Action: Close priority habitat to non-energy leasable mineral leasing. This includes not permitting any new leases to expand an existing mine. No Action

Action: Complete activity level travel plans within five years of the record of decision. During activity level planning, where appropriate, designate routes in priority habitat with current administrative/agency purpose or need to administrative access only. No Action

Action: Consider potential changes in climate (Miller et al. 2011) when proposing post-fire seedings using native plants. Consider seed collections from the warmer component within a species' current range for selection of native seed. (Kramer and Havens 2009). No Action

Action: Consider potential changes in climate (Miller et al. 2011) when proposing restoration seedings when using native plants. Consider collection from the warmer component of the species current range when selecting native species (Kramer and Havens 2009). No Action

Action: Coordinate with other resources (Range, Wildlife, and Riparian) to conduct land health assessments to determine existing structure/condition/composition of vegetation within all BLM HMAs and FS WHTs. No Action

Action: Design fuels management projects in priority sage-grouse habitat to strategically and effectively reduce wildfire threats in the greatest area. This may require fuels treatments implemented in a more linear versus block design (Launchbaugh et al. 2007). No Action

Action: Design post ES&R and BAER management to ensure long term persistence of seeded or pre-burn native plants. This may require temporary or long-term changes in livestock grazing, wild horse and burro, and travel management, etc., to achieve and maintain the desired condition of ES&R and BAER projects to benefit sage-grouse (Eiswerth and Shonkwiler 2006). No Action

Action: Design post restoration management to ensure long term persistence. This could include changes in livestock grazing management, wild horse and burro management and travel management, etc., to achieve and maintain the desired condition of the restoration effort that benefits sage-grouse (Eiswerth and Shonkwiler 2006).

No Action

Action: Develop specific objectives to conserve, enhance or restore priority sage-grouse habitat based on BLM ESDs (FS may use other methods) and assessments (including within wetlands and riparian areas). If an effective grazing system that meets sage-grouse habitat requirements is not already in place, analyze at least one alternative that conserves, restores or enhances sage-grouse habitat in the NEPA document prepared for the permit renewal (Doherty et al. 2011b, Williams et al. 2011).

No Action

Action: During drought periods, prioritize evaluating effects of the drought in priority sage-grouse habitat areas relative to their needs for food and cover. Since there is a lag in vegetation recovery following drought (Thurow and Taylor 1999, Cagney et al. 2010), ensure that post-drought management allows for vegetation recovery that meets sage-grouse needs in priority sage-grouse habitat areas.

No Action

Action: During fuels management project design, consider the utility of using livestock to strategically reduce fine fuels (Diamond et al. 2009), and implement grazing management that will accomplish this objective (Davies et al. 2011 and Launchbaugh et al. 2007). Consult with ecologists to minimize impacts to native perennial grasses.

No Action

Action: Evaluate and take advantage of opportunities to remove, bury, or modify existing power lines within priority sage-grouse habitat areas.

No Action

Action: Evaluate the role of existing seedings that are currently composed of primarily introduced perennial grasses in and adjacent to priority sage-grouse habitats to determine if they should be restored to sagebrush or habitat of higher quality for sage-grouse. If these seedings are part of an AMP/ Conservation Plan or if they provide value in conserving or enhancing the rest of the priority habitats, then no restoration would be necessary. Assess the compatibility of these seedings for sage-grouse habitat or as a component of a grazing system during the land health assessments (or other analyses [FS only]) (Davies et al. 2011).

No Action

Action: Follow Best Management Practices (WO IM 2011-138, see appendix E.)

No Action

Action: For all BLM HMAs and FS WHTs within priority sage-grouse habitat, prioritize the evaluation of all AMLs based on indicators that address structure/condition/composition of vegetation and measurements specific to achieving sage-grouse habitat objectives.

No Action

Action: For existing non-energy leasable mineral leases in priority habitat, in addition to the solid minerals BMPs (Appendix E), follow the same BMPs applied to Fluid Minerals (Appendix D), when wells are used for solution mining.

No Action

Action: Implement management actions (grazing decisions, Annual Operating Instructions [FS only], AMP/Conservation Plan development, or other agreements) to modify grazing management to meet seasonal sage-grouse habitat requirements (Connelly et al. 2011c). Consider singly, or in combination, changes in: 1) Season or timing of use; 2) Numbers of livestock (includes temporary non-use or livestock removal); 3) Distribution of livestock use; 4) Intensity of use; and 5) Type of livestock (e.g., cattle, sheep, horses, llamas, alpacas and goats) (Briske et al. 2011).

No Action

Action: In fire prone areas where sagebrush seed is required for sage-grouse habitat restoration, consider establishing seed harvest areas that are managed for seed production (Armstrong 2007) and are a priority for protection from outside disturbances.

No Action

Action: In priority habitat, conduct land health assessments that include (at a minimum) indicators and measurements of structure/condition/composition of vegetation specific to achieving sage-grouse habitat objectives (Doherty et al. 2011). If local/state seasonal habitat objectives are not available, use sage-grouse habitat recommendations from Connelly et al. 2000b and Hagen et al. 2007.

No Action

Action: In priority habitat, conduct restoration of roads, primitive roads and trails not designated in travel management plans. This also includes primitive route/roads that were not designated in Wilderness Study Areas and within lands with wilderness characteristics that have been selected for protection in previous RMPs.

No Action

Action: In priority habitat, design any new structural range improvements and location of supplements (salt or protein blocks) to conserve, enhance, or restore sage-grouse habitat through an improved grazing management system relative to sage-grouse objectives. Structural range improvements, in this context, include but are not limited to: cattleguards, fences, exclosures, corrals or other livestock handling structures; pipelines, troughs, storage tanks (including moveable tanks used in livestock water hauling), windmills, ponds/reservoirs, solar panels and spring developments. Potential for invasive species establishment or increase following construction must be considered in the project planning process and monitored and treated post-construction.

No Action

Action: In priority habitat, do not recommend withdrawal proposals not associated with mineral activity unless the land management is consistent with sage-grouse conservation measures. (For example; in a proposed withdrawal for a military training range buffer area, manage the buffer area with sage-grouse conservation measures.)

No Action

Action: In priority habitat, evaluate existing structural range improvements and location of supplements (salt or protein blocks) to make sure they conserve, enhance or restore sage-grouse habitat.

No Action

Action: In priority habitat, limit motorized travel to existing roads, primitive roads, and trails at a minimum, until such time as travel management planning is complete and routes are either designated or closed.

No Action

Action: In priority habitat, limit route construction to realignments of existing designated routes if that realignment has a minimal impact on sage-grouse habitat, eliminates the need to construct a new road, or is necessary for motorist safety.

No Action

Action: In priority habitat, manage for vegetation composition and structure consistent with ecological site potential and within the reference state to achieve sage-grouse seasonal habitat objectives.

No Action

Action: In priority habitat, monitor for, and treat invasive species associated with existing range improvements (Gelbard and Belnap 2003 and Bergquist et al. 2007).

No Action

Action: In priority habitat, only allow treatments that conserve, enhance or restore sage-grouse habitat (this includes treatments that benefit livestock as part of an AMP/Conservation Plan to improve sage-grouse habitat).

No Action

Action: In priority habitat, restore saleable mineral pits no longer in use to meet sage-grouse habitat conservation objectives.

No Action

Action: In priority habitat, travel management should evaluate the need for permanent or seasonal road closures.

No Action

Action: In priority habitat, use existing roads, or realignments as described above to access valid existing rights that are not yet developed. If valid existing rights cannot be accessed via existing roads, then build any new road constructed to the absolute minimum standard necessary, and add the surface disturbance to the total disturbance in the priority area. If that disturbance exceeds 3 % for that area, then evaluate and implement additional, effective mitigation necessary to offset the resulting loss of sage-grouse habitat (see Objectives).

No Action

Action: In priority habitat, work cooperatively on integrated ranch planning within sage-grouse habitat so operations with deeded/BLM and/or FS allotments can be planned as single units.

No Action

Action: In priority sage-grouse habitat areas, prioritize suppression, immediately after life and property, to conserve the habitat.

Action: In general sage-grouse habitat, prioritize suppression where wildfires threaten priority sage-grouse habitat.

Action: Include sage-grouse habitat parameters as defined by Connelly et al. (2000), Hagen et al. (2007) or if available, State Sage-Grouse Conservation plans and appropriate local information in habitat restoration objectives. Make meeting these objectives within priority sage-grouse habitat areas the highest restoration priority.

No Action

Action: Integrated Vegetation Management would be used to control, suppress, and eradicate, where possible, noxious and invasive species per BLM

No Action

Action: Maintain retirement of grazing privileges as an option in priority sage-grouse areas when the current permittee is willing to retire grazing on all or part of an allotment. Analyze the adverse impacts of no livestock use on wildfire and invasive species threats (Crawford et al. 2004) in evaluating retirement proposals.

No Action

Action: Make applicable Best Management Practices (see Appendix E) mandatory as Conditions of Approval within priority sage-grouse habitat.

No Action

Action: Make priority sage-grouse habitat areas exclusion areas for new BLM ROW or FS Special Use Authorization (SUA) permits. Consider the following exceptions: Within designated ROW or SUA corridors encumbered by existing ROW or SUA authorizations: new ROWs or SUAs may be co-located only if the entire footprint of the proposed project (including construction and staging), can be completed within the existing disturbance associated with the authorized ROWs or SUAs. Subject to valid, existing rights: where new ROWs or SUAs associated with valid existing rights are required, co-locate new ROWs or SUAs within existing ROWs or SUAs or where it best minimizes sage-grouse impacts. Use existing roads, or realignments as described above, to access valid existing rights that are not yet developed. If valid existing rights cannot be accessed via existing roads, then build any new road constructed to the absolute minimum standard necessary, and add the surface disturbance to the total disturbance in the priority area. If that disturbance exceeds 3% for that area, then evaluate and implement additional effective mitigation on a case-by-case basis to offset the resulting loss of sage-grouse habitat.

No Action

Action: Make re-establishment of sagebrush cover and desirable understory plants (relative to ecological site potential) the highest priority for restoration efforts.

No Action

Action: Manage riparian areas and wet meadows for proper functioning condition or other similar methodology (FS only) within priority sage-grouse habitats.

No Action

No Action

Action: No Similar Action

No Action

Action: No Similar Action

Sub-objective: Quantify and delineate general habitat for capability to provide connectivity among priority areas (Knick and Hanser 2011).

Action: No Similar Action

Sub-objective: Conserve, enhance or restore sage-grouse habitat and connectivity (Knick and Hanser 2011) to promote movement and genetic diversity, with emphasis on those habitats occupied by sage-grouse.

Action: No Similar Action

· Sub-objective: Assess general sage-grouse habitats to determine potential to replace lost priority habitat caused by perturbations and/or disturbances and provide connectivity (Knick and Hanser 2011) between priority areas. These habitats should be given some priority over other general sage-grouse habitats that provide marginal or substandard sage-grouse habitat. Restore historical habitat functionality to support sage-grouse populations guided by objectives to maintain or enhance connectivity. Total area and locations will be determined at the Land Use Plan level. Enhance general sage-grouse habitat such that population declines in one area are replaced elsewhere within the habitat.

No Action

Action: No Similar Action

No Action

Action: Only allow BLM Special Recreation Permits (SRPs) and FS Recreation Special Use Authorizations (RSUAs) in priority habitat that have neutral or beneficial effects to priority habitat areas.

No Action

Action: Prioritize completion of land health assessments (FS may use other analyses) and processing grazing permits within priority sage-grouse habitat areas. Focus this process on allotments that have the best opportunities for conserving, enhancing or restoring habitat for sage-grouse. Utilize BLM Ecological Site Descriptions (ESDs) (FS may use other methods) to conduct land health assessments to determine if standards of range-land health are being met.

No Action

Action: Prioritize implementation of restoration projects based on environmental variables that improve chances for project success in areas most likely to benefit sage-grouse (Meinke et al. 2009). Prioritize restoration in seasonal habitats that are thought to be limiting sage-grouse distribution and/or abundance.

No Action

Action: Prioritize native seed allocation for use in sage-grouse habitat in years when preferred native seed is in short supply. This may require reallocation of native seed from Emergency Stabilization and Rehabilitation (ES&R) (BLM) and/or Burn Area Emergency Rehabilitation (BAER) (FS) projects outside of priority sage-grouse habitat to those inside it. Use of native plant seeds for ES&R or BAER seedings is required based on availability, adaptation (site potential), and probability of success (Richards et al. 1998). Where probability of success or native seed availability is low, non-native seeds may be used as long as they meet sage-grouse habitat conservation objectives (Pyke 2011). Re-establishment of appropriate sagebrush species/subspecies and important understory plants, relative to site potential, shall be the highest priority for rehabilitation efforts.

No Action

Action: Propose lands within priority sage-grouse habitat areas for mineral withdrawal.

No Action

Action: Require use of native seeds for restoration based on availability, adaptation (ecological site potential), and probability of success (Richards et al. 1998). Where probability of success or adapted seed availability is low, non-native seeds may be used as long as they support sage-grouse habitat objectives (Pyke 2011). No Action

Action: Restore native (or desirable) plants and create landscape patterns which most benefit sage-grouse. No Action

Action: Retain public ownership of priority sage-grouse habitat. Consider exceptions where: There is mixed ownership, and land exchanges would allow for additional or more contiguous federal ownership patterns within the priority sage-grouse habitat area. Under priority sage-grouse habitat areas with minority federal ownership, include an additional, effective mitigation agreement for any disposal of federal land. As a final preservation measure consideration should be given to pursuing a permanent conservation easement. No Action

Action: To reduce outright sage-grouse strikes and mortality, remove, modify or mark fences in high risk areas within priority sage-grouse habitat based on proximity to lek, lek size, and topography (Christiansen 2009, Stevens 2011). No Action

Action: When conducting NEPA analysis for wild horse and burro management activities, water developments or other rangeland improvements for wild horses in priority sage-grouse habitat, address the direct and indirect effects to sage-grouse populations and habitat. Implement any water developments or rangeland improvements using the criteria identified for domestic livestock identified above in priority habitats. No Action

Action: When developing or modifying water developments in priority habitat, use applicable best management practices (BMPs, see Appendix C) to mitigate potential impacts from West Nile virus (Clark et al. 2006, Doherty 2007, Walker et al. 2007b, Walker and Naugle 2011). No Action

Action: When reseeding roads, primitive roads and trails in priority habitat, use appropriate seed mixes and consider the use of transplanted sagebrush.	No Action
Action: Where existing leases or ROWs or SUAs have had some level of development (road, fence, well, etc.) and are no longer in use, reclaim the site by removing these features and restoring the habitat.	No Action
Action: Where riparian areas and wet meadows meet proper functioning condition or meet standards using other similar methodology (FS only), strive to attain reference state vegetation relative to the ecological site description.	Same as Priority Areas.
Action: Where suitable conservation actions cannot be achieved in priority habitat, seek to acquire state and private lands with intact subsurface mineral estate by donation, purchase or exchange in order to best conserve, enhance or restore sage-grouse habitat.	No Action
Action: Where the federal government owns the mineral estate in priority habitat, and the surface is in non-federal ownership, apply the conservation measures applied on public lands.	No Action
Action: Where the federal government owns the surface, and the mineral estate is in non-federal ownership in priority habitat, apply appropriate Fluid Mineral BMPs (see Appendix D) to surface development.	No Action
Action: Within priority habitat, develop or amend BLM Herd Management Area Plans (HMAPs) and FS Wildhorse Territory Plans (WHTPs) to incorporate sage-grouse habitat objectives and management considerations for all BLM herd management areas (HMAs) and FS Wildhorse Territories (WHTs).	No Action
Action: Within priority sage-grouse habitat, incorporate sage-grouse habitat objectives and management considerations into all BLM and FS grazing allotments through Allotment Management Plans (AMPs) or permit renewals and/or FS Annual Operating Instructions.	No Action

Action: Within priority sage-grouse habitat, reduce hot season grazing on riparian and meadow complexes to promote recovery or maintenance of appropriate vegetation and water quality. Utilize fencing/herding techniques or seasonal use or livestock distribution changes to reduce pressure on riparian or wet meadow vegetation used by sage-grouse in the hot season (summer) (Aldridge and Brigham 2002, Crawford et al. 2004, Hagen et al. 2007).

No Action

Action: Within sage-grouse habitats, manage wet meadows to maintain a component of perennial forbs with diverse species richness relative to site potential (e.g., reference state) to facilitate brood rearing. Also conserve or enhance these wet meadow complexes to maintain or increase amount of edge and cover within that edge to minimize elevated mortality during the late brood rearing period (Hagen et al. 2007, Kolada et al. 2009, Atamian et al. 2010).

Same as Priority Areas.

Address post reclamation management in reclamation plan such that goals and objectives are to protect and improve sage-grouse habitat needs.

Apply a phased development approach with concurrent reclamation.

No Action

As funding and logistics permit, restore annual grasslands to a species composition characterized by perennial grasses, forbs, and shrubs.

No Action

As safety allows, conduct mop-up where the black adjoins unburned islands, dog legs, or other habitat features to minimize sagebrush loss.

No Action

Assign a sage-grouse resource advisor to all extended attack fires in or near key sage-grouse habitat areas. Prior to the fire season, provide training to sage-grouse resource advisors on wildfire suppression organization, objectives, tactics, and procedures to develop a cadre of qualified individuals.

No Action

BMP Section B: Fluid Minerals

No Action

Build steep shorelines to reduce shallow water (>60 cm) and aquatic vegetation around the perimeter of impoundments (Knight et al. 2003). Construction of steep shorelines also will create more permanent ponds that are a deterrent to colonizing mosquito species like Cx. tarsalis which prefer newly flooded sites with high primary productivity (Knight et al. 2003).	No Action
Bury distribution power lines.	No Action
Bury power lines.	No Action
Clean up refuse (Bui et al. 2011).	Clean up refuse (Bui et al. 2011).
Close and reclaim duplicate roads by restoring original landform and establishing desired vegetation.	No Action
Cluster disturbances associated with operations (fracturing stimulation, liquids gatherin, etc.) and facilities as close as possible.	Cluster disturbances associated with operations (fracturing stimulation, liquids gatherin, etc.) and facilities as close as possible.
Collocate powerlines, flowlines, and small pipelines under or immediately adjacent to existing roads (Bui et al. 2010).	No Action
Conservation Measure: Apply a seasonal restriction on exploratory drilling that prohibits surface-disturbing activities during the nesting and early brood-rearing season in all priority sage-grouse habitat during this period.	No Action
Conservation Measure: Complete Master Development Plans in lieu of Application for Permit to Drill (APD)-by-APD processing for all but wildcat wells.	No Action
Conservation Measure: For future actions, require a full reclamation bond specific to the site in accordance with 43 CFR 3104.2, 3104.3, and 3104.5. Insure bonds are sufficient for costs relative to reclamation (Connelly et al. 2000, Hagen et al. 2007) that would result in full restoration of the lands to the condition it was found prior to disturbance. Base the reclamation costs on the assumption that contractors for the BLM or FS will perform the work.	No Action
Conservation Measure: Identify areas where acquisitions (including subsurface mineral rights) or conservation easements, would benefit sage-grouse habitat.	No Action

Conservation Measure: Make applicable Best Management Practices (BMPs, see Appendix D) mandatory as Conditions of Approval within priority sage-grouse habitat.	No Action
Conservation Measure: Require unitization when deemed necessary for proper development and operation of an area (with strong oversight and monitoring) to minimize adverse impacts to sage-grouse according to the Federal Lease Form, 3100-11, Sections 4 and 6.	No Action
Conservation Measure: When permitting APDs on existing leases that are not yet developed, the proposed surface disturbance cannot exceed 3% for that area. Consider an exception if: Additional, effective mitigation is demonstrated to offset the resulting loss of sage-grouse (see Objectives). When necessary, conduct additional, effective mitigation in 1) priority sage-grouse habitat areas or – less preferably – 2) general sage-grouse habitat (dependent upon the area-specific ability to increase sage-grouse populations). Conduct additional, effective mitigation first within the same population area where the impact is realized, and if not possible then conduct mitigation within the same Management Zone as the impact, per 2006 WAFWA Strategy – pg 2-17.	No Action
Construct dams or impoundments that restrict down slope seepage or overflow by digging ponds in flat areas rather than damming natural draws for effluent water storage, or lining constructed ponds in areas where seepage is anticipated (Knight et al. 2003).	No Action
Construct road crossings at right angles to ephemeral drainages and stream crossings. Control the spread and effects of non-native plant species (Gelbard and Belnap 2003, Bergquist et al. 2007, Evangelista et al. 2011). (E.g. by washing vehicles and equipment.)	Construct road crossings at right angles to ephemeral drainages and stream crossings. Control the spread and effects of non-native plant species (Evangelista et al. 2011). (E.g. by washing vehicles and equipment.)
Coordinate road construction and use among ROW or SUA holders. Cover (e.g., fine mesh netting or use other effective techniques) all drilling and production pits and tanks regardless of size to reduce sage-grouse mortality.	Coordinate road construction and use among ROW or SUA holders. Cover (e.g., fine mesh netting or use other effective techniques) all drilling and production pits and tanks regardless of size to reduce sage-grouse mortality.

Design or site permanent structures which create movement (e.g. pump jack) to minimize impacts to sage-grouse.	No Action
Design roads to an appropriate standard no higher than necessary to accommodate their intended purpose.	Design roads to an appropriate standard no higher than necessary to accommodate their intended purpose.
Design vegetation treatment in areas of high fire frequency to facilitate firefighting safety, reduce the risk of extreme fire behavior; and to reduce the risk and rate of fire spread to key and restoration habitats.	No Action
Develop state-specific sage-grouse toolboxes containing maps, a list of resource advisors, contact information, local guidance, and other relevant information.	No Action
Do not issue ROWs or SUAs to counties on newly constructed energy or mineral development roads, unless for a temporary use consistent with all other terms and conditions included in this document.	Do not issue ROWs or SUAs to counties on newly constructed energy or mineral development roads, unless for a temporary use consistent with all other terms and conditions included in this document.
During periods of multiple fires, ensure line officers are involved in setting priorities.	No Action
Emphasize the use of native plant species, recognizing that non-native species may be necessary depending on the availability of native seed and prevailing site conditions.	No Action
Ensure proposed sagebrush treatments are planned with interdisciplinary input from BLM, FS, and /or state wildlife agency biologist and that treatment acreage is conservative in the context of surrounding sage-grouse seasonal habitats and landscape.	No Action
Equip tanks and other above-ground facilities with structures or devices that discourage nesting of raptors and corvids.	Equip tanks and other above-ground facilities with structures or devices that discourage nesting of raptors and corvids.
Establish speed limits on BLM and FS system roads to reduce vehicle/wildlife collisions or design roads to be driven at slower speeds.	Establish speed limits on BLM and FS system roads to reduce vehicle/wildlife collisions or design roads to be driven at slower speeds.
Establish trip restrictions (Lyon and Anderson 2003) or minimization through use of telemetry and remote well control (e.g., Supervisory Control and Data Acquisition).	No Action
Fence pond site to restrict access by livestock and other wild ungulates that trample and disturb shorelines, enrich sediments with manure and create hoof print pockets of water that are attractive to breeding mosquitoes.	No Action

Fit transmission towers with anti-perch devices (Lammers and Collopy 2007).	No Action
Give priority for implementing specific sage-grouse habitat restoration projects in annual grasslands first to sites which are adjacent to or surrounded by sage-grouse key habitats. Annual grasslands are second priority for restoration when the sites not adjacent to key habitat, but within 2 miles of key habitat. The third priority for annual grasslands habitat restoration projects are sites beyond 2 miles of key habitat. The intent is to focus restoration outward from existing, intact habitat.	No Action
GOAL: Maintain and/or increase sage-grouse abundance and distribution by conserving, enhancing or restoring the sagebrush ecosystem upon which populations depend in cooperation with other conservation partners.	GOAL: Same as Priority Habitat.
Include objectives for ensuring habitat restoration to meet sage-grouse habitat needs in reclamation practices/sites (Pyke 2011).	No Action
Increase the size of fresh -water ponds to accommodate a greater volume of water than is discharged. This will result in un-vegetated and muddy shorelines that breeding Cx. tarsalis avoid (De Szalay and Resh 2000). This modification may reduce Cx. tarsalis habitat but could create larval habitat for Culicoides sonorensis, a vector of blue tongue disease, and should be used sparingly (Schmidtman et al. 2000). Steep shorelines should be used in combination with this technique whenever possible (Knight et al. 2003).	No Action
Irrigate interim reclamation if necessary for establishing seedlings more quickly.	No Action
Limit noise to less than 10 decibels above ambient measures (20-24 dBA) at sunrise at the perimeter of a lek during active lek season (Patricelli et al. 2010, Blickley et al. In preparation).	No Action
Line the channel where discharge water flows into the pond with crushed rock, or use a horizontal pipe to discharge inflow directly into existing open water, thus precluding shallow surface inflow and accumulation of sediment that promotes aquatic vegetation.	No Action

Line the overflow spillway with crushed rock, and construct the spillway with steep sides to preclude the accumulation of shallow water and vegetation.	No Action
Locate man camps outside of priority sage-grouse habitats.	No Action
Locate new compressor stations outside priority habitats and design them to reduce noise that may be directed towards priority habitat.	No Action
Locate roads to avoid important areas and habitats.	No Action
Maintain the water level below that of rooted vegetation for a muddy shoreline that is unfavorable habitat for mosquito larvae. Rooted vegetation includes both aquatic and upland vegetative types. Avoid flooding terrestrial vegetation in flat terrain or low lying areas. Aquatic habitats with a vegetated inflow and outflow separated by open water produce 5-10 fold fewer Culex mosquitoes than completely vegetated wetlands (Walton and Workman 1998). Wetlands with open water also had significantly fewer stage III and IV instars which may be attributed to increased predator abundances in open water habitats (Walton and Workman 1998).	No Action
Maximize the area of interim reclamation on long-term access roads and well pads, including reshaping, topsoiling and revegetating cut-and-fill slopes.	No Action
Minimize burnout operations in key sage-grouse habitat areas by constructing direct fireline whenever safe and practical to do so.	No Action
Minimize unnecessary cross-country vehicle travel during fire operations in sage-grouse habitat.	No Action
No Similar Objective	No Action

o Action: In priority habitat, design and implement fuels treatments with an emphasis on protecting existing sagebrush ecosystems. Do not reduce sagebrush canopy cover to less than 15% (Connelly et al. 2000, Hagen et al. 2007) unless a fuels management objective requires additional reduction in sagebrush cover to meet strategic protection of priority sage-grouse habitat and conserve habitat quality for the species. Closely evaluate the benefits of the fuel break against the additional loss of sagebrush cover in future NEPA documents. Apply appropriate seasonal restrictions for implementing fuels management treatments according to the type of seasonal habitats present in a priority area. Allow no fuels treatments in known winter range unless the treatments are designed to strategically reduce wildfire risk around or in the winter range and will maintain winter range habitat quality. Do not use fire to treat sagebrush in less than 12-inch precipitation zones (e.g., Wyoming big sagebrush or other xeric sagebrush species; Connelly et al. 2000, Hagen et al. 2007, Beck et al. 2009). However, if as a last resort and after all other treatment opportunities have been explored and site specific variables allow, the use of prescribed fire for fuel breaks that would disrupt the fuel continuity across the landscape could be considered, in stands where cheatgrass is a very minor component in the

No Action

o Action: In priority habitat, provide the following conservation measures as terms and conditions of the approved RMP: Do not allow new surface occupancy on federal leases within priority habitats, this includes winter concentration areas (Doherty et al. 2008, Carpenter et al. 2010) during any time of the year. Consider an exception: If the lease is entirely within priority habitats, apply a 4-mile NSO around the lek, and limit permitted disturbances to 1 per section with no more than 3% surface disturbance in that section. If the entire lease is within the 4-mile lek perimeter, limit permitted disturbances to 1 per section with no more than 3% surface disturbance in that section. Require any development to be placed at the most distal part of the lease from the lek, or, depending on topography and other habitat aspects, in an area that is less demonstrably harmful to sage-grouse.

No Action

OBJECTIVE: Maintain or increase current distribution and abundance of sage-grouse on BLM administered lands in support of the range-wide goals.

No Action

OBJECTIVE: Manage land uses, habitat treatments, and anthropogenic disturbances below thresholds necessary to conserve local sage-grouse populations, sagebrush communities and landscapes.

No Action

Objective: Manage wild horse and burro population levels within established Appropriate Management Levels (AML).

No Action

Objective: No Similar Objective

No Action

Objective: No Similar Objective

No Action

Objective: No Similar Objective

No Action

Objective: No Similar Objective

No Action

Objective: Prioritize gathers in priority sage-grouse habitat, unless removals are necessary in other areas to prevent catastrophic environmental issues, including herd health impacts.

No Action

Objective: Protect priority sage-grouse habitats from anthropogenic disturbances that will reduce distribution or abundance of sage-grouse

No Action

On critical fire weather days, pre-position additional fire suppression resources to optimize a quick and efficient response in sage-grouse habitat areas.	No Action
Pipelines must be under or immediately adjacent to the road (Bui et al. 2010).	No Action
Place infrastructure in already disturbed locations where the habitat has not been fully restored.	No Action
Place liquid gathering facilities outside of priority areas. Have no tanks at well locations within priority habitat areas to minimize truck traffic and perching and nesting sites for ravens and raptors.	No Action
Place new utility developments (power lines, pipelines, etc.) and transportation routes in existing utility or transportation corridors.	No Action
Planning Direction Note: Relocate existing designated ROW corridors crossing priority sage-grouse habitat void of any authorized ROWs, outside of the priority habitat area. If relocation is not possible, undesignate that entire corridor during the planning process.	No Action
Planning direction Note: Each planning effort will identify the specific allotment(s) where permanent retirement of grazing privileges is potentially beneficial.	No Action
Power-wash all firefighting vehicles, to the extent possible, including engines, water tenders, personnel vehicles, and ATVs prior to deploying in or near sage-grouse habitat areas to minimize noxious weed spread.	No Action
Power-wash all vehicles and equipment involved in fuels management activities prior to entering the area to minimize the introduction of undesirable and/or invasive plant species.	No Action
Priority sage-grouse habitats are areas that have the highest conservation value to maintaining or increasing sage-grouse populations. These areas would include breeding, late brood-rearing, winter concentration areas, and where known, migration or connectivity corridors.	General sage-grouse habitat is occupied (seasonal or year-round) habitat outside of priority habitat.
Protect wildland areas from wildfire originating on private lands, infrastructure corridors, and recreational areas.	No Action

Provide localized maps to dispatch offices and extended attack incident commanders for use in prioritizing wildfire suppression resources and designing suppression tactics.	No Action
Provide training to fuels treatment personnel on sage-grouse biology, habitat requirements, and identification of areas utilized locally.	No Action
Reduce the risk of vehicle or human-caused wildfires and the spread of invasive species by planting perennial vegetation (e.g., green-strips) paralleling road rights-of-way.	No Action
Remove or re-inject produced water to reduce habitat for mosquitoes that vector West Nile virus. If surface disposal of produced water continues, use the following steps for reservoir design to limit favorable mosquito habitat: Overbuild size of ponds for muddy and non-vegetated shorelines. Build steep shorelines to decrease vegetation and increase wave actions. Avoid flooding terrestrial vegetation in flat terrain or low lying areas. Construct dams or impoundments that restrict down slope seepage or overflow. Line the channel where discharge water flows into the pond with crushed rock. Construct spillway with steep sides and line it with crushed rock. Treat waters with larvicides to reduce mosquito production where water occurs on the surface.	No Action
Remove standing and encroaching trees within at least 100 meters of occupied sage-grouse leks and other habitats (e.g., nesting, wintering, and brood rearing) to reduce the availability of perch sites for avian predators, as appropriate, and resources permit.	No Action
Require noise shields when drilling during the lek, nesting, brood-rearing, or wintering season.	No Action
Require sage-grouse safe fences around sumps.	No Action
Require sage-grouse-safe fences.	No Action
Restore disturbed areas at final reclamation to the pre-disturbance landforms and desired plant community.	No Action
Restrict pit and impoundment construction to reduce or eliminate threats from West Nile virus (Doherty 2007).	Restrict pit and impoundment construction to reduce or eliminate threats from West Nile virus (Doherty 2007).

Restrict the construction of tall facilities and fences to the minimum number and amount needed.	Restrict the construction of tall facilities and fences to the minimum number and amount needed.
Restrict vehicle traffic to only authorized users on newly constructed routes (using signage, gates, etc.)	No Action
Roads - PPH	No Action
Site and/or minimize linear ROWs or SUAs to reduce disturbance to sagebrush habitats.	No Action
Strategically place and maintain pre-treated strips/areas (e.g., mowing, herbicide application, and strictly managed grazed strips) to aid in controlling wildfire should wildfire occur near key habitats or important restoration areas (such as where investments in restoration have already been made).	No Action
Sub-objective: Designate priority sage-grouse habitats for each WAFWA management zone (Stiver et al. 2006) across the current geographic range of sage-grouse that are large enough to stabilize populations in the short term and enhance populations over the long term.	Sub-objective: Designate general sage-grouse habitats for each WAFWA management zone (Stiver et al. 2006) across the current geographic range of sage-grouse that provide for major life history function (e.g., breeding, migration, or winter survival) in order to maintain genetic diversity needed for sustainable Greater Sage-Grouse populations.
Sub-objective: Develop quantifiable habitat and population objectives with WAFWA and other conservation partners at the management zone and/or other appropriate scales. Develop a monitoring and adaptive management strategy to track whether these objectives are being met, and allow for revisions to management approaches if they are not.	No Action

Sub-objective: Manage priority sage-grouse habitats so that discrete anthropogenic disturbances cover less than 3% of the total sage-grouse habitat regardless of ownership. Anthropogenic features include but are not limited to paved highways, graded gravel roads, transmission lines, substations, wind turbines, oil and gas wells, geothermal wells and associated facilities, pipelines, landfills, homes, and mines. In priority habitats where the 3% disturbance threshold is already exceeded from any source, no further anthropogenic disturbances will be permitted by BLM or FS until enough habitat has been restored to maintain the area under this threshold (subject to valid existing rights). In this instance, an additional objective will be designated for the priority area to prioritize and reclaim/restore anthropogenic disturbances so that 3% or less of the total priority habitat area is disturbed within 10 years.

No Action

Sub-objective: To maintain or increase current populations, manage or restore priority areas so that at least 70% of the land cover provides adequate sagebrush habitat to meet sage-grouse needs.

No Action

To the extent possible, locate wildfire suppression facilities (i.e., base camps, spike camps, drop points, staging areas, and heli-bases) in areas where physical disturbance to sage-grouse habitat can be minimized. These include disturbed areas, grasslands, near roads/trails or in other areas where there is existing disturbance or minimal sagebrush cover.

No Action

Use directional and horizontal drilling to reduce surface disturbance.  
Use dust abatement practices on roads and pads.

Use directional and horizontal drilling to reduce surface disturbance.  
Use dust abatement practices on roads and pads.

Use fire prescriptions that minimize undesirable effects on vegetation or soils (e.g., minimize mortality of desirable perennial plant species and reduce risk of hydrophobicity).

No Action

Use only closed-loop systems for drilling operations and no reserve pits.

No Action

Use remote monitoring techniques for production facilities and develop a plan to reduce the frequency of vehicle use (Lyon and Anderson 2003).	Use remote monitoring techniques for production facilities and develop a plan to reduce the frequency of vehicle use (Lyon and Anderson 2003).
--	--

Utilize mulching techniques to expedite reclamation and to protect soils.	No Action
---	-----------

Utilize retardant and mechanized equipment to minimize burned acreage during initial attack.	No Action
--	-----------

Where applicable, design fuels treatment objective to protect existing sagebrush ecosystems, modify fire behavior, restore native plants, and create landscape patterns which most benefit sage-grouse habitat.	No Action
---	-----------

Where applicable, incorporate roads and natural fuel breaks into fuel break design.	No Action
---	-----------

Where appropriate, ensure that treatments are configured in a manner (e.g., strips) that promotes use by sage-grouse (See Connelly et al., 2000*)	No Action
---	-----------

Action: Same as Alternative B.

Action: Same as Alternative B.

Action: Composition, function, and structure of native vegetation communities will be consistent with the reference state of the appropriate ESD and will be maximized to provide for healthy, resilient, and recovering sage-grouse habitat components. (WWP)

Action: Same as Alternative B.

Action: Same as Alternative B.

Action: Same as Alternative B.

Action: Exotic seedlings will be rehabbed, interseeded, restored to recover sagebrush in areas to expand occupied habitats. (WWP)

Action: Same as Alternative B.

Action: Same as Alternative B.

Active restoration practices:” “Removal of livestock water troughs, pipelines, and wells.” “Where possible, without further damage to springs/water sources, remove waterline piping and maximize water at spring/stream sources supporting diverse riparian and meadow vegetation. “ “Promote natural healing of headcuts to the maximum extent possible by limiting disturbance throughout the watershed. At times, a combination of methods may need to be used – but gabions and structural devices and boulder dumping should be limited, and restoration should strive for a functioning system. “ “Ripping/recontouring of roads and seeding with native local ecotypes of shrubs and grasses. (WWP)

Active restoration of crested wheatgrass seedlings. This can be accomplished, following targeted restoration planning to expand, reconnect or recover habitats required by sage-grouse by:” “Inter-seeding sagebrush seed or seedlings. “ “Removal of crested wheatgrass through plowing while minimizing use of herbicides. Subsequent re-seeding with local native ecotypes. “ “Active restoration of cheatgrass infestation areas.” “In all cases, local native plant ecotype seeds and seedlings must be used. (WWP)

**Alternative D - Priority Habitat Areas**

**Alternative D - Medial Habitat Areas**

Action: No Similar Action  
Action: No Similar Action  
GOAL: Same as Alternative B.  
OBJECTIVE: Identify and strategically protect larger in-tact sagebrush areas and areas of lower fragmentation to maintain sage-grouse population persistence.

Action: No Similar Action  
Sub-objective: Same as Alternative B.

OBJECTIVE: Identify and expand sagebrush areas to increase the extent and condition of available habitat on the landscape.

OBJECTIVE: Reconnect and expand areas of higher native plant community integrity/ rangeland health to increase the extent of high quality habitat and, where possible, to account for the future effects of climate change.

OBJECTIVE: Increase the amount and functionality of seasonal habitats. a. Increase canopy cover and average patch size of sagebrush in perennial grasslands. b. Increase the amount, condition and connectivity of seasonal habitats. c. Protect or improve sage-grouse migration/ movement corridors . d. Reduce conifer encroachment within sage-grouse seasonal habitats. e. Improve understory (grass, forb) and/or riparian condition within breeding and late brood-rearing habitats. f. Reduce the extent of annual grasslands within to priority habitat.

Action: No Similar Action  
Action: No Similar Action  
GOAL: Same as Alternative B.  
OBJECTIVE: Identify and strategically protect larger in-tact sagebrush areas and areas of lower fragmentation to maintain sage-grouse population persistence.

Action: No Similar Action  
Sub-objective: Designate medial sage-grouse habitats within WAFWA management zone IV (Stiver et al. 2006) that augment identified priority habitat areas.

OBJECTIVE: Identify and expand sagebrush areas to increase the extent and condition of available habitat on the landscape.

OBJECTIVE: Same as Priority.

OBJECTIVE: Increase the amount and functionality of seasonal habitats. a. Increase canopy cover and average patch size of sagebrush in perennial grasslands. b. Increase the amount, condition and connectivity of seasonal habitats. c. Protect or improve sage-grouse migration/ movement corridors . d. Reduce conifer encroachment within sage-grouse seasonal habitats. e. Improve understory (grass, forb) and/or riparian condition within breeding and late brood-rearing habitats. f. Reduce the extent of annual grasslands within to priority habitat.

H/PGH map of pph by alternative

Action: No Similar Action

OBJECTIVE: Manage anthropogenic development and human disturbance in priority habitat to minimize the likelihood of adverse local population-level effects on sage-grouse and provide for no net loss of habitat.

bitat

OBJECTIVE: Reduce or minimize risk of West Nile Virus or other diseases.

Priority sage-grouse habitats are areas that have the highest conservation value to maintaining or increasing sage-grouse populations. These areas would include breeding, late brood-rearing, winter concentration areas, and where known, migration or connectivity corridors.

Designate areas as ROW Avoidance areas and exclusion areas for wind and solar development. The following uses are not allowed: Transmission facilities (greater than 50kV in size - based on recent IM), wind energy testing and development, commercial solar development, commercial geothermal development, nuclear development, oil and gas development, mineral development, airports, and ancillary facilities associated with any of the forementioned development; paved roads and graded gravel roads, and landfills.

Designate areas as ROW Avoidance areas.

New ROW and land use authorizations would be avoided whenever possible. Any new ROW and land use authorizations would not result in a net loss of sage-grouse habitat of the respective priority area.

Same as Priority areas.

Land authorizations that are temporary in nature (such as film permits, apiaries sites, etc.), that do not result in loss of sage-grouse habitat would be subject to seasonal or timing restrictions and are otherwise exempt from mitigation requirements regarding habitat loss.

Same as priority areas.

New authorizations and modifications to existing ROW and land use authorizations would be subject to siting prescriptions and design features considered on a case-by-case basis, in subsequent NEPA analysis. This could include modifications to the types of uses that are excluded from consideration as new authorizations. For example upgrade of an existing 50kV powerline to a 115kV powerline, to eliminate the need for an additional line could be considered.

New authorizations and modifications to existing ROW and land use authorizations would be considered subject to siting prescriptions and design features considered on a case-by-case basis, in subsequent NEPA analysis.

New authorizations or modifications should be sited substantially within an existing disturbance or minimum necessary adjacent to the existing footprint, where feasible.

New authorizations or modifications should be sited substantially within the existing disturbance footprints where feasible.

Removal/relocation/ or burial opportunities for powerlines should be explored and implemented where feasible.

Same as Priority areas.

Site new authorizations or facilities outside the lek avoidance buffer areas (defined as???) unless topographic features reduce or eliminate effects to the lek.

Same as Priority areas.

Guy wires will be avoided where feasible. Where guy wires are necessary and appropriate without causing a human safety risk, bird collision diverters will be required.

Same as Priority areas.

Design structures and facilities to reduce perching and nesting opportunities for avian predators.

Same as Priority areas.

New power and communication lines, outside of existing ROWs, would be buried, where physically feasible, and associated above-ground disturbance areas would be seeded with perennial vegetation as per vegetation management.

New power and communication lines, outside of existing ROWs, would be buried, where physically and economically feasible, and associated above-ground disturbance areas would be seeded with perennial vegetation as per vegetation management.

Adhere to seasonal restrictions?  
Linear ROWs may be considered as vegetated fuel-breaks.

Same as Priority areas.

Retain public ownership of priority sage-grouse habitat. Consider exceptions where: There is mixed ownership, and land exchanges would allow for additional or more contiguous federal ownership patterns within the priority sage-grouse habitat area.

Same as priority areas.

Action: Lands currently identified for retention within priority areas would be retained unless disposal of those lands would increase the extent or provide for connectivity of priority areas.

Action: No Similar Action

Action: No Similar Action

Action: No Similar Action

Action: No Similar Action

Action: No Similar Action

Key Decision: Identify Proposed Withdrawal Areas [We need for guidance here . Is the NTT action calling for withdrawals meant to be more for special designations such ACECs] Need to look at what needs to be retained and what we can get rid of, per LUP handbook Action: Withdrawal for the protection of sage-grouse may or may not be the most appropriate means to provide for the maintenance and enhancement for sage-grouse\*. ROW Avoidance and Exclusion designations will be evaluated to provide necessary protections. Action: When modifying or extending an existing withdrawal, ensure the lands are segregated from all of the mining and mineral leasing laws, as long as the segregation does not interfere with the intent of the withdrawal. \*Note: Lands are generally withdrawn for a specific use of the land by a BLM or another federal agency, and not simply to protect a resource. The withdrawn lands are generally segregated from some or all the public land laws and some or all of the mining and mineral leasing laws for a specific period of time. For example, if

Action: No Similar Action

Action: No Similar Action

Key Decision: Lands for Acquisition Action: Identify lands for acquisition that increase the extent of or provide for connectivity of PPH. Action: Acquisition of sage-grouse PPH will have priority over the acquisition of land for other program purposes subject to the approval of the Authorized officer.

Key Decision: Lands for Exchange Action: Evaluate potential land exchanges containing historically low-quality sage-grouse habitat that may be too costly to restore in exchange for lands of higher quality habitat, lands that connect seasonal sage-grouse habitats or lands providing for T&E species. These potential exchanges should lead to an increase in the extent or continuity of or provide for improved connectivity of PPH. Higher priority will be given to exchanges for those in-tact areas of sagebrush that will contribute to the expansion of PPH sagebrush areas currently in public ownership. Lower priority will be given to those lands that will promote enhancement the other PPH and PGH areas.

Same as Priority areas.

Solar and wind energy development is not allowed.

Action: Wind and solar energy development would be restricted where adverse effects could not be mitigated. Ancillary facilities such as roads, electric lines, etc. could potentially be authorized provided there is no net loss of sage-grouse habitat through mitigation.

Action: Process unauthorized use. If the unauthorized use does not serve the best interest of the public, reclaim the site by removing these features and restoring the habitat. If the use needs to be authorized, management actions for new authorizations would need to be consistent with objectives for conserving sage-grouse.

Same as Priority areas.

Action: No Similar Action

Action: No Similar Action

Action: No Similar Action

Action: No Similar Action

Action: Prioritize implementation of vegetation rehabilitation projects to achieve the greatest improvement in sage-grouse abundance and distribution.

Same as Priority areas.

Factors contributing to higher emphasis for implementation include:

- Projects within priority habitat areas.
- Sites where environmental variables contribute to improved chances for project success (Meinke et al. 2009).
- Improvement of seasonal habitats that are thought to be limiting sage-grouse distribution and/or abundance (wintering areas, wet meadows and riparian areas, nesting areas, leks, etc.).
- Re-establishment of sagebrush cover in otherwise suitable sage-grouse habitat (native perennial grasslands, recently burned areas).
- Re-establishment of desirable understory vegetation in existing sagebrush stands.

- Cooperative efforts that may improve sage-grouse habitat quality over multiple ownerships.
- Projects in general habitat areas that may provide connectivity between suitable habitats or expand existing good quality habitats.
- Projects that address conifer encroachment into

Action: Develop objectives for rehabilitation projects that include sage-grouse habitat characteristics. Objectives for sagebrush canopy cover and plant community structure should be consistent with what would be expected for the ecological site( s) of the project area. Consult sage-grouse habitat parameters as defined by Connelly et al. (2000), Hagen et al. (2007), State or Local Sage-Grouse Conservation plans and other local information in order to develop restoration objectives that most effectively improve sage-grouse habitat quality.

Same as Priority areas.

Action: No Similar Action  
Same as Alternative B.

Action: No Similar Action  
Same as Priority areas.

Action: Implement management changes, as necessary, to maintain suitable sage-grouse habitat, improve unsuitable sage-grouse habitat and to ensure long-term persistence of improved sage-grouse habitat achieved through restoration efforts. (Eiswerth and Shonkwiler 2006). Management changes could be considered for livestock grazing, wild horse and burros, travel planning, etc.

Same as Priority areas.

Action: Utilize existing and appropriate rangeland health assessment and sage-grouse habitat assessment (currently the Habitat Assessment Framework) processes to quantify sage-grouse habitat quality. Prioritize assessment completion in priority habitat areas.

Use strategically placed fuel breaks (e.g. fire resistant vegetation, green-strip seedings, etc.) to aid in firefighter safety, assist in control of wildfire spread and in minimizing human ignitions and reduce the potential extent or chance of wildfire. Same as Priority areas.

Strategically pre-treat areas to reduce fine fuels through mechanical treatments, grazing strategies, chemical or biological application (brown stripping), etc. Same as Priority areas.

Action: Proactively protect sage-grouse habitat from fire through strategic wildfire suppression planning. Planning measures may include: pre-planning of wildfire suppression tactics in important sage-grouse habitat; prioritizing suppression of wildfire in priority areas; Train firefighting personnel regarding sage-grouse/sagebrush management issues as related to wildfire suppression activities, including maps (e.g. habitat, strategies, etc.); Where appropriate (e.g. expected lightning occurrence) stage initial attack resources closer to areas of expected lightning or storm paths to ensure quicker response times; Conducting burn-out/backfiring operations in a manner that minimizes the loss of sagebrush when possible; utilize other applicable fire management strategies; the Agency Administrator or Duty Officer will prioritize the assignment of resources for suppression activities in the event of multiple wildfire starts in priority habitat. Use resource advisors during extended attack. Resource Advisors should also be available on short notice during red flag conditions. Retain all

Action: Implement integrated weed management actions for noxious and invasive weed populations that are impacting or threatening sage-grouse habitat quality . In concert with partners and/or weed management areas as appropriate apply education, inventory, prevention, control, rehabilitation, and monitoring strategies that protect or enhance sage-grouse habitat .

Same as Priority areas.

Action: Implement rehabilitation projects that will increase sage-grouse abundance and distribution where sage-grouse habitat is of less quality than the land is capable of producing in relation to site potential .

Same as Priority areas.

Action: Utilize cooperative planning efforts to develop and implement habitat restoration projects. Expertise and ideas from local landowners, working groups, and other federal, state, county, and private organizations should be solicited and considered in development of projects .

Same as Priority areas.

Action: Consider design features that will contribute to the most favorable conditions for success when planning and implementing rehabilitation projects.

Same as Priority areas.

Considerations should include: - Careful review of available plant species and their adaptation to the site when developing seed mixes. (Lambert 2005, VegSpec). - The impacts of potential climate changes (Miller et al. 2011), consider utilizing the warmer component of a species' current range when selecting native species for restoration (Kramer and Havens 2009). -

The need to reduce annual grass densities and competition through herbicide, targeted grazing, tillage, prescribed fire, etc. (Pyke 2011). - The need to reduce density and competition of perennial grasses and techniques to accomplish this reduction (Pellant and Lysne 2005 ). - Techniques to introduced desired species to the site such as drill seeding, broadcast seeding followed by a seed coverage technique such as harrowing, chaining or livestock trampling, transplanting container or bareroot seedlings , etc. - Assessment of on-site

Action: Conduct monitoring of vegetation utilizing techniques that quantify sage-grouse habitat parameters to determine if vegetation management objectives are being achieved. This monitoring would occur consistent with appropriate BLM and FS direction which current utilizes the Habitat Assessment Framework and BLM Technical Reference 1734-4.

Same as Priority areas.

GOAL: In priority habitat, design and implement fuels treatments with an emphasis on protecting existing sagebrush ecosystems and successfully rehabilitated areas and strategically and effectively reduce wildfire threats in the greatest area.

Action: No Similar Action

Same as Priority areas.

Action: Design and implement fuels treatments with an emphasis on maintaining, protecting, and expanding sage grouse habitats. Enhance (or maintain/retain) sagebrush canopy cover and community structure to match expected potential for the ecological site and consistent with sage-grouse habitat objectives unless fuels management objectives requires additional reduction in sagebrush cover to meet strategic protection of sage-grouse habitat. Closely evaluate the benefits of the fuel management treatments against the additional loss of sagebrush cover on the local landscape in the NEPA process. Apply appropriate seasonal restrictions for implementing fuels management treatments according to the type of seasonal habitats present in a priority area. Allow no treatments in known winter range unless the treatments are designed to strategically reduce wildfire risk around and/or in the winter range and will maintain, increase, or enhance winter range habitat quality. Ensure chemical applications are utilized where they would

Same as Priority areas.

Action: Make progress toward desired future condition (DFC) in the Low-elevation Shrub, Perennial Grass, Invasive Annual Grass, Mid-Elevation Shrub, Mountain Shrubs, and Juniper vegetation types. Use chemical, mechanical, seeding, and prescribed fire treatments as appropriate to enhance and restore habitats that are currently in FRCC2 and FRCC3. In Perennial Grass, Invasive Annual Grass, and juniper-invaded cover types, restore sagebrush steppe with an aggressive sagebrush seeding effort, using the appropriate sagebrush subspecies for the treatment area. Conduct vegetation treatments in areas that pose a wildland fire risk to sage-grouse habitats. Treat areas within sage-grouse habitats that have low resiliency to disturbance (i.e. areas characterized by lower native plant species diversity than expected for the site, undesirable plant species composition, and dead or decadent sagebrush) to improve long-term habitat suitability for sage-grouse. Treat sage grouse habitat and potential restoration areas to expand priority areas. Improve sage grouse potential restoration habitats

Same as Priority areas.

Action: Suppress wildland fires in sage-grouse habitats.

Designate or design developed recreation sites and associated facilities to direct use away from sensitive areas and provide sustainable recreational opportunities. Same as Priority areas.

Incorporate seasonal restrictions for authorized activities to minimize impacts to GRSG and/or their habitat. Same as Priority areas.

Recreation activities and developed recreation sites and facilities within lands not designated as a recreation management area would be managed and designed to minimize adverse effects to GRSG by directing use away from sensitive areas. Same as Priority areas.

Limit snow machine travel to existing routes in sage-grouse wintering areas from November 1 through March 31. Assess routes during subsequent travel management planning. Same as Priority areas.

Action: No Similar Action

Repeat

Action: No Similar Action

Action: No Similar Action

Action: Within grazing allotments containing sage-grouse habitat, incorporate grazing management measures designed to meet sage-grouse habitat objectives through allotment management plans (AMPs), grazing permit renewal or permit modification processes. Same as Priority areas.

Same as Priority areas.

Where opportunities exist, work cooperatively with other land managers to allow livestock operations that utilize mixed federal, private and/or state land to be managed at the landscape scale to benefit sage-grouse and their habitat. Same as Priority areas.

Action: Priority areas are the highest priority for land health assessments (and FS assessments) and processing of grazing permits within priority sage-grouse habitat areas, with emphasis in management units of greatest concern with respect to sage-grouse. Where possible, conduct land health assessments at the watershed, or other meaningful landscape-scale.

Action: Prioritize land health assessments (and FS assessments) and processing of grazing permits after priority areas, with emphasis in management units of greatest concern with respect to sage-grouse. Where possible, conduct land health assessments at the watershed, or other meaningful landscape-scale.

Action: During the land health assessment process determine whether vegetation structure, condition and composition are meeting sage-grouse habitat objectives in sagebrush cover types through implementation of the habitat assessment framework, (Stiver et al 2010 as amended/replaced) or other BLM or Forest Service approved methodology, in accordance with current policy and guidance.

Same as Priority areas.

Action: Use monitoring information and rangeland health assessments to develop specific habitat objectives and grazing management plans designed to maintain, enhance and restore sage-grouse habitat. Prioritize implementation of grazing systems or permit modifications that make progress towards meeting habitat objectives, in areas that are not meeting these objectives.

Same as Priority areas.

Action: Manage for vegetation composition and structure consistent with appropriate sage-grouse seasonal habitat objectives relative to site potential.

Same as Priority areas.

Action: Where livestock management practices are not compatible with meeting or making progress towards habitat objectives, implement changes in grazing management through grazing authorization modifications, or AMP implementation. Potential considerations include, but are not limited to, changes in: 1) Season or timing of use; 2) Numbers of livestock; 3) Distribution of livestock use; 4) Duration and/or level of use; 5) Kind of livestock (e.g., cattle, sheep, horses, or goats) (Briske et al. 2011). 6) Voluntary measures such as temporary non-use; and 7) Grazing schedules (including rest or deferment)

Same as Priority areas.

Action: Adjust grazing management (i.e. delay turnout, adjust pasture rotations, adjust the amount and/or duration of grazing, etc.) to promote adequate food and cover for sage-grouse during drought periods. Use a recognized drought indicator, such as the Drought Monitor or Palmer Drought Severity Index, to determine when abnormally dry or drought conditions are developing, present, or easing. Since there is a lag in vegetation recovery following drought (Thurow and Taylor 1999, Cagney et al. 2010), allow for vegetation recovery through post-drought management that meets sage-grouse needs in priority sage-grouse habitat areas.

Same as Priority areas.

Manage livestock grazing in sage-grouse habitats so that proper functioning conditions and late brood rearing habitat objectives are achieved in riparian and lentic areas according to site potential.

Action: Limit authorization of new water developments to projects that would benefit, maintain, or have a neutral effect on priority sage-grouse habitat (such as by shifting livestock use away from critical areas). New developments that divert surface water must be designed to maintain integrity and functionality riparian or wetland vegetation and hydrology. New developments should also be sited in lower quality habitats or, disturbed areas where possible, and avoid areas that have not had significant prior grazing use (Adopted from Idaho State Plan page 4.64). Ensure that troughs are fitted with wildlife escape ramps to facilitate use of and escape by animals, including sage-grouse.

Same as Priority areas.

Action: During project inspections, analyze the design and condition of existing water developments associated with springs, wetlands or playas, such as headboxes, exclosures, pipelines and troughs to determine if modification, repair or retrofitting or removal is needed to maintain or restore the integrity and functionality of the riparian/lentic areas to current site potential within priority sage-grouse habitat. Modifications may include, but are not limited to, installing float valves on troughs, reconfiguring exclosure fencing, or moving troughs out of riparian/lentic areas. Ensure that troughs are fitted with wildlife escape ramps to facilitate use of and escape by animals, including sage-grouse.

Same as Priority areas.

Action: No Similar Action

Action: No Similar Action

Action: Assess the compatibility of existing non-native seedings for sage-grouse habitat or as a component of a grazing system or forage reserve during land health assessments (Davies et al. 2011). Evaluate existing seedings currently dominated by introduced perennial grasses in and adjacent to priority sage-grouse habitats to determine if they should be diversified with native grasses, forbs, and shrubs, including sagebrush. If these seedings are part of an AMP/ Conservation Plan and if they provide value in conserving or enhancing the rest of the priority habitats, restoration may not be appropriate.

Same as Priority areas.

Consider the potential for invasive and noxious weed establishment or increase following construction in the project planning process and monitor and treat post-construction. Where appropriate, areas of soil disturbance will be planted with a seed mix designed to compete with invasive species.

Same as Priority areas.

Action: Design any new structural range improvements consistent with objectives to maintain, enhance, or restore sage-grouse habitat.

Same as Priority areas.

Design and locate fences to minimize the potential for sage-grouse strikes.

Same as Priority areas.

Action: When developing or modifying water developments in priority habitat, use best management practices (BMPs, see Appendix C) to mitigate potential impacts from West Nile virus (Clark et al. 2006, Doherty 2007, Walker et al. 2007b, Walker and Naugle 2011).

Action: When developing or modifying water developments in priority habitat, use best management practices (BMPs, see Appendix C) to mitigate potential impacts from West Nile virus (Clark et al. 2006, Doherty 2007, Walker et al. 2007b, Walker and Naugle 2011).

Action: During project inspections, evaluate the design and location of existing structural range improvements and location of supplements (salt or protein blocks) with respect to their effect on sage-grouse habitat, including, but not limited to: potential for sage-grouse strikes, avian predation due to creation of roosting, perching or nesting sites, introduction of weeds, West Nile Virus and effects to vegetation structure or composition. Assess existing livestock management fences within priority sage-grouse habitat for risk of sage-grouse strikes based on proximity to leks, lek size, and topography (Christiansen 2009; Stevens 2011) or existing collision risk models (Stevens 2012). Prioritize removal, modification or marking of fences in areas of moderate or high collision risk to reduce the incidence of sage-grouse mortality due to fence strikes. Avoid building new permanent fences within 2 km of occupied leks or winter concentration areas. If this is not feasible, ensure that high risk segments are marked with collision diverter devices or as latest science indicates. Utilize temporary fencing

Wind energy development is excluded in priority areas.	Wind energy development project must comply with the 2012 U.S. Fish and Wildlife Service's Wind Energy Guidelines.

General procedure for requesting and granting exceptions to seasonal wildlife restrictions:

Same as Priority areas.

Even with conscientious planning up front, it is sometimes not possible to avoid impacts to wildlife. In such cases, temporary exceptions to wildlife seasonal restrictions may be allowed at times to accommodate certain activities, such as construction of energy development facilities, power transmission lines or other projects, if the activities can be done quickly and with little or no disturbance to the wildlife species of interest. The intent of allowing an exception is to eliminate a restriction when it has no applicability or is not needed to avoid impacts to wildlife. The discretion to allow an exception is limited to those situations where the degree of impacts to wildlife, as predicted in the NEPA analysis (e.g., as completed in the EA or EIS for the project in question), would be the same, with or without the restriction. An exception is a case-by-case, one time exemption from a seasonal restriction for a specified portion of the project, right-of-way or lease area.

## Alternative D - General Habitat Areas

Action: No Similar Action

Action: No Similar Action

GOAL: Same as Alternative B.

OBJECTIVE: Conserve, enhance or restore general habitat areas to improve habitat condition and connectivity between priority and medial habitat areas.

Action: No Similar Action

Sub-objective: Same as Alternative B.

OBJECTIVE: Manage general habitats in a way that buffers adjoining priority and medial habitat from disturbances.

OBJECTIVE: Same as Priority.

OBJECTIVE: Reduce the extent of annual grassland adjacent to priority and medial habitat, improve conditions to reconnect priority and medial habitats.

Same as Medial Habitat.

New ROW and land use authorizations would be avoided whenever possible.

Action: Lands are available for leasing subject to applicable timing restrictions (seasonal and daily) for exploration activities and initial mine development, as well as a stipulation preventing surface occupancy within xx miles of an occupied sage-grouse lek. Lands are available for prospecting, subject to applicable timing restrictions (seasonal and daily). Prospecting would not be allowed within xx miles of an occupied sage-grouse lek.

Action: For existing undeveloped non-energy mineral leases, require timing restrictions (seasonal and daily) when exploration activities or mine development is proposed, as appropriate. Also require appropriate BMPs (Appendix E to the NTT Report) as Conditions of Approval to the mine plan, and require restoration of habitat or off-site mitigation, if on-site restoration is not feasible.

Same as priority areas.

Action: No Similar Action

Require new 3809 notices and plans of operation include measures to avoid or minimize adverse effects to sage-grouse and habitat. Ensure compliance with 3809 regulations to prevent unnecessary and undue degradation (from WO IM 2012-044).reasonable and appropriate BMPs (see Appendix E of NTT Report) as a Condition of Approval of a 3809 Plan of Operations or Notice.

No new authorizations would be approved within xx miles of an occupied lek.  
Disposals would be subject to seasonal timing restrictions, as appropriate.

Same as priority areas.

Same as priority areas.

Same as priority areas.

Action: Allow geophysical exploration subject to seasonal timing restrictions and/or other restrictions that may apply.

Action: Where the federal government owns the mineral estate in general habitat and the surface is in non-federal ownership, apply stipulations, conservation measures and design features consistent with those applied to public lands in general habitat in the area.

Recommend to the mineral estate owner that they apply a timing restriction stipulation and restrict activities within xx miles of an occupied lek, when concurring to the approval of authorizations for mineral-related surface disturbance on lands in general habitat. Note: This would be a realty action, as the mineral estate is not involved.

New water developments that divert surface water must be designed to maintain integrity and functionality of riparian or wetland vegetation and hydrology. New developments should also be sited in lower quality habitats or disturbed areas where possible (Adopted from Idaho State Plan page 4.64). Ensure that troughs are fitted with wildlife escape ramps to facilitate use of and escape by animals, including sage-grouse.

Action: When developing or modifying water developments in priority habitat, use best management practices (BMPs, see Appendix C) to mitigate potential impacts from West Nile virus (Clark et al. 2006, Doherty 2007, Walker et al. 2007b, Walker and Naugle 2011).

Action: During project inspections, evaluate the design and location of existing structural range improvements and location of supplements (salt or protein blocks) with respect to their effect on sage-grouse habitat, including, but not limited to: potential for sage-grouse strikes, avian predation due to creation of roosting, perching or nesting sites, introduction of weeds, West Nile Virus and effects to vegetation structure or composition. Avoid building new fences within 2 km of occupied leks or winter concentration areas. If this is not feasible, ensure that high risk segments are marked with collision diverter devices or as latest science indicates.

**Alternative E - Idaho - Common to All Areas**

**Alternative E - Idaho - Core Areas**

Maintain existing requirements regarding site-specific environmental analysis, public involvement, consultation with Tribes and other agencies, or compliance with applicable laws without waiver.

Action: No Similar Action

Conduct appropriate, site-specific analysis as described in the National Environmental Policy Act and any requisite site-specific decision-making (i.e. 43 CFR Subpart 4160 or 36 CFR Part 251) prior to approving proposed management actions.

Action: No Similar Action

Analyze impacts to other sagebrush steppe species and impacts to State endowment trust lands managed by the Idaho Department of Lands during site-specific project NEPA analysis.

Action: No Similar Action

Activities not specifically addressed by the Alternative are still subject to the allowances and restrictions of the applicable resource management plans.

Action: No Similar Action

Conserve the Greater sage-grouse (*Centrocercus urophasianus*) ("sage-grouse") and its habitat to avoid a listing under the Endangered Species Act ("ESA") (see BLM 2011a).

Same as Common to All Areas.

Conserve sage-grouse and its habitat while maintaining predictable levels of land use.

Action: No Similar Action

Action: No Similar Action

Action: No Similar Action

Action: No Similar Action

Action: No Similar Action

on

Action: No Similar Action

Focus management by Federal and State agencies on the maintenance and enhancement of habitats, populations and connectivity in areas within this management zone.

Action: No Similar Action

Prioritize conservation efforts and policies to address the primary threats to the species, such as wildfire, as described in the USFWS's 2010 listing determination.

Maintain all existing permits, contracts, or other legal instruments authorizing the occupancy and use of Federal lands without revocation, suspension or modification, unless or until any statutory or regulatory decision-making process to revoke, suspend, or modify such permit, contract or legal instrument is completed.	Action: No Similar Action
Maintain any project or activity decision completed prior to the issuance of a final decision regarding this land use plan amendment process without revocation, suspension or modification.	Action: No Similar Action
Maintain existing mineral leases, contracts, permits, and associated activities without additional restrictions.	Action: No Similar Action
Maintain existing mining activities conducted pursuant to the General Mining Law of 1872 without additional restrictions.	Action: No Similar Action
All existing land uses and landowner activities would continue to occur and regulatory mechanisms are subject to all valid existing rights.	Action: No Similar Action
enhance or restore general habitat areas to improve Action: No Similar Action	habitat condition and connectivity between priority a Sub-objective: Designate core sage-grouse habitats within the State of Idaho that ???
Action: No Similar Action	CHZ and IHZ, in combination, focus on protecting each of the two key meta-populations in the State. These meta-populations consist of a large aggregation of interconnected breeding subpopulations of sage-grouse that have the highest likelihood of long-term persistence. One meta-population is located north of the Snake River and includes the Mountain Valley and Desert Conservation Areas; the other is located south of the Snake River and includes the West Owyhee and Southern Conservation Areas.
The Conservation Areas (Mountain Valleys, Desert, West Owyhee and Southern) are divided into Core, Important, and General Habitat Zones (“HZs”).	CHZ and IHZ (Map 3 Gov Final Alt p. 22) total approximately 9.770 million acres, account for ninety percent (90%) of the known leks or breeding display areas in Idaho, and are believed to harbor the vast majority of the State’s sage-grouse populations.

Action: No Similar Action

The CHZ encompasses approximately 5.68 million acres and supports the highest breeding densities of sage-grouse in Idaho. These areas include approximately sixty-five percent (65%) of the known active leks and are occupied by approximately seventy-three percent (73%) of male sage-grouse counted at leks throughout the SGMA. This management theme represents, and generally exceeds, the State's base population objective for the species. The CHZ represents strongholds for sage-grouse populations in Idaho and supports the largest populations.

Action: No Similar Action

Areas designated within the CHZ were mapped based on the following key data sets: Twenty-five (25%) and fifty (50%) breeding bird density classes, which represent the top fifty (50%) of all leks in terms of male attendance, buffered at times by portions of the seventy-five (75%) class, depending on location, and the top two categories of the BLM's connectivity and persistence model (Makela and Major).<sup>3</sup> The lek connectivity model estimates the likelihood that those leks or population are likely to persist through time (Knick and Hanser 2011).

Action: No Similar Action

Depending on location, additional lands beyond the 25% and 50% thresholds have been included in the CHZ to consolidate key breeding areas, to include wilderness areas and lands within national monuments, and to foster population connectivity with neighboring states. The State recognizes that these are fluid boundaries because the habitat is not static, and as new information regarding the species becomes available, it may be necessary to adjust the boundaries for the three management zones.

Designate all National Forest System and BLM lands within the area containing the entire known sage-grouse population in the State of Idaho as described in Map 3 (Gov Alt) as the Sage-Grouse Management Area. Do not alter this designation, with the exception of technical corrections, for five (5) years without substantial and compelling evidence. Action: No Similar Action

Classify the following habitat zones within the Sage-Grouse Management Area: Core Habitat Zone (“CHZ”), Important Habitat Zone (“IHZ”) and General Habitat Zone (“GHZ”). Action: No Similar Action

Establish the following Conservation Areas within the Sage-Grouse Management Area: West Owyhee Conservation Area; Southern Conservation Area; Desert Conservation Area; and Mountain Valleys Conservation Area. Action: No Similar Action

The Conservation Areas North of the Snake River are defined as: Mountain Valleys CA— Starting at Rexburg and extending west, sage-grouse habitat north and west of Highway 33 to Howe, Highway 33/22 to Arco, Highway 26/20/93 to Carey, Highway 20 west to Mountain Home, south from Mountain Home on Highway 51 to the Snake River. West-Central is included in this area. Desert CA—South of the Mountain Valleys CA and north of the Snake River with a similar east-west extent.. Action: No Similar Action

The Conservation Areas South of the Snake River are defined as: West Owyhee CA— South of the Snake River and west of the Jarbidge River. Southern CA—South of the Snake River and east of the Jarbidge River, including East Idaho uplands and Bear Lake Plateau. Action: No Similar Action

Action: No Similar Action

CHZ includes approximately 3 million acres in the Mountain Valleys and Desert Cas, and includes approximately 2.7 million acres in the West Owyhee and Southern CAs.

<p>Areas not meeting the general biological standard of 25-50% breeding bird density (as described below) are included within CHZ to recognize the importance of targeted restoration efforts to ensure these areas would still retain high restoration potential.</p>	<p>Focus mitigation efforts on increasing the resiliency and productivity of sage-grouse populations and habitats.</p>
<p>Wildfire and invasive species are a greater threat to sage-grouse in the Desert and West Owyhee CAs than in the Mountain Valleys or Southern CAs.</p>	<p>Action: No Similar Action</p>
<p>Sage-grouse habitats in the Desert and West Owyhee CAs are relatively contiguous, while those in the Mountain Valleys and Southern CAs tend to be more fragmented.</p>	<p>Action: No Similar Action</p>
<p>Correction or modification of designations may occur through: administrative corrections, adaptive regulatory triggers, curtailment of adaptive regulatory triggers, and the emergency wildfire clause.</p>	<p>Action: No Similar Action</p>
<p>Action: No Similar Action</p>	<p>Generally Suitable Uses and Activities: Fire Management, Invasive Species management, recreation, livestock grazing.</p>
<p>Action: No Similar Action</p>	<p>Core Habitat Zones apply a relatively restrictive approach aimed at providing a high level of protection to the species.</p>
<p>Delineate a Sage-Grouse Management Area subdivided into three distinct management zones - Core Habitat Zone (CHZ), Important Habitat Zone (IHZ) and General Habitat Zone (GHZ).</p>	<p>Action: No Similar Action</p>
<p>Maintain, through coordination between the Idaho BLM State Director and the Director of the Idaho Department of Fish and Wildlife, a map of the Sage-Grouse Management Area and make available to the public a map of the SGMA, including records regarding any corrections or modifications. Maps.</p>	<p>Action: No Similar Action</p>
<p>Habitats depicted on the map of sage-grouse management zones and habitat types are not static and adjustments or updates of the map would be appropriate as a result of updates to the data set upon which the map is based.</p>	<p>Action: No Similar Action</p>

The map of sage-grouse management zones and habitat types provided does not equate to verified boundary locations or on-the-ground habitat types, and is intended to provide a general idea of where certain types of habitat and conservation priorities are spatially located as of the date of the map.

Reduce the number and size of wildfires in sage-grouse habitat through incorporation of the BLM Washington Office Instruction Memorandum - IM 2011-138.

Action: No Similar Action

Develop a consistent wildfire suppression plan that improves on the wildfire suppression baseline by twenty-five percent (25%) through:

- a. Ensuring close coordination with Federal and State firefighters, local fire departments and local expertise to create the best possible network of strategic fuel breaks and road access to minimize and reduce the size of a wildfire following ignition;
- b. Developing consistent fire response plans and mutual aid agreements necessary to achieves a 25% improvement in the fire suppression baseline;
- c. Requesting and placing additional firefighting resources and establish new Incident Attack Centers, with particular emphasis in the West Owyhee Conservation Area;
- d. Creating and maintaining effective fuel breaks in strategic locations that will modify fire behavior and increase fire suppression effectiveness according to the following criteria:
  - Targeting establishment of fuel breaks along existing roads or other disturbances.
  - Identifying and targeting higher-risk roads for fuel break construction and maintenance based on fire history maps.
  - Implementing a strategic approach to using these roads for rapid fire response.
  - Analyzing the benefits of the fuel break against

Action: No Similar Action

Adjust grazing permits during the renewal process to include measures (including but not limited to measures described in Gov Alt section J) to achieve desired habitat conditions, if through the assessment process, livestock grazing is found to be limiting the achievement of the habitat characteristics (Gov Alt Tables 3-5 and #43). Measures must be tailored to address the specific management issues.

Action: No Similar Action

Action: No Similar Action

Action: No Similar Action

Action: No Similar Action

Action: No Similar Action

Establish strategically located forage reserves focusing on areas unsuitable for sage-grouse habitat restoration or lower priority habitat restoration areas when feasible.

Action: No Similar Action

Implement grazing management systems that ensure adequate nesting and early brood rearing habitat within the breeding landscape.

Action: No Similar Action

Modify grazing management through appropriate herding, salting, and water-source management (e.g., turning troughs/pipelines on/off, extending pipelines/moving troughs) when use-pattern mapping or monitoring demonstrates an opportunity to adjust livestock distribution to benefit occupied sage-grouse breeding habitat.

Action: No Similar Action	Graze exotic perennial grass seedings and/or annual grasslands to avoid grazing during breeding season in occupied sage-grouse habitat if available and feasible.
Action: No Similar Action	Modify authorized seasons of use within grazing permits to provide greater flexibility in managing livestock for the benefit of sage-grouse.
Action: No Similar Action	Maintain residual herbaceous vegetation at the end of the growing/grazing season to contribute to nesting and brood-rearing habitat during the coming nesting season consistent with conditions described in Table 5 (#43 and Gov Alt).
Action: No Similar Action	Modify grazing management to meet seasonal sage-grouse habitat requirements (#43). Provide flexibility in grazing management through scheduling the intensity, timing, duration and frequency of grazing use over time that best promotes management objectives.
Action: No Similar Action	Action: No Similar Action Prioritize evaluation of the CHZ during drought periods relative to sage-grouse needs for food and cover. Ensure that post-drought management allows for vegetation recovery that meets sage-grouse needs in priority sage-grouse habitat areas.
Action: No Similar Action	Conduct rangeland health assessments utilizing published characteristics of sage-grouse habitat and the Ecological Site Descriptions, and Gov Alt Tables 3-5 (#43), and where available and applicable, rangeland health determinations made in accordance with 43 C.F.R. 418.2(c).
Action: No Similar Action	Maintain existing grazing management absent substantial and compelling information, if, based on the assessment, the current grazing system achieves the habitat characteristics (Gov Alt Tables 3-5, & #43).

Action: No Similar Action

Implement grazing management adjustments, where management changes are determined necessary (#384), that are narrowly tailored to address the specific habitat objective applied at the allotment and/or activity plan level, including but not limited to the actions outlined in (Gov Alt Section J).

and dropping - this can be covered under riparian objectives/actions

and dropping

under 384

Action: No Similar Action

Manage grazing of riparian areas, meadows, springs, and seeps in a manner that promotes vegetative structure and composition appropriate to the site.

Action: No Similar Action

Action: No Similar Action

Action: No Similar Action

Action: No Similar Action

Consider grazing options within the landscape and site-specific contexts; and manipulate vegetative conditions through the timing and intensity of grazing practices, based on factors including, but not limited to, elevation, weather, and plant growth.

Action: No Similar Action

Consider additional options for scheduled grazing based on the three habitat zones in light of unintended consequences of altering grazing use, such as a possible increased risk of wildfire, before adjusting management.

Altering grazing schemes in allotments within the CHZ, where needed and appropriate, through enhanced grazing opportunities utilizing introduced seedings or areas with lower value to sage-grouse (e.g., GHZ).

Complete the allotment assessment process in conjunction with scheduled term grazing permit renewals (i.e., every ten years), giving priority to areas that have the potential to provide the greatest benefit to sage-grouse.

Prioritize and concentrate allocation of resources for assessment and permit renewal on allotments within the CHZ that have declining sage-grouse populations, with secondary priority given to stable or increasing populations within the CHZ.

Utilize a variety of information sources, when available, in the allotment assessment process, including: published characteristics of sage-grouse habitat; Ecological Site Descriptions; existing vegetation; habitat inventories/assessments (Stiver et al. 2010); and state and transition models that describe vegetation and other physical attributes for sage-grouse. Include discussion of whether the allotment (or any pasture/significant area therein) has the existing vegetation and/or existing ecological condition (seral state) to provide sage-grouse habitat (Category 1); or whether the allotment (or any pasture/significant area therein) has the ecological potential to provide sage-grouse habitat (Category 2).

Action: No Similar Action

Include measures tailored to address specific management issues (see J. Governors Alt - Adaptive Measure for Livestock Grazing), when livestock grazing is limiting achievement of the habitat characteristics (Tables 3-5 # 43), within renewed permits.

Action: No Similar Action

Maintain flexibility in grazing management and the opportunity to schedule and adjust intensity, timing, duration, and frequency of grazing use over time in a manner that maintains rangeland health and habitat quality.

Apply adaptive management measures for livestock grazing (#433-440, #442-450) singly, or in combination where appropriate, in the development and implementation of grazing management, based upon the assessment process, the ecological conditions, the ecological potential and the status of sage-grouse populations. Maintain flexibility in administering grazing programs and providing offsetting grazing options over relatively large landscapes to successfully implement these measures.

Continuously evaluate the applicability and inclusion of best management practices (Gov Alt Section G and actions #539-546, #662-670) and other protective stipulations described with regard to new science, information and data emerge regarding the habitats and behaviors of the species.

Action: No Similar Action

Action: No Similar Action

Implement adaptive management changes to existing grazing permits where improper grazing is determined to be the casual factor in not meeting habitat characteristics, specific to site capability, based upon monitoring over time with appropriate spatial variability.

Adaptive Regulatory Triggers apply where two out of the following three criteria are demonstrated within a Conservation Area, excluding areas within the GHZ, apply management actions (#7, #43, #53, #77-78, #102, #105, #117, #151-152, #182-186, #223-225, # 227, # 320, #356-360, #376, #382-384, #386, #451-456 & #471-476) for CHZ to IHZ areas containing wintering or breeding habitat in the relevant Conservation Area:

Action: No Similar Action

- i. Finite rate of change ( $\lambda$ ) over three years starting with the baseline years 2009- 2011 is significantly less than 1.0. This is a moving average for rate of change (i.e. 2011-2013, 2012-2014, 2013-2015, etc.) when compared to 1.0 (indicating a stable population).
- ii. Number of males on lek routes declines by >20% over a three-year period compared to 2011 values.
- iii. A 30% or greater loss of sagebrush habitat is documented within defined breeding or winter habitat during a three-year period.

Curtailment of Adaptive Regulatory Triggers apply where the core population data within the relevant Conservation Area meets or exceeds the 2011 values over a three-year period, areas within the IHZ are no longer subject to the CHZ management provisions.

Action: No Similar Action

Objective 2: Initiate a management review of the regulatory approach to assess causal factors for declines if a 10% loss of habitat loss occurs within the first three years of implementation. IDFG would lead the review in coordination with the Governor's Office of Species Conservation and other relevant State and Federal agencies. The review would include a determination of whether the loss is based on a population-related decline (e.g., West Nile virus, drought) or is driven by habitat loss. If the loss is habitat-driven, the review team will assess the effectiveness of current best management practices, funding levels and restoration efforts in order to preclude the triggering of the adaptive regulatory triggers.

Action: No Similar Action

Action: No Similar Action

Apply adaptive regulatory triggers when two of the follow criteria are demonstrated: i. Maximum number of males on lek routes declines by >20% over a three-year period compared to 2011 values. ii. A 30% or greater loss of sagebrush habitat is documented within defined breeding or winter habitat during a three-year period. iii. The finite rate of change ( $\lambda$ ) over 3 years starting with the baseline years 2009- 2011 is significantly less than 1.0.

Action: No Similar Action

Apply CHZ best management practices (Section V of Gov Alt) to IHZ areas within the same Conservation Area when the adaptive regulatory trigger is operative and when the problem is habitat related as determined by a review of the population data and associated habitats.

Apply CHZ regulatory mechanisms to IHZ areas within the same Conservation Area where a wildfire burns 200,000 acres or more of CHZ habitat, and at least 50% of the burned acres contained important breeding or wintering habitat.

Action: No Similar Action

This alternative includes adaptive regulatory triggers and an emergency wildfire clause to ensure the populations and habitats within the CHZ maintained and enhanced.

Action: No Similar Action

The adaptive regulatory triggers are intended to provide a regulatory backstop for navigating unanticipated and deleterious impacts to the species.

Provide a regulatory backstop through the implementation of adaptive regulatory triggers, when a significant and unanticipated loss of sage-grouse habitats and populations occurs apply the conservation benefits of the CHZ to the IHZ within the relevant Conservation Area.

Action: No Similar Action

Action: No Similar Action

Apply adaptive management triggers when a significant loss of population or habitat has been demonstrated to occur over time or unexpectedly to provide a regulatory mechanism to stabilize habitats and populations and prevent further loss in the CHZ and IHZ.

Emergency Wildfire Clause applies where a wildfire burns 200,000 acres or more of the CHZ, and at least fifty percent of the burned acres contained important breeding or wintering habitat, apply management actions (#7, #43, #53, #77-78, #102, #105, #117, #151-152, #182-186, #223-225, # 227, # 320, #356-360, #376, #382-384, #386, #451-456 & #471-476) for CHZ to IHZ areas within the appropriate Conservation Area.

Action: No Similar Action

Apply immediate response following a significant loss of sage-grouse habitat due to catastrophic wildfire as described in the Emergency Wildfire Clause.

Action: No Similar Action

on

Plan, select, implement and monitor required compensatory mitigation projects according to the Idaho Sage-Grouse Mitigation Framework (ISAC 2011).

Action: No Similar Action

Utilize a science-based statewide strategy to guide the selection of compensatory mitigation actions that will receive funding based on the benefits to sage-grouse populations.

Action: No Similar Action

The State will establish a mitigation bank of sage-grouse habitation restoration projects that future development projects would repay through compensatory mitigation requirements.

on

Action: No Similar Action

Objective 1: Assess the effectiveness of this objective (1) every three years with respect to the primary threats of wildfire, invasive species and infrastructure.

Action: No Similar Action

Objective 1: Evaluate secondary threats addressed in this Alternative according the various schedules contained in the regulatory language.

Action: No Similar Action

Objective 1: IDFG will lead assessments in coordination with the Governor's Office of Species Conservation and relevant Federal agencies.

Action: No Similar Action

Objective 2: Regularly analyze the effectiveness of the regulatory mechanisms to determine the effectiveness of active conservation and restoration efforts, including conifer control, wildfire suppression, and more passive habitat protection techniques such as establishment and maintenance of fuel breaks.

Action: No Similar Action

Action: No Similar Action

Objective 2: Evaluate progress achieving this objective by using areas within the CHZ, IHZ (to a lesser extent) as the baseline for comparison.

Action: No Similar Action

Objective 2: Use three primary indicators to evaluate progress toward achieving objective 2 to provide a baseline for population status: 1) Maximum number of males counted on lek routes in 2011 within CHZ. 2) Number of active leks counted in 2011 within CHZ. 3) Average rate of population change. The evaluation will use the average value for  $\lambda$  (finite rate of change) for 2009-2011 within CHZ to determine statistical significance and compare population growth calculations ( $\lambda$ ) to a value of 1.0 which indicates a stable population.

Conduct fine and site scale-habitat assessments to help inform grazing management based on habitat characteristics described in # 43.

Conduct fine and site scale-habitat assessments to help inform grazing management based on habitat characteristics described in # 43.

Conduct a determination of factors causing any failure to achieve the habitat characteristics (Tables 3, 4 and 5 # 43) at a resolution sufficient to document the habitat condition, including consideration of local spatial and inter-annual variability. Determination must utilize data from multiple years or multiple locations within an allotment.

Conduct assessments at a resolution sufficient to document the habitat condition, including local spatial and inter-annual variability. Conduct determinations relative to the habitat characteristics (Gov Alt Tables 3-5 and #43) based upon existing ecological condition, ecological potential, and existing vegetation information to ensure the assessment recognizes whether or not these habitat characteristics are achievable.

Objective 2: Monitor the stability of habitat and population trends over time to examine the effectiveness of the regulatory mechanisms.

nd medial habitat areas.

Sub-objective: Designate important sage-grouse habitats within the State of Idaho that ???

Sub-objective: Designate general sage-grouse habitats within the State of Idaho that ???

CHZ and IHZ, in combination, focus on protecting each of the two key meta-populations in the State. These meta-populations consist of a large aggregation of interconnected breeding subpopulations of sage-grouse that have the highest likelihood of long-term persistence. One meta-population is located north of the Snake River and includes the Mountain Valley and Desert Conservation Areas; the other is located south of the Snake River and includes the West Owyhee and Southern Conservation Areas.

Action: No Similar Action

CHZ and IHZ (Map 3 Gov Final Alt p. 22) total approximately 9.770 million acres, account for ninety percent (90%) of the known leks or breeding display areas in Idaho, and are believed to harbor the vast majority of the State's sage-grouse populations.

GHZ (Map 3 Gov Final Alt p. 22) encompasses approximately 5.45 million acres, on which are found ten percent (10%) of the known leks and five percent (5%) of the male sage-grouse attending leks. GHZ is the lowest priority for conservation or restoration efforts.

The IHZ encompasses approximately 4.09 million acres. These areas include approximately twenty-five percent (25%) of the known active leks and are occupied by an estimated twenty-two percent (22%) of sage-grouse males. This management zone generally captures high-quality habitat and populations necessary for providing a management buffer for the CHZ, connecting patches of the CHZ, and supporting important populations and habitat independent of the CHZ.

The IHZ is primarily defined by the seventy-five (75%) breeding bird density areas. Given the migratory life history of many sage-grouse populations, a portion of the birds breeding in CHZ may make seasonal use of areas within the IHZ. The IHZ also includes areas of value for migration corridors, connectivity among breeding areas, and long-term persistence of each of the two key meta-populations of sage-grouse in Idaho.

Action: No Similar Action

The GHZ encompasses approximately 5.45 million acres. This management zone generally includes few active leks, and fragmented or marginal habitat. The GHZ also includes habitat for two isolated populations of sage-grouse in the East Idaho Uplands and West Central Idaho. While these two areas generally represent better habitat than the remainder of the GHZ, the isolated nature of these populations make it unlikely that they will contribute to the long-term persistence of the two key meta-populations in the State of Idaho. Thus, local working group efforts will be key in these areas.

Return water to the original water source, to the extent practicable, to reduce suitable habitat for mosquitoes.

Minimize creation of breeding habitat for mosquitoes in sage-grouse habitat to reduce the risk of transmission of West Nile virus to sage-grouse.

Permit and design new ponds or reservoirs to reduce the potential impacts of West Nile Virus transmission.

Minimize the construction of new ponds or reservoirs except as needed to meet important resource management and/or restoration objectives.

Develop and maintain non-pond/reservoir watering facilities, such as troughs and bottomless tanks, to provide high quality water that minimizes the development of habitat for mosquitoes.

Construct water return features and maintain functioning float valves to prohibit water from being spilled on the ground surrounding the trough and/or tank.

Apply adaptive management measures for livestock grazing (#433-440, #442-450) singly, or in combination where appropriate, in the development and implementation of grazing management, based upon the assessment process, the ecological conditions, the ecological potential and the status of sage-grouse populations. Maintain flexibility in administering grazing programs and providing offsetting grazing options over relatively large landscapes to successfully implement these measures.

Action: No Similar Action

Apply CHZ best management practices (Section V of Gov Alt) to IHZ areas within the same Conservation Area when the adaptive regulatory trigger is operative and when the problem is habitat related as determined by a review of the population data and associated habitats. Action: No Similar Action

Apply CHZ regulatory mechanisms to IHZ areas within the same Conservation Area where a wildfire burns 200,000 acres or more of CHZ habitat, and at least 50% of the burned acres contained important breeding or wintering habitat.

This alternative includes adaptive regulatory triggers and an emergency wildfire clause to ensure the populations and habitats within the IHZ are maintained and enhanced albeit to a lesser extent than within CHZ. Action: No Similar Action

The adaptive regulatory triggers are intended to provide a regulatory backstop for navigating unanticipated and deleterious impacts to the species.

Action: No Similar Action

Action: No Similar Action

Action: No Similar Action

Apply adaptive management triggers when a significant loss of population or habitat has been demonstrated to occur over time or unexpectedly to provide a regulatory mechanism to stabilize habitats and populations and prevent further loss in the CHZ and IHZ.

Objective 2: Evaluate progress achieving this objective by using areas within the CHZ, IHZ (to a lesser extent) as the baseline for comparison.

Action: No Similar Action

Action: No Similar Action

Action: No Similar Action

Conduct fine and site scale-habitat assessments to help inform grazing management based on habitat characteristics described in # 43.

Action: No Similar Action

Conduct assessments at a resolution sufficient to document the habitat condition, including local spatial and inter-annual variability. Conduct determinations relative to the habitat characteristics (Gov Alt Tables 3-5 and #43) based upon existing ecological condition, ecological potential, and existing vegetation information to ensure the assessment recognizes whether or not these habitat characteristics are achievable.
