	Same as Sub Regional PPH and PGH

Same as SR minus 3% threshold. NEED TO DETERMINE HOW TO ADDRESS THE 3% DISTURBANCE THRESHOLD. If the 3% disturbance is analyzed under the NTT alternative, does it have to be here?

Same as Sub Regional PPH and PGH  
DFO PPH same as sub-region Core and DFO PGH same as SR PGH

Current RMP Pg. 64 Actions 2,3,7 and 8 Note:  
Actions described under the lands and realty section and not repeated here still apply to utility and communications corridors and related authorizations.

2. Analyze requests for land use authorizations on a case-by-case basis and apply mitigation measures as necessary in compliance with the NEPA process.
3. Locate new right-of-way facilities within or adjacent to existing rights-of-way, to the extent practical, in order to minimize adverse environmental impacts and the proliferation of separate rights-of-way.
7. Where avoidance areas and designated corridors overlap (e.g. the Lewis and Clark Trail and the designated corridor through the Beaverhead River Canyon), issuance of new right-of-way and upgrade/expansion of existing rights-of-way will be allowed if mitigated measures can reduce impacts to resources of concern to an appropriate level.
8. Provide access across public lands to and along right-of-way corridors and use areas necessary to construct new facilities, except in avoidance areas where access would be considered on a case-by-case basis.

Current DFO RMP - appendix X pg. 213 Powerlines and Generation Facilities Issue: Existing power lines near a lek, brood-rearing habitat, or winter habitat increases the risk of predation on sage grouse by raptors. 1. Document the segment(s) of line causing problems. 2. Determine by cooperative action-agencies, utilities, and landowners- whether or not modification of poles to limit perching will prevent electrocution of raptors and decrease predation on sage grouse. 3. Emphasize the following if perch prevention modifications do not work to protect sage grouse and sage-brush habitat: a) reroute the line using distance, topography, or vegetative cover; or b) bury the line. 4. Explore opportunities for technical assistance and funding. 5. Remove power line when use is completed. Issue: Existing power line is causing consistent or significant collision mortality on sage grouse. 1. Document the segment(s) of line causing consistent or biologically significant mortality- with agencies, utilities, and landowners cooperating in the effort. 2. Initiate collision prevention measures using guidelines (Avian Power Line Action Committee 1994) on identified segments. Measures are subject to restriction or modification for wind and ice loading or other engineering concerns, or updated collision prevention information. 3. Remove power lines that traverse

Same as #90 above from Current DFO RMP - appendix X pg. 213

Same as SR PPH and PGH

Same as #90 above from Current DFO RMP - appendix X pg. 213 RMP also referenced to use Avian Powerline Action Committee guidelines (1994) which were updated in 2006, also Avian Protection Plan Guidelines published by APLIC and USFWS 2005 is available.

Same as SR PPH and PGH also refer to Appendix E pg. 118 NATURAL REVEGETATION

Current RMP Pg 64, Action 2. Analyze requests for land use authorizations on a case-by-case basis and apply mitigation measures as necessary in compliance with the NEPA process. Appendix X. pg 213 Issue: New power lines proposed in areas that provide sage grouse habitat can pose threat to sage grouse. # 6. Restrict construction to prevent disturbance during critical periods: a)breeding - March 15-May 15 b)winter - Dec 1 - March 15.

Acquisition Criteria - Appendix H pg.129 Lands would be considered for acquisition if one of more of the following criteria is met and acquisition would:

- Facilitate access to public lands and resources
- Maintain or enhance the manageability of public lands and resources
- Maintain or enhance important public values and uses, especially
  - o Special Status Species plant, animal and fish habitats

acres retained; acres of habitat Action: No Similar Action

acres identified for acquisition Action: No Similar Action

Current RMP - Withdrawals Pg 41 Actions 1,2,3,5  
1. Review existing withdrawals on a case-by-case basis prior to the end of the withdrawal period or as other-wise required by law to determine whether the withdrawals should be extended, revoked, or modified. Withdrawals no longer needed, in whole or in part, for the purpose for which they were withdrawn will be revoked or modified. Appendix J describes the existing withdrawals in the planning area as shown on Map 16 (oversized). 2. Consider other agency requests for withdrawal relinquishments, extensions or modifications on a case-by- case basis. 3. Consider new withdrawal proposals on a case-by-case basis where the public land would transfer from one federal agency to another or where resource values or agency investments are best protected by withdrawal. Lands proposed to be withdrawn should be the minimum area required for the intended use and where applicable alternative prescriptions such as the use of rights-of-way, leases, permits, or cooperative agreements are inadequate to protect the resource values. 5. Review any additional existing land classifications on a case-by-case basis to determine if they should be continued or terminated.

acres withdrawn

Same as NA?

Acres closed/withdrawn

Current RMP - Acquisition Criteria - Appendix H pg.129 Lands would be considered for acquisition if one of more of the following criteria is met and acquisition would:

- Facilitate access to public lands and resources
- Maintain or enhance the manageability of public lands and resources
- Maintain or enhance important public values and uses, especially
  - o Special Status Species plant, animal and fish habitats

Acres/miles of corridors

Land Ownership Adjustment Pg. 38 In considering whether an exchange is in the public interest, consideration is given to the opportunity to:

- achieve better management of Federal lands,
- meet the needs of state and local residents and their economies,
- secure important objectives, including but not limited to, protection of fish and wildlife habitats, cultural re-sources, watersheds, wilderness and aesthetic values; enhancement of recreation opportunities and public access; consolidation of lands and/or interests in lands; consolidation of split estate; expansion of communities; accommodation of land use authorizations; pro-motion of multiple-use values; and fulfillment of public needs.

Goal 2 pg. 39 Retain public lands with high resource values in public ownership. Adjust land ownership to consolidate public land holdings, acquire lands with high public resource values, and meet public and community needs.

Acres

Appendix X pg 213 Issue: Wind generation may impact sage grouse and sage grouse habitat. 1. Consult with USFWS Ecological Services for site selection evaluation information.

2. Use the best available information to:
  - a) identify important sage grouse breeding, brood-rearing , and winter habitat in an appropriate vicinity of a proposed facility and associated infra-structure; and
  - b) site wind generation facilities – with agencies, utilities, and landowners cooperating – using topography, vegetative cover, site distance, etc. to effectively protect identified sage grouse habitat.
3. Identify and avoid both local (daily)and seasonal migration routes.
4. Restrict timing of construction to minimize disturbance during critical periods:
  - a) breeding – March 15 – May 15
  - b) winter – December 1 – March 15
5. Take appropriate measures to prevent introduction or dispersal of noxious weeds during construction, main-tenance, and operation as required by federal and state laws.
6. Develop offsite mitigation strategies in situations in which fragmentation or degradation of sage grouse habi-tat is unavoidable.

Acres available for renewable  
acres  
acres available for wind

Same as sub -region

2. Use the best available information to:
4. Restrict timing of construction to minimize disturbance during critical periods:

Appendix X. pg 208 Issue: Some sagebrush communities may have been significantly altered by past grazing management practices. 1. Implement appropriate grazing management strategies and range management practices where soil conditions and ecological processes will support sage grouse and desired commodities and societal values. 2. Establish suitable goals for sagebrush communities that have deteriorated to such an extent that livestock management alone may not contribute to habitat objectives. 3. Offer private landowners incentives when and where appropriate to achieve sage grouse objectives. Rangeland Veg pg. 51 Action 14 14. Improve existing seedings that are not meeting rangeland health standards for plant vigor and density by implementing grazing management systems or re-seeding with appropriate species of natives or cultivars. Focus restoration of any existing seedings on areas containing high resource values and/or priority habitats and species. Allow the use of all available tools. also refer to Appendix E pg. 118

NATURAL REVEGETATION

See above↑ - WAFWA guidelines are incorporated in Appendix X and include restoration guidelines, also refer to Appendix E pg. 118 NATURAL

REVEGETATION Rangeland Veg pg. 51 Action 14  
14. Improve existing seedings that are not meeting range-land health standards for plant vigor and density by implementing grazing management systems or re-seeding with appropriate species of natives or cultivars. Focus restoration of any existing seedings on areas containing high resource values and/or priority habitats and species. Allow the use of all available tools. Sagebrush Steppe Wildlife Habitats Pg. 73 Actions 42, 43, 44

42. Use the National and Montana sage grouse conservation strategies (see Appendix X) as the basis to address habitat management in the watershed planning process and in project level analysis.

43. Manage sagebrush habitats so that mid-scale level shrub cover includes a mix of height classes with herbaceous understory adequate for meeting seasonal habitat requirements for sage grouse and other wildlife species that use sagebrush habitat including wintering antelope and mule deer.

- In habitats with predominately mountain big sagebrush, manage sites with the potential to support sagebrush in a manner that maintains > 70 percent of those areas in canopy closure of 5 to 25 percent.

Action: No Similar Action

Rangeland Veg pg. 51 Action 14 14. Improve existing seedings that are not meeting range-land health standards for plant vigor and density by implementing grazing management systems or re-seeding with appropriate species of natives or cultivars. Livestock Grazing Pg. 42 Actions 1,2 and 4

1. Authorize an average of between 101,183 and 113,219 Animal Unit Months (AUMs) on about 425 allotments, subject to lands meeting the Western Montana Standards for Rangeland Health and make adjustments to allotments for management efficiency.
2. Use watershed evaluations (see Map 20 for watershed areas) when authorizing livestock grazing to assess whether the Western Montana Standards for Rangeland Health (Appendix A) are being met or if changes in livestock grazing are necessary.
3. Incorporate the Guidelines for Livestock Grazing as described in Appendix A into livestock grazing permits, as well as strategies outlined in Best Management Practices for Grazing (MT DNRC 1999), when applicable.
4. Follow the procedures outlined in the Rangeland Health Standards Handbook (H-4180) for areas that do not meet the Western Montana Standards for Rangeland Health due to livestock grazing.

Appendix X pg.208 Conservations measures for Fire Management Issue: Reduction of sagebrush by wildfire.

1. Schedule annual coordination meetings – with appropriate resource staff including fire specialists, wildlife biologists, and range ecologists – to incorporate new sage grouse habitat and other wildlife habitat information needed to set wildfire suppression priorities related to resources. Distribute updates to fire dispatchers for initial attack planning.
2. Identify the location of known sage grouse habitat and other wildlife habitats of concern, such as latitude and longitude with a polygon and radius, to avoid disturbance or degradation by temporary facilities, such as fire camps, staging areas, and helibases.
3. Incorporate known sage grouse habitat information into each Wildfire Situation Analysis to help determine appropriate suppression plans and prioritize multiple fires.
4. Retain unburned areas of sage grouse habitat, such as interior islands and patches between roads and fire perimeter, unless compelling safety, resource protection, or control objectives are at risk.

NOXIOUS WEEDS, INVASIVE AND NON-NATIVE SPECIES pg 49 Actions:

- 1 Manage Montana State designated noxious weeds according to the principles of integrated pest management found in Partners Against Weeds: An Action Plan for the Bureau of Land Management (USDI-BLM 1996b), the Montana Weed Management Plan (Duncan 2001), and the Montana Noxious Weed Act.
- 2 Participate in education and awareness programs for staff, cooperators, and the public.
- 3 Continue inventory of public lands for noxious weeds.
- 4 Monitor treatment areas
- 5 Continue cooperative agreements with Beaverhead and Madison counties for Integrated Weed Management.
- 6 Encourage development of Cooperative Weed Management Areas where all the landowners are cooperatively working to contain or eradicate noxious weeds within designated areas.
- 7 Control noxious weeds by various methods that include chemical, cultural, physical, mechanical, and biological treatments or other land practices.
- 8 Evaluate treatment and control of invasive species such as cheatgrass in site-specific projects associated with the watershed analysis.
- 9 Reestablish perennial vegetation in a timely manner

See above↑ - WAFWA guidelines are incorporated in Appendix X and include restoration guidelines, also refer to Appendix E pg. 118 NATURAL

REVEGETATION Rangeland Veg pg. 51 Action 14  
14. Improve existing seedings that are not meeting range-land health standards for plant vigor and density by implementing grazing management systems or re-seeding with appropriate species of natives or cultivars. Focus restoration of any existing seedings on areas containing high resource values and/or priority habitats and species. Allow the use of all available tools. Sagebrush Steppe Wildlife Habitats Pg. 73 Actions 42, 43, 44

42. Use the National and Montana sage grouse conservation strategies (see Appendix X) as the basis to address habitat management in the watershed planning process and in project level analysis.

43. Manage sagebrush habitats so that mid-scale level shrub cover includes a mix of height classes with herbaceous understory adequate for meeting seasonal habitat requirements for sage grouse and other wildlife species that use sagebrush habitat including wintering antelope and mule deer.

- In habitats with predominately mountain big sagebrush, manage sites with the potential to support sagebrush in a manner that maintains > 70 percent of those areas in canopy closure of 5 to 25 percent.

Same as NA - under current management public is involved in planning during watershed assessments and MTFWP is consulted on all projects and BLM is actively involved in the local sage grouse working group and has a local Resource Advisory Council (RAC), consisting of landowners and other local interests.

Appendix E pg. 118 NATURAL REVEGETATION In many cases, successful reestablishment of native species occurs if the perennial plant species are not killed as a result of the fire, or if viable and desirable seed or root mass is present. Generally, in these areas it would be necessary to rest the burned area from livestock grazing for at least two growing seasons. In some situations, the area may be closed to vehicles by issuing a temporary emergency closure. The only rehabilitation that may be necessary is repairing damaged fencing and/or construction of temporary fencing around the burned area until the native vegetation is successfully re-established. Seeding guidelines:

- Native species will be utilized over nonnative species as appropriate and based on seed availability.
- A project inspector will monitor all phases of implementation.
- The area to be seeded will be rested from grazing for at least two growing seasons or until vegetation is successfully established. Livestock will be excluded by using fencing, closing specific pastures, or closing en-tire allotments.
- Only native species will be seeded in WSAs.
- Monitoring will determine the effectiveness of seeding and to indicate when grazing will resume.
- Use only certified weed-free sources and collect seed samples for an All States Noxious Weed Test. Seed nonnatives only in areas of the burn where high

WILDLIFE including SPECIAL STATUS BIRDS AND MAMMALS - pg 73 Monitoring Support and assist FWP in monitoring wildlife habitat and population goals through the Montana Comprehensive Fish and Wildlife Conservation Strategy. Assess changes in sagebrush, coniferous forest and riparian/wetland habitat distribution, canopy, composition and condition on a landscape and watershed basis during watershed evaluations (see Map 20 for watershed areas). Where vegetation treatments have been implemented, or natural events have occurred, monitor changes in species composition and structure compared to pre-treatment conditions. Continue to monitor known populations of special status species, in conjunction with Federal, state and private agencies or organizations (bald eagle, peregrine falcon, sage grouse, pygmy rabbit, trumpeter swan, raptors). Monitoring may use intensive research projects or periodic population/habitat inventories to determine habitat extent or population status. This monitoring may be accomplished through contracts and/or with the aid of partnership funding sources in support of individual species conservation strategies. Participate in Intermountain Joint Venture efforts for all-bird monitoring at mid- and fine-scale.

DFO ROD/RMP pg. 28 Goal 2 Restore and maintain desired ecological conditions and fuel loadings through use of prescribed fire, wildland fire use, and other treatment methods. Actions 1. Place priority on fuels reduction in wildland urban interface areas. Prioritize treatments by comparing historical fire regimes and current fire severity. Focus management on maintaining fire dependent ecosystems and restoring those outside their natural balance through mechanical, chemical, and prescribed fire treatments. 2. Use both prescribed fire and mechanical treatments to treat conifer encroachment in the non-forest habitat types, for aspen restoration and as a post-harvest treatment in timber harvest areas. See the Rangeland Vegetation and Forest and Woodland Vegetation sections for treatment proposals and acres. 5. Coordinate all vegetation treatment projects using pre-scribed fire with FWP and adjacent landowners. Appendix X pg.207 Conservations measures for Fire Management Issue: Reduction of sagebrush by prescribed fire. 1. Sites should not be burned unless: a) biological and physical limitations of the site and impact on sage grouse are identified and considered, b) management objectives for the site, including those for wildlife, are clearly defined, c) potential for weed invasion and successional trends are well understood, and d) capability exists to

DFO RMP pg 28 Goal 2 Restore and maintain desired ecological conditions and fuel loadings through use of prescribed fire, wildland fire use, and other treatment methods. Actions 1,2 and 5: 1. Place priority on fuels reduction in wildland urban interface areas. Prioritize treatments by comparing historical fire regimes and current fire severity. Focus management on maintaining fire dependent ecosystems and restoring those outside their natural balance through mechanical, chemical, and prescribed fire treatments. 2. Use both prescribed fire and mechanical treatments to treat conifer encroachment in the non-forest habitat types, for aspen restoration and as a post-harvest treatment in timber harvest areas. See the Rangeland Vegetation and Forest and Woodland Vegetation sections for treatment proposals and acres. 5. Coordinate all vegetation treatment projects using pre-scribed fire with FWP and adjacent landowners.

Same as SR

Fuels and Fire Management pg 29, Goal 3 Use rehabilitation to mitigate the adverse effects of fire on the soil, vegetation, and water resources in a cost effective manner. Actions 1. Consider if emergency fire rehabilitation is necessary following a wildland fire, depending on the situation. 2. If necessary, pursue funding and follow the process outlined in BLM's Emergency Fire Rehabilitation Handbook (H-1742-1) and Appendix E. Separate environmental analysis will only be completed for emergency fire rehabilitation projects that are outside the scope of activities described in Appendix E. Appendix E. pg. 118 Seeding guidelines:

- Native species will be utilized over nonnative species as appropriate and based on seed availability.
- A project inspector will monitor all phases of implementation.
- The area to be seeded will be rested from grazing for at least two growing seasons or until vegetation is successfully established. Livestock will be excluded by using fencing, closing specific pastures, or closing en-tire allotments.
- Only native species will be seeded in WSAs.
- Monitoring will determine the effectiveness of seeding and to indicate when grazing will resume.
- Use only certified weed-free sources and collect seed samples for an All States Noxious Weed Test. Seed nonnatives only in areas of the burn where high

Proposed RMP/Final EIS Ch 2 pg. 55 Coal and Oil Shale Management Common to All Alternatives

Under all alternatives, BLM would consider proposals for coal and oil shale leasing on a case-by-case basis for mineral resources under the administration of the federal government. To date, no areas have been identified with economic reserves to support future leasing analysis. Site-specific environmental analysis and a plan amendment would be required to lease for coal or oil shale. There are currently no regulations governing the leasing of oil shale. Any leases issued would be issued under the authority of 30 U.S.C. Chapter 3A, Subchapter V, Sec. 241 which authorizes the Secretary of the Interior to lease deposits of oil shale. Unsuitability criteria described in 43 CFR 3461 would be applied to coal lands determined to have development potential on a case-by-case.

ROD/RMP pg45 - Action 9 Consider proposals for coal and oil shale leasing on a case-by-case basis. A plan amendment would be necessary to lease, along with the appropriate level of environmental analysis.

- Issue any oil shale leases under the authority of 30 U.S.C. Chapter 3A, Subchapter V, Sec. 241 which authorizes the Secretary of the Interior to lease deposits of oil shale
- Apply unsuitability criteria described in 43 CFR Part 3461 to coal lands determined to have development potential on a case-

Proposed RMP/Final EIS Ch 2 pg. 57- LOCATABLE MINERALS Goal – Encourage and facilitate development of locatable minerals in the manner to prevent unnecessary or undue degradation. Management Common to All Alternatives Standard management practices in the public land administration of locatable minerals would continue across all alternatives. BLM would coordinate with MT DEQ during the review, approval, inspection and reclamation of mining operations. At a minimum, conduct annual compliance inspections on each active notice. Requirements of all state and federal laws would be met in the management of mining operations. Administration of locatable minerals on public lands would continue as required by law and regulation (43 CFR 3809) by taking the following steps: Review and process notices to ensure the proposed action does not create unnecessary or undue degradation of the environment. Review and process plans of operation to ensure the proposed action does not create unnecessary or undue degradation of the environment. Conduct at a minimum annual compliance inspections on each active notice and plan of operation. Allow casual use where work is done by hand and no explosives are used. Refer inquiries to appropriate agencies for further guidance on other permit requirements.

Action: No Similar Action

Salable Minerals (Mineral Materials) pg 49. Goal: Provide for the extraction of mineral materials to meet public demand, while minimizing adverse impacts to other resource values.

#### Allocations

Manage 136,226 acres as closed to mineral material disposal in the following areas (see Map 22):

- Bear Trap Wilderness
- All nine Wilderness Study Areas
- Centennial Sandhills
- Christnot Mill
- Developed recreation sites
- Lewis's Lookout
- Sheep Creek Common Use Area
- Lands within one-quarter mile either side of the Big Sheep Creek Road, except in sections 26 and 35 in T14S, R10W and section 2 in T15S, R10W

Manage the remainder of the planning area as open to mineral material disposal, subject to the provisions described in the Action section below.

#### Actions:

1 Maintain current mineral material sites (see Map 22) until material is exhausted or other circumstances warrant closure.

2 Encourage extraction of mineral materials from previously disturbed sites rather than opening new sites.

Same as NA - Covered in Appendix N pg 169

Pg. 45 Action 3 Manage oil and gas leases existing prior to the Record of Decision for the Dillon RMP according to the existing lease stipulations. When the lease expires, manage those lands according to the oil and gas decisions and required stipulations outlined in the ROD/Approved Plan. All stipulations for fluid mineral development apply to geophysical explorations as well. All leased parcels have stipulations applied consistent with DFO RMP as outlined in Table 5 on pg 44 of RMP. (Did not attempt to paste table in here for formatting reasons)

RMP Final EIS Alt. C Pg. 53 Table 6 lists stipulations that were analyzed. Winter/Spring habitat – NL  
Leks – NL ½ mile buffer Breeding habitat – NSO NL  
= no lease NSO = no surface occupancy Under Alternative C, 80 percent (1,086,596 acres) of the planning area would not be available for oil and gas leasing. This includes all the lands identified in Alternative B, plus lands in these additional locations:

- Sage Grouse Winter/Spring Range
- Lands within 1/2 mile of Sage Grouse Strutting Grounds (leks)

DFO RMP Appendix M pg. 156, pp 5 The BLM planning process is the mechanism used to evaluate and determine where and how federal oil and gas resources will be made available for leasing. In areas where oil and gas development may conflict with other resources, the areas may be closed to leasing.

RMP Final EIS Alt. C Pg. 53 Table 6 lists stipulations that were analyzed. Winter/Spring habitat – NL  
Leks – NL ½ mile buffer Breeding habitat – NSO NL  
= no lease NSO = no surface occupancy Under Alternative C, 80 percent (1,086,596 acres) of the planning area would not be available for oil and gas leasing. This includes all the lands identified in Alternative B, plus lands in these additional locations:

- Sage Grouse Winter/Spring Range
- Lands within 1/2 mile of Sage Grouse Strutting Grounds (leks)

Final RMP Pg. 46 Goal 2 Allow environmentally responsible geophysical exploration for energy resources in the Dillon Field Office on lands administered by the BLM. Actions: 1 Review Notices of Intent to Conduct Geophysical Exploration (NOI) in the planning area and develop appropriate mitigation measures so as not to create undue and unnecessary degradation. 2 Prepare a site-specific environmental analysis for each NOI filed. Develop mitigation measures using the oil and gas lease stipulations approved in this plan as the starting point. • The transient nature of geophysical exploration and the short-term impacts of the exploration may provide an opportunity for operations to occur in seasonal wildlife areas during the time of closure under lease stipulations without creating detrimental effects on wild-life. As such the proposed exploration will be

DFO ROD/RMP pg. 44 Allocations Make the remainder of federal mineral estate in the planning area (approximately 1,209,278 acres) available for leasing, subject to the stipulations specified in Table 5 or under Standard Lease Terms. • Approximately 433,797 acres are available for oil and gas leasing, subject to No Surface Occupancy stipulations. • Approximately 632,061 acres are available for oil and gas leasing, subject to Timing Limitations and/ or Controlled Surface Use stipulations. • Approximately 143,420 acres are available and subject to standard lease terms (and to the CSUs listed on Table 5 that apply to the entire planning area) Appendix M - Split Estate, pg. 167 On split estate lands where the surface ownership is private, the BLM places necessary restrictions and requirements on its leases and permit approvals and works in cooperation with the surface owner. BLM has established policies for the management of federal oil and gas resources in accordance with federal laws and regulations. The BLM does not have the legal authority to regulate how private surface is managed. BLM does have the statutory authority to require measures by lessees to avoid or minimize adverse impacts that may result from federally authorized mineral lease activities. These measures, in the form of lease stipulations or permit

Same as SR

RMP pg. 60 Wheeled Motorized Use/Non-Motorized Use Manage no areas as "open" under the regulations at 43 CFR Part 8340-8342. Manage 826,876 acres as "limited" to designated routes for OHV use under the regulations at 43 CFR Part 8340-8342. • Designate approximately 1,342 miles of road on BLM lands as open to public travel as shown on Maps 26 and 27 (oversized). • Make 159 miles of the 1,342 miles of road subject to seasonal restrictions Appendix X pg. 214 Roads and Motorized Vehicles Issue: Roads may increase sage grouse mortality through collisions with vehicles, displacement because of human disturbance, or other factors. 1. Identify, map, quantify, and evaluate impacts of existing roads, including 2-tracks, in relation to known lek locations and sage grouse winter ranges. 2. Consider impacts to sage grouse when designing new roads and modifying existing roads. 3. Consider seasonal use restrictions or signing to avoid disturbance of critical times, such as winter and nesting periods.

Action: No Similar Action

Pg. 61 Action 9 9. Evaluate "new roads" on a case-by-case basis through an environmental assessment process to determine whether they will be open to public travel. "New roads" means roads that do not presently exist but are necessary for access to timber sales, mining activities, to provide general access, or to facilitate other authorized uses of public lands. Designate routes determined to enhance public access opportunities that do not conflict with management of other resources as open and add them to the travel management map through routine plan maintenance.

Same as NA- Travel Management plan is complete for DFO

Pg. 59 Action 1 TRANSPORTATION AND FACILITIES MAINTENANCE Goal 1 Manage facilities, including roads and trails, to provide for public access or administrative needs, while maintaining or protecting resource values and in coordination with other federal agencies, state and local governments, and private landowners. Actions 1 Inventory and maintain transportation system roads and trails under BLM jurisdiction in accordance with assigned maintenance levels as outlined in Appendix O to meet public health and safety requirements, but also in consideration of resource issues including but not limited to proliferation of weeds and disturbance of cultural resources. Appendix O pg. 171 Transportation system roads and trails are classified by maintenance levels specified in BLM Manual Handbook H-9113- 2. Any changes or updates to maintenance levels will be incorporated into this planning guidance.

Action: No Similar Action

Appendix X pg 215 Issue: Roads and their associated disturbances and cumulative effects contribute to the loss of habitat and declining sage grouse populations.

1. Develop a transportation management plan across ownership boundaries in critical sage grouse habitats.
2. Participate in travel planning efforts and educate the general public about the impacts of roads on sage grouse and critical habitat.
3. Consider buffers, removal, realignment, or seasonal closures where appropriate to avoid degradation of habitat.
4. Re-vegetate closed roads with plant species beneficial to sage grouse.

Same as above ↑ also covered in Appendix X under Vegetation pg 215 and Rangeland Vegetation, Invasive Species, Travel management and any other place re-vegetation is discussed

Same as SR

Not really a Concern, but can use same wording as SR.

Appendix X pp. 215 Roads and Motorized Vehicles

Issue: Roads and their associated disturbances and cumulative effects contribute to the loss of habitat and declining sage grouse populations. Action 3. Consider buffers, removal, realignment, or seasonal closures where appropriate to avoid degradation of habitat. Action 5. Issue special use permits for certain activities with distance and timing restrictions to maintain the integrity of breeding habitat.

Appendix X pp. 214 Roads and Motorized Vehicles

Issue: Roads may increase sage grouse mortality through collisions with vehicles, displacement because of human disturbance or other factors. 1. Identify, map, quantify, and evaluate impacts of existing roads, including 2-tracks, in relation to known lek locations and sage grouse winter ranges. 2. Consider impacts to sage grouse when designing new roads and modifying existing roads. 3. Consider seasonal use restrictions or signing to avoid disturbance of critical times, such as winter and nesting periods. 4. Consider the use of speed bumps where appropriate to reduce vehicle speeds near leks, such as during oil and gas development. 5. Manage on-road travel and OHV use in key grouse areas to avoid disturbance during critical times such as winter and nesting periods. 6. Plan or permit organized events to avoid increased traffic and impacts to sage grouse

RMP pg. 60 Wheeled Motorized Use/Non-Motorized Use Manage no areas as "open" under the regulations at 43 CFR Part 8340-8342. Manage 826,876 acres as "limited" to designated routes for OHV use under the regulations at 43 CFR Part 8340-8342. • Designate approximately 1,342 miles of road on BLM lands as open to public travel as shown

Appendix X pp. 214 Recreational Disturbance of Sage Grouse Issue: Management of lek viewing may be necessary.

1. Establish viewing guidelines, i.e., distance, timing, approach methods, signage, parking areas, and area closures.
2. Consider sage grouse needs when developing roads and OHV management plans.
3. Develop and provide educational materials to the public describing effects of concentrated recreational activities and the importance of seasonal ranges to sage grouse.
4. Encourage recreationists to avoid continuous or concentrated use within 1.5 miles of leks from March 15 to May 15.
5. Issue special use permits for certain activities with distance and timing restrictions to maintain the integrity of breeding habitat.
6. Discourage concentration of hunters on critical seasonal habitats, such as during late big game seasons, when sage grouse are present.

Livestock Grazing Pg. 42 Actions 2, 3, 4, 5, 6, and 8

2. Use watershed evaluations (see Map 20 for watershed areas) when authorizing livestock grazing to assess whether the Western Montana Standards for Rangeland Health (Appendix A) are being met or if changes in livestock grazing are necessary.
3. Incorporate the Guidelines for Livestock Grazing as described in Appendix A into livestock grazing permits, as well as strategies outlined in Best Management Practices for Grazing (MT DNRC 1999), when applicable.
4. Follow the procedures outlined in the Rangeland Health Standards Handbook (H-4180) for areas that do not meet the Western Montana Standards for Rangeland Health due to livestock grazing.
5. Continue to implement existing Allotment Management Plans (AMPs), including the associated range improvement projects.
6. Develop and implement new Allotment Management Plans to direct site-specific management of livestock grazing after completion of rangeland health assessments conducted on a watershed basis.
8. Establish allowable use levels for grazing allotments during the watershed evaluation process. Make any adjustments to livestock numbers, including increases or decreases, following watershed evaluations, standards for rangeland health

Answered above ↑ Appendix X pg. 208 action 3  
Grazing Management Issue: Conflicting priorities for land uses, species, and habitats.

3. Offer private landowners incentives when and where appropriated to achieve sage grouse objectives.

Livestock Grazing Pg. 42 Actions 2, 3, 4, 5, 6, and 8

2. Use watershed evaluations (see Map 20 for watershed areas) when authorizing livestock grazing to assess whether the Western Montana Standards for Rangeland Health (Appendix A) are being met or if changes in livestock grazing are necessary.
3. Incorporate the Guidelines for Livestock Grazing as described in Appendix A into livestock grazing permits, as well as strategies outlined in Best Management Practices for Grazing (MT DNRC 1999), when applicable.
4. Follow the procedures outlined in the Rangeland Health Standards Handbook (H-4180) for areas that do not meet the Western Montana Standards for Rangeland Health due to livestock grazing.
5. Continue to implement existing Allotment Management Plans (AMPs), including the associated range improvement projects.
6. Develop and implement new Allotment Management Plans to direct site-specific management of livestock grazing after completion of rangeland health assessments conducted on a watershed basis.
8. Establish allowable use levels for grazing allotments during the watershed evaluation process. Make any adjustments to livestock numbers, including increases or decreases, following watershed evaluations, standards for rangeland health

Same as NA - Wildlife and SSS Pg 72 Actions 42-48 sagebrush steppe wildlife habitats 42 Use the National and Montana sage grouse conservation strategies (see Appendix X) as the basis to address habitat management in the watershed planning process and in project level analysis.

43 Manage sagebrush habitats so that mid-scale level shrub cover includes a mix of height classes with herbaceous understory adequate for meeting seasonal habitat requirements for sage grouse and other wildlife species that use sagebrush habitat including wintering antelope and mule deer.

- In habitats with predominately mountain big sagebrush, manage sites with the potential to support sagebrush in a manner that maintains > 70 percent of those areas in canopy closure of 5 to 25 percent.
- In habitats that include predominately Wyoming big sagebrush, manage sites with ecological potential to maintain sagebrush over at least 60 percent of those areas in a canopy closure of 5 to 25 percent.
- Maintain an herbaceous understory emphasizing multiple species of native forbs and grasses, recognizing that herbaceous productivity decreases at >10-15 percent canopy cover.
- Emphasize restoration and rehabilitation of sagebrush in areas that are capable of supporting sagebrush and contribute to the distribution and con-

Same as NA - All actions listed above Appendix B - Montana BMP's for grazing pg. 105 Appendix X Sage Grouse Management incorporates WAFWA guidelines

Same as NA - Appendix B pg. 105 - Montana BMP's for grazing incorporated by reference.

Appendix X pg 208

Issue: Improper grazing or lack of grazing can change the composition and/or structure of the native plant community and thereby reduce or eliminate food and cover for sage grouse.

1. Monitor the response of forbs (kinds, vigor, and production), and the compositional diversity of native species with respect to livestock grazing, evaluate the data, and make necessary adjustments.
2. Identify reasons for lack of grass and forb cover in sage-brush communities and recommend practices to increase the native herbaceous understory.
3. Identify critical sage grouse areas, and adjust grazing to minimize conflict among the production of commodities and protection of societal values.
4. Use monitoring methods that are best suited to the type of grazing management being incorporated at a site.
5. Adjust stocking levels (up or down) within the carrying capacity of the pasture or range. Adjustments should be based on monitoring program evaluating plant and soil response with respect to actual livestock use, weather, wildlife use, insects, and other environmental factors.

Pg. 42 Action 7. Modify grazing schedules and livestock management practices as necessary during drought conditions. Appendix X, pg 208 Issue: Drought may result in the degradation of native plant communities, and reduces forage production and sage grouse habitat.

1. Livestock managers should have drought management strategies or plans, e.g. water facilities; forage sources formulated for implementation during periods of drought.

Riparian Wetland Veg pg. 55 Objectives (Desired Future Condition after 20- 50 years of management)

Riparian and wetland vegetation supports the biological, hydrologic, and physical components of streams and wetlands based on site-specific capabilities. Deciduous woody and coniferous communities are present with diverse composition, density, and age structure within site potential. Herbaceous plant communities are dominated by deep-rooted native species that support streambank and shore-line stability, floodplain development, and nutrient cycling. Stream channels display the dimensions, pattern, and profile that are representative of site potential (Rosgen).

Emphasize maintenance of riparian communities on approximately 415 miles of stream dominated by a tall deciduous shrub or aspen/cottonwood habitat types and on approximately 500 miles of stream dominated by herbaceous and coniferous habitat types (based on 2002 inventory summary).

Action: 3 Implement the Western Montana Standards for Range-land Health (see Appendix A) to achieve proper functioning condition in riparian and wetland habitats. Incorporate the Guidelines for Livestock Grazing, as well as strategies outlined in Best Management Practices for Grazing (MT DNRC 1999), when applicable. Appendix X pg 208 Issue: Riparian

Pg 69, Action 7. Install functional wildlife access ramps on all water tanks on public lands. Pg. 56

Action 13 Analyze water developments on a case-by-case basis, considering the following:

- Available water flow. In general, no water developments that remove more than 50% of average summer daily flows from a water source will be constructed unless systems can be designed for return flows back into the drainage within a 1/4 mile of the diversion.
- Protection of source water riparian and wet-land habitat. Where isolated springs are developed, associated riparian habitat will be protected, usually through fencing.
- Protection of other resource values from direct and indirect impacts from construction and use of the water source. Measures to protect riparian habitats and other resource values including but not limited to sensitive plant species and cultural resources will be implemented based on site-specific needs. Only off- stream water developments and/or armored water gaps will be considered on streams where fencing has excluded the riparian area to prevent impacts to various resources.
- Location of water tanks in relation to other resource values. Measures to protect resource values in proximity to tank locations will be implemented based on site-specific needs. In general, water tanks will be placed at least 1/4 mile from

Pg 69 Actions 7, 8, 9, 16 7. Install functional wildlife access ramps on all water tanks on public lands. 8. Modify existing fences on public land identified as barriers to wildlife movement to accommodate wildlife passage. 9. Follow "wildlife friendly" fence specifications in BLM Manual H1741-1 for new fences. 16. Coordinate when new roads are proposed for construction and/or when changes are proposed regarding travel restrictions on existing roads to determine if concerns with wildlife displacement and/or habitat fragmentation exist. See the Travel Management section for additional details.

Pg. 73 Action 44 44. When making project decisions located in sage grouse habitats, objectives for sage grouse habitats and relevant information about sage grouse seasonal habitat will be considered when determining the desired resource condition. If specific issues regarding sage grouse are identified, applicable conservation actions or guidelines will be reviewed by interdisciplinary teams and considered in the decision-making process. None of the conservation actions or guidelines in the Management Plan and Conservation Strategies for Sage Grouse in Montana will be construed as mandatory or standards. Also see fencing below

Action: No Similar Action

Pg 51 Action 14 Improve existing seedings that are not meeting range-land health standards for plant vigor and density by implementing grazing management systems or re-seeding with appropriate species of natives or cultivars. Focus restoration of any existing seedings on areas containing high resource values and/or priority habitats and species. Allow the use of all available tools. Appendix X pg. 215 Issue: The age distribution of sagebrush may have been altered by management, such as a young stand recovering from disturbance or a mature stand with poor regeneration. 1. Map and inventory areas believed to be deficient in quality of habitat or exhibiting poor health. 2. Evaluate the site potential and desired condition, and develop specific objectives accordingly within specific landscapes. 3. If sagebrush is lacking: a) develop and implement grazing practices that influence sagebrush growth, b) inter-seed historical breeding and winter habitats with the appropriate sagebrush species, c) identify and promote seed sources for habitat restoration efforts, d) encourage the voluntary use of sagebrush in habitat incentive programs, such as the Conservation Reserve Program, and work to develop additional funding sources for such programs, e) reclaim and/or re-seed areas disturbed by treatments when necessary, and f) promote sage plantings,

Pg 69 Actions 8 and 9 8. Modify existing fences on public land identified as barriers to wildlife movement to accommodate wildlife passage. 9. Follow "wildlife friendly" fence specifications in BLM Manual H1741-1 for new fences. Appendix X pg 209 Issue: Potential for sage grouse to be disturbed or displaced by concentrations of livestock near leks or winter habitat. 1. Discourage concentration of livestock on leks or other key sage grouse habitats. • Avoid placement of salt or mineral supplements near leks during the breeding season (March-June), and • Avoid supplemental winter feeding of livestock, where practical, on sage grouse winter habitat and around leks Issue: Existing fences near breeding, brood-rearing, or winter habitats can increase the risk of collision mortalities and /or predation on sage grouse by hawks, eagles, and ravens by providing perches. 1. If portions of existing fences are found to pose a significant threat to sage grouse as strike sties or raptor perches, mitigate through moving or modifying posts, implementation of predator control programs, etc. Actions may include increasing the visibility of the fences by flagging or by designing "take-down" fences. 2. Offer private landowners incentives when and where appropriate to achieve sage grouse objectives. Appendix X Pg 211- 212 Noxious Weed Mgmnt Issue: Weed infestations

Same as NA. Dillon utilizes Watersheds Assessments and has a sage-grouse assessment process in place. All allotments in the DFO have been assessed in the last 10 years.

DFO has a very aggressive noxious weeds program

DFO is also monitoring sage grouse habitat following guidelines set forth in the Management Plan and Conservation Strategies for Sage Grouse in Montana.

All prescribed fire units are designed to improve habitat conditions and discussed with local FWP biologists to reduce conflicts with wildlife use, Did not paste it here, but also refer to Rangeland Vegetation pg. 51 Actions 4,5,6,7,8,9,12,13 All identify habitat considerations for fire management.

All projects are coordinated with FWP biologists to meet wildlife habitat needs.

Same as NA - Also addressed in grazing management, habitat restoration and noxious weeds

Climate change is not currently considered for re-seeding under current RMP guidelines

Appendix E BMP's could be amended to the DFO RMP  
– MOST if not all are already used when site specific  
NEPA is done.

Appendix E BMP's could be amended to the DFO RMP  
– MOST if not all are already used when site specific  
NEPA is done.

This was common to all alternatives and therefore incorporated into the Final RMP on pg 46 and 47 under Locatable minerals. Also refer to Appendix N Standard operating procedures for Mineral material sites in DFO ROD/RMP pg. 169. I MAY JUST RECOMMEND USING WORDING FROM SUB-REGION ALTERNATIVE.

also Appendix N pg 169 of DFO RMP has SOP for Mineral Material Sites

No Lease was analyzed under alt C in draft RMP. See below for Final Decision I feel this is adequate as we have no active drilling/wells and no APD's in DFO Online link to BMP's for Fluid Minerals located in Appendix B Also see Washington Office IM No. 2004-194. Also refer to Appendix M Procedures in oil and gas recovery. In DFO ROD/RMP Any geophysical exploration would require site specific NEPA.

DFO currently does not have any level of development. Last geophysical exploration was in 2008. Nothing has been developed on those leases  
May need plan amendment to update the ¼ mile NSO currently in DFO RMP to 4m NSO if warranted.  
Can add Appendix D BMP's from NTT  
←← See scenario analyzed in RMP for full field development. max of ten wells could be drilled over the life of the RMP RMP plan amendment would be needed to exceed this over the life of the plan.

0  
0

Need to update NSO distance around active leks.

0  
0

Same as NA, All motorized travel in DFO is limited to designated routes. All of these actions listed under travel require an EA to be completed if we make any changes to the TMP.

Same as NA Would require an EA anyway Should this be under Travel Management?

Same as NA - Should this be under Travel Management?

Same as NA - Should this be under Travel  
Management?

Is this a Recreation/travel issue or Mineral Split  
Estate??

Is this a Recreation/travel issue or Mineral Split  
Estate??

Is this a Recreation/travel issue or Mineral Split  
Estate??

SRP in sage grouse habitat are not specifically addressed in RMP, however most if not all our SRP are outfitter /guides for fishing or big game hunting, not likely to impact sage grouse.

Same as NA

Most of our winter snow machine travel is not in gsg winter habitat. Do we even need to address this?

No Concern All allotments in DFO have had health assessments completed and ESD were used to determine Function. Changes have been made to improve sage grouse habitat conditions where standards were not met.

Same as NA - DFO is active in Local gsg working group, and works with landowners during permit renewal to benefit all wildlife species.

Same as NA, All allotments in DFO have been assessed in the past ten years and changes have been made where not meeting the standards or sagebrush habitat requirements.

Currently being done during Watershed Assesments.

Sams as NA - Not going to paste the whole thing here.  
No Concern. Monitoring and habitat objectives are outlined in WA EA's

addressed in multiple locations in RMP, and already pasted into multiple actions in this matrix.

This is all considered during Watershed assessments when AMP's are renewed.

Same as NA - Reductions were made during drought periods around 2003-2004 and post drought management was allotted for. We are currently talking to Permittees regarding possible reductions for 2013.

Same as NA - new water developments are analyzed during watershed assessments.

Same as NA - Currently evaluated during watershed analysis process, most historic seedings have converted back to sagebrush habitat.

Same as NA - the DFO has been modifying fences, marking fences around leks and has has an aggressive weeds management program for the past 10 years.

West nile has not been identified as an issue in DFO possibly due to elevation and the species of mosquito that is a carrier does not survive here.

These are all analyzed during Watershed assessments.  
The DFO has been actively removing, modifying and marking fences around leks.

If warranted no grazing is analyzed on specific parcels or pastures/allotments during Watershed assessments.

This is analyzed under Watershed Assesments.  
0

Same as NA - This is analyzed during our watershed assessments

Not really an issue in MT to reduce threat of fire in annual grasslands.

**Alternative B – Priority Areas****Alternative B - General Areas**

§ Action: In priority habitat, propose withdrawal from mineral entry based on risk to the sage-grouse and its habitat from conflicting locatable mineral potential and development. Make any existing claims within the withdrawal area subject to validity exams or buy out. Include claims that have been subsequently determined to be null and void in the proposed withdrawal. In plans of operations required prior to any proposed surface disturbing activities, include the following: Additional, effective mitigation in perpetuity for conservation (In accordance with existing policy, WO IM 2008-204). Example: purchase private land and mineral rights or severed subsurface mineral rights within the priority area and deed to US Government). Consider seasonal restrictions if deemed effective.

No Action

1. Action: In priority habitat, apply the following nine conservation measures through Resource Management Plan (RMP) implementation decisions (e.g., approval of an Application for Permit to Drill, Sundry Notice, etc.) and upon completion of the environmental record of review (43 CFR 3162.5), including appropriate documentation of compliance with NEPA. In this process evaluate, among other things: Whether the conservation measure is “reasonable” (43 CFR 3101.1-2) with the valid existing rights; and Whether the action is in conformance with the approved RMP.

No Action

Action (Alternative 1): Allow geophysical exploration within priority sage-grouse habitat areas to obtain exploratory information for areas outside of and adjacent to priority sage-grouse habitat areas. Allow geophysical operations only by helicopter-portable drilling methods and in accordance with seasonal timing restrictions and/or other restrictions that may apply.

No Action

Action (Alternative 1): Close priority sage-grouse habitat areas to fluid mineral leasing. Upon expiration or termination of existing leases, do not accept nominations/expressions of interest for parcels within priority areas. No Action

Action (Alternative 2): Allow geophysical exploration within priority sage-grouse habitat areas to obtain exploratory information for areas outside of and adjacent to priority sage-grouse habitat areas. Only allow geophysical operations by helicopter-portable drilling methods and in accordance with seasonal timing restrictions and/or other restrictions that may apply. No Action

Action (Alternative 2): Close priority sage-grouse habitat areas to fluid mineral leasing. Consider an exception when there is an opportunity for the BLM and FS to influence conservation measures where surface and/or mineral ownership is not entirely federally owned (i.e., checkerboard ownership). In this case, a plan amendment may be developed that opens the priority area for new leasing. The plan must demonstrate long-term population increases in the priority area through mitigation (prior to issuing the lease) including lease stipulations, off-site mitigation, etc., and avoid short-term losses that put the sage-grouse population at risk from stochastic events leading to extirpation. No Action

Action: Analyze springs, seeps and associated pipelines to determine if modifications are necessary to maintain the continuity of the predevelopment riparian area within priority sage-grouse habitats. Make modifications where necessary, considering impacts to other water uses when such considerations are neutral or beneficial to sage-grouse. No Action

Action: Authorize new water development for diversion from spring or seep source only when priority sage-grouse habitat would benefit from the development. This includes developing new water sources for livestock as part of an AMP/conservation plan to improve sage-grouse habitat. Same as Priority Areas.

Action: Close priority habitat to mineral material sales. No Action

Action: Close priority habitat to non-energy leasable mineral leasing. This includes not permitting any new leases to expand an existing mine. No Action

Action: Complete activity level travel plans within five years of the record of decision. During activity level planning, where appropriate, designate routes in priority habitat with current administrative/agency purpose or need to administrative access only. No Action

Action: Consider potential changes in climate (Miller et al. 2011) when proposing post-fire seedings using native plants. Consider seed collections from the warmer component within a species' current range for selection of native seed. (Kramer and Havens 2009). No Action

Action: Consider potential changes in climate (Miller et al. 2011) when proposing restoration seedings when using native plants. Consider collection from the warmer component of the species current range when selecting native species (Kramer and Havens 2009). No Action

Action: Coordinate with other resources (Range, Wildlife, and Riparian) to conduct land health assessments to determine existing structure/condition/composition of vegetation within all BLM HMAs and FS WHTs. No Action

Action: Design fuels management projects in priority sage-grouse habitat to strategically and effectively reduce wildfire threats in the greatest area. This may require fuels treatments implemented in a more linear versus block design (Launchbaugh et al. 2007). No Action

Action: Design post ES&R and BAER management to ensure long term persistence of seeded or pre-burn native plants. This may require temporary or long-term changes in livestock grazing, wild horse and burro, and travel management, etc., to achieve and maintain the desired condition of ES&R and BAER projects to benefit sage-grouse (Eiswerth and Shonkwiler 2006). No Action

Action: Design post restoration management to ensure long term persistence. This could include changes in livestock grazing management, wild horse and burro management and travel management, etc., to achieve and maintain the desired condition of the restoration effort that benefits sage-grouse (Eiswerth and Shonkwiler 2006).

No Action

Action: Develop specific objectives to conserve, enhance or restore priority sage-grouse habitat based on BLM ESDs (FS may use other methods) and assessments (including within wetlands and riparian areas). If an effective grazing system that meets sage-grouse habitat requirements is not already in place, analyze at least one alternative that conserves, restores or enhances sage-grouse habitat in the NEPA document prepared for the permit renewal (Doherty et al. 2011b, Williams et al. 2011).

No Action

Action: During drought periods, prioritize evaluating effects of the drought in priority sage-grouse habitat areas relative to their needs for food and cover. Since there is a lag in vegetation recovery following drought (Thurrow and Taylor 1999, Cagney et al. 2010), ensure that post-drought management allows for vegetation recovery that meets sage-grouse needs in priority sage-grouse habitat areas.

No Action

Action: During fuels management project design, consider the utility of using livestock to strategically reduce fine fuels (Diamond et al. 2009), and implement grazing management that will accomplish this objective (Davies et al. 2011 and Launchbaugh et al. 2007). Consult with ecologists to minimize impacts to native perennial grasses.

No Action

Action: Evaluate and take advantage of opportunities to remove, bury, or modify existing power lines within priority sage-grouse habitat areas.

No Action

Action: Evaluate the role of existing seedings that are currently composed of primarily introduced perennial grasses in and adjacent to priority sage-grouse habitats to determine if they should be restored to sagebrush or habitat of higher quality for sage-grouse. If these seedings are part of an AMP/ Conservation Plan or if they provide value in conserving or enhancing the rest of the priority habitats, then no restoration would be necessary. Assess the compatibility of these seedings for sage-grouse habitat or as a component of a grazing system during the land health assessments (or other analyses [FS only]) (Davies et al. 2011).

No Action

Action: Follow Best Management Practices (WO IM 2011-138, see appendix E.)

No Action

Action: For all BLM HMAs and FS WHTs within priority sage-grouse habitat, prioritize the evaluation of all AMLs based on indicators that address structure/condition/composition of vegetation and measurements specific to achieving sage-grouse habitat objectives.

No Action

Action: For existing non-energy leasable mineral leases in priority habitat, in addition to the solid minerals BMPs (Appendix E), follow the same BMPs applied to Fluid Minerals (Appendix D), when wells are used for solution mining.

No Action

Action: Implement management actions (grazing decisions, Annual Operating Instructions [FS only], AMP/Conservation Plan development, or other agreements) to modify grazing management to meet seasonal sage-grouse habitat requirements (Connelly et al. 2011c). Consider singly, or in combination, changes in: 1) Season or timing of use; 2) Numbers of livestock (includes temporary non-use or livestock removal); 3) Distribution of livestock use; 4) Intensity of use; and 5) Type of livestock (e.g., cattle, sheep, horses, llamas, alpacas and goats) (Briske et al. 2011).

No Action

Action: In fire prone areas where sagebrush seed is required for sage-grouse habitat restoration, consider establishing seed harvest areas that are managed for seed production (Armstrong 2007) and are a priority for protection from outside disturbances.

No Action

Action: In priority habitat, conduct land health assessments that include (at a minimum) indicators and measurements of structure/condition/composition of vegetation specific to achieving sage-grouse habitat objectives (Doherty et al. 2011). If local/state seasonal habitat objectives are not available, use sage-grouse habitat recommendations from Connelly et al. 2000b and Hagen et al. 2007.

No Action

Action: In priority habitat, conduct restoration of roads, primitive roads and trails not designated in travel management plans. This also includes primitive route/roads that were not designated in Wilderness Study Areas and within lands with wilderness characteristics that have been selected for protection in previous RMPs.

No Action

Action: In priority habitat, design any new structural range improvements and location of supplements (salt or protein blocks) to conserve, enhance, or restore sage-grouse habitat through an improved grazing management system relative to sage-grouse objectives. Structural range improvements, in this context, include but are not limited to: cattleguards, fences, exclosures, corrals or other livestock handling structures; pipelines, troughs, storage tanks (including moveable tanks used in livestock water hauling), windmills, ponds/reservoirs, solar panels and spring developments. Potential for invasive species establishment or increase following construction must be considered in the project planning process and monitored and treated post-construction.

No Action

Action: In priority habitat, do not recommend withdrawal proposals not associated with mineral activity unless the land management is consistent with sage-grouse conservation measures. (For example; in a proposed withdrawal for a military training range buffer area, manage the buffer area with sage-grouse conservation measures.)

No Action

Action: In priority habitat, evaluate existing structural range improvements and location of supplements (salt or protein blocks) to make sure they conserve, enhance or restore sage-grouse habitat. No Action

Action: In priority habitat, limit motorized travel to existing roads, primitive roads, and trails at a minimum, until such time as travel management planning is complete and routes are either designated or closed. No Action

Action: In priority habitat, limit route construction to realignments of existing designated routes if that realignment has a minimal impact on sage-grouse habitat, eliminates the need to construct a new road, or is necessary for motorist safety. No Action

Action: In priority habitat, manage for vegetation composition and structure consistent with ecological site potential and within the reference state to achieve sage-grouse seasonal habitat objectives. No Action

Action: In priority habitat, monitor for, and treat invasive species associated with existing range improvements (Gelbard and Belnap 2003 and Bergquist et al. 2007). No Action

Action: In priority habitat, only allow treatments that conserve, enhance or restore sage-grouse habitat (this includes treatments that benefit livestock as part of an AMP/Conservation Plan to improve sage-grouse habitat). No Action

Action: In priority habitat, restore saleable mineral pits no longer in use to meet sage-grouse habitat conservation objectives. No Action

Action: In priority habitat, travel management should evaluate the need for permanent or seasonal road closures. No Action

Action: In priority habitat, use existing roads, or realignments as described above to access valid existing rights that are not yet developed. If valid existing rights cannot be accessed via existing roads, then build any new road constructed to the absolute minimum standard necessary, and add the surface disturbance to the total disturbance in the priority area. If that disturbance exceeds 3 % for that area, then evaluate and implement additional, effective mitigation necessary to offset the resulting loss of sage-grouse habitat (see Objectives).

No Action

Action: In priority habitat, work cooperatively on integrated ranch planning within sage-grouse habitat so operations with deeded/BLM and/or FS allotments can be planned as single units.

No Action

Action: In priority sage-grouse habitat areas, prioritize suppression, immediately after life and property, to conserve the habitat.

Action: In general sage-grouse habitat, prioritize suppression where wildfires threaten priority sage-grouse habitat.

Action: Include sage-grouse habitat parameters as defined by Connelly et al. (2000), Hagen et al. (2007) or if available, State Sage-Grouse Conservation plans and appropriate local information in habitat restoration objectives. Make meeting these objectives within priority sage-grouse habitat areas the highest restoration priority.

No Action

Action: Integrated Vegetation Management would be used to control, suppress, and eradicate, where possible, noxious and invasive species per BLM

No Action

Action: Maintain retirement of grazing privileges as an option in priority sage-grouse areas when the current permittee is willing to retire grazing on all or part of an allotment. Analyze the adverse impacts of no livestock use on wildfire and invasive species threats (Crawford et al. 2004) in evaluating retirement proposals.

No Action

Action: Make applicable Best Management Practices (see Appendix E) mandatory as Conditions of Approval within priority sage-grouse habitat.

No Action

Action: Make priority sage-grouse habitat areas exclusion areas for new BLM ROW or FS Special Use Authorization (SUA) permits. Consider the following exceptions: Within designated ROW or SUA corridors encumbered by existing ROW or SUA authorizations: new ROWs or SUAs may be co-located only if the entire footprint of the proposed project (including construction and staging), can be completed within the existing disturbance associated with the authorized ROWs or SUAs. Subject to valid, existing rights: where new ROWs or SUAs associated with valid existing rights are required, co-locate new ROWs or SUAs within existing ROWs or SUAs or where it best minimizes sage-grouse impacts. Use existing roads, or realignments as described above, to access valid existing rights that are not yet developed. If valid existing rights cannot be accessed via existing roads, then build any new road constructed to the absolute minimum standard necessary, and add the surface disturbance to the total disturbance in the priority area. If that disturbance exceeds 3% for that area, then evaluate and implement additional effective mitigation on a case-by-case basis to offset the resulting loss of sage-grouse habitat.

No Action

Action: Make re-establishment of sagebrush cover and desirable understory plants (relative to ecological site potential) the highest priority for restoration efforts.

No Action

Action: Manage riparian areas and wet meadows for proper functioning condition or other similar methodology (FS only) within priority sage-grouse habitats.

Action: No Similar Action

No Action

Action: No Similar Action

Sub-objective: Quantify and delineate general habitat for capability to provide connectivity among priority areas (Knick and Hanser 2011).

Action: No Similar Action

Sub-objective: Conserve, enhance or restore sage-grouse habitat and connectivity (Knick and Hanser 2011) to promote movement and genetic diversity, with emphasis on those habitats occupied by sage-grouse.

Action: No Similar Action

· Sub-objective: Assess general sage-grouse habitats to determine potential to replace lost priority habitat caused by perturbations and/or disturbances and provide connectivity (Knick and Hanser 2011) between priority areas. These habitats should be given some priority over other general sage-grouse habitats that provide marginal or substandard sage-grouse habitat. Restore historical habitat functionality to support sage-grouse populations guided by objectives to maintain or enhance connectivity. Total area and locations will be determined at the Land Use Plan level. Enhance general sage-grouse habitat such that population declines in one area are replaced elsewhere within the habitat.

No Action

Action: No Similar Action

No Action

Action: Only allow BLM Special Recreation Permits (SRPs) and FS Recreation Special Use Authorizations (RSUAs) in priority habitat that have neutral or beneficial effects to priority habitat areas.

No Action

Action: Prioritize completion of land health assessments (FS may use other analyses) and processing grazing permits within priority sage-grouse habitat areas. Focus this process on allotments that have the best opportunities for conserving, enhancing or restoring habitat for sage-grouse. Utilize BLM Ecological Site Descriptions (ESDs) (FS may use other methods) to conduct land health assessments to determine if standards of range-land health are being met.

No Action

Action: Prioritize implementation of restoration projects based on environmental variables that improve chances for project success in areas most likely to benefit sage-grouse (Meinke et al. 2009). Prioritize restoration in seasonal habitats that are thought to be limiting sage-grouse distribution and/or abundance.

No Action

Action: Prioritize native seed allocation for use in sage-grouse habitat in years when preferred native seed is in short supply. This may require reallocation of native seed from Emergency Stabilization and Rehabilitation (ES&R) (BLM) and/or Burn Area Emergency Rehabilitation (BAER) (FS) projects outside of priority sage-grouse habitat to those inside it. Use of native plant seeds for ES&R or BAER seedings is required based on availability, adaptation (site potential), and probability of success (Richards et al. 1998). Where probability of success or native seed availability is low, non-native seeds may be used as long as they meet sage-grouse habitat conservation objectives (Pyke 2011). Re-establishment of appropriate sagebrush species/subspecies and important understory plants, relative to site potential, shall be the highest priority for rehabilitation efforts.

No Action

Action: Propose lands within priority sage-grouse habitat areas for mineral withdrawal.

No Action

Action: Require use of native seeds for restoration based on availability, adaptation (ecological site potential), and probability of success (Richards et al. 1998). Where probability of success or adapted seed availability is low, non-native seeds may be used as long as they support sage-grouse habitat objectives (Pyke 2011). No Action

Action: Restore native (or desirable) plants and create landscape patterns which most benefit sage-grouse. No Action

Action: Retain public ownership of priority sage-grouse habitat. Consider exceptions where: There is mixed ownership, and land exchanges would allow for additional or more contiguous federal ownership patterns within the priority sage-grouse habitat area. Under priority sage-grouse habitat areas with minority federal ownership, include an additional, effective mitigation agreement for any disposal of federal land. As a final preservation measure consideration should be given to pursuing a permanent conservation easement. No Action

Action: To reduce outright sage-grouse strikes and mortality, remove, modify or mark fences in high risk areas within priority sage-grouse habitat based on proximity to lek, lek size, and topography (Christiansen 2009, Stevens 2011). No Action

Action: When conducting NEPA analysis for wild horse and burro management activities, water developments or other rangeland improvements for wild horses in priority sage-grouse habitat, address the direct and indirect effects to sage-grouse populations and habitat. Implement any water developments or rangeland improvements using the criteria identified for domestic livestock identified above in priority habitats. No Action

Action: When developing or modifying water developments in priority habitat, use applicable best management practices (BMPs, see Appendix C) to mitigate potential impacts from West Nile virus (Clark et al. 2006, Doherty 2007, Walker et al. 2007b, Walker and Naugle 2011). No Action

Action: When reseeding roads, primitive roads and trails in priority habitat, use appropriate seed mixes and consider the use of transplanted sagebrush.	No Action
Action: Where existing leases or ROWs or SUAs have had some level of development (road, fence, well, etc.) and are no longer in use, reclaim the site by removing these features and restoring the habitat.	No Action
Action: Where riparian areas and wet meadows meet proper functioning condition or meet standards using other similar methodology (FS only), strive to attain reference state vegetation relative to the ecological site description.	Same as Priority Areas.
Action: Where suitable conservation actions cannot be achieved in priority habitat, seek to acquire state and private lands with intact subsurface mineral estate by donation, purchase or exchange in order to best conserve, enhance or restore sage-grouse habitat.	No Action
Action: Where the federal government owns the mineral estate in priority habitat, and the surface is in non-federal ownership, apply the conservation measures applied on public lands.	No Action
Action: Where the federal government owns the surface, and the mineral estate is in non-federal ownership in priority habitat, apply appropriate Fluid Mineral BMPs (see Appendix D) to surface development.	No Action
Action: Within priority habitat, develop or amend BLM Herd Management Area Plans (HMAPs) and FS Wildhorse Territory Plans (WHTPs) to incorporate sage-grouse habitat objectives and management considerations for all BLM herd management areas (HMAs) and FS Wildhorse Territories (WHTs).	No Action
Action: Within priority sage-grouse habitat, incorporate sage-grouse habitat objectives and management considerations into all BLM and FS grazing allotments through Allotment Management Plans (AMPs) or permit renewals and/or FS Annual Operating Instructions.	No Action

Action: Within priority sage-grouse habitat, reduce hot season grazing on riparian and meadow complexes to promote recovery or maintenance of appropriate vegetation and water quality. Utilize fencing/herding techniques or seasonal use or livestock distribution changes to reduce pressure on riparian or wet meadow vegetation used by sage-grouse in the hot season (summer) (Aldridge and Brigham 2002, Crawford et al. 2004, Hagen et al. 2007).

No Action

Action: Within sage-grouse habitats, manage wet meadows to maintain a component of perennial forbs with diverse species richness relative to site potential (e.g., reference state) to facilitate brood rearing. Also conserve or enhance these wet meadow complexes to maintain or increase amount of edge and cover within that edge to minimize elevated mortality during the late brood rearing period (Hagen et al. 2007, Kolada et al. 2009, Atamian et al. 2010).

Same as Priority Areas.

Address post reclamation management in reclamation plan such that goals and objectives are to protect and improve sage-grouse habitat needs.

Apply a phased development approach with concurrent reclamation.

No Action

As funding and logistics permit, restore annual grasslands to a species composition characterized by perennial grasses, forbs, and shrubs.

No Action

As safety allows, conduct mop-up where the black adjoins unburned islands, dog legs, or other habitat features to minimize sagebrush loss.

No Action

Assign a sage-grouse resource advisor to all extended attack fires in or near key sage-grouse habitat areas. Prior to the fire season, provide training to sage-grouse resource advisors on wildfire suppression organization, objectives, tactics, and procedures to develop a cadre of qualified individuals.

No Action

BMP Section B: Fluid Minerals

No Action

Build steep shorelines to reduce shallow water (>60 cm) and aquatic vegetation around the perimeter of impoundments (Knight et al. 2003). Construction of steep shorelines also will create more permanent ponds that are a deterrent to colonizing mosquito species like Cx. tarsalis which prefer newly flooded sites with high primary productivity (Knight et al. 2003).	No Action
Bury distribution power lines.	No Action
Bury power lines.	No Action
Clean up refuse (Bui et al. 2011).	Clean up refuse (Bui et al. 2011).
Close and reclaim duplicate roads by restoring original landform and establishing desired vegetation.	No Action
Cluster disturbances associated with operations (fracturing stimulation, liquids gatherin, etc.) and facilities as close as possible.	Cluster disturbances associated with operations (fracturing stimulation, liquids gatherin, etc.) and facilities as close as possible.
Collocate powerlines, flowlines, and small pipelines under or immediately adjacent to existing roads (Bui et al. 2010).	No Action
Conservation Measure: Apply a seasonal restriction on exploratory drilling that prohibits surface-disturbing activities during the nesting and early brood-rearing season in all priority sage-grouse habitat during this period.	No Action
Conservation Measure: Complete Master Development Plans in lieu of Application for Permit to Drill (APD)-by-APD processing for all but wildcat wells.	No Action
Conservation Measure: For future actions, require a full reclamation bond specific to the site in accordance with 43 CFR 3104.2, 3104.3, and 3104.5. Insure bonds are sufficient for costs relative to reclamation (Connelly et al. 2000, Hagen et al. 2007) that would result in full restoration of the lands to the condition it was found prior to disturbance. Base the reclamation costs on the assumption that contractors for the BLM or FS will perform the work.	No Action
Conservation Measure: Identify areas where acquisitions (including subsurface mineral rights) or conservation easements, would benefit sage-grouse habitat.	No Action

Conservation Measure: Make applicable Best Management Practices (BMPs, see Appendix D) mandatory as Conditions of Approval within priority sage-grouse habitat.	No Action
Conservation Measure: Require unitization when deemed necessary for proper development and operation of an area (with strong oversight and monitoring) to minimize adverse impacts to sage-grouse according to the Federal Lease Form, 3100-11, Sections 4 and 6.	No Action
Conservation Measure: When permitting APDs on existing leases that are not yet developed, the proposed surface disturbance cannot exceed 3% for that area. Consider an exception if: Additional, effective mitigation is demonstrated to offset the resulting loss of sage-grouse (see Objectives). When necessary, conduct additional, effective mitigation in 1) priority sage-grouse habitat areas or – less preferably – 2) general sage-grouse habitat (dependent upon the area-specific ability to increase sage-grouse populations). Conduct additional, effective mitigation first within the same population area where the impact is realized, and if not possible then conduct mitigation within the same Management Zone as the impact, per 2006 WAFWA Strategy – pg 2-17.	No Action
Construct dams or impoundments that restrict down slope seepage or overflow by digging ponds in flat areas rather than damming natural draws for effluent water storage, or lining constructed ponds in areas where seepage is anticipated (Knight et al. 2003).	No Action
Construct road crossings at right angles to ephemeral drainages and stream crossings. Control the spread and effects of non-native plant species (Gelbard and Belnap 2003, Bergquist et al. 2007, Evangelista et al. 2011). (E.g. by washing vehicles and equipment.)	Construct road crossings at right angles to ephemeral drainages and stream crossings. Control the spread and effects of non-native plant species (Evangelista et al. 2011). (E.g. by washing vehicles and equipment.)
Coordinate road construction and use among ROW or SUA holders. Cover (e.g., fine mesh netting or use other effective techniques) all drilling and production pits and tanks regardless of size to reduce sage-grouse mortality.	Coordinate road construction and use among ROW or SUA holders. Cover (e.g., fine mesh netting or use other effective techniques) all drilling and production pits and tanks regardless of size to reduce sage-grouse mortality.

Design or site permanent structures which create movement (e.g. pump jack) to minimize impacts to sage-grouse.	No Action
Design roads to an appropriate standard no higher than necessary to accommodate their intended purpose.	Design roads to an appropriate standard no higher than necessary to accommodate their intended purpose.
Design vegetation treatment in areas of high fire frequency to facilitate firefighting safety, reduce the risk of extreme fire behavior; and to reduce the risk and rate of fire spread to key and restoration habitats.	No Action
Develop state-specific sage-grouse toolboxes containing maps, a list of resource advisors, contact information, local guidance, and other relevant information.	No Action
Do not issue ROWs or SUAs to counties on newly constructed energy or mineral development roads, unless for a temporary use consistent with all other terms and conditions included in this document.	Do not issue ROWs or SUAs to counties on newly constructed energy or mineral development roads, unless for a temporary use consistent with all other terms and conditions included in this document.
During periods of multiple fires, ensure line officers are involved in setting priorities.	No Action
Emphasize the use of native plant species, recognizing that non-native species may be necessary depending on the availability of native seed and prevailing site conditions.	No Action
Ensure proposed sagebrush treatments are planned with interdisciplinary input from BLM, FS, and /or state wildlife agency biologist and that treatment acreage is conservative in the context of surrounding sage-grouse seasonal habitats and landscape.	No Action
Equip tanks and other above-ground facilities with structures or devices that discourage nesting of raptors and corvids.	Equip tanks and other above-ground facilities with structures or devices that discourage nesting of raptors and corvids.
Establish speed limits on BLM and FS system roads to reduce vehicle/wildlife collisions or design roads to be driven at slower speeds.	Establish speed limits on BLM and FS system roads to reduce vehicle/wildlife collisions or design roads to be driven at slower speeds.
Establish trip restrictions (Lyon and Anderson 2003) or minimization through use of telemetry and remote well control (e.g., Supervisory Control and Data Acquisition).	No Action
Fence pond site to restrict access by livestock and other wild ungulates that trample and disturb shorelines, enrich sediments with manure and create hoof print pockets of water that are attractive to breeding mosquitoes.	No Action

Fit transmission towers with anti-perch devices (Lammers and Collopy 2007).	No Action
Give priority for implementing specific sage-grouse habitat restoration projects in annual grasslands first to sites which are adjacent to or surrounded by sage-grouse key habitats. Annual grasslands are second priority for restoration when the sites not adjacent to key habitat, but within 2 miles of key habitat. The third priority for annual grasslands habitat restoration projects are sites beyond 2 miles of key habitat. The intent is to focus restoration outward from existing, intact habitat.	No Action
GOAL: Maintain and/or increase sage-grouse abundance and distribution by conserving, enhancing or restoring the sagebrush ecosystem upon which populations depend in cooperation with other conservation partners.	GOAL: Same as Priority Habitat.
Include objectives for ensuring habitat restoration to meet sage-grouse habitat needs in reclamation practices/sites (Pyke 2011).	No Action
Increase the size of fresh -water ponds to accommodate a greater volume of water than is discharged. This will result in un-vegetated and muddy shorelines that breeding Cx. tarsalis avoid (De Szalay and Resh 2000). This modification may reduce Cx. tarsalis habitat but could create larval habitat for Culicoides sonorensis, a vector of blue tongue disease, and should be used sparingly (Schmidtman et al. 2000). Steep shorelines should be used in combination with this technique whenever possible (Knight et al. 2003).	No Action
Irrigate interim reclamation if necessary for establishing seedlings more quickly.	No Action
Limit noise to less than 10 decibels above ambient measures (20-24 dBA) at sunrise at the perimeter of a lek during active lek season (Patricelli et al. 2010, Blickley et al. In preparation).	No Action
Line the channel where discharge water flows into the pond with crushed rock, or use a horizontal pipe to discharge inflow directly into existing open water, thus precluding shallow surface inflow and accumulation of sediment that promotes aquatic vegetation.	No Action

Line the overflow spillway with crushed rock, and construct the spillway with steep sides to preclude the accumulation of shallow water and vegetation.	No Action
Locate man camps outside of priority sage-grouse habitats.	No Action
Locate new compressor stations outside priority habitats and design them to reduce noise that may be directed towards priority habitat.	No Action
Locate roads to avoid important areas and habitats.	No Action
Maintain the water level below that of rooted vegetation for a muddy shoreline that is unfavorable habitat for mosquito larvae. Rooted vegetation includes both aquatic and upland vegetative types. Avoid flooding terrestrial vegetation in flat terrain or low lying areas. Aquatic habitats with a vegetated inflow and outflow separated by open water produce 5-10 fold fewer Culex mosquitoes than completely vegetated wetlands (Walton and Workman 1998). Wetlands with open water also had significantly fewer stage III and IV instars which may be attributed to increased predator abundances in open water habitats (Walton and Workman 1998).	No Action
Maximize the area of interim reclamation on long-term access roads and well pads, including reshaping, topsoiling and revegetating cut-and-fill slopes.	No Action
Minimize burnout operations in key sage-grouse habitat areas by constructing direct fireline whenever safe and practical to do so.	No Action
Minimize unnecessary cross-country vehicle travel during fire operations in sage-grouse habitat.	No Action
No Similar Objective	No Action

o Action: In priority habitat, design and implement fuels treatments with an emphasis on protecting existing sagebrush ecosystems. Do not reduce sagebrush canopy cover to less than 15% (Connelly et al. 2000, Hagen et al. 2007) unless a fuels management objective requires additional reduction in sagebrush cover to meet strategic protection of priority sage-grouse habitat and conserve habitat quality for the species. Closely evaluate the benefits of the fuel break against the additional loss of sagebrush cover in future NEPA documents. Apply appropriate seasonal restrictions for implementing fuels management treatments according to the type of seasonal habitats present in a priority area. Allow no fuels treatments in known winter range unless the treatments are designed to strategically reduce wildfire risk around or in the winter range and will maintain winter range habitat quality. Do not use fire to treat sagebrush in less than 12-inch precipitation zones (e.g., Wyoming big sagebrush or other xeric sagebrush species; Connelly et al. 2000, Hagen et al. 2007, Beck et al. 2009). However, if as a last resort and after all other treatment opportunities have been explored and site specific variables allow, the use of prescribed fire for fuel breaks that would disrupt the fuel continuity across the landscape could be considered, in stands where cheatgrass is a very minor component in the

No Action

o Action: In priority habitat, provide the following conservation measures as terms and conditions of the approved RMP: Do not allow new surface occupancy on federal leases within priority habitats, this includes winter concentration areas (Doherty et al. 2008, Carpenter et al. 2010) during any time of the year. Consider an exception: If the lease is entirely within priority habitats, apply a 4-mile NSO around the lek, and limit permitted disturbances to 1 per section with no more than 3% surface disturbance in that section. If the entire lease is within the 4-mile lek perimeter, limit permitted disturbances to 1 per section with no more than 3% surface disturbance in that section. Require any development to be placed at the most distal part of the lease from the lek, or, depending on topography and other habitat aspects, in an area that is less demonstrably harmful to sage-grouse.

No Action

OBJECTIVE: Maintain or increase current distribution and abundance of sage-grouse on BLM administered lands in support of the range-wide goals.

No Action

OBJECTIVE: Manage land uses, habitat treatments, and anthropogenic disturbances below thresholds necessary to conserve local sage-grouse populations, sagebrush communities and landscapes.

No Action

Objective: Manage wild horse and burro population levels within established Appropriate Management Levels (AML).

No Action

Objective: No Similar Objective

No Action

Objective: No Similar Objective

No Action

Objective: No Similar Objective

No Action

Objective: No Similar Objective

No Action

Objective: Prioritize gathers in priority sage-grouse habitat, unless removals are necessary in other areas to prevent catastrophic environmental issues, including herd health impacts.

No Action

Objective: Protect priority sage-grouse habitats from anthropogenic disturbances that will reduce distribution or abundance of sage-grouse

No Action

On critical fire weather days, pre-position additional fire suppression resources to optimize a quick and efficient response in sage-grouse habitat areas.	No Action
Pipelines must be under or immediately adjacent to the road (Bui et al. 2010).	No Action
Place infrastructure in already disturbed locations where the habitat has not been fully restored.	No Action
Place liquid gathering facilities outside of priority areas. Have no tanks at well locations within priority habitat areas to minimize truck traffic and perching and nesting sites for ravens and raptors.	No Action
Place new utility developments (power lines, pipelines, etc.) and transportation routes in existing utility or transportation corridors.	No Action
Planning Direction Note: Relocate existing designated ROW corridors crossing priority sage-grouse habitat void of any authorized ROWs, outside of the priority habitat area. If relocation is not possible, undesignate that entire corridor during the planning process.	No Action
Planning direction Note: Each planning effort will identify the specific allotment(s) where permanent retirement of grazing privileges is potentially beneficial.	No Action
Power-wash all firefighting vehicles, to the extent possible, including engines, water tenders, personnel vehicles, and ATVs prior to deploying in or near sage-grouse habitat areas to minimize noxious weed spread.	No Action
Power-wash all vehicles and equipment involved in fuels management activities prior to entering the area to minimize the introduction of undesirable and/or invasive plant species.	No Action
Priority sage-grouse habitats are areas that have the highest conservation value to maintaining or increasing sage-grouse populations. These areas would include breeding, late brood-rearing, winter concentration areas, and where known, migration or connectivity corridors.	General sage-grouse habitat is occupied (seasonal or year-round) habitat outside of priority habitat.
Protect wildland areas from wildfire originating on private lands, infrastructure corridors, and recreational areas.	No Action

Provide localized maps to dispatch offices and extended attack incident commanders for use in prioritizing wildfire suppression resources and designing suppression tactics.	No Action
Provide training to fuels treatment personnel on sage-grouse biology, habitat requirements, and identification of areas utilized locally.	No Action
Reduce the risk of vehicle or human-caused wildfires and the spread of invasive species by planting perennial vegetation (e.g., green-strips) paralleling road rights-of-way.	No Action
Remove or re-inject produced water to reduce habitat for mosquitoes that vector West Nile virus. If surface disposal of produced water continues, use the following steps for reservoir design to limit favorable mosquito habitat: Overbuild size of ponds for muddy and non-vegetated shorelines. Build steep shorelines to decrease vegetation and increase wave actions. Avoid flooding terrestrial vegetation in flat terrain or low lying areas. Construct dams or impoundments that restrict down slope seepage or overflow. Line the channel where discharge water flows into the pond with crushed rock. Construct spillway with steep sides and line it with crushed rock. Treat waters with larvicides to reduce mosquito production where water occurs on the surface.	No Action
Remove standing and encroaching trees within at least 100 meters of occupied sage-grouse leks and other habitats (e.g., nesting, wintering, and brood rearing) to reduce the availability of perch sites for avian predators, as appropriate, and resources permit.	No Action
Require noise shields when drilling during the lek, nesting, brood-rearing, or wintering season.	No Action
Require sage-grouse safe fences around sumps.	No Action
Require sage-grouse-safe fences.	No Action
Restore disturbed areas at final reclamation to the pre-disturbance landforms and desired plant community.	No Action
Restrict pit and impoundment construction to reduce or eliminate threats from West Nile virus (Doherty 2007).	Restrict pit and impoundment construction to reduce or eliminate threats from West Nile virus (Doherty 2007).

Restrict the construction of tall facilities and fences to the minimum number and amount needed.	Restrict the construction of tall facilities and fences to the minimum number and amount needed.
Restrict vehicle traffic to only authorized users on newly constructed routes (using signage, gates, etc.)	No Action
Roads - PPH	No Action
Site and/or minimize linear ROWs or SUAs to reduce disturbance to sagebrush habitats.	No Action
Strategically place and maintain pre-treated strips/areas (e.g., mowing, herbicide application, and strictly managed grazed strips) to aid in controlling wildfire should wildfire occur near key habitats or important restoration areas (such as where investments in restoration have already been made).	No Action
Sub-objective: Designate priority sage-grouse habitats for each WAFWA management zone (Stiver et al. 2006) across the current geographic range of sage-grouse that are large enough to stabilize populations in the short term and enhance populations over the long term.	Sub-objective: Designate general sage-grouse habitats for each WAFWA management zone (Stiver et al. 2006) across the current geographic range of sage-grouse that provide for major life history function (e.g., breeding, migration, or winter survival) in order to maintain genetic diversity needed for sustainable Greater Sage-Grouse populations.
Sub-objective: Develop quantifiable habitat and population objectives with WAFWA and other conservation partners at the management zone and/or other appropriate scales. Develop a monitoring and adaptive management strategy to track whether these objectives are being met, and allow for revisions to management approaches if they are not.	No Action

Sub-objective: Manage priority sage-grouse habitats so that discrete anthropogenic disturbances cover less than 3% of the total sage-grouse habitat regardless of ownership. Anthropogenic features include but are not limited to paved highways, graded gravel roads, transmission lines, substations, wind turbines, oil and gas wells, geothermal wells and associated facilities, pipelines, landfills, homes, and mines. In priority habitats where the 3% disturbance threshold is already exceeded from any source, no further anthropogenic disturbances will be permitted by BLM or FS until enough habitat has been restored to maintain the area under this threshold (subject to valid existing rights). In this instance, an additional objective will be designated for the priority area to prioritize and reclaim/restore anthropogenic disturbances so that 3% or less of the total priority habitat area is disturbed within 10 years.

No Action

Sub-objective: To maintain or increase current populations, manage or restore priority areas so that at least 70% of the land cover provides adequate sagebrush habitat to meet sage-grouse needs.

No Action

To the extent possible, locate wildfire suppression facilities (i.e., base camps, spike camps, drop points, staging areas, and heli-bases) in areas where physical disturbance to sage-grouse habitat can be minimized. These include disturbed areas, grasslands, near roads/trails or in other areas where there is existing disturbance or minimal sagebrush cover.

No Action

Use directional and horizontal drilling to reduce surface disturbance.  
Use dust abatement practices on roads and pads.

Use directional and horizontal drilling to reduce surface disturbance.  
Use dust abatement practices on roads and pads.

Use fire prescriptions that minimize undesirable effects on vegetation or soils (e.g., minimize mortality of desirable perennial plant species and reduce risk of hydrophobicity).

No Action

Use only closed-loop systems for drilling operations and no reserve pits.

No Action

Use remote monitoring techniques for production facilities and develop a plan to reduce the frequency of vehicle use (Lyon and Anderson 2003).	Use remote monitoring techniques for production facilities and develop a plan to reduce the frequency of vehicle use (Lyon and Anderson 2003).
--	--

Utilize mulching techniques to expedite reclamation and to protect soils.	No Action
---	-----------

Utilize retardant and mechanized equipment to minimize burned acreage during initial attack.	No Action
--	-----------

Where applicable, design fuels treatment objective to protect existing sagebrush ecosystems, modify fire behavior, restore native plants, and create landscape patterns which most benefit sage-grouse habitat.	No Action
---	-----------

Where applicable, incorporate roads and natural fuel breaks into fuel break design.	No Action
---	-----------

Where appropriate, ensure that treatments are configured in a manner (e.g., strips) that promotes use by sage-grouse (See Connelly et al., 2000*)	No Action
---	-----------

Action: No Similar Action

Action: No similar action.

Action: No similar action.

Action: Industrial solar projects will be prohibited in ACECs and occupied habitats. (WWP)

Action: Same as Alternative B.

Action: Same as Alternative B.

Action: Composition, function, and structure of native vegetation communities will be consistent with the reference state of the appropriate ESD and will be maximized to provide for healthy, resilient, and recovering sage-grouse habitat components. (WWP)

Action: Same as Alternative B.

Action: Same as Alternative B.

Action: Same as Alternative B.

Action: Exotic seedlings will be rehabbed, interseeded, restored to recover sagebrush in areas to expand occupied habitats. (WWP)

Action: Same as Alternative B.

Action: Same as Alternative B.

Active restoration practices:” “Removal of livestock water troughs, pipelines, and wells.” “Where possible, without further damage to springs/water sources, remove waterline piping and maximize water at spring/stream sources supporting diverse riparian and meadow vegetation. “ “Promote natural healing of headcuts to the maximum extent possible by limiting disturbance throughout the watershed. At times, a combination of methods may need to be used – but gabions and structural devices and boulder dumping should be limited, and restoration should strive for a functioning system. “ “Ripping/recontouring of roads and seeding with native local ecotypes of shrubs and grasses. (WWP)

Active restoration of crested wheatgrass seedlings. This can be accomplished, following targeted restoration planning to expand, reconnect or recover habitats required by sage-grouse by:” “Inter-seeding sagebrush seed or seedlings. “ “Removal of crested wheatgrass through plowing while minimizing use of herbicides. Subsequent re-seeding with local native ecotypes. “ “Active restoration of cheatgrass infestation areas.” “In all cases, local native plant ecotype seeds and seedlings must be used. (WWP)

**Alternative D - Priority Habitat Areas**

**Alternative D - Medial Habitat Areas**

Action: No Similar Action

Action: No Similar Action

GOAL: Same as Alternative B.

OBJECTIVE: Identify and strategically protect larger in-tact sagebrush areas and areas of lower fragmentation to maintain sage-grouse population persistence.

Action: No Similar Action

Sub-objective: Same as Alternative B.

OBJECTIVE: Identify and expand sagebrush areas to increase the extent and condition of available habitat on the landscape.

OBJECTIVE: Reconnect and expand areas of higher native plant community integrity/ rangeland health to increase the extent of high quality habitat and, where possible, to account for the future effects of climate change.

Action: No Similar Action

Action: No Similar Action

GOAL: Same as Alternative B.

OBJECTIVE: Identify and strategically protect larger in-tact sagebrush areas and areas of lower fragmentation to maintain sage-grouse population persistence.

Action: No Similar Action

Sub-objective: Designate medial sage-grouse habitats within WAFWA management zone IV (Stiver et al. 2006) that augment identified priority habitat areas.

OBJECTIVE: Identify and expand sagebrush areas to increase the extent and condition of available habitat on the landscape.

OBJECTIVE: Same as Priority.

OBJECTIVE: Increase the amount and functionality of seasonal habitats. a. Increase canopy cover and average patch size of sagebrush in perennial grasslands. b. Increase the amount, condition and connectivity of seasonal habitats. c. Protect or improve sage-grouse migration/ movement corridors . d. Reduce conifer encroachment within sage-grouse seasonal habitats. e. Improve understory (grass, forb) and/or riparian condition within breeding and late brood-rearing habitats. f. Reduce the extent of annual grasslands within to priority habitat.

Designate areas as ROW Avoidance areas and exclusion areas for wind and solar development. The following uses are not allowed: Transmission facilities (greater than 50kV in size - based on recent IM), wind energy testing and development, commercial solar development, commercial geothermal development, nuclear development, oil and gas development, mineral development, airports, and ancillary facilities associated with any of the forementioned development; paved roads and graded gravel roads, and landfills.

Designate areas as ROW Avoidance areas.

New ROW and land use authorizations would be avoided whenever possible. Any new ROW and land use authorizations would not result in a net loss of sage-grouse habitat of the respective priority area.

Same as Priority areas.

Land authorizations that are temporary in nature (such as film permits, apiaries sites, etc.), that do not result in loss of sage-grouse habitat would be subject to seasonal or timing restrictions and are otherwise exempt from mitigation requirements regarding habitat loss.

Same as priority areas.

New authorizations and modifications to existing ROW and land use authorizations would be subject to siting prescriptions and design features considered on a case-by-case basis, in subsequent NEPA analysis. This could include modifications to the types of uses that are excluded from consideration as new authorizations. For example upgrade of an existing 50kV powerline to a 115kV powerline, to eliminate the need for an additional line could be considered.

New authorizations and modifications to existing ROW and land use authorizations would be considered subject to siting prescriptions and design features considered on a case-by-case basis, in subsequent NEPA analysis.

New authorizations or modifications should be sited substantially within an existing disturbance or minimum necessary adjacent to the existing footprint, where feasible.

New authorizations or modifications should be sited substantially within the existing disturbance footprints where feasible.

Removal/relocation/ or burial opportunities for powerlines should be explored and implemented where feasible.

Same as Priority areas.

Site new authorizations or facilities outside the lek avoidance buffer areas (defined as???) unless topographic features reduce or eliminate effects to the lek.

Same as Priority areas.

Guy wires will be avoided where feasible. Where guy wires are necessary and appropriate without causing a human safety risk, bird collision diverters will be required.

Same as Priority areas.

Design structures and facilities to reduce perching and nesting opportunities for avian predators.	Same as Priority areas.
New power and communication lines, outside of existing ROWs, would be buried, where physically feasible, and associated above-ground disturbance areas would be seeded with perennial vegetation as per vegetation management.	New power and communication lines, outside of existing ROWs, would be buried, where physically and economically feasible, and associated above-ground disturbance areas would be seeded with perennial vegetation as per vegetation management.
Adhere to seasonal restrictions? Linear ROWs may be considered as vegetated fuel-breaks.	Same as Priority areas. Same as Priority areas.

Action: No Similar Action	Action: No Similar Action
Retain public ownership of priority sage-grouse habitat. Consider exceptions where: There is mixed ownership, and land exchanges would allow for additional or more contiguous federal ownership patterns within the priority sage-grouse habitat area.	Same as priority areas.
Action: Lands currently identified for retention within priority areas would be retained unless disposal of those lands would increase the extent or provide for connectivity of priority areas.	
Action: No Similar Action	Action: No Similar Action
Action: No Similar Action	Action: No Similar Action

Withdrawal Areas [We need for guidance here . Is the NTT action calling for withdrawals meant to be more for special designations such ACECs] Need to look at what needs to be retained and what we can get rid of, per LUP handbook Action: Withdrawal for the protection of sage-grouse may or may not be the most appropriate means to provide for the maintenance and enhancement for sage-grouse\*. ROW Avoidance and Exclusion designations will be evaluated to provide necessary protections. Action: When modifying or extending an existing withdrawal, ensure the lands are segregated from all of the mining and mineral leasing laws, as long as the segregation does not interfere with the intent of the withdrawal. \*Note: Lands are generally withdrawn for a specific use of the land by a BLM or another federal agency, and not simply to protect a resource. The withdrawn lands are generally segregated from some or all the public land laws and some or all of the mining and mineral

Action: No Similar Action  
Action: No Similar Action

Action: No Similar Action

Key Decision: Lands for Acquisition  
Action: Identify lands for acquisition that increase the extent of or provide for connectivity of PPH. Action: Acquisition of sage-grouse PPH will have priority over the acquisition of land for other program purposes subject to the approval of the Authorized officer.

Action: No Similar Action

Key Decision: Lands for Exchange  
Action: Evaluate potential land exchanges containing historically low-quality sage-grouse habitat that may be too costly to restore in exchange for lands of higher quality habitat, lands that connect seasonal sage-grouse habitats or lands providing for T&E species. These potential exchanges should lead to an increase in the extent or continuity of or provide for improved connectivity of PPH. Higher priority will be given to exchanges for those in-tact areas of sagebrush that will contribute to the expansion of PPH sagebrush areas currently in public ownership. Lower priority will be given to those lands that will promote enhancement the other PPH and PGH areas.

Same as Priority areas.

Solar and wind energy development is not allowed.

Action: Wind and solar energy development would be restricted where adverse effects could not be mitigated. Ancillary facilities such as roads, electric lines, etc. could potentially be authorized provided there is no net loss of sage-grouse habitat through mitigation.

Action: Process unauthorized use. If the unauthorized use does not serve the best interest of the public, reclaim the site by removing these features and restoring the habitat. If the use needs to be authorized, management actions for new authorizations would need to be consistent with objectives for conserving sage-grouse.

Same as Priority areas.

vegetation rehabilitation projects to achieve the greatest improvement in sage-grouse habitat. Factors contributing to higher emphasis for implementation include:

- Projects within priority habitat areas.
- Sites where environmental variables contribute to improved chances for project success (Meinke et al. 2009).
- Improvement of seasonal habitats that are thought to be limiting sage-grouse distribution and/or abundance (wintering areas, wet meadows and riparian areas, nesting areas, leks, etc.).
- Re-establishment of sagebrush cover in otherwise suitable sage-grouse habitat (native perennial grasslands, recently burned areas).
- Re-establishment of desirable understory vegetation in existing sagebrush stands.
- Cooperative efforts that may improve sage-grouse habitat quality over multiple ownerships.
- Projects in general habitat areas that may provide connectivity between suitable habitats or expand existing good quality habitats.
- Projects that address Same as Priority areas.

Action: Develop objectives that include sage-grouse habitat objectives for re-vegetation projects being done to enhance sage-grouse habitat. Objectives for sagebrush canopy cover and plant community structure should be consistent with what would be expected for the ecological site(s) of the project area. Consider general sage-grouse habitat parameters as defined by Connelly et al. (2000), Hagen et al. (2007), State or Local Sage-Grouse Conservation plans and other local information in order to develop restoration objectives that most effectively improve sage-grouse habitat quality.

Same as Priority areas.

Action: No Similar Action  
Same as Alternative B.

Action: No Similar Action  
Same as Priority areas.

Action: Implement management changes, as necessary, to maintain suitable sage-grouse habitat, improve unsuitable sage-grouse habitat and to ensure long-term persistence of improved sage-grouse habitat achieved through restoration efforts. (Eiswerth and Shonkwiler 2006). Management changes could be considered for livestock grazing, wild horse and burros, travel planning, etc.

Action: Utilize existing and appropriate rangeland health assessment and sage-grouse habitat assessment (currently the Habitat Assessment Framework) processes to quantify sage-grouse habitat quality. Prioritize assessment completion in priority habitat areas.

Same as Priority areas.

habitat from fire through strategic wildfire suppression planning. Planning measures may include: pre-planning of wildfire suppression tactics in important sage-grouse habitat; prioritizing suppression of wildfire in priority areas; Train firefighting personnel regarding sage-grouse/sagebrush management issues as related to wildfire suppression activities, including maps (e.g. habitat, strategies, etc.); Where appropriate (e.g. expected lightning occurrence) stage initial attack resources closer to areas of expected lightning or storm paths to ensure quicker response times; Conducting burn-out/backfiring operations in a manner that minimizes the loss of sagebrush when possible; utilize other applicable fire management strategies; the Agency Administrator or Duty Officer will prioritize the assignment of resources for suppression activities in the event of multiple wildfire starts in priority habitat. Use resource advisors during extended attack. Resource Advisors

Same as Priority areas.

Use strategically placed fuel breaks (e.g. fire resistant vegetation, green-strip seedings, etc.) to aid in firefighter safety, assist in control of wildfire spread and in minimizing human ignitions and reduce the potential extent or chance of wildfire.

Same as Priority areas.

Strategically pre-treat areas to reduce fine fuels through mechanical treatments, grazing strategies, chemical or biological application (brown stripping), etc.

Same as Priority areas.

Action: Implement integrated weed management actions for noxious and invasive weed populations that are impacting or threatening sage-grouse habitat quality . In concert with partners and/or weed management areas as appropriate apply education, inventory, prevention, control, rehabilitation, and monitoring strategies that protect or enhance sage-grouse habitat .

Same as Priority areas.

Action: Implement rehabilitation projects on degraded areas that have the potential to produce good quality sage-grouse habitat.

Same as Priority areas.

Action: Utilize cooperative planning efforts to develop and implement habitat restoration projects. Expertise and ideas from local landowners, working groups, and other federal, state, county, and private organizations should be solicited and considered in development of projects .

Same as Priority areas.

will contribute to the most favorable conditions for success when planning and implementing rehabilitation projects. Considerations should include: - Careful review of available plant species and their adaptation to the site when developing seed mixes. (Lambert 2005, VegSpec). - The impacts of potential climate changes (Miller et al. 2011), consider utilizing the warmer component of a species' current range when selecting native species for restoration (Kramer and Havens 2009). - The need to reduce annual grass densities and competition through herbicide, targeted grazing, tillage, prescribed fire, etc. (Pyke 2011). - The need to reduce density and competition of perennial grasses and techniques to accomplish this reduction (Pellant and Lysne 2005 ). - Techniques to introduce desired species to the site such as drill seeding, broadcast seeding followed by a seed coverage technique such as harrowing, chaining or livestock trampling, transplanting container or Same as Priority areas.

Action: Monitor vegetation utilizing techniques that quantify sage-grouse habitat attributes to determine if vegetation management objectives are being achieved. This monitoring would occur consistent with appropriate BLM and FS direction which current utilizes the Habitat Assessment Framework and BLM Technical Reference 1734-4.

GOAL: In priority habitat, design and implement fuels treatments with an emphasis on protecting existing sagebrush ecosystems and successfully rehabilitated areas and strategically and effectively reduce wildfire threats in the greatest area.

Same as Priority areas.

Action: Suppress wildland fires in sage-grouse habitats.

future condition (DFC) in the Low-elevation Shrub, Perennial Grass, Invasive Annual Grass, Mid-Elevation Shrub, Mountain Shrubs, and Juniper vegetation types. Use chemical, mechanical, seeding, and prescribed fire treatments as appropriate to enhance and restore habitats that are currently in FRCC2 and FRCC3. In Perennial Grass, Invasive Annual Grass, and juniper-invaded cover types, restore sagebrush steppe with an aggressive sagebrush seeding effort, using the appropriate sagebrush subspecies for the treatment area. Conduct vegetation treatments in areas that pose a wildland fire risk to sage-grouse habitats. Treat areas within sage-grouse habitats that have low resiliency to disturbance (i.e. areas characterized by lower native plant species diversity than expected for the site, undesirable plant species composition, and dead or decadent sagebrush) to improve long-term habitat suitability for sage-grouse. Treat sage grouse habitat and potential restoration areas to expand priority

Same as Priority areas.

treatments with an emphasis on maintaining, protecting, and expanding sage grouse habitats. Enhance (or maintain/retain) sagebrush canopy cover and community structure to match expected potential for the ecological site and consistent with sage-grouse habitat objectives unless fuels management objectives requires additional reduction in sagebrush cover to meet strategic protection of sage-grouse habitat. Closely evaluate the benefits of the fuel management treatments against the additional loss of sagebrush cover on the local landscape in the NEPA process. Apply appropriate seasonal restrictions for implementing fuels management treatments according to the type of seasonal habitats present in a priority area. Allow no treatments in known winter range unless the treatments are designed to strategically reduce wildfire risk around and/or in the winter range and will maintain, increase, or enhance winter range habitat quality. Ensure chemical applications are utilized where

No similar action.

Action: Travel management planning would evaluate the need for permanent or seasonal road closures as per Travel Management Handbook 8342.1.

Same as Priority areas.

Action: Prioritize areas for complete transportation management plans as per handbook 8342.1.

Action: Complete Transportation management plans as per handbook 8342.1.

Action: Consider sage-grouse objectives during subsequent travel management planning. Design and designate a travel system to minimize adverse effects to GSG (i.e. designate or design routes to direct use away from sensitive areas and still provide for high-quality and sustainable travel routes and administrative access, legislatively mandated requirements, and commercial needs). Allow for route upgrade, closure of existing routes, and creation of new routes to help protect habitat and meet user group needs, thereby reducing the potential for pioneering unauthorized routes. The emphasis of the comprehensive travel and transportation planning within priority habitat would be placed on having a neutral or positive effect on sage grouse habitat.

Same as Priority areas.

Action: No Similar Action

Action: No Similar Action

Action: Prioritize restoration of linear disturbances (those routes not designatged in a Travel Management Plan) in priority GSG habitat.

Action: Prioritize restoration of linear disturbances (those routes not designatged in a Travel Management Plan) after priority GSG habitat.

Action: When rehabilitating linear disturbances, use seed mixes or transplant techniques that will maintain or enhance GSG habitat.

Same as Priority areas.

Schedule road maintenance to avoid disturbance during sensitive periods and times.

Same as Priority areas.

Action: SRPs would be analyzed on a case by case basis per Special Recreation Permit Manual 2930 and through the NEPA process to minimize impacts to GRSG and/or habitat by directing use away from sensitive seasons and/or areas. Coordinate issuance of SRPs with IDFG and Idaho Outfitter and Guide licensing board when relevant and appropriate.

Same as Priority areas.

Designate or design developed recreation sites and associated facilities to direct use away from sensitive areas and provide sustainable recreational opportunities.

Same as Priority areas.

Incorporate seasonal restrictions for authorized activities to minimize impacts to GRSG and/or their habitat.

Same as Priority areas.

Recreation activities and developed recreation sites and facilities within lands not designated as a recreation management area would be managed and designed to minimize adverse effects to GRSG by directing use away from sensitive areas.

Same as Priority areas.

Limit snow machine travel to existing routes in sage-grouse wintering areas from November 1 through March 31. Assess routes during subsequent travel management planning.

Same as Priority areas.

Action: No Similar Action

Repeat

Action: No Similar Action

Action: No Similar Action

Action: Within grazing allotments containing sage-grouse habitat, incorporate grazing management measures designed to meet sage-grouse habitat objectives through allotment management plans (AMPs), grazing permit renewal or permit modification processes.

Same as Priority areas.

Where opportunities exist, work cooperatively with other land managers to allow livestock operations that utilize mixed federal, private and/or state land to be managed at the landscape scale to benefit sage-grouse and their habitat.

Same as Priority areas.

Action: Priority areas are the highest priority for land health assessments (and FS assessments) and processing of grazing permits within priority sage-grouse habitat areas, with emphasis in management units of greatest concern with respect to sage-grouse. Where possible, conduct land health assessments at the watershed, or other meaningful landscape-scale.

Action: Prioritize land health assessments (and FS assessments) and processing of grazing permits after priority areas, with emphasis in management units of greatest concern with respect to sage-grouse. Where possible, conduct land health assessments at the watershed, or other meaningful landscape-scale.

Action: During the land health assessment process determine whether vegetation structure, condition and composition are meeting sage-grouse habitat objectives in sagebrush cover types through implementation of the habitat assessment framework, (Stiver et al 2010 as amended/replaced) or other BLM or Forest Service approved methodology, in accordance with current policy and guidance.

Same as Priority areas.

Action: Use monitoring information and rangeland health assessments to develop specific habitat objectives and grazing management plans designed to maintain, enhance and restore sage-grouse habitat. Prioritize implementation of grazing systems or permit modifications that make progress towards meeting habitat objectives, in areas that are not meeting these objectives.

Same as Priority areas.

Action: Manage for vegetation composition and structure consistent with appropriate sage-grouse seasonal habitat objectives relative to site potential.

Same as Priority areas.

Action: Where livestock management practices are not compatible with meeting or making progress towards habitat objectives, implement changes in grazing management through grazing authorization modifications, or AMP implementation. Potential considerations include, but are not limited to, changes in: 1) Season or timing of use; 2) Numbers of livestock; 3) Distribution of livestock use; 4) Duration and/or level of use; 5) Kind of livestock (e.g., cattle, sheep, horses, or goats) (Briske et al. 2011). 6) Voluntary measures such as temporary non-use; and 7) Grazing schedules (including rest or deferment)

Same as Priority areas.

Action: Adjust grazing management (i.e. delay turnout, adjust pasture rotations, adjust the amount and/or duration of grazing, etc.) to promote adequate food and cover for sage-grouse during drought periods. Use a recognized drought indicator, such as the Drought Monitor or Palmer Drought Severity Index, to determine when abnormally dry or drought conditions are developing, present, or easing. Since there is a lag in vegetation recovery following drought (Thurow and Taylor 1999, Cagney et al. 2010), allow for vegetation recovery through post-drought management that meets sage-grouse needs in priority sage-grouse habitat areas.

Same as Priority areas.

Manage livestock grazing in sage-grouse habitats so that proper functioning conditions and late brood rearing habitat objectives are achieved in riparian and lentic areas according to site potential.

Same as Priority areas.

Action: No Similar Action

Action: No Similar Action

Action: No Similar Action

Action: No Similar Action

Action: No Similar Action

Action: Limit authorization of new water developments to projects that would benefit, maintain, or have a neutral effect on priority sage-grouse habitat (such as by shifting livestock use away from critical areas). New developments that divert surface water must be designed to maintain integrity and functionality riparian or wetland vegetation and hydrology. New developments should also be sited in lower quality habitats or, disturbed areas where possible, and avoid areas that have not had significant prior grazing use (Adopted from Idaho State Plan page 4.64). Ensure that troughs are fitted with wildlife escape ramps to facilitate use of and escape by animals, including sage-grouse.

Same as Priority areas.

Action: During project inspections, analyze the design and condition of existing water developments associated with springs, wetlands or playas, such as headboxes, exclosures, pipelines and troughs to determine if modification, repair or retrofitting or removal is needed to maintain or restore the integrity and functionality of the riparian/lentic areas to current site potential within priority sage-grouse habitat. Modifications may include, but are not limited to, installing float valves on troughs, reconfiguring exclosure fencing, or moving troughs out of riparian/lentic areas. Ensure that troughs are fitted with wildlife escape ramps to facilitate use of and escape by animals, including sage-grouse.

Same as Priority areas.

Action: No Similar Action

Action: No Similar Action

Action: Assess the compatibility of existing non-native seedings for sage-grouse habitat or as a component of a grazing system or forage reserve during land health assessments (Davies et al. 2011). Evaluate existing seedings currently dominated by introduced perennial grasses in and adjacent to priority sage-grouse habitats to determine if they should be diversified with native grasses, forbs, and shrubs, including sagebrush. If these seedings are part of an AMP/ Conservation Plan and if they provide value in conserving or enhancing the rest of the priority habitats, restoration may not be appropriate.

Same as Priority areas.

Consider the potential for invasive and noxious weed establishment or increase following construction in the project planning process and monitor and treat post-construction. Where appropriate, areas of soil disturbance will be planted with a seed mix designed to compete with invasive species.

Same as Priority areas.

Action: Design any new structural range improvements consistent with objectives to maintain, enhance, or restore sage-grouse habitat.

Same as Priority areas.

Design and locate fences to minimize the potential for sage-grouse strikes.

Same as Priority areas.

Action: When developing or modifying water developments in priority habitat, use best management practices (BMPs, see Appendix C) to mitigate potential impacts from West Nile virus (Clark et al. 2006, Doherty 2007, Walker et al. 2007b, Walker and Naugle 2011).

Action: When developing or modifying water developments in priority habitat, use best management practices (BMPs, see Appendix C) to mitigate potential impacts from West Nile virus (Clark et al. 2006, Doherty 2007, Walker et al. 2007b, Walker and Naugle 2011).

... evaluate the design and location of existing structural range improvements and location of supplements (salt or protein blocks) with respect to their effect on sage-grouse habitat, including, but not limited to: potential for sage-grouse strikes, avian predation due to creation of roosting, perching or nesting sites, introduction of weeds, West Nile Virus and effects to vegetation structure or composition.

Assess existing livestock management fences within priority sage-grouse habitat for risk of sage-grouse strikes based on proximity to leks, lek size, and topography (Christiansen 2009; Stevens 2011) or existing collision risk models (Stevens 2012). Prioritize removal, modification or marking of fences in areas of moderate or high collision risk to reduce the incidence of sage-grouse mortality due to fence strikes. Avoid building new permanent fences within 2 km of occupied leks or winter concentration areas. If this is not feasible, ensure that high risk segments are marked with collision diverter

Wind energy development is excluded in priority areas.	Wind energy development project must comply with the 2012 U.S. Fish and Wildlife Service's Wind Energy Guidelines.

granting exceptions to seasonal wildlife restrictions:

Even with conscientious planning up front, it is sometimes not possible to avoid impacts to wildlife. In such cases, temporary exceptions to wildlife seasonal restrictions may be allowed at times to accommodate certain activities, such as construction of energy development facilities, power transmission lines or other projects, if the activities can be done quickly and with little or no disturbance to the wildlife species of interest. The intent of allowing an exception is to eliminate a restriction when it has no applicability or is not needed to avoid impacts to wildlife. The discretion to allow an exception is limited to those situations where the degree of impacts to wildlife, as predicted in the NEPA analysis (e.g., as completed in the EA or EIS for the project in question), would be the same, with or without the restriction. An exception is a case-by-case, one time exemption from a seasonal restriction for a specified portion of the Same as Priority areas.

Action: Lands are available for leasing subject to applicable timing restrictions (seasonal and daily) for exploration activities and initial mine development, as well as a stipulation preventing surface occupancy within xx miles of an occupied sage-grouse lek. Lands are available for prospecting, subject to applicable timing restrictions (seasonal and daily). Prospecting would not be allowed within xx miles of an occupied sage-grouse lek.

Action: For existing undeveloped non-energy mineral leases, require timing restrictions (seasonal and daily) when exploration activities or mine development is proposed, as appropriate. Also require appropriate BMPs (Appendix E to the NTT Report) as Conditions of Approval to the mine plan, and require restoration of habitat or off-site mitigation, if on-site restoration is not feasible.

Same as priority areas.

Action: No Similar Action

Require new 3809 notices and plans of operation include measures to avoid or minimize adverse effects to sage-grouse and habitat. Ensure compliance with 3809 regulations to prevent unnecessary and undue degradation (from WO IM 2012-044).reasonable and appropriate BMPs (see Appendix E of NTT Report) as a Condition of Approval of a 3809 Plan of Operations or Notice.

No new authorizations would be approved within xx miles of an occupied lek. Disposals would be subject to seasonal timing restrictions, as appropriate.

Same as priority areas.

Same as priority areas.

Same as priority areas.

Action: Allow geophysical exploration subject to seasonal timing restrictions and/or other restrictions that may apply.

Action: No Similar Action

Action: No Similar Action

Not Applicable - no existing leases in general habitat.

Conservation Measure: If surface disturbing activities are proposed on a future lease, require a full reclamation bond specific to the site. Base the reclamation costs on the assumption that contractors for the BLM will perform the work.

Conservation Measure: When an APD is submitted for approval on a future lease, make applicable Best Management Practices (BMPs) mandatory as Conditions of Approval.

Action: Where the federal government owns the mineral estate in general habitat and the surface is in non-federal ownership, apply stipulations, conservation measures and design features consistent with those applied to public lands in general habitat in the area.

Recommend to the mineral estate owner that they apply a timing restriction stipulation and restrict activities within xx miles of an occupied lek, when concurring to the approval of authorizations for mineral-related surface disturbance on lands in general habitat. Note: This would be a realty action, as the mineral estate is not involved.

New water developments that divert surface water must be designed to maintain integrity and functionality of riparian or wetland vegetation and hydrology. New developments should also be sited in lower quality habitats or disturbed areas where possible (Adopted from Idaho State Plan page 4.64). Ensure that troughs are fitted with wildlife escape ramps to facilitate use of and escape by animals, including sage-grouse.

Action: When developing or modifying water developments in priority habitat, use best management practices (BMPs, see Appendix C) to mitigate potential impacts from West Nile virus (Clark et al. 2006, Doherty 2007, Walker et al. 2007b, Walker and Naugle 2011).

Action: During project inspections, evaluate the design and location of existing structural range improvements and location of supplements (salt or protein blocks) with respect to their effect on sage-grouse habitat, including, but not limited to: potential for sage-grouse strikes, avian predation due to creation of roosting, perching or nesting sites, introduction of weeds, West Nile Virus and effects to vegetation structure or composition.

Avoid building new fences within 2 km of occupied leks or winter concentration areas. If this is not feasible, ensure that high risk segments are marked with collision diverter devices or as latest science indicates.

# Idaho and Southwestern Montana Greater Sage-Grouse

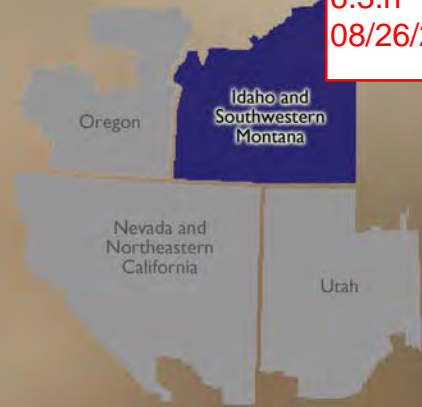

Proposed  
Land Use Plan Amendment and  
Final Environmental Impact Statement

Volume I

US Department of the Interior  
Bureau of Land Management

US Department of Agriculture  
Forest Service

June 2015

Forest Service

The Bureau of Land Management's multiple-use mission is to sustain the health and productivity of the public lands for the use and enjoyment of present and future generations. The Bureau accomplishes this by managing such activities as outdoor recreation, livestock grazing, mineral development, and energy production, and by conserving natural, historical, cultural, and other resources on public lands.

**BLM-IDAHO****Greater Sage-Grouse Planning Issues for the BLM Planning Teams to Insert and Analyze in Administrative Draft Proposed Plan (ADPP)****January 19, 2015**

*The March 4, 2010 decision by the U.S. Fish and Wildlife Service that the greater sage-grouse warranted listing but was precluded [Endangered and Threatened Wildlife and Plants; 12-Month Findings for Petitions to list the Greater Sage-Grouse (*Centrocercus urophasianus*) as Threatened or Endangered] set in motion the most comprehensive land-use planning initiative in the BLM's history.*

*In 2011, the BLM began updating land-use plans across the West so as to ensure not only the long-term viability of the greater sage-grouse on public lands and the continued economic vitality of the West. This has been a complex and demanding process involving collaboration with an unprecedented number of stakeholders, including Governors, State Fish and Game agencies, the U.S. Fish and Wildlife Service and many others. The BLM's mandate of multiple use and sustained yield has required us to balance the full range of resource uses on public lands, including the conservation of crucial wildlife habitat. As we have worked through this process, public land managers throughout the BLM have made difficult resource management decisions.*

*These documents provide key guidance that will enable the BLM to finalize land use plans that will contribute to the conservation of the Greater Sage-Grouse and other sagebrush associated species across the West. The guidance outlines a suite of tools, such as disturbance limits in key habitats and mitigation approaches, which will help us to reach this goal. These mechanisms will work in concert to conserve sage-grouse habitat so that we can achieve our twin goals of thriving Greater Sage-Grouse populations and robust Western economies.*

**Issue:****Development in Highly Important Landscapes****Direction:**

The BLM will designate Sagebrush Focal Areas (SFAs) consisting of the BLM-managed lands within the area depicted in the October 27, 2014 USFWS memo, *Greater Sage-Grouse: Additional Recommendation to Refine Land Use Allocations in Highly Important Landscapes*. The ADPP will reflect the following management guidance for the SFAs:

- 1) The ADPP will recommend administrative withdrawals from the 1872 Mining Law (locatable minerals) in SFAs, subject to valid existing rights.
- 2) These areas will be NSO, without exceptions, for oil and gas development.
- 3) The BLM will prioritize management and conservation actions in these areas, including, but not limited to review of livestock grazing permits/leases.

**Issue:** **Mitigation**  
**Direction:** The ADPP will include the updated Mitigation Framework (Attachment I) and drop-in Chapter 2 language to reflect the following language:

*“In undertaking BLM management actions, and, consistent with valid existing rights and applicable law, in authorizing third-party actions that result in habitat loss and degradation, the BLM will require and assure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions.”*

**Issue:** **Mapping**  
**Direction:** Not Applicable

**Issue:** **Disturbance**  
**Direction:** Per the original April 2014 NPT guidance on disturbance, the ADPP will use the 3% disturbance cap at the Biologically Significant Unit (BSU) and project scale. The density calculation (an average of 1 facility per 640 acres) applies to energy and mining facilities. The disturbance cap will not be applied to foreclose development of locatable minerals on unpatented claims located under the 1872 Mining Law; the disturbance from locatable mining will be accounted for in determining the percent disturbance and whether the cap has been exceeded. BLM-ID will use the disturbance calculation methodology developed prior to this guidance.

**Issue:** **Vegetation Objectives**  
**Direction:** The ADPP will establish and incorporate vegetation and GRSG habitat objectives (see Attachment II for specific guidance and a GRSG Habitat Objectives Table template that follows the Sage-Grouse Habitat Assessment Framework Technical Reference-6710-1). The vegetation and GRSG habitat objectives guidance states that the values for the desired conditions in the GRSG Habitat Objectives Table are to be used, at a minimum, to meet the applicable land health standard in sage-grouse habitats. Planning units may include additional indicators and desired condition values as appropriate. The desired condition value for each indicator can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%).

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP. The vegetation objective should be placed in the Vegetation section of the ADPP.

**Issue:**

**Livestock Grazing**

**Direction:**

The following management actions will be included in the Livestock Grazing section of the ADPP.

- *The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (ex., fire) and legal obligations.*
- *The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.*
- *Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.*
- *At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.*

Attachment III provides guidance as to how the BLM will incorporate GRGS decisions from the Sage-Grouse RMP/Amendments into grazing permits/leases.

**Issue:**

**Mineral Materials (Salable Minerals)**

**Direction:**

All Priority Habitat Management Areas will be closed to mineral materials development. All Important Habitat Management Areas and General Habitat Management Areas will be open to mineral materials development, consistent with the Idaho Anthropogenic Disturbance Criteria.

**Issue:** **High-voltage Transmission and Major Pipeline ROWs and Corridors**

**Direction:**

1) Apply the recommended NPT allocation guidance for PHMA of avoidance.

2) GHMA will remain open. BLM-ID will employ a location and design process to ensure protection.

3) For sub-regions that have planned priority transmission lines that traverse their planning area (Gateway West, Boardman to Hemingway, and TransWest Express, including those portions of Gateway South that are co-located), apply the following language as a management action in their ADPP:

*“Priority Habitat Management Areas (PHMAs) and General Habitat Management Areas (GHMAs) are designated as avoidance areas for high voltage transmission line ROWs, except for the transmission projects specifically identified below. All authorizations in these areas, other than the excepted projects, must comply with the conservation measures outlined in this proposed plan, including the RDFs and avoidance criteria presented in [insert citation here] of this document. The BLM is currently processing an application for [Insert name of transmission project] and the NEPA review for this project is well underway. The BLM is analyzing GRSG mitigation measures through the project’s NEPA review process, which will include analysis of the following conservations measures, avoidance criteria, and RDFs outlined in this document [list the criteria/RDFs].”*

**Issue:**

**Direction:**

**Coal Suitability**

Sub-regions will include the following management action:

*“At the time an application for a new coal lease or lease modification is submitted to the BLM, the BLM will determine whether the lease application area is "unsuitable" for all or certain coal mining methods pursuant to 43 CFR 3461.5. PHMA is essential habitat for maintaining GRSG for purposes of the suitability criteria set forth at 43 CFR 3461.5(o)(1).”*

**Issue:**

**Direction:**

**Fluid Mineral Resources (Including Geothermal)**

All ADPPs will include the conservation objective for leasing and development outside of GRSG habitat:

*“Priority will be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMA and GHMA. When analyzing leasing and authorizing development of fluid mineral resources, including geothermal, in PHMA and GHMA, and subject to applicable*

*stipulations for the conservation of Greater Sage-Grouse, priority will be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-Grouse. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 U.S.C. 226(p) and 43 C.F.R. 3162.3-1(h).”*

*“Where a proposed oil and gas or geothermal project on an existing lease could adversely affect GRSG populations or habitat, the BLM will work with the lessees, operators, or other project proponents to avoid, reduce and mitigate adverse impacts to the extent compatible with lessees' rights to drill and produce oil and gas or geothermal resources. The BLM will work with the lessee, operator, or project proponent in developing an APD for the lease to avoid and minimize impacts to sage-grouse or its habitat and will ensure that the best information about the GRSG and its habitat informs and helps to guide development of such Federal leases.”*

**Issue:**  
**Direction:**

**No Surface Occupancy (NSO) Exception Language**

Follow NPT guidance for Priority Habitat Management Areas. No-surface-occupancy stipulations will be included in new oil and gas leases at the time of leasing only and may not be applied to existing oil and gas leases that did not include no-surface-occupancy stipulation at the time of leasing. Include the following language into the ADPP:

*No waivers or modifications to an oil and gas lease no-surface-occupancy stipulation will be granted. The Authorized Officer may grant an exception to an oil and gas lease no-surface-occupancy stipulation only where the proposed action:*

- (i) Would not have direct, indirect, or cumulative effects on GRSG or its habitat; or,*
- (ii) Is proposed to be undertaken as an alternative to a similar action occurring on a nearby parcel, and would provide a clear conservation gain to GRSG.*

*Exceptions based on conservation gain (ii) may only be considered in (a) PHMAs of mixed ownership where federal minerals underlie less than fifty percent of the total surface, or (b) areas of the public lands where the proposed exception is an alternative to an action occurring on a nearby parcel subject to a valid Federal oil and gas lease existing as of the date of this RMP [revision or amendment]. Exceptions based on conservation gain must also include measures, such as enforceable institutional controls and buffers, sufficient to allow the BLM to conclude that such benefits will endure for the duration of the proposed action's impacts.*

*Any exceptions to this lease stipulation may be approved by the Authorized Officer only with the concurrence of the State Director. The Authorized Officer may not grant an exception unless the applicable state wildlife agency, the USFWS, and the BLM unanimously find that the proposed action satisfies (i) or (ii). Such finding shall initially be made by a team of one field biologist or other GRSG expert from each respective agency. In the event the initial finding is not unanimous, the finding may be elevated to the appropriate BLM State Director, USFWS State Ecological Services Director, and state wildlife agency head for final resolution. In the event their finding is not unanimous, the exception will not be granted. Approved exceptions will be made publically available at least quarterly."*

**Issue:**

**Adaptive Management**

**Direction:**

Follow the NPT Adaptive Management Guidance and Sideboards. When a hard trigger is hit in a BSU, the designated response will be put in place in that BSU. Triggers and responses have been developed with local state and FWS experts.

When a hard trigger is hit in a BSU within a PAC that has multiple BSUs, including those that cross state lines, the WAFWA Management Zone Greater Sage-Grouse Conservation Team will convene to determine the causal factor, put project level responses in place, as appropriate and discuss further appropriate actions to be applied. The team will also investigate the status of the hard triggers in other BSUs within the PAC and will invoke the appropriate plan response. Adoption of any further actions at the plan level may require initiating a plan amendment process.

**Issue:**

**Application of Lek Buffers**

**Direction:**

The ADPP will require the use of lek buffer-distances for all new BLM-managed and BLM-authorized anthropogenic disturbances in both GHMA and PHMA (see Attachment X) through this drop-in Chapter 2 language:

*"In undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will apply the lek buffer-distances identified in the USGS Report Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review ([Open File Report 2014-1239](#)) in accordance with Attachment X."*

Buffer Attachment

**Applying Lek Buffer-Distances When Approving Actions**

- *Buffer Distances and Evaluation of Impacts to Leks*

Evaluate impacts to leks from actions requiring NEPA analysis. In addition to any other relevant information determined to be appropriate (e.g. State wildlife agency plans), the BLM will assess and address impacts from the following activities using the lek buffer-distances as identified in the USGS Report *Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review* (Open File Report 2014-1239). The BLM will apply the lek buffer-distances specified as the lower end of the interpreted range in the report unless justifiable departures are determined to be appropriate (see below). The lower end of the interpreted range of the lek buffer-distances is as follows:

- linear features (roads) within 3.1 miles of leks
- infrastructure related to energy development within 3.1 miles of leks.
- tall structures (e.g., communication or transmission towers, transmission lines) within 2 miles of leks.
- low structures (e.g., fences, rangeland structures) within 1.2 miles of leks.
- surface disturbance (continuing human activities that alter or remove the natural vegetation) within 3.1 miles of leks.
- noise and related disruptive activities including those that do not result in habitat loss (e.g., motorized recreational events) at least 0.25 miles from leks.

Justifiable departures to decrease or increase from these distances, based on local data, best available science, landscape features, and other existing protections (e.g., land use allocations, state regulations) may be appropriate for determining activity impacts. The USGS report recognized “that because of variation in populations, habitats, development patterns, social context, and other factors, for a particular disturbance type, there is no single distance that is an appropriate buffer for all populations and habitats across the sage-grouse range”. The USGS report also states that “various protection measures have been developed and implemented... [which have] the ability (alone or in concert with others) to protect important habitats, sustain populations, and support multiple-use demands for public lands”. All variations in lek buffer-distances will require appropriate analysis and disclosure as part of activity authorization.

In determining lek locations, the BLM will use the most recent active or occupied lek data available from the state wildlife agency.

- *For Actions in GHMA*

The BLM will apply the lek buffer-distances identified above as Conditions of Approval to fully address the impacts to leks as identified in the NEPA analysis.

- Impacts should first be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.
- If it is not possible to relocate the project outside of the applicable lek buffer-distance(s) identified above, the BLM may approve the project only if:
  - Based on best available science, landscape features, and other existing protections, (e.g., land use allocations, state regulations), the BLM determines that a lek buffer-distance other than the applicable distance identified above offers the same or a greater level of protection to GRS and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area; or

- The BLM determines that impacts to GRSG and its habitat are minimized such that the project will cause minor or no new disturbance (ex. co-location with existing authorizations); and
  - Any residual impacts within the lek buffer-distances are addressed through compensatory mitigation measures sufficient to ensure a net conservation gain, as outlined in the Mitigation Strategy (Appendix X).
- *For Actions in PHMA*

The BLM will apply the lek buffer-distances identified above as Conditions of Approval to fully address the impacts to leks as identified in the NEPA analysis. Impacts should be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.

The BLM may approve actions in PHMA that are within the applicable lek buffer distance identified above only if:

- The BLM, with input from the state fish and wildlife agency, determines, based on best available science, landscape features, and other existing protections, that a buffer distance other than the distance identified above offers the same or greater level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area.
- The BLM will explain its justification for determining the approved buffer distances meet these conditions in its project decision.

## Attachment I

# GREATER SAGE-GROUSE RMPA/FEIS TEMPLATE LANGUAGE FOR ADDRESSING MITIGATION

[ ] = Instructions

[ ] = Fill in the blank

[This mitigation language addresses greater sage-grouse. However, if you are working on a plan revision, you may need to add additional language to be more inclusive of other resource and value objectives (e.g. cultural resources, national historic trails, recreation values, other special status species) that may need to be mitigated.]

## Chapter 1 - Introduction

[Nothing new to add to EIS]

## Chapter 2 – Alternatives – [Proposed Plan/Proposed Plan Amendment]

- Add these two new sections (below) to the **Chapter 2 Alternatives** section.
- Replace the Regional Mitigation placeholder language that was included in the draft EIS with the new “Mitigation” section, below.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

Consistent with the proposed plan’s goal outlined in [Table 2-X – Description of Alternatives], the intent of the [Proposed Plan/Proposed Plan Amendment] is to provide a net conservation gain to the species. To do so, in undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and assure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. This is also consistent with BLM Manual 6840 – Special Status Species Management, Section .02B, which states “to initiate protective conservation measures that reduce or eliminate threats to Bureau sensitive species to minimize the likelihood of the need for listing of these species under the ESA.”

## Mitigation

*Mitigation Standards.* In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and assure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see the concepts of durability, timeliness, and additionality as described further in Appendix X).

*Greater Sage-Grouse Conservation Team.* The BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. This Team will develop a WAFWA Management Zone Regional Mitigation Strategy (hereafter, Regional Mitigation Strategy). The Team will also compile and report on monitoring data (including data on habitat condition, population trends, and mitigation effectiveness) from States across the WAFWA Management Zone (see Monitoring section). Subsequently, the Team will use these data to either modify the appropriate Regional Mitigation Strategy or recommend adaptive management actions (see Adaptive Management section).

The BLM/USFS will invite governmental and Tribal partners to participate in this Team, including the State Wildlife Agency and U.S. Fish and Wildlife Service, in compliance with the exemptions provided for committees defined in the Federal Advisory Committee Act and the regulations that implement that act. The BLM/USFS will strive for a collaborative and unified approach between Federal agencies (e.g. FWS, BLM, and USFS), Tribal governments, state and local government(s), and other stakeholders for greater sage-grouse conservation. The Team will provide advice, and will not make any decisions that impact Federal lands. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

*Developing a Regional Mitigation Strategy.* The Team will develop a Regional Mitigation Strategy to inform the mitigation components of NEPA analyses for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy will be developed within one year of the issuance of the Record of Decision. The BLM's Regional Mitigation Manual MS-1794 will serve as a framework for developing the Regional Mitigation Strategy. The Regional Mitigation Strategy will be applicable to the States/Field Offices/Forests within the WAFWA Management Zone's boundaries.

Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can provide a net conservation gain to the species. The Regional Mitigation Strategy developed by the Team will elaborate on the components identified above (i.e.

avoidance, minimization, and compensation; additionality, timeliness, and durability) and further explained in Appendix [X].

In the time period before the Strategy is developed, BLM will consider regional conditions, trends, and sites, to the greatest extent possible, when applying the mitigation hierarchy and will ensure that mitigation is consistent with the standards set forth in the first paragraph of this section.

*Incorporating the Regional Mitigation Strategy into NEPA Analyses.* The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

*Implementing a Compensatory Mitigation Program.* Consistent with the principles identified above, the BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be implemented at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

### **Chapter 3 – Affected Environment**

[Nothing to add]

### **Chapter 4 – Environmental Consequences – [Proposed Plan/Proposed Plan Amendment]**

#### **Mitigation**

This Chapter describes the environmental consequences associated with the impacts to greater sage-grouse and its habitat from activities carried out in conformance with this plan, in addition to BLM/USFS management actions. In undertaking BLM/USFS management actions, and consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and

compensating for impacts by applying beneficial mitigation actions. In addition, to help implement this [Proposed Plan / Proposed Plan Amendment], a WAFWA Management Zone Regional Mitigation Strategy (per Appendix [X]) will be developed within one year of the issuance of the Record of Decision. The Strategy will elaborate on the components identified in Chapter 2 (avoidance, minimization, compensation, additionality, timeliness, and durability), and will be considered by the BLM/USFS for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The implementation of a Regional Mitigation Strategy will benefit greater sage-grouse, the public, and land-users by providing a reduction in threats, increased public transparency and confidence, and a predictable permit process for land-use authorization applicants.

### Appendix [X]

- Add this new Appendix.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

### Appendix (X) – Mitigation – [Proposed Plan/Proposed Plan Amendment]

#### General

In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require and assure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see glossary).

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy that will inform the NEPA decision making process including the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. A robust and transparent Regional Mitigation Strategy will contribute to greater sage-grouse habitat conservation by reducing, eliminating, or minimizing threats and compensating for residual impacts to greater sage-grouse and its habitat.

The BLM's Regional Mitigation Manual MS-1794 serves as a framework for developing and implementing a Regional Mitigation Strategy. The following sections provide additional guidance specific to the development and implementation of a WAFWA Management Zone Regional Mitigation Strategy.

### Developing a WAFWA Management Zone Regional Mitigation Strategy

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy to guide the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy should consider any State-level greater sage-grouse mitigation guidance that is consistent with the requirements identified in this Appendix. The Regional Mitigation Strategy should be developed in a transparent manner, based on the best science available and standardized metrics.

As described in Chapter 2, the BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. The Strategy will be developed within one year of the issuance of the Record of Decision.

The Regional Mitigation Strategy should include mitigation guidance on avoidance, minimization, and compensation, as follows:

- Avoidance
  - Include avoidance areas (e.g. right-of-way avoidance/exclusion areas, no surface occupancy areas) already included in laws, regulations, policies, and/or land use plans (e.g. Resource Management Plans, Forest Plans, State Plans); and,
  - Include any potential, additional avoidance actions (e.g. additional avoidance best management practices) with regard to greater sage-grouse conservation.
- Minimization
  - Include minimization actions (e.g. required design features, best management practices) already included in laws, regulations, policies, land use plans, and/or land-use authorizations; and,
  - Include any potential, additional minimization actions (e.g. additional minimization best management practices) with regard to greater sage-grouse conservation.
- Compensation
  - Include discussion of impact/project valuation, compensatory mitigation options, siting, compensatory project types and costs, monitoring, reporting, and program administration. Each of these topics is discussed in more detail below.
    - Residual Impact and Compensatory Mitigation Project Valuation Guidance
      - A common standardized method should be identified for estimating the value of the residual impacts and value of the compensatory mitigation projects, including accounting for any uncertainty associated with the effectiveness of the projects.

- This method should consider the quality of habitat, scarcity of the habitat, and the size of the impact/project.
- For compensatory mitigation projects, consideration of durability (see glossary), timeliness (see glossary), and the potential for failure (e.g. uncertainty associated with effectiveness) may require an upward adjustment of the valuation.
- The resultant compensatory mitigation project will, after application of the above guidance, result in proactive conservation measures for Greater Sage-grouse (consistent with BLM Manual 6840 – Special Status Species Management, section .02).
- **Compensatory Mitigation Options**
  - Options for implementing compensatory mitigation should be identified, such as:
    - Utilizing certified mitigation/conservation bank or credit exchanges.
    - Contributing to an existing mitigation/conservation fund.
    - Authorized-user conducted mitigation projects.
  - For any compensatory mitigation project, the investment must be additional (i.e. additionality: the conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project).
- **Compensatory Mitigation Siting**
  - Sites should be in areas that have the potential to yield a net conservation gain to the greater sage-grouse, regardless of land ownership.
  - Sites should be durable (see glossary).
  - Sites identified by existing plans and strategies (e.g. fire restoration plans, invasive species strategies, healthy land focal areas) should be considered, if those sites have the potential to yield a net conservation gain to greater sage-grouse and are durable.
- **Compensatory Mitigation Project Types and Costs**
  - Project types should be identified that help reduce threats to greater sage-grouse (e.g. protection, conservation, and restoration projects).
  - Each project type should have a goal and measurable objectives.
  - Each project type should have associated monitoring and maintenance requirements, for the duration of the impact.
  - To inform contributions to a mitigation/conservation fund, expected costs for these project types (and their monitoring and maintenance), within the WAFWA Management Zone, should be identified.
- **Compensatory Mitigation Compliance and Monitoring**
  - Mitigation projects should be inspected to ensure they are implemented as designed, and if not, there should be methods to enforce compliance.
  - Mitigation projects should be monitored to ensure that the goals and objectives are met and that the benefits are effective for the duration of the impact.

- Compensatory Mitigation Reporting
  - Standardized, transparent, scalable, and scientifically-defensible reporting requirements should be identified for mitigation projects.
  - Reports should be compiled, summarized, and reviewed in the WAFWA Management Zone in order to determine if greater sage-grouse conservation has been achieved and/or to support adaptive management recommendations.
- Compensatory Mitigation Program Implementation Guidelines
  - Guidelines for implementing the State-level compensatory mitigation program should include holding and applying compensatory mitigation funds, operating a transparent and credible accounting system, certifying mitigation credits, and managing reporting requirements.

### Incorporating the Regional Mitigation Strategy into NEPA Analyses

The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

### Implementing a Compensatory Mitigation Program

The BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be managed at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

### **Glossary Terms**

**Additionality:** The conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project. (adopted and modified from BLM Manual Section 1794).

**Avoidance mitigation:** Avoiding the impact altogether by not taking a certain action or parts of an action. (40 CFR 1508.20(a)) (e.g. may also include avoiding the impact by moving the proposed action to a different time or location.)

**Compensatory mitigation:** Compensating for the (residual) impact by replacing or providing substitute resources or environments. (40 CFR 1508.20)

**Compensatory mitigation projects:** The [restoration](#), [creation](#), [enhancement](#), and/or [preservation](#) of impacted resources (adopted and modified from 33 CFR 332), such as on-the-ground actions to improve and/or protect habitats (e.g. chemical vegetation treatments, land acquisitions, conservation easements). (adopted and modified from BLM Manual Section 1794).

**Compensatory mitigation sites:** The durable areas where compensatory mitigation projects will occur. (adopted and modified from BLM Manual Section 1794).

**Durability (protective and ecological):** the maintenance of the effectiveness of a mitigation site and project for the duration of the associated impacts, which includes resource, administrative/legal, and financial considerations. (adopted and modified from BLM Manual Section 1794).

**Minimization mitigation:** Minimizing impacts by limiting the degree or magnitude of the action and its implementation. (40 CFR 1508.20 (b))

**Residual impacts:** Impacts that remain after applying avoidance and minimization mitigation; also referred to as unavoidable impacts.

**Timeliness:** The lack of a time lag between impacts and the achievement of compensatory mitigation goals and objectives (BLM Manual Section 1794).

## Attachment II

### **Greater Sage-Grouse (GRSG) Land Use Plans Vegetation Objectives Guidance**

#### **Purpose**

- I. Provide the planning units with land use planning vegetation objectives that need to be incorporated into the administrative draft proposed plans.
- II. Provide guidance on the use of a template for GRSG habitat objectives in the Special Status Species section of the ADPPs.
- III. Provide guidance on prioritizing land health assessments in sage-grouse habitats and conducting assessments at the watershed scale using the sage-grouse habitat objectives.

#### **Guidance**

- I. Planning units will include the following land use plan vegetation objective within the Vegetation section of their administrative draft proposed land use plans (ADPPs) that states:

*In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).*
- II. Planning units will populate the GRSG Habitat Objectives table template to provide vegetation objectives for sage-grouse life history stages based on the ecology in your region to be used to meet the applicable land health standard in GRSG habitats. Planning units are encouraged to work across boundaries when developing the objectives to ensure regional continuity and will provide appropriate peer-reviewed science to support the habitat values for the indicators. These desired condition value can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%). Planning units may include additional indicators and desired condition values as appropriate (see the Sage-Grouse Habitat Assessment Framework (HAF, *Technical Reference 6710-1*) for appropriate indicators). The HAF contains values for habitat suitability indicators in sage-grouse seasonal habitats from the Connelly et al. (2000) sage-grouse guidelines and has incorporated many of the core indicators in the AIM strategy (Toevs et al. 2011) as well. Planning units may use the indicator values from Connelly et al. (2000) while developing the land use plan Sage-Grouse Habitat Objectives table.

When using the indicators to guide management actions or during land health assessments, consider that the indicators are sensitive to the ecological processes operating at the scale of interest and that a single habitat indicator does not necessarily define habitat suitability for an area or particular scale. Indicators must be collectively reviewed, assessed based on the site potential, and put into spatial and temporal context to correctly determine habitat suitability which will include more than one scale and multiple indicators. Assessment and evaluation of these objectives will follow the steps described in the HAF.

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP and is to be used as a minimum to meet the applicable land health standard in sage-grouse habitats.

Greater Sage-Grouse Habitat Objectives

ATTRIBUTE	INDICATORS	DESIRED CONDITION	Reference
<b>BREEDING AND NESTING (Seasonal Use Period March 1-June 15)</b>			
Lek Security	Proximity of trees		
	Proximity of sagebrush to leks		
Cover	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover		
	Sagebrush height Arid sites Mesic sites		
	Predominant sagebrush shape		
	Perennial grass cover Arid sites Mesic sites		
	Perennial grass and forb height		
	Perennial forb canopy cover Arid sites Mesic sites		
<b>BROOD-REARING/SUMMER<sup>1</sup> (Seasonal Use Period June 16-October 31)</b>			
Cover	% of Seasonal habitat meeting desired condition		
	Sagebrush canopy cover		
	Sagebrush height		
	Perennial grass canopy cover and forbs		
	Riparian areas/mesic meadows		
	Upland and riparian perennial forb availability		
<b>WINTER<sup>1</sup> (Seasonal Use Period November 1-February 28)</b>			
Cover and Food	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover above snow		
	Sagebrush height above snow		

- III. The BLM will prioritize land health assessments in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. Field offices are to conduct land health assessments at the watershed scale and use the GRSG habitat objectives when assessing the applicable standard in GRSG habitats.

When conducting land health assessments, the BLM should follow, at a minimum, “Interpreting Indicators of Rangeland Health” (Pellant et. al. 2005) and the “BLM Core Terrestrial Indicators and Methods” (MacKinnon et al. 2011). For assessments being conducted in GRSG designated management areas, the BLM should collect additional data to inform the HAF indicators that have not been collected using the above methods. Implementation of the principles outlined in the AIM strategy will allow the data to be used to generate unbiased estimates of condition across the area of interest; facilitate consistent data collection and rollup analysis among management units; help provide consistent data to inform the classification and interpretation of imagery; and provide condition and trend of the indicators describing sagebrush characteristics important to sage-grouse habitat.

## Attachment III

### **Incorporating GSGR RMP Decisions into Grazing Authorizations**

#### **Purpose**

The purpose is to provide recommended ADPP language; outline the process for prioritizing the review and processing of grazing permits/leases to determine if modification is necessary (prior to renewal and in accordance with prioritization criteria); provide direction for including specific management thresholds and defined responses that will allow adjustments to livestock grazing within the terms and conditions of permits; and provide a process for prioritizing compliance monitoring within Sagebrush Focal Areas (SFAs) and Priority Habitat Management Areas (PHMAs).

#### **Background**

The BLM manages approximately 18,000 livestock grazing permits and leases on the public lands. Livestock grazing is an integral part of the BLM multiple-use mission and is authorized by the Taylor Grazing Act (1934), the Federal Land Policy Management Act (1976) and the Public Rangeland Improvement Act (1978). By statute and regulation, grazing leases and permits are normally issued for 10-year periods. Annually, a range of 1,200 to 3,200 grazing permits expire and the BLM receives 500 to 1,500 grazing permit/lease transfer requests.

The BLM currently issues permits/leases in accordance with:

- All applicable law, regulation, policy (NEPA, consultation, proposed/final grazing decision-also known as a fully processed permit); or
- Various appropriation authorities enacted between 1999 and 2014 extending terms and conditions of expiring or transferred permits/leases that the BLM is unable to fully process before their expiration; or
- Section 402(c)(2) of FLPMA (as amended by Public Law 113-291, enacted December 19, 2014).

Congress has acted to ensure that grazing permittees could continue to graze if the BLM is unable to complete the environmental analysis mandated by the NEPA and other applicable laws. Since 1999, a provision (“the rider”) has been included in the Interior Appropriations bill that, in various forms, generally authorizes the BLM to renew grazing permits and leases under their same terms and conditions until it fully processes the permit renewal in compliance with NEPA, ESA, and other legal or regulatory requirements. The most recent rider is contained in Section 411, Public Law 113-76.<sup>1</sup> The FLPMA amendment to Section 402 (c) allows BLM to renew

---

<sup>1</sup> The Consolidated Appropriations Act, 2014 includes the provision Section 411 which states: “Section 415 of division E of Public Law 112–74 is amended by striking “and 2013” and inserting “through 2015.” The terms and conditions of section 325 of Public Law 108-108 (117 stat. 1307), regarding permits at the Department of the Interior and the Forest Service, shall remain in effect through fiscal year 2015. A grazing permit or lease issued by the Secretary of the Interior for lands administered by the Bureau of Land Management that is the subject of a request for a grazing preference transfer shall be issued, without further processing, for the remaining time period in

grazing permits and leases under the same terms and conditions. This relieves the BLM's renewal processing workload, allowing the BLM to prioritize permit processing based on sensitivity of the resources at issue.<sup>2</sup>

The BLM may modify terms and conditions of a permit or lease at any time following completion of appropriate analysis and consultation, cooperation, and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public.<sup>3</sup> Under 43 C.F.R. 4160.1, the BLM must serve a proposed decision on any affected applicant, permittee or lessee, any agent and lien holder of record. Copies of the decisions are provided to the interested publics.

**Recommended Language to be incorporated as Livestock Grazing Management Actions within the GRSG ADPPs:**

- The BLM will prioritize the review of grazing permits/leases, including those prior to renewal to determine if modification is necessary, and processing of grazing permits and leases, in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource conditions (ex., fire) and legal obligations.
- The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.
- Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to

---

the existing permit or lease using the same mandatory terms and conditions. If the authorized officer determines a change in the mandatory terms and conditions is required, the new permit must be processed as directed in section 325 of Public Law 108-108.” Where a FO is unable to fully process a permit renewal in compliance with all applicable laws prior to the permit expiration, Section 411 extends the authority to renew the grazing permit with the same terms and conditions as the expiring permit. Section 325 provides the process for authorizing grazing until a permit or lease is issued in compliance with all applicable law and regulatory processes.

<sup>2</sup> The newly amended section 402(c) of FLPMA provides permanent authority to BLM to renew expiring permits. That section states, “The terms and conditions in a grazing permit or lease that has expired, or was terminated due to a grazing preference transfer, shall be continued under a new permit or lease until the date on which the Secretary concerned completes any environmental analysis and documentation for the permit or lease required under the National Environmental Policy Act of 1969 (42 U.S.C. 4321 et seq.) and other applicable laws.”

<sup>3</sup> 43 CFR 4130.3-3 states: Following consultation, cooperation and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public, the authorized officer may modify terms and conditions of the permit or lease when the active grazing use or related management practices are not meeting the land use plan, allotment management plan or other activity plan, or management objectives, or is not in conformance with the provisions of subpart 4180 (Fundamentals of Rangeland Health and Standards and Guidelines for Grazing Administration).

help ensure compliance with the terms and conditions within the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.

- At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

### **Addressing GRSG RMP Amendments/Revisions Objectives in Grazing Permits/Leases**

BLM will develop criteria to prioritize the workload to process permits/leases (either fully processed or reauthorized based on the Appropriations rider, or issued under Section 402(c)(2) of FLPMA) and determine whether modification is necessary prior to renewal within PHMAs, beginning with those in SFAs. In setting priorities, those containing riparian areas and areas not meeting Land Health Standards (43 C.F.R. 4180) will take precedence. Potential criteria for prioritizing permit modifications could include:

- Are there riparian areas or wet meadows in the permit/lease area?
- Was current livestock grazing identified as a causal factor for not meeting Land Health Standards?
- Since the last allotment/watershed evaluation, is there current monitoring information to determine that the watershed/allotment is currently achieving or making significant progress towards achieving land health standards?
- Does the permit have terms and conditions adequate to ensure proper grazing practices to meet GRSG habitat objectives found in the Special Status Species section of the land use plan?
- Is there data that indicates that the GRSG habitat objectives, including the Habitat Objectives table, found in the Special Status Species section of the land use plan are being met?
- Is there a request from the permittee to modify the terms and conditions of his/her permit?

Additionally, if an existing permit/lease within PHMAs requires modification because current grazing is a significant causal factor for not meeting the Land Health Standards, the BLM will prepare the appropriate NEPA analysis and issue the proposed/final grazing decision under 43 C.F.R. Subpart 4160, subject to administrative appeal and potential judicial challenge.

The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA. Adjustments to meet seasonal Sage-Grouse habitat requirements could include:

- Season or timing of use;
- Numbers of livestock (includes temporary non-use or livestock removal);
- Distribution of livestock use;
- Intensity of use; and
- Type of livestock (e.g., cattle, sheep, horses, llamas, alpacas and goats).

## **Compliance Monitoring**

The BLM will monitor grazing permits/leases renewed or modified in accordance with the direction contained in this guidance as follows: Allotments within SFAs, followed by those in other PHMA, and focusing on those with riparian areas, will be prioritized for monitoring to ensure compliance with the terms and conditions in the permits. The BLM will collect, at a minimum, the following monitoring data:

- Vegetation Condition
- Actual Use
- Utilization
- Use Supervision

## **Concerning Voluntary Relinquishments**

All ADPPs will include the following language:

At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

For completing this, BLM offices should use [WO IM 2013-184 Relinquishment of Grazing Permitted Use](#) or the most recent policy guidance.

**BLM-IDAHO**

**Greater Sage-Grouse Planning Issues for the BLM Planning Teams to Insert and Analyze in Administrative Draft Proposed Plan (ADPP)**

January ~~1923~~, 2015

*The March 4, 2010 decision by the U.S. Fish and Wildlife Service that the greater sage-grouse warranted listing but was precluded [Endangered and Threatened Wildlife and Plants; 12-Month Findings for Petitions to list the Greater Sage-Grouse (*Centrocercus urophasianus*) as Threatened or Endangered] set in motion the most comprehensive land-use planning initiative in the BLM’s history.*

*In 2011, the BLM began updating land-use plans across the West so as to ensure not only the long-term viability of the greater sage-grouse on public lands and the continued economic vitality of the West. This has been a complex and demanding process involving collaboration with an unprecedented number of stakeholders, including Governors, State Fish and Game agencies, the U.S. Fish and Wildlife Service and many others. The BLM’s mandate of multiple use and sustained yield has required us to balance the full range of resource uses on public lands, including the conservation of crucial wildlife habitat. As we have worked through this process, public land managers throughout the BLM have made difficult resource management decisions.*

*These documents provide key guidance that will enable the BLM to finalize land use plans that will contribute to the conservation of the Greater Sage-Grouse and other sagebrush associated species across the West. The guidance outlines a suite of tools, such as disturbance limits in key habitats and mitigation approaches, which will help us to reach this goal. These mechanisms will work in concert to conserve sage-grouse habitat so that we can achieve our twin goals of thriving Greater Sage-Grouse populations and robust Western economies.*

**Issue:**

**Development in Highly Important Landscapes**

**Direction:**

The BLM will designate Sagebrush Focal Areas (SFAs) consisting of the BLM-managed lands within the area depicted in the October 27, 2014 USFWS memo, *Greater Sage-Grouse: Additional Recommendation to Refine Land Use Allocations in Highly Important Landscapes*.

In the Special Status Species Section of Chapter 2, include the following management action drop in language (for the Proposed Alternative only): “Designate Sagebrush Focal Areas (SFA) as shown on Map X (x acres). All BLM-administered lands within the SFA boundary would be:

- 1) Recommended for withdrawal from the General Mining Act of 1872, subject to valid existing rights.
- 2) Managed as NSO, without waiver, exception, or modification, for fluid mineral leasing.

3) Prioritized for management and conservation actions in these areas, including, but not limited to review of livestock grazing permits/leases (see livestock grazing section for additional actions)."

~~The ADPP will reflect the following management guidance for the SFAs:~~

~~The ADPP will recommend administrative withdrawals from the 1872 Mining Law (locatable minerals) in SFAs, subject to valid existing rights.~~

~~These areas will be NSO, without exceptions, for oil and gas development.~~

~~The BLM will prioritize management and conservation actions in these areas, including, but not limited to review of livestock grazing permits/leases.~~

**Issue:**

**Mitigation**

**Direction:**

The ADPP will include the updated Mitigation Framework (Attachment I) and drop-in Chapter 2 language to reflect the following language:

*"In all sage-grouse habitat, in undertaking BLM management actions, and, consistent with valid existing rights and applicable law, in authorizing third-party actions that result in habitat loss and degradation, the BLM will require and assure-ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions."*

**Issue:**

**Mapping**

**Direction:**

Not Applicable

**Issue:**

**Disturbance**

**Direction:**

Per the original April 2014 NPT guidance on disturbance, the ADPP will use the 3% disturbance cap at the Biologically Significant Unit (BSU) and project scale. The density calculation (an average of 1 facility per 640 acres) applies to energy and mining facilities. The disturbance cap will not be applied to foreclose development of locatable minerals on unpatented claims located under the 1872 Mining Law; the disturbance from locatable mining will be accounted for in determining the percent disturbance and whether the cap has been exceeded. BLM-ID will use the disturbance calculation methodology developed prior to this guidance.

Planning units will include the following land use plan actions within their ADPPs that states:

a. If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSB Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances (subject to applicable

- laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.) will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.
- b. If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a Priority Habitat Management Areas, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain the area under the cap (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.).

**Issue:**

**Direction:**

**Vegetation Objectives**

The ADPP will establish and incorporate vegetation and GRSG habitat objectives (see Attachment III for specific guidance and a GRSG Habitat Objectives Table template that follows the Sage-Grouse Habitat Assessment Framework Technical Reference-6710-1). The vegetation and GRSG habitat objectives guidance states that the values for the desired conditions in the GRSG Habitat Objectives Table are to be used, at a minimum, to meet the applicable land health standard in sage-grouse habitats. Planning units may include additional indicators and desired condition values as appropriate. The desired condition value for each indicator can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%).

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP. The vegetation objective should be placed in the Vegetation section of the ADPP. Planning units will include the following land use plan vegetation objective within the Vegetation section of their ADPPs:

In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).

**Issue:**

**Direction:**

**Livestock Grazing**

The following management actions will be included in the Livestock Grazing section of the ADPP.

- *The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in*

*Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (ex., fire) and legal obligations.*

- *The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.*
- *Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.*
- *At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.*

Attachment III provides guidance as to how the BLM will incorporate GRGS decisions from the Sage-Grouse RMP/Amendments into grazing permits/leases.

***Issue:***

***Direction:***

**Mineral Materials (Salable Minerals)**

All Priority Habitat Management Areas will be closed to mineral materials development. All Important Habitat Management Areas and General Habitat Management Areas will be open to mineral materials development, consistent with the Idaho Anthropogenic Disturbance Criteria.

***Issue:***

***Direction:***

**High-voltage Transmission and Major Pipeline ROWs and Corridors**

1) Apply the recommended NPT allocation guidance for PHMA of avoidance.

2) GHMA will remain open. BLM-ID will employ a location and design process to ensure protection.

3) For sub-regions that have planned priority transmission lines that traverse their planning area (Gateway West, Boardman to Hemingway, and TransWest Express, including those portions of Gateway South that are co-located), apply the following language as a management action in their ADPP:

*“Priority Habitat Management Areas (PHMAs) and General Habitat Management Areas (GHMAs) are designated as avoidance areas for high voltage transmission line ROWs, except for the transmission projects specifically identified below. All authorizations in these areas, other than the excepted projects, must comply with the conservation measures outlined in this proposed plan, including the RDFs and avoidance criteria presented in [insert citation here] of this document. The BLM is currently processing an application for [Insert name of transmission project] and the NEPA review for this project is well underway. The BLM is analyzing GRSG mitigation measures through the project’s NEPA review process, which will include analysis of the following conservation measures; ~~avoidance criteria, and RDFs outlined in this document [list the criteria/RDFs].~~”*

**Issue:** Coal Suitability

**Direction:** ~~Sub-regions will include the following management action:~~  
~~“At the time an application for a new coal lease or lease modification is submitted to the BLM, the BLM will determine whether the lease application area is “unsuitable” for all or certain coal mining methods pursuant to 43 CFR 3461.5. PHMA is essential habitat for maintaining GRSG for purposes of the suitability criteria set forth at 43 CFR 3461.5(o)(1).”~~Not Applicable in Idaho

**Issue:** Fluid Mineral Resources (Including Geothermal)

**Direction:** All ADPPs will include the following as a conservation objective~~for leasing and development outside of GRSG habitat:~~

*“Priority will be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMA and GHMA. When analyzing leasing and authorizing development of fluid mineral resources, including geothermal, in PHMA and GHMA, and subject to applicable stipulations for the conservation of Greater Sage-Grouse, priority will be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-Grouse. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 U.S.C. 226(p) and 43 C.F.R. 3162.3-1(h).”*

*“Where a proposed ~~oil and gas or geothermal~~fluid mineral development project on an existing lease could adversely affect GRSG populations or habitat, the BLM will work with the lessees, operators, or other project*

*proponents to avoid, reduce and mitigate adverse impacts to the extent compatible with lessees' rights to drill and produce ~~oil and gas or geothermal~~fluid mineral resources. The BLM will work with the lessee, operator, or project proponent in developing an APD for the lease to avoid and minimize impacts to sage-grouse or its habitat and will ensure that the best information about the GRSG and its habitat informs and helps to guide development of such Federal leases.”*

**Issue:**

**Direction:**

**No Surface Occupancy (NSO) Exception Language**

Follow NPT guidance for Priority Habitat Management Areas. No-surface-occupancy stipulations will be included in new fluid mineral ~~oil and gas~~ leases at the time of leasing only and may not be applied to existing ~~oil and gas~~fluid mineral leases that did not include no-surface-occupancy stipulation at the time of leasing. Include the following language into the ADPP:

*No waivers or modifications to ~~an oil and gas~~fluid mineral lease no-surface-occupancy stipulation will be granted. The Authorized Officer may grant an exception to ~~an oil and gas~~fluid mineral lease no-surface-occupancy stipulation only where the proposed action:*

- (i) Would not have direct, indirect, or cumulative effects on GRSG or its habitat; or,*
- (ii) Is proposed to be undertaken as an alternative to a similar action occurring on a nearby parcel, and would provide a clear conservation gain to GRSG.*

*Exceptions based on conservation gain (ii) may only be considered in (a) PHMAs of mixed ownership where federal minerals underlie less than fifty percent of the total surface, or (b) areas of the public lands where the proposed exception is an alternative to an action occurring on a nearby parcel subject to a valid Federal ~~oil and gas~~fluid mineral lease existing as of the date of this RMP [revision or amendment]. Exceptions based on conservation gain must also include measures, such as enforceable institutional controls and buffers, sufficient to allow the BLM to conclude that such benefits will endure for the duration of the proposed action's impacts.*

*Any exceptions to this lease stipulation may be approved by the Authorized Officer only with the concurrence of the State Director. The Authorized Officer may not grant an exception unless the applicable state wildlife agency, the USFWS, and the BLM unanimously find that the proposed action satisfies (i) or (ii). Such finding shall initially be made by a team of one field biologist or other GRSG expert from each respective agency. In the event the initial finding is not unanimous, the finding may be elevated to the appropriate BLM State Director, USFWS State*

*Ecological Services Director, and state wildlife agency head for final resolution. In the event their finding is not unanimous, the exception will not be granted. Approved exceptions will be made publically available at least quarterly."*

**Issue:**

**Adaptive Management**

**Direction:**

Follow the NPT Adaptive Management Guidance and Sideboards. When a hard trigger is hit in a BSU, the designated response will be put in place in that BSU. Triggers and responses have been developed with local state and FWS experts.

When a hard trigger is hit in a BSU within a PAC that has multiple BSUs, including those that cross state lines, the WAFWA Management Zone Greater Sage-Grouse Conservation Team will convene to determine the causal factor, put project level responses in place, as appropriate and discuss further appropriate actions to be applied. The team will also investigate the status of the hard triggers in other BSUs within the PAC and will invoke the appropriate plan response. Adoption of any further actions at the plan level may require initiating a plan amendment process.

**Issue:**

**Application of Lek Buffers**

**Direction:**

The ADPP will require the use of lek buffer-distances for all new BLM-managed and BLM-authorized anthropogenic disturbances in both GHMA and PHMA (see Attachment ~~XIV~~) through this drop-in Chapter 2 language:

*"In undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will apply the lek buffer-distances identified in the USGS Report Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review (Open File Report 2014-1239) in accordance with *Attachment Appendix X*."*

Allocation Direction

\*Southwest Montana will follow the allocations designated for the MT ADPP

## Attachment I

# GREATER SAGE-GROUSE RMPA/FEIS TEMPLATE LANGUAGE FOR ADDRESSING MITIGATION

[ ] = Instructions

[ ] = Fill in the blank

[This mitigation language addresses greater sage-grouse. However, if you are working on a plan revision, you may need to add additional language to be more inclusive of other resource and value objectives (e.g. cultural resources, national historic trails, recreation values, other special status species) that may need to be mitigated.]

## Chapter 1 - Introduction

[Nothing new to add to EIS]

## Chapter 2 – Alternatives – [Proposed Plan/Proposed Plan Amendment]

- Add these two new sections (below) to the **Chapter 2 Alternatives** section.
- Replace the Regional Mitigation placeholder language that was included in the draft EIS with the new “Mitigation” section, below.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

Consistent with the proposed plan’s goal outlined in [Table 2-X – Description of Alternatives], the intent of the [Proposed Plan/Proposed Plan Amendment] is to provide a net conservation gain to the species. To do so, in undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and ~~ensure~~ ~~assure~~ mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. This is also consistent with BLM Manual 6840 – Special Status Species Management, Section .02B, which states “to initiate protective conservation measures that reduce or eliminate threats to Bureau sensitive species to minimize the likelihood of the need for listing of these species under the ESA.”

## Mitigation

*Mitigation Standards.* In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and ~~assure~~ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see the concepts of durability, timeliness, and additionality as described further in Appendix X).

*Greater Sage-Grouse Conservation Team.* The BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. This Team will develop a WAFWA Management Zone Regional Mitigation Strategy (hereafter, Regional Mitigation Strategy). The Team will also compile and report on monitoring data (including data on habitat condition, population trends, and mitigation effectiveness) from States across the WAFWA Management Zone (see Monitoring section). Subsequently, the Team will use these data to either modify the appropriate Regional Mitigation Strategy or recommend adaptive management actions (see Adaptive Management section).

The BLM/USFS will invite governmental and Tribal partners to participate in this Team, including the State Wildlife Agency and U.S. Fish and Wildlife Service, in compliance with the exemptions provided for committees defined in the Federal Advisory Committee Act and the regulations that implement that act. The BLM/USFS will strive for a collaborative and unified approach between Federal agencies (e.g. FWS, BLM, and USFS), Tribal governments, state and local government(s), and other stakeholders for greater sage-grouse conservation. The Team will provide advice, and will not make any decisions that impact Federal lands. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

*Developing a Regional Mitigation Strategy.* The Team will develop a Regional Mitigation Strategy to inform the mitigation components of NEPA analyses for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy will be developed within one year of the issuance of the Record of Decision. The BLM's Regional Mitigation Manual MS-1794 will serve as a framework for developing the Regional Mitigation Strategy. The Regional Mitigation Strategy will be applicable to the States/Field Offices/Forests within the WAFWA Management Zone's boundaries.

Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can provide a net conservation gain to the species. The Regional Mitigation Strategy developed by the Team will elaborate on the components identified above (i.e.

avoidance, minimization, and compensation; additionality, timeliness, and durability) and further explained in Appendix [X].

In the time period before the Strategy is developed, BLM will consider regional conditions, trends, and sites, to the greatest extent possible, when applying the mitigation hierarchy and will ensure that mitigation is consistent with the standards set forth in the first paragraph of this section.

*Incorporating the Regional Mitigation Strategy into NEPA Analyses.* The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

*Implementing a Compensatory Mitigation Program.* Consistent with the principles identified above, the BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be implemented at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

### **Chapter 3 – Affected Environment**

[Nothing to add]

### **Chapter 4 – Environmental Consequences – [Proposed Plan/Proposed Plan Amendment]**

#### **Mitigation**

This Chapter describes the environmental consequences associated with the impacts to greater sage-grouse and its habitat from activities carried out in conformance with this plan, in addition to BLM/USFS management actions. In undertaking BLM/USFS management actions, and consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and

compensating for impacts by applying beneficial mitigation actions. In addition, to help implement this [Proposed Plan / Proposed Plan Amendment], a WAFWA Management Zone Regional Mitigation Strategy (per Appendix [X]) will be developed within one year of the issuance of the Record of Decision. The Strategy will elaborate on the components identified in Chapter 2 (avoidance, minimization, compensation, additionality, timeliness, and durability), and will be considered by the BLM/USFS for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The implementation of a Regional Mitigation Strategy will benefit greater sage-grouse, the public, and land-users by providing a reduction in threats, increased public transparency and confidence, and a predictable permit process for land-use authorization applicants.

### Appendix [X]

- Add this new Appendix.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

### Appendix (X) – Mitigation – [Proposed Plan/Proposed Plan Amendment]

#### General

In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require and ~~assure-ensure~~ mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see glossary).

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy that will inform the NEPA decision making process including the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. A robust and transparent Regional Mitigation Strategy will contribute to greater sage-grouse habitat conservation by reducing, eliminating, or minimizing threats and compensating for residual impacts to greater sage-grouse and its habitat.

The BLM's Regional Mitigation Manual MS-1794 serves as a framework for developing and implementing a Regional Mitigation Strategy. The following sections provide additional guidance specific to the development and implementation of a WAFWA Management Zone Regional Mitigation Strategy.

### Developing a WAFWA Management Zone Regional Mitigation Strategy

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy to guide the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy should consider any State-level greater sage-grouse mitigation guidance that is consistent with the requirements identified in this Appendix. The Regional Mitigation Strategy should be developed in a transparent manner, based on the best science available and standardized metrics.

As described in Chapter 2, the BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. The Strategy will be developed within one year of the issuance of the Record of Decision.

The Regional Mitigation Strategy should include mitigation guidance on avoidance, minimization, and compensation, as follows:

- Avoidance
  - Include avoidance areas (e.g. right-of-way avoidance/exclusion areas, no surface occupancy areas) already included in laws, regulations, policies, and/or land use plans (e.g. Resource Management Plans, Forest Plans, State Plans); and,
  - Include any potential, additional avoidance actions (e.g. additional avoidance best management practices) with regard to greater sage-grouse conservation.
- Minimization
  - Include minimization actions (e.g. required design features, best management practices) already included in laws, regulations, policies, land use plans, and/or land-use authorizations; and,
  - Include any potential, additional minimization actions (e.g. additional minimization best management practices) with regard to greater sage-grouse conservation.
- Compensation
  - Include discussion of impact/project valuation, compensatory mitigation options, siting, compensatory project types and costs, monitoring, reporting, and program administration. Each of these topics is discussed in more detail below.
    - Residual Impact and Compensatory Mitigation Project Valuation Guidance
      - A common standardized method should be identified for estimating the value of the residual impacts and value of the compensatory mitigation projects, including accounting for any uncertainty associated with the effectiveness of the projects.

- This method should consider the quality of habitat, scarcity of the habitat, and the size of the impact/project.
- For compensatory mitigation projects, consideration of durability (see glossary), timeliness (see glossary), and the potential for failure (e.g. uncertainty associated with effectiveness) may require an upward adjustment of the valuation.
- The resultant compensatory mitigation project will, after application of the above guidance, result in proactive conservation measures for Greater Sage-grouse (consistent with BLM Manual 6840 – Special Status Species Management, section .02).
- **Compensatory Mitigation Options**
  - Options for implementing compensatory mitigation should be identified, such as:
    - Utilizing certified mitigation/conservation bank or credit exchanges.
    - Contributing to an existing mitigation/conservation fund.
    - Authorized-user conducted mitigation projects.
  - For any compensatory mitigation project, the investment must be additional (i.e. additionality: the conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project).
- **Compensatory Mitigation Siting**
  - Sites should be in areas that have the potential to yield a net conservation gain to the greater sage-grouse, regardless of land ownership.
  - Sites should be durable (see glossary).
  - Sites identified by existing plans and strategies (e.g. fire restoration plans, invasive species strategies, healthy land focal areas) should be considered, if those sites have the potential to yield a net conservation gain to greater sage-grouse and are durable.
- **Compensatory Mitigation Project Types and Costs**
  - Project types should be identified that help reduce threats to greater sage-grouse (e.g. protection, conservation, and restoration projects).
  - Each project type should have a goal and measurable objectives.
  - Each project type should have associated monitoring and maintenance requirements, for the duration of the impact.
  - To inform contributions to a mitigation/conservation fund, expected costs for these project types (and their monitoring and maintenance), within the WAFWA Management Zone, should be identified.
- **Compensatory Mitigation Compliance and Monitoring**
  - Mitigation projects should be inspected to ensure they are implemented as designed, and if not, there should be methods to enforce compliance.
  - Mitigation projects should be monitored to ensure that the goals and objectives are met and that the benefits are effective for the duration of the impact.

- Compensatory Mitigation Reporting
  - Standardized, transparent, scalable, and scientifically-defensible reporting requirements should be identified for mitigation projects.
  - Reports should be compiled, summarized, and reviewed in the WAFWA Management Zone in order to determine if greater sage-grouse conservation has been achieved and/or to support adaptive management recommendations.
- Compensatory Mitigation Program Implementation Guidelines
  - Guidelines for implementing the State-level compensatory mitigation program should include holding and applying compensatory mitigation funds, operating a transparent and credible accounting system, certifying mitigation credits, and managing reporting requirements.

### Incorporating the Regional Mitigation Strategy into NEPA Analyses

The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

### Implementing a Compensatory Mitigation Program

The BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be managed at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

### **Glossary Terms**

**Additionality:** The conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project. (adopted and modified from BLM Manual Section 1794).

**Avoidance mitigation:** Avoiding the impact altogether by not taking a certain action or parts of an action. (40 CFR 1508.20(a)) (e.g. may also include avoiding the impact by moving the proposed action to a different time or location.)

**Compensatory mitigation:** Compensating for the (residual) impact by replacing or providing substitute resources or environments. (40 CFR 1508.20)

**Compensatory mitigation projects:** The [restoration](#), [creation](#), [enhancement](#), and/or [preservation](#) of impacted resources (adopted and modified from 33 CFR 332), such as on-the-ground actions to improve and/or protect habitats (e.g. chemical vegetation treatments, land acquisitions, conservation easements). (adopted and modified from BLM Manual Section 1794).

**Compensatory mitigation sites:** The durable areas where compensatory mitigation projects will occur. (adopted and modified from BLM Manual Section 1794).

**Durability (protective and ecological):** the maintenance of the effectiveness of a mitigation site and project for the duration of the associated impacts, which includes resource, administrative/legal, and financial considerations. (adopted and modified from BLM Manual Section 1794).

**Minimization mitigation:** Minimizing impacts by limiting the degree or magnitude of the action and its implementation. (40 CFR 1508.20 (b))

**Residual impacts:** Impacts that remain after applying avoidance and minimization mitigation; also referred to as unavoidable impacts.

**Timeliness:** The lack of a time lag between impacts and the achievement of compensatory mitigation goals and objectives (BLM Manual Section 1794).

## Attachment II

### **Greater Sage-Grouse (GRSG) Land Use Plans Disturbance Caps Guidance**

#### **Purpose**

- I. Provide the planning units with land use planning actions that need to be incorporated into the administrative draft proposed plans to respond to the 3% disturbance cap once it is exceeded in either the Biologically Significant Units (BSU) or at the project scale.
- II. Provide guidance on the use of the west-wide habitat degradation (disturbance) data layers as well as the use of locally collected disturbance data for BSUs to determine if the disturbance cap has been exceeded as the land use plans (LUP) are being implemented.
- III. Provide guidance on the use of locally collected disturbance data for project authorizations to determine if the disturbance cap has been exceeded as the LUPs are being implemented.
- IV. Provide guidance on the inclusion of fire in disturbance calculations.
- V. Provide guidance on the use of the density of energy and mining facilities during authorizations
- VI. Provide guidance on the use of the BER analysis in the land use plans (Chapter 2, Affected Environment) and the use of the “west-wide” sagebrush availability and habitat degradation data/estimates for the Priority Habitat Management Areas in each population for monitoring and management purposes as the LUPs are being implemented.
- VII. Provide guidance on what is considered in the disturbance calculations versus what is considered for the disturbance cap.

#### **Guidance**

- I. Planning units will include the following land use plan actions within their administrative draft proposed land use plans (ADPPs) that states:
  - a. *If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.) will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.*
  - b. *If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a Priority Habitat Management Areas, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain*

*the area under the cap (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.).*

- II. Use of west-wide habitat degradation data as well as the use of locally collected disturbance data to determine the level of existing disturbance:
  - a) In the GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, use the west-wide data at a minimum and/or locally collected disturbance data as available (e.g., DDCT) for the anthropogenic disturbance types listed in Table 1.
  
- III. Use of locally collected disturbance data for project authorizations:
  - a) In a proposed project analysis area, digitize all existing anthropogenic disturbances identified in the GRSG Monitoring Framework and the 7 additional features that are considered threats to sage-grouse (Table 2). Using 1 meter resolution NAIP imagery is recommended. Use local data if available.
  
- IV. Fire-burned and habitat treatment areas will not be included in the project scale degradation disturbance calculation for managing sage-grouse habitat under a disturbance cap. These areas will be considered part of a sagebrush availability when rangewide, consistent, interagency fine- and site-scale monitoring has been completed and the areas have been determined to meet sage-grouse habitat requirements. These and other disturbances identified in Table 3 will be part of a sagebrush availability evaluation and will be considered along with other local conditions that may affect sage-grouse during the analysis of the proposed project area.
  
- V. Planning units are directed to use a density cap related to the density of energy and mining facilities (listed below) during project scale authorizations. If the disturbance density in a proposed project area is on average less than 1/ 640 acres, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than an average of 1/ 640 acres, either defer the proposed project or co-locate it into existing disturbed area (*subject to applicable laws and regulations, such as the 1872 Mining Law, valid existing rights, etc.*).
  - Energy (oil and gas wells and development facilities)
  - Energy (coal mines)
  - Energy (wind towers)
  - Energy (solar fields)
  - Energy (geothermal)
  - Mining (active locatable, leasable, and saleable developments)

- VI. Planning units are directed to continue using the baseline data from the 2013 USGS Baseline Environmental Report (BER) in the Affected Environment section of the proposed plans/ FEISs. West-wide sagebrush availability and habitat degradation data layers will be used for the Priority Habitat Management Areas in each population for monitoring (see the GRSG Monitoring Framework in the Monitoring Appendix of the EIS) and management purposes as the LUPs are being implemented. The BER reported on individual threats across the range of sage-grouse while the west-wide disturbance calculation consolidated the anthropogenic disturbance data into a single measure using formulas from the GRSG Monitoring Framework. These calculations will be completed on an annual basis by the BLM's National Operation Center. Planning units will be provided the 2014 baseline disturbance calculation derived from the west-wide data once the RODs are signed that describe the Priority Habitat Management Areas.
- VII. Planning units are directed to use the three measures (sagebrush availability, habitat degradation, density of energy and mining) in conjunction with other information during the NEPA process to most effectively site project locations, such as by clustering disturbances and/or locating facilities in already disturbed areas. Although locatable mine sites are included in the degradation calculation, mining activities under the 1872 mining law may not be subject to the 3% disturbance cap. Details about locatable mining activities should be fully disclosed and analyzed in the NEPA process to assess impacts to sage-grouse and their habitat as well as to BLM goals and objectives, and other BLM programs and activities.

### **Additional Information/Formulas**

Disturbance Calculations for the BSUs and for the Project Analysis Areas:

- For the BSUs: **% Degradation Disturbance = (combined acres of the 12 degradation threats\*) ÷ (acres of all lands within the PHMAs in a BSU) x 100.**
- For the Project Analysis Area: **% Degradation Disturbance = (combined acres of the 12 degradation threats<sup>1</sup> plus the 7 site scale threats<sup>2</sup>) ÷ (acres of all lands within the project analysis area in the PHMA) x 100.**

<sup>1</sup> see Table 3. <sup>2</sup> see Table 2

Project analysis area method for permitting surface disturbance activities:

- Draw the project analysis area polygon which consists of a 4 mile buffer around the proposed project footprint plus areas intersected by any 4 mile buffers from nearby leks or mapped seasonal habitats.

- Map disturbances or use locally available data. Use of NAIP imagery is recommended.
- Calculate percent existing disturbance using the formula above. If existing disturbance is less than 3%, proceed to next step. If existing disturbance is greater than 3%, defer the project.
- Add proposed project disturbance footprint area and recalculate the percent disturbance. If disturbance is less than 3%, proceed to next step. If disturbance is greater than 3%, defer project.
- Calculate the disturbance density of energy and mining facilities (listed above). If the disturbance density is less than 1 facility per 640 acres, averaged across project analysis area, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than 1 facility per 640 acres, averaged across the project analysis area, either defer the proposed project or co-locate it into existing disturbed area.
- If a project that would exceed the degradation cap or density cap cannot be deferred due to valid existing rights or other existing laws and regulations, fully disclose the local and regional impacts of the proposed action in the associated NEPA.

Table 1. Anthropogenic disturbance types for disturbance calculations. Data sources are described for the west-wide habitat degradation estimates (Table copied from the GRSG Monitoring Framework)

<b>Degradation Type</b>	<b>Subcategory</b>	<b>Data Source</b>	<b>Direct Area of Influence</b>	<b>Area Source</b>

## **Background**

In the USFWS's 2010 listing decision for sage-grouse, the USFWS identified 18 threats contributing to the destruction, modification, or curtailment of the sage-grouse's habitat or range (75 FR 13910 2010). In April 2014, the Interagency GRSG Disturbance and Monitoring Sub-Team finalized the Greater Sage-Grouse Monitoring Framework (hereafter, framework) to track these threats. The 18 threats have been aggregated into three measures to account for whether the threat predominantly removes sagebrush or degrades habitat. The three measures are:

Measure 1: Sagebrush Availability (percent of sagebrush per unit area)

Measure 2: Habitat Degradation (percent of human activity per unit area)

Measure 3: Density of Energy and Mining (facilities and locations per unit area)

The BLM is committed to monitoring the three disturbance measures and reporting them to the FWS on an annual basis. However, for the purposes of calculating the amount of disturbance to provide information for management decisions and inform the success of the sage-grouse planning effort, the data depicting the location and extent of the 12 anthropogenic types of threats will be used at a minimum in the BSUs and those same 12 anthropogenic and the additional 7 types of features that are threats to sage-grouse will be used in the project analysis areas.

		Scales		
		Broad/Mid (Populations)	Intermediate (BSU)	Local/Project (Seas. Hab.)
Habitat Degradation	Unit:	WAFWA Populations	Biologically Significant Unit	Project/Local Habitat Area <sup>5</sup>
	Area of Interest:	PHMAs	PHMAs	PHMAs
	Data:	Westwide degradation data	Westwide <sup>2</sup> , State, Local	State, Local
	Formula (Measure 2a):	<u>12 Degradation Threats</u> PHMAs in Populations	<u>12 Degradation Threats</u> PHMAs in BSUs	<u>12 Degradation Threats + 7<sup>7</sup></u> PHMAs in Proj./Loc. Hab. Area <sup>6</sup>
	Management:	Internal BLM & FS estimates	3% <sup>3</sup> Cap, Adapt. Mgmt <sup>4</sup>	3% <sup>3</sup> Disturbance Cap
	All Lands:	Yes	Yes	Yes
	Fire Included:	No	No	No
	Who:	BLM NOC	BLM NOC <sup>2</sup> or State Offices	State Offices or Field Offices
Sagebrush Availability	Unit:	WAFWA Populations	Biologically Significant Unit	n/a
	Area of Interest:	PHMAs	PHMAs	
	Data:	LANDFIRE Updated EVT	Updated EVT or State data	
	Formula (Measure 1a):	<u>Existing Updated Sagebrush</u> PHMAs in Populations	<u>Existing Updated Sagebrush</u> PHMAs in BSUs	
	Management:	Internal BLM & FS estimates	Adaptive Management <sup>4</sup>	
	All Lands:	Yes	Yes

	Who:	BLM NOC	BLM NOC <sup>2</sup> or State Offices	
Energy and Mining	Unit:	WAFWA Populations	n/a	Project Area & Seasonal Hab.
	Area of Interest:	PHMAs		PHMAs
	Data:	Westwide well & mine data		Westwide <sup>2</sup> , State data
	Formula (Measure 3):	<u>Well Pads and Mines<sup>1</sup></u> Square Mile		<u>Well Pads and Mines<sup>1</sup></u> Square Mile
	Management:	Internal BLM & FS estimates		Project Authorization
	All Lands:	Yes		Yes
	Fire Included:	No		No
	Who:	BLM NOC		BLM NOC or SOs or FOs

**ACRONYMS**

PHMA = Priority Habitat Management Area      BSU = Biologically Significant Unit  
 EVT = Existing Vegetation Type              BpS = Areas of Biotic Potential

<sup>1</sup> Only mines with a Plan of Operation (>5 acres of disturbance) will be included.  
<sup>2</sup> Westwide data will be used only if state or local data are not available.  
<sup>3</sup> A 5% disturbance cap will be allowed in Wyoming.  
<sup>4</sup> This may be one of several variables used to inform Adaptive Management. The BSU is the scale at which Adaptive Management will be applied.  
<sup>5</sup> A moving window analysis will be conducted at this scale by the NOC using westwide data. If available, state and local data/analysis should be used for Adaptive Management  
<sup>6</sup> The analysis area will be based on a 4-mile project area, 4-mile buffers around leks/ lek complexes, or other seasonal habitat, and clipped to PHMA (DDCT methodology).  
<sup>7</sup> See Table 2

## Attachment III

### **Greater Sage-Grouse (GRSG) Land Use Plans Vegetation Objectives Guidance**

#### **Purpose**

- I. Provide the planning units with land use planning vegetation objectives that need to be incorporated into the administrative draft proposed plans.
- II. Provide guidance on the use of a template for GRSG habitat objectives in the Special Status Species section of the ADPPs.
- III. Provide guidance on prioritizing land health assessments in sage-grouse habitats and conducting assessments at the watershed scale using the sage-grouse habitat objectives.

#### **Guidance**

- I. Planning units will include the following land use plan vegetation objective within the Vegetation section of their administrative draft proposed land use plans (ADPPs) that states:

*In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).*

- II. Planning units will populate the GRSG Habitat Objectives table template to provide vegetation objectives for sage-grouse life history stages based on the ecology in your region to be used to meet the applicable land health standard in GRSG habitats. Planning units are encouraged to work across boundaries when developing the objectives to ensure regional continuity and will provide appropriate peer-reviewed science to support the habitat values for the indicators. These desired condition value can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%). Planning units may include additional indicators and desired condition values as appropriate (see the Sage-Grouse Habitat Assessment Framework (HAF, *Technical Reference 6710-1*) for appropriate indicators). The HAF contains values for habitat suitability indicators in sage-grouse seasonal habitats from the Connelly et al. (2000) sage-grouse guidelines and has incorporated many of the core indicators in the AIM strategy (Toevs et al. 2011) as well. Planning units may use the indicator values from Connelly et al. (2000) while developing the land use plan Sage-Grouse Habitat Objectives table.

When using the indicators to guide management actions or during land health assessments, consider that the indicators are sensitive to the ecological processes operating at the scale of interest and that a single habitat indicator does not necessarily define habitat suitability for an area or particular scale. Indicators must be collectively reviewed, assessed based on the site potential, and put into spatial and temporal context to correctly determine habitat suitability which will include more than one scale and multiple indicators. Assessment and evaluation of these objectives will follow the steps described in the HAF.

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP and is to be used as a minimum to meet the applicable land health standard in sage-grouse habitats.

Greater Sage-Grouse Habitat Objectives

ATTRIBUTE	INDICATORS	DESIRED CONDITION	Reference
<b>BREEDING AND NESTING (Seasonal Use Period March 1-June 15)</b>			
Lek Security	Proximity of trees		
	Proximity of sagebrush to leks		
Cover	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover		
	Sagebrush height Arid sites Mesic sites		
	Predominant sagebrush shape		
	Perennial grass cover Arid sites Mesic sites		
	Perennial grass and forb height		
	Perennial forb canopy cover Arid sites Mesic sites		
<b>BROOD-REARING/SUMMER<sup>1</sup> (Seasonal Use Period June 16-October 31)</b>			
Cover	% of Seasonal habitat meeting desired condition		
	Sagebrush canopy cover		
	Sagebrush height		
	Perennial grass canopy cover and forbs		
	Riparian areas/mesic meadows		
	Upland and riparian perennial forb availability		
<b>WINTER<sup>1</sup> (Seasonal Use Period November 1-February 28)</b>			
Cover and Food	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover above snow		
	Sagebrush height above snow		

- III. The BLM will prioritize land health assessments in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. Field offices are to conduct land health assessments at the watershed scale and use the GRSG habitat objectives when assessing the applicable standard in GRSG habitats.

When conducting land health assessments, the BLM should follow, at a minimum, “Interpreting Indicators of Rangeland Health” (Pellant et. al. 2005) and the “BLM Core Terrestrial Indicators and Methods” (MacKinnon et al. 2011). For assessments being conducted in GRSG designated management areas, the BLM should collect additional data to inform the HAF indicators that have not been collected using the above methods. Implementation of the principles outlined in the AIM strategy will allow the data to be used to generate unbiased estimates of condition across the area of interest; facilitate consistent data collection and rollup analysis among management units; help provide consistent data to inform the classification and interpretation of imagery; and provide condition and trend of the indicators describing sagebrush characteristics important to sage-grouse habitat.

## Attachment IVH

### **Incorporating GSGR RMP Decisions into Grazing Authorizations**

#### **Purpose**

The purpose is to provide recommended ADPP language; outline the process for prioritizing the review and processing of grazing permits/leases to determine if modification is necessary (prior to renewal and in accordance with prioritization criteria); provide direction for including specific management thresholds and defined responses that will allow adjustments to livestock grazing within the terms and conditions of permits; and provide a process for prioritizing compliance monitoring within Sagebrush Focal Areas (SFAs) and Priority Habitat Management Areas (PHMAs).

#### **Background**

The BLM manages approximately 18,000 livestock grazing permits and leases on the public lands. Livestock grazing is an integral part of the BLM multiple-use mission and is authorized by the Taylor Grazing Act (1934), the Federal Land Policy Management Act (1976) and the Public Rangeland Improvement Act (1978). By statute and regulation, grazing leases and permits are normally issued for 10-year periods. Annually, a range of 1,200 to 3,200 grazing permits expire and the BLM receives 500 to 1,500 grazing permit/lease transfer requests.

The BLM currently issues permits/leases in accordance with:

- All applicable law, regulation, policy (NEPA, consultation, proposed/final grazing decision-also known as a fully processed permit); or
- Various appropriation authorities enacted between 1999 and 2014 extending terms and conditions of expiring or transferred permits/leases that the BLM is unable to fully process before their expiration; or
- Section 402(c)(2) of FLPMA (as amended by Public Law 113-291, enacted December 19, 2014).

Congress has acted to ensure that grazing permittees could continue to graze if the BLM is unable to complete the environmental analysis mandated by the NEPA and other applicable laws. Since 1999, a provision (“the rider”) has been included in the Interior Appropriations bill that, in various forms, generally authorizes the BLM to renew grazing permits and leases under their same terms and conditions until it fully processes the permit renewal in compliance with NEPA, ESA, and other legal or regulatory requirements. The most recent rider is contained in Section 411, Public Law 113-76.<sup>1</sup> The FLPMA amendment to Section 402 (c) allows BLM to renew

---

<sup>1</sup> The Consolidated Appropriations Act, 2014 includes the provision Section 411 which states: “Section 415 of division E of Public Law 112–74 is amended by striking “and 2013” and inserting “through 2015.” The terms and conditions of section 325 of Public Law 108-108 (117 stat. 1307), regarding permits at the Department of the Interior and the Forest Service, shall remain in effect through fiscal year 2015. A grazing permit or lease issued by the Secretary of the Interior for lands administered by the Bureau of Land Management that is the subject of a request for a grazing preference transfer shall be issued, without further processing, for the remaining time period in

grazing permits and leases under the same terms and conditions. This relieves the BLM's renewal processing workload, allowing the BLM to prioritize permit processing based on sensitivity of the resources at issue.<sup>2</sup>

The BLM may modify terms and conditions of a permit or lease at any time following completion of appropriate analysis and consultation, cooperation, and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public.<sup>3</sup> Under 43 C.F.R. 4160.1, the BLM must serve a proposed decision on any affected applicant, permittee or lessee, any agent and lien holder of record. Copies of the decisions are provided to the interested publics.

**Recommended Language to be incorporated as Livestock Grazing Management Actions within the GRSG ADPPs:**

- The BLM will prioritize the review of grazing permits/leases, including those prior to renewal to determine if modification is necessary, and processing of grazing permits and leases, in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource conditions (ex., fire) and legal obligations.
- The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.
- Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to

---

the existing permit or lease using the same mandatory terms and conditions. If the authorized officer determines a change in the mandatory terms and conditions is required, the new permit must be processed as directed in section 325 of Public Law 108-108.” Where a FO is unable to fully process a permit renewal in compliance with all applicable laws prior to the permit expiration, Section 411 extends the authority to renew the grazing permit with the same terms and conditions as the expiring permit. Section 325 provides the process for authorizing grazing until a permit or lease is issued in compliance with all applicable law and regulatory processes.

<sup>2</sup> The newly amended section 402(c) of FLPMA provides permanent authority to BLM to renew expiring permits. That section states, “The terms and conditions in a grazing permit or lease that has expired, or was terminated due to a grazing preference transfer, shall be continued under a new permit or lease until the date on which the Secretary concerned completes any environmental analysis and documentation for the permit or lease required under the National Environmental Policy Act of 1969 (42 U.S.C. 4321 et seq.) and other applicable laws.”

<sup>3</sup> 43 CFR 4130.3-3 states: Following consultation, cooperation and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public, the authorized officer may modify terms and conditions of the permit or lease when the active grazing use or related management practices are not meeting the land use plan, allotment management plan or other activity plan, or management objectives, or is not in conformance with the provisions of subpart 4180 (Fundamentals of Rangeland Health and Standards and Guidelines for Grazing Administration).

help ensure compliance with the terms and conditions within the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.

- At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

### **Addressing GRSG RMP Amendments/Revisions Objectives in Grazing Permits/Leases**

BLM will develop criteria to prioritize the workload to process permits/leases (either fully processed or reauthorized based on the Appropriations rider, or issued under Section 402(c)(2) of FLPMA) and determine whether modification is necessary prior to renewal within PHMAs, beginning with those in SFAs. In setting priorities, those containing riparian areas and areas not meeting Land Health Standards (43 C.F.R. 4180) will take precedence. Potential criteria for prioritizing permit modifications could include:

- Are there riparian areas or wet meadows in the permit/lease area?
- Was current livestock grazing identified as a causal factor for not meeting Land Health Standards?
- Since the last allotment/watershed evaluation, is there current monitoring information to determine that the watershed/allotment is currently achieving or making significant progress towards achieving land health standards?
- Does the permit have terms and conditions adequate to ensure proper grazing practices to meet GRSG habitat objectives found in the Special Status Species section of the land use plan?
- Is there data that indicates that the GRSG habitat objectives, including the Habitat Objectives table, found in the Special Status Species section of the land use plan are being met?
- Is there a request from the permittee to modify the terms and conditions of his/her permit?

Additionally, if an existing permit/lease within PHMAs requires modification because current grazing is a significant causal factor for not meeting the Land Health Standards, the BLM will prepare the appropriate NEPA analysis and issue the proposed/final grazing decision under 43 C.F.R. Subpart 4160, subject to administrative appeal and potential judicial challenge.

The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA. Adjustments to meet seasonal Sage-Grouse habitat requirements could include:

- Season or timing of use;
- Numbers of livestock (includes temporary non-use or livestock removal);
- Distribution of livestock use;
- Intensity of use; and
- Type of livestock (e.g., cattle, sheep, horses, llamas, alpacas and goats).

## **Compliance Monitoring**

The BLM will monitor grazing permits/leases renewed or modified in accordance with the direction contained in this guidance as follows: Allotments within SFAs, followed by those in other PHMA, and focusing on those with riparian areas, will be prioritized for monitoring to ensure compliance with the terms and conditions in the permits. The BLM will collect, at a minimum, the following monitoring data:

- Vegetation Condition
- Actual Use
- Utilization
- Use Supervision

## **Concerning Voluntary Relinquishments**

All ADPPs will include the following language:

At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

For completing this, BLM offices should use [WO IM 2013-184 Relinquishment of Grazing Permitted Use](#) or the most recent policy guidance.

Buffer Attachment V

**Applying Lek Buffer-Distances When Approving Actions**

- *Buffer Distances and Evaluation of Impacts to Leks*

Evaluate impacts to leks from actions requiring NEPA analysis. In addition to any other relevant information determined to be appropriate (e.g. State wildlife agency plans), the BLM will assess and address impacts from the following activities using the lek buffer-distances as identified in the USGS Report *Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review* (Open File Report 2014-1239). The BLM will apply the lek buffer-distances specified as the lower end of the interpreted range in the report unless justifiable departures are determined to be appropriate (see below). The lower end of the interpreted range of the lek buffer-distances is as follows:

  - linear features (roads) within 3.1 miles of leks
  - infrastructure related to energy development within 3.1 miles of leks.
  - tall structures (e.g., communication or transmission towers, transmission lines) within 2 miles of leks.
  - low structures (e.g., fences, rangeland structures) within 1.2 miles of leks.
  - surface disturbance (continuing human activities that alter or remove the natural vegetation) within 3.1 miles of leks.
  - noise and related disruptive activities including those that do not result in habitat loss (e.g., motorized recreational events) at least 0.25 miles from leks.

Justifiable departures to decrease or increase from these distances, based on local data, best available science, landscape features, and other existing protections (e.g., land use allocations, state regulations) may be appropriate for determining activity impacts. The USGS report recognized “that because of variation in populations, habitats, development patterns, social context, and other factors, for a particular disturbance type, there is no single distance that is an appropriate buffer for all populations and habitats across the sage-grouse range”. The USGS report also states that “various protection measures have been developed and implemented... [which have] the ability (alone or in concert with others) to protect important habitats, sustain populations, and support multiple-use demands for public lands”. All variations in lek buffer-distances will require appropriate analysis and disclosure as part of activity authorization.

In determining lek locations, the BLM will use the most recent active or occupied lek data available from the state wildlife agency.

- *For Actions in GHMA*

The BLM will apply the lek buffer-distances identified above as required conservation measures, such as Conditions of Approval, to fully address the impacts to leks as identified in the NEPA analysis.

  - Impacts should first be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.
  - If it is not possible to relocate the project outside of the applicable lek buffer-distance(s) identified above, the BLM may approve the project only if:
    - Based on best available science, landscape features, and other existing protections, (e.g., land use allocations, state regulations), the BLM determines that a lek buffer-distance other than the

applicable distance identified above offers the same or a greater level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area; or

- The BLM determines that impacts to GRSG and its habitat are minimized such that the project will cause minor or no new disturbance (ex. co-location with existing authorizations); and
- Any residual impacts within the lek buffer-distances are addressed through compensatory mitigation measures sufficient to ensure a net conservation gain, as outlined in the Mitigation Strategy (Appendix X).

- *For Actions in PHMA*

The BLM will apply the lek buffer-distances identified above as Conditions of Approval to fully address the impacts to leks as identified in the NEPA analysis. Impacts should be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.

The BLM may approve actions in PHMA that are within the applicable lek buffer distance identified above only if:

- The BLM, with input from the state fish and wildlife agency, determines, based on best available science, landscape features, and other existing protections, that a buffer distance other than the distance identified above offers the same or greater level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area.
- The BLM will explain its justification for determining the approved buffer distances meet these conditions in its project decision.

## ***BLM-IDAHO***

### **Greater Sage-Grouse Planning Issues for the BLM Planning Teams to Insert and Analyze in Administrative Draft Proposed Plan (ADPP)**

**January 30, 2015**

*The March 4, 2010 decision by the U.S. Fish and Wildlife Service that the greater sage-grouse warranted listing but was precluded [Endangered and Threatened Wildlife and Plants; 12-Month Findings for Petitions to list the Greater Sage-Grouse (*Centrocercus urophasianus*) as Threatened or Endangered] set in motion the most comprehensive land-use planning initiative in the BLM's history.*

*In 2011, the BLM began updating land-use plans across the West so as to ensure not only the long-term viability of the greater sage-grouse on public lands and the continued economic vitality of the West. This has been a complex and demanding process involving collaboration with an unprecedented number of stakeholders, including Governors, State Fish and Game agencies, the U.S. Fish and Wildlife Service and many others. The BLM's mandate of multiple use and sustained yield has required us to balance the full range of resource uses on public lands, including the conservation of crucial wildlife habitat. As we have worked through this process, public land managers throughout the BLM have made difficult resource management decisions.*

*These documents provide key guidance that will enable the BLM to finalize land use plans that will contribute to the conservation of the Greater Sage-Grouse and other sagebrush associated species across the West. The guidance outlines a suite of tools, such as disturbance limits in key habitats and mitigation approaches, which will help us to reach this goal. These mechanisms will work in concert to conserve sage-grouse habitat so that we can achieve our twin goals of thriving Greater Sage-Grouse populations and robust Western economies.*

***Issue:***

**Development in Highly Important Landscapes**

***Direction:***

As more specifically provided in this guidance, the ADPP will include Sagebrush Focal Areas (SFA), consisting of the BLM and FS-managed lands within the area depicted in the October 27, 2014 USFWS memo, *Greater Sage-Grouse: Additional Recommendation to Refine Land Use Allocations in Highly Important Landscapes*. In the Special Status Species Section of Chapter 2, include the following management action drop in language (for the Proposed Plan only):

*“Designate Sagebrush Focal Areas (SFA) as shown on Map X (x acres). SFAs will be managed as PHMA, with the following additional management:*

- 1) Recommended for withdrawal from the General Mining Act of 1872, subject to valid existing rights.*
- 2) Managed as NSO, without waiver, exception, or modification, for fluid mineral leasing.*

- 3) *Prioritized for management and conservation actions in these areas, including, but not limited to review of livestock grazing permits/leases (see livestock grazing section for additional actions)."*

**The NOC will provide updated shapefiles that delineate the SFAs.**

Except as otherwise provided below, the ADPP will provide that all BLM- and FS-managed lands (including subsurface) within SFAs will be allocated and managed as PHMA and include the management actions above.

- *Do Not Include the following in SFA Management*
  - Hawley Mountain WSA (ID), Shoshone WSA (ID), Cedar Buttes WSA (ID), Lower Salmon Falls Creek (ID), Little Jack Wilderness (ID), Bruneau-Jarbidge Wilderness (ID) in non-habitat – The current management in these areas is generally protective of GRSG. As applicable, these will continue to be managed so as not to impair their suitability for preservation as wilderness, or under the terms of the Wilderness Act to preserve wilderness character.
    - To the extent that these areas were analyzed for contingent management as general or priority habitat, the ADPP will include contingent allocations and management direction that would apply in the event that Congress releases the areas from WSA status
  - Non-habitat areas outside Little Jack and Bruneau-Jarbidge Wilderness and Salmon Falls Creek ACEC which were previously shown within the SFA –These areas will not be managed as PHMA or SFA.
- Do Include Donkey Hills ACEC –In order to consolidate parcels for protection as SFAs, this area will be treated as PHMA and included for SFA management.
- *Do Not Include Other Agency Land in SFA Management* – while lands managed by other agencies will be shown on the SFA maps, BLM ADPP decisions will not be applied to them.
- *Do Not Include Private/State Lands in SFA Management* – while private lands may be within the SFA boundaries, ADPP decisions will not be applied to them, but may apply to Federal subsurface underlying such lands as provided below.
- *Subsurface Estate:*
  - Under private/state lands: subsurface estate in PHMA and GHMA should be treated as PHMA with SFA management actions.
  - Under other Federal lands: subsurface state should be treated as PHMA with SFA management actions if it is not already withdrawn (such as in Refuges or Parks) and PHMA or GHMA management was analyzed in the DEIS.

Additional direction/drop in language for the ADPPs on SFAs will be forthcoming.

**Issue:**

**Direction:**

**Mitigation**

The ADPP will include the updated Mitigation Framework (Attachment I) and drop-in Chapter 2 language to reflect the following language:

*“In all sage-grouse habitat, in undertaking BLM management actions, and, consistent with valid existing rights and applicable law, in authorizing third-party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions.”*

**Issue:**

**Direction:**

**Mapping**

Not Applicable

**Issue:**

**Direction:**

**Disturbance**

Per the original April 2014 NPT guidance on disturbance, the ADPP will use the 3% disturbance cap at the Biologically Significant Unit (BSU) and project scale. The density calculation (an average of 1 facility per 640 acres) applies to energy and mining facilities. The disturbance cap will not be applied to foreclose development of locatable minerals on unpatented claims located under the 1872 Mining Law; the disturbance from locatable mining will be accounted for in determining the percent disturbance and whether the cap has been exceeded. BLM-ID will use the disturbance calculation methodology developed prior to this guidance (see Attachment II).

Planning units will include the following land use plan actions within their ADPPs that states:

- a. *If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.) will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.*

- b. *If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a Priority Habitat Management Areas, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain the area under the cap (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.).*

**Issue:**

**Direction:**

**Vegetation Objectives**

The ADPP will establish and incorporate vegetation and GRSG habitat objectives (see Attachment III for specific guidance and a GRSG Habitat Objectives Table template that follows the Sage-Grouse Habitat Assessment Framework Technical Reference-6710-1). The vegetation and GRSG habitat objectives guidance states that the values for the desired conditions in the GRSG Habitat Objectives Table are to be used, at a minimum, to meet the applicable land health standard in sage-grouse habitats. Planning units may include additional indicators and desired condition values as appropriate. The desired condition value for each indicator can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%).

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP. The vegetation objective should be placed in the Vegetation section of the ADPP. Planning units will include the following land use plan vegetation objective within the Vegetation section of their ADPPs:

*In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).*

**Issue:**

**Direction:**

**Livestock Grazing**

The following management actions will be included in the Livestock Grazing section of the ADPP.

- *The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (ex., fire) and legal obligations.*

- *The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.*
- *Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.*
- *At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.*

Attachment III provides guidance as to how the BLM will incorporate GRGS decisions from the Sage-Grouse RMP/Amendments into grazing permits/leases.

**Issue:**

**Direction:**

**Mineral Materials (Salable Minerals)**

All Priority Habitat Management Areas will be closed to mineral materials development. All Important Habitat Management Areas and General Habitat Management Areas will be open to mineral materials development, consistent with the Idaho Anthropogenic Disturbance Criteria.

**Issue:**

**Direction:**

**High-voltage Transmission and Major Pipeline ROWs and Corridors**

1) Apply the recommended NPT allocation guidance for PHMA of avoidance.

2) GHMA will remain open. BLM-ID will employ a location and design process to ensure protection.

3) For sub-regions that have planned priority transmission lines that traverse their planning area (Gateway West, Boardman to Hemingway, and TransWest Express, including those portions of Gateway South that are co-located), apply the following language as a management action in their ADPP:

*“Priority Habitat Management Areas (PHMAs) and General Habitat Management Areas (GHMAs) are designated as avoidance areas for high*

*voltage transmission line ROWs, except for the transmission projects specifically identified below. All authorizations in these areas, other than the excepted projects, must comply with the conservation measures outlined in this proposed plan, including the RDFs and avoidance criteria presented in [insert citation here] of this document. The BLM is currently processing an application for [Insert name of transmission project] and the NEPA review for this project is well underway. The BLM is analyzing GRSG mitigation measures through the project's NEPA review process, which will include analysis of the following conservations measures.”*

**Issue:** **Coal Suitability**  
**Direction:** Not Applicable in Idaho

**Issue:** **Fluid Mineral Resources (Including Geothermal)**  
**Direction:** All ADPPs will include the following as a conservation objective:

*“Priority will be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMA and GHMA. When analyzing leasing and authorizing development of fluid mineral resources, including geothermal, in PHMA and GHMA, and subject to applicable stipulations for the conservation of Greater Sage-Grouse, priority will be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-Grouse. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 U.S.C. 226(p) and 43 C.F.R. 3162.3-1(h).”*

*“Where a proposed fluid mineral development project on an existing lease could adversely affect GRSG populations or habitat, the BLM will work with the lessees, operators, or other project proponents to avoid, reduce and mitigate adverse impacts to the extent compatible with lessees' rights to drill and produce fluid mineral resources. The BLM will work with the lessee, operator, or project proponent in developing an APD for the lease to avoid and minimize impacts to sage-grouse or its habitat and will ensure that the best information about the GRSG and its habitat informs and helps to guide development of such Federal leases.”*

**Issue:** **No Surface Occupancy (NSO) Exception Language**  
**Direction:** Follow NPT guidance for Priority Habitat Management Areas. No-surface-occupancy stipulations will be included in new fluid mineral leases at the time of leasing only and may not be applied to existing fluid mineral leases that did not include no-surface-occupancy stipulation at the time of leasing. Include the following language into the ADPP:

*“No waivers or modifications to a fluid mineral lease no-surface-occupancy stipulation will be granted. The Authorized Officer may grant an exception to a fluid mineral lease no-surface-occupancy stipulation only where the proposed action:*

- (i) Would not have direct, indirect, or cumulative effects on GRSG or its habitat; or,*
- (ii) Is proposed to be undertaken as an alternative to a similar action occurring on a nearby parcel, and would provide a clear conservation gain to GRSG.*

*Exceptions based on conservation gain (ii) may only be considered in (a) PHMAs of mixed ownership where federal minerals underlie less than fifty percent of the total surface, or (b) areas of the public lands where the proposed exception is an alternative to an action occurring on a nearby parcel subject to a valid Federal fluid mineral lease existing as of the date of this RMP [revision or amendment]. Exceptions based on conservation gain must also include measures, such as enforceable institutional controls and buffers, sufficient to allow the BLM to conclude that such benefits will endure for the duration of the proposed action’s impacts.*

*Any exceptions to this lease stipulation may be approved by the Authorized Officer only with the concurrence of the State Director. The Authorized Officer may not grant an exception unless the applicable state wildlife agency, the USFWS, and the BLM unanimously find that the proposed action satisfies (i) or (ii). Such finding shall initially be made by a team of one field biologist or other GRSG expert from each respective agency. In the event the initial finding is not unanimous, the finding may be elevated to the appropriate BLM State Director, USFWS State Ecological Services Director, and state wildlife agency head for final resolution. In the event their finding is not unanimous, the exception will not be granted. Approved exceptions will be made publically available at least quarterly.”*

**Issue:**

**Adaptive Management**

**Direction:**

Follow the NPT Adaptive Management Guidance and Sideboards. When a hard trigger is hit in a BSU, the designated response will be put in place in that BSU. Triggers and responses have been developed with local state and FWS experts.

When a hard trigger is hit in a BSU within a PAC that has multiple BSUs, including those that cross state lines, the WAFWA Management Zone Greater Sage-Grouse Conservation Team will convene to determine the causal factor, put project level responses in place, as appropriate and discuss further appropriate actions to be applied. The team will also

investigate the status of the hard triggers in other BSUs within the PAC and will invoke the appropriate plan response. Adoption of any further actions at the plan level may require initiating a plan amendment process.

**Issue:**

**Direction:**

**Application of Lek Buffers**

The ADPP will require the use of lek buffer-distances for all new BLM-managed and BLM-authorized anthropogenic disturbances in both GHMA and PHMA (see Attachment IV) through this drop-in Chapter 2 language:

*“In undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will apply the lek buffer-distances identified in the USGS Report Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review (Open File Report 2014-1239) in accordance with Appendix X.”*

Allocation Direction

\*Southwest Montana will follow the allocations designated for the MT ADPP

	<b>Idaho/SW MT*</b>

## Attachment I

# GREATER SAGE-GROUSE RMPA/FEIS TEMPLATE LANGUAGE FOR ADDRESSING MITIGATION

[ ] = Instructions

[ ] = Fill in the blank

[This mitigation language addresses greater sage-grouse. However, if you are working on a plan revision, you may need to add additional language to be more inclusive of other resource and value objectives (e.g. cultural resources, national historic trails, recreation values, other special status species) that may need to be mitigated.]

## Chapter 1 - Introduction

[Nothing new to add to EIS]

## Chapter 2 – Alternatives – [Proposed Plan/Proposed Plan Amendment]

- Add these two new sections (below) to the **Chapter 2 Alternatives** section.
- Replace the Regional Mitigation placeholder language that was included in the draft EIS with the new “Mitigation” section, below.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

Consistent with the proposed plan’s goal outlined in [Table 2-X – Description of Alternatives], the intent of the [Proposed Plan/Proposed Plan Amendment] is to provide a net conservation gain to the species. To do so, in undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. This is also consistent with BLM Manual 6840 – Special Status Species Management, Section .02B, which states “to initiate protective conservation measures that reduce or eliminate threats to Bureau sensitive species to minimize the likelihood of the need for listing of these species under the ESA.”

## Mitigation

*Mitigation Standards.* In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see the concepts of durability, timeliness, and additionality as described further in Appendix X).

*Greater Sage-Grouse Conservation Team.* The BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. This Team will develop a WAFWA Management Zone Regional Mitigation Strategy (hereafter, Regional Mitigation Strategy). The Team will also compile and report on monitoring data (including data on habitat condition, population trends, and mitigation effectiveness) from States across the WAFWA Management Zone (see Monitoring section). Subsequently, the Team will use these data to either modify the appropriate Regional Mitigation Strategy or recommend adaptive management actions (see Adaptive Management section).

The BLM/USFS will invite governmental and Tribal partners to participate in this Team, including the State Wildlife Agency and U.S. Fish and Wildlife Service, in compliance with the exemptions provided for committees defined in the Federal Advisory Committee Act and the regulations that implement that act. The BLM/USFS will strive for a collaborative and unified approach between Federal agencies (e.g. FWS, BLM, and USFS), Tribal governments, state and local government(s), and other stakeholders for greater sage-grouse conservation. The Team will provide advice, and will not make any decisions that impact Federal lands. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

*Developing a Regional Mitigation Strategy.* The Team will develop a Regional Mitigation Strategy to inform the mitigation components of NEPA analyses for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy will be developed within one year of the issuance of the Record of Decision. The BLM's Regional Mitigation Manual MS-1794 will serve as a framework for developing the Regional Mitigation Strategy. The Regional Mitigation Strategy will be applicable to the States/Field Offices/Forests within the WAFWA Management Zone's boundaries.

Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can provide a net conservation gain to the species. The Regional Mitigation Strategy developed by the Team will elaborate on the components identified above (i.e.

avoidance, minimization, and compensation; additionality, timeliness, and durability) and further explained in Appendix [X].

In the time period before the Strategy is developed, BLM will consider regional conditions, trends, and sites, to the greatest extent possible, when applying the mitigation hierarchy and will ensure that mitigation is consistent with the standards set forth in the first paragraph of this section.

*Incorporating the Regional Mitigation Strategy into NEPA Analyses.* The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

*Implementing a Compensatory Mitigation Program.* Consistent with the principles identified above, the BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be implemented at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

### **Chapter 3 – Affected Environment**

[Nothing to add]

### **Chapter 4 – Environmental Consequences – [Proposed Plan/Proposed Plan Amendment]**

#### **Mitigation**

This Chapter describes the environmental consequences associated with the impacts to greater sage-grouse and its habitat from activities carried out in conformance with this plan, in addition to BLM/USFS management actions. In undertaking BLM/USFS management actions, and consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and

compensating for impacts by applying beneficial mitigation actions. In addition, to help implement this [Proposed Plan / Proposed Plan Amendment], a WAFWA Management Zone Regional Mitigation Strategy (per Appendix [X]) will be developed within one year of the issuance of the Record of Decision. The Strategy will elaborate on the components identified in Chapter 2 (avoidance, minimization, compensation, additionality, timeliness, and durability), and will be considered by the BLM/USFS for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The implementation of a Regional Mitigation Strategy will benefit greater sage-grouse, the public, and land-users by providing a reduction in threats, increased public transparency and confidence, and a predictable permit process for land-use authorization applicants.

### Appendix [X]

- Add this new Appendix.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

### Appendix (X) – Mitigation – [Proposed Plan/Proposed Plan Amendment]

#### General

In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see glossary).

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy that will inform the NEPA decision making process including the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. A robust and transparent Regional Mitigation Strategy will contribute to greater sage-grouse habitat conservation by reducing, eliminating, or minimizing threats and compensating for residual impacts to greater sage-grouse and its habitat.

The BLM's Regional Mitigation Manual MS-1794 serves as a framework for developing and implementing a Regional Mitigation Strategy. The following sections provide additional guidance specific to the development and implementation of a WAFWA Management Zone Regional Mitigation Strategy.

### Developing a WAFWA Management Zone Regional Mitigation Strategy

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy to guide the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy should consider any State-level greater sage-grouse mitigation guidance that is consistent with the requirements identified in this Appendix. The Regional Mitigation Strategy should be developed in a transparent manner, based on the best science available and standardized metrics.

As described in Chapter 2, the BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. The Strategy will be developed within one year of the issuance of the Record of Decision.

The Regional Mitigation Strategy should include mitigation guidance on avoidance, minimization, and compensation, as follows:

- Avoidance
  - Include avoidance areas (e.g. right-of-way avoidance/exclusion areas, no surface occupancy areas) already included in laws, regulations, policies, and/or land use plans (e.g. Resource Management Plans, Forest Plans, State Plans); and,
  - Include any potential, additional avoidance actions (e.g. additional avoidance best management practices) with regard to greater sage-grouse conservation.
- Minimization
  - Include minimization actions (e.g. required design features, best management practices) already included in laws, regulations, policies, land use plans, and/or land-use authorizations; and,
  - Include any potential, additional minimization actions (e.g. additional minimization best management practices) with regard to greater sage-grouse conservation.
- Compensation
  - Include discussion of impact/project valuation, compensatory mitigation options, siting, compensatory project types and costs, monitoring, reporting, and program administration. Each of these topics is discussed in more detail below.
    - Residual Impact and Compensatory Mitigation Project Valuation Guidance
      - A common standardized method should be identified for estimating the value of the residual impacts and value of the compensatory mitigation projects, including accounting for any uncertainty associated with the effectiveness of the projects.

- This method should consider the quality of habitat, scarcity of the habitat, and the size of the impact/project.
- For compensatory mitigation projects, consideration of durability (see glossary), timeliness (see glossary), and the potential for failure (e.g. uncertainty associated with effectiveness) may require an upward adjustment of the valuation.
- The resultant compensatory mitigation project will, after application of the above guidance, result in proactive conservation measures for Greater Sage-grouse (consistent with BLM Manual 6840 – Special Status Species Management, section .02).
- **Compensatory Mitigation Options**
  - Options for implementing compensatory mitigation should be identified, such as:
    - Utilizing certified mitigation/conservation bank or credit exchanges.
    - Contributing to an existing mitigation/conservation fund.
    - Authorized-user conducted mitigation projects.
  - For any compensatory mitigation project, the investment must be additional (i.e. additionality: the conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project).
- **Compensatory Mitigation Siting**
  - Sites should be in areas that have the potential to yield a net conservation gain to the greater sage-grouse, regardless of land ownership.
  - Sites should be durable (see glossary).
  - Sites identified by existing plans and strategies (e.g. fire restoration plans, invasive species strategies, healthy land focal areas) should be considered, if those sites have the potential to yield a net conservation gain to greater sage-grouse and are durable.
- **Compensatory Mitigation Project Types and Costs**
  - Project types should be identified that help reduce threats to greater sage-grouse (e.g. protection, conservation, and restoration projects).
  - Each project type should have a goal and measurable objectives.
  - Each project type should have associated monitoring and maintenance requirements, for the duration of the impact.
  - To inform contributions to a mitigation/conservation fund, expected costs for these project types (and their monitoring and maintenance), within the WAFWA Management Zone, should be identified.
- **Compensatory Mitigation Compliance and Monitoring**
  - Mitigation projects should be inspected to ensure they are implemented as designed, and if not, there should be methods to enforce compliance.
  - Mitigation projects should be monitored to ensure that the goals and objectives are met and that the benefits are effective for the duration of the impact.

- Compensatory Mitigation Reporting
  - Standardized, transparent, scalable, and scientifically-defensible reporting requirements should be identified for mitigation projects.
  - Reports should be compiled, summarized, and reviewed in the WAFWA Management Zone in order to determine if greater sage-grouse conservation has been achieved and/or to support adaptive management recommendations.
- Compensatory Mitigation Program Implementation Guidelines
  - Guidelines for implementing the State-level compensatory mitigation program should include holding and applying compensatory mitigation funds, operating a transparent and credible accounting system, certifying mitigation credits, and managing reporting requirements.

### Incorporating the Regional Mitigation Strategy into NEPA Analyses

The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

### Implementing a Compensatory Mitigation Program

The BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be managed at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

### **Glossary Terms**

**Additionality:** The conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project. (adopted and modified from BLM Manual Section 1794).

**Avoidance mitigation:** Avoiding the impact altogether by not taking a certain action or parts of an action. (40 CFR 1508.20(a)) (e.g. may also include avoiding the impact by moving the proposed action to a different time or location.)

**Compensatory mitigation:** Compensating for the (residual) impact by replacing or providing substitute resources or environments. (40 CFR 1508.20)

**Compensatory mitigation projects:** The [restoration](#), [creation](#), [enhancement](#), and/or [preservation](#) of impacted resources (adopted and modified from 33 CFR 332), such as on-the-ground actions to improve and/or protect habitats (e.g. chemical vegetation treatments, land acquisitions, conservation easements). (adopted and modified from BLM Manual Section 1794).

**Compensatory mitigation sites:** The durable areas where compensatory mitigation projects will occur. (adopted and modified from BLM Manual Section 1794).

**Durability (protective and ecological):** the maintenance of the effectiveness of a mitigation site and project for the duration of the associated impacts, which includes resource, administrative/legal, and financial considerations. (adopted and modified from BLM Manual Section 1794).

**Minimization mitigation:** Minimizing impacts by limiting the degree or magnitude of the action and its implementation. (40 CFR 1508.20 (b))

**Residual impacts:** Impacts that remain after applying avoidance and minimization mitigation; also referred to as unavoidable impacts.

**Timeliness:** The lack of a time lag between impacts and the achievement of compensatory mitigation goals and objectives (BLM Manual Section 1794).

## Attachment II

### **Greater Sage-Grouse (GRSG) Land Use Plans Disturbance Caps Guidance**

#### **Purpose**

- I. Provide the planning units with land use planning actions that need to be incorporated into the administrative draft proposed plans to respond to the 3% disturbance cap once it is exceeded in either the Biologically Significant Units (BSU) or at the project scale.
- II. Provide guidance on the use of the west-wide habitat degradation (disturbance) data layers as well as the use of locally collected disturbance data for BSUs to determine if the disturbance cap has been exceeded as the land use plans (LUP) are being implemented.
- III. Provide guidance on the use of locally collected disturbance data for project authorizations to determine if the disturbance cap has been exceeded as the LUPs are being implemented.
- IV. Provide guidance on the inclusion of fire in disturbance calculations.
- V. Provide guidance on the use of the density of energy and mining facilities during authorizations
- VI. Provide guidance on the use of the BER analysis in the land use plans (Chapter 2, Affected Environment) and the use of the “west-wide” sagebrush availability and habitat degradation data/estimates for the Priority Habitat Management Areas in each population for monitoring and management purposes as the LUPs are being implemented.
- VII. Provide guidance on what is considered in the disturbance calculations versus what is considered for the disturbance cap.

#### **Guidance**

- I. Planning units will include the following land use plan actions within their administrative draft proposed land use plans (ADPPs) that states:
  - a. *If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.) will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.*
  - b. *If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a Priority Habitat Management Areas, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain*

*the area under the cap (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.).*

- II. Use of west-wide habitat degradation data as well as the use of locally collected disturbance data to determine the level of existing disturbance:
  - a) In the GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, use the west-wide data at a minimum and/or locally collected disturbance data as available (e.g., DDCT) for the anthropogenic disturbance types listed in Table 1.
  
- III. Use of locally collected disturbance data for project authorizations:
  - a) In a proposed project analysis area, digitize all existing anthropogenic disturbances identified in the GRSG Monitoring Framework and the 7 additional features that are considered threats to sage-grouse (Table 2). Using 1 meter resolution NAIP imagery is recommended. Use local data if available.
  
- IV. Fire-burned and habitat treatment areas will not be included in the project scale degradation disturbance calculation for managing sage-grouse habitat under a disturbance cap. These areas will be considered part of a sagebrush availability when rangewide, consistent, interagency fine- and site-scale monitoring has been completed and the areas have been determined to meet sage-grouse habitat requirements. These and other disturbances identified in Table 3 will be part of a sagebrush availability evaluation and will be considered along with other local conditions that may affect sage-grouse during the analysis of the proposed project area.
  
- V. Planning units are directed to use a density cap related to the density of energy and mining facilities (listed below) during project scale authorizations. If the disturbance density in a proposed project area is on average less than 1/ 640 acres, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than an average of 1/ 640 acres, either defer the proposed project or co-locate it into existing disturbed area (*subject to applicable laws and regulations, such as the 1872 Mining Law, valid existing rights, etc.*).
  - Energy (oil and gas wells and development facilities)
  - Energy (coal mines)
  - Energy (wind towers)
  - Energy (solar fields)
  - Energy (geothermal)
  - Mining (active locatable, leasable, and saleable developments)

- VI. Planning units are directed to continue using the baseline data from the 2013 USGS Baseline Environmental Report (BER) in the Affected Environment section of the proposed plans/ FEISs. West-wide sagebrush availability and habitat degradation data layers will be used for the Priority Habitat Management Areas in each population for monitoring (see the GRSG Monitoring Framework in the Monitoring Appendix of the EIS) and management purposes as the LUPs are being implemented. The BER reported on individual threats across the range of sage-grouse while the west-wide disturbance calculation consolidated the anthropogenic disturbance data into a single measure using formulas from the GRSG Monitoring Framework. These calculations will be completed on an annual basis by the BLM's National Operation Center. Planning units will be provided the 2014 baseline disturbance calculation derived from the west-wide data once the RODs are signed that describe the Priority Habitat Management Areas.
- VII. Planning units are directed to use the three measures (sagebrush availability, habitat degradation, density of energy and mining) in conjunction with other information during the NEPA process to most effectively site project locations, such as by clustering disturbances and/or locating facilities in already disturbed areas. Although locatable mine sites are included in the degradation calculation, mining activities under the 1872 mining law may not be subject to the 3% disturbance cap. Details about locatable mining activities should be fully disclosed and analyzed in the NEPA process to assess impacts to sage-grouse and their habitat as well as to BLM goals and objectives, and other BLM programs and activities.

### **Additional Information/Formulas**

A collaborative effort in Idaho developed a disturbance calculation method that includes the 3% disturbance cap plus a modifier that includes effective habitat and is described in Appendix G of their ADPP. The formulas below are excerpted from that Appendix.

Disturbance Calculations for the BSU:

$$\text{Disturbance Percentage} = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}^1}{\text{Acres within the BSU} * \left( \frac{\text{Acres of Effective Habitat within the BSU}}{\text{Acres within the BSU}} + 0.3 \right)} \right) \times 100$$

Disturbance Calculations for Project Analysis Areas:

*Disturbance Percentage*

$$= \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}^{1,2}}{\text{Acres within the Project Area} * \left( \frac{\text{Acres of Effective Habitat within the BSU}}{\text{Acres within the BSU}} + 0.3 \right)} \right) \times 100$$

<sup>1</sup> see Table 3. <sup>2</sup> see Table 2.

Project analysis area method for permitting surface disturbance activities:

- Draw the project analysis area polygon which consists of a 4 mile buffer around the proposed project footprint plus all of the area within a 4 mile buffer from nearby leks if those lek buffers intersect the project buffer. In areas with mapped or modeled nesting habitats, the areas to be included in the project analysis area are the mapped/ modeled habitat within 4 miles beyond the project 4 mile buffer.
- Map disturbances or use locally available data. Use of NAIP imagery is recommended.
- Calculate percent existing disturbance using the formula above. If existing disturbance is less than 3%, proceed to next step. If existing disturbance is greater than 3%, defer the project.
- Add proposed project disturbance footprint area and recalculate the percent disturbance. If disturbance is less than 3%, proceed to next step. If disturbance is greater than 3%, defer project.
- Calculate the disturbance density of energy and mining facilities (listed above). If the disturbance density is less than 1 facility per 640 acres, averaged across project analysis area, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than 1 facility per 640 acres, averaged across the project analysis area, either defer the proposed project or co-locate it into existing disturbed area.
- If a project that would exceed the degradation cap or density cap cannot be deferred due to valid existing rights or other existing laws and regulations, fully disclose the local and regional impacts of the proposed action in the associated NEPA.

Table 1. Anthropogenic disturbance types for disturbance calculations. Data sources are described for the west-wide habitat degradation estimates (Table copied from the GRSG Monitoring Framework)

<b>Degradation Type</b>	<b>Subcategory</b>	<b>Data Source</b>	<b>Direct Area of Influence</b>	<b>Area Source</b>

## **Background**

In the USFWS's 2010 listing decision for sage-grouse, the USFWS identified 18 threats contributing to the destruction, modification, or curtailment of the sage-grouse's habitat or range (75 FR 13910 2010). In April 2014, the Interagency GRSG Disturbance and Monitoring Sub-Team finalized the Greater Sage-Grouse Monitoring Framework (hereafter, framework) to track these threats. The 18 threats have been aggregated into three measures to account for whether the threat predominantly removes sagebrush or degrades habitat. The three measures are:

Measure 1: Sagebrush Availability (percent of sagebrush per unit area)

Measure 2: Habitat Degradation (percent of human activity per unit area)

Measure 3: Density of Energy and Mining (facilities and locations per unit area)

The BLM is committed to monitoring the three disturbance measures and reporting them to the FWS on an annual basis. However, for the purposes of calculating the amount of disturbance to provide information for management decisions and inform the success of the sage-grouse planning effort, the data depicting the location and extent of the 12 anthropogenic types of threats will be used at a minimum in the BSUs and those same 12 anthropogenic and the additional 7 types of features that are threats to sage-grouse will be used in the project analysis areas.

		Scales		
		Broad/Mid (Populations)	Intermediate (BSU)	Local/Project (Seas. Hab.)
Habitat Degradation	Unit:	WAFWA Populations	Biologically Significant Unit	Project/Local Habitat Area <sup>6</sup>
	Area of Interest:	PHMAs	PHMAs	PHMAs
	Data:	Westwide degradation data	Westwide <sup>2</sup> , State, Local	State, Local
	Formula (Measure 2a):	<u>12 Degradation Threats</u> PHMAs in Populations	<u>12 Degradation Threats</u> PHMAs in BSUs	<u>12 Degradation Threats + 7<sup>7</sup></u> PHMAs in Proj./Loc. Hab. Area <sup>6</sup>
	Management:	Internal BLM & FS estimates	3% <sup>3</sup> Cap, Adapt. Mgmt <sup>4</sup>	3% <sup>3</sup> Disturbance Cap
	All Lands:	Yes	Yes	Yes
	Fire Included:	No	No	No
	Who:	BLM NOC	BLM NOC <sup>3</sup> or State Offices	State Offices or Field Offices

	Area of Interest:	PHMAs		PHMAs
	Data:	Westwide well & mine data		Westwide <sup>2</sup> , State data
	Formula (Measure 3):	<u>Well Pads and Mines<sup>1</sup></u> Square Mile		<u>Well Pads and Mines<sup>1</sup></u> Square Mile
	Management:	Internal BLM & FS estimates		Project Authorization
	All Lands:	Yes		Yes
	Fire Included:	No		No
	Who:	BLM NOC		BLM NOC or SOs or FOs

**ACRONYMS**

PHMA = Priority Habitat Management Area      BSU = Biologically Significant Unit  
 EVT = Existing Vegetation Type              BpS = Areas of Biotic Potential

<sup>1</sup> Only mines with a Plan of Operation (>5 acres of disturbance) will be included.  
<sup>2</sup> Westwide data will be used only if state or local data are not available.  
<sup>3</sup> A 5% disturbance cap will be allowed in Wyoming.  
<sup>4</sup> This may be one of several variables used to inform Adaptive Management. The BSU is the scale at which Adaptive Management will be applied.  
<sup>5</sup> A moving window analysis will be conducted at this scale by the NOC using westwide data. If available, state and local data/analysis should be used for Adaptive Management  
<sup>6</sup> The analysis area will be based on a 4-mile project area, 4-mile buffers around leks/lek complexes, or other seasonal habitat, and clipped to sage-grouse habitat and PHMA (DDCT methodology).  
<sup>7</sup> See Table 2

## Attachment III

### **Greater Sage-Grouse (GRSG) Land Use Plans Vegetation Objectives Guidance**

#### **Purpose**

- I. Provide the planning units with land use planning vegetation objectives that need to be incorporated into the administrative draft proposed plans.
- II. Provide guidance on the use of a template for GRSG habitat objectives in the Special Status Species section of the ADPPs.
- III. Provide guidance on prioritizing land health assessments in sage-grouse habitats and conducting assessments at the watershed scale using the sage-grouse habitat objectives.

#### **Guidance**

- I. Planning units will include the following land use plan vegetation objective within the Vegetation section of their administrative draft proposed land use plans (ADPPs) that states:

*In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).*
- II. Planning units will populate the GRSG Habitat Objectives table template to provide vegetation objectives for sage-grouse life history stages based on the ecology in your region to be used to meet the applicable land health standard in GRSG habitats. Planning units are encouraged to work across boundaries when developing the objectives to ensure regional continuity and will provide appropriate peer-reviewed science to support the habitat values for the indicators. These desired condition value can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%). Planning units may include additional indicators and desired condition values as appropriate (see the Sage-Grouse Habitat Assessment Framework (HAF, *Technical Reference 6710-1*) for appropriate indicators). The HAF contains values for habitat suitability indicators in sage-grouse seasonal habitats from the Connelly et al. (2000) sage-grouse guidelines and has incorporated many of the core indicators in the AIM strategy (Toevs et al. 2011) as well. Planning units may use the indicator values from Connelly et al. (2000) while developing the land use plan Sage-Grouse Habitat Objectives table.

When using the indicators to guide management actions or during land health assessments, consider that the indicators are sensitive to the ecological processes operating at the scale of interest and that a single habitat indicator does not necessarily define habitat suitability for an area or particular scale. Indicators must be collectively reviewed, assessed based on the site potential, and put into spatial and temporal context to correctly determine habitat suitability which will include more than one scale and multiple indicators. Assessment and evaluation of these objectives will follow the steps described in the HAF.

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP and is to be used as a minimum to meet the applicable land health standard in sage-grouse habitats.

Greater Sage-Grouse Habitat Objectives

ATTRIBUTE	INDICATORS	DESIRED CONDITION	Reference
<b>BREEDING AND NESTING (Seasonal Use Period March 1-June 15)</b>			
Lek Security	Proximity of trees		
	Proximity of sagebrush to leks		
Cover	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover		
	Sagebrush height Arid sites Mesic sites		
	Predominant sagebrush shape		
	Perennial grass cover Arid sites Mesic sites		
	Perennial grass and forb height		
	Perennial forb canopy cover Arid sites Mesic sites		
<b>BROOD-REARING/SUMMER<sup>1</sup> (Seasonal Use Period June 16-October 31)</b>			
Cover	% of Seasonal habitat meeting desired condition		
	Sagebrush canopy cover		
	Sagebrush height		
	Perennial grass canopy cover and forbs		
	Riparian areas/mesic meadows		
	Upland and riparian perennial forb availability		
<b>WINTER<sup>1</sup> (Seasonal Use Period November 1-February 28)</b>			
Cover and Food	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover above snow		
	Sagebrush height above snow		

- III. The BLM will prioritize land health assessments in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. Field offices are to conduct land health assessments at the watershed scale and use the GRSG habitat objectives when assessing the applicable standard in GRSG habitats.

When conducting land health assessments, the BLM should follow, at a minimum, “Interpreting Indicators of Rangeland Health” (Pellant et. al. 2005) and the “BLM Core Terrestrial Indicators and Methods” (MacKinnon et al. 2011). For assessments being conducted in GRSG designated management areas, the BLM should collect additional data to inform the HAF indicators that have not been collected using the above methods. Implementation of the principles outlined in the AIM strategy will allow the data to be used to generate unbiased estimates of condition across the area of interest; facilitate consistent data collection and rollup analysis among management units; help provide consistent data to inform the classification and interpretation of imagery; and provide condition and trend of the indicators describing sagebrush characteristics important to sage-grouse habitat.

## Attachment IV

### **Incorporating GSGR RMP Decisions into Grazing Authorizations**

#### **Purpose**

The purpose is to provide recommended ADPP language; outline the process for prioritizing the review and processing of grazing permits/leases to determine if modification is necessary (prior to renewal and in accordance with prioritization criteria); provide direction for including specific management thresholds and defined responses that will allow adjustments to livestock grazing within the terms and conditions of permits; and provide a process for prioritizing compliance monitoring within Sagebrush Focal Areas (SFAs) and Priority Habitat Management Areas (PHMAs).

#### **Background**

The BLM manages approximately 18,000 livestock grazing permits and leases on the public lands. Livestock grazing is an integral part of the BLM multiple-use mission and is authorized by the Taylor Grazing Act (1934), the Federal Land Policy Management Act (1976) and the Public Rangeland Improvement Act (1978). By statute and regulation, grazing leases and permits are normally issued for 10-year periods. Annually, a range of 1,200 to 3,200 grazing permits expire and the BLM receives 500 to 1,500 grazing permit/lease transfer requests.

The BLM currently issues permits/leases in accordance with:

- All applicable law, regulation, policy (NEPA, consultation, proposed/final grazing decision-also known as a fully processed permit); or
- Various appropriation authorities enacted between 1999 and 2014 extending terms and conditions of expiring or transferred permits/leases that the BLM is unable to fully process before their expiration; or
- Section 402(c)(2) of FLPMA (as amended by Public Law 113-291, enacted December 19, 2014).

Congress has acted to ensure that grazing permittees could continue to graze if the BLM is unable to complete the environmental analysis mandated by the NEPA and other applicable laws. Since 1999, a provision (“the rider”) has been included in the Interior Appropriations bill that, in various forms, generally authorizes the BLM to renew grazing permits and leases under their same terms and conditions until it fully processes the permit renewal in compliance with NEPA, ESA, and other legal or regulatory requirements. The most recent rider is contained in Section 411, Public Law 113-76.<sup>1</sup> The FLPMA amendment to Section 402 (c) allows BLM to renew

---

<sup>1</sup> The Consolidated Appropriations Act, 2014 includes the provision Section 411 which states: “Section 415 of division E of Public Law 112–74 is amended by striking “and 2013” and inserting “through 2015.” The terms and conditions of section 325 of Public Law 108-108 (117 stat. 1307), regarding permits at the Department of the Interior and the Forest Service, shall remain in effect through fiscal year 2015. A grazing permit or lease issued by the Secretary of the Interior for lands administered by the Bureau of Land Management that is the subject of a request for a grazing preference transfer shall be issued, without further processing, for the remaining time period in

grazing permits and leases under the same terms and conditions. This relieves the BLM's renewal processing workload, allowing the BLM to prioritize permit processing based on sensitivity of the resources at issue.<sup>2</sup>

The BLM may modify terms and conditions of a permit or lease at any time following completion of appropriate analysis and consultation, cooperation, and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public.<sup>3</sup> Under 43 C.F.R. 4160.1, the BLM must serve a proposed decision on any affected applicant, permittee or lessee, any agent and lien holder of record. Copies of the decisions are provided to the interested publics.

**Recommended Language to be incorporated as Livestock Grazing Management Actions within the GRSG ADPPs:**

- The BLM will prioritize the review of grazing permits/leases, including those prior to renewal to determine if modification is necessary, and processing of grazing permits and leases, in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource conditions (ex., fire) and legal obligations.
- The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.
- Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to

---

the existing permit or lease using the same mandatory terms and conditions. If the authorized officer determines a change in the mandatory terms and conditions is required, the new permit must be processed as directed in section 325 of Public Law 108-108.” Where a FO is unable to fully process a permit renewal in compliance with all applicable laws prior to the permit expiration, Section 411 extends the authority to renew the grazing permit with the same terms and conditions as the expiring permit. Section 325 provides the process for authorizing grazing until a permit or lease is issued in compliance with all applicable law and regulatory processes.

<sup>2</sup> The newly amended section 402(c) of FLPMA provides permanent authority to BLM to renew expiring permits. That section states, “The terms and conditions in a grazing permit or lease that has expired, or was terminated due to a grazing preference transfer, shall be continued under a new permit or lease until the date on which the Secretary concerned completes any environmental analysis and documentation for the permit or lease required under the National Environmental Policy Act of 1969 (42 U.S.C. 4321 et seq.) and other applicable laws.”

<sup>3</sup> 43 CFR 4130.3-3 states: Following consultation, cooperation and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public, the authorized officer may modify terms and conditions of the permit or lease when the active grazing use or related management practices are not meeting the land use plan, allotment management plan or other activity plan, or management objectives, or is not in conformance with the provisions of subpart 4180 (Fundamentals of Rangeland Health and Standards and Guidelines for Grazing Administration).

help ensure compliance with the terms and conditions within the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.

- At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

### **Addressing GRSG RMP Amendments/Revisions Objectives in Grazing Permits/Leases**

BLM will develop criteria to prioritize the workload to process permits/leases (either fully processed or reauthorized based on the Appropriations rider, or issued under Section 402(c)(2) of FLPMA) and determine whether modification is necessary prior to renewal within PHMAs, beginning with those in SFAs. In setting priorities, those containing riparian areas and areas not meeting Land Health Standards (43 C.F.R. 4180) will take precedence. Potential criteria for prioritizing permit modifications could include:

- Are there riparian areas or wet meadows in the permit/lease area?
- Was current livestock grazing identified as a causal factor for not meeting Land Health Standards?
- Since the last allotment/watershed evaluation, is there current monitoring information to determine that the watershed/allotment is currently achieving or making significant progress towards achieving land health standards?
- Does the permit have terms and conditions adequate to ensure proper grazing practices to meet GRSG habitat objectives found in the Special Status Species section of the land use plan?
- Is there data that indicates that the GRSG habitat objectives, including the Habitat Objectives table, found in the Special Status Species section of the land use plan are being met?
- Is there a request from the permittee to modify the terms and conditions of his/her permit?

Additionally, if an existing permit/lease within PHMAs requires modification because current grazing is a significant causal factor for not meeting the Land Health Standards, the BLM will prepare the appropriate NEPA analysis and issue the proposed/final grazing decision under 43 C.F.R. Subpart 4160, subject to administrative appeal and potential judicial challenge.

The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA. Adjustments to meet seasonal Sage-Grouse habitat requirements could include:

- Season or timing of use;
- Numbers of livestock (includes temporary non-use or livestock removal);
- Distribution of livestock use;
- Intensity of use; and
- Type of livestock (e.g., cattle, sheep, horses, llamas, alpacas and goats).

## **Compliance Monitoring**

The BLM will monitor grazing permits/leases renewed or modified in accordance with the direction contained in this guidance as follows: Allotments within SFAs, followed by those in other PHMA, and focusing on those with riparian areas, will be prioritized for monitoring to ensure compliance with the terms and conditions in the permits. The BLM will collect, at a minimum, the following monitoring data:

- Vegetation Condition
- Actual Use
- Utilization
- Use Supervision

## **Concerning Voluntary Relinquishments**

All ADPPs will include the following language:

At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

For completing this, BLM offices should use [WO IM 2013-184 Relinquishment of Grazing Permitted Use](#) or the most recent policy guidance.

Attachment V

**Applying Lek Buffer-Distances When Approving Actions**

- *Buffer Distances and Evaluation of Impacts to Leks*

Evaluate impacts to leks from actions requiring NEPA analysis. In addition to any other relevant information determined to be appropriate (e.g. State wildlife agency plans), the BLM will assess and address impacts from the following activities using the lek buffer-distances as identified in the USGS Report *Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review* ([Open File Report 2014-1239](#)). The BLM will apply the lek buffer-distances specified as the lower end of the interpreted range in the report unless justifiable departures are determined to be appropriate (see below). The lower end of the interpreted range of the lek buffer-distances is as follows:

  - linear features (roads) within 3.1 miles of leks
  - infrastructure related to energy development within 3.1 miles of leks.
  - tall structures (e.g., communication or transmission towers, transmission lines) within 2 miles of leks.
  - low structures (e.g., fences, rangeland structures) within 1.2 miles of leks.
  - surface disturbance (continuing human activities that alter or remove the natural vegetation) within 3.1 miles of leks.
  - noise and related disruptive activities including those that do not result in habitat loss (e.g., motorized recreational events) at least 0.25 miles from leks.

Justifiable departures to decrease or increase from these distances, based on local data, best available science, landscape features, and other existing protections (e.g., land use allocations, state regulations) may be appropriate for determining activity impacts. The USGS report recognized “that because of variation in populations, habitats, development patterns, social context, and other factors, for a particular disturbance type, there is no single distance that is an appropriate buffer for all populations and habitats across the sage-grouse range”. The USGS report also states that “various protection measures have been developed and implemented... [which have] the ability (alone or in concert with others) to protect important habitats, sustain populations, and support multiple-use demands for public lands”. All variations in lek buffer-distances will require appropriate analysis and disclosure as part of activity authorization.

In determining lek locations, the BLM will use the most recent active or occupied lek data available from the state wildlife agency.

- *For Actions in GHMA*

The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis.

  - Impacts should first be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.
  - If it is not possible to relocate the project outside of the applicable lek buffer-distance(s) identified above, the BLM may approve the project only if:
    - Based on best available science, landscape features, and other existing protections, (e.g., land use allocations, state regulations), the BLM determines that a lek buffer-distance other than the applicable distance identified above offers the same or a greater

level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area; or

- The BLM determines that impacts to GRSG and its habitat are minimized such that the project will cause minor or no new disturbance (ex. co-location with existing authorizations); and
- Any residual impacts within the lek buffer-distances are addressed through compensatory mitigation measures sufficient to ensure a net conservation gain, as outlined in the Mitigation Strategy (Appendix X).

- *For Actions in PHMA*

The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis. Impacts should be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.

The BLM may approve actions in PHMA that are within the applicable lek buffer distance identified above only if:

- The BLM, with input from the state fish and wildlife agency, determines, based on best available science, landscape features, and other existing protections, that a buffer distance other than the distance identified above offers the same or greater level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area.
- The BLM will explain its justification for determining the approved buffer distances meet these conditions in its project decision.

**BLM-IDAHO****Greater Sage-Grouse Planning Issues for the BLM Planning Teams to Insert and Analyze in Administrative Draft Proposed Plan (ADPP)****January 30, 2015**

*The March 4, 2010 decision by the U.S. Fish and Wildlife Service that the greater sage-grouse warranted listing but was precluded [Endangered and Threatened Wildlife and Plants; 12-Month Findings for Petitions to list the Greater Sage-Grouse (*Centrocercus urophasianus*) as Threatened or Endangered] set in motion the most comprehensive land-use planning initiative in the BLM's history.*

*In 2011, the BLM began updating land-use plans across the West so as to ensure not only the long-term viability of the greater sage-grouse on public lands and the continued economic vitality of the West. This has been a complex and demanding process involving collaboration with an unprecedented number of stakeholders, including Governors, State Fish and Game agencies, the U.S. Fish and Wildlife Service and many others. The BLM's mandate of multiple use and sustained yield has required us to balance the full range of resource uses on public lands, including the conservation of crucial wildlife habitat. As we have worked through this process, public land managers throughout the BLM have made difficult resource management decisions.*

*These documents provide key guidance that will enable the BLM to finalize land use plans that will contribute to the conservation of the Greater Sage-Grouse and other sagebrush associated species across the West. The guidance outlines a suite of tools, such as disturbance limits in key habitats and mitigation approaches, which will help us to reach this goal. These mechanisms will work in concert to conserve sage-grouse habitat so that we can achieve our twin goals of thriving Greater Sage-Grouse populations and robust Western economies.*

**Issue:****Development in Highly Important Landscapes****Direction:**

As more specifically provided in this guidance, the ADPP will include Sagebrush Focal Areas (SFA), consisting of the BLM and FS-managed lands within the area depicted in the October 27, 2014 USFWS memo, *Greater Sage-Grouse: Additional Recommendation to Refine Land Use Allocations in Highly Important Landscapes*. In the Special Status Species Section of Chapter 2, include the following management action drop in language (for the Proposed Plan only):

*“Designate Sagebrush Focal Areas (SFA) as shown on Map X (x acres). SFAs will be managed as PHMA, with the following additional management:*

- 1) Recommended for withdrawal from the General Mining Act of 1872, subject to valid existing rights.*
- 2) Managed as NSO, without waiver, exception, or modification, for fluid mineral leasing.*

- 3) *Prioritized for management and conservation actions in these areas, including, but not limited to review of livestock grazing permits/leases (see livestock grazing section for additional actions)."*

**The NOC will provide updated shapefiles that delineate the SFAs.**

Except as otherwise provided below, the ADPP will provide that all BLM- and FS-managed lands (including subsurface) within SFAs will be allocated and managed as PHMA and include the management actions above.

- *Do Not Include the following in SFA Management*
  - Hawley Mountain WSA (ID), Shoshone WSA (ID), Cedar Buttes WSA (ID), Lower Salmon Falls Creek (ID), Little Jack Wilderness (ID), Bruneau-Jarbidge Wilderness (ID) in non-habitat – The current management in these areas is generally protective of GRSG. As applicable, these will continue to be managed so as not to impair their suitability for preservation as wilderness, or under the terms of the Wilderness Act to preserve wilderness character.
    - To the extent that these areas were analyzed for contingent management as general or priority habitat, the ADPP will include contingent allocations and management direction that would apply in the event that Congress releases the areas from WSA status
  - Non-habitat areas outside Little Jack and Bruneau-Jarbidge Wilderness and Salmon Falls Creek ACEC which were previously shown within the SFA –These areas will not be managed as PHMA or SFA.
- Do Include Donkey Hills ACEC –In order to consolidate parcels for protection as SFAs, this area will be treated as PHMA and included for SFA management.
- *Do Not Include Other Agency Land in SFA Management* – while lands managed by other agencies will be shown on the SFA maps, BLM ADPP decisions will not be applied to them.
- *Do Not Include Private/State Lands in SFA Management* – while private lands may be within the SFA boundaries, ADPP decisions will not be applied to them, but may apply to Federal subsurface underlying such lands as provided below.
- *Subsurface Estate:*
  - Under private/state lands: subsurface estate in PHMA and GHMA should be treated as PHMA with SFA management actions.
  - Under other Federal lands: subsurface state should be treated as PHMA with SFA management actions if it is not already withdrawn (such as in Refuges or Parks) and PHMA or GHMA management was analyzed in the DEIS.

Additional direction/drop in language for the ADPPs on SFAs will be forthcoming.

**Issue:**

**Direction:**

**Mitigation**

The ADPP will include the updated Mitigation Framework (Attachment I) and drop-in Chapter 2 language to reflect the following language:

*“In all sage-grouse habitat, in undertaking BLM management actions, and, consistent with valid existing rights and applicable law, in authorizing third-party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions.”*

**Issue:**

**Direction:**

**Mapping**

Not Applicable

**Issue:**

**Direction:**

**Disturbance**

Per the original April 2014 NPT guidance on disturbance, the ADPP will use the 3% disturbance cap at the Biologically Significant Unit (BSU) and project scale. The density calculation (an average of 1 facility per 640 acres) applies to energy and mining facilities. The disturbance cap will not be applied to foreclose development of locatable minerals on unpatented claims located under the 1872 Mining Law; the disturbance from locatable mining will be accounted for in determining the percent disturbance and whether the cap has been exceeded. BLM-ID will use the disturbance calculation methodology developed prior to this guidance (see Attachment II).

Planning units will include the following land use plan actions within their ADPPs that states:

- a. *If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.) will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.*

- b. *If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a Priority Habitat Management Areas, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain the area under the cap (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.).*

**Issue:**

**Direction:**

**Vegetation Objectives**

The ADPP will establish and incorporate vegetation and GRSG habitat objectives (see Attachment III for specific guidance and a GRSG Habitat Objectives Table template that follows the Sage-Grouse Habitat Assessment Framework Technical Reference-6710-1). The vegetation and GRSG habitat objectives guidance states that the values for the desired conditions in the GRSG Habitat Objectives Table are to be used, at a minimum, to meet the applicable land health standard in sage-grouse habitats. Planning units may include additional indicators and desired condition values as appropriate. The desired condition value for each indicator can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%).

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP. The vegetation objective should be placed in the Vegetation section of the ADPP. Planning units will include the following land use plan vegetation objective within the Vegetation section of their ADPPs:

*In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).*

**Issue:**

**Direction:**

**Livestock Grazing**

The following management actions will be included in the Livestock Grazing section of the ADPP.

- *The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (ex., fire) and legal obligations.*

- *The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.*
- *Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.*
- *At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.*

Attachment III provides guidance as to how the BLM will incorporate GRGS decisions from the Sage-Grouse RMP/Amendments into grazing permits/leases.

**Issue:**

**Direction:**

**Mineral Materials (Salable Minerals)**

All Priority Habitat Management Areas will be closed to mineral materials development. All Important Habitat Management Areas and General Habitat Management Areas will be open to mineral materials development, consistent with the Idaho Anthropogenic Disturbance Criteria.

**Issue:**

**Direction:**

**High-voltage Transmission and Major Pipeline ROWs and Corridors**

1) Apply the recommended NPT allocation guidance for PHMA of avoidance.

2) GHMA will remain open. BLM-ID will employ a location and design process to ensure protection.

3) For sub-regions that have planned priority transmission lines that traverse their planning area (Gateway West, Boardman to Hemingway, and TransWest Express, including those portions of Gateway South that are co-located), apply the following language as a management action in their ADPP:

*“Priority Habitat Management Areas (PHMAs) and General Habitat Management Areas (GHMAs) are designated as avoidance areas for high*

*voltage transmission line ROWs, except for the transmission projects specifically identified below. All authorizations in these areas, other than the excepted projects, must comply with the conservation measures outlined in this proposed plan, including the RDFs and avoidance criteria presented in [insert citation here] of this document. The BLM is currently processing an application for [Insert name of transmission project] and the NEPA review for this project is well underway. The BLM is analyzing GRSG mitigation measures through the project's NEPA review process, which will include analysis of the following conservations measures.”*

**Issue:** **Coal Suitability**  
**Direction:** Not Applicable in Idaho

**Issue:** **Fluid Mineral Resources (Including Geothermal)**  
**Direction:** All ADPPs will include the following as a conservation objective:

*“Priority will be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMA and GHMA. When analyzing leasing and authorizing development of fluid mineral resources, including geothermal, in PHMA and GHMA, and subject to applicable stipulations for the conservation of Greater Sage-Grouse, priority will be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-Grouse. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 U.S.C. 226(p) and 43 C.F.R. 3162.3-1(h).”*

*“Where a proposed fluid mineral development project on an existing lease could adversely affect GRSG populations or habitat, the BLM will work with the lessees, operators, or other project proponents to avoid, reduce and mitigate adverse impacts to the extent compatible with lessees' rights to drill and produce fluid mineral resources. The BLM will work with the lessee, operator, or project proponent in developing an APD for the lease to avoid and minimize impacts to sage-grouse or its habitat and will ensure that the best information about the GRSG and its habitat informs and helps to guide development of such Federal leases.”*

**Issue:** **No Surface Occupancy (NSO) Exception Language**  
**Direction:** Follow NPT guidance for Priority Habitat Management Areas. No-surface-occupancy stipulations will be included in new fluid mineral leases at the time of leasing only and may not be applied to existing fluid mineral leases that did not include no-surface-occupancy stipulation at the time of leasing. Include the following language into the ADPP:

*“No waivers or modifications to a fluid mineral lease no-surface-occupancy stipulation will be granted. The Authorized Officer may grant an exception to a fluid mineral lease no-surface-occupancy stipulation only where the proposed action:*

- (i) Would not have direct, indirect, or cumulative effects on GRSG or its habitat; or,*
- (ii) Is proposed to be undertaken as an alternative to a similar action occurring on a nearby parcel, and would provide a clear conservation gain to GRSG.*

*Exceptions based on conservation gain (ii) may only be considered in (a) PHMAs of mixed ownership where federal minerals underlie less than fifty percent of the total surface, or (b) areas of the public lands where the proposed exception is an alternative to an action occurring on a nearby parcel subject to a valid Federal fluid mineral lease existing as of the date of this RMP [revision or amendment]. Exceptions based on conservation gain must also include measures, such as enforceable institutional controls and buffers, sufficient to allow the BLM to conclude that such benefits will endure for the duration of the proposed action’s impacts.*

*Any exceptions to this lease stipulation may be approved by the Authorized Officer only with the concurrence of the State Director. The Authorized Officer may not grant an exception unless the applicable state wildlife agency, the USFWS, and the BLM unanimously find that the proposed action satisfies (i) or (ii). Such finding shall initially be made by a team of one field biologist or other GRSG expert from each respective agency. In the event the initial finding is not unanimous, the finding may be elevated to the appropriate BLM State Director, USFWS State Ecological Services Director, and state wildlife agency head for final resolution. In the event their finding is not unanimous, the exception will not be granted. Approved exceptions will be made publically available at least quarterly.”*

***Issue:***

***Direction:***

**Adaptive Management**

Follow the NPT Adaptive Management Guidance and Sideboards. When a hard trigger is hit in a BSU, the designated response will be put in place in that BSU. Triggers and responses have been developed with local state and FWS experts.

When a hard trigger is hit in a BSU within a PAC that has multiple BSUs, including those that cross state lines, the WAFWA Management Zone Greater Sage-Grouse Conservation Team will convene to determine the causal factor, put project level responses in place, as appropriate and discuss further appropriate actions to be applied. The team will also

investigate the status of the hard triggers in other BSUs within the PAC and will invoke the appropriate plan response. Adoption of any further actions at the plan level may require initiating a plan amendment process.

**Issue:**

**Direction:**

**Application of Lek Buffers**

The ADPP will require the use of lek buffer-distances for all new BLM-managed and BLM-authorized anthropogenic disturbances in both GHMA and PHMA (see Attachment IV) through this drop-in Chapter 2 language:

*“In undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will apply the lek buffer-distances identified in the USGS Report Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review (Open File Report 2014-1239) in accordance with Appendix X.”*

Allocation Direction

\*Southwest Montana will follow the allocations designated for the MT ADPP

## Attachment I

# GREATER SAGE-GROUSE RMPA/FEIS TEMPLATE LANGUAGE FOR ADDRESSING MITIGATION

[ ] = Instructions

[ ] = Fill in the blank

[This mitigation language addresses greater sage-grouse. However, if you are working on a plan revision, you may need to add additional language to be more inclusive of other resource and value objectives (e.g. cultural resources, national historic trails, recreation values, other special status species) that may need to be mitigated.]

## Chapter 1 - Introduction

[Nothing new to add to EIS]

## Chapter 2 – Alternatives – [Proposed Plan/Proposed Plan Amendment]

- Add these two new sections (below) to the **Chapter 2 Alternatives** section.
- Replace the Regional Mitigation placeholder language that was included in the draft EIS with the new “Mitigation” section, below.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

Consistent with the proposed plan’s goal outlined in [Table 2-X – Description of Alternatives], the intent of the [Proposed Plan/Proposed Plan Amendment] is to provide a net conservation gain to the species. To do so, in undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. This is also consistent with BLM Manual 6840 – Special Status Species Management, Section .02B, which states “to initiate protective conservation measures that reduce or eliminate threats to Bureau sensitive species to minimize the likelihood of the need for listing of these species under the ESA.”

## Mitigation

*Mitigation Standards.* In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see the concepts of durability, timeliness, and additionality as described further in Appendix X).

*Greater Sage-Grouse Conservation Team.* The BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. This Team will develop a WAFWA Management Zone Regional Mitigation Strategy (hereafter, Regional Mitigation Strategy). The Team will also compile and report on monitoring data (including data on habitat condition, population trends, and mitigation effectiveness) from States across the WAFWA Management Zone (see Monitoring section). Subsequently, the Team will use these data to either modify the appropriate Regional Mitigation Strategy or recommend adaptive management actions (see Adaptive Management section).

The BLM/USFS will invite governmental and Tribal partners to participate in this Team, including the State Wildlife Agency and U.S. Fish and Wildlife Service, in compliance with the exemptions provided for committees defined in the Federal Advisory Committee Act and the regulations that implement that act. The BLM/USFS will strive for a collaborative and unified approach between Federal agencies (e.g. FWS, BLM, and USFS), Tribal governments, state and local government(s), and other stakeholders for greater sage-grouse conservation. The Team will provide advice, and will not make any decisions that impact Federal lands. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

*Developing a Regional Mitigation Strategy.* The Team will develop a Regional Mitigation Strategy to inform the mitigation components of NEPA analyses for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy will be developed within one year of the issuance of the Record of Decision. The BLM's Regional Mitigation Manual MS-1794 will serve as a framework for developing the Regional Mitigation Strategy. The Regional Mitigation Strategy will be applicable to the States/Field Offices/Forests within the WAFWA Management Zone's boundaries.

Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can provide a net conservation gain to the species. The Regional Mitigation Strategy developed by the Team will elaborate on the components identified above (i.e.

avoidance, minimization, and compensation; additionality, timeliness, and durability) and further explained in Appendix [X].

In the time period before the Strategy is developed, BLM will consider regional conditions, trends, and sites, to the greatest extent possible, when applying the mitigation hierarchy and will ensure that mitigation is consistent with the standards set forth in the first paragraph of this section.

*Incorporating the Regional Mitigation Strategy into NEPA Analyses.* The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

*Implementing a Compensatory Mitigation Program.* Consistent with the principles identified above, the BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be implemented at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

### **Chapter 3 – Affected Environment**

[Nothing to add]

### **Chapter 4 – Environmental Consequences – [Proposed Plan/Proposed Plan Amendment]**

#### **Mitigation**

This Chapter describes the environmental consequences associated with the impacts to greater sage-grouse and its habitat from activities carried out in conformance with this plan, in addition to BLM/USFS management actions. In undertaking BLM/USFS management actions, and consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and

compensating for impacts by applying beneficial mitigation actions. In addition, to help implement this [Proposed Plan / Proposed Plan Amendment], a WAFWA Management Zone Regional Mitigation Strategy (per Appendix [X]) will be developed within one year of the issuance of the Record of Decision. The Strategy will elaborate on the components identified in Chapter 2 (avoidance, minimization, compensation, additionality, timeliness, and durability), and will be considered by the BLM/USFS for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The implementation of a Regional Mitigation Strategy will benefit greater sage-grouse, the public, and land-users by providing a reduction in threats, increased public transparency and confidence, and a predictable permit process for land-use authorization applicants.

### Appendix [X]

- Add this new Appendix.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

### Appendix (X) – Mitigation – [Proposed Plan/Proposed Plan Amendment]

#### General

In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see glossary).

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy that will inform the NEPA decision making process including the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. A robust and transparent Regional Mitigation Strategy will contribute to greater sage-grouse habitat conservation by reducing, eliminating, or minimizing threats and compensating for residual impacts to greater sage-grouse and its habitat.

The BLM's Regional Mitigation Manual MS-1794 serves as a framework for developing and implementing a Regional Mitigation Strategy. The following sections provide additional guidance specific to the development and implementation of a WAFWA Management Zone Regional Mitigation Strategy.

### Developing a WAFWA Management Zone Regional Mitigation Strategy

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy to guide the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy should consider any State-level greater sage-grouse mitigation guidance that is consistent with the requirements identified in this Appendix. The Regional Mitigation Strategy should be developed in a transparent manner, based on the best science available and standardized metrics.

As described in Chapter 2, the BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. The Strategy will be developed within one year of the issuance of the Record of Decision.

The Regional Mitigation Strategy should include mitigation guidance on avoidance, minimization, and compensation, as follows:

- Avoidance
  - Include avoidance areas (e.g. right-of-way avoidance/exclusion areas, no surface occupancy areas) already included in laws, regulations, policies, and/or land use plans (e.g. Resource Management Plans, Forest Plans, State Plans); and,
  - Include any potential, additional avoidance actions (e.g. additional avoidance best management practices) with regard to greater sage-grouse conservation.
- Minimization
  - Include minimization actions (e.g. required design features, best management practices) already included in laws, regulations, policies, land use plans, and/or land-use authorizations; and,
  - Include any potential, additional minimization actions (e.g. additional minimization best management practices) with regard to greater sage-grouse conservation.
- Compensation
  - Include discussion of impact/project valuation, compensatory mitigation options, siting, compensatory project types and costs, monitoring, reporting, and program administration. Each of these topics is discussed in more detail below.
    - Residual Impact and Compensatory Mitigation Project Valuation Guidance
      - A common standardized method should be identified for estimating the value of the residual impacts and value of the compensatory mitigation projects, including accounting for any uncertainty associated with the effectiveness of the projects.

- This method should consider the quality of habitat, scarcity of the habitat, and the size of the impact/project.
- For compensatory mitigation projects, consideration of durability (see glossary), timeliness (see glossary), and the potential for failure (e.g. uncertainty associated with effectiveness) may require an upward adjustment of the valuation.
- The resultant compensatory mitigation project will, after application of the above guidance, result in proactive conservation measures for Greater Sage-grouse (consistent with BLM Manual 6840 – Special Status Species Management, section .02).
- **Compensatory Mitigation Options**
  - Options for implementing compensatory mitigation should be identified, such as:
    - Utilizing certified mitigation/conservation bank or credit exchanges.
    - Contributing to an existing mitigation/conservation fund.
    - Authorized-user conducted mitigation projects.
  - For any compensatory mitigation project, the investment must be additional (i.e. additionality: the conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project).
- **Compensatory Mitigation Siting**
  - Sites should be in areas that have the potential to yield a net conservation gain to the greater sage-grouse, regardless of land ownership.
  - Sites should be durable (see glossary).
  - Sites identified by existing plans and strategies (e.g. fire restoration plans, invasive species strategies, healthy land focal areas) should be considered, if those sites have the potential to yield a net conservation gain to greater sage-grouse and are durable.
- **Compensatory Mitigation Project Types and Costs**
  - Project types should be identified that help reduce threats to greater sage-grouse (e.g. protection, conservation, and restoration projects).
  - Each project type should have a goal and measurable objectives.
  - Each project type should have associated monitoring and maintenance requirements, for the duration of the impact.
  - To inform contributions to a mitigation/conservation fund, expected costs for these project types (and their monitoring and maintenance), within the WAFWA Management Zone, should be identified.
- **Compensatory Mitigation Compliance and Monitoring**
  - Mitigation projects should be inspected to ensure they are implemented as designed, and if not, there should be methods to enforce compliance.
  - Mitigation projects should be monitored to ensure that the goals and objectives are met and that the benefits are effective for the duration of the impact.

- Compensatory Mitigation Reporting
  - Standardized, transparent, scalable, and scientifically-defensible reporting requirements should be identified for mitigation projects.
  - Reports should be compiled, summarized, and reviewed in the WAFWA Management Zone in order to determine if greater sage-grouse conservation has been achieved and/or to support adaptive management recommendations.
- Compensatory Mitigation Program Implementation Guidelines
  - Guidelines for implementing the State-level compensatory mitigation program should include holding and applying compensatory mitigation funds, operating a transparent and credible accounting system, certifying mitigation credits, and managing reporting requirements.

### Incorporating the Regional Mitigation Strategy into NEPA Analyses

The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

### Implementing a Compensatory Mitigation Program

The BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be managed at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

### **Glossary Terms**

**Additionality:** The conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project. (adopted and modified from BLM Manual Section 1794).

**Avoidance mitigation:** Avoiding the impact altogether by not taking a certain action or parts of an action. (40 CFR 1508.20(a)) (e.g. may also include avoiding the impact by moving the proposed action to a different time or location.)

**Compensatory mitigation:** Compensating for the (residual) impact by replacing or providing substitute resources or environments. (40 CFR 1508.20)

**Compensatory mitigation projects:** The [restoration](#), [creation](#), [enhancement](#), and/or [preservation](#) of impacted resources (adopted and modified from 33 CFR 332), such as on-the-ground actions to improve and/or protect habitats (e.g. chemical vegetation treatments, land acquisitions, conservation easements). (adopted and modified from BLM Manual Section 1794).

**Compensatory mitigation sites:** The durable areas where compensatory mitigation projects will occur. (adopted and modified from BLM Manual Section 1794).

**Durability (protective and ecological):** the maintenance of the effectiveness of a mitigation site and project for the duration of the associated impacts, which includes resource, administrative/legal, and financial considerations. (adopted and modified from BLM Manual Section 1794).

**Minimization mitigation:** Minimizing impacts by limiting the degree or magnitude of the action and its implementation. (40 CFR 1508.20 (b))

**Residual impacts:** Impacts that remain after applying avoidance and minimization mitigation; also referred to as unavoidable impacts.

**Timeliness:** The lack of a time lag between impacts and the achievement of compensatory mitigation goals and objectives (BLM Manual Section 1794).

## Attachment II

### **Greater Sage-Grouse (GRSG) Land Use Plans Disturbance Caps Guidance**

#### **Purpose**

- I. Provide the planning units with land use planning actions that need to be incorporated into the administrative draft proposed plans to respond to the 3% disturbance cap once it is exceeded in either the Biologically Significant Units (BSU) or at the project scale.
- II. Provide guidance on the use of the west-wide habitat degradation (disturbance) data layers as well as the use of locally collected disturbance data for BSUs to determine if the disturbance cap has been exceeded as the land use plans (LUP) are being implemented.
- III. Provide guidance on the use of locally collected disturbance data for project authorizations to determine if the disturbance cap has been exceeded as the LUPs are being implemented.
- IV. Provide guidance on the inclusion of fire in disturbance calculations.
- V. Provide guidance on the use of the density of energy and mining facilities during authorizations
- VI. Provide guidance on the use of the BER analysis in the land use plans (Chapter 2, Affected Environment) and the use of the “west-wide” sagebrush availability and habitat degradation data/estimates for the Priority Habitat Management Areas in each population for monitoring and management purposes as the LUPs are being implemented.
- VII. Provide guidance on what is considered in the disturbance calculations versus what is considered for the disturbance cap.

#### **Guidance**

- I. Planning units will include the following land use plan actions within their administrative draft proposed land use plans (ADPPs) that states:
  - a. *If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.) will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.*
  - b. *If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a Priority Habitat Management Areas, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain*

*the area under the cap (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.).*

- II. Use of west-wide habitat degradation data as well as the use of locally collected disturbance data to determine the level of existing disturbance:
  - a) In the GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, use the west-wide data at a minimum and/or locally collected disturbance data as available (e.g., DDCT) for the anthropogenic disturbance types listed in Table 1.
  
- III. Use of locally collected disturbance data for project authorizations:
  - a) In a proposed project analysis area, digitize all existing anthropogenic disturbances identified in the GRSG Monitoring Framework and the 7 additional features that are considered threats to sage-grouse (Table 2). Using 1 meter resolution NAIP imagery is recommended. Use local data if available.
  
- IV. Fire-burned and habitat treatment areas will not be included in the project scale degradation disturbance calculation for managing sage-grouse habitat under a disturbance cap. These areas will be considered part of a sagebrush availability when rangewide, consistent, interagency fine- and site-scale monitoring has been completed and the areas have been determined to meet sage-grouse habitat requirements. These and other disturbances identified in Table 3 will be part of a sagebrush availability evaluation and will be considered along with other local conditions that may affect sage-grouse during the analysis of the proposed project area.
  
- V. Planning units are directed to use a density cap related to the density of energy and mining facilities (listed below) during project scale authorizations. If the disturbance density in a proposed project area is on average less than 1/ 640 acres, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than an average of 1/ 640 acres, either defer the proposed project or co-locate it into existing disturbed area (*subject to applicable laws and regulations, such as the 1872 Mining Law, valid existing rights, etc.*).
  - Energy (oil and gas wells and development facilities)
  - Energy (coal mines)
  - Energy (wind towers)
  - Energy (solar fields)
  - Energy (geothermal)
  - Mining (active locatable, leasable, and saleable developments)

- VI. Planning units are directed to continue using the baseline data from the 2013 USGS Baseline Environmental Report (BER) in the Affected Environment section of the proposed plans/ FEISs. West-wide sagebrush availability and habitat degradation data layers will be used for the Priority Habitat Management Areas in each population for monitoring (see the GRSG Monitoring Framework in the Monitoring Appendix of the EIS) and management purposes as the LUPs are being implemented. The BER reported on individual threats across the range of sage-grouse while the west-wide disturbance calculation consolidated the anthropogenic disturbance data into a single measure using formulas from the GRSG Monitoring Framework. These calculations will be completed on an annual basis by the BLM's National Operation Center. Planning units will be provided the 2014 baseline disturbance calculation derived from the west-wide data once the RODs are signed that describe the Priority Habitat Management Areas.
- VII. Planning units are directed to use the three measures (sagebrush availability, habitat degradation, density of energy and mining) in conjunction with other information during the NEPA process to most effectively site project locations, such as by clustering disturbances and/or locating facilities in already disturbed areas. Although locatable mine sites are included in the degradation calculation, mining activities under the 1872 mining law may not be subject to the 3% disturbance cap. Details about locatable mining activities should be fully disclosed and analyzed in the NEPA process to assess impacts to sage-grouse and their habitat as well as to BLM goals and objectives, and other BLM programs and activities.

### **Additional Information/Formulas**

A collaborative effort in Idaho developed a disturbance calculation method that includes the 3% disturbance cap plus a modifier that includes effective habitat and is described in Appendix G of their ADPP. The formulas below are excerpted from that Appendix.

Disturbance Calculations for the BSU:

$$\text{Disturbance Percentage} = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}^1}{\text{Acres within the BSU} * \left( \frac{\text{Acres of Effective Habitat within the BSU}}{\text{Acres within the BSU}} + 0.3 \right)} \right) \times 100$$

Disturbance Calculations for Project Analysis Areas (PAAs):

$$\text{Disturbance Percentage} = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}^{1,2}}{\text{Acres within the PAA} * \left( \frac{\text{Acres of Effective Habitat within the PAA}}{\text{Acres within the PAA}} + 0.3 \right)} \right) \times 100$$

<sup>1</sup> see Table 3. <sup>2</sup> see Table 2.

Project analysis area (PAA) method for permitting surface disturbance activities:

1. Determine potentially affected occupied leks by placing a four-mile buffer around the project boundary as defined by the proposed area of physical disturbance related to the project. All occupied leks within this buffer will be considered affected by the proposed project.
2. Next place a four mile boundary around each of the occupied leks identified in item 1, above.
3. The polygon formed by the merging and dissolving of polygons from step 1 and 2 creates the Project Analysis Area (PAA) for surface disturbance activities.
4. Map existing disturbances within the analysis area or use locally available spatial data. Use of digitized NAIP imagery is recommended.
5. Calculate percent existing disturbance using the formula above. If existing disturbance is less than 3%, proceed to next step. If existing disturbance is greater than 3%, defer the project.
6. Add proposed project disturbance footprint area and recalculate the percent disturbance. If disturbance is less than 3%, proceed to next step. If disturbance is greater than 3%, defer project.
7. Calculate the disturbance density of energy and mining facilities (listed above). If the disturbance density is less than 1 facility per 640 acres, averaged across project analysis area, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than 1 facility per 640 acres, averaged across the project analysis area, either defer the proposed project or co-locate it into existing disturbed area.
8. If a project that would exceed the degradation cap or density cap cannot be deferred due to valid existing rights or other existing laws and regulations, fully disclose the local and regional impacts of the proposed action in the associated NEPA.

Table 1. Anthropogenic disturbance types for disturbance calculations. Data sources are described for the west-wide habitat degradation estimates (Table copied from the GRSG Monitoring Framework)

<b>Degradation Type</b>	<b>Subcategory</b>	<b>Data Source</b>	<b>Direct Area of Influence</b>	<b>Area Source</b>
<b>Energy (oil &amp; gas)</b>	Wells	IHS; BLM (AFMSS)	5.0ac (2.0ha)	BLM WO-300

Infrastructure (communication towers)		X	
Infrastructure (other vertical structures)		X	
Other developed rights-of-way		X	

## **Background**

In the USFWS's 2010 listing decision for sage-grouse, the USFWS identified 18 threats contributing to the destruction, modification, or curtailment of the sage-grouse's habitat or range (75 FR 13910 2010). In April 2014, the Interagency GRSG Disturbance and Monitoring Sub-Team finalized the Greater Sage-Grouse Monitoring Framework (hereafter, framework) to track these threats. The 18 threats have been aggregated into three measures to account for whether the threat predominantly removes sagebrush or degrades habitat. The three measures are:

Measure 1: Sagebrush Availability (percent of sagebrush per unit area)

Measure 2: Habitat Degradation (percent of human activity per unit area)

Measure 3: Density of Energy and Mining (facilities and locations per unit area)

The BLM is committed to monitoring the three disturbance measures and reporting them to the FWS on an annual basis. However, for the purposes of calculating the amount of disturbance to provide information for management decisions and inform the success of the sage-grouse planning effort, the data depicting the location and extent of the 12 anthropogenic types of threats will be used at a minimum in the BSUs and those same 12 anthropogenic and the additional 7 types of features that are threats to sage-grouse will be used in the project analysis areas.

		Scales		
		Broad/Mid (Populations)	Intermediate (BSU)	Local/Project (Seas. Hab.)
Habitat Degradation	Unit:	WAFWA Populations	Biologically Significant Unit	Project/Local Habitat Area <sup>5</sup>
	Area of Interest:	PHMAs	PHMAs	PHMAs
	Data:	Westwide degradation data	Westwide <sup>3</sup> , State, Local	State, Local
	Formula (Measure 2a):	<u>12 Degradation Threats</u> PHMAs in Populations	<u>12 Degradation Threats</u> PHMAs in BSUs	<u>12 Degradation Threats + 7</u> PHMAs in Proj. <sup>2</sup>
	Management:	Internal BLM & FS estimates	3% Cap, Adapt. Mgmt <sup>4</sup>	3% Disturbance Cap
	All Lands:	Yes	Yes	Yes
	Fire Included:	No	No	No
	Who:	BLM NOC	BLM NOC <sup>3</sup> or State Offices	State Offices or Field Offices
Sagebrush Availability	Unit:	WAFWA Populations	Biologically Significant Unit	n/a
	Area of Interest:	PHMAs	PHMAs	
	Data:	LANDFIRE Updated EVT <sup>1</sup>	Updated EVT or State data	
	Formula (Measure 1a):	<u>Existing Updated Sagebrush</u> PHMAs in Populations	<u>Existing Updated Sagebrush</u> PHMAs in BSUs

	Data:	Westwide well & mine data		Westwide <sup>2</sup> , State data
	Formula (Measure 3):	<u>Well Pds and Mines</u> <sup>1</sup> Square Mile		<u>Well Pds and Mines</u> <sup>1</sup> Square Mile
	Management:	Internal BLM & FS estimates		Project Authorization
	All Lands:	Yes		Yes
	Fire Included:	No		No
	Who:	BLM NOC		BLM NOC or SOs or FOs
<b>ACRONYMS</b>				
PHMA = Priority Habitat Management Area      BSU = Biologically Significant Unit				
EVT = Existing Vegetation Type                      EpS = Areas of Biotic Potential				
<sup>1</sup> Only mines with a Plan of Operation (>5 acres of disturbance) will be included.				
<sup>2</sup> Westwide data will be used only if state or local data are not available.				
<sup>3</sup> This footnote was removed from the table. January 2015.				
<sup>4</sup> This may be one of several variables used to inform Adaptive Management. The BSU is the scale at which Adaptive Management will be applied.				
<sup>5</sup> A moving window analysis will be conducted at this scale by the NOC using westwide data. If available, state and local data/analysis should be used for Adaptive Management				
<sup>6</sup> The project analysis area will be based on a 4-mile radius polygon around the project area combined with a 4-mile buffer around any leaks within the project boundary in PHMA (Idaho methodology).				
<sup>7</sup> See Table 2				

## Attachment III

### **Greater Sage-Grouse (GRSG) Land Use Plans Vegetation Objectives Guidance**

#### **Purpose**

- I. Provide the planning units with land use planning vegetation objectives that need to be incorporated into the administrative draft proposed plans.
- II. Provide guidance on the use of a template for GRSG habitat objectives in the Special Status Species section of the ADPPs.
- III. Provide guidance on prioritizing land health assessments in sage-grouse habitats and conducting assessments at the watershed scale using the sage-grouse habitat objectives.

#### **Guidance**

- I. Planning units will include the following land use plan vegetation objective within the Vegetation section of their administrative draft proposed land use plans (ADPPs) that states:

*In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).*
- II. Planning units will populate the GRSG Habitat Objectives table template to provide vegetation objectives for sage-grouse life history stages based on the ecology in your region to be used to meet the applicable land health standard in GRSG habitats. Planning units are encouraged to work across boundaries when developing the objectives to ensure regional continuity and will provide appropriate peer-reviewed science to support the habitat values for the indicators. These desired condition value can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%). Planning units may include additional indicators and desired condition values as appropriate (see the Sage-Grouse Habitat Assessment Framework (HAF, *Technical Reference 6710-1*) for appropriate indicators). The HAF contains values for habitat suitability indicators in sage-grouse seasonal habitats from the Connelly et al. (2000) sage-grouse guidelines and has incorporated many of the core indicators in the AIM strategy (Toevs et al. 2011) as well. Planning units may use the indicator values from Connelly et al. (2000) while developing the land use plan Sage-Grouse Habitat Objectives table.

When using the indicators to guide management actions or during land health assessments, consider that the indicators are sensitive to the ecological processes operating at the scale of interest and that a single habitat indicator does not necessarily define habitat suitability for an area or particular scale. Indicators must be collectively reviewed, assessed based on the site potential, and put into spatial and temporal context to correctly determine habitat suitability which will include more than one scale and multiple indicators. Assessment and evaluation of these objectives will follow the steps described in the HAF.

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP and is to be used as a minimum to meet the applicable land health standard in sage-grouse habitats.

Greater Sage-Grouse Habitat Objectives

ATTRIBUTE	INDICATORS	DESIRED CONDITION	Reference
<b>BREEDING AND NESTING (Seasonal Use Period March 1-June 15)</b>			
Lek Security	Proximity of trees		
	Proximity of sagebrush to leks		
Cover	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover		
	Sagebrush height Arid sites Mesic sites		
	Predominant sagebrush shape		
	Perennial grass cover Arid sites Mesic sites		
	Perennial grass and forb height		
	Perennial forb canopy cover Arid sites Mesic sites		
<b>BROOD-REARING/SUMMER<sup>1</sup> (Seasonal Use Period June 16-October 31)</b>			
Cover	% of Seasonal habitat meeting desired condition		
	Sagebrush canopy cover		
	Sagebrush height		
	Perennial grass canopy cover and forbs		
	Riparian areas/mesic meadows		
	Upland and riparian perennial forb availability		
<b>WINTER<sup>1</sup> (Seasonal Use Period November 1-February 28)</b>			
Cover and Food	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover above snow		
	Sagebrush height above snow		

- III. The BLM will prioritize land health assessments in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. Field offices are to conduct land health assessments at the watershed scale and use the GRSG habitat objectives when assessing the applicable standard in GRSG habitats.

When conducting land health assessments, the BLM should follow, at a minimum, “Interpreting Indicators of Rangeland Health” (Pellant et. al. 2005) and the “BLM Core Terrestrial Indicators and Methods” (MacKinnon et al. 2011). For assessments being conducted in GRSG designated management areas, the BLM should collect additional data to inform the HAF indicators that have not been collected using the above methods. Implementation of the principles outlined in the AIM strategy will allow the data to be used to generate unbiased estimates of condition across the area of interest; facilitate consistent data collection and rollup analysis among management units; help provide consistent data to inform the classification and interpretation of imagery; and provide condition and trend of the indicators describing sagebrush characteristics important to sage-grouse habitat.

## Attachment IV

### **Incorporating GSGR RMP Decisions into Grazing Authorizations**

#### **Purpose**

The purpose is to provide recommended ADPP language; outline the process for prioritizing the review and processing of grazing permits/leases to determine if modification is necessary (prior to renewal and in accordance with prioritization criteria); provide direction for including specific management thresholds and defined responses that will allow adjustments to livestock grazing within the terms and conditions of permits; and provide a process for prioritizing compliance monitoring within Sagebrush Focal Areas (SFAs) and Priority Habitat Management Areas (PHMAs).

#### **Background**

The BLM manages approximately 18,000 livestock grazing permits and leases on the public lands. Livestock grazing is an integral part of the BLM multiple-use mission and is authorized by the Taylor Grazing Act (1934), the Federal Land Policy Management Act (1976) and the Public Rangeland Improvement Act (1978). By statute and regulation, grazing leases and permits are normally issued for 10-year periods. Annually, a range of 1,200 to 3,200 grazing permits expire and the BLM receives 500 to 1,500 grazing permit/lease transfer requests.

The BLM currently issues permits/leases in accordance with:

- All applicable law, regulation, policy (NEPA, consultation, proposed/final grazing decision-also known as a fully processed permit); or
- Various appropriation authorities enacted between 1999 and 2014 extending terms and conditions of expiring or transferred permits/leases that the BLM is unable to fully process before their expiration; or
- Section 402(c)(2) of FLPMA (as amended by Public Law 113-291, enacted December 19, 2014).

Congress has acted to ensure that grazing permittees could continue to graze if the BLM is unable to complete the environmental analysis mandated by the NEPA and other applicable laws. Since 1999, a provision (“the rider”) has been included in the Interior Appropriations bill that, in various forms, generally authorizes the BLM to renew grazing permits and leases under their same terms and conditions until it fully processes the permit renewal in compliance with NEPA, ESA, and other legal or regulatory requirements. The most recent rider is contained in Section 411, Public Law 113-76.<sup>1</sup> The FLPMA amendment to Section 402 (c) allows BLM to renew

---

<sup>1</sup> The Consolidated Appropriations Act, 2014 includes the provision Section 411 which states: “Section 415 of division E of Public Law 112–74 is amended by striking “and 2013” and inserting “through 2015.” The terms and conditions of section 325 of Public Law 108-108 (117 stat. 1307), regarding permits at the Department of the Interior and the Forest Service, shall remain in effect through fiscal year 2015. A grazing permit or lease issued by the Secretary of the Interior for lands administered by the Bureau of Land Management that is the subject of a request for a grazing preference transfer shall be issued, without further processing, for the remaining time period in

grazing permits and leases under the same terms and conditions. This relieves the BLM's renewal processing workload, allowing the BLM to prioritize permit processing based on sensitivity of the resources at issue.<sup>2</sup>

The BLM may modify terms and conditions of a permit or lease at any time following completion of appropriate analysis and consultation, cooperation, and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public.<sup>3</sup> Under 43 C.F.R. 4160.1, the BLM must serve a proposed decision on any affected applicant, permittee or lessee, any agent and lien holder of record. Copies of the decisions are provided to the interested publics.

**Recommended Language to be incorporated as Livestock Grazing Management Actions within the GRSG ADPPs:**

- The BLM will prioritize the review of grazing permits/leases, including those prior to renewal to determine if modification is necessary, and processing of grazing permits and leases, in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource conditions (ex., fire) and legal obligations.
- The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.
- Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to

---

the existing permit or lease using the same mandatory terms and conditions. If the authorized officer determines a change in the mandatory terms and conditions is required, the new permit must be processed as directed in section 325 of Public Law 108-108.” Where a FO is unable to fully process a permit renewal in compliance with all applicable laws prior to the permit expiration, Section 411 extends the authority to renew the grazing permit with the same terms and conditions as the expiring permit. Section 325 provides the process for authorizing grazing until a permit or lease is issued in compliance with all applicable law and regulatory processes.

<sup>2</sup> The newly amended section 402(c) of FLPMA provides permanent authority to BLM to renew expiring permits. That section states, “The terms and conditions in a grazing permit or lease that has expired, or was terminated due to a grazing preference transfer, shall be continued under a new permit or lease until the date on which the Secretary concerned completes any environmental analysis and documentation for the permit or lease required under the National Environmental Policy Act of 1969 (42 U.S.C. 4321 et seq.) and other applicable laws.”

<sup>3</sup> 43 CFR 4130.3-3 states: Following consultation, cooperation and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public, the authorized officer may modify terms and conditions of the permit or lease when the active grazing use or related management practices are not meeting the land use plan, allotment management plan or other activity plan, or management objectives, or is not in conformance with the provisions of subpart 4180 (Fundamentals of Rangeland Health and Standards and Guidelines for Grazing Administration).

help ensure compliance with the terms and conditions within the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.

- At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

### **Addressing GRSG RMP Amendments/Revisions Objectives in Grazing Permits/Leases**

BLM will develop criteria to prioritize the workload to process permits/leases (either fully processed or reauthorized based on the Appropriations rider, or issued under Section 402(c)(2) of FLPMA) and determine whether modification is necessary prior to renewal within PHMAs, beginning with those in SFAs. In setting priorities, those containing riparian areas and areas not meeting Land Health Standards (43 C.F.R. 4180) will take precedence. Potential criteria for prioritizing permit modifications could include:

- Are there riparian areas or wet meadows in the permit/lease area?
- Was current livestock grazing identified as a causal factor for not meeting Land Health Standards?
- Since the last allotment/watershed evaluation, is there current monitoring information to determine that the watershed/allotment is currently achieving or making significant progress towards achieving land health standards?
- Does the permit have terms and conditions adequate to ensure proper grazing practices to meet GRSG habitat objectives found in the Special Status Species section of the land use plan?
- Is there data that indicates that the GRSG habitat objectives, including the Habitat Objectives table, found in the Special Status Species section of the land use plan are being met?
- Is there a request from the permittee to modify the terms and conditions of his/her permit?

Additionally, if an existing permit/lease within PHMAs requires modification because current grazing is a significant causal factor for not meeting the Land Health Standards, the BLM will prepare the appropriate NEPA analysis and issue the proposed/final grazing decision under 43 C.F.R. Subpart 4160, subject to administrative appeal and potential judicial challenge.

The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA. Adjustments to meet seasonal Sage-Grouse habitat requirements could include:

- Season or timing of use;
- Numbers of livestock (includes temporary non-use or livestock removal);
- Distribution of livestock use;
- Intensity of use; and
- Type of livestock (e.g., cattle, sheep, horses, llamas, alpacas and goats).

## **Compliance Monitoring**

The BLM will monitor grazing permits/leases renewed or modified in accordance with the direction contained in this guidance as follows: Allotments within SFAs, followed by those in other PHMA, and focusing on those with riparian areas, will be prioritized for monitoring to ensure compliance with the terms and conditions in the permits. The BLM will collect, at a minimum, the following monitoring data:

- Vegetation Condition
- Actual Use
- Utilization
- Use Supervision

## **Concerning Voluntary Relinquishments**

All ADPPs will include the following language:

At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

For completing this, BLM offices should use [WO IM 2013-184 Relinquishment of Grazing Permitted Use](#) or the most recent policy guidance.

Attachment V

**Applying Lek Buffer-Distances When Approving Actions**

- *Buffer Distances and Evaluation of Impacts to Leks*

Evaluate impacts to leks from actions requiring NEPA analysis. In addition to any other relevant information determined to be appropriate (e.g. State wildlife agency plans), the BLM will assess and address impacts from the following activities using the lek buffer-distances as identified in the USGS Report *Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review* ([Open File Report 2014-1239](#)). The BLM will apply the lek buffer-distances specified as the lower end of the interpreted range in the report unless justifiable departures are determined to be appropriate (see below). The lower end of the interpreted range of the lek buffer-distances is as follows:

  - linear features (roads) within 3.1 miles of leks
  - infrastructure related to energy development within 3.1 miles of leks.
  - tall structures (e.g., communication or transmission towers, transmission lines) within 2 miles of leks.
  - low structures (e.g., fences, rangeland structures) within 1.2 miles of leks.
  - surface disturbance (continuing human activities that alter or remove the natural vegetation) within 3.1 miles of leks.
  - noise and related disruptive activities including those that do not result in habitat loss (e.g., motorized recreational events) at least 0.25 miles from leks.

Justifiable departures to decrease or increase from these distances, based on local data, best available science, landscape features, and other existing protections (e.g., land use allocations, state regulations) may be appropriate for determining activity impacts. The USGS report recognized “that because of variation in populations, habitats, development patterns, social context, and other factors, for a particular disturbance type, there is no single distance that is an appropriate buffer for all populations and habitats across the sage-grouse range”. The USGS report also states that “various protection measures have been developed and implemented... [which have] the ability (alone or in concert with others) to protect important habitats, sustain populations, and support multiple-use demands for public lands”. All variations in lek buffer-distances will require appropriate analysis and disclosure as part of activity authorization.

In determining lek locations, the BLM will use the most recent active or occupied lek data available from the state wildlife agency.

- *For Actions in GHMA*

The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis.

  - Impacts should first be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.
  - If it is not possible to relocate the project outside of the applicable lek buffer-distance(s) identified above, the BLM may approve the project only if:
    - Based on best available science, landscape features, and other existing protections, (e.g., land use allocations, state regulations), the BLM determines that a lek buffer-distance other than the applicable distance identified above offers the same or a greater

level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area; or

- The BLM determines that impacts to GRSG and its habitat are minimized such that the project will cause minor or no new disturbance (ex. co-location with existing authorizations); and
- Any residual impacts within the lek buffer-distances are addressed through compensatory mitigation measures sufficient to ensure a net conservation gain, as outlined in the Mitigation Strategy (Appendix X).

- *For Actions in PHMA*

The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis. Impacts should be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.

The BLM may approve actions in PHMA that are within the applicable lek buffer distance identified above only if:

- The BLM, with input from the state fish and wildlife agency, determines, based on best available science, landscape features, and other existing protections, that a buffer distance other than the distance identified above offers the same or greater level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area.
- The BLM will explain its justification for determining the approved buffer distances meet these conditions in its project decision.

**BLM-IDAHO****Greater Sage-Grouse Planning Issues for the BLM Planning Teams to Insert and Analyze in Administrative Draft Proposed Plan (ADPP)****January 30, 2015**

*The March 4, 2010 decision by the U.S. Fish and Wildlife Service that the greater sage-grouse warranted listing but was precluded [Endangered and Threatened Wildlife and Plants; 12-Month Findings for Petitions to list the Greater Sage-Grouse (*Centrocercus urophasianus*) as Threatened or Endangered] set in motion the most comprehensive land-use planning initiative in the BLM's history.*

*In 2011, the BLM began updating land-use plans across the West so as to ensure not only the long-term viability of the greater sage-grouse on public lands and the continued economic vitality of the West. This has been a complex and demanding process involving collaboration with an unprecedented number of stakeholders, including Governors, State Fish and Game agencies, the U.S. Fish and Wildlife Service and many others. The BLM's mandate of multiple use and sustained yield has required us to balance the full range of resource uses on public lands, including the conservation of crucial wildlife habitat. As we have worked through this process, public land managers throughout the BLM have made difficult resource management decisions.*

*These documents provide key guidance that will enable the BLM to finalize land use plans that will contribute to the conservation of the Greater Sage-Grouse and other sagebrush associated species across the West. The guidance outlines a suite of tools, such as disturbance limits in key habitats and mitigation approaches, which will help us to reach this goal. These mechanisms will work in concert to conserve sage-grouse habitat so that we can achieve our twin goals of thriving Greater Sage-Grouse populations and robust Western economies.*

**Issue:****Development in Highly Important Landscapes****Direction:**

As more specifically provided in this guidance, the ADPP will include Sagebrush Focal Areas (SFA), consisting of the BLM and FS-managed lands within the area depicted in the October 27, 2014 USFWS memo, *Greater Sage-Grouse: Additional Recommendation to Refine Land Use Allocations in Highly Important Landscapes*. In the Special Status Species Section of Chapter 2, include the following management action drop in language (for the Proposed Plan only):

*“Designate Sagebrush Focal Areas (SFA) as shown on Map X (x acres). SFAs will be managed as PHMA, with the following additional management:*

- 1) Recommended for withdrawal from the General Mining Act of 1872, subject to valid existing rights.*
- 2) Managed as NSO, without waiver, exception, or modification, for fluid mineral leasing.*

- 3) *Prioritized for management and conservation actions in these areas, including, but not limited to review of livestock grazing permits/leases (see livestock grazing section for additional actions)."*

**The NOC will provide updated shapefiles that delineate the SFAs.**

Except as otherwise provided below, the ADPP will provide that all BLM- and FS-managed lands (including subsurface) within SFAs will be allocated and managed as PHMA and include the management actions above.

- *Do Not Include the following in SFA Management*
  - Hawley Mountain WSA (ID), Shoshone WSA (ID), Cedar Buttes WSA (ID), Lower Salmon Falls Creek (ID), Little Jack Wilderness (ID), Bruneau-Jarbidge Wilderness (ID) in non-habitat – The current management in these areas is generally protective of GRSG. As applicable, these will continue to be managed so as not to impair their suitability for preservation as wilderness, or under the terms of the Wilderness Act to preserve wilderness character.
    - To the extent that these areas were analyzed for contingent management as general or priority habitat, the ADPP will include contingent allocations and management direction that would apply in the event that Congress releases the areas from WSA status
  - Non-habitat areas outside Little Jack and Bruneau-Jarbidge Wilderness and Salmon Falls Creek ACEC which were previously shown within the SFA –These areas will not be managed as PHMA or SFA.
- Do Include Forest Service Lost River Mountains North (~5,000 acres) Area and South Area (~6,000 acres)– these areas will be treated as PHMA, with the SFA management actions for this FS-land.
- Do Include Donkey Hills ACEC –In order to consolidate parcels for protection as SFAs, this area will be treated as PHMA and included for SFA management.
- *Do Not Include Other Agency Land in SFA Management* – while lands managed by other agencies will be shown on the SFA maps, BLM ADPP decisions will not be applied to them.
- *Do Not Include Private/State Lands in SFA Management* – while private lands may be within the SFA boundaries, ADPP decisions will not be applied to them, but may apply to Federal subsurface underlying such lands as provided below.
- *Subsurface Estate:*
  - Under private/state lands: subsurface estate in PHMA and GHMA should be treated as PHMA with SFA management actions.

- Under other Federal lands: subsurface state should be treated as PHMA with SFA management actions if it is not already withdrawn (such as in Refuges or Parks) and PHMA or GHMA management was analyzed in the DEIS.

Additional direction/drop in language for the ADPPs on SFAs will be forthcoming.

**Issue:**

**Direction:**

**Mitigation**

The ADPP will include the updated Mitigation Framework (Attachment I) and drop-in Chapter 2 language to reflect the following language:

*“In all sage-grouse habitat, in undertaking BLM management actions, and, consistent with valid existing rights and applicable law, in authorizing third-party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions.”*

**Issue:**

**Direction:**

**Mapping**

Not Applicable

**Issue:**

**Direction:**

**Disturbance**

Per the original April 2014 NPT guidance on disturbance, the ADPP will use the 3% disturbance cap at the Biologically Significant Unit (BSU) and project scale. The density calculation (an average of 1 facility per 640 acres) applies to energy and mining facilities. The disturbance cap will not be applied to foreclose development of locatable minerals on unpatented claims located under the 1872 Mining Law; the disturbance from locatable mining will be accounted for in determining the percent disturbance and whether the cap has been exceeded. BLM-ID will use the disturbance calculation methodology developed prior to this guidance (see Attachment II).

Planning units will include the following land use plan actions within their ADPPs that states:

- a. If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSB Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid*

*existing rights, etc.) will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.*

- b. *If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a Priority Habitat Management Areas, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain the area under the cap (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.).*

**Issue:**

**Direction:**

**Vegetation Objectives**

The ADPP will establish and incorporate vegetation and GRSG habitat objectives (see Attachment III for specific guidance and a GRSG Habitat Objectives Table template that follows the Sage-Grouse Habitat Assessment Framework Technical Reference-6710-1). The vegetation and GRSG habitat objectives guidance states that the values for the desired conditions in the GRSG Habitat Objectives Table are to be used, at a minimum, to meet the applicable land health standard in sage-grouse habitats. Planning units may include additional indicators and desired condition values as appropriate. The desired condition value for each indicator can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%).

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP. The vegetation objective should be placed in the Vegetation section of the ADPP. Planning units will include the following land use plan vegetation objective within the Vegetation section of their ADPPs:

*In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).*

**Issue:**

**Direction:**

**Livestock Grazing**

The following management actions will be included in the Livestock Grazing section of the ADPP.

- *The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting Land Health Standards, with focus on those containing riparian areas,*

*including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (ex., fire) and legal obligations.*

- *The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.*
- *Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.*
- *At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.*

Attachment III provides guidance as to how the BLM will incorporate GRGS decisions from the Sage-Grouse RMP/Amendments into grazing permits/leases.

***Issue:***

***Direction:***

**Mineral Materials (Salable Minerals)**

All Priority Habitat Management Areas will be closed to mineral materials development. All Important Habitat Management Areas and General Habitat Management Areas will be open to mineral materials development, consistent with the Idaho Anthropogenic Disturbance Criteria.

***Issue:***

***Direction:***

**High-voltage Transmission and Major Pipeline ROWs and Corridors**

1) Apply the recommended NPT allocation guidance for PHMA of avoidance.

2) GHMA will remain open. BLM-ID will employ a location and design process to ensure protection.

3) For sub-regions that have planned priority transmission lines that traverse their planning area (Gateway West, Boardman to Hemingway, and TransWest Express, including those portions of Gateway South that

are co-located), apply the following language as a management action in their ADPP:

*“Priority Habitat Management Areas (PHMAs) and General Habitat Management Areas (GHMAs) are designated as avoidance areas for high voltage transmission line ROWs, except for the transmission projects specifically identified below. All authorizations in these areas, other than the excepted projects, must comply with the conservation measures outlined in this proposed plan, including the RDFs and avoidance criteria presented in [insert citation here] of this document. The BLM is currently processing an application for [Insert name of transmission project] and the NEPA review for this project is well underway. The BLM is analyzing GRSG mitigation measures through the project’s NEPA review process, which will include analysis of the following conservations measures.”*

**Issue:** Coal Suitability  
**Direction:** Not Applicable in Idaho

**Issue:** Fluid Mineral Resources (Including Geothermal)  
**Direction:** All ADPPs will include the following as a conservation objective:

*“Priority will be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMA and GHMA. When analyzing leasing and authorizing development of fluid mineral resources, including geothermal, in PHMA and GHMA, and subject to applicable stipulations for the conservation of Greater Sage-Grouse, priority will be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-Grouse. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 U.S.C. 226(p) and 43 C.F.R. 3162.3-1(h).”*

*“Where a proposed fluid mineral development project on an existing lease could adversely affect GRSG populations or habitat, the BLM will work with the lessees, operators, or other project proponents to avoid, reduce and mitigate adverse impacts to the extent compatible with lessees' rights to drill and produce fluid mineral resources. The BLM will work with the lessee, operator, or project proponent in developing an APD for the lease to avoid and minimize impacts to sage-grouse or its habitat and will ensure that the best information about the GRSG and its habitat informs and helps to guide development of such Federal leases.”*

**Issue:** No Surface Occupancy (NSO) Exception Language  
**Direction:** Follow NPT guidance for Priority Habitat Management Areas. No-surface-occupancy stipulations will be included in new fluid mineral

leases at the time of leasing only and may not be applied to existing fluid mineral leases that did not include no-surface-occupancy stipulation at the time of leasing. Include the following language into the ADPP:

*“No waivers or modifications to a fluid mineral lease no-surface-occupancy stipulation will be granted. The Authorized Officer may grant an exception to a fluid mineral lease no-surface-occupancy stipulation only where the proposed action:*

- (i) Would not have direct, indirect, or cumulative effects on GRSG or its habitat; or,*
- (ii) Is proposed to be undertaken as an alternative to a similar action occurring on a nearby parcel, and would provide a clear conservation gain to GRSG.*

*Exceptions based on conservation gain (ii) may only be considered in (a) PHMAs of mixed ownership where federal minerals underlie less than fifty percent of the total surface, or (b) areas of the public lands where the proposed exception is an alternative to an action occurring on a nearby parcel subject to a valid Federal fluid mineral lease existing as of the date of this RMP [revision or amendment]. Exceptions based on conservation gain must also include measures, such as enforceable institutional controls and buffers, sufficient to allow the BLM to conclude that such benefits will endure for the duration of the proposed action’s impacts.*

*Any exceptions to this lease stipulation may be approved by the Authorized Officer only with the concurrence of the State Director. The Authorized Officer may not grant an exception unless the applicable state wildlife agency, the USFWS, and the BLM unanimously find that the proposed action satisfies (i) or (ii). Such finding shall initially be made by a team of one field biologist or other GRSG expert from each respective agency. In the event the initial finding is not unanimous, the finding may be elevated to the appropriate BLM State Director, USFWS State Ecological Services Director, and state wildlife agency head for final resolution. In the event their finding is not unanimous, the exception will not be granted. Approved exceptions will be made publically available at least quarterly.”*

**Issue:**

**Direction:**

**Adaptive Management**

Follow the NPT Adaptive Management Guidance and Sideboards. When a hard trigger is hit in a BSU, the designated response will be put in place in that BSU. Triggers and responses have been developed with local state and FWS experts.

When a hard trigger is hit in a BSU within a PAC that has multiple BSUs, including those that cross state lines, the WAFWA Management Zone Greater Sage-Grouse Conservation Team will convene to determine the causal factor, put project level responses in place, as appropriate and discuss further appropriate actions to be applied. The team will also investigate the status of the hard triggers in other BSUs within the PAC and will invoke the appropriate plan response. Adoption of any further actions at the plan level may require initiating a plan amendment process.

***Issue:***

***Direction:***

**Application of Lek Buffers**

The ADPP will require the use of lek buffer-distances for all new BLM-managed and BLM-authorized anthropogenic disturbances in both GHMA and PHMA (see Attachment IV) through this drop-in Chapter 2 language:

*“In undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will apply the lek buffer-distances identified in the USGS Report Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review ([Open File Report 2014-1239](#)) in accordance with Appendix X.”*

Allocation Direction

\*Southwest Montana will follow the allocations designated for the MT ADPP

## Attachment I

# GREATER SAGE-GROUSE RMPA/FEIS TEMPLATE LANGUAGE FOR ADDRESSING MITIGATION

[Red box] = Instructions

[Yellow box] = Fill in the blank

[This mitigation language addresses greater sage-grouse. However, if you are working on a plan revision, you may need to add additional language to be more inclusive of other resource and value objectives (e.g. cultural resources, national historic trails, recreation values, other special status species) that may need to be mitigated.]

## Chapter 1 - Introduction

[Nothing new to add to EIS]

## Chapter 2 – Alternatives – [Proposed Plan/Proposed Plan Amendment]

- Add these two new sections (below) to the **Chapter 2 Alternatives** section.
- Replace the Regional Mitigation placeholder language that was included in the draft EIS with the new “Mitigation” section, below.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

Consistent with the proposed plan’s goal outlined in [Table 2-X – Description of Alternatives], the intent of the [Proposed Plan/Proposed Plan Amendment] is to provide a net conservation gain to the species. To do so, in undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. This is also consistent with BLM Manual 6840 – Special Status Species Management, Section .02B, which states “to initiate protective conservation measures that reduce or eliminate threats to Bureau sensitive species to minimize the likelihood of the need for listing of these species under the ESA.”

## Mitigation

*Mitigation Standards.* In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see the concepts of durability, timeliness, and additionality as described further in Appendix X).

*Greater Sage-Grouse Conservation Team.* The BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. This Team will develop a WAFWA Management Zone Regional Mitigation Strategy (hereafter, Regional Mitigation Strategy). The Team will also compile and report on monitoring data (including data on habitat condition, population trends, and mitigation effectiveness) from States across the WAFWA Management Zone (see Monitoring section). Subsequently, the Team will use these data to either modify the appropriate Regional Mitigation Strategy or recommend adaptive management actions (see Adaptive Management section).

The BLM/USFS will invite governmental and Tribal partners to participate in this Team, including the State Wildlife Agency and U.S. Fish and Wildlife Service, in compliance with the exemptions provided for committees defined in the Federal Advisory Committee Act and the regulations that implement that act. The BLM/USFS will strive for a collaborative and unified approach between Federal agencies (e.g. FWS, BLM, and USFS), Tribal governments, state and local government(s), and other stakeholders for greater sage-grouse conservation. The Team will provide advice, and will not make any decisions that impact Federal lands. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

*Developing a Regional Mitigation Strategy.* The Team will develop a Regional Mitigation Strategy to inform the mitigation components of NEPA analyses for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy will be developed within one year of the issuance of the Record of Decision. The BLM's Regional Mitigation Manual MS-1794 will serve as a framework for developing the Regional Mitigation Strategy. The Regional Mitigation Strategy will be applicable to the States/Field Offices/Forests within the WAFWA Management Zone's boundaries.

Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can provide a net conservation gain to the species. The Regional Mitigation Strategy developed by the Team will elaborate on the components identified above (i.e.

avoidance, minimization, and compensation; additionality, timeliness, and durability) and further explained in Appendix [X].

In the time period before the Strategy is developed, BLM will consider regional conditions, trends, and sites, to the greatest extent possible, when applying the mitigation hierarchy and will ensure that mitigation is consistent with the standards set forth in the first paragraph of this section.

*Incorporating the Regional Mitigation Strategy into NEPA Analyses.* The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

*Implementing a Compensatory Mitigation Program.* Consistent with the principles identified above, the BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be implemented at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

### **Chapter 3 – Affected Environment**

[Nothing to add]

### **Chapter 4 – Environmental Consequences – [Proposed Plan/Proposed Plan Amendment]**

#### **Mitigation**

This Chapter describes the environmental consequences associated with the impacts to greater sage-grouse and its habitat from activities carried out in conformance with this plan, in addition to BLM/USFS management actions. In undertaking BLM/USFS management actions, and consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and

compensating for impacts by applying beneficial mitigation actions. In addition, to help implement this [Proposed Plan / Proposed Plan Amendment], a WAFWA Management Zone Regional Mitigation Strategy (per Appendix [X]) will be developed within one year of the issuance of the Record of Decision. The Strategy will elaborate on the components identified in Chapter 2 (avoidance, minimization, compensation, additionality, timeliness, and durability), and will be considered by the BLM/USFS for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The implementation of a Regional Mitigation Strategy will benefit greater sage-grouse, the public, and land-users by providing a reduction in threats, increased public transparency and confidence, and a predictable permit process for land-use authorization applicants.

### Appendix [X]

- Add this new Appendix.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

### Appendix (X) – Mitigation – [Proposed Plan/Proposed Plan Amendment]

#### General

In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see glossary).

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy that will inform the NEPA decision making process including the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. A robust and transparent Regional Mitigation Strategy will contribute to greater sage-grouse habitat conservation by reducing, eliminating, or minimizing threats and compensating for residual impacts to greater sage-grouse and its habitat.

The BLM's Regional Mitigation Manual MS-1794 serves as a framework for developing and implementing a Regional Mitigation Strategy. The following sections provide additional guidance specific to the development and implementation of a WAFWA Management Zone Regional Mitigation Strategy.

### Developing a WAFWA Management Zone Regional Mitigation Strategy

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy to guide the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy should consider any State-level greater sage-grouse mitigation guidance that is consistent with the requirements identified in this Appendix. The Regional Mitigation Strategy should be developed in a transparent manner, based on the best science available and standardized metrics.

As described in Chapter 2, the BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. The Strategy will be developed within one year of the issuance of the Record of Decision.

The Regional Mitigation Strategy should include mitigation guidance on avoidance, minimization, and compensation, as follows:

- Avoidance
  - Include avoidance areas (e.g. right-of-way avoidance/exclusion areas, no surface occupancy areas) already included in laws, regulations, policies, and/or land use plans (e.g. Resource Management Plans, Forest Plans, State Plans); and,
  - Include any potential, additional avoidance actions (e.g. additional avoidance best management practices) with regard to greater sage-grouse conservation.
- Minimization
  - Include minimization actions (e.g. required design features, best management practices) already included in laws, regulations, policies, land use plans, and/or land-use authorizations; and,
  - Include any potential, additional minimization actions (e.g. additional minimization best management practices) with regard to greater sage-grouse conservation.
- Compensation
  - Include discussion of impact/project valuation, compensatory mitigation options, siting, compensatory project types and costs, monitoring, reporting, and program administration. Each of these topics is discussed in more detail below.
    - Residual Impact and Compensatory Mitigation Project Valuation Guidance
      - A common standardized method should be identified for estimating the value of the residual impacts and value of the compensatory mitigation projects, including accounting for any uncertainty associated with the effectiveness of the projects.

- This method should consider the quality of habitat, scarcity of the habitat, and the size of the impact/project.
- For compensatory mitigation projects, consideration of durability (see glossary), timeliness (see glossary), and the potential for failure (e.g. uncertainty associated with effectiveness) may require an upward adjustment of the valuation.
- The resultant compensatory mitigation project will, after application of the above guidance, result in proactive conservation measures for Greater Sage-grouse (consistent with BLM Manual 6840 – Special Status Species Management, section .02).
- **Compensatory Mitigation Options**
  - Options for implementing compensatory mitigation should be identified, such as:
    - Utilizing certified mitigation/conservation bank or credit exchanges.
    - Contributing to an existing mitigation/conservation fund.
    - Authorized-user conducted mitigation projects.
  - For any compensatory mitigation project, the investment must be additional (i.e. additionality: the conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project).
- **Compensatory Mitigation Siting**
  - Sites should be in areas that have the potential to yield a net conservation gain to the greater sage-grouse, regardless of land ownership.
  - Sites should be durable (see glossary).
  - Sites identified by existing plans and strategies (e.g. fire restoration plans, invasive species strategies, healthy land focal areas) should be considered, if those sites have the potential to yield a net conservation gain to greater sage-grouse and are durable.
- **Compensatory Mitigation Project Types and Costs**
  - Project types should be identified that help reduce threats to greater sage-grouse (e.g. protection, conservation, and restoration projects).
  - Each project type should have a goal and measurable objectives.
  - Each project type should have associated monitoring and maintenance requirements, for the duration of the impact.
  - To inform contributions to a mitigation/conservation fund, expected costs for these project types (and their monitoring and maintenance), within the WAFWA Management Zone, should be identified.
- **Compensatory Mitigation Compliance and Monitoring**
  - Mitigation projects should be inspected to ensure they are implemented as designed, and if not, there should be methods to enforce compliance.
  - Mitigation projects should be monitored to ensure that the goals and objectives are met and that the benefits are effective for the duration of the impact.

- Compensatory Mitigation Reporting
  - Standardized, transparent, scalable, and scientifically-defensible reporting requirements should be identified for mitigation projects.
  - Reports should be compiled, summarized, and reviewed in the WAFWA Management Zone in order to determine if greater sage-grouse conservation has been achieved and/or to support adaptive management recommendations.
- Compensatory Mitigation Program Implementation Guidelines
  - Guidelines for implementing the State-level compensatory mitigation program should include holding and applying compensatory mitigation funds, operating a transparent and credible accounting system, certifying mitigation credits, and managing reporting requirements.

### Incorporating the Regional Mitigation Strategy into NEPA Analyses

The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

### Implementing a Compensatory Mitigation Program

The BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be managed at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

### **Glossary Terms**

**Additionality:** The conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project. (adopted and modified from BLM Manual Section 1794).

**Avoidance mitigation:** Avoiding the impact altogether by not taking a certain action or parts of an action. (40 CFR 1508.20(a)) (e.g. may also include avoiding the impact by moving the proposed action to a different time or location.)

**Compensatory mitigation:** Compensating for the (residual) impact by replacing or providing substitute resources or environments. (40 CFR 1508.20)

**Compensatory mitigation projects:** The [restoration](#), [creation](#), [enhancement](#), and/or [preservation](#) of impacted resources (adopted and modified from 33 CFR 332), such as on-the-ground actions to improve and/or protect habitats (e.g. chemical vegetation treatments, land acquisitions, conservation easements). (adopted and modified from BLM Manual Section 1794).

**Compensatory mitigation sites:** The durable areas where compensatory mitigation projects will occur. (adopted and modified from BLM Manual Section 1794).

**Durability (protective and ecological):** the maintenance of the effectiveness of a mitigation site and project for the duration of the associated impacts, which includes resource, administrative/legal, and financial considerations. (adopted and modified from BLM Manual Section 1794).

**Minimization mitigation:** Minimizing impacts by limiting the degree or magnitude of the action and its implementation. (40 CFR 1508.20 (b))

**Residual impacts:** Impacts that remain after applying avoidance and minimization mitigation; also referred to as unavoidable impacts.

**Timeliness:** The lack of a time lag between impacts and the achievement of compensatory mitigation goals and objectives (BLM Manual Section 1794).

## Attachment II

### **Greater Sage-Grouse (GRSG) Land Use Plans Disturbance Caps Guidance**

#### **Purpose**

- I. Provide the planning units with land use planning actions that need to be incorporated into the administrative draft proposed plans to respond to the 3% disturbance cap once it is exceeded in either the Biologically Significant Units (BSU) or at the project scale.
- II. Provide guidance on the use of the west-wide habitat degradation (disturbance) data layers as well as the use of locally collected disturbance data for BSUs to determine if the disturbance cap has been exceeded as the land use plans (LUP) are being implemented.
- III. Provide guidance on the use of locally collected disturbance data for project authorizations to determine if the disturbance cap has been exceeded as the LUPs are being implemented.
- IV. Provide guidance on the inclusion of fire in disturbance calculations.
- V. Provide guidance on the use of the density of energy and mining facilities during authorizations
- VI. Provide guidance on the use of the BER analysis in the land use plans (Chapter 2, Affected Environment) and the use of the “west-wide” sagebrush availability and habitat degradation data/estimates for the Priority Habitat Management Areas in each population for monitoring and management purposes as the LUPs are being implemented.
- VII. Provide guidance on what is considered in the disturbance calculations versus what is considered for the disturbance cap.

#### **Guidance**

- I. Planning units will include the following land use plan actions within their administrative draft proposed land use plans (ADPPs) that states:
  - a. *If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.) will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.*
  - b. *If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a Priority Habitat Management Areas, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain*

*the area under the cap (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.).*

- II. Use of west-wide habitat degradation data as well as the use of locally collected disturbance data to determine the level of existing disturbance:
  - a) In the GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, use the west-wide data at a minimum and/or locally collected disturbance data as available (e.g., DDCT) for the anthropogenic disturbance types listed in Table 1.
  
- III. Use of locally collected disturbance data for project authorizations:
  - a) In a proposed project analysis area, digitize all existing anthropogenic disturbances identified in the GRSG Monitoring Framework and the 7 additional features that are considered threats to sage-grouse (Table 2). Using 1 meter resolution NAIP imagery is recommended. Use local data if available.
  
- IV. Fire-burned and habitat treatment areas will not be included in the project scale degradation disturbance calculation for managing sage-grouse habitat under a disturbance cap. These areas will be considered part of a sagebrush availability when rangewide, consistent, interagency fine- and site-scale monitoring has been completed and the areas have been determined to meet sage-grouse habitat requirements. These and other disturbances identified in Table 3 will be part of a sagebrush availability evaluation and will be considered along with other local conditions that may affect sage-grouse during the analysis of the proposed project area.
  
- V. Planning units are directed to use a density cap related to the density of energy and mining facilities (listed below) during project scale authorizations. If the disturbance density in a proposed project area is on average less than 1/ 640 acres, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than an average of 1/ 640 acres, either defer the proposed project or co-locate it into existing disturbed area (*subject to applicable laws and regulations, such as the 1872 Mining Law, valid existing rights, etc.*).
  - Energy (oil and gas wells and development facilities)
  - Energy (coal mines)
  - Energy (wind towers)
  - Energy (solar fields)
  - Energy (geothermal)
  - Mining (active locatable, leasable, and saleable developments)

- VI. Planning units are directed to continue using the baseline data from the 2013 USGS Baseline Environmental Report (BER) in the Affected Environment section of the proposed plans/ FEISs. West-wide sagebrush availability and habitat degradation data layers will be used for the Priority Habitat Management Areas in each population for monitoring (see the GRSG Monitoring Framework in the Monitoring Appendix of the EIS) and management purposes as the LUPs are being implemented. The BER reported on individual threats across the range of sage-grouse while the west-wide disturbance calculation consolidated the anthropogenic disturbance data into a single measure using formulas from the GRSG Monitoring Framework. These calculations will be completed on an annual basis by the BLM's National Operation Center. Planning units will be provided the 2014 baseline disturbance calculation derived from the west-wide data once the RODs are signed that describe the Priority Habitat Management Areas.
- VII. Planning units are directed to use the three measures (sagebrush availability, habitat degradation, density of energy and mining) in conjunction with other information during the NEPA process to most effectively site project locations, such as by clustering disturbances and/or locating facilities in already disturbed areas. Although locatable mine sites are included in the degradation calculation, mining activities under the 1872 mining law may not be subject to the 3% disturbance cap. Details about locatable mining activities should be fully disclosed and analyzed in the NEPA process to assess impacts to sage-grouse and their habitat as well as to BLM goals and objectives, and other BLM programs and activities.

### **Additional Information/Formulas**

A collaborative effort in Idaho developed a disturbance calculation method that includes the 3% disturbance cap plus a modifier that includes effective habitat and is described in Appendix G of their ADPP. The formulas below are excerpted from that Appendix.

Disturbance Calculations for the BSU:

$$\begin{aligned} & \text{Disturbance Percentage} \\ & = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}^1}{\text{Acres within the BSU} * \left( \frac{\text{Acres of Effective Habitat within the BSU}}{\text{Acres within the BSU}} + 0.3 \right)} \right) \times 100 \end{aligned}$$

Disturbance Calculations for Project Analysis Areas (PAAs):

$$\text{Disturbance Percentage} = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}^{1,2}}{\text{Acres within the PAA} * \left( \frac{\text{Acres of Effective Habitat within the PAA}}{\text{Acres within the PAA}} + 0.3 \right)} \right) \times 100$$

<sup>1</sup> see Table 3. <sup>2</sup> see Table 2.

Project analysis area (PAA) method for permitting surface disturbance activities:

1. Determine potentially affected occupied leks by placing a four-mile buffer around the project boundary as defined by the proposed area of physical disturbance related to the project. All occupied leks within this buffer will be considered affected by the proposed project.
2. Next place a four mile boundary around each of the occupied leks identified in item 1, above.
3. The polygon formed by the merging and dissolving of polygons from step 1 and 2 creates the Project Analysis Area (PAA) for surface disturbance activities.
4. Map existing disturbances within the analysis area or use locally available spatial data. Use of digitized NAIP imagery is recommended.
5. Calculate percent existing disturbance using the formula above. If existing disturbance is less than 3%, proceed to next step. If existing disturbance is greater than 3%, defer the project.
6. Add proposed project disturbance footprint area and recalculate the percent disturbance. If disturbance is less than 3%, proceed to next step. If disturbance is greater than 3%, defer project.
7. Calculate the disturbance density of energy and mining facilities (listed above). If the disturbance density is less than 1 facility per 640 acres, averaged across project analysis area, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than 1 facility per 640 acres, averaged across the project analysis area, either defer the proposed project or co-locate it into existing disturbed area.
8. If a project that would exceed the degradation cap or density cap cannot be deferred due to valid existing rights or other existing laws and regulations, fully disclose the local and regional impacts of the proposed action in the associated NEPA.

Table 1. Anthropogenic disturbance types for disturbance calculations. Data sources are described for the west-wide habitat degradation estimates (Table copied from the GRSG Monitoring Framework)

<b>Degradation Type</b>	<b>Subcategory</b>	<b>Data Source</b>	<b>Direct Area of Influence</b>	<b>Area Source</b>
<b>Energy (oil &amp; gas)</b>	Wells	IHS; BLM (AFMSS)	5.0ac (2.0ha)	BLM WO-300

Infrastructure (power lines)		X	
Infrastructure (communication towers)		X	
Infrastructure (other vertical structures)		X	
Other developed rights-of-way		X	

## **Background**

In the USFWS's 2010 listing decision for sage-grouse, the USFWS identified 18 threats contributing to the destruction, modification, or curtailment of the sage-grouse's habitat or range (75 FR 13910 2010). In April 2014, the Interagency GRSG Disturbance and Monitoring Sub-Team finalized the Greater Sage-Grouse Monitoring Framework (hereafter, framework) to track these threats. The 18 threats have been aggregated into three measures to account for whether the threat predominantly removes sagebrush or degrades habitat. The three measures are:

Measure 1: Sagebrush Availability (percent of sagebrush per unit area)

Measure 2: Habitat Degradation (percent of human activity per unit area)

Measure 3: Density of Energy and Mining (facilities and locations per unit area)

The BLM is committed to monitoring the three disturbance measures and reporting them to the FWS on an annual basis. However, for the purposes of calculating the amount of disturbance to provide information for management decisions and inform the success of the sage-grouse planning effort, the data depicting the location and extent of the 12 anthropogenic types of threats will be used at a minimum in the BSUs and those same 12 anthropogenic and the additional 7 types of features that are threats to sage-grouse will be used in the project analysis areas.

		Scales		
		Broad/Mid (Populations)	Intermediate (BSU)	Local/Project (Seas. Hab.)
Habitat Degradation	Unit:	WAFWA Populations	Biologically Significant Unit	Project/Local Habitat Area <sup>5</sup>
	Area of Interest:	PHMAs	PHMAs	PHMAs
	Data:	Westwide degradation data	Westwide <sup>3</sup> , State, Local	State, Local
	Formula (Measure 2a):	<u>12 Degradation Threats</u> PHMAs in Populations	<u>12 Degradation Threats</u> PHMAs in BSUs	<u>12 Degradation Threats + 7<sup>7</sup></u> PHMAs in Proj. <sup>2</sup>
	Management:	Internal BLM & FS estimates	3% Cap, Adapt. Mgmt <sup>4</sup>	3% Disturbance Cap
	All Lands:	Yes	Yes	Yes
	Fire Included:	No	No	No
	Who:	BLM NOC	BLM NOC <sup>3</sup> or State Offices	State Offices or Field Offices
Sagebrush Availability	Unit:	WAFWA Populations	Biologically Significant Unit	n/a

Energy and Mining	Unit:	WAFWA Populations	n/a	Project Area & Seasonal Hab.
	Area of Interest:	PHMAs		PHMAs
	Data:	Westwide well & mine data		Westwide <sup>2</sup> , State data
	Formula (Measure 3):	<u>Well Pds and Mines<sup>1</sup></u> Square Mile		<u>Well Pds and Mines<sup>1</sup></u> Square Mile
	Management:	Internal BLM & FS estimates		Project Authorization
	All Lands:	Yes		Yes
	Fire Included:	No		No
	Who:	BLM NOC		BLM NOC or SOs or FOs
<b>ACRONYMS</b>				
PHMA = Priority Habitat Management Area      BSU = Biologically Significant Unit				
EVT = Existing Vegetation Type                      EpS = Areas of Biotic Potential				
<sup>1</sup> Only mines with a Plan of Operation (>5 acres of disturbance) will be included.				
<sup>2</sup> Westwide data will be used only if state or local data are not available.				
<sup>3</sup> This footnote was removed from the table. January 2015.				
<sup>4</sup> This may be one of several variables used to inform Adaptive Management. The BSU is the scale at which Adaptive Management will be applied.				
<sup>5</sup> A moving window analysis will be conducted at this scale by the NOC using westwide data. If available, state and local data/analysis should be used for Adaptive Management				
<sup>6</sup> The project analysis area will be based on a 4-mile radius polygon around the project area combined with a 4-mile buffer around any leaks within the project boundary in PHMA (Idaho methodology).				
<sup>7</sup> See Table 2				

## Attachment III

### **Greater Sage-Grouse (GRSG) Land Use Plans Vegetation Objectives Guidance**

#### **Purpose**

- I. Provide the planning units with land use planning vegetation objectives that need to be incorporated into the administrative draft proposed plans.
- II. Provide guidance on the use of a template for GRSG habitat objectives in the Special Status Species section of the ADPPs.
- III. Provide guidance on prioritizing land health assessments in sage-grouse habitats and conducting assessments at the watershed scale using the sage-grouse habitat objectives.

#### **Guidance**

- I. Planning units will include the following land use plan vegetation objective within the Vegetation section of their administrative draft proposed land use plans (ADPPs) that states:

*In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).*
- II. Planning units will populate the GRSG Habitat Objectives table template to provide vegetation objectives for sage-grouse life history stages based on the ecology in your region to be used to meet the applicable land health standard in GRSG habitats. Planning units are encouraged to work across boundaries when developing the objectives to ensure regional continuity and will provide appropriate peer-reviewed science to support the habitat values for the indicators. These desired condition value can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%). Planning units may include additional indicators and desired condition values as appropriate (see the Sage-Grouse Habitat Assessment Framework (HAF, *Technical Reference 6710-1*) for appropriate indicators). The HAF contains values for habitat suitability indicators in sage-grouse seasonal habitats from the Connelly et al. (2000) sage-grouse guidelines and has incorporated many of the core indicators in the AIM strategy (Toevs et al. 2011) as well. Planning units may use the indicator values from Connelly et al. (2000) while developing the land use plan Sage-Grouse Habitat Objectives table.

When using the indicators to guide management actions or during land health assessments, consider that the indicators are sensitive to the ecological processes operating at the scale of interest and that a single habitat indicator does not necessarily define habitat suitability for an area or particular scale. Indicators must be collectively reviewed, assessed based on the site potential, and put into spatial and temporal context to correctly determine habitat suitability which will include more than one scale and multiple indicators. Assessment and evaluation of these objectives will follow the steps described in the HAF.

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP and is to be used as a minimum to meet the applicable land health standard in sage-grouse habitats.

Greater Sage-Grouse Habitat Objectives

ATTRIBUTE	INDICATORS	DESIRED CONDITION	Reference
<b>BREEDING AND NESTING (Seasonal Use Period March 1-June 15)</b>			
Lek Security	Proximity of trees		
	Proximity of sagebrush to leks		
Cover	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover		
	Sagebrush height Arid sites Mesic sites		
	Predominant sagebrush shape		
	Perennial grass cover Arid sites Mesic sites		
	Perennial grass and forb height		
	Perennial forb canopy cover Arid sites Mesic sites		
<b>BROOD-REARING/SUMMER<sup>1</sup> (Seasonal Use Period June 16-October 31)</b>			
Cover	% of Seasonal habitat meeting desired condition		
	Sagebrush canopy cover		
	Sagebrush height		
	Perennial grass canopy cover and forbs		
	Riparian areas/mesic meadows		
	Upland and riparian perennial forb availability		
<b>WINTER<sup>1</sup> (Seasonal Use Period November 1-February 28)</b>			
Cover and Food	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover above snow		
	Sagebrush height above snow		

- III. The BLM will prioritize land health assessments in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. Field offices are to conduct land health assessments at the watershed scale and use the GRSG habitat objectives when assessing the applicable standard in GRSG habitats.

When conducting land health assessments, the BLM should follow, at a minimum, “Interpreting Indicators of Rangeland Health” (Pellant et. al. 2005) and the “BLM Core Terrestrial Indicators and Methods” (MacKinnon et al. 2011). For assessments being conducted in GRSG designated management areas, the BLM should collect additional data to inform the HAF indicators that have not been collected using the above methods. Implementation of the principles outlined in the AIM strategy will allow the data to be used to generate unbiased estimates of condition across the area of interest; facilitate consistent data collection and rollup analysis among management units; help provide consistent data to inform the classification and interpretation of imagery; and provide condition and trend of the indicators describing sagebrush characteristics important to sage-grouse habitat.

## Attachment IV

### **Incorporating GSGR RMP Decisions into Grazing Authorizations**

#### **Purpose**

The purpose is to provide recommended ADPP language; outline the process for prioritizing the review and processing of grazing permits/leases to determine if modification is necessary (prior to renewal and in accordance with prioritization criteria); provide direction for including specific management thresholds and defined responses that will allow adjustments to livestock grazing within the terms and conditions of permits; and provide a process for prioritizing compliance monitoring within Sagebrush Focal Areas (SFAs) and Priority Habitat Management Areas (PHMAs).

#### **Background**

The BLM manages approximately 18,000 livestock grazing permits and leases on the public lands. Livestock grazing is an integral part of the BLM multiple-use mission and is authorized by the Taylor Grazing Act (1934), the Federal Land Policy Management Act (1976) and the Public Rangeland Improvement Act (1978). By statute and regulation, grazing leases and permits are normally issued for 10-year periods. Annually, a range of 1,200 to 3,200 grazing permits expire and the BLM receives 500 to 1,500 grazing permit/lease transfer requests.

The BLM currently issues permits/leases in accordance with:

- All applicable law, regulation, policy (NEPA, consultation, proposed/final grazing decision-also known as a fully processed permit); or
- Various appropriation authorities enacted between 1999 and 2014 extending terms and conditions of expiring or transferred permits/leases that the BLM is unable to fully process before their expiration; or
- Section 402(c)(2) of FLPMA (as amended by Public Law 113-291, enacted December 19, 2014).

Congress has acted to ensure that grazing permittees could continue to graze if the BLM is unable to complete the environmental analysis mandated by the NEPA and other applicable laws. Since 1999, a provision (“the rider”) has been included in the Interior Appropriations bill that, in various forms, generally authorizes the BLM to renew grazing permits and leases under their same terms and conditions until it fully processes the permit renewal in compliance with NEPA, ESA, and other legal or regulatory requirements. The most recent rider is contained in Section 411, Public Law 113-76.<sup>1</sup> The FLPMA amendment to Section 402 (c) allows BLM to renew

---

<sup>1</sup> The Consolidated Appropriations Act, 2014 includes the provision Section 411 which states: “Section 415 of division E of Public Law 112–74 is amended by striking “and 2013” and inserting “through 2015.” The terms and conditions of section 325 of Public Law 108-108 (117 stat. 1307), regarding permits at the Department of the Interior and the Forest Service, shall remain in effect through fiscal year 2015. A grazing permit or lease issued by the Secretary of the Interior for lands administered by the Bureau of Land Management that is the subject of a request for a grazing preference transfer shall be issued, without further processing, for the remaining time period in

grazing permits and leases under the same terms and conditions. This relieves the BLM's renewal processing workload, allowing the BLM to prioritize permit processing based on sensitivity of the resources at issue.<sup>2</sup>

The BLM may modify terms and conditions of a permit or lease at any time following completion of appropriate analysis and consultation, cooperation, and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public.<sup>3</sup> Under 43 C.F.R. 4160.1, the BLM must serve a proposed decision on any affected applicant, permittee or lessee, any agent and lien holder of record. Copies of the decisions are provided to the interested publics.

### **Recommended Language to be incorporated as Livestock Grazing Management Actions within the GRSG ADPPs:**

- The BLM will prioritize the review of grazing permits/leases, including those prior to renewal to determine if modification is necessary, and processing of grazing permits and leases, in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource conditions (ex., fire) and legal obligations.
- The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.
- Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to

---

the existing permit or lease using the same mandatory terms and conditions. If the authorized officer determines a change in the mandatory terms and conditions is required, the new permit must be processed as directed in section 325 of Public Law 108-108.” Where a FO is unable to fully process a permit renewal in compliance with all applicable laws prior to the permit expiration, Section 411 extends the authority to renew the grazing permit with the same terms and conditions as the expiring permit. Section 325 provides the process for authorizing grazing until a permit or lease is issued in compliance with all applicable law and regulatory processes.

<sup>2</sup> The newly amended section 402(c) of FLPMA provides permanent authority to BLM to renew expiring permits. That section states, “The terms and conditions in a grazing permit or lease that has expired, or was terminated due to a grazing preference transfer, shall be continued under a new permit or lease until the date on which the Secretary concerned completes any environmental analysis and documentation for the permit or lease required under the National Environmental Policy Act of 1969 (42 U.S.C. 4321 et seq.) and other applicable laws.”

<sup>3</sup> 43 CFR 4130.3-3 states: Following consultation, cooperation and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public, the authorized officer may modify terms and conditions of the permit or lease when the active grazing use or related management practices are not meeting the land use plan, allotment management plan or other activity plan, or management objectives, or is not in conformance with the provisions of subpart 4180 (Fundamentals of Rangeland Health and Standards and Guidelines for Grazing Administration).

help ensure compliance with the terms and conditions within the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.

- At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

### **Addressing GRSG RMP Amendments/Revisions Objectives in Grazing Permits/Leases**

BLM will develop criteria to prioritize the workload to process permits/leases (either fully processed or reauthorized based on the Appropriations rider, or issued under Section 402(c)(2) of FLPMA) and determine whether modification is necessary prior to renewal within PHMAs, beginning with those in SFAs. In setting priorities, those containing riparian areas and areas not meeting Land Health Standards (43 C.F.R. 4180) will take precedence. Potential criteria for prioritizing permit modifications could include:

- Are there riparian areas or wet meadows in the permit/lease area?
- Was current livestock grazing identified as a causal factor for not meeting Land Health Standards?
- Since the last allotment/watershed evaluation, is there current monitoring information to determine that the watershed/allotment is currently achieving or making significant progress towards achieving land health standards?
- Does the permit have terms and conditions adequate to ensure proper grazing practices to meet GRSG habitat objectives found in the Special Status Species section of the land use plan?
- Is there data that indicates that the GRSG habitat objectives, including the Habitat Objectives table, found in the Special Status Species section of the land use plan are being met?
- Is there a request from the permittee to modify the terms and conditions of his/her permit?

Additionally, if an existing permit/lease within PHMAs requires modification because current grazing is a significant causal factor for not meeting the Land Health Standards, the BLM will prepare the appropriate NEPA analysis and issue the proposed/final grazing decision under 43 C.F.R. Subpart 4160, subject to administrative appeal and potential judicial challenge.

The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA. Adjustments to meet seasonal Sage-Grouse habitat requirements could include:

- Season or timing of use;
- Numbers of livestock (includes temporary non-use or livestock removal);
- Distribution of livestock use;
- Intensity of use; and
- Type of livestock (e.g., cattle, sheep, horses, llamas, alpacas and goats).

## **Compliance Monitoring**

The BLM will monitor grazing permits/leases renewed or modified in accordance with the direction contained in this guidance as follows: Allotments within SFAs, followed by those in other PHMA, and focusing on those with riparian areas, will be prioritized for monitoring to ensure compliance with the terms and conditions in the permits. The BLM will collect, at a minimum, the following monitoring data:

- Vegetation Condition
- Actual Use
- Utilization
- Use Supervision

## **Concerning Voluntary Relinquishments**

All ADPPs will include the following language:

At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

For completing this, BLM offices should use [WO IM 2013-184 Relinquishment of Grazing Permitted Use](#) or the most recent policy guidance.

Attachment V

**Applying Lek Buffer-Distances When Approving Actions**

- *Buffer Distances and Evaluation of Impacts to Leks*

Evaluate impacts to leks from actions requiring NEPA analysis. In addition to any other relevant information determined to be appropriate (e.g. State wildlife agency plans), the BLM will assess and address impacts from the following activities using the lek buffer-distances as identified in the USGS Report *Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review* ([Open File Report 2014-1239](#)). The BLM will apply the lek buffer-distances specified as the lower end of the interpreted range in the report unless justifiable departures are determined to be appropriate (see below). The lower end of the interpreted range of the lek buffer-distances is as follows:

  - linear features (roads) within 3.1 miles of leks
  - infrastructure related to energy development within 3.1 miles of leks.
  - tall structures (e.g., communication or transmission towers, transmission lines) within 2 miles of leks.
  - low structures (e.g., fences, rangeland structures) within 1.2 miles of leks.
  - surface disturbance (continuing human activities that alter or remove the natural vegetation) within 3.1 miles of leks.
  - noise and related disruptive activities including those that do not result in habitat loss (e.g., motorized recreational events) at least 0.25 miles from leks.

Justifiable departures to decrease or increase from these distances, based on local data, best available science, landscape features, and other existing protections (e.g., land use allocations, state regulations) may be appropriate for determining activity impacts. The USGS report recognized “that because of variation in populations, habitats, development patterns, social context, and other factors, for a particular disturbance type, there is no single distance that is an appropriate buffer for all populations and habitats across the sage-grouse range”. The USGS report also states that “various protection measures have been developed and implemented... [which have] the ability (alone or in concert with others) to protect important habitats, sustain populations, and support multiple-use demands for public lands”. All variations in lek buffer-distances will require appropriate analysis and disclosure as part of activity authorization.

In determining lek locations, the BLM will use the most recent active or occupied lek data available from the state wildlife agency.

- *For Actions in GHMA*

The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis.

  - Impacts should first be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.
  - If it is not possible to relocate the project outside of the applicable lek buffer-distance(s) identified above, the BLM may approve the project only if:
    - Based on best available science, landscape features, and other existing protections, (e.g., land use allocations, state regulations), the BLM determines that a lek buffer-distance other than the applicable distance identified above offers the same or a greater

level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area; or

- The BLM determines that impacts to GRSG and its habitat are minimized such that the project will cause minor or no new disturbance (ex. co-location with existing authorizations); and
- Any residual impacts within the lek buffer-distances are addressed through compensatory mitigation measures sufficient to ensure a net conservation gain, as outlined in the Mitigation Strategy (Appendix X).

- *For Actions in PHMA*

The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis. Impacts should be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.

The BLM may approve actions in PHMA that are within the applicable lek buffer distance identified above only if:

- The BLM, with input from the state fish and wildlife agency, determines, based on best available science, landscape features, and other existing protections, that a buffer distance other than the distance identified above offers the same or greater level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area.
- The BLM will explain its justification for determining the approved buffer distances meet these conditions in its project decision.

Draft Internal Working Document- Not For Distribution -Pre-Decisional Deliberative Document

**BLM-IDAHO**

**Greater Sage-Grouse Planning Issues for the BLM Planning Teams to Insert and Analyze in Administrative Draft Proposed Plan (ADPP)**

**January 30, 2015**

*The March 4, 2010 decision by the U.S. Fish and Wildlife Service that the greater sage-grouse warranted listing but was precluded [Endangered and Threatened Wildlife and Plants; 12-Month Findings for Petitions to list the Greater Sage-Grouse (*Centrocercus urophasianus*) as Threatened or Endangered] set in motion the most comprehensive land-use planning initiative in the BLM's history.*

*In 2011, the BLM began updating land-use plans across the West so as to ensure not only the long-term viability of the greater sage-grouse on public lands and the continued economic vitality of the West. This has been a complex and demanding process involving collaboration with an unprecedented number of stakeholders, including Governors, State Fish and Game agencies, the U.S. Fish and Wildlife Service and many others. The BLM's mandate of multiple use and sustained yield has required us to balance the full range of resource uses on public lands, including the conservation of crucial wildlife habitat. As we have worked through this process, public land managers throughout the BLM have made difficult resource management decisions.*

*These documents provide key guidance that will enable the BLM to finalize land use plans that will contribute to the conservation of the Greater Sage-Grouse and other sagebrush associated species across the West. The guidance outlines a suite of tools, such as disturbance limits in key habitats and mitigation approaches, which will help us to reach this goal. These mechanisms will work in concert to conserve sage-grouse habitat so that we can achieve our twin goals of thriving Greater Sage-Grouse populations and robust Western economies.*

**Issue:**

**Development in Highly Important Landscapes**

**Direction:**

As more specifically provided in this guidance, the ADPP will include Sagebrush Focal Areas (SFA), consisting of the BLM and FS-managed lands within the area depicted in the October 27, 2014 USFWS memo, *Greater Sage-Grouse: Additional Recommendation to Refine Land Use Allocations in Highly Important Landscapes*. In the Special Status Species Section of Chapter 2, include the following management action drop in language (for the Proposed Plan only):

*“Designate Sagebrush Focal Areas (SFA) as shown on Map X (x acres). SFAs will be managed as PHMA, with the following additional management:*

- 1) Recommended for withdrawal from the General Mining Act of 1872, subject to valid existing rights.*
- 2) Managed as NSO, without waiver, exception, or modification, for fluid mineral leasing.*

- 3) *Prioritized for management and conservation actions in these areas, including, but not limited to review of livestock grazing permits/leases (see livestock grazing section for additional actions)."*

**The NOC will provide updated shapefiles that delineate the SFAs.**

Except as otherwise provided below, the ADPP will provide that all BLM- and FS-managed lands (including subsurface) within SFAs will be allocated and managed as PHMA and include the management actions above.

- *Do Not Include the following in SFA Management*
  - Hawley Mountain WSA (ID), Shoshone WSA (ID), Cedar Buttes WSA (ID), Lower Salmon Falls Creek (ID), Little Jack Wilderness (ID), Bruneau-Jarbidge Wilderness (ID) in non-habitat – The current management in these areas is generally protective of GRSG. As applicable, these will continue to be managed so as not to impair their suitability for preservation as wilderness, or under the terms of the Wilderness Act to preserve wilderness character.
    - To the extent that these areas were analyzed for contingent management as general or priority habitat, the ADPP will include contingent allocations and management direction that would apply in the event that Congress releases the areas from WSA status
  - Non-habitat areas outside Little Jack and Bruneau-Jarbidge Wilderness and Salmon Falls Creek ACEC which were previously shown within the SFA –These areas will not be managed as PHMA or SFA.
- Do Include Forest Service Lost River Mountains North (~5,000 acres) Area and South Area (~6,000 acres)– these areas will be treated as PHMA, with the SFA management actions for this FS-land.
- Do Include Donkey Hills ACEC –In order to consolidate parcels for protection as SFAs, this area will be treated as PHMA and included for SFA management.
- *Do Not Include Other Agency Land in SFA Management* – while lands managed by other agencies will be shown on the SFA maps, BLM ADPP decisions will not be applied to them.
- *Do Not Include Private/State Lands in SFA Management* – while private lands may be within the SFA boundaries, ADPP decisions will not be applied to them, but may apply to Federal subsurface underlying such lands as provided below.
- *Subsurface Estate:*
  - Under private/state lands: subsurface estate in PHMA and GHMA should be treated as PHMA with SFA management actions.

- Under other Federal lands: subsurface state should be treated as PHMA with SFA management actions if it is not already withdrawn (such as in Refuges or Parks) and PHMA or GHMA management was analyzed in the DEIS.

Additional direction/drop in language for the ADPPs on SFAs will be forthcoming.

**Issue:**  
**Direction:**

**Mitigation**

The ADPP will include the updated Mitigation Framework (Attachment I) and drop-in Chapter 2 language to reflect the following language:

*“In all sage-grouse habitat, in undertaking BLM management actions, and, consistent with valid existing rights and applicable law, in authorizing third-party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions.”*

**Issue:**  
**Direction:**

**Mapping**

Not Applicable

**Issue:**  
**Direction:**

**Disturbance**

Per the original April 2014 NPT guidance on disturbance, the ADPP will use the 3% disturbance cap at the Biologically Significant Unit (BSU) and project scale. The density calculation (an average of 1 facility per 640 acres) applies to energy and mining facilities. The disturbance cap will not be applied to foreclose development of locatable minerals on unpatented claims located under the 1872 Mining Law; the disturbance from locatable mining will be accounted for in determining the percent disturbance and whether the cap has been exceeded. BLM-ID will use the disturbance calculation methodology developed prior to this guidance (see Attachment II).

Planning units will include the following land use plan actions within their ADPPs that states:

- a. If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSB Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid*

- existing rights, etc.) will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.*
- b. If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a Priority Habitat Management Areas, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain the area under the cap (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.).*

**Issue:**

**Direction:**

**Vegetation Objectives**

The ADPP will establish and incorporate vegetation and GRSG habitat objectives (see Attachment III for specific guidance and a GRSG Habitat Objectives Table template that follows the Sage-Grouse Habitat Assessment Framework Technical Reference-6710-1). The vegetation and GRSG habitat objectives guidance states that the values for the desired conditions in the GRSG Habitat Objectives Table are to be used, at a minimum, to meet the applicable land health standard in sage-grouse habitats. Planning units may include additional indicators and desired condition values as appropriate. The desired condition value for each indicator can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%).

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP. The vegetation objective should be placed in the Vegetation section of the ADPP. Planning units will include the following land use plan vegetation objective within the Vegetation section of their ADPPs:

*In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).*

**Issue:**

**Direction:**

**Livestock Grazing**

The following management actions will be included in the Livestock Grazing section of the ADPP.

- *The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting Land Health Standards, with focus on those containing riparian areas,*

*including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (ex., fire) and legal obligations.*

- *The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.*
- *Alloments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.*
- *At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.*

Attachment III provides guidance as to how the BLM will incorporate GRGS decisions from the Sage-Grouse RMP/Amendments into grazing permits/leases.

**Issue:**

**Mineral Materials (Salable Minerals)**

**Direction:**

All Priority Habitat Management Areas will be closed to mineral materials development. All Important Habitat Management Areas and General Habitat Management Areas will be open to mineral materials development, consistent with the Idaho Anthropogenic Disturbance Criteria.

**Issue:**

**High-voltage Transmission and Major Pipeline ROWs and Corridors**

**Direction:**

- 1) Apply the recommended NPT allocation guidance for PHMA of avoidance.
- 2) GHMA will remain open. BLM-ID will employ a location and design process to ensure protection.
- 3) For sub-regions that have planned priority transmission lines that traverse their planning area (Gateway West, Boardman to Hemingway, and TransWest Express, including those portions of Gateway South that

are co-located), apply the following language as a management action in their ADPP:

*“Priority Habitat Management Areas (PHMAs) and ~~General Important Habitat~~ Management Areas (~~GHMAs~~IHMAs) are designated as avoidance areas for high voltage transmission line ROWs, except for the transmission projects specifically identified below. All authorizations in these areas, other than the excepted projects, must comply with the conservation measures outlined in this proposed plan, including the RDFs and avoidance criteria presented in [insert citation here] of this document. The BLM is currently processing an application for [Insert name of transmission project] and the NEPA review for this project is well underway. The BLM is analyzing GRSG mitigation measures through the project’s NEPA review process, which will include analysis of the following conservation measures.”*

**Commented [jmbeck1]:** This has already been fixed.

**Issue:** Coal Suitability  
**Direction:** Not Applicable in Idaho

**Issue:** Fluid Mineral Resources (Including Geothermal)  
**Direction:** All ADPPs will include the following as a conservation objective:

*“Priority will be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMA and ~~GHMA~~IHMA. When analyzing leasing and authorizing development of fluid mineral resources, including geothermal, in PHMA and ~~GHMA~~IHMA, and subject to applicable stipulations for the conservation of Greater Sage-Grouse, priority will be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-Grouse. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 U.S.C. 226(p) and 43 C.F.R. 3162.3-1(h).”*

*“Where a proposed fluid mineral development project on an existing lease could adversely affect GRSG populations or habitat, the BLM will work with the lessees, operators, or other project proponents to avoid, reduce and mitigate adverse impacts to the extent compatible with lessees’ rights to drill and produce fluid mineral resources. The BLM will work with the lessee, operator, or project proponent in developing an APD for the lease to avoid and minimize impacts to sage-grouse or its habitat and will ensure that the best information about the GRSG and its habitat informs and helps to guide development of such Federal leases.”*

**Commented [jmbeck2]:** The original language was not consistent with Idaho’s 3-tiered habitat mapping and contradicts the allocation table.

**Issue:** No Surface Occupancy (NSO) Exception Language

**Direction:** Follow NPT guidance for Priority Habitat Management Areas. No-surface-occupancy stipulations will be included in new fluid mineral leases at the time of leasing only and may not be applied to existing fluid mineral leases that did not include no-surface-occupancy stipulation at the time of leasing. Include the following language into the ADPP:

*“No waivers or modifications to a fluid mineral lease no-surface-occupancy stipulation will be granted. The Authorized Officer may grant an exception to a fluid mineral lease no-surface-occupancy stipulation only where the proposed action:*

- (i) Would not have direct, indirect, or cumulative effects on GRSG or its habitat; or,*
- (ii) Is proposed to be undertaken as an alternative to a similar action occurring on a nearby parcel, and would provide a clear conservation gain to GRSG.*

*Exceptions based on conservation gain (ii) may only be considered in (a) PHMAs of mixed ownership where federal minerals underlie less than fifty percent of the total surface, or (b) areas of the public lands where the proposed exception is an alternative to an action occurring on a nearby parcel subject to a valid Federal fluid mineral lease existing as of the date of this RMP [revision or amendment]. Exceptions based on conservation gain must also include measures, such as enforceable institutional controls and buffers, sufficient to allow the BLM to conclude that such benefits will endure for the duration of the proposed action’s impacts.*

*Any exceptions to this lease stipulation may be approved by the Authorized Officer only with the concurrence of the State Director. The Authorized Officer may not grant an exception unless the applicable state wildlife agency, the USFWS, and the BLM unanimously find that the proposed action satisfies (i) or (ii). Such finding shall initially be made by a team of one field biologist or other GRSG expert from each respective agency. In the event the initial finding is not unanimous, the finding may be elevated to the appropriate BLM State Director, USFWS State Ecological Services Director, and state wildlife agency head for final resolution. In the event their finding is not unanimous, the exception will not be granted. Approved exceptions will be made publically available at least quarterly.”*

**Issue:** **Adaptive Management**

**Direction:** Follow the NPT Adaptive Management Guidance and Sideboards. When a hard trigger is hit in a BSU, the designated response will be put in place in that BSU. Triggers and responses have been developed with local state and FWS experts.

When a hard trigger is hit in a BSU within a PAC that has multiple BSUs, including those that cross state lines, the WAFWA Management Zone Greater Sage-Grouse Conservation Team will convene to determine the causal factor, put project level responses in place, as appropriate and discuss further appropriate actions to be applied. The team will also investigate the status of the hard triggers in other BSUs within the PAC and will invoke the appropriate plan response. Adoption of any further actions at the plan level may require initiating a plan amendment process.

**Issue:**  
**Direction:**

**Application of Lek Buffers**

The ADPP will require the use of lek buffer-distances for all new BLM-managed and BLM-authorized anthropogenic disturbances in ~~both~~ GHMA, IHMA, and PHMA (see Attachment IV) through this drop-in Chapter 2 language:

*“In undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will apply the lek buffer-distances identified in the USGS Report Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review (Open File Report 2014-1239) in accordance with Appendix X.”*

**Commented [jmbeck3]:** The original language was not consistent with Idaho’s 3-tiered habitat mapping.

Allocation Direction

\*Southwest Montana will follow the allocations designated for the MT ADPP

	<i>Idaho/SW MT*</i>
<b>Solar - Priority</b>	Exclusion <i>Imp - Avoid</i>
<b>Solar – General</b>	Open
<b>Wind – Priority</b>	Exclusion <i>Imp – Avoid</i>

Attachment I

**GREATER SAGE-GROUSE RMPA/FEIS  
TEMPLATE LANGUAGE FOR ADDRESSING  
MITIGATION**

[Green box] = Instructions  
[Yellow box] = Fill in the blank

[This mitigation language addresses greater sage-grouse. However, if you are working on a plan revision, you may need to add additional language to be more inclusive of other resource and value objectives (e.g. cultural resources, national historic trails, recreation values, other special status species) that may need to be mitigated.]

**Chapter 1 - Introduction**

[Nothing new to add to EIS]

**Chapter 2 – Alternatives – [Proposed Plan/Proposed Plan Amendment]**

- Add these two new sections (below) to the **Chapter 2 Alternatives** section.
- Replace the Regional Mitigation placeholder language that was included in the draft EIS with the new “Mitigation” section, below.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

Consistent with the proposed plan’s goal outlined in [Table 2-X – Description of Alternatives], the intent of the [Proposed Plan/Proposed Plan Amendment] is to provide a net conservation gain to the species. To do so, in undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. This is also consistent with BLM Manual 6840 – Special Status Species Management, Section .02B, which states “to initiate protective conservation measures that reduce or eliminate threats to Bureau sensitive species to minimize the likelihood of the need for listing of these species under the ESA.”

**Mitigation**

*Mitigation Standards.* In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see the concepts of durability, timeliness, and additionality as described further in Appendix X).

*Greater Sage-Grouse Conservation Team.* The BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. This Team will develop a WAFWA Management Zone Regional Mitigation Strategy (hereafter, Regional Mitigation Strategy). The Team will also compile and report on monitoring data (including data on habitat condition, population trends, and mitigation effectiveness) from States across the WAFWA Management Zone (see Monitoring section). Subsequently, the Team will use these data to either modify the appropriate Regional Mitigation Strategy or recommend adaptive management actions (see Adaptive Management section).

The BLM/USFS will invite governmental and Tribal partners to participate in this Team, including the State Wildlife Agency and U.S. Fish and Wildlife Service, in compliance with the exemptions provided for committees defined in the Federal Advisory Committee Act and the regulations that implement that act. The BLM/USFS will strive for a collaborative and unified approach between Federal agencies (e.g. FWS, BLM, and USFS), Tribal governments, state and local government(s), and other stakeholders for greater sage-grouse conservation. The Team will provide advice, and will not make any decisions that impact Federal lands. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

*Developing a Regional Mitigation Strategy.* The Team will develop a Regional Mitigation Strategy to inform the mitigation components of NEPA analyses for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy will be developed within one year of the issuance of the Record of Decision. The BLM's Regional Mitigation Manual MS-1794 will serve as a framework for developing the Regional Mitigation Strategy. The Regional Mitigation Strategy will be applicable to the States/Field Offices/Forests within the WAFWA Management Zone's boundaries.

Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can provide a net conservation gain to the species. The Regional Mitigation Strategy developed by the Team will elaborate on the components identified above (i.e.

avoidance, minimization, and compensation; additionality, timeliness, and durability) and further explained in Appendix [X].

In the time period before the Strategy is developed, BLM will consider regional conditions, trends, and sites, to the greatest extent possible, when applying the mitigation hierarchy and will ensure that mitigation is consistent with the standards set forth in the first paragraph of this section.

*Incorporating the Regional Mitigation Strategy into NEPA Analyses.* The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

*Implementing a Compensatory Mitigation Program.* Consistent with the principles identified above, the BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be implemented at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

### **Chapter 3 – Affected Environment**

[Nothing to add]

### **Chapter 4 – Environmental Consequences – [Proposed Plan/Proposed Plan Amendment]**

#### **Mitigation**

This Chapter describes the environmental consequences associated with the impacts to greater sage-grouse and its habitat from activities carried out in conformance with this plan, in addition to BLM/USFS management actions. In undertaking BLM/USFS management actions, and consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and

compensating for impacts by applying beneficial mitigation actions. In addition, to help implement this [Proposed Plan / Proposed Plan Amendment], a WAFWA Management Zone Regional Mitigation Strategy (per Appendix [X]) will be developed within one year of the issuance of the Record of Decision. The Strategy will elaborate on the components identified in Chapter 2 (avoidance, minimization, compensation, additionality, timeliness, and durability), and will be considered by the BLM/USFS for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The implementation of a Regional Mitigation Strategy will benefit greater sage-grouse, the public, and land-users by providing a reduction in threats, increased public transparency and confidence, and a predictable permit process for land-use authorization applicants.

#### Appendix [X]

- Add this new Appendix.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

#### Appendix (X) – Mitigation – [Proposed Plan/Proposed Plan Amendment]

##### General

In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see glossary).

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy that will inform the NEPA decision making process including the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. A robust and transparent Regional Mitigation Strategy will contribute to greater sage-grouse habitat conservation by reducing, eliminating, or minimizing threats and compensating for residual impacts to greater sage-grouse and its habitat.

The BLM's Regional Mitigation Manual MS-1794 serves as a framework for developing and implementing a Regional Mitigation Strategy. The following sections provide additional guidance specific to the development and implementation of a WAFWA Management Zone Regional Mitigation Strategy.

#### Developing a WAFWA Management Zone Regional Mitigation Strategy

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy to guide the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy should consider any State-level greater sage-grouse mitigation guidance that is consistent with the requirements identified in this Appendix. The Regional Mitigation Strategy should be developed in a transparent manner, based on the best science available and standardized metrics.

As described in Chapter 2, the BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. The Strategy will be developed within one year of the issuance of the Record of Decision.

The Regional Mitigation Strategy should include mitigation guidance on avoidance, minimization, and compensation, as follows:

- Avoidance
  - Include avoidance areas (e.g. right-of-way avoidance/exclusion areas, no surface occupancy areas) already included in laws, regulations, policies, and/or land use plans (e.g. Resource Management Plans, Forest Plans, State Plans); and,
  - Include any potential, additional avoidance actions (e.g. additional avoidance best management practices) with regard to greater sage-grouse conservation.
- Minimization
  - Include minimization actions (e.g. required design features, best management practices) already included in laws, regulations, policies, land use plans, and/or land-use authorizations; and,
  - Include any potential, additional minimization actions (e.g. additional minimization best management practices) with regard to greater sage-grouse conservation.
- Compensation
  - Include discussion of impact/project valuation, compensatory mitigation options, siting, compensatory project types and costs, monitoring, reporting, and program administration. Each of these topics is discussed in more detail below.
    - Residual Impact and Compensatory Mitigation Project Valuation Guidance
      - A common standardized method should be identified for estimating the value of the residual impacts and value of the compensatory mitigation projects, including accounting for any uncertainty associated with the effectiveness of the projects.

- This method should consider the quality of habitat, scarcity of the habitat, and the size of the impact/project.
- For compensatory mitigation projects, consideration of durability (see glossary), timeliness (see glossary), and the potential for failure (e.g. uncertainty associated with effectiveness) may require an upward adjustment of the valuation.
- The resultant compensatory mitigation project will, after application of the above guidance, result in proactive conservation measures for Greater Sage-grouse (consistent with BLM Manual 6840 – Special Status Species Management, section .02).
- **Compensatory Mitigation Options**
  - Options for implementing compensatory mitigation should be identified, such as:
    - Utilizing certified mitigation/conservation bank or credit exchanges.
    - Contributing to an existing mitigation/conservation fund.
    - Authorized-user conducted mitigation projects.
  - For any compensatory mitigation project, the investment must be additional (i.e. additionality: the conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project).
- **Compensatory Mitigation Siting**
  - Sites should be in areas that have the potential to yield a net conservation gain to the greater sage-grouse, regardless of land ownership.
  - Sites should be durable (see glossary).
  - Sites identified by existing plans and strategies (e.g. fire restoration plans, invasive species strategies, healthy land focal areas) should be considered, if those sites have the potential to yield a net conservation gain to greater sage-grouse and are durable.
- **Compensatory Mitigation Project Types and Costs**
  - Project types should be identified that help reduce threats to greater sage-grouse (e.g. protection, conservation, and restoration projects).
  - Each project type should have a goal and measurable objectives.
  - Each project type should have associated monitoring and maintenance requirements, for the duration of the impact.
  - To inform contributions to a mitigation/conservation fund, expected costs for these project types (and their monitoring and maintenance), within the WAFWA Management Zone, should be identified.
- **Compensatory Mitigation Compliance and Monitoring**
  - Mitigation projects should be inspected to ensure they are implemented as designed, and if not, there should be methods to enforce compliance.
  - Mitigation projects should be monitored to ensure that the goals and objectives are met and that the benefits are effective for the duration of the impact.

- Compensatory Mitigation Reporting
  - Standardized, transparent, scalable, and scientifically-defensible reporting requirements should be identified for mitigation projects.
  - Reports should be compiled, summarized, and reviewed in the WAFWA Management Zone in order to determine if greater sage-grouse conservation has been achieved and/or to support adaptive management recommendations.
- Compensatory Mitigation Program Implementation Guidelines
  - Guidelines for implementing the State-level compensatory mitigation program should include holding and applying compensatory mitigation funds, operating a transparent and credible accounting system, certifying mitigation credits, and managing reporting requirements.

#### Incorporating the Regional Mitigation Strategy into NEPA Analyses

The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

#### Implementing a Compensatory Mitigation Program

The BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be managed at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

#### **Glossary Terms**

**Additionality:** The conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project. (adopted and modified from BLM Manual Section 1794).

**Avoidance mitigation:** Avoiding the impact altogether by not taking a certain action or parts of an action. (40 CFR 1508.20(a)) (e.g. may also include avoiding the impact by moving the proposed action to a different time or location.)

**Compensatory mitigation:** Compensating for the (residual) impact by replacing or providing substitute resources or environments. (40 CFR 1508.20)

**Compensatory mitigation projects:** The [restoration](#), [creation](#), [enhancement](#), and/or [preservation](#) of impacted resources (adopted and modified from 33 CFR 332), such as on-the-ground actions to improve and/or protect habitats (e.g. chemical vegetation treatments, land acquisitions, conservation easements). (adopted and modified from BLM Manual Section 1794).

**Compensatory mitigation sites:** The durable areas where compensatory mitigation projects will occur. (adopted and modified from BLM Manual Section 1794).

**Durability (protective and ecological):** the maintenance of the effectiveness of a mitigation site and project for the duration of the associated impacts, which includes resource, administrative/legal, and financial considerations. (adopted and modified from BLM Manual Section 1794).

**Minimization mitigation:** Minimizing impacts by limiting the degree or magnitude of the action and its implementation. (40 CFR 1508.20 (b))

**Residual impacts:** Impacts that remain after applying avoidance and minimization mitigation; also referred to as unavoidable impacts.

**Timeliness:** The lack of a time lag between impacts and the achievement of compensatory mitigation goals and objectives (BLM Manual Section 1794).

## Attachment II

### **Greater Sage-Grouse (GRSG) Land Use Plans Disturbance Caps Guidance**

#### **Purpose**

- I. Provide the planning units with land use planning actions that need to be incorporated into the administrative draft proposed plans to respond to the 3% disturbance cap once it is exceeded in either the Biologically Significant Units (BSU) or at the project scale.
- II. Provide guidance on the use of the west-wide habitat degradation (disturbance) data layers as well as the use of locally collected disturbance data for BSUs to determine if the disturbance cap has been exceeded as the land use plans (LUP) are being implemented.
- III. Provide guidance on the use of locally collected disturbance data for project authorizations to determine if the disturbance cap has been exceeded as the LUPs are being implemented.
- IV. Provide guidance on the inclusion of fire in disturbance calculations.
- V. Provide guidance on the use of the density of energy and mining facilities during authorizations
- VI. Provide guidance on the use of the BER analysis in the land use plans (Chapter 2, Affected Environment) and the use of the “west-wide” sagebrush availability and habitat degradation data/estimates for the Priority Habitat Management Areas in each population for monitoring and management purposes as the LUPs are being implemented.
- VII. Provide guidance on what is considered in the disturbance calculations versus what is considered for the disturbance cap.

#### **Guidance**

- I. Planning units will include the following land use plan actions within their administrative draft proposed land use plans (ADPPs) that states:
  - a. *If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.) will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.*
  - b. *If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a Priority Habitat Management Areas, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain*

*the area under the cap (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.).*

- II. Use of west-wide habitat degradation data as well as the use of locally collected disturbance data to determine the level of existing disturbance:
  - a) In the GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, use the west-wide data at a minimum and/or locally collected disturbance data as available (e.g., DDCT) for the anthropogenic disturbance types listed in Table 1.
- III. Use of locally collected disturbance data for project authorizations:
  - a) In a proposed project analysis area, digitize all existing anthropogenic disturbances identified in the GRSG Monitoring Framework and the 7 additional features that are considered threats to sage-grouse (Table 2). Using 1 meter resolution NAIP imagery is recommended. Use local data if available.
- IV. Fire-burned and habitat treatment areas will not be included in the project scale degradation disturbance calculation for managing sage-grouse habitat under a disturbance cap. These areas will be considered part of a sagebrush availability when rangewide, consistent, interagency fine- and site-scale monitoring has been completed and the areas have been determined to meet sage-grouse habitat requirements. These and other disturbances identified in Table 3 will be part of a sagebrush availability evaluation and will be considered along with other local conditions that may affect sage-grouse during the analysis of the proposed project area.
- V. Planning units are directed to use a density cap related to the density of energy and mining facilities (listed below) during project scale authorizations. If the disturbance density in a proposed project area is on average less than 1/ 640 acres, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than an average of 1/ 640 acres, either defer the proposed project or co-locate it into existing disturbed area (*subject to applicable laws and regulations, such as the 1872 Mining Law, valid existing rights, etc.*).
  - Energy (oil and gas wells and development facilities)
  - Energy (coal mines)
  - Energy (wind towers)
  - Energy (solar fields)
  - Energy (geothermal)
  - Mining (active locatable, leasable, and saleable developments)

- VI. Planning units are directed to continue using the baseline data from the 2013 USGS Baseline Environmental Report (BER) in the Affected Environment section of the proposed plans/ FEISs. West-wide sagebrush availability and habitat degradation data layers will be used for the Priority Habitat Management Areas in each population for monitoring (see the GRSG Monitoring Framework in the Monitoring Appendix of the EIS) and management purposes as the LUPs are being implemented. The BER reported on individual threats across the range of sage-grouse while the west-wide disturbance calculation consolidated the anthropogenic disturbance data into a single measure using formulas from the GRSG Monitoring Framework. These calculations will be completed on an annual basis by the BLM's National Operation Center. Planning units will be provided the 2014 baseline disturbance calculation derived from the west-wide data once the RODs are signed that describe the Priority Habitat Management Areas.
- VII. Planning units are directed to use the three measures (sagebrush availability, habitat degradation, density of energy and mining) in conjunction with other information during the NEPA process to most effectively site project locations, such as by clustering disturbances and/or locating facilities in already disturbed areas. Although locatable mine sites are included in the degradation calculation, mining activities under the 1872 mining law may not be subject to the 3% disturbance cap. Details about locatable mining activities should be fully disclosed and analyzed in the NEPA process to assess impacts to sage-grouse and their habitat as well as to BLM goals and objectives, and other BLM programs and activities.

**Additional Information/Formulas**

A collaborative effort in Idaho developed a disturbance calculation method that includes the 3% disturbance cap plus a modifier that includes effective habitat and is described in Appendix G of their ADPP. The formulas below are excerpted from that Appendix.

Disturbance Calculations for the BSU:

$$\begin{aligned} & \text{Disturbance Percentage} \\ & = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}^1}{\text{Acres within the BSU} * \left( \frac{\text{Acres of Effective Habitat within the BSU}}{\text{Acres within the BSU}} + 0.3 \right)} \right) \times 100 \end{aligned}$$

Disturbance Calculations for Project Analysis Areas (PAAs):

$$\text{Disturbance Percentage} = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}^{12}}{\text{Acres within the PAA} * \left( \frac{\text{Acres of Effective Habitat within the PAA}}{\text{Acres within the PAA}} + 0.3 \right)} \right) \times 100$$

<sup>1</sup> see Table 3. <sup>2</sup> see Table 2.

Project analysis area (PAA) method for permitting surface disturbance activities:

1. Determine potentially affected occupied leks by placing a four-mile buffer around the project boundary as defined by the proposed area of physical disturbance related to the project. All occupied leks within this buffer will be considered affected by the proposed project.
2. Next place a four mile boundary around each of the occupied leks identified in item 1, above.
3. The polygon formed by the merging and dissolving of polygons from step 1 and 2 creates the Project Analysis Area (PAA) for surface disturbance activities.
4. Map existing disturbances within the analysis area or use locally available spatial data. Use of digitized NAIP imagery is recommended.
5. Calculate percent existing disturbance using the formula above. If existing disturbance is less than 3%, proceed to next step. If existing disturbance is greater than 3%, defer the project.
6. Add proposed project disturbance footprint area and recalculate the percent disturbance. If disturbance is less than 3%, proceed to next step. If disturbance is greater than 3%, defer project.
7. Calculate the disturbance density of energy and mining facilities (listed above). If the disturbance density is less than 1 facility per 640 acres, averaged across project analysis area, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than 1 facility per 640 acres, averaged across the project analysis area, either defer the proposed project or co-locate it into existing disturbed area.
8. If a project that would exceed the degradation cap or density cap cannot be deferred due to valid existing rights or other existing laws and regulations, fully disclose the local and regional impacts of the proposed action in the associated NEPA.

Table 1. Anthropogenic disturbance types for disturbance calculations. Data sources are described for the west-wide habitat degradation estimates (Table copied from the GRSG Monitoring Framework)

<b>Degradation Type</b>	<b>Subcategory</b>	<b>Data Source</b>	<b>Direct Area of Influence</b>	<b>Area Source</b>
<b>Energy (oil &amp; gas)</b>	Wells	IHS; BLM (AFMSS)	5.0ac (2.0ha)	BLM WO-300

Infrastructure (other vertical structures)		X	
Other developed rights-of-way		X	

## **Background**

In the USFWS's 2010 listing decision for sage-grouse, the USFWS identified 18 threats contributing to the destruction, modification, or curtailment of the sage-grouse's habitat or range (75 FR 13910 2010). In April 2014, the Interagency GRSG Disturbance and Monitoring Sub-Team finalized the Greater Sage-Grouse Monitoring Framework (hereafter, framework) to track these threats. The 18 threats have been aggregated into three measures to account for whether the threat predominantly removes sagebrush or degrades habitat. The three measures are:

Measure 1: Sagebrush Availability (percent of sagebrush per unit area)

Measure 2: Habitat Degradation (percent of human activity per unit area)

Measure 3: Density of Energy and Mining (facilities and locations per unit area)

The BLM is committed to monitoring the three disturbance measures and reporting them to the FWS on an annual basis. However, for the purposes of calculating the amount of disturbance to provide information for management decisions and inform the success of the sage-grouse planning effort, the data depicting the location and extent of the 12 anthropogenic types of threats will be used at a minimum in the BSUs and those same 12 anthropogenic and the additional 7 types of features that are threats to sage-grouse will be used in the project analysis areas.

		Scales		
		Broad/Mid (Populations)	Intermediate (BSU)	Local/Project (Seas. Hab.)
Habitat Degradation	Unit:	WAFWA Populations	Biologically Significant Unit	Project/Local Habitat Area <sup>5</sup>
	Area of Interest:	PHMAs	PHMAs	PHMAs

<b>ACRONYMS</b>				
PHMA = Priority Habitat Management Area      BSU = Biologically Significant Unit				
EVT = Existing Vegetation Type                  BpS = Areas of Biotic Potential				
<sup>1</sup> Only mines with a Plan of Operation (>5 acres of disturbance) will be included.				
<sup>2</sup> Westwide data will be used only if state or local data are not available.				
<sup>3</sup> This footnote was removed from the table, January 2015.				
<sup>4</sup> This may be one of several variables used to inform Adaptive Management. The BSU is the scale at which Adaptive Management will be applied.				
<sup>5</sup> A moving window analysis will be conducted at this scale by the NOC using westwide data. If available, state and local data analysis should be used for Adaptive Management.				
<sup>6</sup> The project analysis area will be based on a 4-mile radius polygon around the project area combined with a 4-mile buffer around any jets within the project boundary in PHMA (Idaho methodology).				
<sup>7</sup> See Table 2				

## Attachment III

### **Greater Sage-Grouse (GRSG) Land Use Plans Vegetation Objectives Guidance**

#### **Purpose**

- I. Provide the planning units with land use planning vegetation objectives that need to be incorporated into the administrative draft proposed plans.
- II. Provide guidance on the use of a template for GRSG habitat objectives in the Special Status Species section of the ADPPs.
- III. Provide guidance on prioritizing land health assessments in sage-grouse habitats and conducting assessments at the watershed scale using the sage-grouse habitat objectives.

#### **Guidance**

- I. Planning units will include the following land use plan vegetation objective within the Vegetation section of their administrative draft proposed land use plans (ADPPs) that states:  
*In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).*
- II. Planning units will populate the GRSG Habitat Objectives table template to provide vegetation objectives for sage-grouse life history stages based on the ecology in your region to be used to meet the applicable land health standard in GRSG habitats. Planning units are encouraged to work across boundaries when developing the objectives to ensure regional continuity and will provide appropriate peer-reviewed science to support the habitat values for the indicators. These desired condition value can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%). Planning units may include additional indicators and desired condition values as appropriate (see the Sage-Grouse Habitat Assessment Framework (HAF, *Technical Reference 6710-1*) for appropriate indicators). The HAF contains values for habitat suitability indicators in sage-grouse seasonal habitats from the Connelly et al. (2000) sage-grouse guidelines and has incorporated many of the core indicators in the AIM strategy (Toevs et al. 2011) as well. Planning units may use the indicator values from Connelly et al. (2000) while developing the land use plan Sage-Grouse Habitat Objectives table.

When using the indicators to guide management actions or during land health assessments, consider that the indicators are sensitive to the ecological processes operating at the scale of interest and that a single habitat indicator does not necessarily define habitat suitability for an area or particular scale. Indicators must be collectively reviewed, assessed based on the site potential, and put into spatial and temporal context to correctly determine habitat suitability which will include more than one scale and multiple indicators. Assessment and evaluation of these objectives will follow the steps described in the HAF.

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP and is to be used as a minimum to meet the applicable land health standard in sage-grouse habitats.

Greater Sage-Grouse Habitat Objectives

ATTRIBUTE	INDICATORS	DESIRED CONDITION	Reference
<b>BREEDING AND NESTING (Seasonal Use Period March 1-June 15)</b>			
Lek Security	Proximity of trees		
	Proximity of sagebrush to leks		
Cover	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover		
	Sagebrush height		
	Arid sites		
	Mesic sites		
	Predominant sagebrush shape		
	Perennial grass cover		
Arid sites			
Mesic sites			
Perennial grass and forb height			
Perennial forb canopy cover			
Arid sites			
Mesic sites			
<b>BROOD-REARING/SUMMER<sup>1</sup> (Seasonal Use Period June 16-October 31)</b>			
Cover	% of Seasonal habitat meeting desired condition		
	Sagebrush canopy cover		
	Sagebrush height		
	Perennial grass canopy cover and forbs		
	Riparian areas/mesic meadows		
	Upland and riparian perennial forb availability		
<b>WINTER<sup>1</sup> (Seasonal Use Period November 1-February 28)</b>			
Cover and Food	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover above snow		
	Sagebrush height above snow		

- III. The BLM will prioritize land health assessments in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. Field offices are to conduct land health assessments at the watershed scale and use the GRSG habitat objectives when assessing the applicable standard in GRSG habitats.

When conducting land health assessments, the BLM should follow, at a minimum, “Interpreting Indicators of Rangeland Health” (Pellant et. al. 2005) and the “BLM Core Terrestrial Indicators and Methods” (MacKinnon et al. 2011). For assessments being conducted in GRSG designated management areas, the BLM should collect additional data to inform the HAF indicators that have not been collected using the above methods. Implementation of the principles outlined in the AIM strategy will allow the data to be used to generate unbiased estimates of condition across the area of interest; facilitate consistent data collection and rollup analysis among management units; help provide consistent data to inform the classification and interpretation of imagery; and provide condition and trend of the indicators describing sagebrush characteristics important to sage-grouse habitat.

## Attachment IV

### **Incorporating GSGR RMP Decisions into Grazing Authorizations**

#### **Purpose**

The purpose is to provide recommended ADPP language; outline the process for prioritizing the review and processing of grazing permits/leases to determine if modification is necessary (prior to renewal and in accordance with prioritization criteria); provide direction for including specific management thresholds and defined responses that will allow adjustments to livestock grazing within the terms and conditions of permits; and provide a process for prioritizing compliance monitoring within Sagebrush Focal Areas (SFAs) and Priority Habitat Management Areas (PHMAs).

#### **Background**

The BLM manages approximately 18,000 livestock grazing permits and leases on the public lands. Livestock grazing is an integral part of the BLM multiple-use mission and is authorized by the Taylor Grazing Act (1934), the Federal Land Policy Management Act (1976) and the Public Rangeland Improvement Act (1978). By statute and regulation, grazing leases and permits are normally issued for 10-year periods. Annually, a range of 1,200 to 3,200 grazing permits expire and the BLM receives 500 to 1,500 grazing permit/lease transfer requests.

The BLM currently issues permits/leases in accordance with:

- All applicable law, regulation, policy (NEPA, consultation, proposed/final grazing decision-also known as a fully processed permit); or
- Various appropriation authorities enacted between 1999 and 2014 extending terms and conditions of expiring or transferred permits/leases that the BLM is unable to fully process before their expiration; or
- Section 402(c)(2) of FLPMA (as amended by Public Law 113-291, enacted December 19, 2014).

Congress has acted to ensure that grazing permittees could continue to graze if the BLM is unable to complete the environmental analysis mandated by the NEPA and other applicable laws. Since 1999, a provision (“the rider”) has been included in the Interior Appropriations bill that, in various forms, generally authorizes the BLM to renew grazing permits and leases under their same terms and conditions until it fully processes the permit renewal in compliance with NEPA, ESA, and other legal or regulatory requirements. The most recent rider is contained in Section 411, Public Law 113-76.<sup>1</sup> The FLPMA amendment to Section 402 (c) allows BLM to renew

---

<sup>1</sup> The Consolidated Appropriations Act, 2014 includes the provision Section 411 which states: “Section 415 of division E of Public Law 112-74 is amended by striking “and 2013” and inserting “through 2015.” The terms and conditions of section 325 of Public Law 108-108 (117 stat. 1307), regarding permits at the Department of the Interior and the Forest Service, shall remain in effect through fiscal year 2015. A grazing permit or lease issued by the Secretary of the Interior for lands administered by the Bureau of Land Management that is the subject of a request for a grazing preference transfer shall be issued, without further processing, for the remaining time period in

grazing permits and leases under the same terms and conditions. This relieves the BLM's renewal processing workload, allowing the BLM to prioritize permit processing based on sensitivity of the resources at issue.<sup>2</sup>

The BLM may modify terms and conditions of a permit or lease at any time following completion of appropriate analysis and consultation, cooperation, and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public.<sup>3</sup> Under 43 C.F.R. 4160.1, the BLM must serve a proposed decision on any affected applicant, permittee or lessee, any agent and lien holder of record. Copies of the decisions are provided to the interested publics.

**Recommended Language to be incorporated as Livestock Grazing Management Actions within the GRSG ADPPs:**

- The BLM will prioritize the review of grazing permits/leases, including those prior to renewal to determine if modification is necessary, and processing of grazing permits and leases, in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource conditions (ex., fire) and legal obligations.
- The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.
- Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to

---

the existing permit or lease using the same mandatory terms and conditions. If the authorized officer determines a change in the mandatory terms and conditions is required, the new permit must be processed as directed in section 325 of Public Law 108-108.” Where a FO is unable to fully process a permit renewal in compliance with all applicable laws prior to the permit expiration, Section 411 extends the authority to renew the grazing permit with the same terms and conditions as the expiring permit. Section 325 provides the process for authorizing grazing until a permit or lease is issued in compliance with all applicable law and regulatory processes.

<sup>2</sup> The newly amended section 402(c) of FLPMA provides permanent authority to BLM to renew expiring permits. That section states, “The terms and conditions in a grazing permit or lease that has expired, or was terminated due to a grazing preference transfer, shall be continued under a new permit or lease until the date on which the Secretary concerned completes any environmental analysis and documentation for the permit or lease required under the National Environmental Policy Act of 1969 (42 U.S.C. 4321 et seq.) and other applicable laws.”

<sup>3</sup> 43 CFR 4130.3-3 states: Following consultation, cooperation and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public, the authorized officer may modify terms and conditions of the permit or lease when the active grazing use or related management practices are not meeting the land use plan, allotment management plan or other activity plan, or management objectives, or is not in conformance with the provisions of subpart 4180 (Fundamentals of Rangeland Health and Standards and Guidelines for Grazing Administration).

help ensure compliance with the terms and conditions within the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.

- At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

### **Addressing GRSR RMP Amendments/Revisions Objectives in Grazing Permits/Leases**

BLM will develop criteria to prioritize the workload to process permits/leases (either fully processed or reauthorized based on the Appropriations rider, or issued under Section 402(c)(2) of FLPMA) and determine whether modification is necessary prior to renewal within PHMAs, beginning with those in SFAs. In setting priorities, those containing riparian areas and areas not meeting Land Health Standards (43 C.F.R. 4180) will take precedence. Potential criteria for prioritizing permit modifications could include:

- Are there riparian areas or wet meadows in the permit/lease area?
- Was current livestock grazing identified as a causal factor for not meeting Land Health Standards?
- Since the last allotment/watershed evaluation, is there current monitoring information to determine that the watershed/allotment is currently achieving or making significant progress towards achieving land health standards?
- Does the permit have terms and conditions adequate to ensure proper grazing practices to meet GRSR habitat objectives found in the Special Status Species section of the land use plan?
- Is there data that indicates that the GRSR habitat objectives, including the Habitat Objectives table, found in the Special Status Species section of the land use plan are being met?
- Is there a request from the permittee to modify the terms and conditions of his/her permit?

Additionally, if an existing permit/lease within PHMAs requires modification because current grazing is a significant causal factor for not meeting the Land Health Standards, the BLM will prepare the appropriate NEPA analysis and issue the proposed/final grazing decision under 43 C.F.R. Subpart 4160, subject to administrative appeal and potential judicial challenge.

The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSR Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA. Adjustments to meet seasonal Sage-Grouse habitat requirements could include:

- Season or timing of use;
- Numbers of livestock (includes temporary non-use or livestock removal);
- Distribution of livestock use;
- Intensity of use; and
- Type of livestock (e.g., cattle, sheep, horses, llamas, alpacas and goats).

### **Compliance Monitoring**

The BLM will monitor grazing permits/leases renewed or modified in accordance with the direction contained in this guidance as follows: Allotments within SFAs, followed by those in other PHMA, and focusing on those with riparian areas, will be prioritized for monitoring to ensure compliance with the terms and conditions in the permits. The BLM will collect, at a minimum, the following monitoring data:

- Vegetation Condition
- Actual Use
- Utilization
- Use Supervision

### **Concerning Voluntary Relinquishments**

All ADPPs will include the following language:

At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

For completing this, BLM offices should use [WO IM 2013-184 Relinquishment of Grazing Permitted Use](#) or the most recent policy guidance.

Attachment V

**Applying Lek Buffer-Distances When Approving Actions**

- *Buffer Distances and Evaluation of Impacts to Leks*  
Evaluate impacts to leks from actions requiring NEPA analysis. In addition to any other relevant information determined to be appropriate (e.g. State wildlife agency plans), the BLM will assess and address impacts from the following activities using the lek buffer-distances as identified in the USGS Report *Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review (Open File Report 2014-1239)*. The BLM will apply the lek buffer-distances specified as the lower end of the interpreted range in the report unless justifiable departures are determined to be appropriate (see below). The lower end of the interpreted range of the lek buffer-distances is as follows:
  - linear features (roads) within 3.1 miles of leks
  - infrastructure related to energy development within 3.1 miles of leks.
  - tall structures (e.g., communication or transmission towers, transmission lines) within 2 miles of leks.
  - low structures (e.g., fences, rangeland structures) within 1.2 miles of leks.
  - surface disturbance (continuing human activities that alter or remove the natural vegetation) within 3.1 miles of leks.
  - noise and related disruptive activities including those that do not result in habitat loss (e.g., motorized recreational events) at least 0.25 miles from leks.

Justifiable departures to decrease or increase from these distances, based on local data, best available science, landscape features, and other existing protections (e.g., land use allocations, state regulations) may be appropriate for determining activity impacts. The USGS report recognized “that because of variation in populations, habitats, development patterns, social context, and other factors, for a particular disturbance type, there is no single distance that is an appropriate buffer for all populations and habitats across the sage-grouse range”. The USGS report also states that “various protection measures have been developed and implemented... [which have] the ability (alone or in concert with others) to protect important habitats, sustain populations, and support multiple-use demands for public lands”. All variations in lek buffer-distances will require appropriate analysis and disclosure as part of activity authorization.

In determining lek locations, the BLM will use the most recent active or occupied lek data available from the state wildlife agency.

- *For Actions in GHMA*  
The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis.
  - Impacts should first be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.
  - If it is not possible to relocate the project outside of the applicable lek buffer-distance(s) identified above, the BLM may approve the project only if:
    - Based on best available science, landscape features, and other existing protections, (e.g., land use allocations, state regulations), the BLM determines that a lek buffer-distance other than the applicable distance identified above offers the same or a greater

- level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area; or
- The BLM determines that impacts to GRSG and its habitat are minimized such that the project will cause minor or no new disturbance (ex. co-location with existing authorizations); and
- Any residual impacts within the lek buffer-distances are addressed through compensatory mitigation measures sufficient to ensure a net conservation gain, as outlined in the Mitigation Strategy (Appendix X).

- *For Actions in PHMA*

The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis. Impacts should be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.

The BLM may approve actions in PHMA that are within the applicable lek buffer distance identified above only if:

- The BLM, with input from the state fish and wildlife agency, determines, based on best available science, landscape features, and other existing protections, that a buffer distance other than the distance identified above offers the same or greater level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area.
- The BLM will explain its justification for determining the approved buffer distances meet these conditions in its project decision.

**BLM-IDAHO****Greater Sage-Grouse Planning Issues for the BLM Planning Teams to Insert and Analyze in Administrative Draft Proposed Plan (ADPP)****January 30, 2015**

*The March 4, 2010 decision by the U.S. Fish and Wildlife Service that the greater sage-grouse warranted listing but was precluded [Endangered and Threatened Wildlife and Plants; 12-Month Findings for Petitions to list the Greater Sage-Grouse (*Centrocercus urophasianus*) as Threatened or Endangered] set in motion the most comprehensive land-use planning initiative in the BLM's history.*

*In 2011, the BLM began updating land-use plans across the West so as to ensure not only the long-term viability of the greater sage-grouse on public lands and the continued economic vitality of the West. This has been a complex and demanding process involving collaboration with an unprecedented number of stakeholders, including Governors, State Fish and Game agencies, the U.S. Fish and Wildlife Service and many others. The BLM's mandate of multiple use and sustained yield has required us to balance the full range of resource uses on public lands, including the conservation of crucial wildlife habitat. As we have worked through this process, public land managers throughout the BLM have made difficult resource management decisions.*

*These documents provide key guidance that will enable the BLM to finalize land use plans that will contribute to the conservation of the Greater Sage-Grouse and other sagebrush associated species across the West. The guidance outlines a suite of tools, such as disturbance limits in key habitats and mitigation approaches, which will help us to reach this goal. These mechanisms will work in concert to conserve sage-grouse habitat so that we can achieve our twin goals of thriving Greater Sage-Grouse populations and robust Western economies.*

**Issue:****Development in Highly Important Landscapes****Direction:**

As more specifically provided in this guidance, the ADPP will include Sagebrush Focal Areas (SFA), consisting of the BLM and FS-managed lands within the area depicted in the October 27, 2014 USFWS memo, *Greater Sage-Grouse: Additional Recommendation to Refine Land Use Allocations in Highly Important Landscapes*. In the Special Status Species Section of Chapter 2, include the following management action drop in language (for the Proposed Plan only):

*“Designate Sagebrush Focal Areas (SFA) as shown on Map X (x acres). SFAs will be managed as PHMA, with the following additional management:*

- 1) Recommended for withdrawal from the General Mining Act of 1872, subject to valid existing rights.*
- 2) Managed as NSO, without waiver, exception, or modification, for fluid mineral leasing.*

- 3) *Prioritized for management and conservation actions in these areas, including, but not limited to review of livestock grazing permits/leases (see livestock grazing section for additional actions)."*

**The NOC will provide updated shapefiles that delineate the SFAs.**

Except as otherwise provided below, the ADPP will provide that all BLM- and FS-managed lands (including subsurface) within SFAs will be allocated and managed as PHMA and include the management actions above.

- *Do Not Include the following in SFA Management*
  - Hawley Mountain WSA (ID), Shoshone WSA (ID), Cedar Buttes WSA (ID), Lower Salmon Falls Creek (ID), Little Jack Wilderness (ID), Bruneau-Jarbidge Wilderness (ID) in non-habitat – The current management in these areas is generally protective of GRSG. As applicable, these will continue to be managed so as not to impair their suitability for preservation as wilderness, or under the terms of the Wilderness Act to preserve wilderness character.
    - To the extent that these areas were analyzed for contingent management as general or priority habitat, the ADPP will include contingent allocations and management direction that would apply in the event that Congress releases the areas from WSA status
  - Non-habitat areas outside Little Jack and Bruneau-Jarbidge Wilderness and Salmon Falls Creek ACEC which were previously shown within the SFA –These areas will not be managed as PHMA or SFA.
- Do Include Forest Service Lost River Mountains North (~5,000 acres) Area and South Area (~6,000 acres)– these areas will be treated as PHMA, with the SFA management actions for this FS-land.
- Do Include Donkey Hills ACEC –In order to consolidate parcels for protection as SFAs, this area will be treated as PHMA and included for SFA management.
- *Do Not Include Other Agency Land in SFA Management* – while lands managed by other agencies will be shown on the SFA maps, BLM ADPP decisions will not be applied to them.
- *Do Not Include Private/State Lands in SFA Management* – while private lands may be within the SFA boundaries, ADPP decisions will not be applied to them, but may apply to Federal subsurface underlying such lands as provided below.
- *Subsurface Estate:*
  - Under private/state lands: subsurface estate in PHMA and GHMA should be treated as PHMA with SFA management actions.

- Under other Federal lands: subsurface state should be treated as PHMA with SFA management actions if it is not already withdrawn (such as in Refuges or Parks) and PHMA or GHMA management was analyzed in the DEIS.

Additional direction/drop in language for the ADPPs on SFAs will be forthcoming.

**Issue:**

**Direction:**

**Mitigation**

The ADPP will include the updated Mitigation Framework (Attachment I) and drop-in Chapter 2 language to reflect the following language:

*“In all sage-grouse habitat, in undertaking BLM management actions, and, consistent with valid existing rights and applicable law, in authorizing third-party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions.”*

**Issue:**

**Direction:**

**Mapping**

Not Applicable

**Issue:**

**Direction:**

**Disturbance**

Per the original April 2014 NPT guidance on disturbance, the ADPP will use the 3% disturbance cap at the Biologically Significant Unit (BSU) and project scale. The density calculation (an average of 1 facility per 640 acres) applies to energy and mining facilities. The disturbance cap will not be applied to foreclose development of locatable minerals on unpatented claims located under the 1872 Mining Law; the disturbance from locatable mining will be accounted for in determining the percent disturbance and whether the cap has been exceeded. BLM-ID will use the disturbance calculation methodology developed prior to this guidance (see Attachment II).

Planning units will include the following land use plan actions within their ADPPs that states:

- a. If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSB Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid*

*existing rights, etc.) will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.*

- b. *If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a Priority Habitat Management Areas, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain the area under the cap (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.).*

**Issue:**

**Direction:**

**Vegetation Objectives**

The ADPP will establish and incorporate vegetation and GRSG habitat objectives (see Attachment III for specific guidance and a GRSG Habitat Objectives Table template that follows the Sage-Grouse Habitat Assessment Framework Technical Reference-6710-1). The vegetation and GRSG habitat objectives guidance states that the values for the desired conditions in the GRSG Habitat Objectives Table are to be used, at a minimum, to meet the applicable land health standard in sage-grouse habitats. Planning units may include additional indicators and desired condition values as appropriate. The desired condition value for each indicator can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%).

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP. The vegetation objective should be placed in the Vegetation section of the ADPP. Planning units will include the following land use plan vegetation objective within the Vegetation section of their ADPPs:

*In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).*

**Issue:**

**Direction:**

**Livestock Grazing**

The following management actions will be included in the Livestock Grazing section of the ADPP.

- *The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting Land Health Standards, with focus on those containing riparian areas,*

*including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (ex., fire) and legal obligations.*

- *The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.*
- *Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.*
- *At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.*

Attachment III provides guidance as to how the BLM will incorporate GRGS decisions from the Sage-Grouse RMP/Amendments into grazing permits/leases.

***Issue:***

***Direction:***

**Mineral Materials (Salable Minerals)**

All Priority Habitat Management Areas will be closed to mineral materials development. All Important Habitat Management Areas and General Habitat Management Areas will be open to mineral materials development, consistent with the Idaho Anthropogenic Disturbance Criteria.

***Issue:***

***Direction:***

**High-voltage Transmission and Major Pipeline ROWs and Corridors**

1) Apply the recommended NPT allocation guidance for PHMA of avoidance.

2) GHMA will remain open. BLM-ID will employ a location and design process to ensure protection.

3) For sub-regions that have planned priority transmission lines that traverse their planning area (Gateway West, Boardman to Hemingway, and TransWest Express, including those portions of Gateway South that

are co-located), apply the following language as a management action in their ADPP:

*“Priority Habitat Management Areas (PHMAs) and Important Habitat Management Areas (IHMAAs) are designated as avoidance areas for high voltage transmission line ROWs, except for the transmission projects specifically identified below. All authorizations in these areas, other than the excepted projects, must comply with the conservation measures outlined in this proposed plan, including the RDFs and avoidance criteria presented in [insert citation here] of this document. The BLM is currently processing an application for [Insert name of transmission project] and the NEPA review for this project is well underway. The BLM is analyzing GRSG mitigation measures through the project’s NEPA review process, which will include analysis of the following conservations measures.”*

**Issue:** Coal Suitability  
**Direction:** Not Applicable in Idaho

**Issue:** Fluid Mineral Resources (Including Geothermal)  
**Direction:** All ADPPs will include the following as a conservation objective:

*“Priority will be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMA, IHMA, and GHMA. When analyzing leasing and authorizing development of fluid mineral resources, including geothermal, in PHMA, IHMA, and GHMA, and subject to applicable stipulations for the conservation of Greater Sage-Grouse, priority will be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-Grouse. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 U.S.C. 226(p) and 43 C.F.R. 3162.3-1(h).”*

*“Where a proposed fluid mineral development project on an existing lease could adversely affect GRSG populations or habitat, the BLM will work with the lessees, operators, or other project proponents to avoid, reduce and mitigate adverse impacts to the extent compatible with lessees' rights to drill and produce fluid mineral resources. The BLM will work with the lessee, operator, or project proponent in developing an APD for the lease to avoid and minimize impacts to sage-grouse or its habitat and will ensure that the best information about the GRSG and its habitat informs and helps to guide development of such Federal leases.”*

**Issue:** No Surface Occupancy (NSO) Exception Language  
**Direction:** Follow NPT guidance for Priority Habitat Management Areas. No-surface-occupancy stipulations will be included in new fluid mineral

leases at the time of leasing only and may not be applied to existing fluid mineral leases that did not include no-surface-occupancy stipulation at the time of leasing. Include the following language into the ADPP:

*“No waivers or modifications to a fluid mineral lease no-surface-occupancy stipulation will be granted. The Authorized Officer may grant an exception to a fluid mineral lease no-surface-occupancy stipulation only where the proposed action:*

- (i) Would not have direct, indirect, or cumulative effects on GRSG or its habitat; or,*
- (ii) Is proposed to be undertaken as an alternative to a similar action occurring on a nearby parcel, and would provide a clear conservation gain to GRSG.*

*Exceptions based on conservation gain (ii) may only be considered in (a) PHMAs of mixed ownership where federal minerals underlie less than fifty percent of the total surface, or (b) areas of the public lands where the proposed exception is an alternative to an action occurring on a nearby parcel subject to a valid Federal fluid mineral lease existing as of the date of this RMP [revision or amendment]. Exceptions based on conservation gain must also include measures, such as enforceable institutional controls and buffers, sufficient to allow the BLM to conclude that such benefits will endure for the duration of the proposed action’s impacts.*

*Any exceptions to this lease stipulation may be approved by the Authorized Officer only with the concurrence of the State Director. The Authorized Officer may not grant an exception unless the applicable state wildlife agency, the USFWS, and the BLM unanimously find that the proposed action satisfies (i) or (ii). Such finding shall initially be made by a team of one field biologist or other GRSG expert from each respective agency. In the event the initial finding is not unanimous, the finding may be elevated to the appropriate BLM State Director, USFWS State Ecological Services Director, and state wildlife agency head for final resolution. In the event their finding is not unanimous, the exception will not be granted. Approved exceptions will be made publically available at least quarterly.”*

**Issue:**

**Direction:**

**Adaptive Management**

Follow the NPT Adaptive Management Guidance and Sideboards. When a hard trigger is hit in a BSU, the designated response will be put in place in that BSU. Triggers and responses have been developed with local state and FWS experts.

When a hard trigger is hit in a BSU within a PAC that has multiple BSUs, including those that cross state lines, the WAFWA Management Zone Greater Sage-Grouse Conservation Team will convene to determine the causal factor, put project level responses in place, as appropriate and discuss further appropriate actions to be applied. The team will also investigate the status of the hard triggers in other BSUs within the PAC and will invoke the appropriate plan response. Adoption of any further actions at the plan level may require initiating a plan amendment process.

***Issue:***

***Direction:***

**Application of Lek Buffers**

The ADPP will require the use of lek buffer-distances for all new BLM-managed and BLM-authorized anthropogenic disturbances in both GHMA, IHMA, and PHMA (see Attachment IV) through this drop-in Chapter 2 language:

*“In undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will apply the lek buffer-distances identified in the USGS Report Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review (Open File Report 2014-1239) in accordance with Appendix X.”*

Allocation Direction

\*Southwest Montana will follow the allocations designated for the MT ADPP

## Attachment I

# GREATER SAGE-GROUSE RMPA/FEIS TEMPLATE LANGUAGE FOR ADDRESSING MITIGATION

[ ] = Instructions

[ ] = Fill in the blank

[This mitigation language addresses greater sage-grouse. However, if you are working on a plan revision, you may need to add additional language to be more inclusive of other resource and value objectives (e.g. cultural resources, national historic trails, recreation values, other special status species) that may need to be mitigated.]

## Chapter 1 - Introduction

[Nothing new to add to EIS]

## Chapter 2 – Alternatives – [Proposed Plan/Proposed Plan Amendment]

- Add these two new sections (below) to the **Chapter 2 Alternatives** section.
- Replace the Regional Mitigation placeholder language that was included in the draft EIS with the new “Mitigation” section, below.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

Consistent with the proposed plan’s goal outlined in [Table 2-X – Description of Alternatives], the intent of the [Proposed Plan/Proposed Plan Amendment] is to provide a net conservation gain to the species. To do so, in undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. This is also consistent with BLM Manual 6840 – Special Status Species Management, Section .02B, which states “to initiate protective conservation measures that reduce or eliminate threats to Bureau sensitive species to minimize the likelihood of the need for listing of these species under the ESA.”

## Mitigation

*Mitigation Standards.* In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see the concepts of durability, timeliness, and additionality as described further in Appendix X).

*Greater Sage-Grouse Conservation Team.* The BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. This Team will develop a WAFWA Management Zone Regional Mitigation Strategy (hereafter, Regional Mitigation Strategy). The Team will also compile and report on monitoring data (including data on habitat condition, population trends, and mitigation effectiveness) from States across the WAFWA Management Zone (see Monitoring section). Subsequently, the Team will use these data to either modify the appropriate Regional Mitigation Strategy or recommend adaptive management actions (see Adaptive Management section).

The BLM/USFS will invite governmental and Tribal partners to participate in this Team, including the State Wildlife Agency and U.S. Fish and Wildlife Service, in compliance with the exemptions provided for committees defined in the Federal Advisory Committee Act and the regulations that implement that act. The BLM/USFS will strive for a collaborative and unified approach between Federal agencies (e.g. FWS, BLM, and USFS), Tribal governments, state and local government(s), and other stakeholders for greater sage-grouse conservation. The Team will provide advice, and will not make any decisions that impact Federal lands. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

*Developing a Regional Mitigation Strategy.* The Team will develop a Regional Mitigation Strategy to inform the mitigation components of NEPA analyses for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy will be developed within one year of the issuance of the Record of Decision. The BLM's Regional Mitigation Manual MS-1794 will serve as a framework for developing the Regional Mitigation Strategy. The Regional Mitigation Strategy will be applicable to the States/Field Offices/Forests within the WAFWA Management Zone's boundaries.

Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can provide a net conservation gain to the species. The Regional Mitigation Strategy developed by the Team will elaborate on the components identified above (i.e.

avoidance, minimization, and compensation; additionality, timeliness, and durability) and further explained in Appendix [X].

In the time period before the Strategy is developed, BLM will consider regional conditions, trends, and sites, to the greatest extent possible, when applying the mitigation hierarchy and will ensure that mitigation is consistent with the standards set forth in the first paragraph of this section.

*Incorporating the Regional Mitigation Strategy into NEPA Analyses.* The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

*Implementing a Compensatory Mitigation Program.* Consistent with the principles identified above, the BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be implemented at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

### **Chapter 3 – Affected Environment**

[Nothing to add]

### **Chapter 4 – Environmental Consequences – [Proposed Plan/Proposed Plan Amendment]**

#### **Mitigation**

This Chapter describes the environmental consequences associated with the impacts to greater sage-grouse and its habitat from activities carried out in conformance with this plan, in addition to BLM/USFS management actions. In undertaking BLM/USFS management actions, and consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and

compensating for impacts by applying beneficial mitigation actions. In addition, to help implement this [Proposed Plan / Proposed Plan Amendment], a WAFWA Management Zone Regional Mitigation Strategy (per Appendix [X]) will be developed within one year of the issuance of the Record of Decision. The Strategy will elaborate on the components identified in Chapter 2 (avoidance, minimization, compensation, additionality, timeliness, and durability), and will be considered by the BLM/USFS for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The implementation of a Regional Mitigation Strategy will benefit greater sage-grouse, the public, and land-users by providing a reduction in threats, increased public transparency and confidence, and a predictable permit process for land-use authorization applicants.

### Appendix [X]

- Add this new Appendix.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

### Appendix (X) – Mitigation – [Proposed Plan/Proposed Plan Amendment]

#### General

In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see glossary).

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy that will inform the NEPA decision making process including the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. A robust and transparent Regional Mitigation Strategy will contribute to greater sage-grouse habitat conservation by reducing, eliminating, or minimizing threats and compensating for residual impacts to greater sage-grouse and its habitat.

The BLM's Regional Mitigation Manual MS-1794 serves as a framework for developing and implementing a Regional Mitigation Strategy. The following sections provide additional guidance specific to the development and implementation of a WAFWA Management Zone Regional Mitigation Strategy.

### Developing a WAFWA Management Zone Regional Mitigation Strategy

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy to guide the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy should consider any State-level greater sage-grouse mitigation guidance that is consistent with the requirements identified in this Appendix. The Regional Mitigation Strategy should be developed in a transparent manner, based on the best science available and standardized metrics.

As described in Chapter 2, the BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. The Strategy will be developed within one year of the issuance of the Record of Decision.

The Regional Mitigation Strategy should include mitigation guidance on avoidance, minimization, and compensation, as follows:

- Avoidance
  - Include avoidance areas (e.g. right-of-way avoidance/exclusion areas, no surface occupancy areas) already included in laws, regulations, policies, and/or land use plans (e.g. Resource Management Plans, Forest Plans, State Plans); and,
  - Include any potential, additional avoidance actions (e.g. additional avoidance best management practices) with regard to greater sage-grouse conservation.
- Minimization
  - Include minimization actions (e.g. required design features, best management practices) already included in laws, regulations, policies, land use plans, and/or land-use authorizations; and,
  - Include any potential, additional minimization actions (e.g. additional minimization best management practices) with regard to greater sage-grouse conservation.
- Compensation
  - Include discussion of impact/project valuation, compensatory mitigation options, siting, compensatory project types and costs, monitoring, reporting, and program administration. Each of these topics is discussed in more detail below.
    - Residual Impact and Compensatory Mitigation Project Valuation Guidance
      - A common standardized method should be identified for estimating the value of the residual impacts and value of the compensatory mitigation projects, including accounting for any uncertainty associated with the effectiveness of the projects.

- This method should consider the quality of habitat, scarcity of the habitat, and the size of the impact/project.
- For compensatory mitigation projects, consideration of durability (see glossary), timeliness (see glossary), and the potential for failure (e.g. uncertainty associated with effectiveness) may require an upward adjustment of the valuation.
- The resultant compensatory mitigation project will, after application of the above guidance, result in proactive conservation measures for Greater Sage-grouse (consistent with BLM Manual 6840 – Special Status Species Management, section .02).
- **Compensatory Mitigation Options**
  - Options for implementing compensatory mitigation should be identified, such as:
    - Utilizing certified mitigation/conservation bank or credit exchanges.
    - Contributing to an existing mitigation/conservation fund.
    - Authorized-user conducted mitigation projects.
  - For any compensatory mitigation project, the investment must be additional (i.e. additionality: the conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project).
- **Compensatory Mitigation Siting**
  - Sites should be in areas that have the potential to yield a net conservation gain to the greater sage-grouse, regardless of land ownership.
  - Sites should be durable (see glossary).
  - Sites identified by existing plans and strategies (e.g. fire restoration plans, invasive species strategies, healthy land focal areas) should be considered, if those sites have the potential to yield a net conservation gain to greater sage-grouse and are durable.
- **Compensatory Mitigation Project Types and Costs**
  - Project types should be identified that help reduce threats to greater sage-grouse (e.g. protection, conservation, and restoration projects).
  - Each project type should have a goal and measurable objectives.
  - Each project type should have associated monitoring and maintenance requirements, for the duration of the impact.
  - To inform contributions to a mitigation/conservation fund, expected costs for these project types (and their monitoring and maintenance), within the WAFWA Management Zone, should be identified.
- **Compensatory Mitigation Compliance and Monitoring**
  - Mitigation projects should be inspected to ensure they are implemented as designed, and if not, there should be methods to enforce compliance.
  - Mitigation projects should be monitored to ensure that the goals and objectives are met and that the benefits are effective for the duration of the impact.

- Compensatory Mitigation Reporting
  - Standardized, transparent, scalable, and scientifically-defensible reporting requirements should be identified for mitigation projects.
  - Reports should be compiled, summarized, and reviewed in the WAFWA Management Zone in order to determine if greater sage-grouse conservation has been achieved and/or to support adaptive management recommendations.
- Compensatory Mitigation Program Implementation Guidelines
  - Guidelines for implementing the State-level compensatory mitigation program should include holding and applying compensatory mitigation funds, operating a transparent and credible accounting system, certifying mitigation credits, and managing reporting requirements.

### Incorporating the Regional Mitigation Strategy into NEPA Analyses

The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

### Implementing a Compensatory Mitigation Program

The BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be managed at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

### **Glossary Terms**

**Additionality:** The conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project. (adopted and modified from BLM Manual Section 1794).

**Avoidance mitigation:** Avoiding the impact altogether by not taking a certain action or parts of an action. (40 CFR 1508.20(a)) (e.g. may also include avoiding the impact by moving the proposed action to a different time or location.)

**Compensatory mitigation:** Compensating for the (residual) impact by replacing or providing substitute resources or environments. (40 CFR 1508.20)

**Compensatory mitigation projects:** The [restoration](#), [creation](#), [enhancement](#), and/or [preservation](#) of impacted resources (adopted and modified from 33 CFR 332), such as on-the-ground actions to improve and/or protect habitats (e.g. chemical vegetation treatments, land acquisitions, conservation easements). (adopted and modified from BLM Manual Section 1794).

**Compensatory mitigation sites:** The durable areas where compensatory mitigation projects will occur. (adopted and modified from BLM Manual Section 1794).

**Durability (protective and ecological):** the maintenance of the effectiveness of a mitigation site and project for the duration of the associated impacts, which includes resource, administrative/legal, and financial considerations. (adopted and modified from BLM Manual Section 1794).

**Minimization mitigation:** Minimizing impacts by limiting the degree or magnitude of the action and its implementation. (40 CFR 1508.20 (b))

**Residual impacts:** Impacts that remain after applying avoidance and minimization mitigation; also referred to as unavoidable impacts.

**Timeliness:** The lack of a time lag between impacts and the achievement of compensatory mitigation goals and objectives (BLM Manual Section 1794).

## Attachment II

### **Greater Sage-Grouse (GRSG) Land Use Plans Disturbance Caps Guidance**

#### **Purpose**

- I. Provide the planning units with land use planning actions that need to be incorporated into the administrative draft proposed plans to respond to the 3% disturbance cap once it is exceeded in either the Biologically Significant Units (BSU) or at the project scale.
- II. Provide guidance on the use of the west-wide habitat degradation (disturbance) data layers as well as the use of locally collected disturbance data for BSUs to determine if the disturbance cap has been exceeded as the land use plans (LUP) are being implemented.
- III. Provide guidance on the use of locally collected disturbance data for project authorizations to determine if the disturbance cap has been exceeded as the LUPs are being implemented.
- IV. Provide guidance on the inclusion of fire in disturbance calculations.
- V. Provide guidance on the use of the density of energy and mining facilities during authorizations
- VI. Provide guidance on the use of the BER analysis in the land use plans (Chapter 2, Affected Environment) and the use of the “west-wide” sagebrush availability and habitat degradation data/estimates for the Priority Habitat Management Areas in each population for monitoring and management purposes as the LUPs are being implemented.
- VII. Provide guidance on what is considered in the disturbance calculations versus what is considered for the disturbance cap.

#### **Guidance**

- I. Planning units will include the following land use plan actions within their administrative draft proposed land use plans (ADPPs) that states:
  - a. *If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.) will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.*
  - b. *If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a Priority Habitat Management Areas, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain*

*the area under the cap (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.).*

- II. Use of west-wide habitat degradation data as well as the use of locally collected disturbance data to determine the level of existing disturbance:
  - a) In the GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, use the west-wide data at a minimum and/or locally collected disturbance data as available (e.g., DDCT) for the anthropogenic disturbance types listed in Table 1.
  
- III. Use of locally collected disturbance data for project authorizations:
  - a) In a proposed project analysis area, digitize all existing anthropogenic disturbances identified in the GRSG Monitoring Framework and the 7 additional features that are considered threats to sage-grouse (Table 2). Using 1 meter resolution NAIP imagery is recommended. Use local data if available.
  
- IV. Fire-burned and habitat treatment areas will not be included in the project scale degradation disturbance calculation for managing sage-grouse habitat under a disturbance cap. These areas will be considered part of a sagebrush availability when rangewide, consistent, interagency fine- and site-scale monitoring has been completed and the areas have been determined to meet sage-grouse habitat requirements. These and other disturbances identified in Table 3 will be part of a sagebrush availability evaluation and will be considered along with other local conditions that may affect sage-grouse during the analysis of the proposed project area.
  
- V. Planning units are directed to use a density cap related to the density of energy and mining facilities (listed below) during project scale authorizations. If the disturbance density in a proposed project area is on average less than 1/ 640 acres, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than an average of 1/ 640 acres, either defer the proposed project or co-locate it into existing disturbed area (*subject to applicable laws and regulations, such as the 1872 Mining Law, valid existing rights, etc.*).
  - Energy (oil and gas wells and development facilities)
  - Energy (coal mines)
  - Energy (wind towers)
  - Energy (solar fields)
  - Energy (geothermal)
  - Mining (active locatable, leasable, and saleable developments)

- VI. Planning units are directed to continue using the baseline data from the 2013 USGS Baseline Environmental Report (BER) in the Affected Environment section of the proposed plans/ FEISs. West-wide sagebrush availability and habitat degradation data layers will be used for the Priority Habitat Management Areas in each population for monitoring (see the GRSG Monitoring Framework in the Monitoring Appendix of the EIS) and management purposes as the LUPs are being implemented. The BER reported on individual threats across the range of sage-grouse while the west-wide disturbance calculation consolidated the anthropogenic disturbance data into a single measure using formulas from the GRSG Monitoring Framework. These calculations will be completed on an annual basis by the BLM's National Operation Center. Planning units will be provided the 2014 baseline disturbance calculation derived from the west-wide data once the RODs are signed that describe the Priority Habitat Management Areas.
- VII. Planning units are directed to use the three measures (sagebrush availability, habitat degradation, density of energy and mining) in conjunction with other information during the NEPA process to most effectively site project locations, such as by clustering disturbances and/or locating facilities in already disturbed areas. Although locatable mine sites are included in the degradation calculation, mining activities under the 1872 mining law may not be subject to the 3% disturbance cap. Details about locatable mining activities should be fully disclosed and analyzed in the NEPA process to assess impacts to sage-grouse and their habitat as well as to BLM goals and objectives, and other BLM programs and activities.

### **Additional Information/Formulas**

A collaborative effort in Idaho developed a disturbance calculation method that includes the 3% disturbance cap plus a modifier that includes effective habitat and is described in Appendix G of their ADPP. The formulas below are excerpted from that Appendix.

Disturbance Calculations for the BSU:

$$\begin{aligned} & \text{Disturbance Percentage} \\ & = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}^1}{\text{Acres within the BSU} * \left( \frac{\text{Acres of Effective Habitat within the BSU}}{\text{Acres within the BSU}} + 0.3 \right)} \right) \times 100 \end{aligned}$$

Disturbance Calculations for Project Analysis Areas (PAAs):

$$\text{Disturbance Percentage} = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}^{1,2}}{\text{Acres within the PAA} * \left( \frac{\text{Acres of Effective Habitat within the PAA}}{\text{Acres within the PAA}} + 0.3 \right)} \right) \times 100$$

<sup>1</sup> see Table 3. <sup>2</sup> see Table 2.

Project analysis area (PAA) method for permitting surface disturbance activities:

1. Determine potentially affected occupied leks by placing a four-mile buffer around the project boundary as defined by the proposed area of physical disturbance related to the project. All occupied leks within this buffer will be considered affected by the proposed project.
2. Next place a four mile boundary around each of the occupied leks identified in item 1, above.
3. The polygon formed by the merging and dissolving of polygons from step 1 and 2 creates the Project Analysis Area (PAA) for surface disturbance activities.
4. Map existing disturbances within the analysis area or use locally available spatial data. Use of digitized NAIP imagery is recommended.
5. Calculate percent existing disturbance using the formula above. If existing disturbance is less than 3%, proceed to next step. If existing disturbance is greater than 3%, defer the project.
6. Add proposed project disturbance footprint area and recalculate the percent disturbance. If disturbance is less than 3%, proceed to next step. If disturbance is greater than 3%, defer project.
7. Calculate the disturbance density of energy and mining facilities (listed above). If the disturbance density is less than 1 facility per 640 acres, averaged across project analysis area, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than 1 facility per 640 acres, averaged across the project analysis area, either defer the proposed project or co-locate it into existing disturbed area.
8. If a project that would exceed the degradation cap or density cap cannot be deferred due to valid existing rights or other existing laws and regulations, fully disclose the local and regional impacts of the proposed action in the associated NEPA.

Table 1. Anthropogenic disturbance types for disturbance calculations. Data sources are described for the west-wide habitat degradation estimates (Table copied from the GRSG Monitoring Framework)

<b>Degradation Type</b>	<b>Subcategory</b>	<b>Data Source</b>	<b>Direct Area of Influence</b>	<b>Area Source</b>
<b>Energy (oil &amp; gas)</b>	Wells	IHS; BLM (AFMSS)	5.0ac (2.0ha)	BLM WO-300

Infrastructure (power lines)		X	
Infrastructure (communication towers)		X	
Infrastructure (other vertical structures)		X	
Other developed rights-of-way		X	

## **Background**

In the USFWS's 2010 listing decision for sage-grouse, the USFWS identified 18 threats contributing to the destruction, modification, or curtailment of the sage-grouse's habitat or range (75 FR 13910 2010). In April 2014, the Interagency GRSG Disturbance and Monitoring Sub-Team finalized the Greater Sage-Grouse Monitoring Framework (hereafter, framework) to track these threats. The 18 threats have been aggregated into three measures to account for whether the threat predominantly removes sagebrush or degrades habitat. The three measures are:

Measure 1: Sagebrush Availability (percent of sagebrush per unit area)

Measure 2: Habitat Degradation (percent of human activity per unit area)

Measure 3: Density of Energy and Mining (facilities and locations per unit area)

The BLM is committed to monitoring the three disturbance measures and reporting them to the FWS on an annual basis. However, for the purposes of calculating the amount of disturbance to provide information for management decisions and inform the success of the sage-grouse planning effort, the data depicting the location and extent of the 12 anthropogenic types of threats will be used at a minimum in the BSUs and those same 12 anthropogenic and the additional 7 types of features that are threats to sage-grouse will be used in the project analysis areas.

		Scales		
		Broad/Mid (Populations)	Intermediate (BSU)	Local/Project (Seas. Hab.)
Habitat Degradation	Unit:	WAFWA Populations	Biologically Significant Unit	Project/Local Habitat Area <sup>5</sup>

<b>ACRONYMS</b>				
PHMA = Priority Habitat Management Area      BSU = Biologically Significant Unit				
EVT = Existing Vegetation Type                      EpS = Areas of Biotic Potential				
<sup>1</sup> Only mines with a Plan of Operation (>5 acres of disturbance) will be included.				
<sup>2</sup> Westwide data will be used only if state or local data are not available.				
<sup>3</sup> This footnote was removed from the table. January 2015.				
<sup>4</sup> This may be one of several variables used to inform Adaptive Management. The BSU is the scale at which Adaptive Management will be applied.				
<sup>5</sup> A moving window analysis will be conducted at this scale by the NOC using westwide data. If available, state and local data/analysis should be used for Adaptive Management				
<sup>6</sup> The project analysis area will be based on a 4-mile radius polygon around the project area combined with a 4-mile buffer around any leaks within the project boundary in PHMA (Idaho methodology).				
<sup>7</sup> See Table 2				

## Attachment III

### **Greater Sage-Grouse (GRSG) Land Use Plans Vegetation Objectives Guidance**

#### **Purpose**

- I. Provide the planning units with land use planning vegetation objectives that need to be incorporated into the administrative draft proposed plans.
- II. Provide guidance on the use of a template for GRSG habitat objectives in the Special Status Species section of the ADPPs.
- III. Provide guidance on prioritizing land health assessments in sage-grouse habitats and conducting assessments at the watershed scale using the sage-grouse habitat objectives.

#### **Guidance**

- I. Planning units will include the following land use plan vegetation objective within the Vegetation section of their administrative draft proposed land use plans (ADPPs) that states:

*In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).*
- II. Planning units will populate the GRSG Habitat Objectives table template to provide vegetation objectives for sage-grouse life history stages based on the ecology in your region to be used to meet the applicable land health standard in GRSG habitats. Planning units are encouraged to work across boundaries when developing the objectives to ensure regional continuity and will provide appropriate peer-reviewed science to support the habitat values for the indicators. These desired condition value can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%). Planning units may include additional indicators and desired condition values as appropriate (see the Sage-Grouse Habitat Assessment Framework (HAF, *Technical Reference 6710-1*) for appropriate indicators). The HAF contains values for habitat suitability indicators in sage-grouse seasonal habitats from the Connelly et al. (2000) sage-grouse guidelines and has incorporated many of the core indicators in the AIM strategy (Toevs et al. 2011) as well. Planning units may use the indicator values from Connelly et al. (2000) while developing the land use plan Sage-Grouse Habitat Objectives table.

When using the indicators to guide management actions or during land health assessments, consider that the indicators are sensitive to the ecological processes operating at the scale of interest and that a single habitat indicator does not necessarily define habitat suitability for an area or particular scale. Indicators must be collectively reviewed, assessed based on the site potential, and put into spatial and temporal context to correctly determine habitat suitability which will include more than one scale and multiple indicators. Assessment and evaluation of these objectives will follow the steps described in the HAF.

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP and is to be used as a minimum to meet the applicable land health standard in sage-grouse habitats.

Greater Sage-Grouse Habitat Objectives

ATTRIBUTE	INDICATORS	DESIRED CONDITION	Reference
<b>BREEDING AND NESTING (Seasonal Use Period March 1-June 15)</b>			
Lek Security	Proximity of trees		
	Proximity of sagebrush to leks		
Cover	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover		
	Sagebrush height Arid sites Mesic sites		
	Predominant sagebrush shape		
	Perennial grass cover Arid sites Mesic sites		
	Perennial grass and forb height		
	Perennial forb canopy cover Arid sites Mesic sites		
<b>BROOD-REARING/SUMMER<sup>1</sup> (Seasonal Use Period June 16-October 31)</b>			
Cover	% of Seasonal habitat meeting desired condition		
	Sagebrush canopy cover		
	Sagebrush height		
	Perennial grass canopy cover and forbs		
	Riparian areas/mesic meadows		
	Upland and riparian perennial forb availability		
<b>WINTER<sup>1</sup> (Seasonal Use Period November 1-February 28)</b>			
Cover and Food	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover above snow		
	Sagebrush height above snow		

- III. The BLM will prioritize land health assessments in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. Field offices are to conduct land health assessments at the watershed scale and use the GRSG habitat objectives when assessing the applicable standard in GRSG habitats.

When conducting land health assessments, the BLM should follow, at a minimum, “Interpreting Indicators of Rangeland Health” (Pellant et. al. 2005) and the “BLM Core Terrestrial Indicators and Methods” (MacKinnon et al. 2011). For assessments being conducted in GRSG designated management areas, the BLM should collect additional data to inform the HAF indicators that have not been collected using the above methods. Implementation of the principles outlined in the AIM strategy will allow the data to be used to generate unbiased estimates of condition across the area of interest; facilitate consistent data collection and rollup analysis among management units; help provide consistent data to inform the classification and interpretation of imagery; and provide condition and trend of the indicators describing sagebrush characteristics important to sage-grouse habitat.

## Attachment IV

### **Incorporating GSGR RMP Decisions into Grazing Authorizations**

#### **Purpose**

The purpose is to provide recommended ADPP language; outline the process for prioritizing the review and processing of grazing permits/leases to determine if modification is necessary (prior to renewal and in accordance with prioritization criteria); provide direction for including specific management thresholds and defined responses that will allow adjustments to livestock grazing within the terms and conditions of permits; and provide a process for prioritizing compliance monitoring within Sagebrush Focal Areas (SFAs) and Priority Habitat Management Areas (PHMAs).

#### **Background**

The BLM manages approximately 18,000 livestock grazing permits and leases on the public lands. Livestock grazing is an integral part of the BLM multiple-use mission and is authorized by the Taylor Grazing Act (1934), the Federal Land Policy Management Act (1976) and the Public Rangeland Improvement Act (1978). By statute and regulation, grazing leases and permits are normally issued for 10-year periods. Annually, a range of 1,200 to 3,200 grazing permits expire and the BLM receives 500 to 1,500 grazing permit/lease transfer requests.

The BLM currently issues permits/leases in accordance with:

- All applicable law, regulation, policy (NEPA, consultation, proposed/final grazing decision-also known as a fully processed permit); or
- Various appropriation authorities enacted between 1999 and 2014 extending terms and conditions of expiring or transferred permits/leases that the BLM is unable to fully process before their expiration; or
- Section 402(c)(2) of FLPMA (as amended by Public Law 113-291, enacted December 19, 2014).

Congress has acted to ensure that grazing permittees could continue to graze if the BLM is unable to complete the environmental analysis mandated by the NEPA and other applicable laws. Since 1999, a provision (“the rider”) has been included in the Interior Appropriations bill that, in various forms, generally authorizes the BLM to renew grazing permits and leases under their same terms and conditions until it fully processes the permit renewal in compliance with NEPA, ESA, and other legal or regulatory requirements. The most recent rider is contained in Section 411, Public Law 113-76.<sup>1</sup> The FLPMA amendment to Section 402 (c) allows BLM to renew

---

<sup>1</sup> The Consolidated Appropriations Act, 2014 includes the provision Section 411 which states: “Section 415 of division E of Public Law 112–74 is amended by striking “and 2013” and inserting “through 2015.” The terms and conditions of section 325 of Public Law 108-108 (117 stat. 1307), regarding permits at the Department of the Interior and the Forest Service, shall remain in effect through fiscal year 2015. A grazing permit or lease issued by the Secretary of the Interior for lands administered by the Bureau of Land Management that is the subject of a request for a grazing preference transfer shall be issued, without further processing, for the remaining time period in

grazing permits and leases under the same terms and conditions. This relieves the BLM's renewal processing workload, allowing the BLM to prioritize permit processing based on sensitivity of the resources at issue.<sup>2</sup>

The BLM may modify terms and conditions of a permit or lease at any time following completion of appropriate analysis and consultation, cooperation, and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public.<sup>3</sup> Under 43 C.F.R. 4160.1, the BLM must serve a proposed decision on any affected applicant, permittee or lessee, any agent and lien holder of record. Copies of the decisions are provided to the interested publics.

**Recommended Language to be incorporated as Livestock Grazing Management Actions within the GRSG ADPPs:**

- The BLM will prioritize the review of grazing permits/leases, including those prior to renewal to determine if modification is necessary, and processing of grazing permits and leases, in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource conditions (ex., fire) and legal obligations.
- The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.
- Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to

---

the existing permit or lease using the same mandatory terms and conditions. If the authorized officer determines a change in the mandatory terms and conditions is required, the new permit must be processed as directed in section 325 of Public Law 108-108.” Where a FO is unable to fully process a permit renewal in compliance with all applicable laws prior to the permit expiration, Section 411 extends the authority to renew the grazing permit with the same terms and conditions as the expiring permit. Section 325 provides the process for authorizing grazing until a permit or lease is issued in compliance with all applicable law and regulatory processes.

<sup>2</sup> The newly amended section 402(c) of FLPMA provides permanent authority to BLM to renew expiring permits. That section states, “The terms and conditions in a grazing permit or lease that has expired, or was terminated due to a grazing preference transfer, shall be continued under a new permit or lease until the date on which the Secretary concerned completes any environmental analysis and documentation for the permit or lease required under the National Environmental Policy Act of 1969 (42 U.S.C. 4321 et seq.) and other applicable laws.”

<sup>3</sup> 43 CFR 4130.3-3 states: Following consultation, cooperation and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public, the authorized officer may modify terms and conditions of the permit or lease when the active grazing use or related management practices are not meeting the land use plan, allotment management plan or other activity plan, or management objectives, or is not in conformance with the provisions of subpart 4180 (Fundamentals of Rangeland Health and Standards and Guidelines for Grazing Administration).

help ensure compliance with the terms and conditions within the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.

- At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

### **Addressing GRSG RMP Amendments/Revisions Objectives in Grazing Permits/Leases**

BLM will develop criteria to prioritize the workload to process permits/leases (either fully processed or reauthorized based on the Appropriations rider, or issued under Section 402(c)(2) of FLPMA) and determine whether modification is necessary prior to renewal within PHMAs, beginning with those in SFAs. In setting priorities, those containing riparian areas and areas not meeting Land Health Standards (43 C.F.R. 4180) will take precedence. Potential criteria for prioritizing permit modifications could include:

- Are there riparian areas or wet meadows in the permit/lease area?
- Was current livestock grazing identified as a causal factor for not meeting Land Health Standards?
- Since the last allotment/watershed evaluation, is there current monitoring information to determine that the watershed/allotment is currently achieving or making significant progress towards achieving land health standards?
- Does the permit have terms and conditions adequate to ensure proper grazing practices to meet GRSG habitat objectives found in the Special Status Species section of the land use plan?
- Is there data that indicates that the GRSG habitat objectives, including the Habitat Objectives table, found in the Special Status Species section of the land use plan are being met?
- Is there a request from the permittee to modify the terms and conditions of his/her permit?

Additionally, if an existing permit/lease within PHMAs requires modification because current grazing is a significant causal factor for not meeting the Land Health Standards, the BLM will prepare the appropriate NEPA analysis and issue the proposed/final grazing decision under 43 C.F.R. Subpart 4160, subject to administrative appeal and potential judicial challenge.

The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA. Adjustments to meet seasonal Sage-Grouse habitat requirements could include:

- Season or timing of use;
- Numbers of livestock (includes temporary non-use or livestock removal);
- Distribution of livestock use;
- Intensity of use; and
- Type of livestock (e.g., cattle, sheep, horses, llamas, alpacas and goats).

## **Compliance Monitoring**

The BLM will monitor grazing permits/leases renewed or modified in accordance with the direction contained in this guidance as follows: Allotments within SFAs, followed by those in other PHMA, and focusing on those with riparian areas, will be prioritized for monitoring to ensure compliance with the terms and conditions in the permits. The BLM will collect, at a minimum, the following monitoring data:

- Vegetation Condition
- Actual Use
- Utilization
- Use Supervision

## **Concerning Voluntary Relinquishments**

All ADPPs will include the following language:

At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

For completing this, BLM offices should use [WO IM 2013-184 Relinquishment of Grazing Permitted Use](#) or the most recent policy guidance.

Attachment V

**Applying Lek Buffer-Distances When Approving Actions**

- *Buffer Distances and Evaluation of Impacts to Leks*

Evaluate impacts to leks from actions requiring NEPA analysis. In addition to any other relevant information determined to be appropriate (e.g. State wildlife agency plans), the BLM will assess and address impacts from the following activities using the lek buffer-distances as identified in the USGS Report *Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review* ([Open File Report 2014-1239](#)). The BLM will apply the lek buffer-distances specified as the lower end of the interpreted range in the report unless justifiable departures are determined to be appropriate (see below). The lower end of the interpreted range of the lek buffer-distances is as follows:

  - linear features (roads) within 3.1 miles of leks
  - infrastructure related to energy development within 3.1 miles of leks.
  - tall structures (e.g., communication or transmission towers, transmission lines) within 2 miles of leks.
  - low structures (e.g., fences, rangeland structures) within 1.2 miles of leks.
  - surface disturbance (continuing human activities that alter or remove the natural vegetation) within 3.1 miles of leks.
  - noise and related disruptive activities including those that do not result in habitat loss (e.g., motorized recreational events) at least 0.25 miles from leks.

Justifiable departures to decrease or increase from these distances, based on local data, best available science, landscape features, and other existing protections (e.g., land use allocations, state regulations) may be appropriate for determining activity impacts. The USGS report recognized “that because of variation in populations, habitats, development patterns, social context, and other factors, for a particular disturbance type, there is no single distance that is an appropriate buffer for all populations and habitats across the sage-grouse range”. The USGS report also states that “various protection measures have been developed and implemented... [which have] the ability (alone or in concert with others) to protect important habitats, sustain populations, and support multiple-use demands for public lands”. All variations in lek buffer-distances will require appropriate analysis and disclosure as part of activity authorization.

In determining lek locations, the BLM will use the most recent active or occupied lek data available from the state wildlife agency.

- *For Actions in GHMA*

The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis.

  - Impacts should first be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.
  - If it is not possible to relocate the project outside of the applicable lek buffer-distance(s) identified above, the BLM may approve the project only if:
    - Based on best available science, landscape features, and other existing protections, (e.g., land use allocations, state regulations), the BLM determines that a lek buffer-distance other than the applicable distance identified above offers the same or a greater

level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area; or

- The BLM determines that impacts to GRSG and its habitat are minimized such that the project will cause minor or no new disturbance (ex. co-location with existing authorizations); and
- Any residual impacts within the lek buffer-distances are addressed through compensatory mitigation measures sufficient to ensure a net conservation gain, as outlined in the Mitigation Strategy (Appendix X).

- *For Actions in PHMA*

The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis. Impacts should be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.

The BLM may approve actions in PHMA that are within the applicable lek buffer distance identified above only if:

- The BLM, with input from the state fish and wildlife agency, determines, based on best available science, landscape features, and other existing protections, that a buffer distance other than the distance identified above offers the same or greater level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area.
- The BLM will explain its justification for determining the approved buffer distances meet these conditions in its project decision.

Issue	Applies To	Where to incorporate	Language
Land Retention	All ADPPs	Section 2.6.2, Lands and Realty – Land Tenure	<p>Include drop-in language:</p> <p><i>"Lands classified as priority, important, and general habitat for Greater Sage-Grouse will be retained in federal management unless: (1) the agency can demonstrate that disposal of the lands will provide a net conservation gain to the Greater Sage-Grouse or (2) the agency can demonstrate that the disposal of the lands will have no direct or indirect adverse impact on conservation of the Greater Sage-Grouse."</i></p>
Prescribed Fire	All ADPPs	Section 2.6.2, Wildland Fire Management – Pre-Suppression	<p>Include drop-in language:</p> <p><i>"If prescribed fire is used in Greater Sage-Grouse habitat, the NEPA analysis for the Burn Plan will address:</i></p> <ul style="list-style-type: none"> <li><i>• why alternative techniques were not selected as a viable options;</i></li> <li><i>• how Greater Sage-Grouse goals and objectives would be met by its use;</i></li> <li><i>• how the COT Report objectives would be addressed and met;</i></li> <li><i>• a risk assessment to address how potential threats to Greater Sage-Grouse habitat would be minimized.</i></li> </ul> <p><i>a) Allow prescribed fire as a vegetation or fuels treatment in Wyoming big sagebrush sites or other xeric sagebrush species sites, or in areas with a potential for post-fire exotic annual dominance only after the NEPA analysis for the Burn Plan has addressed the four bullets outlined above. Prescribed fire could be used to meet specific fuels objectives that would protect Greater Sage-Grouse habitat in PHMAs (e.g., creation of fuel breaks that would disrupt the fuel continuity across the landscape in stands where annual invasive grasses are a minor component in the understory, burning slash piles from conifer reduction treatments, used as a component with other treatment methods to combat annual grasses and restore native plant communities).</i></p> <p><i>b) Allow prescribed fire in known winter range only after the NEPA analysis for the Burn Plan has addressed the four bullets outlined above. Any prescribed fire in winter habitat would need to be designed to strategically reduce wildfire risk around and/or in the winter range and designed to protect winter range habitat quality."</i></p>
Conifer Removal	All ADPPs	Section 2.6.2, Vegetation – Conifer Encroachment	<p>Include drop-in language:</p> <p><u>For Great Basin</u>  <i>"Remove conifers encroaching into sagebrush habitats. Prioritize treatments closest to occupied sage-grouse habitats and near occupied leks, and where juniper encroachment is phase 1 or phase 2. Use of site-specific analysis and tools like VDDT and the FIAT report (Chambers et. al., 2014) will help refine the location for specific areas to be treated."</i></p> <p><u>For Rocky Mountain</u>  <i>"Remove conifers encroaching into sagebrush habitats. Prioritize treatments closest to occupied sage-grouse habitats and near occupied leks, and where juniper encroachment is phase 1 or phase 2. Use of site-specific</i></p>

			<p><i>analysis and principles like those included in the FIAT report (Chambers et. al., 2014) and other ongoing modeling efforts to address conifer encroachment will help refine the location for specific priority areas to be treated.”</i></p>
TTM Temp Closures	All ADPPs	Section 2.6.2, Comprehensive Trails and Travel Management	<p>Include drop-in language:</p> <p><i>“In PHMA, IHMA, and GHMA, temporary closures will be considered in accordance with 43 CFR subpart 8364 (Closures and Restrictions); 43 CFR subpart 8351 (Designated National Area); 43 CFR subpart 6302 (Use of Wilderness Areas, Prohibited Acts, and Penalties); 43 CFR subpart 8341 (Conditions of Use).</i></p> <p><i>Temporary closure or restriction orders under these authorities are enacted at the discretion of the authorized officer to resolve management conflicts and protect persons, property, and public lands and resources. Where an authorized officer determines that off-highway vehicles are causing or will cause considerable adverse effects upon soil, vegetation, wildlife, wildlife habitat, cultural resources, historical resources, threatened or endangered species, wilderness suitability, other authorized uses, or other resources, the affected areas shall be immediately closed to the type(s) of vehicle causing the adverse effect until the adverse effects are eliminated and measures implemented to prevent recurrence. (43 CFR 8341.2) A closure or restriction order should be considered only after other management strategies and alternatives have been explored. The duration of temporary closure or restriction orders should be limited to 24 months or less; however, certain situations may require longer closures and/or iterative temporary closures. This may include closure of routes or areas.”</i></p>
Recreation Facilities	All ADPPs	Section 2.6.2, Recreation and Visitor Services	<p>Include drop-in language:</p> <p><i>“In PHMA and IHMA, do not construct new recreation facilities (e.g., campgrounds, trails, trailheads, staging areas) unless the development would have a net conservation gain to GRSG habitat (such as concentrating recreation, diverting use away from critical areas, etc.), or unless the development is required for visitor health and safety or resource protection.”</i></p>
WH&B	Utah, Oregon, Nevada, Idaho ADPPs	Section 2.6.2, Wild Horses and Burros	<p>Include drop-in language (Oregon, Nevada, Idaho will include language highlighted in yellow prioritizing WHB management actions in SFAs) :</p> <p><u><i>“Management Action 1:</i></u> <i>Manage herd management areas (HMAs) in GRSG habitat within established AML ranges to achieve and maintain GRSG habitat objectives (Table 2-X).</i></p> <p><u><i>Management Action 2:</i></u> <i>Complete rangeland health assessments for HMAs containing GRSG habitat using an interdisciplinary team of specialists (e.g. range, wildlife, and riparian). The priorities for conducting assessments are:</i></p> <ol style="list-style-type: none"> <li><i>1. HMAs containing SFA;</i></li> <li><i>2. HMAs containing PHMA;</i></li> <li><i>3. HMAS containing IHMA</i></li> <li><i>4. HMAs containing only GHMA;</i></li> <li><i>5. HMAs containing sagebrush habitat outside of PHMA, IHMA. and GHMA mapped habitat;</i></li> </ol>

			<p>6. <i>HMA</i>s without <i>GRSG</i> habitat.</p> <p><u>Management Action 3:</u> <i>Prioritize gathers and population growth suppression techniques in HMA</i>s in <i>GRSG</i> habitat, unless removals are necessary in other areas to address higher priority environmental issues, including herd health impacts. Place higher priority on Herd Areas not allocated as Herd Management Areas and occupied by wild horses and burros in <i>SFA</i>s followed by <i>PHMA</i>, as these areas are to be managed for zero wild horses and burros.</p> <p><u>Management Action 4:</u> In <i>SFA</i>s and <i>PHMA</i> outside of <i>SFA</i>, assess and adjust <i>AML</i>s through the <i>NEPA</i> process within <i>HMA</i>s when wild horses or burros are identified as a significant causal factor in not meeting land health standards, even if current <i>AML</i> is not being exceeded .</p> <p><u>Management Action 5:</u> In <i>SFA</i>s and <i>PHMA</i> outside of <i>SFA</i>, monitor the effects of <i>WHB</i> use in relation to <i>GRSG</i> seasonal habitat objectives on an annual basis to help determine future management actions.</p> <p><u>Management Action 6:</u> Develop or amend herd management area plans (<i>HMAP</i>s) to incorporate <i>GRSG</i> habitat objectives and management considerations for all <i>HMA</i>s within <i>GRSG</i> habitat, with emphasis placed on <i>SFA</i>s and other <i>PHMA</i>s.</p> <p><u>Management Action 7:</u> Consider removals or exclusion of <i>WHB</i> during or immediately following emergency situations (such as fire, floods, and drought) to facilitate meeting <i>GRSG</i> habitat objectives where <i>HMA</i>s overlap with <i>GRSG</i> habitat.</p> <p><u>Management Action 8:</u> When conducting <i>NEPA</i> analysis for wild horse/burro management activities, water developments, or other rangeland improvements for wild horses, address the direct and indirect effects to <i>GRSG</i> populations and habitat. Implement any water developments or rangeland improvements using the criteria identified for domestic livestock.</p> <p><u>Management Action 9:</u> Coordinate with professionals from other federal and state agencies, researchers at universities, and others to utilize and evaluate new management tools (e.g., population growth suppression, inventory techniques, and telemetry) for implementing the <i>WHB</i> program.”</p>
Split Estate	All <i>ADPP</i> s	Section 2.6.2, Fluid Minerals	<p>Include drop-in language:</p> <p>“Where the federal government owns the mineral estate in <i>PHMA</i>s, <i>IHMA</i>s, and <i>GHMA</i>s, and the surface is in non-federal ownership, apply the same stipulations, <i>COA</i>s, and/or conservation measures and <i>RDF</i>s applied if the mineral estate is developed on <i>BLM</i>-administered lands in that management area, to the maximum extent permissible under existing authorities, and in coordination with the landowner.”</p> <p>“Where the federal government owns the surface and the mineral estate is in non-federal ownership in <i>PHMA</i>, <i>IHMA</i>, and <i>GHMA</i>, apply appropriate surface use <i>COA</i>s, stipulations, and mineral <i>RDF</i>s through <i>ROW</i> grants or</p>

			<i>other surface management instruments, to the maximum extent permissible under existing authorities, in coordination with the mineral estate owner/lessee.”</i>
Technical/ Economically Feasible	All ADPPs	Glossary	<p>Include drop-in language:</p> <p><i>“Actions that are practical or feasible from the technical and economic standpoint and using common sense, rather than simply desirable from the standpoint of the applicant. It is the BLM’s sole responsibility to determine what actions are technically and economically feasible. The BLM will consider whether implementation of the proposed action is likely given past and current practice and technology; this consideration does not necessarily require a cost-benefit analysis or speculation about an applicant’s costs and profit.”</i> (Modified from the CEQ’s 40 Most Asked Questions and BLM NEPA Handbook, Section 6.6.3)</p>
RDFs	All ADPPs	Appendix, Glossary	<p>Insert as introductory text in the RDF Appendix, and as an entry in the glossary under “Required Design Feature”</p> <p><i>Required Design Features (RDFs) are required for certain activities in all GRSG habitat. RDFs establish the minimum specifications for certain activities to help mitigate adverse impacts. However, the applicability and overall effectiveness of each RDF cannot be fully assessed until the project level when the project location and design are known. Because of site-specific circumstances, some RDFs may not apply to some projects (e.g., a resource is not present on a given site) and/or may require slight variations (e.g., a larger or smaller protective area). All variations in RDFs would require that at least one of the following be demonstrated in the NEPA analysis associated with the project/activity:</i></p> <ul style="list-style-type: none"> <li>• <i>A specific RDF is documented to not be applicable to the site-specific conditions of the project/activity (e.g. due to site limitations or engineering considerations). Economic considerations, such as increased costs, do not necessarily require that an RDF be varied or rendered inapplicable;</i></li> <li>• <i>An alternative RDF is determined to provide equal or better protection for GRSG or its habitat;</i></li> <li>• <i>A specific RDF will provide no additional protection to GRSG or its habitat.</i></li> </ul>
PACs/COT	All ADPPs	Chapter 1 (exact location TBD, will vary for each ADPP)	<p>Include drop-in language:</p> <p><b><i>Greater Sage-grouse Conservation Objectives: Priority Areas for Conservation and how they correlate with Priority and General Habitat Management Areas</i></b></p> <p><i>In 2012, the Director of the USFWS asked the Conservation Objectives Team (COT), consisting of state and USFWS representatives, to produce recommendations regarding the degree to which the threats need to be reduced or ameliorated to conserve GRSG so that it would no longer be in danger of extinction or likely to become in danger of extinction in the foreseeable future. The COT Report (USFWS 2013a) provides objectives based upon the best scientific and commercial data available at the time of its release. The BLM/FS planning decisions analyzed in the LUP/EISs are intended to ameliorate threats identified in the COT report and to reverse the trends in habitat condition. The COT Report can be viewed online at the following address:</i></p> <p><a href="http://www.fws.gov/mountain-prairie/species/birds/sagegrouse/COT/COT-Report-with-Dear-Interested-Reader-">http://www.fws.gov/mountain-prairie/species/birds/sagegrouse/COT/COT-Report-with-Dear-Interested-Reader-</a></p>

			<p><a href="#">Letter.pdf</a></p> <p><i>The highest level objective in the COT Report is identified as meeting the objectives of WAFWA’s 2006 GRSG Comprehensive Strategy of “reversing negative population trends and achieving a neutral or positive population trend.”</i></p> <p><i>The COT Report provides a WAFWA Management Zone and Population Risk Assessment. The report identifies localized threats from sagebrush elimination, fire, conifer encroachment, weed and annual grass invasion, mining, free-roaming wild horses and burros, urbanization, and widespread threats from energy development, infrastructure, grazing, and recreation (USFWS 2013a, p. 18).</i></p> <p><i>Key areas across the landscape that are considered “necessary to maintain redundant, representative, and resilient populations” are identified within the COT Report. The USFWS in concert with the respective state wildlife management agencies identified these key areas as Priority Areas for Conservation (PACs).</i></p> <p><i>Within the [insert name of planning area here], the PACs consist of a total _____ acres. Under the Proposed Plan, the PACs are comprised of _____ acres of PHMA managed by the BLM/FS, _____ acres of GHMA managed by the BLM/FS, and _____ acres of non-habitat managed by the BLM/FS [adapt to each particular ADPP, such as include IHMA in Idaho and “other mapped habitat” in Nevada].</i></p>
SFA	All ADPPs that have SFA	Section 1.1.1 (for amendments), will vary for revisions	<p>Include drop-in language:</p> <p><i>“On October 27, 2014, the FWS provided the BLM/FS a memorandum titled “Greater Sage-Grouse: Additional Recommendations to Refine Land Use Allocations in Highly Important Landscapes”. The memorandum and associated maps provided by the FWS identify areas that represent recognized “strongholds” for GRSG that have been noted and referenced by the conservation community as having the highest densities of GRSG and other criteria important for the persistence of the species. These areas have been incorporated into the Proposed Plan as Sagebrush Focal Areas (SFA) (Map X), and will be managed as PHMA with the following additional management:</i></p> <ol style="list-style-type: none"> <li><i>1) Recommended for withdrawal from the General Mining Act of 1872, subject to valid existing rights.</i></li> </ol> <p>[Note: item #1 will need to be adjusted for WY to say: “Recommended for withdrawal from the General Mining Act of 1872, subject to valid existing rights, the lands show in Map Y (x acres)]</p> <ol style="list-style-type: none"> <li><i>2) Managed as NSO, without waiver, exception, or modification, for fluid mineral leasing.</i></li> <li><i>3) Prioritized for management and conservation actions in these areas, including, but not limited to review of livestock grazing permits/leases (see livestock grazing section for additional actions).”</i></li> </ol> <p>The SOL will work with the BLM Subregional Teams to draft language that address specifically how non-habitat within SFAs was handled in ADPPs. Idaho, Nevada, and Utah ADPPs will likely need more specific language.</p>
		Glossary	<p>Include drop-in definition for “Sagebrush Focal Area”:</p> <p><i>“Areas identified by the FWS that that represent recognized “strongholds” for GRSG that have been noted and</i></p>

			<i>referenced by the conservation community as having the highest densities of GRSG and other criteria important for the persistence of GRSG.”</i>
All Allocations	All ADPPs	Chap 1, Planning Criteria Section	Include drop-in language as a separate planning criterion:  <i>“Where more restrictive land use allocations or decisions are made in existing RMPs, those more restrictive land use allocations or decisions will remain in effect and will not be amended by this LUPA.”</i>
		Chap 2, Management Common to All Alternatives	Include drop-in language as a management action common to all alternatives:  <i>“Where more restrictive land use allocations or decisions are made in existing RMPs, those more restrictive land use allocations or decisions will remain in effect and will not be amended by this LUPA.”</i>
Buffers	All ADPPs except for those in WY	Section 1.1.1 (for amendments), will vary for revisions	Include drop-in language:  <i>“On November 21, 2014 the USGS published “Conservation Buffer Distance Estimates for Greater Sage-Grouse—A Review” (USGS 2014). The USGS review provided a compilation and summary of published scientific studies that evaluate the influence of anthropogenic activities and infrastructure on GRSG populations. The BLM has reviewed this information and examined how lek buffer-distances were addressed through land use allocations and other management actions in the Draft [Insert Plan Name]. Based on this review, in undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third party actions, the he BLM will apply the lek buffer-distances in the USGS Report “Conservation Buffer Distance Estimates for Greater Sage Grouse-A Review (Open File Report 2014-1239)” in both GHMA and PHMA as detailed in [Appendix X].” .</i>
Mitigation Framework	All ADPPs	Mitigation Appendix	There was a typo on page 1 of the Mitigation Framework that was distributed on January 30 <sup>th</sup> . At the bottom of the page, the following sentence should be corrected to read:  <i>This is also consistent with BLM Manual 6840 – Special Status Species Management, Section .02B, which states “to initiate <u>proactive</u> <del>protective</del> conservation measures that reduce or eliminate threats to Bureau sensitive species to minimize the likelihood of the need for listing of these species under the ESA.</i>  This corrected sentence accurately quotes BLM Manual 6840.
Livestock Grazing	All ADPPs	Section 2.6.2, Livestock Grazing	There was an error in the Livestock Grazing issue direction distributed on January 30 <sup>th</sup> . Under the "Livestock Grazing" issue, the "and/or" needs to be replaced with "and". The revised second bullet point drop-in now reads:  <i>"The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table <del>and/or</del> Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA."</i>
Introduction	All ADPPs	Section 2.6.1 (for	<b>PENDING:</b> Consistent language for Chap 2.6.1 that states why the PRMPs changed from what was in the DRMP

Draft internal document – pre decisional – do not disclose

of Alternatives		amendments), will vary for revisions	pref. alternative, and generally explain BLM's approach. This will be distributed on 2/11.
--------------------	--	---	--

Clarification in the Mitigation Plan and the overall glossary:

“Actions which result in habitat loss and degradation” include those identified as threats which contribute to Greater Sage-Grouse disturbance as identified by the U.S. Fish and Wildlife Service in its 2010 listing decision (75 FR 13910) and shown in Table 2 in the attached Monitoring Framework (Appendix X).

**Table 2.** Relationship between the 18 threats and the three habitat disturbance measures for monitoring and disturbance calculations.

<b>USFWS Listing Decision Threat</b>	<b>Sagebrush Availability</b>	<b>Habitat Degradation</b>	<b>Energy and Mining Density</b>
Agriculture	X		
Urbanization	X		
Wildfire	X		
Conifer encroachment	X

Other developed rights-of-way		X	

## **BLM-MONTANA AND DAKOTAS**

### **Greater Sage-Grouse Planning Issues for the BLM Planning Teams to Insert and Analyze in Administrative Draft Proposed Plans (ADPPs)**

**January 30, 2015**

*The March 4, 2010 decision by the U.S. Fish and Wildlife Service that the greater sage-grouse warranted listing but was precluded [Endangered and Threatened Wildlife and Plants; 12-Month Findings for Petitions to list the Greater Sage-Grouse (*Centrocercus urophasianus*) as Threatened or Endangered] set in motion the most comprehensive land-use planning initiative in the BLM's history.*

*In 2011, the BLM began updating land-use plans across the West so as to ensure not only the long-term viability of the greater sage-grouse on public lands and the continued economic vitality of the West. This has been a complex and demanding process involving collaboration with an unprecedented number of stakeholders, including Governors, State Fish and Game agencies, the U.S. Fish and Wildlife Service and many others. The BLM's mandate of multiple use and sustained yield has required us to balance the full range of resource uses on public lands, including the conservation of crucial wildlife habitat. As we have worked through this process, public land managers throughout the BLM have made difficult resource management decisions.*

*These documents provide key guidance that will enable the BLM to finalize land use plans that will contribute to the conservation of the Greater Sage-Grouse and other sagebrush associated species across the West. The guidance outlines a suite of tools, such as disturbance limits in key habitats and mitigation approaches, which will help us to reach this goal. These mechanisms will work in concert to conserve sage-grouse habitat so that we can achieve our twin goals of thriving Greater Sage-Grouse populations and robust Western economies.*

**Issue:**

**Development in Highly Important Landscapes**

**Direction:**

As more specifically provided in this guidance, the ADPP will include Sagebrush Focal Areas (SFA), consisting of the BLM and FS-managed lands within the area depicted in the October 27, 2014 USFWS memo, *Greater Sage-Grouse: Additional Recommendation to Refine Land Use Allocations in Highly Important Landscapes*. In the Special Status Species Section of Chapter 2, include the following management action drop in language (for the Proposed Plan only):

*“Designate Sagebrush Focal Areas (SFA) as shown on Map X (x acres). SFAs will be managed as PHMA, with the following additional management:*

- 1) Recommended for withdrawal from the General Mining Act of 1872, subject to valid existing rights.*
- 2) Managed as NSO, without waiver, exception, or modification, for fluid mineral leasing.*

- 3) *Prioritized for management and conservation actions in these areas, including, but not limited to review of livestock grazing permits/leases (see livestock grazing section for additional actions)."*

The ADPP will also reiterate the SFA decisions in the locatable minerals, fluid minerals, and livestock grazing sections of Chapter 2.

**The NOC will provide updated shapefiles that delineate the SFAs.**

Except as otherwise provided below, the ADPP will provide that all BLM- and FS-managed lands (including subsurface) within SFAs will be allocated and managed as PHMA and include the management actions above.

- *Do Not Include GHMA in SFAs*—While GHMA may be within the SFA boundaries, GHMA (surface and subsurface) will continue to be managed as GHMA and not be included in SFA management.
- *Do Not Include the following in SFA Management:*
  - Burnt Lodge and Seven Blackfoot WSA (including federal mineral estate underlying private surface within the boundaries of the WSAs) - The current management is generally protective of GRSG in the WSAs. These will continue to be managed so as not to impair their suitability for preservation as wilderness.
    - To the extent that these areas were analyzed for contingent management as general or priority habitat, the ADPP will include contingent allocations and management direction that would apply in the event that Congress releases the areas from WSA status.
  - 640 acres between the Burnt Lodge WSA and CMR Wildlife Refuge –This area should be managed to the most restrictive management analyzed in the Draft Land Use Plan/DEIS.
- *Do Not Include Areas outside of the Planning Areas* – SFA will not apply to Upper Missouri River Breaks National Monument as it is outside of the ADPP planning areas.
- *Do Not Include Other Agency Land in SFA Management* – while lands managed by other agencies will be shown on the SFA maps, BLM ADPP decisions will not be applied to them.
- *Do Not Include Private/State Lands in SFA Management* – while private/state lands may be within the SFA boundaries, ADPP decisions will not be applied to them, but may apply to Federal subsurface underlying such lands as provided below.
- *Subsurface Estate:*
  - Under private/state lands: subsurface estate identified as PHMA in the DEIS should be treated as PHMA with SFA management actions.

- Under other Federal lands: subsurface estate should be treated as PHMA with SFA management actions if it is not already withdrawn (such as in Refuges or Parks) and PHMA-management was analyzed in the DEIS.

Additional direction/drop in language for the ADPPs regarding SFAs will be forthcoming.

**Issue:**

**Direction:**

**Mitigation**

The MT/DK ADPPs will include the updated Mitigation Framework (Attachment I) and drop-in Chapter 2 language to reflect the following language:

*“In all sage-grouse habitat, in undertaking BLM management actions, and, consistent with valid existing rights and applicable law, in authorizing third-party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions.”*

**Issue:**

**Direction:**

**Mapping**

Not Applicable

**Issue:**

**Direction:**

**Disturbance**

BLM-MT will use a 3% disturbance cap at the Biologically Significant Unit (BSU) and project scale, until the state strategy, similar to WY’s Core Strategy of 5% for all lands and all disturbances, is fully implemented. The density calculation (an average of 1 facility per 640 acres) applies to energy and mining facilities. The disturbance cap will not be applied to foreclose development of locatable minerals on unpatented claims located under the 1872 Mining Law; the disturbance from locatable mining will be accounted for in determining the percent disturbance and whether the cap has been exceeded. See Attachment II for appropriate scales and methodology for calculating disturbance and recommended drop-in language. Planning units will include the following land use plan actions within their ADPPs that states:

- a. If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid*

*existing rights, etc.) will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.*

- b. *If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a Priority Habitat Management Areas, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain the area under the cap (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.).*

**Issue:**

**Direction:**

**Vegetation Objectives**

The MT/DK ADPPs will establish and incorporate vegetation and GRSG habitat objectives (see Attachment III for specific guidance and a GRSG Habitat Objectives Table template that follows the Sage-Grouse Habitat Assessment Framework Technical Reference-6710-1). The vegetation and GRSG habitat objectives guidance states that the values for the desired conditions in the GRSG Habitat Objectives Table are to be used, at a minimum, to meet the applicable land health standard in sage-grouse habitats. Planning units may include additional indicators and desired condition values as appropriate. The desired condition value for each indicator can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%).

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP. The vegetation objective should be placed in the Vegetation section of the ADPP. Planning units will include the following land use plan vegetation objective within the Vegetation section of their ADPPs:

*In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).*

**Issue:**

**Direction:**

**Livestock Grazing**

The following management actions will be included in the Livestock Grazing section of the MT and DK ADPPs.

- *The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting Land Health*

*Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (ex., fire) and legal obligations.*

- *The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.*
- *Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.*
- *At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.*

Attachment IV provides guidance as to how the BLM will incorporate GRGS decisions from the Sage-Grouse RMP/Amendments into grazing permits/leases.

**Issue:**

**Direction:**

**Mineral Materials (Salable Minerals)**

As directed in the NPT guidance, all Priority Habitat Management Areas will be closed to new mineral materials development.

The following management action will be applied to all ADPPs:

*“PHMAs are closed to new mineral material sales. However, these areas remain “open” to free use permits and the expansion of existing active pits, only if the following criteria are met:*

- *the activity is within the Biologically Significant Unit (BSU) and project area disturbance cap;*
- *the activity is subject to the provisions set forth in the mitigation framework [Appendix X];*
- *all applicable required design features are applied; and [if applicable] the activity is permissible under the specific sub-regional screening criteria [site location in ADPP where this screening process is present].”*

**Issue:** **High-voltage Transmission and Major Pipeline ROWs and Corridors**  
**Direction:** Apply the recommended NPT allocation guidance for PHMA and GHMA of avoidance.

**Issue:** **Coal Suitability**  
**Direction:** Sub-regions will include the following management action:  
*“At the time an application for a new coal lease or lease modification is submitted to the BLM, the BLM will determine whether the lease application area is "unsuitable" for all or certain coal mining methods pursuant to 43 CFR 3461.5. PHMA is essential habitat for maintaining GRSG for purposes of the suitability criteria set forth at 43 CFR 3461.5(o)(1).”*

**Issue:** **Fluid Mineral Resources (Including Geothermal)**  
**Direction:** The MT/DK ADPPs will include the following as a conservation objective:

*“Priority will be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMA and GHMA. When analyzing leasing and authorizing development of fluid mineral resources, including geothermal, in PHMA and GHMA, and subject to applicable stipulations for the conservation of Greater Sage-Grouse, priority will be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-Grouse. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 U.S.C. 226(p) and 43 C.F.R. 3162.3-1(h).”*

*“Where a proposed fluid mineral development project on an existing lease could adversely affect GRSG populations or habitat, the BLM will work with the lessees, operators, or other project proponents to avoid, reduce and mitigate adverse impacts to the extent compatible with lessees' rights to drill and produce fluid mineral resources. The BLM will work with the lessee, operator, or project proponent in developing an APD for the lease to avoid and minimize impacts to sage-grouse or its habitat and will ensure that the best information about the GRSG and its habitat informs and helps to guide development of such Federal leases.”*

**Issue:** **No Surface Occupancy (NSO) Exception Language**  
**Direction:** Follow NPT guidance for Priority Habitat Management Areas. No-surface-occupancy stipulations will be included in new fluid mineral leases at the time of leasing only and may not be applied to existing fluid mineral leases that did not include no-surface-occupancy stipulation at the

time of leasing. Include the following language into the MT and DK ADPPs:

*No waivers or modifications to a fluid mineral lease no-surface-occupancy stipulation will be granted. The Authorized Officer may grant an exception to a fluid mineral lease no-surface-occupancy stipulation only where the proposed action:*

- (i) Would not have direct, indirect, or cumulative effects on GRSG or its habitat; or,*
- (ii) Is proposed to be undertaken as an alternative to a similar action occurring on a nearby parcel, and would provide a clear conservation gain to GRSG.*

*Exceptions based on conservation gain (ii) may only be considered in (a) PHMAs of mixed ownership where federal minerals underlie less than fifty percent of the total surface, or (b) areas of the public lands where the proposed exception is an alternative to an action occurring on a nearby parcel subject to a valid Federal fluid mineral lease existing as of the date of this RMP [revision or amendment]. Exceptions based on conservation gain must also include measures, such as enforceable institutional controls and buffers, sufficient to allow the BLM to conclude that such benefits will endure for the duration of the proposed action's impacts.*

*Any exceptions to this lease stipulation may be approved by the Authorized Officer only with the concurrence of the State Director. The Authorized Officer may not grant an exception unless the applicable state wildlife agency, the USFWS, and the BLM unanimously find that the proposed action satisfies (i) or (ii). Such finding shall initially be made by a team of one field biologist or other GRSG expert from each respective agency. In the event the initial finding is not unanimous, the finding may be elevated to the appropriate BLM State Director, USFWS State Ecological Services Director, and state wildlife agency head for final resolution. In the event their finding is not unanimous, the exception will not be granted. Approved exceptions will be made publically available at least quarterly."*

**Issue:**  
**Direction:**

**Adaptive Management  
For Montana**

Follow the NPT Adaptive Management Guidance and Sideboards. When a hard trigger is hit in a BSU, the designated response will be put in place in that BSU. Triggers and responses have been developed with local state and FWS experts.

When a hard trigger is hit in a BSU within a PAC that has multiple BSUs, including those that cross state lines, the WAFWA Management Zone Greater Sage-Grouse Conservation Team will convene to determine the causal factor, put project level responses in place, as appropriate and discuss further appropriate actions to be applied. The team will also investigate the status of the hard triggers in other BSUs within the PAC and will invoke the appropriate plan response. Adoption of any further actions at the plan level may require initiating a plan amendment process.

For North Dakota

Due to the fragmented habitat and limited amount of sage-grouse in the planning area, ND will not be including an adaptive management strategy in their ADPP. The ADPP should explain that regular review of the populations and habitats will occur and that if a significant decline in sage-grouse or habitat is identified during the life of the plan, ND will work with the USFWS and NDGF to identify the causal factors and discuss ways to address the declines.

**Issue:**  
**Direction:**

**Application of Lek Buffers**

The ADPPs will require the use of lek buffer-distances for all new BLM-managed and BLM-authorized anthropogenic disturbances in both GHMA and PHMA (see Attachment V) through this drop-in Chapter 2 language:

*“In undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will apply the lek buffer-distances identified in the USGS Report Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review (Open File Report 2014-1239) in accordance with Appendix X.”*

Attachment I

**GREATER SAGE-GROUSE RMPA/FEIS  
TEMPLATE LANGUAGE FOR ADDRESSING  
MITIGATION**

[ ] = Instructions

[ ] = Fill in the blank

[This mitigation language addresses greater sage-grouse. However, if you are working on a plan revision, you may need to add additional language to be more inclusive of other resource and value objectives (e.g. cultural resources, national historic trails, recreation values, other special status species) that may need to be mitigated.]

**Chapter 1 - Introduction**

[Nothing new to add to EIS]

**Chapter 2 – Alternatives – [Proposed Plan/Proposed Plan Amendment]**

- Add these two new sections (below) to the **Chapter 2 Alternatives** section.
- Replace the Regional Mitigation placeholder language that was included in the draft EIS with the new “Mitigation” section, below.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

Consistent with the proposed plan’s goal outlined in [Table 2-X – Description of Alternatives], the intent of the [Proposed Plan/Proposed Plan Amendment] is to provide a net conservation gain to the species. To do so, in undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. This is also consistent with BLM Manual 6840 – Special Status Species Management, Section .02B, which states “to initiate protective conservation measures that reduce or eliminate threats to Bureau sensitive species to minimize the likelihood of the need for listing of these species under the ESA.”

**Mitigation**

*Mitigation Standards.* In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net

conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see the concepts of durability, timeliness, and additionality as described further in Appendix X).

*Greater Sage-Grouse Conservation Team.* The BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. This Team will develop a WAFWA Management Zone Regional Mitigation Strategy (hereafter, Regional Mitigation Strategy). The Team will also compile and report on monitoring data (including data on habitat condition, population trends, and mitigation effectiveness) from States across the WAFWA Management Zone (see Monitoring section). Subsequently, the Team will use these data to either modify the appropriate Regional Mitigation Strategy or recommend adaptive management actions (see Adaptive Management section).

The BLM/USFS will invite governmental and Tribal partners to participate in this Team, including the State Wildlife Agency and U.S. Fish and Wildlife Service, in compliance with the exemptions provided for committees defined in the Federal Advisory Committee Act and the regulations that implement that act. The BLM/USFS will strive for a collaborative and unified approach between Federal agencies (e.g. FWS, BLM, and USFS), Tribal governments, state and local government(s), and other stakeholders for greater sage-grouse conservation. The Team will provide advice, and will not make any decisions that impact Federal lands. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

*Developing a Regional Mitigation Strategy.* The Team will develop a Regional Mitigation Strategy to inform the mitigation components of NEPA analyses for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy will be developed within one year of the issuance of the Record of Decision. The BLM's Regional Mitigation Manual MS-1794 will serve as a framework for developing the Regional Mitigation Strategy. The Regional Mitigation Strategy will be applicable to the States/Field Offices/Forests within the WAFWA Management Zone's boundaries.

Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can provide a net conservation gain to the species. The Regional Mitigation Strategy developed by the Team will elaborate on the components identified above (i.e. avoidance, minimization, and compensation; additionality, timeliness, and durability) and further explained in Appendix X.

In the time period before the Strategy is developed, BLM will consider regional conditions, trends, and sites, to the greatest extent possible, when applying the mitigation hierarchy and will ensure that mitigation is consistent with the standards set forth in the first paragraph of this section.

*Incorporating the Regional Mitigation Strategy into NEPA Analyses.* The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

*Implementing a Compensatory Mitigation Program.* Consistent with the principles identified above, the BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be implemented at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

### **Chapter 3 – Affected Environment**

[Nothing to add]

### **Chapter 4 – Environmental Consequences – [Proposed Plan/Proposed Plan Amendment]**

#### **Mitigation**

This Chapter describes the environmental consequences associated with the impacts to greater sage-grouse and its habitat from activities carried out in conformance with this plan, in addition to BLM/USFS management actions. In undertaking BLM/USFS management actions, and consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. In addition, to help implement this [Proposed Plan / Proposed Plan Amendment], a WAFWA Management Zone Regional Mitigation Strategy (per Appendix [X]) will be developed within one year of the

issuance of the Record of Decision. The Strategy will elaborate on the components identified in Chapter 2 (avoidance, minimization, compensation, additionality, timeliness, and durability), and will be considered by the BLM/USFS for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The implementation of a Regional Mitigation Strategy will benefit greater sage-grouse, the public, and land-users by providing a reduction in threats, increased public transparency and confidence, and a predictable permit process for land-use authorization applicants.

## Appendix [X]

- Add this new Appendix.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

## Appendix (X) – Mitigation – [Proposed Plan/Proposed Plan Amendment]

### General

In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see glossary).

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy that will inform the NEPA decision making process including the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. A robust and transparent Regional Mitigation Strategy will contribute to greater sage-grouse habitat conservation by reducing, eliminating, or minimizing threats and compensating for residual impacts to greater sage-grouse and its habitat.

The BLM's Regional Mitigation Manual MS-1794 serves as a framework for developing and implementing a Regional Mitigation Strategy. The following sections provide additional

guidance specific to the development and implementation of a WAFWA Management Zone Regional Mitigation Strategy.

### Developing a WAFWA Management Zone Regional Mitigation Strategy

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy to guide the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy should consider any State-level greater sage-grouse mitigation guidance that is consistent with the requirements identified in this Appendix. The Regional Mitigation Strategy should be developed in a transparent manner, based on the best science available and standardized metrics.

As described in Chapter 2, the BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. The Strategy will be developed within one year of the issuance of the Record of Decision.

The Regional Mitigation Strategy should include mitigation guidance on avoidance, minimization, and compensation, as follows:

- Avoidance
  - Include avoidance areas (e.g. right-of-way avoidance/exclusion areas, no surface occupancy areas) already included in laws, regulations, policies, and/or land use plans (e.g. Resource Management Plans, Forest Plans, State Plans); and,
  - Include any potential, additional avoidance actions (e.g. additional avoidance best management practices) with regard to greater sage-grouse conservation.
- Minimization
  - Include minimization actions (e.g. required design features, best management practices) already included in laws, regulations, policies, land use plans, and/or land-use authorizations; and,
  - Include any potential, additional minimization actions (e.g. additional minimization best management practices) with regard to greater sage-grouse conservation.
- Compensation
  - Include discussion of impact/project valuation, compensatory mitigation options, siting, compensatory project types and costs, monitoring, reporting, and program administration. Each of these topics is discussed in more detail below.
    - Residual Impact and Compensatory Mitigation Project Valuation Guidance
      - A common standardized method should be identified for estimating the value of the residual impacts and value of the compensatory mitigation projects, including accounting for any uncertainty associated with the effectiveness of the projects.
      - This method should consider the quality of habitat, scarcity of the habitat, and the size of the impact/project.
      - For compensatory mitigation projects, consideration of durability (see glossary), timeliness (see glossary), and the potential for failure (e.g.

- uncertainty associated with effectiveness) may require an upward adjustment of the valuation.
- The resultant compensatory mitigation project will, after application of the above guidance, result in proactive conservation measures for Greater Sage-grouse (consistent with BLM Manual 6840 – Special Status Species Management, section .02).
  - **Compensatory Mitigation Options**
    - Options for implementing compensatory mitigation should be identified, such as:
      - Utilizing certified mitigation/conservation bank or credit exchanges.
      - Contributing to an existing mitigation/conservation fund.
      - Authorized-user conducted mitigation projects.
    - For any compensatory mitigation project, the investment must be additional (i.e. additionality: the conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project).
  - **Compensatory Mitigation Siting**
    - Sites should be in areas that have the potential to yield a net conservation gain to the greater sage-grouse, regardless of land ownership.
    - Sites should be durable (see glossary).
    - Sites identified by existing plans and strategies (e.g. fire restoration plans, invasive species strategies, healthy land focal areas) should be considered, if those sites have the potential to yield a net conservation gain to greater sage-grouse and are durable.
  - **Compensatory Mitigation Project Types and Costs**
    - Project types should be identified that help reduce threats to greater sage-grouse (e.g. protection, conservation, and restoration projects).
    - Each project type should have a goal and measurable objectives.
    - Each project type should have associated monitoring and maintenance requirements, for the duration of the impact.
    - To inform contributions to a mitigation/conservation fund, expected costs for these project types (and their monitoring and maintenance), within the WAFWA Management Zone, should be identified.
  - **Compensatory Mitigation Compliance and Monitoring**
    - Mitigation projects should be inspected to ensure they are implemented as designed, and if not, there should be methods to enforce compliance.
    - Mitigation projects should be monitored to ensure that the goals and objectives are met and that the benefits are effective for the duration of the impact.
  - **Compensatory Mitigation Reporting**
    - Standardized, transparent, scalable, and scientifically-defensible reporting requirements should be identified for mitigation projects.

- Reports should be compiled, summarized, and reviewed in the WAFWA Management Zone in order to determine if greater sage-grouse conservation has been achieved and/or to support adaptive management recommendations.
- Compensatory Mitigation Program Implementation Guidelines
  - Guidelines for implementing the State-level compensatory mitigation program should include holding and applying compensatory mitigation funds, operating a transparent and credible accounting system, certifying mitigation credits, and managing reporting requirements.

### Incorporating the Regional Mitigation Strategy into NEPA Analyses

The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

### Implementing a Compensatory Mitigation Program

The BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be managed at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

## **Glossary Terms**

**Additionality:** The conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project. (adopted and modified from BLM Manual Section 1794).

**Avoidance mitigation:** Avoiding the impact altogether by not taking a certain action or parts of an action. (40 CFR 1508.20(a)) (e.g. may also include avoiding the impact by moving the proposed action to a different time or location.)

**Compensatory mitigation:** Compensating for the (residual) impact by replacing or providing substitute resources or environments. (40 CFR 1508.20)

**Compensatory mitigation projects:** The [restoration](#), [creation](#), [enhancement](#), and/or [preservation](#) of impacted resources (adopted and modified from 33 CFR 332), such as on-the-ground actions to improve and/or protect habitats (e.g. chemical vegetation treatments, land acquisitions, conservation easements). (adopted and modified from BLM Manual Section 1794).

**Compensatory mitigation sites:** The durable areas where compensatory mitigation projects will occur. (adopted and modified from BLM Manual Section 1794).

**Durability (protective and ecological):** the maintenance of the effectiveness of a mitigation site and project for the duration of the associated impacts, which includes resource, administrative/legal, and financial considerations. (adopted and modified from BLM Manual Section 1794).

**Minimization mitigation:** Minimizing impacts by limiting the degree or magnitude of the action and its implementation. (40 CFR 1508.20 (b))

**Residual impacts:** Impacts that remain after applying avoidance and minimization mitigation; also referred to as unavoidable impacts.

**Timeliness:** The lack of a time lag between impacts and the achievement of compensatory mitigation goals and objectives (BLM Manual Section 1794).

## Attachment II

### **Greater Sage-Grouse (GRSG) Land Use Plans Disturbance Caps Guidance**

#### **Purpose**

- I. Provide the planning units with land use planning actions that need to be incorporated into the administrative draft proposed plans to respond to the 3% disturbance cap once it is exceeded in either the Biologically Significant Units (BSU) or at the project scale.
- II. Provide guidance on the use of the west-wide habitat degradation (disturbance) data layers as well as the use of locally collected disturbance data for BSUs to determine if the disturbance cap has been exceeded as the land use plans (LUP) are being implemented.
- III. Provide guidance on the use of locally collected disturbance data for project authorizations to determine if the disturbance cap has been exceeded as the LUPs are being implemented.
- IV. Provide guidance on the inclusion of fire in disturbance calculations.
- V. Provide guidance on the use of the density of energy and mining facilities during authorizations
- VI. Provide guidance on the use of the BER analysis in the land use plans (Chapter 2, Affected Environment) and the use of the “west-wide” sagebrush availability and habitat degradation data/estimates for the Priority Habitat Management Areas in each population for monitoring and management purposes as the LUPs are being implemented.
- VII. Provide guidance on what is considered in the disturbance calculations versus what is considered for the disturbance cap.

#### **Guidance**

- I. Planning units will include the following land use plan actions within their administrative draft proposed land use plans (ADPPs) that states:
  - a. *If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.) will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.*
  - b. *If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a Priority Habitat Management Areas, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain the area under the cap (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.).*

Montana will use a 3% disturbance cap until the state of Montana strategy, similar to WY’s Core Area Strategy that uses a 5% disturbance cap for all lands and all disturbances, is fully

implemented. BLM MT will develop, and include in their plans, the conditions to be met prior to the change in the disturbance cap.

- II. Use of west-wide habitat degradation data as well as the use of locally collected disturbance data to determine the level of existing disturbance:
  - a) In the GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, use the west-wide data at a minimum and/or locally collected disturbance data as available (e.g., DDCT) for the anthropogenic disturbance types listed in Table 1.
- III. Use of locally collected disturbance data for project authorizations:
  - a) In a proposed project analysis area, digitize all existing anthropogenic disturbances identified in the GRSG Monitoring Framework and the 7 additional features that are considered threats to sage-grouse (Table 2). Using 1 meter resolution NAIP imagery is recommended. Use local data if available.
- IV. Fire-burned and habitat treatment areas will not be included in the project scale degradation disturbance calculation for managing sage-grouse habitat under a disturbance cap. These areas will be considered part of a sagebrush availability when rangewide, consistent, interagency fine- and site-scale monitoring has been completed and the areas have been determined to meet sage-grouse habitat requirements. These and other disturbances identified in Table 3 will be part of a sagebrush availability evaluation and will be considered along with other local conditions that may affect sage-grouse during the analysis of the proposed project area.
- V. Planning units are directed to use a density cap related to the density of energy and mining facilities (listed below) during project scale authorizations. If the disturbance density in a proposed project area is on average less than 1/ 640 acres, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than an average of 1/ 640 acres, either defer the proposed project or co-locate it into existing disturbed area (*subject to applicable laws and regulations, such as the 1872 Mining Law, valid existing rights, etc.*).
  - Energy (oil and gas wells and development facilities)
  - Energy (coal mines)
  - Energy (wind towers)
  - Energy (solar fields)
  - Energy (geothermal)
  - Mining (active locatable, leasable, and saleable developments)
- VI. Planning units are directed to continue using the baseline data from the 2013 USGS Baseline Environmental Report (BER) in the Affected Environment section of the proposed plans/ FEISs. West-wide sagebrush availability and habitat degradation data layers will be used for the Priority Habitat Management Areas in each population for monitoring (see the GRSG Monitoring Framework in the Monitoring Appendix of the EIS) and management purposes as the LUPs are being implemented. The BER reported on individual threats across the range of sage-grouse while the west-wide disturbance

calculation consolidated the anthropogenic disturbance data into a single measure using formulas from the GRSG Monitoring Framework. These calculations will be completed on an annual basis by the BLM's National Operation Center. Planning units will be provided the 2014 baseline disturbance calculation derived from the west-wide data once the RODs are signed that describe the Priority Habitat Management Areas.

- VII. Planning units are directed to use the three measures (sagebrush availability, habitat degradation, density of energy and mining) in conjunction with other information during the NEPA process to most effectively site project locations, such as by clustering disturbances and/or locating facilities in already disturbed areas. Although locatable mine sites are included in the degradation calculation, mining activities under the 1872 mining law may not be subject to the 3% disturbance cap. Details about locatable mining activities should be fully disclosed and analyzed in the NEPA process to assess impacts to sage-grouse and their habitat as well as to BLM goals and objectives, and other BLM programs and activities.

#### **Additional Information/Formulas**

Disturbance Calculations for the BSUs and for the Project Analysis Areas:

- For the BSUs: **% Degradation Disturbance = (combined acres of the 12 degradation threats\*) ÷ (acres of all lands within the PHMAs in a BSU) x 100.**
- For the Project Analysis Area: **% Degradation Disturbance = (combined acres of the 12 degradation threats<sup>1</sup> plus the 7 site scale threats<sup>2</sup>) ÷ (acres of all lands within the project analysis area in the PHMA) x 100.**

<sup>1</sup> see Table 3. <sup>2</sup> see Table 2

Project analysis area method for permitting surface disturbance activities:

- Determine potentially affected occupied leks by placing a four mile boundary around the proposed area of physical disturbance related to the project. All occupied leks located within the four mile project boundary and within PHMA will be considered affected by the project.
- Next, place a four mile boundary around each of the affected occupied leks.
- The PHMA within the four mile lek boundary and the four mile project boundary creates the project analysis area for each individual project. If there are no occupied leks within the four-mile project boundary, the project analysis area will be that portion of the four-mile project boundary within the Priority Habitat Management Area.
- Map disturbances or use locally available data. Use of NAIP imagery is recommended. In Wyoming, burned areas are included in this step.
- Calculate percent existing disturbance using the formula above. If existing disturbance is less than 3%, proceed to next step. If existing disturbance is greater than 3%, defer the project.
- Add proposed project disturbance footprint area and recalculate the percent disturbance. If disturbance is less than 3%, proceed to next step. If disturbance is greater than 3%, defer project.

- Calculate the disturbance density of energy and mining facilities (listed above). If the disturbance density is less than 1 facility per 640 acres, averaged across project analysis area, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than 1 facility per 640 acres, averaged across the project analysis area, either defer the proposed project or co-locate it into existing disturbed area.
- If a project that would exceed the degradation cap or density cap cannot be deferred due to valid existing rights or other existing laws and regulations, fully disclose the local and regional impacts of the proposed action in the associated NEPA.

Table 1. Anthropogenic disturbance types for disturbance calculations. Data sources are described for the west-wide habitat degradation estimates (Table copied from the GRSG Monitoring Framework)

<b>Degradation Type</b>	<b>Subcategory</b>	<b>Data Source</b>	<b>Direct Area of Influence</b>	<b>Area Source</b>
<b>Energy (oil &amp; gas)</b>	Wells	IHS; BLM (AFMSS)	5.0ac (2.0ha)	BLM WO-300
	Power Plants	Platts (power plants)	5.0ac (2.0ha)	BLM WO-300

Infrastructure (roads)		X	
Infrastructure (railroads)		X	
Infrastructure (power lines)		X	
Infrastructure (communication towers)		X	
Infrastructure (other vertical structures)		X	
Other developed rights-of-way		X	

## **Background**

In the USFWS's 2010 listing decision for sage-grouse, the USFWS identified 18 threats contributing to the destruction, modification, or curtailment of the sage-grouse's habitat or range (75 FR 13910 2010). In April 2014, the Interagency GRSG Disturbance and Monitoring Sub-Team finalized the Greater Sage-Grouse Monitoring Framework (hereafter, framework) to track these threats. The 18 threats have been aggregated into three measures to account for whether the threat predominantly removes sagebrush or degrades habitat. The three measures are:

Measure 1: Sagebrush Availability (percent of sagebrush per unit area)

Measure 2: Habitat Degradation (percent of human activity per unit area)

Measure 3: Density of Energy and Mining (facilities and locations per unit area)

The BLM is committed to monitoring the three disturbance measures and reporting them to the FWS on an annual basis. However, for the purposes of calculating the amount of disturbance to provide information for management decisions and inform the success of the sage-grouse planning effort, the data depicting the location and extent of the 12 anthropogenic types of threats will be used at a minimum in the BSUs and those same 12 anthropogenic and the additional 7 types of features that are threats to sage-grouse will be used in the project analysis areas.

		Scales		
		Broad/Mid (Populations)	Intermediate (BSU)	Local/Project (Seas. Hab.)
Habitat Degradation	Unit:	WAPWA Populations	Biologically Significant Unit	Project/Local Habitat Areas <sup>5</sup>
	Area of Interest:	PHMAs	PHMAs	PHMAs
	Data:	Westwide degradation data	Westwide <sup>2</sup> , State, Local	State, Local
	Formula (Measure 2a):	<u>12 Degradation Threats</u> PHMAs in Populations	<u>12 Degradation Threats</u> PHMAs in BSUs	<u>12 Degradation Threats + 7<sup>7</sup></u> PHMAs in Proj. <sup>6</sup>
	Management:	Internal BLM & FS estimates	3% Cap, Adapt Mgmt <sup>4</sup>	3% Disturbance Cap
	All Lands:	Yes	Yes	Yes
	Fire Included:	No	No	No

	Management:	Internal BLM & FS estimates		Project Authorization
	All Lands:	Yes		Yes
	Fire Included:	No		No
	Who:	BLM NOC		BLM NOC or SOs or FOs

**ACRONYMS**

PHMA = Priority Habitat Management Area      BSU = Biologically Significant Unit  
 EVT = Existing Vegetation Type                EoS = Areas of Biotic Potential

<sup>1</sup> Only mines with a Plan of Operation (>5 acres of disturbance) will be included.  
<sup>2</sup> Westwide data will be used only if state or local data are not available.  
<sup>3</sup> This footnote was removed from the table. January 2015.  
<sup>4</sup> This may be one of several variables used to inform Adaptive Management. The BSU is the scale at which Adaptive Management will be applied.  
<sup>5</sup> A moving window analysis will be conducted at this scale by the NOC using westwide data. If available, state and local data/analysis should be used for Adaptive Management  
<sup>6</sup> The project analysis area will be based on a 4-mile radius project boundary combined with a 4-mile left boundary for leeks within the 4mi project boundary in PHMA (DDCT methodology).  
<sup>7</sup> See Table 2

## Attachment III

### **Greater Sage-Grouse (GRSG) Land Use Plans Vegetation Objectives Guidance**

#### **Purpose**

- I. Provide the planning units with land use planning vegetation objectives that need to be incorporated into the administrative draft proposed plans.
- II. Provide guidance on the use of a template for GRSG habitat objectives in the Special Status Species section of the ADPPs.
- III. Provide guidance on prioritizing land health assessments in sage-grouse habitats and conducting assessments at the watershed scale using the sage-grouse habitat objectives.

#### **Guidance**

- I. Planning units will include the following land use plan vegetation objective within the Vegetation section of their administrative draft proposed land use plans (ADPPs) that states:

*In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).*
- II. Planning units will populate the GRSG Habitat Objectives table template to provide vegetation objectives for sage-grouse life history stages based on the ecology in your region to be used to meet the applicable land health standard in GRSG habitats. Planning units are encouraged to work across boundaries when developing the objectives to ensure regional continuity and will provide appropriate peer-reviewed science to support the habitat values for the indicators. These desired condition value can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%). Planning units may include additional indicators and desired condition values as appropriate (see the Sage-Grouse Habitat Assessment Framework (HAF, *Technical Reference 6710-1*) for appropriate indicators). The HAF contains values for habitat suitability indicators in sage-grouse seasonal habitats from the Connelly et al. (2000) sage-grouse guidelines and has incorporated many of the core indicators in the AIM strategy (Toevs et al. 2011) as well. Planning units may use the indicator values from Connelly et al. (2000) while developing the land use plan Sage-Grouse Habitat Objectives table.

When using the indicators to guide management actions or during land health assessments, consider that the indicators are sensitive to the ecological processes operating at the scale of interest and that a single habitat indicator does not necessarily define habitat suitability for an area or particular scale. Indicators must be collectively reviewed, assessed based on the site potential, and put into spatial and temporal context to correctly determine habitat suitability which will include more than one scale and multiple indicators. Assessment and evaluation of these objectives will follow the steps described in the HAF.

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP and is to be used as a minimum to meet the applicable land health standard in sage-grouse habitats.

Greater Sage-Grouse Habitat Objectives

ATTRIBUTE	INDICATORS	DESIRED CONDITION	Reference
<b>BREEDING AND NESTING (Seasonal Use Period March 1-June 15)</b>			
Lek Security	Proximity of trees		
	Proximity of sagebrush to leks		
Cover	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover		
	Sagebrush height Arid sites Mesic sites		
	Predominant sagebrush shape		
	Perennial grass cover Arid sites Mesic sites		
	Perennial grass and forb height		
	Perennial forb canopy cover Arid sites Mesic sites		
<b>BROOD-REARING/SUMMER<sup>1</sup> (Seasonal Use Period June 16-October 31)</b>			
Cover	% of Seasonal habitat meeting desired condition		
	Sagebrush canopy cover		
	Sagebrush height		
	Perennial grass canopy cover and forbs		
	Riparian areas/mesic meadows		
	Upland and riparian perennial forb availability		
<b>WINTER<sup>1</sup> (Seasonal Use Period November 1-February 28)</b>			
Cover and Food	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover above snow		
	Sagebrush height above snow		

- III. The BLM will prioritize land health assessments in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. Field offices are to conduct land health assessments at the watershed scale and use the GRSG habitat objectives when assessing the applicable standard in GRSG habitats.

When conducting land health assessments, the BLM should follow, at a minimum, “Interpreting Indicators of Rangeland Health” (Pellant et. al. 2005) and the “BLM Core Terrestrial Indicators and Methods” (MacKinnon et al. 2011). For assessments being conducted in GRSG designated management areas, the BLM should collect additional data to inform the HAF indicators that have not been collected using the above methods. Implementation of the principles outlined in the AIM strategy will allow the data to be used to generate unbiased estimates of condition across the area of interest; facilitate consistent data collection and rollup analysis among management units; help provide consistent data to inform the classification and interpretation of imagery; and provide condition and trend of the indicators describing sagebrush characteristics important to sage-grouse habitat.

## Attachment IV

### **Incorporating GSGR RMP Decisions into Grazing Authorizations**

#### **Purpose**

The purpose is to provide recommended ADPP language; outline the process for prioritizing the review and processing of grazing permits/leases to determine if modification is necessary (prior to renewal and in accordance with prioritization criteria); provide direction for including specific management thresholds and defined responses that will allow adjustments to livestock grazing within the terms and conditions of permits; and provide a process for prioritizing compliance monitoring within Sagebrush Focal Areas (SFAs) and Priority Habitat Management Areas (PHMAs).

#### **Background**

The BLM manages approximately 18,000 livestock grazing permits and leases on the public lands. Livestock grazing is an integral part of the BLM multiple-use mission and is authorized by the Taylor Grazing Act (1934), the Federal Land Policy Management Act (1976) and the Public Rangeland Improvement Act (1978). By statute and regulation, grazing leases and permits are normally issued for 10-year periods. Annually, a range of 1,200 to 3,200 grazing permits expire and the BLM receives 500 to 1,500 grazing permit/lease transfer requests.

The BLM currently issues permits/leases in accordance with:

- All applicable law, regulation, policy (NEPA, consultation, proposed/final grazing decision-also known as a fully processed permit); or
- Various appropriation authorities enacted between 1999 and 2014 extending terms and conditions of expiring or transferred permits/leases that the BLM is unable to fully process before their expiration; or
- Section 402(c)(2) of FLPMA (as amended by Public Law 113-291, enacted December 19, 2014).

Congress has acted to ensure that grazing permittees could continue to graze if the BLM is unable to complete the environmental analysis mandated by the NEPA and other applicable laws. Since 1999, a provision (“the rider”) has been included in the Interior Appropriations bill that, in various forms, generally authorizes the BLM to renew grazing permits and leases under their same terms and conditions until it fully processes the permit renewal in compliance with NEPA, ESA, and other legal or regulatory requirements. The most recent rider is contained in Section 411, Public Law 113-76.<sup>1</sup> The FLPMA amendment to Section 402 (c) allows BLM to renew

---

<sup>1</sup> The Consolidated Appropriations Act, 2014 includes the provision Section 411 which states: “Section 415 of division E of Public Law 112-74 is amended by striking “and 2013” and inserting “through 2015.” The terms and conditions of section 325 of Public Law 108-108 (117 stat. 1307), regarding permits at the Department of the Interior and the Forest Service, shall remain in effect through fiscal year 2015. A grazing permit or lease issued by the Secretary of the Interior for lands administered by the Bureau of Land Management that is the subject of a request for a grazing preference transfer shall be issued, without further processing, for the remaining time period in

grazing permits and leases under the same terms and conditions. This relieves the BLM's renewal processing workload, allowing the BLM to prioritize permit processing based on sensitivity of the resources at issue.<sup>2</sup>

The BLM may modify terms and conditions of a permit or lease at any time following completion of appropriate analysis and consultation, cooperation, and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public.<sup>3</sup> Under 43 C.F.R. 4160.1, the BLM must serve a proposed decision on any affected applicant, permittee or lessee, any agent and lien holder of record. Copies of the decisions are provided to the interested publics.

**Recommended Language to be incorporated as Livestock Grazing Management Actions within the GRSG ADPPs:**

- The BLM will prioritize the review of grazing permits/leases, including those prior to renewal to determine if modification is necessary, and processing of grazing permits and leases, in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource conditions (ex., fire) and legal obligations.
- The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.
- Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to

---

the existing permit or lease using the same mandatory terms and conditions. If the authorized officer determines a change in the mandatory terms and conditions is required, the new permit must be processed as directed in section 325 of Public Law 108-108.” Where a FO is unable to fully process a permit renewal in compliance with all applicable laws prior to the permit expiration, Section 411 extends the authority to renew the grazing permit with the same terms and conditions as the expiring permit. Section 325 provides the process for authorizing grazing until a permit or lease is issued in compliance with all applicable law and regulatory processes.

<sup>2</sup> The newly amended section 402(c) of FLPMA provides permanent authority to BLM to renew expiring permits. That section states, “The terms and conditions in a grazing permit or lease that has expired, or was terminated due to a grazing preference transfer, shall be continued under a new permit or lease until the date on which the Secretary concerned completes any environmental analysis and documentation for the permit or lease required under the National Environmental Policy Act of 1969 (42 U.S.C. 4321 et seq.) and other applicable laws.”

<sup>3</sup> 43 CFR 4130.3-3 states: Following consultation, cooperation and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public, the authorized officer may modify terms and conditions of the permit or lease when the active grazing use or related management practices are not meeting the land use plan, allotment management plan or other activity plan, or management objectives, or is not in conformance with the provisions of subpart 4180 (Fundamentals of Rangeland Health and Standards and Guidelines for Grazing Administration).

help ensure compliance with the terms and conditions within the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.

- At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

### **Addressing GRSG RMP Amendments/Revisions Objectives in Grazing Permits/Leases**

BLM will develop criteria to prioritize the workload to process permits/leases (either fully processed or reauthorized based on the Appropriations rider, or issued under Section 402(c)(2) of FLPMA) and determine whether modification is necessary prior to renewal within PHMAs, beginning with those in SFAs. In setting priorities, those containing riparian areas and areas not meeting Land Health Standards (43 C.F.R. 4180) will take precedence. Potential criteria for prioritizing permit modifications could include:

- Are there riparian areas or wet meadows in the permit/lease area?
- Was current livestock grazing identified as a causal factor for not meeting Land Health Standards?
- Since the last allotment/watershed evaluation, is there current monitoring information to determine that the watershed/allotment is currently achieving or making significant progress towards achieving land health standards?
- Does the permit have terms and conditions adequate to ensure proper grazing practices to meet GRSG habitat objectives found in the Special Status Species section of the land use plan?
- Is there data that indicates that the GRSG habitat objectives, including the Habitat Objectives table, found in the Special Status Species section of the land use plan are being met?
- Is there a request from the permittee to modify the terms and conditions of his/her permit?

Additionally, if an existing permit/lease within PHMAs requires modification because current grazing is a significant causal factor for not meeting the Land Health Standards, the BLM will prepare the appropriate NEPA analysis and issue the proposed/final grazing decision under 43 C.F.R. Subpart 4160, subject to administrative appeal and potential judicial challenge.

The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA. Adjustments to meet seasonal Sage-Grouse habitat requirements could include:

- Season or timing of use;
- Numbers of livestock (includes temporary non-use or livestock removal);
- Distribution of livestock use;
- Intensity of use; and
- Type of livestock (e.g., cattle, sheep, horses, llamas, alpacas and goats).

## **Compliance Monitoring**

The BLM will monitor grazing permits/leases renewed or modified in accordance with the direction contained in this guidance as follows: Allotments within SFAs, followed by those in other PHMA, and focusing on those with riparian areas, will be prioritized for monitoring to ensure compliance with the terms and conditions in the permits. The BLM will collect, at a minimum, the following monitoring data:

- Vegetation Condition
- Actual Use
- Utilization
- Use Supervision

## **Concerning Voluntary Relinquishments**

All ADPPs will include the following language:

At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

For completing this, BLM offices should use [WO IM 2013-184 Relinquishment of Grazing Permitted Use](#) or the most recent policy guidance.

Attachment V

**Applying Lek Buffer-Distances When Approving Actions**

- *Buffer Distances and Evaluation of Impacts to Leks*

Evaluate impacts to leks from actions requiring NEPA analysis. In addition to any other relevant information determined to be appropriate (e.g. State wildlife agency plans), the BLM will assess and address impacts from the following activities using the lek buffer-distances as identified in the USGS Report *Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review* ([Open File Report 2014-1239](#)). The BLM will apply the lek buffer-distances specified as the lower end of the interpreted range in the report unless justifiable departures are determined to be appropriate (see below). The lower end of the interpreted range of the lek buffer-distances is as follows:

  - linear features (roads) within 3.1 miles of leks
  - infrastructure related to energy development within 3.1 miles of leks.
  - tall structures (e.g., communication or transmission towers, transmission lines) within 2 miles of leks.
  - low structures (e.g., fences, rangeland structures) within 1.2 miles of leks.
  - surface disturbance (continuing human activities that alter or remove the natural vegetation) within 3.1 miles of leks.
  - noise and related disruptive activities including those that do not result in habitat loss (e.g., motorized recreational events) at least 0.25 miles from leks.

Justifiable departures to decrease or increase from these distances, based on local data, best available science, landscape features, and other existing protections (e.g., land use allocations, state regulations) may be appropriate for determining activity impacts. The USGS report recognized “that because of variation in populations, habitats, development patterns, social context, and other factors, for a particular disturbance type, there is no single distance that is an appropriate buffer for all populations and habitats across the sage-grouse range”. The USGS report also states that “various protection measures have been developed and implemented... [which have] the ability (alone or in concert with others) to protect important habitats, sustain populations, and support multiple-use demands for public lands”. All variations in lek buffer-distances will require appropriate analysis and disclosure as part of activity authorization.

In determining lek locations, the BLM will use the most recent active or occupied lek data available from the state wildlife agency.

- *For Actions in GHMA*

The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis.

  - Impacts should first be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.
  - If it is not possible to relocate the project outside of the applicable lek buffer-distance(s) identified above, the BLM may approve the project only if:
    - Based on best available science, landscape features, and other existing protections, (e.g., land use allocations, state regulations), the BLM determines that a lek buffer-distance other than the applicable distance identified above offers the same or a greater

level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area; or

- The BLM determines that impacts to GRSG and its habitat are minimized such that the project will cause minor or no new disturbance (ex. co-location with existing authorizations); and
- Any residual impacts within the lek buffer-distances are addressed through compensatory mitigation measures sufficient to ensure a net conservation gain, as outlined in the Mitigation Strategy (Appendix X).

- *For Actions in PHMA*

The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis. Impacts should be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.

The BLM may approve actions in PHMA that are within the applicable lek buffer distance identified above only if:

- The BLM, with input from the state fish and wildlife agency, determines, based on best available science, landscape features, and other existing protections, that a buffer distance other than the distance identified above offers the same or greater level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area.
- The BLM will explain its justification for determining the approved buffer distances meet these conditions in its project decision.

**BLM-IDAHO****Greater Sage-Grouse Planning Issues for the BLM Planning Teams to Insert and Analyze in Administrative Draft Proposed Plan (ADPP)****January 30, 2015**

*The March 4, 2010 decision by the U.S. Fish and Wildlife Service that the greater sage-grouse warranted listing but was precluded [Endangered and Threatened Wildlife and Plants; 12-Month Findings for Petitions to list the Greater Sage-Grouse (*Centrocercus urophasianus*) as Threatened or Endangered] set in motion the most comprehensive land-use planning initiative in the BLM's history.*

*In 2011, the BLM began updating land-use plans across the West so as to ensure not only the long-term viability of the greater sage-grouse on public lands and the continued economic vitality of the West. This has been a complex and demanding process involving collaboration with an unprecedented number of stakeholders, including Governors, State Fish and Game agencies, the U.S. Fish and Wildlife Service and many others. The BLM's mandate of multiple use and sustained yield has required us to balance the full range of resource uses on public lands, including the conservation of crucial wildlife habitat. As we have worked through this process, public land managers throughout the BLM have made difficult resource management decisions.*

*These documents provide key guidance that will enable the BLM to finalize land use plans that will contribute to the conservation of the Greater Sage-Grouse and other sagebrush associated species across the West. The guidance outlines a suite of tools, such as disturbance limits in key habitats and mitigation approaches, which will help us to reach this goal. These mechanisms will work in concert to conserve sage-grouse habitat so that we can achieve our twin goals of thriving Greater Sage-Grouse populations and robust Western economies.*

**Issue:****Development in Highly Important Landscapes****Direction:**

As more specifically provided in this guidance, the ADPP will include Sagebrush Focal Areas (SFA), consisting of the BLM and FS-managed lands within the area depicted in the October 27, 2014 USFWS memo, *Greater Sage-Grouse: Additional Recommendation to Refine Land Use Allocations in Highly Important Landscapes*. In the Special Status Species Section of Chapter 2, include the following management action drop in language (for the Proposed Plan only):

*“Designate Sagebrush Focal Areas (SFA) as shown on Map X (x acres). SFAs will be managed as PHMA, with the following additional management:*

- 1) Recommended for withdrawal from the General Mining Act of 1872, subject to valid existing rights.*
- 2) Managed as NSO, without waiver, exception, or modification, for fluid mineral leasing.*

- 3) *Prioritized for management and conservation actions in these areas, including, but not limited to review of livestock grazing permits/leases (see livestock grazing section for additional actions)."*

**The NOC will provide updated shapefiles that delineate the SFAs.**

Except as otherwise provided below, the ADPP will provide that all BLM- and FS-managed lands (including subsurface) within SFAs will be allocated and managed as PHMA and include the management actions above.

- *Do Not Include the following in SFA Management*
  - Hawley Mountain WSA (ID), Shoshone WSA (ID), Cedar Buttes WSA (ID), Lower Salmon Falls Creek (ID), Little Jack Wilderness (ID), Bruneau-Jarbidge Wilderness (ID) in non-habitat – The current management in these areas is generally protective of GRSG. As applicable, these will continue to be managed so as not to impair their suitability for preservation as wilderness, or under the terms of the Wilderness Act to preserve wilderness character.
    - To the extent that these areas were analyzed for contingent management as general or priority habitat, the ADPP will include contingent allocations and management direction that would apply in the event that Congress releases the areas from WSA status
  - Non-habitat areas outside Little Jack and Bruneau-Jarbidge Wilderness and Salmon Falls Creek ACEC which were previously shown within the SFA –These areas will not be managed as PHMA or SFA.
- Do Include Forest Service Lost River Mountains North (~5,000 acres) Area and South Area (~6,000 acres)– these areas will be treated as PHMA, with the SFA management actions for this FS-land.
- Do Include Donkey Hills ACEC –In order to consolidate parcels for protection as SFAs, this area will be treated as PHMA and included for SFA management.
- *Do Not Include Other Agency Land in SFA Management* – while lands managed by other agencies will be shown on the SFA maps, BLM ADPP decisions will not be applied to them.
- *Do Not Include Private/State Lands in SFA Management* – while private lands may be within the SFA boundaries, ADPP decisions will not be applied to them, but may apply to Federal subsurface underlying such lands as provided below.
- *Subsurface Estate:*
  - Under private/state lands: subsurface estate in PHMA and GHMA should be treated as PHMA with SFA management actions.

- Under other Federal lands: subsurface state should be treated as PHMA with SFA management actions if it is not already withdrawn (such as in Refuges or Parks) and PHMA or GHMA management was analyzed in the DEIS.

Additional direction/drop in language for the ADPPs on SFAs will be forthcoming.

**Issue:**

**Direction:**

**Mitigation**

The ADPP will include the updated Mitigation Framework (Attachment I) and drop-in Chapter 2 language to reflect the following language:

*“In all sage-grouse habitat, in undertaking BLM management actions, and, consistent with valid existing rights and applicable law, in authorizing third-party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions.”*

**Issue:**

**Direction:**

**Mapping**

Not Applicable

**Issue:**

**Direction:**

**Disturbance**

Per the original April 2014 NPT guidance on disturbance, the ADPP will use the 3% disturbance cap at the Biologically Significant Unit (BSU) and project scale. The density calculation (an average of 1 facility per 640 acres) applies to energy and mining facilities. The disturbance cap will not be applied to foreclose development of locatable minerals on unpatented claims located under the 1872 Mining Law; the disturbance from locatable mining will be accounted for in determining the percent disturbance and whether the cap has been exceeded. BLM-ID will use the disturbance calculation methodology developed prior to this guidance (see Attachment II).

Planning units will include the following land use plan actions within their ADPPs that states:

- a. If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSB Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid*

*existing rights, etc.) will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.*

- b. *If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a Priority Habitat Management Areas, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain the area under the cap (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.).*

**Issue:**

**Direction:**

**Vegetation Objectives**

The ADPP will establish and incorporate vegetation and GRSG habitat objectives (see Attachment III for specific guidance and a GRSG Habitat Objectives Table template that follows the Sage-Grouse Habitat Assessment Framework Technical Reference-6710-1). The vegetation and GRSG habitat objectives guidance states that the values for the desired conditions in the GRSG Habitat Objectives Table are to be used, at a minimum, to meet the applicable land health standard in sage-grouse habitats. Planning units may include additional indicators and desired condition values as appropriate. The desired condition value for each indicator can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%).

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP. The vegetation objective should be placed in the Vegetation section of the ADPP. Planning units will include the following land use plan vegetation objective within the Vegetation section of their ADPPs:

*In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).*

**Issue:**

**Direction:**

**Livestock Grazing**

The following management actions will be included in the Livestock Grazing section of the ADPP.

- *The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting Land Health Standards, with focus on those containing riparian areas,*

*including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (ex., fire) and legal obligations.*

- *The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.*
- *Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.*
- *At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.*

Attachment III provides guidance as to how the BLM will incorporate GRGS decisions from the Sage-Grouse RMP/Amendments into grazing permits/leases.

***Issue:***

***Direction:***

**Mineral Materials (Salable Minerals)**

All Priority Habitat Management Areas will be closed to mineral materials development. All Important Habitat Management Areas and General Habitat Management Areas will be open to mineral materials development, consistent with the Idaho Anthropogenic Disturbance Criteria.

***Issue:***

***Direction:***

**High-voltage Transmission and Major Pipeline ROWs and Corridors**

1) Apply the recommended NPT allocation guidance for PHMA of avoidance.

2) GHMA will remain open. BLM-ID will employ a location and design process to ensure protection.

3) For sub-regions that have planned priority transmission lines that traverse their planning area (Gateway West, Boardman to Hemingway, and TransWest Express, including those portions of Gateway South that

are co-located), apply the following language as a management action in their ADPP:

*“Priority Habitat Management Areas (PHMAs) and Important Habitat Management Areas (IHMAs) are designated as avoidance areas for high voltage transmission line ROWs, except for the transmission projects specifically identified below. All authorizations in these areas, other than the excepted projects, must comply with the conservation measures outlined in this proposed plan, including the RDFs and avoidance criteria presented in [insert citation here] of this document. The BLM is currently processing an application for [Insert name of transmission project] and the NEPA review for this project is well underway. The BLM is analyzing GRSG mitigation measures through the project’s NEPA review process, which will include analysis of the following conservations measures.”*

**Issue:** Coal Suitability  
**Direction:** Not Applicable in Idaho

**Issue:** Fluid Mineral Resources (Including Geothermal)  
**Direction:** All ADPPs will include the following as a conservation objective:

*“Priority will be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMA, IHMA, and GHMA. When analyzing leasing and authorizing development of fluid mineral resources, including geothermal, in PHMA, IHMA, and GHMA, and subject to applicable stipulations for the conservation of Greater Sage-Grouse, priority will be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-Grouse. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 U.S.C. 226(p) and 43 C.F.R. 3162.3-1(h).”*

*“Where a proposed fluid mineral development project on an existing lease could adversely affect GRSG populations or habitat, the BLM will work with the lessees, operators, or other project proponents to avoid, reduce and mitigate adverse impacts to the extent compatible with lessees' rights to drill and produce fluid mineral resources. The BLM will work with the lessee, operator, or project proponent in developing an APD for the lease to avoid and minimize impacts to sage-grouse or its habitat and will ensure that the best information about the GRSG and its habitat informs and helps to guide development of such Federal leases.”*

**Issue:** No Surface Occupancy (NSO) Exception Language  
**Direction:** Follow NPT guidance for Priority Habitat Management Areas. No-surface-occupancy stipulations will be included in new fluid mineral

leases at the time of leasing only and may not be applied to existing fluid mineral leases that did not include no-surface-occupancy stipulation at the time of leasing. Include the following language into the ADPP:

*“No waivers or modifications to a fluid mineral lease no-surface-occupancy stipulation will be granted. The Authorized Officer may grant an exception to a fluid mineral lease no-surface-occupancy stipulation only where the proposed action:*

- (i) Would not have direct, indirect, or cumulative effects on GRSG or its habitat; or,*
- (ii) Is proposed to be undertaken as an alternative to a similar action occurring on a nearby parcel, and would provide a clear conservation gain to GRSG.*

*Exceptions based on conservation gain (ii) may only be considered in (a) PHMAs of mixed ownership where federal minerals underlie less than fifty percent of the total surface, or (b) areas of the public lands where the proposed exception is an alternative to an action occurring on a nearby parcel subject to a valid Federal fluid mineral lease existing as of the date of this RMP [revision or amendment]. Exceptions based on conservation gain must also include measures, such as enforceable institutional controls and buffers, sufficient to allow the BLM to conclude that such benefits will endure for the duration of the proposed action’s impacts.*

*Any exceptions to this lease stipulation may be approved by the Authorized Officer only with the concurrence of the State Director. The Authorized Officer may not grant an exception unless the applicable state wildlife agency, the USFWS, and the BLM unanimously find that the proposed action satisfies (i) or (ii). Such finding shall initially be made by a team of one field biologist or other GRSG expert from each respective agency. In the event the initial finding is not unanimous, the finding may be elevated to the appropriate BLM State Director, USFWS State Ecological Services Director, and state wildlife agency head for final resolution. In the event their finding is not unanimous, the exception will not be granted. Approved exceptions will be made publically available at least quarterly.”*

**Issue:**

**Direction:**

**Adaptive Management**

Follow the NPT Adaptive Management Guidance and Sideboards. When a hard trigger is hit in a BSU, the designated response will be put in place in that BSU. Triggers and responses have been developed with local state and FWS experts.

When a hard trigger is hit in a BSU within a PAC that has multiple BSUs, including those that cross state lines, the WAFWA Management Zone Greater Sage-Grouse Conservation Team will convene to determine the causal factor, put project level responses in place, as appropriate and discuss further appropriate actions to be applied. The team will also investigate the status of the hard triggers in other BSUs within the PAC and will invoke the appropriate plan response. Adoption of any further actions at the plan level may require initiating a plan amendment process.

***Issue:***

***Direction:***

**Application of Lek Buffers**

The ADPP will require the use of lek buffer-distances for all new BLM-managed and BLM-authorized anthropogenic disturbances in GHMA, IHMA, and PHMA (see Attachment IV) through this drop-in Chapter 2 language:

*“In undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will apply the lek buffer-distances identified in the USGS Report Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review (Open File Report 2014-1239) in accordance with Appendix X.”*

Allocation Direction

\*Southwest Montana will follow the allocations designated for the MT ADPP

## Attachment I

# GREATER SAGE-GROUSE RMPA/FEIS TEMPLATE LANGUAGE FOR ADDRESSING MITIGATION

[Red box] = Instructions

[Yellow box] = Fill in the blank

[This mitigation language addresses greater sage-grouse. However, if you are working on a plan revision, you may need to add additional language to be more inclusive of other resource and value objectives (e.g. cultural resources, national historic trails, recreation values, other special status species) that may need to be mitigated.]

## Chapter 1 - Introduction

[Nothing new to add to EIS]

## Chapter 2 – Alternatives – [Proposed Plan/Proposed Plan Amendment]

- Add these two new sections (below) to the **Chapter 2 Alternatives** section.
- Replace the Regional Mitigation placeholder language that was included in the draft EIS with the new “Mitigation” section, below.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

Consistent with the proposed plan’s goal outlined in [Table 2-X – Description of Alternatives], the intent of the [Proposed Plan/Proposed Plan Amendment] is to provide a net conservation gain to the species. To do so, in undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. This is also consistent with BLM Manual 6840 – Special Status Species Management, Section .02B, which states “to initiate protective conservation measures that reduce or eliminate threats to Bureau sensitive species to minimize the likelihood of the need for listing of these species under the ESA.”

## Mitigation

*Mitigation Standards.* In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see the concepts of durability, timeliness, and additionality as described further in Appendix X).

*Greater Sage-Grouse Conservation Team.* The BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. This Team will develop a WAFWA Management Zone Regional Mitigation Strategy (hereafter, Regional Mitigation Strategy). The Team will also compile and report on monitoring data (including data on habitat condition, population trends, and mitigation effectiveness) from States across the WAFWA Management Zone (see Monitoring section). Subsequently, the Team will use these data to either modify the appropriate Regional Mitigation Strategy or recommend adaptive management actions (see Adaptive Management section).

The BLM/USFS will invite governmental and Tribal partners to participate in this Team, including the State Wildlife Agency and U.S. Fish and Wildlife Service, in compliance with the exemptions provided for committees defined in the Federal Advisory Committee Act and the regulations that implement that act. The BLM/USFS will strive for a collaborative and unified approach between Federal agencies (e.g. FWS, BLM, and USFS), Tribal governments, state and local government(s), and other stakeholders for greater sage-grouse conservation. The Team will provide advice, and will not make any decisions that impact Federal lands. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

*Developing a Regional Mitigation Strategy.* The Team will develop a Regional Mitigation Strategy to inform the mitigation components of NEPA analyses for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy will be developed within one year of the issuance of the Record of Decision. The BLM's Regional Mitigation Manual MS-1794 will serve as a framework for developing the Regional Mitigation Strategy. The Regional Mitigation Strategy will be applicable to the States/Field Offices/Forests within the WAFWA Management Zone's boundaries.

Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can provide a net conservation gain to the species. The Regional Mitigation Strategy developed by the Team will elaborate on the components identified above (i.e.

avoidance, minimization, and compensation; additionality, timeliness, and durability) and further explained in Appendix [X].

In the time period before the Strategy is developed, BLM will consider regional conditions, trends, and sites, to the greatest extent possible, when applying the mitigation hierarchy and will ensure that mitigation is consistent with the standards set forth in the first paragraph of this section.

*Incorporating the Regional Mitigation Strategy into NEPA Analyses.* The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

*Implementing a Compensatory Mitigation Program.* Consistent with the principles identified above, the BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be implemented at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

### **Chapter 3 – Affected Environment**

[Nothing to add]

### **Chapter 4 – Environmental Consequences – [Proposed Plan/Proposed Plan Amendment]**

#### **Mitigation**

This Chapter describes the environmental consequences associated with the impacts to greater sage-grouse and its habitat from activities carried out in conformance with this plan, in addition to BLM/USFS management actions. In undertaking BLM/USFS management actions, and consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and

compensating for impacts by applying beneficial mitigation actions. In addition, to help implement this [Proposed Plan / Proposed Plan Amendment], a WAFWA Management Zone Regional Mitigation Strategy (per Appendix [X]) will be developed within one year of the issuance of the Record of Decision. The Strategy will elaborate on the components identified in Chapter 2 (avoidance, minimization, compensation, additionality, timeliness, and durability), and will be considered by the BLM/USFS for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The implementation of a Regional Mitigation Strategy will benefit greater sage-grouse, the public, and land-users by providing a reduction in threats, increased public transparency and confidence, and a predictable permit process for land-use authorization applicants.

### Appendix [X]

- Add this new Appendix.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

### Appendix (X) – Mitigation – [Proposed Plan/Proposed Plan Amendment]

#### General

In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see glossary).

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy that will inform the NEPA decision making process including the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. A robust and transparent Regional Mitigation Strategy will contribute to greater sage-grouse habitat conservation by reducing, eliminating, or minimizing threats and compensating for residual impacts to greater sage-grouse and its habitat.

The BLM's Regional Mitigation Manual MS-1794 serves as a framework for developing and implementing a Regional Mitigation Strategy. The following sections provide additional guidance specific to the development and implementation of a WAFWA Management Zone Regional Mitigation Strategy.

### Developing a WAFWA Management Zone Regional Mitigation Strategy

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy to guide the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy should consider any State-level greater sage-grouse mitigation guidance that is consistent with the requirements identified in this Appendix. The Regional Mitigation Strategy should be developed in a transparent manner, based on the best science available and standardized metrics.

As described in Chapter 2, the BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. The Strategy will be developed within one year of the issuance of the Record of Decision.

The Regional Mitigation Strategy should include mitigation guidance on avoidance, minimization, and compensation, as follows:

- Avoidance
  - Include avoidance areas (e.g. right-of-way avoidance/exclusion areas, no surface occupancy areas) already included in laws, regulations, policies, and/or land use plans (e.g. Resource Management Plans, Forest Plans, State Plans); and,
  - Include any potential, additional avoidance actions (e.g. additional avoidance best management practices) with regard to greater sage-grouse conservation.
- Minimization
  - Include minimization actions (e.g. required design features, best management practices) already included in laws, regulations, policies, land use plans, and/or land-use authorizations; and,
  - Include any potential, additional minimization actions (e.g. additional minimization best management practices) with regard to greater sage-grouse conservation.
- Compensation
  - Include discussion of impact/project valuation, compensatory mitigation options, siting, compensatory project types and costs, monitoring, reporting, and program administration. Each of these topics is discussed in more detail below.
    - Residual Impact and Compensatory Mitigation Project Valuation Guidance
      - A common standardized method should be identified for estimating the value of the residual impacts and value of the compensatory mitigation projects, including accounting for any uncertainty associated with the effectiveness of the projects.

- This method should consider the quality of habitat, scarcity of the habitat, and the size of the impact/project.
- For compensatory mitigation projects, consideration of durability (see glossary), timeliness (see glossary), and the potential for failure (e.g. uncertainty associated with effectiveness) may require an upward adjustment of the valuation.
- The resultant compensatory mitigation project will, after application of the above guidance, result in proactive conservation measures for Greater Sage-grouse (consistent with BLM Manual 6840 – Special Status Species Management, section .02).
- **Compensatory Mitigation Options**
  - Options for implementing compensatory mitigation should be identified, such as:
    - Utilizing certified mitigation/conservation bank or credit exchanges.
    - Contributing to an existing mitigation/conservation fund.
    - Authorized-user conducted mitigation projects.
  - For any compensatory mitigation project, the investment must be additional (i.e. additionality: the conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project).
- **Compensatory Mitigation Siting**
  - Sites should be in areas that have the potential to yield a net conservation gain to the greater sage-grouse, regardless of land ownership.
  - Sites should be durable (see glossary).
  - Sites identified by existing plans and strategies (e.g. fire restoration plans, invasive species strategies, healthy land focal areas) should be considered, if those sites have the potential to yield a net conservation gain to greater sage-grouse and are durable.
- **Compensatory Mitigation Project Types and Costs**
  - Project types should be identified that help reduce threats to greater sage-grouse (e.g. protection, conservation, and restoration projects).
  - Each project type should have a goal and measurable objectives.
  - Each project type should have associated monitoring and maintenance requirements, for the duration of the impact.
  - To inform contributions to a mitigation/conservation fund, expected costs for these project types (and their monitoring and maintenance), within the WAFWA Management Zone, should be identified.
- **Compensatory Mitigation Compliance and Monitoring**
  - Mitigation projects should be inspected to ensure they are implemented as designed, and if not, there should be methods to enforce compliance.
  - Mitigation projects should be monitored to ensure that the goals and objectives are met and that the benefits are effective for the duration of the impact.

- Compensatory Mitigation Reporting
  - Standardized, transparent, scalable, and scientifically-defensible reporting requirements should be identified for mitigation projects.
  - Reports should be compiled, summarized, and reviewed in the WAFWA Management Zone in order to determine if greater sage-grouse conservation has been achieved and/or to support adaptive management recommendations.
- Compensatory Mitigation Program Implementation Guidelines
  - Guidelines for implementing the State-level compensatory mitigation program should include holding and applying compensatory mitigation funds, operating a transparent and credible accounting system, certifying mitigation credits, and managing reporting requirements.

### Incorporating the Regional Mitigation Strategy into NEPA Analyses

The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

### Implementing a Compensatory Mitigation Program

The BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be managed at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

### **Glossary Terms**

**Additionality:** The conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project. (adopted and modified from BLM Manual Section 1794).

**Avoidance mitigation:** Avoiding the impact altogether by not taking a certain action or parts of an action. (40 CFR 1508.20(a)) (e.g. may also include avoiding the impact by moving the proposed action to a different time or location.)

**Compensatory mitigation:** Compensating for the (residual) impact by replacing or providing substitute resources or environments. (40 CFR 1508.20)

**Compensatory mitigation projects:** The [restoration](#), [creation](#), [enhancement](#), and/or [preservation](#) of impacted resources (adopted and modified from 33 CFR 332), such as on-the-ground actions to improve and/or protect habitats (e.g. chemical vegetation treatments, land acquisitions, conservation easements). (adopted and modified from BLM Manual Section 1794).

**Compensatory mitigation sites:** The durable areas where compensatory mitigation projects will occur. (adopted and modified from BLM Manual Section 1794).

**Durability (protective and ecological):** the maintenance of the effectiveness of a mitigation site and project for the duration of the associated impacts, which includes resource, administrative/legal, and financial considerations. (adopted and modified from BLM Manual Section 1794).

**Minimization mitigation:** Minimizing impacts by limiting the degree or magnitude of the action and its implementation. (40 CFR 1508.20 (b))

**Residual impacts:** Impacts that remain after applying avoidance and minimization mitigation; also referred to as unavoidable impacts.

**Timeliness:** The lack of a time lag between impacts and the achievement of compensatory mitigation goals and objectives (BLM Manual Section 1794).

## Attachment II

### **Greater Sage-Grouse (GRSG) Land Use Plans Disturbance Caps Guidance**

#### **Purpose**

- I. Provide the planning units with land use planning actions that need to be incorporated into the administrative draft proposed plans to respond to the 3% disturbance cap once it is exceeded in either the Biologically Significant Units (BSU) or at the project scale.
- II. Provide guidance on the use of the west-wide habitat degradation (disturbance) data layers as well as the use of locally collected disturbance data for BSUs to determine if the disturbance cap has been exceeded as the land use plans (LUP) are being implemented.
- III. Provide guidance on the use of locally collected disturbance data for project authorizations to determine if the disturbance cap has been exceeded as the LUPs are being implemented.
- IV. Provide guidance on the inclusion of fire in disturbance calculations.
- V. Provide guidance on the use of the density of energy and mining facilities during authorizations
- VI. Provide guidance on the use of the BER analysis in the land use plans (Chapter 2, Affected Environment) and the use of the “west-wide” sagebrush availability and habitat degradation data/estimates for the Priority Habitat Management Areas in each population for monitoring and management purposes as the LUPs are being implemented.
- VII. Provide guidance on what is considered in the disturbance calculations versus what is considered for the disturbance cap.

#### **Guidance**

- I. Planning units will include the following land use plan actions within their administrative draft proposed land use plans (ADPPs) that states:
  - a. *If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.) will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.*
  - b. *If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a Priority Habitat Management Areas, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain*

*the area under the cap (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.).*

- II. Use of west-wide habitat degradation data as well as the use of locally collected disturbance data to determine the level of existing disturbance:
  - a) In the GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, use the west-wide data at a minimum and/or locally collected disturbance data as available (e.g., DDCT) for the anthropogenic disturbance types listed in Table 1.
  
- III. Use of locally collected disturbance data for project authorizations:
  - a) In a proposed project analysis area, digitize all existing anthropogenic disturbances identified in the GRSG Monitoring Framework and the 7 additional features that are considered threats to sage-grouse (Table 2). Using 1 meter resolution NAIP imagery is recommended. Use local data if available.
  
- IV. Fire-burned and habitat treatment areas will not be included in the project scale degradation disturbance calculation for managing sage-grouse habitat under a disturbance cap. These areas will be considered part of a sagebrush availability when rangewide, consistent, interagency fine- and site-scale monitoring has been completed and the areas have been determined to meet sage-grouse habitat requirements. These and other disturbances identified in Table 3 will be part of a sagebrush availability evaluation and will be considered along with other local conditions that may affect sage-grouse during the analysis of the proposed project area.
  
- V. Planning units are directed to use a density cap related to the density of energy and mining facilities (listed below) during project scale authorizations. If the disturbance density in a proposed project area is on average less than 1/ 640 acres, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than an average of 1/ 640 acres, either defer the proposed project or co-locate it into existing disturbed area (*subject to applicable laws and regulations, such as the 1872 Mining Law, valid existing rights, etc.*).
  - Energy (oil and gas wells and development facilities)
  - Energy (coal mines)
  - Energy (wind towers)
  - Energy (solar fields)
  - Energy (geothermal)
  - Mining (active locatable, leasable, and saleable developments)

- VI. Planning units are directed to continue using the baseline data from the 2013 USGS Baseline Environmental Report (BER) in the Affected Environment section of the proposed plans/ FEISs. West-wide sagebrush availability and habitat degradation data layers will be used for the Priority Habitat Management Areas in each population for monitoring (see the GRSG Monitoring Framework in the Monitoring Appendix of the EIS) and management purposes as the LUPs are being implemented. The BER reported on individual threats across the range of sage-grouse while the west-wide disturbance calculation consolidated the anthropogenic disturbance data into a single measure using formulas from the GRSG Monitoring Framework. These calculations will be completed on an annual basis by the BLM's National Operation Center. Planning units will be provided the 2014 baseline disturbance calculation derived from the west-wide data once the RODs are signed that describe the Priority Habitat Management Areas.
- VII. Planning units are directed to use the three measures (sagebrush availability, habitat degradation, density of energy and mining) in conjunction with other information during the NEPA process to most effectively site project locations, such as by clustering disturbances and/or locating facilities in already disturbed areas. Although locatable mine sites are included in the degradation calculation, mining activities under the 1872 mining law may not be subject to the 3% disturbance cap. Details about locatable mining activities should be fully disclosed and analyzed in the NEPA process to assess impacts to sage-grouse and their habitat as well as to BLM goals and objectives, and other BLM programs and activities.

### **Additional Information/Formulas**

A collaborative effort in Idaho developed a disturbance calculation method that includes the 3% disturbance cap plus a modifier that includes effective habitat and is described in Appendix G of their ADPP. The formulas below are excerpted from that Appendix.

Disturbance Calculations for the BSU:

$$\begin{aligned} & \text{Disturbance Percentage} \\ & = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}^1}{\text{Acres within the BSU} * \left( \frac{\text{Acres of Effective Habitat within the BSU}}{\text{Acres within the BSU}} + 0.3 \right)} \right) \times 100 \end{aligned}$$

Disturbance Calculations for Project Analysis Areas (PAAs):

$$\text{Disturbance Percentage} = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}^{1,2}}{\text{Acres within the PAA} * \left( \frac{\text{Acres of Effective Habitat within the PAA}}{\text{Acres within the PAA}} + 0.3 \right)} \right) \times 100$$

<sup>1</sup> see Table 3. <sup>2</sup> see Table 2.

Project analysis area (PAA) method for permitting surface disturbance activities:

1. Determine potentially affected occupied leks by placing a four-mile buffer around the project boundary as defined by the proposed area of physical disturbance related to the project. All occupied leks within this buffer will be considered affected by the proposed project.
2. Next place a four mile boundary around each of the occupied leks identified in item 1, above.
3. The polygon formed by the merging and dissolving of polygons from step 1 and 2 creates the Project Analysis Area (PAA) for surface disturbance activities.
4. Map existing disturbances within the analysis area or use locally available spatial data. Use of digitized NAIP imagery is recommended.
5. Calculate percent existing disturbance using the formula above. If existing disturbance is less than 3%, proceed to next step. If existing disturbance is greater than 3%, defer the project.
6. Add proposed project disturbance footprint area and recalculate the percent disturbance. If disturbance is less than 3%, proceed to next step. If disturbance is greater than 3%, defer project.
7. Calculate the disturbance density of energy and mining facilities (listed above). If the disturbance density is less than 1 facility per 640 acres, averaged across project analysis area, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than 1 facility per 640 acres, averaged across the project analysis area, either defer the proposed project or co-locate it into existing disturbed area.
8. If a project that would exceed the degradation cap or density cap cannot be deferred due to valid existing rights or other existing laws and regulations, fully disclose the local and regional impacts of the proposed action in the associated NEPA.

Table 1. Anthropogenic disturbance types for disturbance calculations. Data sources are described for the west-wide habitat degradation estimates (Table copied from the GRSG Monitoring Framework)

<b>Degradation Type</b>	<b>Subcategory</b>	<b>Data Source</b>	<b>Direct Area of Influence</b>	<b>Area Source</b>
<b>Energy (oil &amp; gas)</b>	Wells	IHS; BLM (AFMSS)	5.0ac (2.0ha)	BLM WO-300

Infrastructure (communication towers)		X	
Infrastructure (other vertical structures)		X	
Other developed rights-of-way		X	

## **Background**

In the USFWS's 2010 listing decision for sage-grouse, the USFWS identified 18 threats contributing to the destruction, modification, or curtailment of the sage-grouse's habitat or range (75 FR 13910 2010). In April 2014, the Interagency GRSG Disturbance and Monitoring Sub-Team finalized the Greater Sage-Grouse Monitoring Framework (hereafter, framework) to track these threats. The 18 threats have been aggregated into three measures to account for whether the threat predominantly removes sagebrush or degrades habitat. The three measures are:

Measure 1: Sagebrush Availability (percent of sagebrush per unit area)

Measure 2: Habitat Degradation (percent of human activity per unit area)

Measure 3: Density of Energy and Mining (facilities and locations per unit area)

The BLM is committed to monitoring the three disturbance measures and reporting them to the FWS on an annual basis. However, for the purposes of calculating the amount of disturbance to provide information for management decisions and inform the success of the sage-grouse planning effort, the data depicting the location and extent of the 12 anthropogenic types of threats will be used at a minimum in the BSUs and those same 12 anthropogenic and the additional 7 types of features that are threats to sage-grouse will be used in the project analysis areas.

		Scales		
		Broad/Mid (Populations)	Intermediate (BSU)	Local/Project (Seas. Hab.)
<b>Habitat Degradation</b>	Unit:	WAFWA Populations	Biologically Significant Unit	Project/Local Habitat Area <sup>5</sup>

<b>Energy and Mining</b>	Unit:	WAFWA Populations		Project Area & Seasonal Hab.
	Area of Interest:	PHMAs		PHMAs
	Data:	Westwide well & mine data		Westwide <sup>2</sup> , State data
	Formula (Measure 3):	<u>Well Pds and Mines</u> <sup>1</sup> Square Mile	n/a	<u>Well Pds and Mines</u> <sup>1</sup> Square Mile
	Management:	Internal BLM & FS estimates		Project Authorization
	All Lands:	Yes		Yes
	Fire Included:	No		No
	Who:	BLM NOC		BLM NOC or SOs or FOs
<b>ACRONYMS</b>				
PHMA = Priority Habitat Management Area      BSU = Biologically Significant Unit				
EVT = Existing Vegetation Type                      EpS = Areas of Biotic Potential				
<sup>1</sup> Only mines with a Plan of Operation (>5 acres of disturbance) will be included.				
<sup>2</sup> Westwide data will be used only if state or local data are not available.				
<sup>3</sup> This footnote was removed from the table. January 2015.				
<sup>4</sup> This may be one of several variables used to inform Adaptive Management. The BSU is the scale at which Adaptive Management will be applied.				
<sup>5</sup> A moving window analysis will be conducted at this scale by the NOC using westwide data. If available, state and local data/analysis should be used for Adaptive Management				
<sup>6</sup> The project analysis area will be based on a 4-mile radius polygon around the project area combined with a 4-mile buffer around any leaks within the project boundary in PHMA (Idaho methodology).				
<sup>7</sup> See Table 2				

## Attachment III

### **Greater Sage-Grouse (GRSG) Land Use Plans Vegetation Objectives Guidance**

#### **Purpose**

- I. Provide the planning units with land use planning vegetation objectives that need to be incorporated into the administrative draft proposed plans.
- II. Provide guidance on the use of a template for GRSG habitat objectives in the Special Status Species section of the ADPPs.
- III. Provide guidance on prioritizing land health assessments in sage-grouse habitats and conducting assessments at the watershed scale using the sage-grouse habitat objectives.

#### **Guidance**

- I. Planning units will include the following land use plan vegetation objective within the Vegetation section of their administrative draft proposed land use plans (ADPPs) that states:

*In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).*
- II. Planning units will populate the GRSG Habitat Objectives table template to provide vegetation objectives for sage-grouse life history stages based on the ecology in your region to be used to meet the applicable land health standard in GRSG habitats. Planning units are encouraged to work across boundaries when developing the objectives to ensure regional continuity and will provide appropriate peer-reviewed science to support the habitat values for the indicators. These desired condition value can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%). Planning units may include additional indicators and desired condition values as appropriate (see the Sage-Grouse Habitat Assessment Framework (HAF, *Technical Reference 6710-1*) for appropriate indicators). The HAF contains values for habitat suitability indicators in sage-grouse seasonal habitats from the Connelly et al. (2000) sage-grouse guidelines and has incorporated many of the core indicators in the AIM strategy (Toevs et al. 2011) as well. Planning units may use the indicator values from Connelly et al. (2000) while developing the land use plan Sage-Grouse Habitat Objectives table.

When using the indicators to guide management actions or during land health assessments, consider that the indicators are sensitive to the ecological processes operating at the scale of interest and that a single habitat indicator does not necessarily define habitat suitability for an area or particular scale. Indicators must be collectively reviewed, assessed based on the site potential, and put into spatial and temporal context to correctly determine habitat suitability which will include more than one scale and multiple indicators. Assessment and evaluation of these objectives will follow the steps described in the HAF.

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP and is to be used as a minimum to meet the applicable land health standard in sage-grouse habitats.

Greater Sage-Grouse Habitat Objectives

ATTRIBUTE	INDICATORS	DESIRED CONDITION	Reference
<b>BREEDING AND NESTING (Seasonal Use Period March 1-June 15)</b>			
Lek Security	Proximity of trees		
	Proximity of sagebrush to leks		
Cover	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover		
	Sagebrush height Arid sites Mesic sites		
	Predominant sagebrush shape		
	Perennial grass cover Arid sites Mesic sites		
	Perennial grass and forb height		
	Perennial forb canopy cover Arid sites Mesic sites		
<b>BROOD-REARING/SUMMER<sup>1</sup> (Seasonal Use Period June 16-October 31)</b>			
Cover	% of Seasonal habitat meeting desired condition		
	Sagebrush canopy cover		
	Sagebrush height		
	Perennial grass canopy cover and forbs		
	Riparian areas/mesic meadows		
	Upland and riparian perennial forb availability		
<b>WINTER<sup>1</sup> (Seasonal Use Period November 1-February 28)</b>			
Cover and Food	% of seasonal habitat meeting desired conditions		
	Sagebrush canopy cover above snow		
	Sagebrush height above snow		

- III. The BLM will prioritize land health assessments in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. Field offices are to conduct land health assessments at the watershed scale and use the GRSG habitat objectives when assessing the applicable standard in GRSG habitats.

When conducting land health assessments, the BLM should follow, at a minimum, “Interpreting Indicators of Rangeland Health” (Pellant et. al. 2005) and the “BLM Core Terrestrial Indicators and Methods” (MacKinnon et al. 2011). For assessments being conducted in GRSG designated management areas, the BLM should collect additional data to inform the HAF indicators that have not been collected using the above methods. Implementation of the principles outlined in the AIM strategy will allow the data to be used to generate unbiased estimates of condition across the area of interest; facilitate consistent data collection and rollup analysis among management units; help provide consistent data to inform the classification and interpretation of imagery; and provide condition and trend of the indicators describing sagebrush characteristics important to sage-grouse habitat.

## Attachment IV

### **Incorporating GSGR RMP Decisions into Grazing Authorizations**

#### **Purpose**

The purpose is to provide recommended ADPP language; outline the process for prioritizing the review and processing of grazing permits/leases to determine if modification is necessary (prior to renewal and in accordance with prioritization criteria); provide direction for including specific management thresholds and defined responses that will allow adjustments to livestock grazing within the terms and conditions of permits; and provide a process for prioritizing compliance monitoring within Sagebrush Focal Areas (SFAs) and Priority Habitat Management Areas (PHMAs).

#### **Background**

The BLM manages approximately 18,000 livestock grazing permits and leases on the public lands. Livestock grazing is an integral part of the BLM multiple-use mission and is authorized by the Taylor Grazing Act (1934), the Federal Land Policy Management Act (1976) and the Public Rangeland Improvement Act (1978). By statute and regulation, grazing leases and permits are normally issued for 10-year periods. Annually, a range of 1,200 to 3,200 grazing permits expire and the BLM receives 500 to 1,500 grazing permit/lease transfer requests.

The BLM currently issues permits/leases in accordance with:

- All applicable law, regulation, policy (NEPA, consultation, proposed/final grazing decision-also known as a fully processed permit); or
- Various appropriation authorities enacted between 1999 and 2014 extending terms and conditions of expiring or transferred permits/leases that the BLM is unable to fully process before their expiration; or
- Section 402(c)(2) of FLPMA (as amended by Public Law 113-291, enacted December 19, 2014).

Congress has acted to ensure that grazing permittees could continue to graze if the BLM is unable to complete the environmental analysis mandated by the NEPA and other applicable laws. Since 1999, a provision (“the rider”) has been included in the Interior Appropriations bill that, in various forms, generally authorizes the BLM to renew grazing permits and leases under their same terms and conditions until it fully processes the permit renewal in compliance with NEPA, ESA, and other legal or regulatory requirements. The most recent rider is contained in Section 411, Public Law 113-76.<sup>1</sup> The FLPMA amendment to Section 402 (c) allows BLM to renew

---

<sup>1</sup> The Consolidated Appropriations Act, 2014 includes the provision Section 411 which states: “Section 415 of division E of Public Law 112-74 is amended by striking “and 2013” and inserting “through 2015.” The terms and conditions of section 325 of Public Law 108-108 (117 stat. 1307), regarding permits at the Department of the Interior and the Forest Service, shall remain in effect through fiscal year 2015. A grazing permit or lease issued by the Secretary of the Interior for lands administered by the Bureau of Land Management that is the subject of a request for a grazing preference transfer shall be issued, without further processing, for the remaining time period in

grazing permits and leases under the same terms and conditions. This relieves the BLM's renewal processing workload, allowing the BLM to prioritize permit processing based on sensitivity of the resources at issue.<sup>2</sup>

The BLM may modify terms and conditions of a permit or lease at any time following completion of appropriate analysis and consultation, cooperation, and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public.<sup>3</sup> Under 43 C.F.R. 4160.1, the BLM must serve a proposed decision on any affected applicant, permittee or lessee, any agent and lien holder of record. Copies of the decisions are provided to the interested publics.

**Recommended Language to be incorporated as Livestock Grazing Management Actions within the GRSG ADPPs:**

- The BLM will prioritize the review of grazing permits/leases, including those prior to renewal to determine if modification is necessary, and processing of grazing permits and leases, in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource conditions (ex., fire) and legal obligations.
- The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.
- Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to

---

the existing permit or lease using the same mandatory terms and conditions. If the authorized officer determines a change in the mandatory terms and conditions is required, the new permit must be processed as directed in section 325 of Public Law 108-108.” Where a FO is unable to fully process a permit renewal in compliance with all applicable laws prior to the permit expiration, Section 411 extends the authority to renew the grazing permit with the same terms and conditions as the expiring permit. Section 325 provides the process for authorizing grazing until a permit or lease is issued in compliance with all applicable law and regulatory processes.

<sup>2</sup> The newly amended section 402(c) of FLPMA provides permanent authority to BLM to renew expiring permits. That section states, “The terms and conditions in a grazing permit or lease that has expired, or was terminated due to a grazing preference transfer, shall be continued under a new permit or lease until the date on which the Secretary concerned completes any environmental analysis and documentation for the permit or lease required under the National Environmental Policy Act of 1969 (42 U.S.C. 4321 et seq.) and other applicable laws.”

<sup>3</sup> 43 CFR 4130.3-3 states: Following consultation, cooperation and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public, the authorized officer may modify terms and conditions of the permit or lease when the active grazing use or related management practices are not meeting the land use plan, allotment management plan or other activity plan, or management objectives, or is not in conformance with the provisions of subpart 4180 (Fundamentals of Rangeland Health and Standards and Guidelines for Grazing Administration).

help ensure compliance with the terms and conditions within the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.

- At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

### **Addressing GRSG RMP Amendments/Revisions Objectives in Grazing Permits/Leases**

BLM will develop criteria to prioritize the workload to process permits/leases (either fully processed or reauthorized based on the Appropriations rider, or issued under Section 402(c)(2) of FLPMA) and determine whether modification is necessary prior to renewal within PHMAs, beginning with those in SFAs. In setting priorities, those containing riparian areas and areas not meeting Land Health Standards (43 C.F.R. 4180) will take precedence. Potential criteria for prioritizing permit modifications could include:

- Are there riparian areas or wet meadows in the permit/lease area?
- Was current livestock grazing identified as a causal factor for not meeting Land Health Standards?
- Since the last allotment/watershed evaluation, is there current monitoring information to determine that the watershed/allotment is currently achieving or making significant progress towards achieving land health standards?
- Does the permit have terms and conditions adequate to ensure proper grazing practices to meet GRSG habitat objectives found in the Special Status Species section of the land use plan?
- Is there data that indicates that the GRSG habitat objectives, including the Habitat Objectives table, found in the Special Status Species section of the land use plan are being met?
- Is there a request from the permittee to modify the terms and conditions of his/her permit?

Additionally, if an existing permit/lease within PHMAs requires modification because current grazing is a significant causal factor for not meeting the Land Health Standards, the BLM will prepare the appropriate NEPA analysis and issue the proposed/final grazing decision under 43 C.F.R. Subpart 4160, subject to administrative appeal and potential judicial challenge.

The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA. Adjustments to meet seasonal Sage-Grouse habitat requirements could include:

- Season or timing of use;
- Numbers of livestock (includes temporary non-use or livestock removal);
- Distribution of livestock use;
- Intensity of use; and
- Type of livestock (e.g., cattle, sheep, horses, llamas, alpacas and goats).

## **Compliance Monitoring**

The BLM will monitor grazing permits/leases renewed or modified in accordance with the direction contained in this guidance as follows: Allotments within SFAs, followed by those in other PHMA, and focusing on those with riparian areas, will be prioritized for monitoring to ensure compliance with the terms and conditions in the permits. The BLM will collect, at a minimum, the following monitoring data:

- Vegetation Condition
- Actual Use
- Utilization
- Use Supervision

## **Concerning Voluntary Relinquishments**

All ADPPs will include the following language:

At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

For completing this, BLM offices should use [WO IM 2013-184 Relinquishment of Grazing Permitted Use](#) or the most recent policy guidance.

Attachment V

**Applying Lek Buffer-Distances When Approving Actions**

- *Buffer Distances and Evaluation of Impacts to Leks*

Evaluate impacts to leks from actions requiring NEPA analysis. In addition to any other relevant information determined to be appropriate (e.g. State wildlife agency plans), the BLM will assess and address impacts from the following activities using the lek buffer-distances as identified in the USGS Report *Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review* ([Open File Report 2014-1239](#)). The BLM will apply the lek buffer-distances specified as the lower end of the interpreted range in the report unless justifiable departures are determined to be appropriate (see below). The lower end of the interpreted range of the lek buffer-distances is as follows:

  - linear features (roads) within 3.1 miles of leks
  - infrastructure related to energy development within 3.1 miles of leks.
  - tall structures (e.g., communication or transmission towers, transmission lines) within 2 miles of leks.
  - low structures (e.g., fences, rangeland structures) within 1.2 miles of leks.
  - surface disturbance (continuing human activities that alter or remove the natural vegetation) within 3.1 miles of leks.
  - noise and related disruptive activities including those that do not result in habitat loss (e.g., motorized recreational events) at least 0.25 miles from leks.

Justifiable departures to decrease or increase from these distances, based on local data, best available science, landscape features, and other existing protections (e.g., land use allocations, state regulations) may be appropriate for determining activity impacts. The USGS report recognized “that because of variation in populations, habitats, development patterns, social context, and other factors, for a particular disturbance type, there is no single distance that is an appropriate buffer for all populations and habitats across the sage-grouse range”. The USGS report also states that “various protection measures have been developed and implemented... [which have] the ability (alone or in concert with others) to protect important habitats, sustain populations, and support multiple-use demands for public lands”. All variations in lek buffer-distances will require appropriate analysis and disclosure as part of activity authorization.

In determining lek locations, the BLM will use the most recent active or occupied lek data available from the state wildlife agency.

- *For Actions in GHMA*

The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis.

  - Impacts should first be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.
  - If it is not possible to relocate the project outside of the applicable lek buffer-distance(s) identified above, the BLM may approve the project only if:
    - Based on best available science, landscape features, and other existing protections, (e.g., land use allocations, state regulations), the BLM determines that a lek buffer-distance other than the applicable distance identified above offers the same or a greater

level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area; or

- The BLM determines that impacts to GRSG and its habitat are minimized such that the project will cause minor or no new disturbance (ex. co-location with existing authorizations); and
- Any residual impacts within the lek buffer-distances are addressed through compensatory mitigation measures sufficient to ensure a net conservation gain, as outlined in the Mitigation Strategy (Appendix X).

- *For Actions in PHMA and IHMA*

The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis. Impacts should be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.

The BLM may approve actions in PHMA and IHMA that are within the applicable lek buffer distance identified above only if:

- The BLM, with input from the state fish and wildlife agency, determines, based on best available science, landscape features, and other existing protections, that a buffer distance other than the distance identified above offers the same or greater level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area.
- The BLM will explain its justification for determining the approved buffer distances meet these conditions in its project decision.

## Idaho and Southwest Montana GRSB Buffers and Seasonal Restrictions Summary

Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
<b>Incidental disturbance to individual GRSB within all habitat types during all seasons</b>			
	Public or administrative activities that include incidental foot, aerial, horseback, or other similar travel.	None.	Impacts from these type of activities are immeasurable and would not warrant any minimization measures.
	Livestock grazing activities (except where specifically noted below).	None.	Impacts from these type of activities are immeasurable and would not warrant any minimization measures.
	Public vehicle travel not otherwise restricted in Travel Management Plans; or administrative vehicle travel on existing routes for maintenance of existing infrastructure, facilities, or vegetation projects; or non-organized/non-permitted activities.	None.	Impacts from these type of activities are immeasurable and would not warrant any minimization measures.
<b>Loss (i.e. death) of nests/eggs, chicks and/or adults that may occur within the nesting<sup>4</sup> habitat during the nesting season</b>			
	Anthropogenic activities such as the use of heavy equipment <sup>2</sup> or	BMP Priority, Important, General: Avoid these activities within nesting	Application of the seasonal nesting habitat restriction would avoid and

## Idaho and Southwest Montana GRSB Buffers and Seasonal Restrictions Summary

Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
	targeted grazing in nesting habitat <sup>3</sup> for: 1) implementation of fuels/vegetation/habitat restoration management projects, 2) infrastructure construction or maintenance, 3) geophysical exploration activities; 4) organized motorized recreational events	habitat during the nesting <sup>3</sup> season.	minimize the loss of nests/chicks/hens. This is a BMP since the impact is loss of individual grouse and is small scale and not population-scale. Disallowing infrastructure maintenance or construction in nesting habitat outright may not be realistic as an RDF. Impacts may be able to be offset via appropriate mitigation.
	Bedding Sheep & Associated Camps	BMP: Priority, Important, General: During the nesting season, locate bedding areas and camps outside of sagebrush areas <sup>3</sup> .	Application of the seasonal nesting habitat restriction would avoid/minimize the loss of nests/chicks by focusing bedding and camps in areas not meeting nest habitat characteristics for sagebrush cover (i.e., use areas less than 15% canopy cover).
	Fences	Existing Fences:  RDF: Priority and Important; BMP for General- Where consistent with policy, laws and/or regulations relative to Wilderness, Wilderness Study Areas and Visual Resource Management, move, modify (e.g. lay down fences) or mark existing fences to reduce collision risk within areas that have a high	Application of these measures would avoid/minimize the loss of birds to fence strikes.

Idaho and Southwest Montana GRSB Buffers and Seasonal Restrictions Summary			
Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
		probability of fence strikes (per Stevens et al. 2012 model or latest science).	
		New Fences:  RDF: Priority and Important; BMP for General- Do not construct new fences within areas of high collision risk unless marked or modified, consistent with policy, laws and/or regulations relative to Wilderness, Wilderness Study Areas and Visual Resource Management .	
<b>Permanent functional or physical loss of a lek or declining attendance at lek<sup>4</sup></b>			
	Unleased fluid minerals	Stipulation: Preiority, Important, General: Do not allow wells, pads, facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek.  Stipulation: Priority, Important, General: Limit average well pad density to no more than 1 per 640 acres within nesting <sup>3</sup> and winter <sup>3</sup> habitat.	This impact may have a population level effect and trip a population trigger therefore we recommended this be an RDF. Recent literature says 0.25 mile and 0.6 mile buffers are not sufficient (Harju et al. 2010). Hess (2011 MS Thesis) found statistical evidence that oil/well pad influence extended as far as 1.6 km from grouse leks. The 1/640 density per based on consideration of 1) Harju et al. (2010) who found pad density of

Idaho and Southwest Montana GRSB Buffers and Seasonal Restrictions Summary			
Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
			1.54 pad/sq km (1 pad/247 ac) had 13-74% lower attendance at leks and 2) Doherty (2008 page iii and 79) who noted potential impacts from oil and gas development were indiscernible at ~1 well/640 acres. IDswMT biology team recommended a more conservative approach to minimize risk of tripping a population trigger, hence the 1/640.
	Commercial solar development	RDF: Priority-No commercial solar development.  RDF: Important- Do not allow new facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek <sup>4</sup> .  BMP-General: Avoid new facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek <sup>4</sup> .	No specific literature available relative to solar development. Recommended buffer is based on recent literature (Harju et al 2010) that 0.6 or 0.25 mile buffers are not. The 2 mile buffer is consistent with Connelly et al. 2000 regarding energy facilities (page 978).
	Roads	BMP: Priority, Important, General: Do not construct new paved or high volume traffic gravel roads within 0.8 mile (1.3 km) of leks <sup>4</sup> .	Patricelli et al. 2012 (Recommendations for interim protections in WY) recommended siting roads 0.7 to 0.8 miles from crucial seasonal habitat. We apply it

Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary			
Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
			here as a lek-centric BMP because we may need to construct a road near a lek (perhaps for fire operations/access or to allow access to private lands or per ROW need). If we buffer roads in the Priority or Important Areas via a large lek buffer, it may lead to disturbance of a much larger area of nesting habitat in the course of avoiding the lek and buffers. The BMP would at least allow for siting to avoid the lek, and reducing road noise near the lek, without compromising broader landscapes.
	Commercial/ industrial Pipelines (oil, gas, slurry, and similar)	BMP: Priority, Important, General. Minimize removal of sagebrush within 0.6 miles of leks <sup>4</sup> .	<p>Application of this measure is designed to minimize loss of sagebrush in the vicinity of the lek. The main concern was with loss of sagebrush in vicinity of lek, that is used by GRSG for cover. The 0.6 mile buffer is based on rationale in the Colorado GRSG Conservation Plan as below:</p> <p>BACKGROUND                      INFORMATION: From Colorado GRSG Conservation Plan                      Appendix B: [Lek Habitat (March</p>

Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary			
Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
			through mid-May) - The basis and rationale for the first radius, 0.6 miles from a lek (Fig. B-1), is developed by summarizing data from 5 separate studies of daytime movements of adult male sage-grouse during the breeding season (Carr 1967, Wallestad and Schladweiler 1974, Rothenmaier 1979, Emmons 1980, Schoenberg 1982), because daytime movements of adult male GRSG during the breeding season do not vary greatly. Wallestad and Schladweiler (1974) found daily movements of adult males ranged between 0.2 and 0.8 miles from leks, with a maximum cruising radius of 0.9 - 1.2 miles. Ellis et al. (1987) reported that dispersal flights of male GRSG (to day-use areas) ranged from 0.3 – 0.5 miles, with the longest flights ranging from 1.2 – 1.3 miles. Carr (1967) recorded a cruising radius for male GRSG that ranged from 0.9-1.1 miles. Rothenmaier (1979) found that 60-80% of male GRSG locations were within 0.6 - 0.7 miles of a lek. Emmons (1980) reported

## Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary

Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
			<p>that male dispersal distances to day-use areas of 0.1 miles were common and that 67% of all use areas were greater than 0.3 miles from the lek. In addition, Schoenberg (1982) found that male daily movements averaged 0.6 miles, but ranged from 0.02 - 1.5 miles.</p> <p>Male GRSG activity patterns during the breeding season include strutting during the early morning hours, feeding and loafing during the day, and roosting on the lek during the night. Grouse attending the lek do not always roost on the exact location where the strutting occurs the next morning. Occasionally (this is lek-dependent), grouse roost in adjacent sagebrush cover.</p> <p>Ultimately, male GRSG require an open area for strutting, and sagebrush immediately adjacent for feeding and loafing. Sagebrush adjacent to the lek is also used as escape cover from predators or other types of disturbance. Female GRSG that attend the lek also use</p>

## Idaho and Southwest Montana GRSB Buffers and Seasonal Restrictions Summary

Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
			<p>the area in this zone in the same fashion as do males (Patterson 1952, Barnett and Crawford 1994, Coggins 1998).]</p> <p>Study locations noted above: Carr-Colorado; Wallestad and Schladweiller- Montana; Emmons-Colorado; Schoenberg- Colorado; Rothenmaier –unable to locate Univ. WY Thesis but study area not defined.</p>
	<p>Miscellaneous anthropogenic structures/ activities (e.g., corrals, water windmills, apiaries, signs, informational kiosks, etc.)</p>	<p>BMP Priority, Important, General: Avoid human activities or placement of new structures as noted within 2 miles (3.2 km) mi of a lek<sup>4</sup> or ensure they are out of the viewshed of the lek.</p>	<p>This is a catch all to reduce impact of miscellaneous structures where possible (some are tall<sup>5</sup>, such as water windmill, some are small, but have human activity- such as kiosks) or activities not otherwise addressed in this table. Based on biology team discussion and input, and Connelly et al. 2000 Guidelines that state, “avoid building powerlines and other tall structures that provide perch sites for raptors within 3 km of seasonal habitats” (page 977). Avoiding “seasonal habitats” entirely by 3 km would preclude any of these activities at all</p>

## Idaho and Southwest Montana GRSB Buffers and Seasonal Restrictions Summary

Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
			in Priority, Important or General, but siting 2 miles + from leks as a BMP would nonetheless help protect leks from disturbance. Adding the “viewshed” caveat can help with siting in cases where topography or such screens view of the activity or structure.
	Campgrounds and other developed recreation facilities (trailheads etc.)	BMP: Priority, Important, General. Avoid development of new campgrounds or recreation facilities in nesting habitat.	Biology team discussion. No literature specific to this issue. Aldrich (2012) mentions GRSB avoidance threshold 2.5 km from any single development at patch scale.
	OHV Play or Open Areas	RDF-Priority and Important; BMP for General. No new Open or Play areas.	Rationale is to reduce risk for further noise, habitat loss, fire risk in the Priority, Important and General Areas.
	Solid Minerals		These measures for solid minerals are intended to reduces noise and human disturbance to lekking birds. Siting/ avoidance buffers not realistic due to the nature of mineral deposits.
		Locatables-BMP Priority,	Regulations 43 CFR 3809.420

## Idaho and Southwest Montana GRSB Buffers and Seasonal Restrictions Summary

Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
		Important, General: Access roads and associated infrastructure not on the mining claim-Avoid disturbance to leks <sup>4</sup> during the lekking season.	performance standards, speak to T/E, and habitat. As a BMP, it provides an opportunity to work with the developer where we can, such as routing access roads etc., siting of facilities/infrastructure etc., that are off the claim, that we have some discretion with.
		Salables- RDF: Priority: Do not construct new salable development within 0.8 mile (1.3 km) of leks <sup>4</sup> .	<u>Salables</u> - No literature specific to salables but buffer distance is based on the noise literature for roads. See Patricelli et al. 2012 (WY recommendations for interim noise protections) that recommended siting roads 0.7 to 0.8 miles from crucial seasonal habitat. Chose RDF for Priority and BMP in Important and General habitat since new Salable pits (e.g., gravel) may be necessary to support road maintenance or improvement for access by fire operations or for other locally important factors.

**Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary**

Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
		<p>Leasables-non-energy (e.g., phosphate)-</p> <p>RDF-Priority and Important: New phosphate leasing is administratively unavailable.</p> <p>BMP-Priority, Important, General- On existing leases avoid disturbance to leks<sup>4</sup> during the lekking season</p>	<p><u>Leasables:</u> None presently known in Priority based on current mapping, but Priority RDF included in case of a trigger trip and re-delineation of IDswMT subregional management areas.</p> <p>In “Important” there is only one such area with existing lease and Known Phosphate Lease Areas (KPLAs), just west of Bear. It is Federal mineral/private surface. No interest in surface mining but there is interest by a company in underground development. Company is proposing facilities on surface, but working with IDFG locally. Lek within .3 mile.</p> <p>BMP for lek disturbance for all Management Areas in case of trigger trip and IDswMT Management Area re-delineation and since there are some KPLAs in the General Management Area. Working with proponent to reduce lek disturbance is realistic and may take on different forms, such as</p>

## Idaho and Southwest Montana GRSB Buffers and Seasonal Restrictions Summary

Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
			road access, placement of facilities, etc.. However, “exclusion” buffers are not realistic given the nature of the location of solid mineral deposits (i.e., cannot site elsewhere). For these, incorporation of appropriate mitigation, in addition to the lek BMP may need to be a primary focus.
	Wind development (commercial)	RDF: Priority-No commercial wind development .  BMP: Important and General: Avoid wind development in nesting and/or winter habitat.	<u>Wind</u> : Labeau et al. (2014) stated that erecting wind turbines at least 5 km from nesting and brood rearing habitat should reduce negative impacts, at least in the short term. However putting a 5 km (3 mile) buffer around leks in Important habitat, would create a defacto closure for the most part, inconsistent with the intent of the Important designation. Hence BMP to avoid placement in nesting or winter habitat.
	Communication Towers	RDF: Priority -Do not allow communication tower construction within 3 miles (5 km) of a lek <sup>4</sup> unless needed to address public safety needs.	Johnson et al. (2011 pg. 427) noted "Analogously, across all management areas there was a steady downward pattern of trends of lek counts as the number of

## Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary

Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
		BMP- Important and General-- Avoid communication tower construction within 3 miles (5 km) of a lek <sup>4</sup> . unless needed to address public safety needs.	towers increased, either within 5 km (Fig. 21) or within 18 km (Fig. 22)."
	Transmission Lines	RDF: Priority, Important, General: Do not allow transmission line construction within 600 m of a lek.  BMP Priority, Important, General: Avoid transmission line construction within 2 miles (3.2 km) of a lek.	A 600 m GRSG avoidance zone reported per Gillan et al. (2013). No other spatial buffer supported by literature. While 600 m is a citable buffer, a 2 mile zone as BMP for Transmission is recommended as well. Based on Connelly et al. 2000 Guidelines to avoid tall structures in important seasonal habitats.
	Distribution Lines	BMP: Priority, Important and General-Avoid distribution line construction within 600 m of a lek or bury where possible	600 m, based on Gillan et al. BMP as this may not always be feasible.
<b>Temporary functional loss of a lek<sup>4</sup>. SEASONAL RESTRICTION</b>			
	BLM and Forest Service permitted anthropogenic activities that result in noise or visual disturbance that may lead to sustained avoidance of the lek during a particular lekking	RDF: Priority and Important- No repeated or sustained behavioral disturbance (e.g., visual, noise, etc.) to lekking birds from 6:00 pm to 9:00 am within 2 miles (3.2 km) of	Recent literature says 0.25 mile and 0.6 mile buffers are not sufficient (Harju et al. 2010). Hess (2011 MS Thesis) found statistical evidence that oil/well pad influence extended

## Idaho and Southwest Montana GRSB Buffers and Seasonal Restrictions Summary

Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
	season.	leks during the lekking season <sup>3</sup> .  BMP-General: Avoid repeated or sustained behavioral disturbance (e.g., visual, noise, etc.) to lekking birds from 6:00 pm to 9:00 am within 2 miles (3.2 km) of leks during the lekking season <sup>3</sup> .	as far as 1.6 km (~ 1 mile) from grouse leks. . IDswMT biology team recommended a more conservative approach to managing disturbance to minimize risk of disturbance.
	Sheep Bedding & Sheep Camps	BMP Priority, Important, General: Avoid bedding sheep and placing camps within 0.6 mi of a lek during the lekking season.	No literature. BMP based on biology team consensus.
	Organized Recreational Events	RDF Priority and Important-Do not schedule disruptive recreational events (e.g., motorized races) within 2.0 miles (3.2 km) of occupied leks during the lekking season.  BMP General- Do not schedule disruptive recreational events (e.g., motorized races) within 2.0 miles (3.2 km) of occupied leks during the lekking season.	Biology team consensus. No specific literature relative to buffers for recreational events but can manage this through avoiding the appropriate season. This threat (organized recreational events) is a short term, typically one-day event, with temporary disruption from noise the main issue.
<b>Permanent functional or physical loss of nesting or winter habitat.</b>			

## Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary

Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
	Anthropogenic development or activities that result in loss of habitat or constant or repeated noise levels or objects on the landscape that result in permanent avoidance of the habitat.	Ensure > 80% of the landscape is functionally and physically meeting GRSG habitat objectives appropriate to the seasonal habitat <sup>3</sup> .	<p>Impacts resulting from loss of habitat vary depending on the extent of the habitat lost. Minimal loss of habitat (e.g. removal of small amounts of sagebrush cover) would not likely result in any measurable impacts to GRSG individuals or the associated populations.</p> <p>More extensive loss of habitat may result in increased probability of population level impacts, and trigger trips, through the increased probability that leks will no longer persist.</p>
	Roads	BMP: Priority, Important, General: Avoid construction of new paved or high volume traffic gravel roads within 0.8 mile (1.3 km) of nesting habitat.	See citations used for permanent loss of leks, above.
	Unreleased Fluid Minerals	Stipulation: Priority, Important, General: Limit average well pad density to no more than 1/640 acres within nesting <sup>3</sup> and winter <sup>3</sup> habitat.	See citations used for permanent loss of leks, above.
	Commercial Solar	RDF: Priority-No commercial solar	See citations used for permanent

Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
		development.  RDF: Important: Do not allow facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek <sup>4</sup> .  BMP-Important: Avoid placing new facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek <sup>4</sup> .	loss of leks, above.
	Campgrounds	BMP-Priority, Important, General. Avoid development of new campgrounds or recreation facilities in nesting habitat.	See citations used for permanent loss of leks, above.
	OHV Play and Open areas	RDF-Priority and Important. No new Open or Play areas. BMP-General: Avoid new Open or Play areas	See citations used for permanent loss of leks, above.
	Wind Development (commercial)	RDF Priority - No commercial wind development .  BMP: Important: Avoid wind development in nesting habitat	See citations used for permanent loss of leks, above.
Temporary functional loss of winter habitat			

## Idaho and Southwest Montana GRSB Buffers and Seasonal Restrictions Summary

Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
	Anthropogenic activities that result in noise or visual disturbance that may lead to avoidance of a particular wintering area during a particular wintering season.	RDF: Priority, Important- No repeated or sustained disturbance from construction activities in winter habitat during the wintering season.  BMP General: Avoid repeated or sustained disturbance from construction activities in winter habitat during the wintering season.	No known buffer. Biology team recommendation.

<sup>1</sup> Land use allocations or activities provided below are examples, but are not limited to those listed.

<sup>2</sup> Heavy equipment includes but is not limited to: tractors, discs, drills, mowers, Lawson aerators, large sprayers, masticators, dozers, graders, large trucks, excavators, backhoes cranes.

<sup>3</sup> As per Habitat Objectives table. Based on local GRSB seasonal use dates. Lekking ~ March 1-May 2<sup>5</sup> depending on elevation; Nesting /early brood ~April 1-June 30; Winter ~December 1-February 28. Source-Modified from ISAC 2006.

<sup>4</sup> Occupied lek as per IDFG definitions (active during at least one of past 5 years). Undetermined status leks will be evaluated on a case by case at the site specific scale during project-level NEPA.

<sup>5</sup> Definition of "tall structure": Any structure that has the potential to disrupt lekking or nesting GRSB and/or decrease the use of an area. This includes but is not limited to communication towers, meteorological towers, electrical transmission or distribution towers, etc.

<b>Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary</b>			
<b>Impacts</b>	<b>Causes<sup>1</sup></b>	<b>Minimization Measures Seasonal/Timing Restrictions &amp; Buffers</b>	<b>Rationale</b>
<b>Incidental disturbance to individual GRSG within all habitat types during all seasons</b>			
	Public or administrative activities that include incidental foot, aerial, horseback, or other similar travel.	None.	Impacts from these type of activities are immeasurable and would not warrant any minimization measures.
	Livestock grazing activities (except where specifically noted below).	None.	Impacts from these type of activities are immeasurable and would not warrant any minimization measures.
	Public vehicle travel not otherwise restricted in Travel Management Plans; or administrative vehicle travel on existing routes for maintenance of existing infrastructure, facilities, or vegetation projects; or non-organized/non-permitted activities.	None.	Impacts from these type of activities are immeasurable and would not warrant any minimization measures.
<b>Loss (i.e. death) of nests/eggs, chicks and/or adults that may occur within the nesting<sup>4</sup> habitat during the nesting season</b>			
	Anthropogenic activities such as the use of heavy equipment <sup>2</sup> or	BMP Priority, Important, General: Avoid these activities within nesting	Application of the seasonal nesting habitat restriction would avoid and

<b>Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary</b>			
<b>Impacts</b>	<b>Causes<sup>1</sup></b>	<b>Minimization Measures Seasonal/Timing Restrictions &amp; Buffers</b>	<b>Rationale</b>
	targeted grazing in nesting habitat <sup>3</sup> for: 1) implementation of fuels/vegetation/habitat restoration management projects, 2) infrastructure construction or maintenance, 3) geophysical exploration activities; 4) organized motorized recreational events	habitat during the nesting <sup>3</sup> season.	minimize the loss of nests/chicks/hens. This is a BMP since the impact is loss of individual grouse and is small scale and not population-scale. Disallowing infrastructure maintenance or construction in nesting habitat outright may not be realistic as an RDF. Impacts may be able to be offset via appropriate mitigation.
	Bedding Sheep & Associated Camps	BMP: Priority, Important, General: During the nesting season, locate bedding areas and camps outside of sagebrush areas <sup>3</sup> .	Application of the seasonal nesting habitat restriction would avoid/minimize the loss of nests/chicks by focusing bedding and camps in areas not meeting nest habitat characteristics for sagebrush cover (i.e., use areas less than 15% canopy cover).
	Fences	Existing Fences:  RDF: Priority and Important; BMP for General- Where consistent with policy, laws and/or regulations relative to Wilderness, Wilderness Study Areas and Visual Resource Management, move, modify (e.g. lay down fences) or mark existing fences to reduce collision risk within areas that have a high	Application of these measures would avoid/minimize the loss of birds to fence strikes.

Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary			
Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
		probability of fence strikes (per Stevens et al. 2012 model or latest science).	
		New Fences:  RDF: Priority and Important; BMP for General- Do not construct new fences within areas of high collision risk unless marked or modified, consistent with policy, laws and/or regulations relative to Wilderness, Wilderness Study Areas and Visual Resource Management .	
<b>Permanent functional or physical loss of a lek or declining attendance at lek<sup>4</sup></b>			
	Unleased fluid minerals	Stipulation: Preiority, Important, General: Do not allow wells, pads, facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek.  Stipulation: Priority, Important, General: Limit average well pad density to no more than 1 per 640 acres within nesting <sup>3</sup> and winter <sup>3</sup> habitat.	This impact may have a population level effect and trip a population trigger therefore we recommended this be an RDF. Recent literature says 0.25 mile and 0.6 mile buffers are not sufficient (Harju et al. 2010). Hess (2011 MS Thesis) found statistical evidence that oil/well pad influence extended as far as 1.6 km from grouse leks. The 1/640 density per based on consideration of 1) Harju et al. (2010) who found pad density of

Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary			
Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
			1.54 pad/sq km (1 pad/247 ac ) had 13-74% lower attendance at leks and 2) Doherty (2008 page iii and 79) who noted potential impacts from oil and gas development were indiscernible at ~1 well/640 acres. IDswMT biology team recommended a more conservative approach to minimize risk of tripping a population trigger, hence the 1/640.
	Commercial solar development	RDF: Priority-No commercial solar development.  RDF: Important- Do not allow new facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek <sup>4</sup> .  BMP-General: Avoid new facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek <sup>4</sup> .	No specific literature available relative to solar development. Recommended buffer is based on recent literature (Harju et al 2010) that 0.6 or 0.25 mile buffers are not. The 2 mile buffer is consistent with Connelly et al. 2000 regarding energy facilities (page 978).
	Roads	BMP: Priority, Important, General: Do not construct new paved or high volume traffic gravel roads within 0.8 mile (1.3 km) of leks <sup>4</sup> .	Patricelli et al. 2012 (Recommendations for interim protections in WY) recommended siting roads 0.7 to 0.8 miles from crucial seasonal habitat. We apply it

Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary			
Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
			here as a lek-centric BMP because we may need to construct a road near a lek (perhaps for fire operations/access or to allow access to private lands or per ROW need). If we buffer roads in the Priority or Important Areas via a large lek buffer, it may lead to disturbance of a much larger area of nesting habitat in the course of avoiding the lek and buffers. The BMP would at least allow for siting to avoid the lek, and reducing road noise near the lek, without compromising broader landscapes.
	Commercial/ industrial Pipelines (oil, gas, slurry, and similar)	BMP: Priority, Important, General. Minimize removal of sagebrush within 0.6 miles of leks <sup>4</sup> .	Application of this measure is designed to minimize loss of sagebrush in the vicinity of the lek. The main concern was with loss of sagebrush in vicinity of lek, that is used by GRSG for cover. The 0.6 mile buffer is based on rationale in the Colorado GRSG Conservation Plan as below:  BACKGROUND INFORMATION: From Colorado GRSG Conservation Plan Appendix B: [Lek Habitat (March

**Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary**

Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
			<p>through mid-May) - The basis and rationale for the first radius, 0.6 miles from a lek (Fig. B-1), is developed by summarizing data from 5 separate studies of daytime movements of adult male sage-grouse during the breeding season (Carr 1967, Wallestad and Schladweiler 1974, Rothenmaier 1979, Emmons 1980, Schoenberg 1982), because daytime movements of adult male GRSG during the breeding season do not vary greatly. Wallestad and Schladweiler (1974) found daily movements of adult males ranged between 0.2 and 0.8 miles from leks, with a maximum cruising radius of 0.9 - 1.2 miles. Ellis et al. (1987) reported that dispersal flights of male GRSG (to day-use areas) ranged from 0.3 – 0.5 miles, with the longest flights ranging from 1.2 – 1.3 miles. Carr (1967) recorded a cruising radius for male GRSG that ranged from 0.9-1.1 miles. Rothenmaier (1979) found that 60-80% of male GRSG locations were within 0.6 - 0.7 miles of a lek. Emmons (1980) reported</p>

Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary			
Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
			<p>that male dispersal distances to day-use areas of 0.1 miles were common and that 67% of all use areas were greater than 0.3 miles from the lek. In addition, Schoenberg (1982) found that male daily movements averaged 0.6 miles, but ranged from 0.02 - 1.5 miles.</p> <p>Male GRSG activity patterns during the breeding season include strutting during the early morning hours, feeding and loafing during the day, and roosting on the lek during the night. Grouse attending the lek do not always roost on the exact location where the strutting occurs the next morning. Occasionally (this is lek-dependent), grouse roost in adjacent sagebrush cover.</p> <p>Ultimately, male GRSG require an open area for strutting, and sagebrush immediately adjacent for feeding and loafing. Sagebrush adjacent to the lek is also used as escape cover from predators or other types of disturbance. Female GRSG that attend the lek also use</p>

			<p>the area in this zone in the same fashion as do males (Patterson 1952, Barnett and Crawford 1994, Coggins 1998).]</p> <p>Study locations noted above: Carr-Colorado; Wallestad and Schladweiler- Montana; Emmons-Colorado; Schoenberg- Colorado; Rothenmaier –unable to locate Univ. WY Thesis but study area not defined.</p>
	Miscellaneous anthropogenic structures/ activities (e.g., corrals, water windmills, apiaries, signs, informational kiosks, etc.)	BMP Priority, Important, General: Avoid human activities or placement of new structures as noted within 2 miles (3.2 km) mi of a lek <sup>4</sup> or ensure they are out of the viewshed of the lek.	This is a catch all to reduce impact of miscellaneous structures where possible (some are tall <sup>5</sup> , such as water windmill, some are small, but have human activity- such as kiosks) or activities not otherwise addressed in this table. Based on biology team discussion and input, and Connelly et al. 2000 Guidelines that state, “avoid building powerlines and other tall structures that provide perch sites for raptors within 3 km of seasonal habitats” (page 977). Avoiding “seasonal habitats” entirely by 3 km would preclude any of these activities at all

<b>Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary</b>			
<b>Impacts</b>	<b>Causes<sup>1</sup></b>	<b>Minimization Measures Seasonal/Timing Restrictions &amp; Buffers</b>	<b>Rationale</b>
			in Priority, Important or General, but siting 2 miles + from leks as a BMP would nonetheless help protect leks from disturbance. Adding the "viewshed" caveat can help with siting in cases where topography or such screens view of the activity or structure.
	Campgrounds and other developed recreation facilities (trailheads etc.)	BMP: Priority, Important, General. Avoid development of new campgrounds or recreation facilities in nesting habitat.	Biology team discussion. No literature specific to this issue. Aldrich (2012) mentions GRSG avoidance threshold 2.5 km from any single development at patch scale.
	OHV Play or Open Areas	RDF-Priority and Important; BMP for General. No new Open or Play areas.	Rationale is to reduce risk for further noise, habitat loss, fire risk in the Priority, Important and General Areas.
	Solid Minerals		These measures for solid minerals are intended to reduces noise and human disturbance to lekking birds. Siting/ avoidance buffers not realistic due to the nature of mineral deposits.
		Locatables-BMP Priority,	Regulations 43 CFR 3809.420

Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary			
Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
		Important, General: Access roads and associated infrastructure not on the mining claim-Avoid disturbance to leks <sup>4</sup> during the lekking season.	performance standards, speak to T/E, and habitat. As a BMP, it provides an opportunity to work with the developer where we can, such as routing access roads etc., siting of facilities/infrastructure etc., that are off the claim, that we have some discretion with.
		Salables- RDF: Priority: Do not construct new salable development within 0.8 mile (1.3 km) of leks <sup>4</sup> .	<u>Salables</u> - No literature specific to salables but buffer distance is based on the noise literature for roads. See Patricelli et al. 2012 (WY recommendations for interim noise protections) that recommended siting roads 0.7 to 0.8 miles from crucial seasonal habitat. Chose RDF for Priority and BMP in Important and General habitat since new Salable pits (e.g., gravel) may be necessary to support road maintenance or improvement for access by fire operations or for other locally important factors.

**Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary**

Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
		<p>Leasables-non-energy (e.g., phosphate)-</p> <p>RDF-Priority and Important: New phosphate leasing is administratively unavailable.</p> <p>BMP-Priority, Important, General- On existing leases avoid disturbance to leks<sup>4</sup> during the lekking season</p>	<p><u>Leasables:</u> None presently known in Priority based on current mapping, but Priority RDF included in case of a trigger trip and re-delineation of IDswMT subregional management areas.</p> <p>In "Important" there is only one such area with existing lease and Known Phosphate Lease Areas (KPLAs), just west of Bear. It is Federal mineral/private surface. No interest in surface mining but there is interest by a company in underground development. Company is proposing facilities on surface, but working with IDFG locally. Lek within .3 mile.</p> <p>BMP for lek disturbance for all Management Areas in case of trigger trip and IDswMT Management Area re-delineation and since there are some KPLAs in the General Management Area. Working with proponent to reduce lek disturbance is realistic and may take on different forms, such as</p>

**Commented [BER1]:** Elena Shaw - The BMP says "New phosphate leasing is administratively unavailable in Important Habitat Mgmt. areas". However, the proposed mgmt. action (page 43) says that "areas outside of KPLAs are open to prospecting and subsequent leasing....." Do these statements say the same thing or do they differ?

Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary			
Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
			road access, placement of facilities, etc.. However, "exclusion" buffers are not realistic given the nature of the location of solid mineral deposits (i.e., cannot site elsewhere). For these, incorporation of appropriate mitigation, in addition to the lek BMP may need to be a primary focus.
	Wind development (commercial)	RDF: Priority-No commercial wind development .  BMP: Important and General: Avoid wind development in nesting and/or winter habitat.	<u>Wind</u> : Labeau et al. (2014) stated that erecting wind turbines at least 5 km from nesting and brood rearing habitat should reduce negative impacts, at least in the short term. However putting a 5 km (3 mile) buffer around leks in Important habitat, would create a defacto closure for the most part, inconsistent with the intent of the Important designation. Hence BMP to avoid placement in nesting or winter habitat.
	Communication Towers	RDF: Priority -Do not allow communication tower construction within 3 miles (5 km) of a lek <sup>4</sup> unless needed to address public safety needs.	Johnson et al. (2011 pg. 427) noted "Analogously, across all management areas there was a steady downward pattern of trends of lek counts as the number of

		BMP- Important and General-- Avoid communication tower construction within 3 miles (5 km) of a lek <sup>4</sup> , unless needed to address public safety needs.	towers increased, either within 5 km (Fig. 21) or within 18 km (Fig. 22)."
	Transmission Lines	RDF: Priority, Important, General: Do not allow transmission line construction within 600 m of a lek.  BMP Priority, Important, General: Avoid transmission line construction within 2 miles (3.2 km) of a lek.	A 600 m GRSG avoidance zone reported per Gillan et al. (2013). No other spatial buffer supported by literature. While 600 m is a citable buffer, a 2 mile zone as BMP for Transmission is recommended as well. Based on Connelly et al. 2000 Guidelines to avoid tall structures in important seasonal habitats.
	Distribution Lines	BMP: Priority, Important and General-Avoid distribution line construction within 600 m of a lek or bury where possible	600 m, based on Gillan et al. BMP as this may not always be feasible.
<b>Temporary functional loss of a lek<sup>4</sup>. SEASONAL RESTRICTION</b>			
	BLM and Forest Service permitted anthropogenic activities that result in noise or visual disturbance that may lead to sustained avoidance of the lek during a particular lekking	RDF: Priority and Important- No repeated or sustained behavioral disturbance (e.g., visual, noise, etc.) to lekking birds from 6:00 pm to 9:00 am within 2 miles (3.2 km) of	Recent literature says 0.25 mile and 0.6 mile buffers are not sufficient (Harju et al. 2010). Hess (2011 MS Thesis) found statistical evidence that oil/well pad influence extended

<b>Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary</b>			
<b>Impacts</b>	<b>Causes<sup>1</sup></b>	<b>Minimization Measures Seasonal/Timing Restrictions &amp; Buffers</b>	<b>Rationale</b>
	season.	leks during the lekking season <sup>3</sup> .  BMP-General: Avoid repeated or sustained behavioral disturbance (e.g., visual, noise, etc.) to lekking birds from 6:00 pm to 9:00 am within 2 miles (3.2 km) of leks during the lekking season <sup>3</sup> .	as far as 1.6 km (~ 1 mile) from grouse leks. . IDswMT biology team recommended a more conservative approach to managing disturbance to minimize risk of disturbance.
	Sheep Bedding & Sheep Camps	BMP Priority, Important, General: Avoid bedding sheep and placing camps within 0.6 mi of a lek during the lekking season.	No literature. BMP based on biology team consensus.
	Organized Recreational Events	RDF Priority and Important-Do not schedule disruptive recreational events (e.g., motorized races) within 2.0 miles (3.2 km) of occupied leks during the lekking season.  BMP General- Do not schedule disruptive recreational events (e.g., motorized races) within 2.0 miles (3.2 km) of occupied leks during the lekking season.	Biology team consensus. No specific literature relative to buffers for recreational events but can manage this through avoiding the appropriate season. This threat (organized recreational events) is a short term, typically one-day event, with temporary disruption from noise the main issue.
<b>Permanent functional or physical loss of nesting or winter habitat.</b>			

<b>Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary</b>			
<b>Impacts</b>	<b>Causes<sup>1</sup></b>	<b>Minimization Measures Seasonal/Timing Restrictions &amp; Buffers</b>	<b>Rationale</b>
	Anthropogenic development or activities that result in loss of habitat or constant or repeated noise levels or objects on the landscape that result in permanent avoidance of the habitat.	Ensure > 80% of the landscape is functionally and physically meeting GRSG habitat objectives appropriate to the seasonal habitat <sup>3</sup> .	<p>Impacts resulting from loss of habitat vary depending on the extent of the habitat lost. Minimal loss of habitat (e.g. removal of small amounts of sagebrush cover) would not likely result in any measurable impacts to GRSG individuals or the associated populations.</p> <p>More extensive loss of habitat may result in increased probability of population level impacts, and trigger trips, through the increased probability that leks will no longer persist.</p>
	Roads	BMP: Priority, Important, General: Avoid construction of new paved or high volume traffic gravel roads within 0.8 mile (1.3 km) of nesting habitat.	See citations used for permanent loss of leks, above.
	Unleased Fluid Minerals	Stipulation: Priority, Important, General: Limit average well pad density to no more than 1/640 acres within nesting <sup>3</sup> and winter <sup>3</sup> habitat.	See citations used for permanent loss of leks, above.
	Commercial Solar	RDF: Priority-No commercial solar	See citations used for permanent

		development.  RDF: Important: Do not allow facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek <sup>4</sup> .  BMP-Important: Avoid placing new facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek <sup>4</sup> .	loss of leks, above.
	Campgrounds	BMP-Priority, Important, General. Avoid development of new campgrounds or recreation facilities in nesting habitat.	See citations used for permanent loss of leks, above.
	OHV Play and Open areas	RDF-Priority and Important. No new Open or Play areas. BMP-General: Avoid new Open or Play areas	See citations used for permanent loss of leks, above.
	Wind Development (commercial)	RDF Priority - No commercial wind development .  BMP: Important: Avoid wind development in nesting habitat	See citations used for permanent loss of leks, above.
Temporary functional loss of winter habitat			

Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary			
Impacts	Causes <sup>1</sup>	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
	Anthropogenic activities that result in noise or visual disturbance that may lead to avoidance of a particular wintering area during a particular wintering season.	RDF: Priority, Important- No repeated or sustained disturbance from construction activities in winter habitat during the wintering season.  BMP General: Avoid repeated or sustained disturbance from construction activities in winter habitat during the wintering season.	No known buffer. Biology team recommendation.

<sup>1</sup> Land use allocations or activities provided below are examples, but are not limited to those listed.

<sup>2</sup> Heavy equipment includes but is not limited to: tractors, discs, drills, mowers, Lawson aerators, large sprayers, masticators, dozers, graders, large trucks, excavators, backhoes cranes.

<sup>3</sup> As per Habitat Objectives table. Based on local GRSG seasonal use dates. Lekking ~ March 1-May 2<sup>5</sup> depending on elevation; Nesting /early brood ~April 1-June 30; Winter ~December 1-February 28. Source-Modified from ISAC 2006.

<sup>4</sup> Occupied lek as per IDFG definitions (active during at least one of past 5 years). Undetermined status leks will be evaluated on a case by case at the site specific scale during project-level NEPA.

<sup>5</sup> Definition of "tall structure": Any structure that has the potential to disrupt lekking or nesting GRSG and/or decrease the use of an area. This includes but is not limited to communication towers, meteorological towers, electrical transmission or distribution towers, etc.

## Appendix F – Idaho Key Habitat Map Update Process and Provisions for Addressing GRSG documented in New Areas Outside Priority, Important and General Habitat Management Areas

### Modifications to Priority, Important and General Habitat Management Areas:

The BLM and FS have worked closely with the State of Idaho and USFWS in using the best available science to delineate GRSG occupancy in Idaho to the extent possible, as reflected in the boundaries of the Priority, Important and General Habitat Management Areas (PHMA, IHMA, GHMA) identified in this Plan. These management areas will be reviewed and updated approximately every 5 years. Prior to a specific 5-year update, however, it is possible that due to progress toward conservation and habitat restoration, vegetation succession or new information arising from scientific studies or targeted surveys, additional areas of occupied GRSG habitat may be identified, occurring outside the three management areas. Such new areas of occupancy must be based on sound science (e.g., telemetry, formal habitat assessments documenting GRSG usage etc.) and represent an occupied seasonal habitat. They must not be based solely on random or occasional observations of GRSG. In these areas GRSG habitat on BLM and/or FS lands will be managed in accordance with Required Design Features, seasonal restrictions and/or BMPs deemed appropriate by BLM or FS for that area. During the 5-year map update, formal designation of these new areas as PHMA, IHMA or GHMA will be considered by BLM/FS in coordination with the State of Idaho and USFWS along with other recommendations for modification to existing PHMA, IHMA or GHMA areas.

### Modifications to the Key Habitat Map:

The Idaho GRSG Key habitat map displays several broad vegetation classes relevant to GRSG conservation and habitat restoration, that underlie and help inform the Priority, Important and General Habitat Management Areas. These vegetation classes include Key habitat, perennial grasslands, annual grasslands and conifer encroachment areas, and have been utilized in GRSG conservation in Idaho since 2000.

As directed in IM ID-2013-010, Idaho BLM annually updates the Key Habitat map. The purpose of this Instruction Memorandum (IM) is to request updates to the Idaho Sage-grouse Habitat Planning Map. The update is needed to reflect habitat changes resulting from wildfire, succession, and vegetation treatments that occurred or were observed since the last update. This update is also intended to capture additional edits recommended by the field offices, sage-grouse Local Working Groups (LWG), or agency partners in sage-grouse conservation.

**Factors to Consider During Edits:** The following factors are applicable to land of any ownership status for which the Bureau of Land Management (BLM) data are available, or for which data or other information are provided by non-BLM partners. If such new data are unavailable, or not provided by partners, retain the existing spatial data in the dataset:

1. Wildfires that have occurred in the most recent calendar year fire season on land administered by the BLM and on land not administered by the BLM.
2. Vegetation management projects that have been completed within key habitat or potential restoration areas of sage-grouse planning areas. This includes activities

such as burned area rehabilitation seeding projects, sagebrush thinning/reduction, conifer thinning/reduction, restoration of annual grasslands, new fuel breaks, etc. However, only consider those treatment areas completed and where a change in habitat classification has occurred (e.g., from annual grassland to perennial grassland; perennial grassland to key habitat, etc.). Areas planned for treatment or in the process of treatment (e.g., cheatgrass chemical treatment is completed, but seeding is pending) should not be included until an observed change in habitat category is achieved.

3. Changes in habitat status resulting from vegetation succession, such as perennial grasslands that have transitioned to key habitat due to increased sagebrush cover.
4. Habitat mapping errors or omissions that have been identified in the existing Idaho Sage-grouse Habitat Planning Map and other edits recommended by sage-grouse conservation partners, as appropriate. For this item, it is crucial that BLM field office biologists or an alternate staff specialist coordinate closely with their agency partners, especially the UFSFS and the Idaho Department of Fish and Game (IDFG), to actively solicit and resolve additional suggested edits that we may not be aware of. Those edits must also be incorporated into the respective BLM office's update submission. This is vital to ensure that the update is completed efficiently and as collaboratively as possible.
5. Since the Idaho Sage-grouse Habitat Planning Map is intended for use by all conservation partners in Idaho, it is important that we maintain a seamless coverage across land ownerships. In that regard, when editing, do not clip out BLM (or non-BLM land) on the basis of land ownership. Rather, make edits based on vegetation boundaries only, using the best available information and professional judgment. If you have uncertainties about accuracies for certain areas, document that in the metadata as appropriate.
6. Based on discussions during map updates in recent years, we will again use a 10.0 acre minimum polygon size for wildfires since data are readily available to that scale. For vegetation treatments, we will also use a minimum area of 10 acres. For sagebrush or other vegetation patches (e.g., key habitat, perennial grassland, annual grassland, conifer encroachment), delineate habitat to the extent you have data, recognizing that some offices may have more recent, finer resolution data than others.
7. Areas that have recently burned, for which the field has little or no information as to habitat status, should be classified as "recent burn." Efforts to document the general habitat status in these areas should be made the following field season if possible, in preparation for the next map update. The field may also attribute 2013 fires as perennial grassland or annual grassland, as appropriate.

8. Sage-grouse habitat polygon descriptions relevant to this IM include key habitat, perennial grassland, annual grassland, and conifer encroachment potential restoration areas.
  - o Key habitat includes areas of generally intact sagebrush that provide sage-grouse habitat during some portion of the year.
  - o Perennial grassland can be reclassified as key habitat once average sagebrush canopy cover is at least 10 percent.
  - o Annual grassland areas may be reclassified as perennial grassland once a restoration, fuels treatment or related project, such as an Emergency Stabilization and Rehabilitation (ES&R) seeding, is considered successful (i.e., seeded perennial species have successfully established).
  - o Conifer encroachment areas may be reclassified as key habitat following treatment of conifers if sagebrush cover is at least 10 percent and there is a perennial understory. They can also be reclassified as perennial grasslands if native perennial herbaceous species are dominant or if an associated restoration seeding is successful.
  
9. Field offices must ensure that original project-level data utilized in this update, including Global Positioning System data files, spatial, tabular and metadata associated with specific vegetation treatments, restoration projects, ES&R projects, etc., are archived at the field level and readily accessible in the event of future data calls.

## Appendix G – Anthropogenic Disturbance and Adaptive Management

### Part I – Baseline Map and Description of Development

The **biologically significant units (BSUs)** are geographical/spatial areas within Greater Sage-grouse habitat that contains relevant and important habitats which is used as the basis for comparative calculations to support evaluation of changes to habitat. The BSUs include all land ownerships for evaluation, although application of the anthropogenic disturbance cap is specific only to BLM and Forest Service lands. The BSUs are used in the evaluation of anthropogenic disturbance and in the adaptive management habitat trigger.

For the Idaho and Southwestern Montana Greater Sage-Grouse Plan Amendment EIS the biologically significant units are defined as:

*Idaho: All of the modeled nesting<sup>1</sup> and delineated winter habitat, which is based on 2011 data, occurring within Priority and/or Important Habitat Management Areas within individual Conservation Areas<sup>2</sup>*

*Montana: All of the Priority Habitat Management Area*

These BSUs form the geographic basis for the calculation of anthropogenic disturbance and in the soft and hard adaptive management habitat triggers.

While the BSUs define the geographic extent and scale of the Subregion's landscape that will be considered in evaluating anthropogenic disturbance and the adaptive management habitat triggers, how disturbance and habitat triggers are calculated differ since anthropogenic disturbance and habitat loss affect Greater Sage-grouse differently (Knick et al. 2013).

The BSU is the total area (acreage) of nesting and wintering habitat within Priority or Important Habitat Management Areas, separately, by each Conservation Area. For Idaho this results in 8 BSUs, 2 each within the Idaho Conservation Areas – 1 in Priority Habitat Management Areas and 1 in Important Habitat Management Areas. There is 1 BSU in southwest Montana and 1 BSU for the Utah portion of the Sawtooth National Forest (Raft River BSU). There are a total of 10 BSUs within the Idaho and Southwestern Montana Subregion as shown in Map-G-1.

In developing these BSUs it was determined at the subregional level that data from these units must be compatible with aggregation to the PAC and WAFWA Management Zone levels, in order to meet FWS needs. In addition, BSUs must be edge matched/aligned with neighboring states. All sub-regions acknowledge there may be locally important biologically significant units smaller than PACs which may or may not be rolled up to PAC level. The Subregions also acknowledge that assessing disturbance at larger scales such as certain PACs, or via rollup of data, provides a baseline metric for future comparison, but dilution may likely mask disturbance concerns occurring at more local scales.

<sup>1</sup> Modeled nesting habitat is defined as those areas of Priority or Important Habitat Management Areas within 6.2 miles of 2011 active leks.

<sup>2</sup> The Utah portion of the Sawtooth National Forest is calculated separately for the Southern Conservation area.

The application of these calculations requires certain assumptions and associated baseline values which set an appropriate benchmark for future comparison.

For the adaptive management evaluation in Idaho the baseline year for comparison of both the population and habitat values is set at 2011. Sage-grouse have been monitored by counting males on leks since the 1950's (IDFG files). Average male lek attendance (statewide average) reached a low point in 1996 (IDFG in file). A more consistent and intensified survey of leks began with the annual monitoring of all 78 lek routes across southern Idaho in 1996. Average male lek attendance has fluctuated since 1996 (Figure G-1) in response to favorable or unfavorable conditions (e.g. weather, habitat improvements or loss, and West Nile virus). Peaks were in 2000, 2006, and 2011 with low points in 2002 and 2009. The increase in male lek attendance after previous declines indicates that sage-grouse populations can rebound over a relatively short time frame (e.g. 5 years) given desirable conditions. The baseline was set at the 2011 average number of males because this level is approximately the medium (8 higher and 7 lower years) of the counts between 1996-2011. At the statewide scale, the 2011 baseline allows 10% and 20% population triggers to be above the second lowest point in 2009. Application of the trigger at a smaller (Conservation Area) scale is a more conservative approach that will indicate potential trends sooner than if applied at the state-wide scale.

**Part II – Anthropogenic Disturbance Calculation**

The specific formula for the percent of anthropogenic disturbance is defined by:

*Disturbance Percentage*

$$= \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}}{\text{Acres within the BSU} * \left( \frac{\text{Acres of Effective Habitat within the BSU}}{\text{Acres within the BSU}} + 0.3 \right)} \right) \times 100$$

The BSU in the denominator represents the total area (acreage) of the applicable area of analysis. Each BSU is tracked and evaluated separately within each of the 10 BSUs, and reaching the 3% disturbance cap in any one BSU has specific management implications both within and beyond that specific BSU as described in the Proposed Plan.

All sub-regions within the Great Basin Region will use the same types of disturbances for fine/site scale monitoring as were used for broad and mid-scale analysis and would use local data and/or more current satellite imagery if available.

Anthropogenic Disturbance included in the numerator is shown in Table G-1.

Table G-1. Anthropogenic Disturbances and Areas of Impact

Datasets as Described in the Monitoring Framework <sup>3</sup>	Source	Spatial Extent
Oil and Gas Wells and Development Facilities	HIS; BLM (AFMSS)	5.0 ac
Coal Mines	BLM; USFS; Office of Surface Mining Reclamation and Enforcement; USGS Mineral Resource Data System	Polygon Area
Wind Towers	Federal Aviation Administration	3.0 ac
Solar Fields	Platts (power plants)	7.3 ac
Geothermal Development Facilities	IHS	3.0 ac or Polygon Area
Mining (Active Locatable, Leasable and Saleable Developments)	InfoMine	5.0 ac or Polygon Area
Roads <sup>4</sup>	ESRI StreetMap Premium	40.7 ft. (surface streets) 84.0 ft. (major roads) 240.2 ft. (Interstate Hwys.)
Railroads <sup>5</sup>	Federal Railroad Administration	30.8 ft.
Powerlines <sup>6</sup>	Platts	100 ft. (1-199kV)

<sup>3</sup> Taken from Table 6 – GRSG Monitoring Framework.

<sup>4</sup> Values described for line features – roads; railroads; powerlines – represent associated widths centered on the line feature.

<sup>5</sup> See previous note.

<sup>6</sup> See previous note.

Datasets as Described in the Monitoring Framework <sup>3</sup>	Source	Spatial Extent
		150 ft. (200-399kV) 200 ft. (400-699kV) 250 ft. (700+kV)
Communication Towers	Federal Communications Commission	2.5 ac
Other Vertical Structures	Federal Aviation Administration	2.5 ac
Additional Local Datasets (need definitions)		
Underground Pipelines		
Coal Bed Methane Ponds		
Meteorological Towers	BLM; Federal Communications Commission	2.5 ac
Nuclear Energy Facilities	As Available	Polygon Area
Airports	Federal Aviation Administration	Polygon Area
Military Ranges (ground based?)		
Hydropower plants		
Recreation Areas (Developed)	BLM data	Polygon Area

The following data sets would *not* be used to calculate anthropogenic disturbance, but would be used in the habitat baseline to estimate habitat availability or the amount of sagebrush on the landscape within biologically significant units.

1. Habitat treatments
2. Wildfire
3. Invasive plants
4. Conifer encroachment
5. Agriculture
6. Urbanization, Ex-urban and rural development

***Travel and Transportation Disturbance in Sage-Grouse Habitat***

The following would count as disturbance (see Part V for definitions):

- Linear transportation features identified as roads that have a maintenance intensity of 3 or 5
- Linear transportation features identified as primitive roads, temporary routes, or administrative routes that have a functional classification and a maintenance intensity of level 3 or 5

**Non-Disturbance**

The following items would not count as disturbance:

- Linear transportation features identified as trails.
- Linear transportation features identified as primitive roads, temporary routes, or administrative routes that have a maintenance intensity of either level 0 or 1.
- Linear transportation features identified as primitive routes.
- Linear disturbances.

### *Derivation of the Disturbance Formula -*

There is no definitive and scientifically proven formula to determine impact to GRSG from disturbance described in current research. However, Knick et al. (2013) did describe certain relationships between GRSG and anthropogenic disturbance that have been used, in conjunction with specific assumptions to describe a mathematical relationship between human disturbance footprint, effective GRSG habitat and effects to GRSG.

The variables in the equation are defined as:

- Acres of a Biologically Significant Unit (BSU)
- Acres of Anthropogenic Development within the BSU
- Acres of Effective GRSG Habitat (sagebrush) within the BSU

Knick et al. (2013) defined their unit of comparison (analogous to a biologically significant unit) as an area within 5 km of the lek. Within this area they also found that 79% of this area contained sagebrush (analogous to effective GRSG habitat). Results of the study show that “Ninety-nine percent of active leks were in landscapes with <3% developed”. This shows that when areas within 5 km of a lek containing 79% sagebrush were 3% developed there was a measurable effect on the presence of GRSG – this defines a disturbance threshold of 3% at which point GRSG are affected. Knick et al. developed a habitat similarity relationship between the proportion of leks and percent of sagebrush which shows the highest proportion of leks when sagebrush percentage is between 70-90% (Knick et al. 2013, Figure 5, Connelly et al. 2000, Wisdom ???). Above 90% and below 70% the proportion of leks is reduced. This helps define the optimum range for sagebrush at between 70-90% and also indicates that the disturbance threshold of 3% is also dependent upon and varies with the percent of sagebrush present (effective habitat).

These findings from Knick et al. (2013) help define some mathematical parameters to define a modeled relationship between disturbance, effective habitat and effects to GRSG. Figure G-2 illustrates three different ‘disturbance curves’ that reflect the relationship between disturbance (y-axis) and effective habitat (sagebrush percentage) (x-axis) when the footprint disturbed is equivalent to 3% of the area. The red boxes (A) represent the conceptual relationship between disturbance and effective habitat as described and interpreted from Knick et al. (2013). The blue diamonds (B) represent a simple calculation based only on disturbance footprint, without regard to effective habitat. The green triangles (C) represent the derived formula to model the relationship.

The ‘A’ disturbance curve shows that when the disturbance footprint is 3% of the area and the sagebrush percentage is between 70-90% the disturbance calculation would be 3. When sagebrush percent falls below 70% or rises above 90%, the change in habitat, even without a change in disturbed footprint would begin to affect the presence of GRSG. As the amount of sagebrush declines while disturbance remains the same there would be an increasing effect to GRSG presence. This disturbance curve is conceptual and Knick et al. (2013) does not explicitly define this relationship, although this relationship does reflect numerical the observations described in Knick et al. (2013).

The ‘B’ disturbance curve is a straight calculation based only on disturbed footprint over a specified area. It does not account for variability of sagebrush percentage, and the only variable is the acres of disturbance. For an area that is 3% disturbed the relationship ‘curve’ is a flat line at 3, regardless of sagebrush percentage. This ‘curve’ or calculation would match the conceptual curve when sagebrush percentage is between 70 and 90%. This calculation would not account for changes in effective habitat due to loss through fire or gain through restoration and rehabilitation.

The ‘C’ disturbance curve models and approximates the conceptual relationship described in Knick et al. (2013). It accounts for changes in effective habitat that would translate into variable effects to GRSG based on loss or gain of habitat. It includes the ability to consider habitat loss such as from fire and to consider habitat gain such as from rehabilitation efforts including conifer removal. The model matched the conceptual relationship in the range of 70% sagebrush and approximates the conceptual relationship in areas with more or less sagebrush cover. The conceptual relationship assumes a more exponential relationship to GRSG effects from loss of habitat, while the derived formula assumes a more linear relationship. There are no available scientific studies that more clearly define the nature of the relationship. The derived formula and the conceptual relationship are substantially similar from 35-90% sagebrush percentage to validate the derived formula’s relative approximation of the relationship.

Figure G-2. Disturbance Relationships

**Development of the Modeled Formula:**

In order to manage and apply a defined disturbance cap it is necessary to take the findings of the appropriate scientific research and utilize them as appropriately as possible to develop management strategies and evaluation techniques consistent with the management objective. Most scientific research is not completed with the intent to develop specific management objectives or approaches; however, it is through the management approaches that the scientific findings utilized to inform management.

Development of the modeled formula began by describing the simplest relationship of disturbance across a defined area by defining the disturbance percentage as:

$$\% \text{ Disturbance} = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}}{\text{Acres within Area of Concern}} \right) * 100$$

This accounts for disturbance, but does not account for changes in effective habitat or sagebrush percentage as described in Knick et al. (2013). To account for effective habitat the formula needs to include a term that adjusts the resulting calculation with regard to effective habitat. This should be reflected as an adjustment to the denominator (acres within area of concern). The denominator would be weighted based on the amount of effective habitat. In mathematical terms this would give a denominator of:

$$(\text{Acres within Area of Concern}) * (\text{Adjustment Based on Effective Habitat})$$

The adjustment term must equal 1.0 when the effective habitat is somewhere between 70-90% as described in Knick et al. (2013). Assuming the adjustment term is related to the relative percentage of sagebrush or effective habitat then the *Adjustment Based on Effective Habitat* could be expressed as:

$$\frac{\text{Acres of Effective Habitat within the Area of Concern}}{\text{Acres within the Area of Concern}}$$

However, this term does not equal 1.0 when effective habitat is less than 100%. In order to meet the requirement of equaling 1.0 a constant must be added. This constant, when added to the percentage calculated in the previous term must equal 1.0 when the *Acres of Effective Habitat within the Area of Concern* is somewhere between 70-90%. In the Idaho and Southwestern Montana Subregional Plan an objective of 70% effective habitat has been defined, which is consistent with Knick et al. (2013). If the objective is 70% then the constant that must be added to this term is 0.3 in order to meet the requirement of equaling 1.0 at 70% effective habitat. This defines the following derived formula that approximates the conceptual relationship described in Knick et al. (2013).

*Disturbance Percentage*

$$= \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance within Area of Concern}}{\text{Acres within the Area of Concern} * \left( \frac{\text{Acres of Effective Habitat within the Area of Concern}}{\text{Acres within the Area of Concern}} + 0.3 \right)} \right) * 100$$

**Scale:**

The particular scale for which this formula is calculated is defined by the Area of Concern. The Knick et al. (2013) used a study area defined by the area within 5 km of an individual lek. The disturbance relationships described previously are applicable at this scale and begin to break down or lose their integrity at greater distances from the lek (18 km). This concern, coupled with limited availability of consistent data across broader areas undermines the reliability and accuracy of the calculation when including areas more distant from the lek.

From a management perspective there is a need to address concerns at the broader scale to help manage those threats before they become a concern at the site specific scale. In Idaho, nesting location data collected by Idaho Department of Fish and Game (IDFG), shows that most nesting habitat occurs

within 6.2 miles (10 km) of the lek. IDFG has also collected telemetry data on GRSG movements and used this data to help define wintering areas. Nesting and wintering areas are the most limited and seasonal habitats in Idaho and additional disturbance in those areas could have impacts to GRSG presence. For these reasons the Area of Concern, referred to as the Biologically Significant Unit have been delineated to include nesting and wintering habitats. This results in areas that include more acres than just those associated within a 5 km area of an individual lek as described by Knick et al. (2013), but that are associated (within 6.2 miles or 10 km) with leks. While the Knick et al. (2013) study did not include winter habitat, because of their relative importance they have also been included as part of the BSU since conceivably disturbances that would cause lek abandonment would also likely cause abandonment or avoidance of other seasonal habitat areas. Using other administratively defined areas not delineated or based on specific GRSG use may undermine the utility and integrity of the disturbance relationship and calculation.

This approach, built upon the findings in Knick et al. (2013), uses those findings to help inform management at a broader scale that would help determine management actions based on disturbance evaluations. Using the BSU as the Area of Concern is a scale larger than described in Knick et al. (2013), but still within the predictive bounds described in that study. The formula can be used to calculate disturbance at the BSU scale to help inform a disturbance cap, and it can also be used at the site or project scale to help inform specific project activities.

**Example 1 – Anthropogenic Disturbance**

In the Southern Conservation Area the Priority BSU was delineated to include 784,958 acres and the Important BSU was delineated to include 1,036,455 acres, which represent the acres of the Biologically Significant Unit to be used in the denominator. The acres of Effective Habitat in the Priority BSU are 424,656 and in the Important BSU are 447,497. This sets up two equations – one for Priority Habitat Management Areas and one for Important Habitat Management Areas.

The existing footprint acres of disturbance within the Priority BSU are 17,661 acres and the footprint acres of disturbance within the Important BSU are 12,748 acres.

This gives the following two equations to define the baseline disturbance condition in the BSUs:

$$Priority = \frac{17661}{(784958 * (\frac{424656}{784958}) + 0.3)} * 100$$

$$Or \left( \frac{17661}{784958 * (0.54) + 0.3} \right) * 100$$

$$Or \left( \frac{17661}{784958 * (0.84)} \right) * 100$$

Yielding a percent disturbance in the Priority BSU of 2.68%

$$Important = \frac{12748}{(1036455 * (\frac{447497}{1036455}) + 0.3)} * 100$$

Yielding the percent disturbance in the Important BSU of 1.68%

If by 2015 we project additional development within the Priority BSU to be 2120 acres (a 12% increase) and development within the Important BSU to be 4000 acres (a 30% increase) then the Priority footprint acres becomes 20,161 acres and the Important footprint acres becomes 16,748 acres. The resulting evaluation for this cumulative disturbance is calculated by:

$$Priority = \frac{19781}{(784958 * (\frac{424656}{784958}) + 0.3)} * 100 \quad Important = \frac{16748}{(1036455 * (\frac{447497}{1036455}) + 0.3)} * 100$$

Yielding the percent disturbance as: Priority = 3.00% and Important = 2.21%

In the examples, given the existing disturbance footprint it would require development of an additional 2,120 acres in the Priority BSU and an additional 10,005 acres in the Important BSU before the 3% cap would be engaged.

### Part III - Adaptive Management

#### Adaptive Management Habitat Trigger-

The specific formula for the change in habitat for the habitat trigger is defined by:

Within Idaho and Utah all factors are measured within the modeled nesting and wintering habitat within Priority or Important Habitat Management Areas (calculated separately) by Conservation Area; in Southwest Montana all factors are measured within the Priority Habitat Management Area.

In simple description the adaptive management habitat trigger calculation is the percentage of Effective Habitat (defined as areas of generally intact sagebrush that provide Greater sage-grouse habitat during some portion of the year) within modeled nesting and wintering areas within Priority or Important Habitat Management Areas by Conservation Area within a particular year when compared to the Effective Habitat within modeled nesting and wintering areas within Priority or Important Habitat Management Areas by Conservation Area as of the 2011 baseline. Using Effective Habitat as the metric of comparison removes non-habitat acres from the calculation. The calculation is evaluated within both Priority and Important Habitat Management Areas separately within each of the 10 BSUs.

For purposes of evaluating the adaptive management habitat triggers, Effective Habitat in Idaho is tracked using the Key Habitat Map which is updated annually by BLM in coordination with IDFG, Forest Service, US FWS and Local Working Groups and tracks the areas of generally intact sagebrush providing Greater sage-grouse habitat during some portion of the year. Effective habitat equates to areas described as Key Habitat on the Key Habitat Map. Appendix F contains a description of the Key Habitat Map maintenance and update process including the inclusion of disturbances from fire and temporary disturbances and habitat restoration/rehabilitation. **For Montana and Utah Effective Habitat is based on...**

Factors: EHP(Y) – where Y is the year and EHC is the acres of Effective Habitat for that year within the baseline 2011 nesting and wintering areas within the Priority Habitat Management Area by Conservation Area

EHI(Y) - where Y is the year and EHI is the acres of Effective Habitat for that year within the baseline 2011 nesting and wintering areas within the Important Habitat Management Area by Conservation Area

ADP(Y) – where Y is the year and AD is the acres of anthropogenic disturbance within Effective Habitat for that year within the 2011 nesting and wintering areas within the Priority Habitat Management Area by Conservation Area

ADI(Y) – where Y is the year and AD is the acres of anthropogenic disturbance within Effective Habitat for that year (Y) within the baseline 2011 nesting and wintering areas within the Important Habitat Management Area by Conservation Area

EHP(2011) – the Effective Habitat within the baseline 2011 nesting and wintering areas within the Priority Habitat Management Area by Conservation Area

EHI(2011) - the Effective Habitat within the baseline 2011 nesting and wintering areas within the Important Habitat Management Area by Conservation Area

ADP(2011) – the acres of anthropogenic disturbance within Effective Habitat within the baseline 2011 nesting and wintering areas within the Priority Habitat Management Area by Conservation Area

ADI(2011) – the acres of anthropogenic disturbance within Effective Habitat within the baseline 2011 nesting and wintering areas within the Important Habitat Management Area by Conservation Area

Formulas:

$$\text{Priority Habitat Management Area} = 100 - \left( \frac{EHP(Y) - ADP(Y)}{EHP(2011) - ADP(2011)} \right) * 100$$

$$\text{Important Habitat Management Area} = 100 - \left( \frac{EHI(Y) - ADI(Y)}{EHI(2011) - ADI(2011)} \right) * 100$$

When this calculation equals or exceeds 10 then an adaptive trigger has been engaged as per AM-7 & AM-8.

Tables 2-7 describe the acreages associated with the BSUs by Conservation Area for the Idaho and Southwestern Montana Subregion. The tables contain values for the entire BSU (Priority and Important), including all ownerships, acres of effective habitat within the BSUs and acres of anthropogenic disturbance within the BSUs.

These values will be used to provide several examples applying the anthropogenic disturbance and adaptive management habitat trigger evaluations. These are for illustrative purposes and do not represent an actual evaluation of ground conditions.

**Example 2 – Adaptive Management – Habitat**

In the Southern Conservation Area the Priority BSU was delineated to include 784,958 acres, of which 424,656 acres were Effective habitat; therefore EHP(2011) is equal to 424,656 acres. Development within the Effective Habitat in 2011 was measured at 10,074 acres; therefore ADP(2011) is equal to 10,074 acres.

If in 2015 we project a cumulative loss of 42,000 Effective habitat acres due to wildfire (10% loss) and an additional 1000 acres of anthropogenic development (10% increase), then

EHP(2015) is equal to 424,656 – 42,000 or 382,656 and ADP(2015) is equal to 10,074+1000 or 11,074. The evaluation for the adaptive management trigger is calculated by:

$$100 - \left( \frac{382656 - 11074}{424656 - 10074} \right) * 100$$

This simplifies to:  $100 - \left( \frac{371582}{414582} \right) * 100$

Or  $100 - (0.896 * 100)$

Or  $100 - 89.6$

Or  $10.4 - \text{equivalent to } 10.4\%$

This evaluation shows a loss of greater than 10 percent and less than 20 percent which would engage the soft habitat trigger as described in AM-8 and not the hard habitat trigger described in AM-7.

**Soft Trigger Considerations and Implementation Actions**

The Sage-Grouse Implementation Task Force, in coordination with BLM and Forest Service would utilize monitoring information to assess when triggers have been tripped. When information indicates that the soft habitat or population trigger may have been tripped, a Sage-Grouse Implementation Task Force, in coordination with BLM and Forest Service - aided by the technical expertise of IDF&G - would assess the factor(s) leading to the decline and identify potential management actions. The Sage-Grouse Implementation Task Force may consider and recommend to BLM possible changes in management to the PHMA. As to the IHMA, the Sage-Grouse Implementation Team may review the causes for decline and potential management changes only to the extent those factors significantly impair the state's ability to meet the overall management objective. It is anticipated IDF&G will collect data annually and will make recommendations to the Implementation Team by August 31st for population triggers and January 15th for habitat triggers.

Only where the monitoring information indicates the cause(s) of the decline is not a primary threat will the Sage-Grouse Implementation Task Force analyze the secondary threats to the species and determine whether further management actions are needed.

**Potential Implementation Level Actions to Consider in the Event Soft Trigger Criteria are Met**

- ✓ Increase monitoring and evaluation of sage-grouse populations in Priority Habitat Management Area (area of concern).
- ✓ Implement Priority Habitat Management Area management strategy in corresponding Important Habitat Management Area of the same Conservation Area.
- ✓ Implement Priority Habitat Management Area RDFs in corresponding Important Habitat Management Area of the same Conservation Area.

- ✓ Not allow any new (large) infrastructure development within the Priority Habitat Management Area (no exceptions allowed).
- ✓ Reallocate resources to focus on primary threats in the Priority Habitat Management Area (e.g. direct resources from other parts of the state to the area of concern).
- ✓ Reallocate resources to focus on secondary threats in the Priority Habitat Management Area (e.g. direct resources from other parts of the state to the area of concern).
- ✓ Apply Priority Habitat Management Area criteria for all primary threats, and/or all secondary threats to the Important Habitat Management Area.
- ✓ Reallocate resources to focus on primary threats in the Important Habitat Management Area (e.g. direct resources from other parts of the state to the area of concern).
- ✓ Reallocate resources to focus on secondary threats in the Important Habitat Management Area (e.g. direct resources from other parts of the state to the area of concern).

**If Livestock Grazing is determined to be a Causal Factor Consider the Following Measures:**

1. Employ grazing management systems that ensure adequate nesting and early brood rearing habitat within the breeding landscape.
2. When use-pattern mapping or monitoring demonstrates an opportunity to adjust livestock distribution to benefit occupied sage-grouse breeding habitat, include as appropriate herding, salting, and water-source management (e.g., turning troughs/pipelines on/off, extending pipelines/moving troughs) in grazing programs.
3. If available and feasible, utilize exotic perennial grass seedings and/or annual grasslands to avoid breeding season of use of occupied sage-grouse habitat.
4. Modify authorized seasons of use within grazing permits to provide greater flexibility in managing livestock for the benefit of sage-grouse.
5. Where appropriate, maintain residual herbaceous vegetation at the end of the growing/grazing season to contribute to nesting and brood-rearing habitat during the coming nesting season. Table 5.
6. Insure that permittees are informed of management and movement requirements related to avoidance of recent burns, rehabilitation seedings or other restoration sites.
7. Manage grazing of riparian areas, meadows, springs, and seeps in a manner that promotes vegetative structure and composition appropriate to the site. In some cases enclosure fencing may be a viable option. However, recognize the availability and quality of desired herbaceous species may be improved by periodic grazing use of the enclosure.
8. Implement management actions (grazing decisions, allotment management plan/conservation plan development, or other agreements) to modify grazing management to meet seasonal sage-grouse habitat requirements. Employ proper grazing management by providing flexibility in scheduling the intensity, timing, duration and frequency of grazing use over time that best promotes management objectives. During drought periods, prioritize evaluating effects of drought in the CMA relative to grouse needs for food and cover. Ensure that post-drought management allows for vegetation recovery that meets sage-grouse needs in priority sage-grouse habitat areas.
9. When using salt or mineral supplements: a) place them in existing disturbed sites, areas with reduced sagebrush cover—e.g., seedings or cheatgrass sites—to reduce impacts to sage-grouse breeding habitat, b) where feasible use salts or mineral supplements to improve management of livestock for the benefit of sage-grouse habitat.

10. In general, avoid constructing new fences within 2 km of occupied leks. Where feasible, place new, taller structures, such as corrals, loading facilities, water-storage tanks, windmills, etc., at least 2 km from occupied leks to reduce opportunities for perching raptors. Careful consideration, based on local conditions, should also be given to the placement of new fences or structures near other important seasonal habitats (winter-use areas, movement corridors etc.) to reduce potential impacts.
11. New spring developments in sage-grouse habitat should be designed to maintain or enhance the free-flowing characteristics of springs and wet meadows. Analyze developed springs, seeps and associated pipelines to determine if modifications are necessary to maintain the continuity of the predevelopment riparian area within priority sage-grouse habitat. Make modifications where necessary, considering impacts to other water users when such considerations are neutral or beneficial to sage-grouse.
12. Ensure that new and existing livestock troughs and open water storage tanks are fitted with ramps to facilitate the use of and escape from troughs by sage-grouse and other wildlife. Do not use floating boards or similar objects, as these are too unstable and are ineffective. Use BMPs to mitigate potential impacts from West Nile virus.
13. When placing new water developments in sage-grouse breeding habitat, choose sites and designs that will provide the greatest enhancement for sage-grouse and sage-grouse habitat.
14. Avoid new water developments in higher quality native breeding/early brood habitats that have not had significant prior grazing use except in situations in which water developments may aid in better livestock distribution across the allotment and will not adversely impact the species.
15. Identify and when feasible, establish strategically located forage reserves focusing on areas unsuitable for sage-grouse habitat restoration or lower priority habitat restoration areas.
16. Monitor for, and treat invasive species associated with, existing range improvements.
17. Consider initiating vegetative manipulation projects where sagebrush canopy cover exceeds optimal characteristics to promote grass and forb understory growth. These projects should only be undertaken where it can be achieved without negatively impacting the species.

### **Adaptive Grazing Management Response**

BLM will individually analyze those allotments and pastures within the relevant Conservation Area. Given limited agency resources, prioritization will be given to areas that have the potential to provide the greatest benefit to sage-grouse. Allocation of resources should be concentrated on allotments within the CMA that have declining sage-grouse populations. Following those permits within the CMA, resources will be further prioritized to allotments within the IMA with breeding habitats that have decreasing lek counts. Sage-grouse populations that are stable or trending upward will be a lower priority for permit renewal and the adaptive assessment process. The assessment/determination process for sage-grouse pursuant to Standard 8 will consider published characteristics of sage-grouse habitat and the Ecological Site Descriptions, existing vegetation, habitat inventories/assessments (Stiver et al. 2010), and where available, state and transition models that describe vegetation and other physical attributes for sage-grouse. The related characteristics within the categories shown below will also be included. These characteristics indicate the ability of a given area to provide sage-grouse habitat.

Category 1: The grazing allotment (or any pasture/significant area therein) has the existing vegetation and existing ecological condition (seral state) to provide sage-grouse habitat

Category 2: The grazing allotment (or any pasture/significant area therein) has the ecological potential to provide sage-grouse habitat.

Where an allotment or pasture meets one of these Categories above, the GRSG Habitat Management Objectives will be incorporated into relevant resource management plans as the desired conditions with the understanding that these desired conditions may not be achievable:

- (a) due to the existing ecological condition, ecological potential or the existing vegetation; or
- (b) due to causal events unrelated to existing livestock grazing.

Allotments will only be managed for the primary seasonal habitat that it has the potential to support. Based on these habitat characteristics, BLM will conduct fine and site scale-habitat assessments to help inform grazing management. Where necessary, a determination of factors causing any failure to achieve the habitat characteristics GRSG HMOs will be conducted at a resolution sufficient to document the habitat condition. This determination will include consideration of local spatial and inter-annual variability. A determination of issues attributable to livestock grazing management shall not result from one year of data at a specific location within an allotment. If the process and conditions outlined above demonstrate that livestock grazing is limiting achievement of the habitat characteristics GRSG HMOs, renewed permits will include measures to achieve desired habitat conditions. These measures must be tailored to address the specific management issues associated with seasonal habitat limitations identified in the fine-scale assessments.

**Part IV – Anthropogenic Disturbance and Adaptive Management 2011 Baseline Indices**

**Table G-2 – Desert Conservation Area Baseline Indices**

				Existing Anthropogenic Disturbance	
<b>Desert Conservation Area</b>	BLM & FS Acres	Total Acres	Effective Habitat	Within BSU	Within Effective Habitat
Priority BSU (nesting and wintering)					
Important BSU (nesting and wintering)					

**Table G-3 – Mountain Valleys Conservation Area Baseline Indices**

				Existing Anthropogenic Disturbance	
<b>Mountain Valleys Conservation Area</b>	BLM & FS Acres	Total Acres	Effective Habitat	Within BSU	Within Effective Habitat
Priority BSU (nesting and wintering)					
Important BSU (nesting and wintering)					

**Table G-4 – Southern Conservation Area Baseline Indices**

				Existing Anthropogenic Disturbance	
<b>Southern Conservation Area</b>	BLM & FS Acres	Total Acres	Effective Habitat	Within BSU	Within Effective Habitat
Priority BSU (nesting and wintering)	560,985	784,958	424,656	17,661	10,074

## **Part V - Travel and Transportation Management Definitions for Use in Anthropogenic Disturbance Calculation**

**Roads** are linear routes managed for use by low clearance vehicles having four or more wheels, and are maintained for regular and continuous use.

**Primitive Roads** are linear routes managed for use by four-wheel drive or high-clearance vehicles. They do not normally meet any design standards.

**Trails** are linear routes managed for human-powered, stock, or OHV forms of transportation or for historical or heritage values. Trails are not generally managed for use by four-wheel drive or high-clearance vehicles.

**Linear Disturbances** are human-made linear features that are not part of the designated transportation network are identified as "Transportation Linear Disturbances." These may include engineered (planned) as well as unplanned single and two-track linear features that are not part of the BLM's transportation system.

**Primitive Routes** are any transportation linear feature located within a WSA or lands with wilderness characteristics designated for protection by a land use plan and not meeting the wilderness inventory road definition.

**Temporary routes** are short-term overland roads, primitive roads or trails which are authorized or acquired for the development, construction or staging of a project or event that has a finite lifespan. Temporary routes are not intended to be part of the permanent or designated transportation network and must be reclaimed when their intended purpose(s) has been fulfilled. Temporary routes should be constructed to minimum standards necessary to accommodate the intended use; the intent is that the project proponent (or their representative) will reclaim the route once the original project purpose or need has been completed. Temporary routes are considered emergency, single use or permitted activity access. Unless they are specifically intended to accommodate public use, they should not be made available for that use. A temporary route will be authorized or acquired for the specific time period and duration specified in the written authorization (permit, ROW, lease, contract etc.) and will be scheduled and budgeted for reclamation to prevent further vehicle use and soil erosion from occurring by providing adequate drainage and re-vegetation.

**Administrative routes** are those that are limited to authorized users (typically motorized access). These are existing routes that lead to developments that have an administrative purpose, where the agency or permitted user must have access for regular maintenance or operation. These authorized developments could include such items as power lines, cabins, weather stations, communication sites, spring

### ***Maintenance Intensities***

#### **Level 0**

##### Maintenance Description:

Existing routes that will no longer be maintained and no longer be declared a route. Routes identified as Level 0 are identified for removal from the Transportation System entirely.

**Maintenance Objectives:**

- No planned annual maintenance.
- Meet identified environmental needs.
- No preventative maintenance or planned annual maintenance activities.

**Level 1****Maintenance Description:**

Routes where minimum (low intensity) maintenance is required to protect adjacent lands and resource values. These roads may be impassable for extended periods of time.

**Maintenance Objectives:**

- Low (Minimal) maintenance intensity.
- Emphasis is given to maintaining drainage and runoff patterns as needed to protect adjacent lands. Grading, brushing, or slide removal is not performed unless route bed drainage is being adversely affected, causing erosion.
- Meet identified resource management objectives.
- Perform maintenance as necessary to protect adjacent lands and resource values.
- No preventative maintenance.
- Planned maintenance activities limited to environmental and resource protection.
- Route surface and other physical features are not maintained for regular traffic.

**Level 3****Maintenance Description:**

Routes requiring moderate maintenance due to low volume use (for example, seasonally or year-round for commercial, recreational, or administrative access). Maintenance Intensities may not provide year-round access but are intended to generally provide resources appropriate to keep the route in use for the majority of the year.

**Maintenance Objectives:**

- Medium (Moderate) maintenance intensity.
- Drainage structures will be maintained as needed. Surface maintenance will be conducted to provide a reasonable level of riding comfort at prudent speeds for the route conditions and intended use. Brushing is conducted as needed to improve sight distance when appropriate for management uses. Landslides adversely affecting drainage receive high priority for removal; otherwise, they will be removed on a scheduled basis.
- Meet identified environmental needs.
- Generally maintained for year-round traffic.
- Perform annual maintenance necessary to protect adjacent lands and resource values.
- Perform preventative maintenance as required to generally keep the route in acceptable condition.
- Planned maintenance activities should include environmental and resource protection efforts, annual route surface.
- Route surface and other physical features are maintained for regular traffic.

**Level 5**

## Maintenance Description:

Route for high (maximum) maintenance due to year-round needs, high volume of traffic, or significant use. Also may include route identified through management objectives as requiring high intensities of maintenance or to be maintained open on a year-round basis.

## Maintenance Objectives:

- High (Maximum) maintenance intensity.
- The entire route will be maintained at least annually. Problems will be repaired as discovered. These routes may be closed or have limited access due to weather conditions but are generally intended for year-round use.
- Meet identified environmental needs.
- Generally maintained for year-round traffic.
- Perform annual maintenance necessary to protect adjacent lands and resource values.
- Perform preventative maintenance as required to generally keep the route in acceptable condition.
- Planned maintenance activities should include environmental and resource protection efforts, annual route surface.
- Route surface and other physical features are maintained for regular traffic.

## Appendix G – Anthropogenic Disturbance and Adaptive Management

### Part I – Baseline Map and Description of Development

The **biologically significant units (BSUs)** are geographical/spatial areas within Greater Sage-grouse habitat that contains relevant and important habitats which is used as the basis for comparative calculations to support evaluation of changes to habitat. The BSUs include all land ownerships for evaluation, although application of the anthropogenic disturbance cap is specific only to BLM and Forest Service lands. The BSUs are used in the evaluation of anthropogenic disturbance and in the adaptive management habitat trigger.

For the Idaho and Southwestern Montana Greater Sage-Grouse Plan Amendment EIS the biologically significant units are defined as:

*Idaho: All of the modeled nesting<sup>1</sup> and delineated winter habitat, which is based on 2011 data, occurring within Priority and/or Important Habitat Management Areas within individual Conservation Areas<sup>2</sup>*

*Montana: All of the Priority Habitat Management Area*

These BSUs form the geographic basis for the calculation of anthropogenic disturbance and in the soft and hard adaptive management habitat triggers.

While the BSUs define the geographic extent and scale of the Subregion's landscape that will be considered in evaluating anthropogenic disturbance and the adaptive management habitat triggers, how disturbance and habitat triggers are calculated differ since anthropogenic disturbance and habitat loss affect Greater Sage-grouse differently (Knick et al. 2013).

The BSU is the total area (acreage) of nesting and wintering habitat within Priority or Important Habitat Management Areas, separately, by each Conservation Area. For Idaho this results in 8 BSUs, 2 each within the Idaho Conservation Areas – 1 in Priority Habitat Management Areas and 1 in Important Habitat Management Areas. There is 1 BSU in southwest Montana and 1 BSU for the Utah portion of the Sawtooth National Forest (Raft River BSU). There are a total of 10 BSUs within the Idaho and Southwestern Montana Subregion as shown in Map-G-1.

In developing these BSUs it was determined at the subregional level that data from these units must be compatible with aggregation to the PAC and WAFWA Management Zone levels, in order to meet FWS needs. In addition, BSUs must be edge matched/aligned with neighboring states. All sub-regions acknowledge there may be locally important biologically significant units smaller than PACs which may or may not be rolled up to PAC level. The Subregions also acknowledge that assessing disturbance at larger scales such as certain PACs, or via rollup of data, provides a baseline metric for future comparison, but dilution may likely mask disturbance concerns occurring at more local scales.

<sup>1</sup> Modeled nesting habitat is defined as those areas of Priority or Important Habitat Management Areas within 6.2 miles of 2011 active leks.

<sup>2</sup> The Utah portion of the Sawtooth National Forest is calculated separately for the Southern Conservation area.

The application of these calculations requires certain assumptions and associated baseline values which set an appropriate benchmark for future comparison.

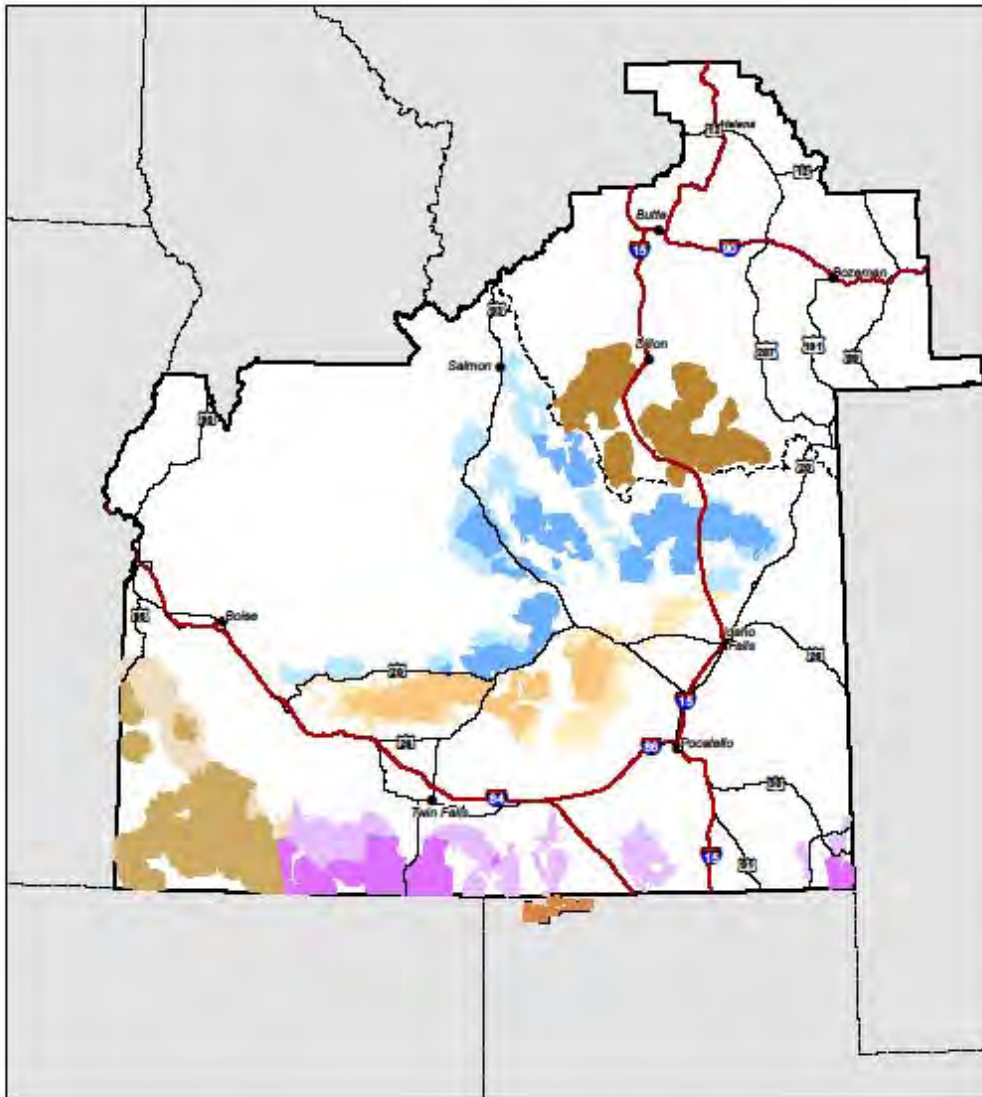

For the adaptive management evaluation in Idaho the baseline year for comparison of both the population and habitat values is set at 2011. Sage-grouse have been monitored by counting males on leks since the 1950's (IDFG files). Average male lek attendance (statewide average) reached a low point in 1996 (IDFG in file). A more consistent and intensified survey of leks began with the annual monitoring of all 78 lek routes across southern Idaho in 1996. Average male lek attendance has fluctuated since 1996 (Figure G-1) in response to favorable or unfavorable conditions (e.g. weather, habitat improvements or loss, and West Nile virus). Peaks were in 2000, 2006, and 2011 with low points in 2002 and 2009. The increase in male lek attendance after previous declines indicates that sage-grouse populations can rebound over a relatively short time frame (e.g. 5 years) given desirable conditions. The baseline was set at the 2011 average number of males because this level is approximately the medium (8 higher and 7 lower years) of the counts between 1996-2011. At the statewide scale, the 2011 baseline allows 10% and 20% population triggers to be above the second lowest point in 2009. Application of the trigger at a smaller (Conservation Area) scale is a more conservative approach that will indicate potential trends sooner than if applied at the state-wide scale.

Figure G-1. Idaho Trend in Male Sage-grouse Lek Attendance.

**Part II – Anthropogenic Disturbance Calculation**

The specific formula for the percent of anthropogenic disturbance is defined by:

*Disturbance Percentage*

$$= \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}}{\text{Acres within the BSU} * \left( \frac{\text{Acres of Effective Habitat within the BSU}}{\text{Acres within the BSU}} + 0.3 \right)} \right) \times 100$$

The BSU in the denominator represents the total area (acreage) of the applicable area of analysis. Each BSU is tracked and evaluated separately within each of the 10 BSUs, and reaching the 3% disturbance cap in any one BSU has specific management implications both within and beyond that specific BSU as described in the Proposed Plan.

All sub-regions within the Great Basin Region will use the same types of disturbances for fine/site scale monitoring as were used for broad and mid-scale analysis and would use local data and/or more current satellite imagery if available.

Anthropogenic Disturbance included in the numerator is shown in Table G-1.

Table G-1. Anthropogenic Disturbances and Areas of Impact

Datasets as Described in the Monitoring Framework <sup>3</sup>	Source	Spatial Extent
Oil and Gas Wells and Development Facilities	HIS; BLM (AFMSS)	5.0 ac
Coal Mines	BLM; USFS; Office of Surface Mining Reclamation and Enforcement; USGS Mineral Resource Data System	Polygon Area
Wind Towers	Federal Aviation Administration	3.0 ac
Solar Fields	Platts (power plants)	7.3 ac
Geothermal Development Facilities	IHS	3.0 ac or Polygon Area
Mining (Active Locatable, Leasable and Saleable Developments)	InfoMine	5.0 ac or Polygon Area
Roads <sup>4</sup>	ESRI StreetMap Premium	40.7 ft. (surface streets) 84.0 ft. (major roads) 240.2 ft. (Interstate Hwys.)
Railroads <sup>5</sup>	Federal Railroad Administration	30.8 ft.
Powerlines <sup>6</sup>	Platts	100 ft. (1-199kV)

<sup>3</sup> Taken from Table 6 – GRSG Monitoring Framework.

<sup>4</sup> Values described for line features – roads; railroads; powerlines – represent associated widths centered on the line feature.

<sup>5</sup> See previous note.

<sup>6</sup> See previous note.

Datasets as Described in the Monitoring Framework <sup>3</sup>	Source	Spatial Extent
		150 ft. (200-399kV) 200 ft. (400-699kV) 250 ft. (700+kV)
Communication Towers	Federal Communications Commission	2.5 ac
Other Vertical Structures	Federal Aviation Administration	2.5 ac
Additional Local Datasets (need definitions)		
Underground Pipelines		
Coal Bed Methane Ponds		
Meteorological Towers	BLM; Federal Communications Commission	2.5 ac
Nuclear Energy Facilities	As Available	Polygon Area
Airports	Federal Aviation Administration	Polygon Area
Military Ranges (ground based?)		
Hydropower plants		
Recreation Areas (Developed)	BLM data	Polygon Area

The following data sets would *not* be used to calculate anthropogenic disturbance, but would be used in the habitat baseline to estimate habitat availability or the amount of sagebrush on the landscape within biologically significant units.

1. Habitat treatments
2. Wildfire
3. Invasive plants
4. Conifer encroachment
5. Agriculture
6. Urbanization, Ex-urban and rural development

***Travel and Transportation Disturbance in Sage-Grouse Habitat***

The following would count as disturbance (see Part V for definitions):

- Linear transportation features identified as roads that have a maintenance intensity of 3 or 5
- Linear transportation features identified as primitive roads, temporary routes, or administrative routes that have a functional classification and a maintenance intensity of level 3 or 5

**Non-Disturbance**

The following items would not count as disturbance:

- Linear transportation features identified as trails.
- Linear transportation features identified as primitive roads, temporary routes, or administrative routes that have a maintenance intensity of either level 0 or 1.
- Linear transportation features identified as primitive routes.
- Linear disturbances.

### *Derivation of the Disturbance Formula -*

There is no definitive and scientifically proven formula to determine impact to GRSG from disturbance described in current research. However, Knick et al. (2013) did describe certain relationships between GRSG and anthropogenic disturbance that have been used, in conjunction with specific assumptions to describe a mathematical relationship between human disturbance footprint, effective GRSG habitat and effects to GRSG.

The variables in the equation are defined as:

Acres of a Biologically Significant Unit (BSU)

Acres of Anthropogenic Development within the BSU

Acres of Effective GRSG Habitat (sagebrush) within the BSU

Knick et al. (2013) defined their unit of comparison (analogous to a biologically significant unit) as an area within 5 km of the lek. Within this area they also found that 79% of this area contained sagebrush (analogous to effective GRSG habitat). Results of the study show that “Ninety-nine percent of active leks were in landscapes with <3% developed”. This shows that when areas within 5 km of a lek containing 79% sagebrush were 3% developed there was a measurable effect on the presence of GRSG – this defines a disturbance threshold of 3% at which point GRSG are affected. Knick et al. developed a habitat similarity relationship between the proportion of leks and percent of sagebrush which shows the highest proportion of leks when sagebrush percentage is between 70-90% (Knick et al. 2013, Figure 5, Connelly et al. 2000, Wisdom ???). Above 90% and below 70% the proportion of leks is reduced. This helps define the optimum range for sagebrush at between 70-90% and also indicates that the disturbance threshold of 3% is also dependent upon and varies with the percent of sagebrush present (effective habitat).

These findings from Knick et al. (2013) help define some mathematical parameters to define a modeled relationship between disturbance, effective habitat and effects to GRSG. Figure G-2 illustrates three different ‘disturbance curves’ that reflect the relationship between disturbance (y-axis) and effective habitat (sagebrush percentage) (x-axis) when the footprint disturbed is equivalent to 3% of the area. The red boxes (A) represent the conceptual relationship between disturbance and effective habitat as described and interpreted from Knick et al. (2013). The blue diamonds (B) represent a simple calculation based only on disturbance footprint, without regard to effective habitat. The green triangles (C) represent the derived formula to model the relationship.

The ‘A’ disturbance curve shows that when the disturbance footprint is 3% of the area and the sagebrush percentage is between 70-90% the disturbance calculation would be 3. When sagebrush percent falls below 70% or rises above 90%, the change in habitat, even without a change in disturbed footprint would begin to affect the presence of GRSG. As the amount of sagebrush declines while disturbance remains the same there would be an increasing effect to GRSG presence. This disturbance curve is conceptual and Knick et al. (2013) does not explicitly define this relationship, although this relationship does reflect numerical the observations described in Knick et al. (2013).

The ‘B’ disturbance curve is a straight calculation based only on disturbed footprint over a specified area. It does not account for variability of sagebrush percentage, and the only variable is the acres of disturbance. For an area that is 3% disturbed the relationship ‘curve’ is a flat line at 3, regardless of sagebrush percentage. This ‘curve’ or calculation would match the conceptual curve when sagebrush percentage is between 70 and 90%. This calculation would not account for changes in effective habitat due to loss through fire or gain through restoration and rehabilitation.

The ‘C’ disturbance curve models and approximates the conceptual relationship described in Knick et al. (2013). It accounts for changes in effective habitat that would translate into variable effects to GRSG based on loss or gain of habitat. It includes the ability to consider habitat loss such as from fire and to consider habitat gain such as from rehabilitation efforts including conifer removal. The model matched the conceptual relationship in the range of 70% sagebrush and approximates the conceptual relationship in areas with more or less sagebrush cover. The conceptual relationship assumes a more exponential relationship to GRSG effects from loss of habitat, while the derived formula assumes a more linear relationship. There are no available scientific studies that more clearly define the nature of the relationship. The derived formula and the conceptual relationship are substantially similar from 35-90% sagebrush percentage to validate the derived formula’s relative approximation of the relationship.

Figure G-2. Disturbance Relationships

**Development of the Modeled Formula:**

In order to manage and apply a defined disturbance cap it is necessary to take the findings of the appropriate scientific research and utilize them as appropriately as possible to develop management strategies and evaluation techniques consistent with the management objective. Most scientific research is not completed with the intent to develop specific management objectives or approaches; however, it is through the management approaches that the scientific findings utilized to inform management.

Development of the modeled formula began by describing the simplest relationship of disturbance across a defined area by defining the disturbance percentage as:

$$\% \text{ Disturbance} = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}}{\text{Acres within Area of Concern}} \right) * 100$$

This accounts for disturbance, but does not account for changes in effective habitat or sagebrush percentage as described in Knick et al. (2013). To account for effective habitat the formula needs to include a term that adjusts the resulting calculation with regard to effective habitat. This should be reflected as an adjustment to the denominator (acres within area of concern). The denominator would be weighted based on the amount of effective habitat. In mathematical terms this would give a denominator of:

$$(\text{Acres within Area of Concern}) * (\text{Adjustment Based on Effective Habitat})$$

The adjustment term must equal 1.0 when the effective habitat is somewhere between 70-90% as described in Knick et al. (2013). Assuming the adjustment term is related to the relative percentage of sagebrush or effective habitat then the *Adjustment Based on Effective Habitat* could be expressed as:

$$\frac{\text{Acres of Effective Habitat within the Area of Concern}}{\text{Acres within the Area of Concern}}$$

However, this term does not equal 1.0 when effective habitat is less than 100%. In order to meet the requirement of equaling 1.0 a constant must be added. This constant, when added to the percentage calculated in the previous term must equal 1.0 when the *Acres of Effective Habitat within the Area of Concern* is somewhere between 70-90%. In the Idaho and Southwestern Montana Subregional Plan an objective of 70% effective habitat has been defined, which is consistent with Knick et al. (2013). If the objective is 70% then the constant that must be added to this term is 0.3 in order to meet the requirement of equaling 1.0 at 70% effective habitat. This defines the following derived formula that approximates the conceptual relationship described in Knick et al. (2013).

*Disturbance Percentage*

$$= \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance within Area of Concern}}{\text{Acres within the Area of Concern} * \left( \frac{\text{Acres of Effective Habitat within the Area of Concern}}{\text{Acres within the Area of Concern}} + 0.3 \right)} \right) * 100$$

**Scale:**

The particular scale for which this formula is calculated is defined by the Area of Concern. The Knick et al. (2013) used a study area defined by the area within 5 km of an individual lek. The disturbance relationships described previously are applicable at this scale and begin to break down or lose their integrity at greater distances from the lek (18 km). This concern, coupled with limited availability of consistent data across broader areas undermines the reliability and accuracy of the calculation when including areas more distant from the lek.

From a management perspective there is a need to address concerns at the broader scale to help manage those threats before they become a concern at the site specific scale. In Idaho, nesting location data collected by Idaho Department of Fish and Game (IDFG), shows that most nesting habitat occurs

within 6.2 miles (10 km) of the lek. IDFG has also collected telemetry data on GRSG movements and used this data to help define wintering areas. Nesting and wintering areas are the most limited and seasonal habitats in Idaho and additional disturbance in those areas could have impacts to GRSG presence. For these reasons the Area of Concern, referred to as the Biologically Significant Unit have been delineated to include nesting and wintering habitats. This results in areas that include more acres than just those associated within a 5 km area of an individual lek as described by Knick et al. (2013), but that are associated (within 6.2 miles or 10 km) with leks. While the Knick et al. (2013) study did not include winter habitat, because of their relative importance they have also been included as part of the BSU since conceivably disturbances that would cause lek abandonment would also likely cause abandonment or avoidance of other seasonal habitat areas. Using other administratively defined areas not delineated or based on specific GRSG use may undermine the utility and integrity of the disturbance relationship and calculation.

This approach, built upon the findings in Knick et al. (2013), uses those findings to help inform management at a broader scale that would help determine management actions based on disturbance evaluations. Using the BSU as the Area of Concern is a scale larger than described in Knick et al. (2013), but still within the predictive bounds described in that study. The formula can be used to calculate disturbance at the BSU scale to help inform a disturbance cap, and it can also be used at the site or project scale to help inform specific project activities.

**Example 1 – Anthropogenic Disturbance**

In the Southern Conservation Area the Priority BSU was delineated to include 784,958 acres and the Important BSU was delineated to include 1,036,455 acres, which represent the acres of the Biologically Significant Unit to be used in the denominator. The acres of Effective Habitat in the Priority BSU are 424,656 and in the Important BSU are 447,497. This sets up two equations – one for Priority Habitat Management Areas and one for Important Habitat Management Areas.

The existing footprint acres of disturbance within the Priority BSU are 17,661 acres and the footprint acres of disturbance within the Important BSU are 12,748 acres.

This gives the following two equations to define the baseline disturbance condition in the BSUs:

$$Priority = \frac{17661}{(784958 * (\frac{424656}{784958}) + 0.3)} * 100$$

$$Or \left( \frac{17661}{784958 * (0.54) + 0.3} \right) * 100$$

$$Or \left( \frac{17661}{784958 * (0.84)} \right) * 100$$

Yielding a percent disturbance in the Priority BSU of 2.68%

$$Important = \frac{12748}{(1036455 * (\frac{447497}{1036455}) + 0.3)} * 100$$

Yielding the percent disturbance in the Important BSU of 1.68%

If by 2015 we project additional development within the Priority BSU to be 2120 acres (a 12% increase) and development within the Important BSU to be 4000 acres (a 30% increase) then the Priority footprint acres becomes 20,161 acres and the Important footprint acres becomes 16,748 acres. The resulting evaluation for this cumulative disturbance is calculated by:

$$Priority = \frac{19781}{(784958 * (\frac{424656}{784958}) + 0.3)} * 100 \quad Important = \frac{16748}{(1036455 * (\frac{447497}{1036455}) + 0.3)} * 100$$

Yielding the percent disturbance as: Priority = 3.00% and Important = 2.21%

In the examples, given the existing disturbance footprint it would require development of an additional 2,120 acres in the Priority BSU and an additional 10,005 acres in the Important BSU before the 3% cap would be engaged.

### Part III - Adaptive Management

#### Adaptive Management Habitat Trigger-

The specific formula for the change in habitat for the habitat trigger is defined by:

Within Idaho and Utah all factors are measured within the modeled nesting and wintering habitat within Priority or Important Habitat Management Areas (calculated separately) by Conservation Area; in Southwest Montana all factors are measured within the Priority Habitat Management Area.

In simple description the adaptive management habitat trigger calculation is the percentage of Effective Habitat (defined as areas of generally intact sagebrush that provide Greater sage-grouse habitat during some portion of the year) within modeled nesting and wintering areas within Priority or Important Habitat Management Areas by Conservation Area within a particular year when compared to the Effective Habitat within modeled nesting and wintering areas within Priority or Important Habitat Management Areas by Conservation Area as of the 2011 baseline. Using Effective Habitat as the metric of comparison removes non-habitat acres from the calculation. The calculation is evaluated within both Priority and Important Habitat Management Areas separately within each of the 10 BSUs.

For purposes of evaluating the adaptive management habitat triggers, Effective Habitat in Idaho is tracked using the Key Habitat Map which is updated annually by BLM in coordination with IDFG, Forest Service, US FWS and Local Working Groups and tracks the areas of generally intact sagebrush providing Greater sage-grouse habitat during some portion of the year. Effective habitat equates to areas described as Key Habitat on the Key Habitat Map. Appendix F contains a description of the Key Habitat Map maintenance and update process including the inclusion of disturbances from fire and temporary disturbances and habitat restoration/rehabilitation. **For Montana and Utah Effective Habitat is based on...**

Factors: EHP(Y) – where Y is the year and EHC is the acres of Effective Habitat for that year within the baseline 2011 nesting and wintering areas within the Priority Habitat Management Area by Conservation Area

EHI(Y) - where Y is the year and EHI is the acres of Effective Habitat for that year within the baseline 2011 nesting and wintering areas within the Important Habitat Management Area by Conservation Area

ADP(Y) – where Y is the year and AD is the acres of anthropogenic disturbance within Effective Habitat for that year within the 2011 nesting and wintering areas within the Priority Habitat Management Area by Conservation Area

ADI(Y) – where Y is the year and AD is the acres of anthropogenic disturbance within Effective Habitat for that year (Y) within the baseline 2011 nesting and wintering areas within the Important Habitat Management Area by Conservation Area

EHP(2011) – the Effective Habitat within the baseline 2011 nesting and wintering areas within the Priority Habitat Management Area by Conservation Area

EHI(2011) - the Effective Habitat within the baseline 2011 nesting and wintering areas within the Important Habitat Management Area by Conservation Area

ADP(2011) – the acres of anthropogenic disturbance within Effective Habitat within the baseline 2011 nesting and wintering areas within the Priority Habitat Management Area by Conservation Area

ADI(2011) – the acres of anthropogenic disturbance within Effective Habitat within the baseline 2011 nesting and wintering areas within the Important Habitat Management Area by Conservation Area

Formulas:

$$\text{Priority Habitat Management Area} = 100 - \left( \frac{EHP(Y) - ADP(Y)}{EHP(2011) - ADP(2011)} \right) * 100$$

$$\text{Important Habitat Management Area} = 100 - \left( \frac{EHI(Y) - ADI(Y)}{EHI(2011) - ADI(2011)} \right) * 100$$

When this calculation equals or exceeds 10 then an adaptive trigger has been engaged as per AM-7 & AM-8.

Tables 2-7 describe the acreages associated with the BSUs by Conservation Area for the Idaho and Southwestern Montana Subregion. The tables contain values for the entire BSU (Priority and Important), including all ownerships, acres of effective habitat within the BSUs and acres of anthropogenic disturbance within the BSUs.

These values will be used to provide several examples applying the anthropogenic disturbance and adaptive management habitat trigger evaluations. These are for illustrative purposes and do not represent an actual evaluation of ground conditions.

**Example 2 – Adaptive Management – Habitat**

In the Southern Conservation Area the Priority BSU was delineated to include 784,958 acres, of which 424,656 acres were Effective habitat; therefore EHP(2011) is equal to 424,656 acres. Development within the Effective Habitat in 2011 was measured at 10,074 acres; therefore ADP(2011) is equal to 10,074 acres.

If in 2015 we project a cumulative loss of 42,000 Effective habitat acres due to wildfire (10% loss) and an additional 1000 acres of anthropogenic development (10% increase), then

EHP(2015) is equal to 424,656 – 42,000 or 382,656 and ADP(2015) is equal to 10,074+1000 or 11,074. The evaluation for the adaptive management trigger is calculated by:

$$100 - \left( \frac{382656 - 11074}{424656 - 10074} \right) * 100$$

This simplifies to:  $100 - \left( \frac{371582}{414582} \right) * 100$

Or  $100 - (0.896 * 100)$

Or  $100 - 89.6$

Or  $10.4 - \text{equivalent to } 10.4\%$

This evaluation shows a loss of greater than 10 percent and less than 20 percent which would engage the soft habitat trigger as described in AM-8 and not the hard habitat trigger described in AM-7.

**Soft Trigger Considerations and Implementation Actions**

The Sage-Grouse Implementation Task Force, in coordination with BLM and Forest Service would utilize monitoring information to assess when triggers have been tripped. When information indicates that the soft habitat or population trigger may have been tripped, a Sage-Grouse Implementation Task Force, in coordination with BLM and Forest Service - aided by the technical expertise of IDF&G - would assess the factor(s) leading to the decline and identify potential management actions. The Sage-Grouse Implementation Task Force may consider and recommend to BLM possible changes in management to the PHMA. As to the IHMA, the Sage-Grouse Implementation Team may review the causes for decline and potential management changes only to the extent those factors significantly impair the state's ability to meet the overall management objective. It is anticipated IDF&G will collect data annually and will make recommendations to the Implementation Team by August 31st for population triggers and January 15th for habitat triggers.

Only where the monitoring information indicates the cause(s) of the decline is not a primary threat will the Sage-Grouse Implementation Task Force analyze the secondary threats to the species and determine whether further management actions are needed.

**Adaptive Management Population Trigger**

Definition of “Significance” for Hard Population Trigger:

The Governor’s Alternative (E) did not define criteria for “significantly less than 1.0”. For purposes of the Plan, IDFG proposes to use a 90% confidence interval around the current 3-year average of  $\lambda$  to evaluate whether  $\lambda$  is significantly less than 1.0. If the 90% confidence interval is less than and does not include 1.0, then  $\lambda$  is significantly less than 1.0. The  $\lambda$  and variance will be calculated following Garton et al. (2011). A 90% confidence interval is justified because:

1. Under a 90% confidence interval the probability of making a false conclusion is 10%, however, the error will be on the conservative side; i.e., the error would benefit the sage-grouse population.

2. The  $\lambda$  criteria would not be used alone; as stated in the ADPP,  $\lambda$  would be used in concert with trend in maximum number of males.

Garton, E. O., J. W. Connelly, J. S. Horne, C. A. Hagen, A. Moser, and M. A. Schroeder. 2011. Greater sage-grouse population dynamics and probability of persistence. *Studies in Avian Biology* 38: 293-382.

### **Potential Implementation Level Actions to Consider in the Event Soft Trigger Criteria are Met**

- ✓ Increase monitoring and evaluation of sage-grouse populations in Priority Habitat Management Area (area of concern).
- ✓ Implement Priority Habitat Management Area management strategy in corresponding Important Habitat Management Area of the same Conservation Area.
- ✓ Implement Priority Habitat Management Area RDFs in corresponding Important Habitat Management Area of the same Conservation Area.
- ✓ Not allow any new (large) infrastructure development within the Priority Habitat Management Area (no exceptions allowed).
- ✓ Reallocate resources to focus on primary threats in the Priority Habitat Management Area (e.g. direct resources from other parts of the state to the area of concern).
- ✓ Reallocate resources to focus on secondary threats in the Priority Habitat Management Area (e.g. direct resources from other parts of the state to the area of concern).
- ✓ Apply Priority Habitat Management Area criteria for all primary threats, and/or all secondary threats to the Important Habitat Management Area.
- ✓ Reallocate resources to focus on primary threats in the Important Habitat Management Area (e.g. direct resources from other parts of the state to the area of concern).
- ✓ Reallocate resources to focus on secondary threats in the Important Habitat Management Area (e.g. direct resources from other parts of the state to the area of concern).

### **If Livestock Grazing is determined to be a Causal Factor Consider the Following Measures:**

1. Employ grazing management systems that ensure adequate nesting and early brood rearing habitat within the breeding landscape.
2. When use-pattern mapping or monitoring demonstrates an opportunity to adjust livestock distribution to benefit occupied sage-grouse breeding habitat, include as appropriate herding, salting, and water-source management (e.g., turning troughs/pipelines on/off, extending pipelines/moving troughs) in grazing programs.
3. If available and feasible, utilize exotic perennial grass seedings and/or annual grasslands to avoid breeding season of use of occupied sage-grouse habitat.
4. Modify authorized seasons of use within grazing permits to provide greater flexibility in managing livestock for the benefit of sage-grouse.
5. Where appropriate, maintain residual herbaceous vegetation at the end of the growing/grazing season to contribute to nesting and brood-rearing habitat during the coming nesting season. Table 5.
6. Insure that permittees are informed of management and movement requirements related to avoidance of recent burns, rehabilitation seedings or other restoration sites.
7. Manage grazing of riparian areas, meadows, springs, and seeps in a manner that promotes vegetative structure and composition appropriate to the site. In some cases enclosure fencing

may be a viable option. However, recognize the availability and quality of desired herbaceous species may be improved by periodic grazing use of the enclosure.

8. Implement management actions (grazing decisions, allotment management plan/conservation plan development, or other agreements) to modify grazing management to meet seasonal sage-grouse habitat requirements. Employ proper grazing management by providing flexibility in scheduling the intensity, timing, duration and frequency of grazing use over time that best promotes management objectives. During drought periods, prioritize evaluating effects of drought in the CMA relative to grouse needs for food and cover. Ensure that post-drought management allows for vegetation recovery that meets sage-grouse needs in priority sage-grouse habitat areas.
9. When using salt or mineral supplements: a) place them in existing disturbed sites, areas with reduced sagebrush cover—e.g., seedings or cheatgrass sites—to reduce impacts to sage-grouse breeding habitat, b) where feasible use salts or mineral supplements to improve management of livestock for the benefit of sage-grouse habitat.
10. In general, avoid constructing new fences within 2 km of occupied leks. Where feasible, place new, taller structures, such as corrals, loading facilities, water-storage tanks, windmills, etc., at least 2 km from occupied leks to reduce opportunities for perching raptors. Careful consideration, based on local conditions, should also be given to the placement of new fences or structures near other important seasonal habitats (winter-use areas, movement corridors etc.) to reduce potential impacts.
11. New spring developments in sage-grouse habitat should be designed to maintain or enhance the free-flowing characteristics of springs and wet meadows. Analyze developed springs, seeps and associated pipelines to determine if modifications are necessary to maintain the continuity of the predevelopment riparian area within priority sage-grouse habitat. Make modifications where necessary, considering impacts to other water users when such considerations are neutral or beneficial to sage-grouse.
12. Ensure that new and existing livestock troughs and open water storage tanks are fitted with ramps to facilitate the use of and escape from troughs by sage-grouse and other wildlife. Do not use floating boards or similar objects, as these are too unstable and are ineffective. Use BMPs to mitigate potential impacts from West Nile virus.
13. When placing new water developments in sage-grouse breeding habitat, choose sites and designs that will provide the greatest enhancement for sage-grouse and sage-grouse habitat.
14. Avoid new water developments in higher quality native breeding/early brood habitats that have not had significant prior grazing use except in situations in which water developments may aid in better livestock distribution across the allotment and will not adversely impact the species.
15. Identify and when feasible, establish strategically located forage reserves focusing on areas unsuitable for sage-grouse habitat restoration or lower priority habitat restoration areas.
16. Monitor for, and treat invasive species associated with, existing range improvements.
17. Consider initiating vegetative manipulation projects where sagebrush canopy cover exceeds optimal characteristics to promote grass and forb understory growth. These projects should only be undertaken where it can be achieved without negatively impacting the species.

### **Adaptive Grazing Management Response**

BLM will individually analyze those allotments and pastures within the relevant Conservation Area. Given limited agency resources, prioritization will be given to areas that have the potential to provide the greatest benefit to sage-grouse. Allocation of resources should be concentrated on

allotments within the CMA that have declining sage-grouse populations. Following those permits within the CMA, resources will be further prioritized to allotments within the IMA with breeding habitats that have decreasing lek counts. Sage-grouse populations that are stable or trending upward will be a lower priority for permit renewal and the adaptive assessment process. The assessment/determination process for sage-grouse pursuant to Standard 8 will consider published characteristics of sage-grouse habitat and the Ecological Site Descriptions, existing vegetation, habitat inventories/assessments (Stiver et al. 2010), and where available, state and transition models that describe vegetation and other physical attributes for sage-grouse. The related characteristics within the categories shown below will also be included. These characteristics indicate the ability of a given area to provide sage-grouse habitat.

Category 1: The grazing allotment (or any pasture/significant area therein) has the existing vegetation and existing ecological condition (seral state) to provide sage-grouse habitat

Category 2: The grazing allotment (or any pasture/significant area therein) has the ecological potential to provide sage-grouse habitat.

Where an allotment or pasture meets one of these Categories above, the GRSG Habitat Management Objectives will be incorporated into relevant resource management plans as the desired conditions with the understanding that these desired conditions may not be achievable:

- (a) due to the existing ecological condition, ecological potential or the existing vegetation; or
- (b) due to causal events unrelated to existing livestock grazing.

Allotments will only be managed for the primary seasonal habitat that it has the potential to support. Based on these habitat characteristics, BLM will conduct fine and site scale-habitat assessments to help inform grazing management. Where necessary, a determination of factors causing any failure to achieve the habitat characteristics GRSG HMOs will be conducted at a resolution sufficient to document the habitat condition. This determination will include consideration of local spatial and inter-annual variability. A determination of issues attributable to livestock grazing management shall not result from one year of data at a specific location within an allotment. If the process and conditions outlined above demonstrate that livestock grazing is limiting achievement of the habitat characteristics GRSG HMOs, renewed permits will include measures to achieve desired habitat conditions. These measures must be tailored to address the specific management issues associated with seasonal habitat limitations identified in the fine-scale assessments.

## Part V - Travel and Transportation Management Definitions for Use in Anthropogenic Disturbance Calculation

**Roads** are linear routes managed for use by low clearance vehicles having four or more wheels, and are maintained for regular and continuous use.

**Primitive Roads** are linear routes managed for use by four-wheel drive or high-clearance vehicles. They do not normally meet any design standards.

**Trails** are linear routes managed for human-powered, stock, or OHV forms of transportation or for historical or heritage values. Trails are not generally managed for use by four-wheel drive or high-clearance vehicles.

**Linear Disturbances** are human-made linear features that are not part of the designated transportation network are identified as "Transportation Linear Disturbances." These may include engineered (planned) as well as unplanned single and two-track linear features that are not part of the BLM's transportation system.

**Primitive Routes** are any transportation linear feature located within a WSA or lands with wilderness characteristics designated for protection by a land use plan and not meeting the wilderness inventory road definition.

**Temporary routes** are short-term overland roads, primitive roads or trails which are authorized or acquired for the development, construction or staging of a project or event that has a finite lifespan. Temporary routes are not intended to be part of the permanent or designated transportation network and must be reclaimed when their intended purpose(s) has been fulfilled. Temporary routes should be constructed to minimum standards necessary to accommodate the intended use; the intent is that the project proponent (or their representative) will reclaim the route once the original project purpose or need has been completed. Temporary routes are considered emergency, single use or permitted activity access. Unless they are specifically intended to accommodate public use, they should not be made available for that use. A temporary route will be authorized or acquired for the specific time period and duration specified in the written authorization (permit, ROW, lease, contract etc.) and will be scheduled and budgeted for reclamation to prevent further vehicle use and soil erosion from occurring by providing adequate drainage and re-vegetation.

**Administrative routes** are those that are limited to authorized users (typically motorized access). These are existing routes that lead to developments that have an administrative purpose, where the agency or permitted user must have access for regular maintenance or operation. These authorized developments could include such items as power lines, cabins, weather stations, communication sites, spring

### *Maintenance Intensities*

#### **Level 0**

##### Maintenance Description:

Existing routes that will no longer be maintained and no longer be declared a route. Routes identified as Level 0 are identified for removal from the Transportation System entirely.

**Maintenance Objectives:**

- No planned annual maintenance.
- Meet identified environmental needs.
- No preventative maintenance or planned annual maintenance activities.

**Level 1****Maintenance Description:**

Routes where minimum (low intensity) maintenance is required to protect adjacent lands and resource values. These roads may be impassable for extended periods of time.

**Maintenance Objectives:**

- Low (Minimal) maintenance intensity.
- Emphasis is given to maintaining drainage and runoff patterns as needed to protect adjacent lands. Grading, brushing, or slide removal is not performed unless route bed drainage is being adversely affected, causing erosion.
- Meet identified resource management objectives.
- Perform maintenance as necessary to protect adjacent lands and resource values.
- No preventative maintenance.
- Planned maintenance activities limited to environmental and resource protection.
- Route surface and other physical features are not maintained for regular traffic.

**Level 3****Maintenance Description:**

Routes requiring moderate maintenance due to low volume use (for example, seasonally or year-round for commercial, recreational, or administrative access). Maintenance Intensities may not provide year-round access but are intended to generally provide resources appropriate to keep the route in use for the majority of the year.

**Maintenance Objectives:**

- Medium (Moderate) maintenance intensity.
- Drainage structures will be maintained as needed. Surface maintenance will be conducted to provide a reasonable level of riding comfort at prudent speeds for the route conditions and intended use. Brushing is conducted as needed to improve sight distance when appropriate for management uses. Landslides adversely affecting drainage receive high priority for removal; otherwise, they will be removed on a scheduled basis.
- Meet identified environmental needs.
- Generally maintained for year-round traffic.
- Perform annual maintenance necessary to protect adjacent lands and resource values.
- Perform preventative maintenance as required to generally keep the route in acceptable condition.
- Planned maintenance activities should include environmental and resource protection efforts, annual route surface.
- Route surface and other physical features are maintained for regular traffic.

**Level 5**

## Maintenance Description:

Route for high (maximum) maintenance due to year-round needs, high volume of traffic, or significant use. Also may include route identified through management objectives as requiring high intensities of maintenance or to be maintained open on a year-round basis.

## Maintenance Objectives:

- High (Maximum) maintenance intensity.
- The entire route will be maintained at least annually. Problems will be repaired as discovered. These routes may be closed or have limited access due to weather conditions but are generally intended for year-round use.
- Meet identified environmental needs.
- Generally maintained for year-round traffic.
- Perform annual maintenance necessary to protect adjacent lands and resource values.
- Perform preventative maintenance as required to generally keep the route in acceptable condition.
- Planned maintenance activities should include environmental and resource protection efforts, annual route surface.
- Route surface and other physical features are maintained for regular traffic.

## Appendix G – Anthropogenic Disturbance and Adaptive Management

### Part I – Baseline Map and Description of Development

The **biologically significant units (BSUs)** are geographical/spatial areas within Greater Sage-grouse habitat that contains relevant and important habitats which is used as the basis for comparative calculations to support evaluation of changes to habitat. The BSUs include all land ownerships for evaluation, although application of the anthropogenic disturbance cap is specific only to BLM and Forest Service lands. The BSUs are used in the evaluation of anthropogenic disturbance and in the adaptive management habitat trigger.

For the Idaho and Southwestern Montana Greater Sage-Grouse Plan Amendment EIS the biologically significant units are defined as:

*Idaho: All of the modeled nesting<sup>1</sup> and delineated winter habitat, which is based on 2011 data, occurring within Priority and/or Important Habitat Management Areas within individual Conservation Areas<sup>2</sup>*

*Montana: All of the Priority Habitat Management Area*

These BSUs form the geographic basis for the calculation of anthropogenic disturbance and in the soft and hard adaptive management habitat triggers.

While the BSUs define the geographic extent and scale of the Subregion's landscape that will be considered in evaluating anthropogenic disturbance and the adaptive management habitat triggers, how disturbance and habitat triggers are calculated differ since anthropogenic disturbance and habitat loss affect Greater Sage-grouse differently (Knick et al. 2013).

The BSU is the total area (acreage) of nesting and wintering habitat within Priority or Important Habitat Management Areas, separately, by each Conservation Area. For Idaho this results in 8 BSUs, 2 each within the Idaho Conservation Areas – 1 in Priority Habitat Management Areas and 1 in Important Habitat Management Areas. There is 1 BSU in southwest Montana and 1 BSU for the Utah portion of the Sawtooth National Forest (Raft River BSU). There are a total of 10 BSUs within the Idaho and Southwestern Montana Subregion as shown in Map-G-1.

In developing these BSUs it was determined at the subregional level that data from these units must be compatible with aggregation to the PAC and WAFWA Management Zone levels, in order to meet FWS needs. In addition, BSUs must be edge matched/aligned with neighboring states. All sub-regions acknowledge there may be locally important biologically significant units smaller than PACs which may or may not be rolled up to PAC level. The Subregions also acknowledge that assessing disturbance at larger scales such as certain PACs, or via rollup of data, provides a baseline metric for future comparison, but dilution may likely mask disturbance concerns occurring at more local scales.

<sup>1</sup> Modeled nesting habitat is defined as those areas of Priority or Important Habitat Management Areas within 6.2 miles of 2011 active leks.

<sup>2</sup> The Utah portion of the Sawtooth National Forest is calculated separately for the Southern Conservation area.

The application of these calculations requires certain assumptions and associated baseline values which set an appropriate benchmark for future comparison.

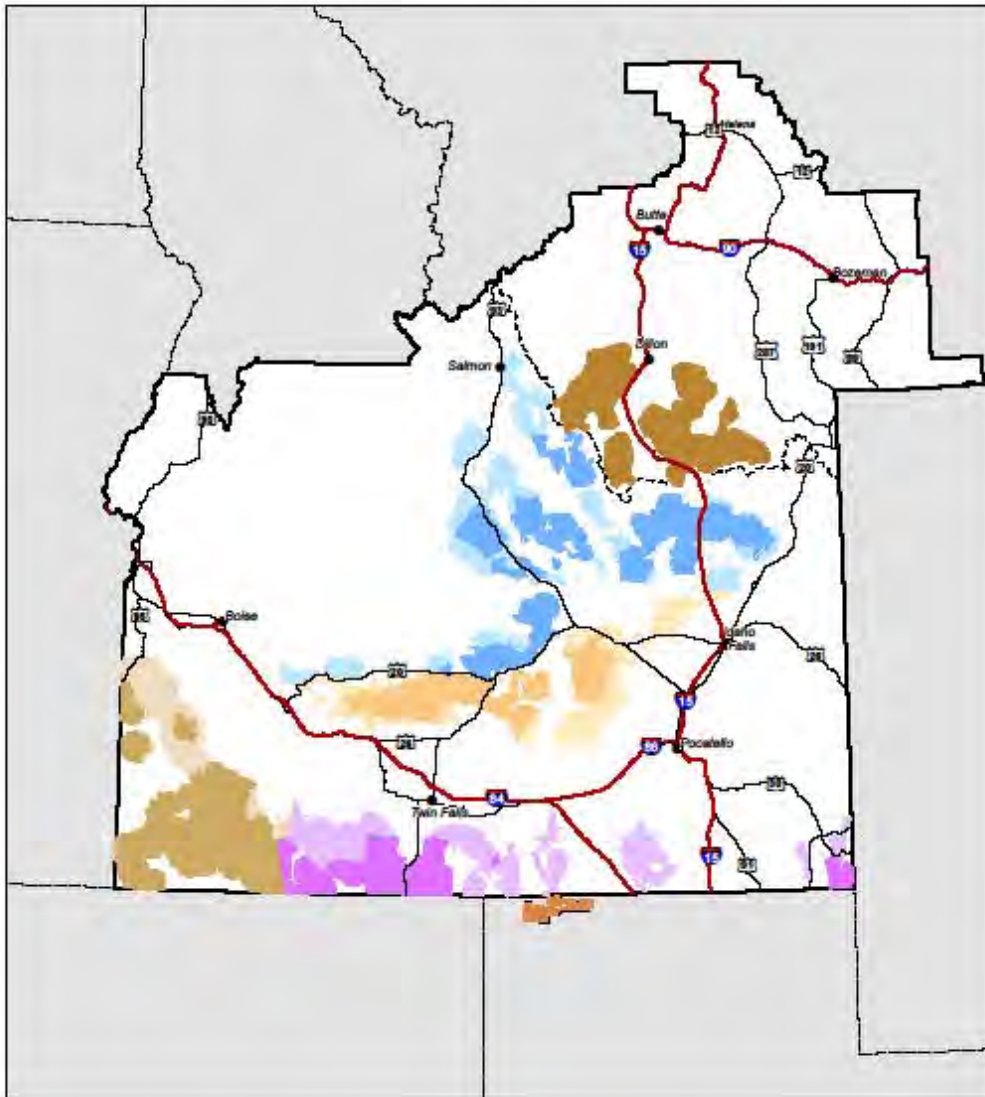

For the adaptive management evaluation in Idaho the baseline year for comparison of both the population and habitat values is set at 2011. Sage-grouse have been monitored by counting males on leks since the 1950's (IDFG files). Average male lek attendance (statewide average) reached a low point in 1996 (IDFG in file). A more consistent and intensified survey of leks began with the annual monitoring of all 78 lek routes across southern Idaho in 1996. Average male lek attendance has fluctuated since 1996 (Figure G-1) in response to favorable or unfavorable conditions (e.g. weather, habitat improvements or loss, and West Nile virus). Peaks were in 2000, 2006, and 2011 with low points in 2002 and 2009. The increase in male lek attendance after previous declines indicates that sage-grouse populations can rebound over a relatively short time frame (e.g. 5 years) given desirable conditions. The baseline was set at the 2011 average number of males because this level is approximately the medium (8 higher and 7 lower years) of the counts between 1996-2011. At the statewide scale, the 2011 baseline allows 10% and 20% population triggers to be above the second lowest point in 2009. Application of the trigger at a smaller (Conservation Area) scale is a more conservative approach that will indicate potential trends sooner than if applied at the state-wide scale.

Figure G-1. Idaho Trend in Male Sage-grouse Lek Attendance.

**Part II – Anthropogenic Disturbance Calculation**

The specific formula for the percent of anthropogenic disturbance is defined by:

*Disturbance Percentage*

$$= \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}}{\text{Acres within the BSU} * \left( \frac{\text{Acres of Effective Habitat within the BSU}}{\text{Acres within the BSU}} + 0.3 \right)} \right) \times 100$$

The BSU in the denominator represents the total area (acreage) of the applicable area of analysis. Each BSU is tracked and evaluated separately within each of the 10 BSUs, and reaching the 3% disturbance cap in any one BSU has specific management implications both within and beyond that specific BSU as described in the Proposed Plan.

All sub-regions within the Great Basin Region will use the same types of disturbances for fine/site scale monitoring as were used for broad and mid-scale analysis and would use local data and/or more current satellite imagery if available.

Anthropogenic Disturbance included in the numerator is shown in Table G-1.

Table G-1. Anthropogenic Disturbances and Areas of Impact

Datasets as Described in the Monitoring Framework <sup>3</sup>	Source	Spatial Extent
Oil and Gas Wells and Development Facilities	HIS; BLM (AFMSS)	5.0 ac
Coal Mines	BLM; USFS; Office of Surface Mining Reclamation and Enforcement; USGS Mineral Resource Data System	Polygon Area
Wind Towers	Federal Aviation Administration	3.0 ac
Solar Fields	Platts (power plants)	7.3 ac
Geothermal Development Facilities	IHS	3.0 ac or Polygon Area
Mining (Active Locatable, Leasable and Saleable Developments)	InfoMine	5.0 ac or Polygon Area
Roads <sup>4</sup>	ESRI StreetMap Premium	40.7 ft. (surface streets) 84.0 ft. (major roads) 240.2 ft. (Interstate Hwys.)
Railroads <sup>5</sup>	Federal Railroad Administration	30.8 ft.
Powerlines <sup>6</sup>	Platts	100 ft. (1-199kV)

<sup>3</sup> Taken from Table 6 – GRSG Monitoring Framework.

<sup>4</sup> Values described for line features – roads; railroads; powerlines – represent associated widths centered on the line feature.

<sup>5</sup> See previous note.

<sup>6</sup> See previous note.

Datasets as Described in the Monitoring Framework <sup>3</sup>	Source	Spatial Extent
		150 ft. (200-399kV) 200 ft. (400-699kV) 250 ft. (700+kV)
Communication Towers	Federal Communications Commission	2.5 ac
Other Vertical Structures	Federal Aviation Administration	2.5 ac
Additional Local Datasets (need definitions)		
Underground Pipelines		
Coal Bed Methane Ponds		
Meteorological Towers	BLM; Federal Communications Commission	2.5 ac
Nuclear Energy Facilities	As Available	Polygon Area
Airports	Federal Aviation Administration	Polygon Area
Military Ranges (ground based?)		
Hydropower plants		
Recreation Areas (Developed)	BLM data	Polygon Area

The following data sets would *not* be used to calculate anthropogenic disturbance, but would be used in the habitat baseline to estimate habitat availability or the amount of sagebrush on the landscape within biologically significant units.

1. Habitat treatments
2. Wildfire
3. Invasive plants
4. Conifer encroachment
5. Agriculture
6. Urbanization, Ex-urban and rural development

***Travel and Transportation Disturbance in Sage-Grouse Habitat***

The following would count as disturbance (see Part V for definitions):

- Linear transportation features identified as roads that have a maintenance intensity of 3 or 5
- Linear transportation features identified as primitive roads, temporary routes, or administrative routes that have a functional classification and a maintenance intensity of level 3 or 5

**Non-Disturbance**

The following items would not count as disturbance:

- Linear transportation features identified as trails.
- Linear transportation features identified as primitive roads, temporary routes, or administrative routes that have a maintenance intensity of either level 0 or 1.
- Linear transportation features identified as primitive routes.
- Linear disturbances.

### *Derivation of the Disturbance Formula -*

There is no definitive and scientifically proven formula to determine impact to GRSG from disturbance described in current research. However, Knick et al. (2013) did describe certain relationships between GRSG and anthropogenic disturbance that have been used, in conjunction with specific assumptions to describe a mathematical relationship between human disturbance footprint, effective GRSG habitat and effects to GRSG.

The variables in the equation are defined as:

- Acres of a Biologically Significant Unit (BSU)
- Acres of Anthropogenic Development within the BSU
- Acres of Effective GRSG Habitat (sagebrush) within the BSU

Knick et al. (2013) defined their unit of comparison (analogous to a biologically significant unit) as an area within 5 km of the lek. Within this area they also found that 79% of this area contained sagebrush (analogous to effective GRSG habitat). Results of the study show that “Ninety-nine percent of active leks were in landscapes with <3% developed”. This shows that when areas within 5 km of a lek containing 79% sagebrush were 3% developed there was a measurable effect on the presence of GRSG – this defines a disturbance threshold of 3% at which point GRSG are affected. Knick et al. developed a habitat similarity relationship between the proportion of leks and percent of sagebrush which shows the highest proportion of leks when sagebrush percentage is between 70-90% (Knick et al. 2013, Figure 5, Connelly et al. 2000, Wisdom ???). Above 90% and below 70% the proportion of leks is reduced. This helps define the optimum range for sagebrush at between 70-90% and also indicates that the disturbance threshold of 3% is also dependent upon and varies with the percent of sagebrush present (effective habitat).

These findings from Knick et al. (2013) help define some mathematical parameters to define a modeled relationship between disturbance, effective habitat and effects to GRSG. Figure G-2 illustrates three different ‘disturbance curves’ that reflect the relationship between disturbance (y-axis) and effective habitat (sagebrush percentage) (x-axis) when the footprint disturbed is equivalent to 3% of the area. The red boxes (A) represent the conceptual relationship between disturbance and effective habitat as described and interpreted from Knick et al. (2013). The blue diamonds (B) represent a simple calculation based only on disturbance footprint, without regard to effective habitat. The green triangles (C) represent the derived formula to model the relationship.

The ‘A’ disturbance curve shows that when the disturbance footprint is 3% of the area and the sagebrush percentage is between 70-90% the disturbance calculation would be 3. When sagebrush percent falls below 70% or rises above 90%, the change in habitat, even without a change in disturbed footprint would begin to affect the presence of GRSG. As the amount of sagebrush declines while disturbance remains the same there would be an increasing effect to GRSG presence. This disturbance curve is conceptual and Knick et al. (2013) does not explicitly define this relationship, although this relationship does reflect numerical the observations described in Knick et al. (2013).

The ‘B’ disturbance curve is a straight calculation based only on disturbed footprint over a specified area. It does not account for variability of sagebrush percentage, and the only variable is the acres of disturbance. For an area that is 3% disturbed the relationship ‘curve’ is a flat line at 3, regardless of sagebrush percentage. This ‘curve’ or calculation would match the conceptual curve when sagebrush percentage is between 70 and 90%. This calculation would not account for changes in effective habitat due to loss through fire or gain through restoration and rehabilitation.

The ‘C’ disturbance curve models and approximates the conceptual relationship described in Knick et al. (2013). It accounts for changes in effective habitat that would translate into variable effects to GRSG based on loss or gain of habitat. It includes the ability to consider habitat loss such as from fire and to consider habitat gain such as from rehabilitation efforts including conifer removal. The model matched the conceptual relationship in the range of 70% sagebrush and approximates the conceptual relationship in areas with more or less sagebrush cover. The conceptual relationship assumes a more exponential relationship to GRSG effects from loss of habitat, while the derived formula assumes a more linear relationship. There are no available scientific studies that more clearly define the nature of the relationship. The derived formula and the conceptual relationship are substantially similar from 35-90% sagebrush percentage to validate the derived formula’s relative approximation of the relationship.

Figure G-2. Disturbance Relationships

**Development of the Modeled Formula:**

In order to manage and apply a defined disturbance cap it is necessary to take the findings of the appropriate scientific research and utilize them as appropriately as possible to develop management strategies and evaluation techniques consistent with the management objective. Most scientific research is not completed with the intent to develop specific management objectives or approaches; however, it is through the management approaches that the scientific findings utilized to inform management.

Development of the modeled formula began by describing the simplest relationship of disturbance across a defined area by defining the disturbance percentage as:

$$\% \text{ Disturbance} = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}}{\text{Acres within Area of Concern}} \right) * 100$$

This accounts for disturbance, but does not account for changes in effective habitat or sagebrush percentage as described in Knick et al. (2013). To account for effective habitat the formula needs to include a term that adjusts the resulting calculation with regard to effective habitat. This should be reflected as an adjustment to the denominator (acres within area of concern). The denominator would be weighted based on the amount of effective habitat. In mathematical terms this would give a denominator of:

$$(\text{Acres within Area of Concern}) * (\text{Adjustment Based on Effective Habitat})$$

The adjustment term must equal 1.0 when the effective habitat is somewhere between 70-90% as described in Knick et al. (2013). Assuming the adjustment term is related to the relative percentage of sagebrush or effective habitat then the *Adjustment Based on Effective Habitat* could be expressed as:

$$\frac{\text{Acres of Effective Habitat within the Area of Concern}}{\text{Acres within the Area of Concern}}$$

However, this term does not equal 1.0 when effective habitat is less than 100%. In order to meet the requirement of equaling 1.0 a constant must be added. This constant, when added to the percentage calculated in the previous term must equal 1.0 when the *Acres of Effective Habitat within the Area of Concern* is somewhere between 70-90%. In the Idaho and Southwestern Montana Subregional Plan an objective of 70% effective habitat has been defined, which is consistent with Knick et al. (2013). If the objective is 70% then the constant that must be added to this term is 0.3 in order to meet the requirement of equaling 1.0 at 70% effective habitat. This defines the following derived formula that approximates the conceptual relationship described in Knick et al. (2013).

*Disturbance Percentage*

$$= \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance within Area of Concern}}{\text{Acres within the Area of Concern} * \left( \frac{\text{Acres of Effective Habitat within the Area of Concern}}{\text{Acres within the Area of Concern}} + 0.3 \right)} \right) * 100$$

**Scale:**

The particular scale for which this formula is calculated is defined by the Area of Concern. The Knick et al. (2013) used a study area defined by the area within 5 km of an individual lek. The disturbance relationships described previously are applicable at this scale and begin to break down or lose their integrity at greater distances from the lek (18 km). This concern, coupled with limited availability of consistent data across broader areas undermines the reliability and accuracy of the calculation when including areas more distant from the lek.

From a management perspective there is a need to address concerns at the broader scale to help manage those threats before they become a concern at the site specific scale. In Idaho, nesting location data collected by Idaho Department of Fish and Game (IDFG), shows that most nesting habitat occurs

within 6.2 miles (10 km) of the lek. IDFG has also collected telemetry data on GRSG movements and used this data to help define wintering areas. Nesting and wintering areas are the most limited and seasonal habitats in Idaho and additional disturbance in those areas could have impacts to GRSG presence. For these reasons the Area of Concern, referred to as the Biologically Significant Unit have been delineated to include nesting and wintering habitats. This results in areas that include more acres than just those associated within a 5 km area of an individual lek as described by Knick et al. (2013), but that are associated (within 6.2 miles or 10 km) with leks. While the Knick et al. (2013) study did not include winter habitat, because of their relative importance they have also been included as part of the BSU since conceivably disturbances that would cause lek abandonment would also likely cause abandonment or avoidance of other seasonal habitat areas. Using other administratively defined areas not delineated or based on specific GRSG use may undermine the utility and integrity of the disturbance relationship and calculation.

This approach, built upon the findings in Knick et al. (2013), uses those findings to help inform management at a broader scale that would help determine management actions based on disturbance evaluations. Using the BSU as the Area of Concern is a scale larger than described in Knick et al. (2013), but still within the predictive bounds described in that study. The formula can be used to calculate disturbance at the BSU scale to help inform a disturbance cap, and it can also be used at the site or project scale to help inform specific project activities.

**Example 1 – Anthropogenic Disturbance**

In the Southern Conservation Area the Priority BSU was delineated to include 784,958 acres and the Important BSU was delineated to include 1,036,455 acres, which represent the acres of the Biologically Significant Unit to be used in the denominator. The acres of Effective Habitat in the Priority BSU are 424,656 and in the Important BSU are 447,497. This sets up two equations – one for Priority Habitat Management Areas and one for Important Habitat Management Areas.

The existing footprint acres of disturbance within the Priority BSU are 17,661 acres and the footprint acres of disturbance within the Important BSU are 12,748 acres.

This gives the following two equations to define the baseline disturbance condition in the BSUs:

$$Priority = \frac{17661}{(784958 * (\frac{424656}{784958}) + 0.3)} * 100$$

$$Or \left( \frac{17661}{784958 * (0.54) + 0.3} \right) * 100$$

$$Or \left( \frac{17661}{784958 * (0.84)} \right) * 100$$

Yielding a percent disturbance in the Priority BSU of 2.68%

$$Important = \frac{12748}{(1036455 * (\frac{447497}{1036455}) + 0.3)} * 100$$

Yielding the percent disturbance in the Important BSU of 1.68%

If by 2015 we project additional development within the Priority BSU to be 2120 acres (a 12% increase) and development within the Important BSU to be 4000 acres (a 30% increase) then the Priority footprint acres becomes 20,161 acres and the Important footprint acres becomes 16,748 acres. The resulting evaluation for this cumulative disturbance is calculated by:

$$Priority = \frac{19781}{(784958 * (\frac{424656}{784958}) + 0.3)} * 100 \quad Important = \frac{16748}{(1036455 * (\frac{447497}{1036455}) + 0.3)} * 100$$

Yielding the percent disturbance as: Priority = 3.00% and Important = 2.21%

In the examples, given the existing disturbance footprint it would require development of an additional 2,120 acres in the Priority BSU and an additional 10,005 acres in the Important BSU before the 3% cap would be engaged.

### Part III - Adaptive Management

#### Adaptive Management Habitat Trigger-

The specific formula for the change in habitat for the habitat trigger is defined by:

Within Idaho and Utah all factors are measured within the modeled nesting and wintering habitat within Priority or Important Habitat Management Areas (calculated separately) by Conservation Area; in Southwest Montana all factors are measured within the Priority Habitat Management Area.

In simple description the adaptive management habitat trigger calculation is the percentage of Effective Habitat (defined as areas of generally intact sagebrush that provide Greater sage-grouse habitat during some portion of the year) within modeled nesting and wintering areas within Priority or Important Habitat Management Areas by Conservation Area within a particular year when compared to the Effective Habitat within modeled nesting and wintering areas within Priority or Important Habitat Management Areas by Conservation Area as of the 2011 baseline. Using Effective Habitat as the metric of comparison removes non-habitat acres from the calculation. The calculation is evaluated within both Priority and Important Habitat Management Areas separately within each of the 10 BSUs.

For purposes of evaluating the adaptive management habitat triggers, Effective Habitat in Idaho is tracked using the Key Habitat Map which is updated annually by BLM in coordination with IDFG, Forest Service, US FWS and Local Working Groups and tracks the areas of generally intact sagebrush providing Greater sage-grouse habitat during some portion of the year. Effective habitat equates to areas described as Key Habitat on the Key Habitat Map. Appendix F contains a description of the Key Habitat Map maintenance and update process including the inclusion of disturbances from fire and temporary disturbances and habitat restoration/rehabilitation. **For Montana and Utah Effective Habitat is based on...**

Factors: EHP(Y) – where Y is the year and EHC is the acres of Effective Habitat for that year within the baseline 2011 nesting and wintering areas within the Priority Habitat Management Area by Conservation Area

EHI(Y) - where Y is the year and EHI is the acres of Effective Habitat for that year within the baseline 2011 nesting and wintering areas within the Important Habitat Management Area by Conservation Area

ADP(Y) – where Y is the year and AD is the acres of anthropogenic disturbance within Effective Habitat for that year within the 2011 nesting and wintering areas within the Priority Habitat Management Area by Conservation Area

ADI(Y) – where Y is the year and AD is the acres of anthropogenic disturbance within Effective Habitat for that year (Y) within the baseline 2011 nesting and wintering areas within the Important Habitat Management Area by Conservation Area

EHP(2011) – the Effective Habitat within the baseline 2011 nesting and wintering areas within the Priority Habitat Management Area by Conservation Area

EHI(2011) - the Effective Habitat within the baseline 2011 nesting and wintering areas within the Important Habitat Management Area by Conservation Area

ADP(2011) – the acres of anthropogenic disturbance within Effective Habitat within the baseline 2011 nesting and wintering areas within the Priority Habitat Management Area by Conservation Area

ADI(2011) – the acres of anthropogenic disturbance within Effective Habitat within the baseline 2011 nesting and wintering areas within the Important Habitat Management Area by Conservation Area

Formulas:

$$\text{Priority Habitat Management Area} = 100 - \left( \frac{EHP(Y) - ADP(Y)}{EHP(2011) - ADP(2011)} \right) * 100$$

$$\text{Important Habitat Management Area} = 100 - \left( \frac{EHI(Y) - ADI(Y)}{EHI(2011) - ADI(2011)} \right) * 100$$

When this calculation equals or exceeds 10 then an adaptive trigger has been engaged as per AM-7 & AM-8.

Tables 2-7 describe the acreages associated with the BSUs by Conservation Area for the Idaho and Southwestern Montana Subregion. The tables contain values for the entire BSU (Priority and Important), including all ownerships, acres of effective habitat within the BSUs and acres of anthropogenic disturbance within the BSUs.

These values will be used to provide several examples applying the anthropogenic disturbance and adaptive management habitat trigger evaluations. These are for illustrative purposes and do not represent an actual evaluation of ground conditions.

**Example 2 – Adaptive Management – Habitat**

In the Southern Conservation Area the Priority BSU was delineated to include 784,958 acres, of which 424,656 acres were Effective habitat; therefore EHP(2011) is equal to 424,656 acres. Development within the Effective Habitat in 2011 was measured at 10,074 acres; therefore ADP(2011) is equal to 10,074 acres.

If in 2015 we project a cumulative loss of 42,000 Effective habitat acres due to wildfire (10% loss) and an additional 1000 acres of anthropogenic development (10% increase), then

EHP(2015) is equal to 424,656 – 42,000 or 382,656 and ADP(2015) is equal to 10,074+1000 or 11,074. The evaluation for the adaptive management trigger is calculated by:

$$100 - \left( \frac{382656 - 11074}{424656 - 10074} \right) * 100$$

This simplifies to:  $100 - \left( \frac{371582}{414582} \right) * 100$

Or  $100 - (0.896 * 100)$

Or  $100 - 89.6$

Or  $10.4 -$  equivalent to 10.4%

This evaluation shows a loss of greater than 10 percent and less than 20 percent which would engage the soft habitat trigger as described in AM-8 and not the hard habitat trigger described in AM-7.

### **Soft Trigger Considerations and Implementation Actions**

The Sage-Grouse Implementation Task Force, in coordination with BLM and Forest Service would utilize monitoring information to assess when triggers have been tripped. When information indicates that the soft habitat or population trigger may have been tripped, a Sage-Grouse Implementation Task Force, in coordination with BLM and Forest Service - aided by the technical expertise of IDF&G - would assess the factor(s) leading to the decline and identify potential management actions. The Sage-Grouse Implementation Task Force may consider and recommend to BLM possible changes in management to the PHMA. As to the IHMA, the Sage-Grouse Implementation Team may review the causes for decline and potential management changes only to the extent those factors significantly impair the state's ability to meet the overall management objective. It is anticipated IDF&G will collect data annually and will make recommendations to the Implementation Team by August 31st for population triggers and January 15th for habitat triggers.

Only where the monitoring information indicates the cause(s) of the decline is not a primary threat will the Sage-Grouse Implementation Task Force analyze the secondary threats to the species and determine whether further management actions are needed.

### **Adaptive Management Population Trigger**

#### **Framework**

#### **Population & Habitat Trigger Justification**

##### Triggers

Because unexpected events (e.g., wildfire, West Nile Virus) may result in a substantial loss of habitat or decline in sage-grouse populations, adaptive management triggers have been

developed. These triggers are intended to improve sage-grouse population trends, protect the overall baseline population, preserve a buffer population, and conserve sage-grouse habitat.

The triggers have both population and habitat components. Population components consider population growth and change in lek size. The habitat component considers loss of breeding and/or winter habitat. Lek size has been related to population change in numerous studies (Connelly and Braun 1997, Connelly et al. 2004, Baumgart 2011, Garton et al. 2011). Garton et al. (2011) used both characteristics as well as number of active leks to assess change for sage-grouse populations throughout the west. A variety of researchers (Swensen et al. 1987, Connelly et al. 2000a, Miller et al. 2011) have shown that loss of winter or breeding habitats resulted in decreased sage-grouse populations. The adaptive management triggers set at a lambda value less than one, a 20% decline in males counted on lek routes, and a 20% loss of breeding or winter habitat as break points that would initiate a population or habitat trigger.

### Population Growth (Finite Rate of Change)

Although populations cannot be accurately estimated, lek counts of males provide a robust method for assessing population trend and estimating population growth ( $\lambda$ ) in an unbiased fashion. Calculating  $\lambda$  (finite rate of change) between successive years for a sage-grouse population is described in Garton et al. (2011). The ratio of males counted in a pair of successive years estimates the finite rate of change ( $\lambda_t$ ) at each lek site in that one-year interval. These ratios can be combined across leks within a population for each year to estimate  $\lambda_t$  for the entire population (or Conservation Zone) or combined across all leks to estimate  $\lambda_t$  for the state between successive years as:

$$\lambda(t) = \frac{\sum_{i=1}^n M_i(t+1)}{\sum_{i=1}^n M_i(t)}$$

where  $M_i(t)$  = number of males counted at lek  $i$  in year  $t$ , across  $n$  leks counted in both years  $t$  and  $t+1$ . Ratio estimation under classic probability sampling designs—simple random, stratified, cluster, and probability proportional to size (PPS)—assumes the sample units (leks counted in two successive years in this case) are drawn according to some random process but the strict requirement to obtain unbiased estimates is that the ratios measured represent an unbiased sample of the ratios (i.e., finite rates of change) from the population or other area sampled. This assumption seems appropriate for leks and the possible tendency to detect (or count) larger leks than smaller leks does not bias the estimate of  $\lambda_t$  across a population or region (Garton et al. 2011), but makes it analogous to a PPS sample showing dramatically increased precision over simple random samples (Scheaffer et al. 1996). Also precision can be estimated for  $\lambda$ .

Because small game populations (including sage-grouse) typically fluctuate among years due to weather and other environmental variables, a  $\lambda_t$  for any given year is not very meaningful. However, a series of years where  $\lambda_t$  remains at or above 1.0 indicates a stable to increasing

population. Moreover, this situation would also provide strong evidence of the effectiveness of conservation actions that may have been employed.

Definition of “Significance” for Hard Population Trigger:

The Governor’s Alternative (E) did not define criteria for “significantly less than 1.0”. For purposes of the Plan, IDFG proposes to use a 90% confidence interval around the current 3-year average of  $\lambda$  to evaluate whether  $\lambda$  is significantly less than 1.0. If the 90% confidence interval is less than and does not include 1.0, then  $\lambda$  is significantly less than 1.0. The  $\lambda$  and variance will be calculated following Garton et al. (2011). A 90% confidence interval is justified because:

1. Under a 90% confidence interval the probability of making a false conclusion is 10%, however, the error will be on the conservative side; i.e., the error would benefit the sage-grouse population.
2. The  $\lambda$  criteria would not be used alone; as stated in the ADPP,  $\lambda$  would be used in concert with trend in maximum number of males.

### Males Counted on Leks

Lek attendance by males has been used as an indicator of population trend in some areas since at least the early 1950s. For many years it was the only indicator used to assess status of sage-grouse populations. However, recent research has shown that male attendance at leks can be affected by severity of the previous winter, weather, timing of counts during spring, and a variety of other factors (Emmons and Braun 1984, Hupp 1987, Baumgart 2011). Baumgart (2011) indicated the probability of male sage-grouse attending leks in south-central Idaho varied among years and appeared to be tied to winter severity. Although lek data provide a powerful data set for assessing population trends over time (Garton et al. 2011), counts for a single year may not reflect trends very well. Thus using lek counts as a trigger must consider the inherent variation in these counts. Moreover, males counted on leks appear to have the most value for assessing population change when used in conjunction with other indicators of population status (e.g., finite rate of change).

Emmons and Braun (1984) reported that lek attendance rates varied from 86% for yearling males to 92% for adult males. These rates were pooled over 5 day periods and may have overestimated attendance (Connelly et al. 2011). In contrast, Walsh et al. (2004) reported average daily male attendance rates of 42% (range = 7-85%) and 19% (range = 0-38%) for adult and yearling sage-grouse, respectively but these rates were not adjusted for detection rate and were likely biased low (Connelly et al. 2011). Moreover, this study involved very small sample sizes (17 adult males, 9 yearling males over 15 leks) and only one breeding season and it was not clear whether all leks in the study area were known and sampled. Preliminary data from Utah (D. Dahlgren, personal communication) indicated that in a study area about 30 miles south of Idaho male sage-grouse lek attendance rates varied from roughly 60% at the beginning of April to about 90% at the end of the month. Recent findings in Idaho (Baumgart 2011) predicted the probability of lek attendance for an adult male following an “average” winter would range from 0.894 (SE = 0.025) on week 3 (~1 April) to 0.766 (SE = 0.040) on week 8 (~ 5 May). Published information suggests that a change in maximum number of males counted on leks of say 10-15% cannot confidently be considered a reflection of population status. However, a 20% decline in

maximum number of males counted on leks would likely not be related to lek attendance patterns but instead would reflect a population decline. Thus, the trigger was set at 20%.

Habitat Trigger

Numerous studies have documented the negative effects of habitat loss including fire and energy development on sage-grouse (Connelly et al. 2000b, Fischer et al. 1996, Nelle et al. 2000, Doherty et al. 2008), but few studies have related the amount of sagebrush habitat lost to population change. In a Montana study area with a non-migratory sage-grouse population, there was a 73% decline in breeding males after 16% of the study area was plowed (Swenson et al. 1987). Walker et al. (2007) indicated that the lowest probability for lek persistence within a landscape occurred where, within 6.4 km of a lek center, the area has < 30% sagebrush. Similarly, Wisdom et al. (2011) reported sage-grouse occupying landscapes with <27% sagebrush as dominant cover would have a low probability of persistence. Connelly et al. (2000a) showed that a fire in 1989 that removed 58% of the sagebrush cover in sage-grouse breeding and winter habitat led to an almost 95% decline in the breeding population a few years later. Similarly, a fire that removed about 30% of breeding/winter habitat resulted in substantial population declines over the next few years (J. W. Connelly, unpublished data; Table 1). A 30% loss of breeding and winter habitat is thus far the lowest amount of habitat loss for which a population response could be detected and landscapes with < 30% area in sagebrush within 6.4 km of lek center have the lowest probability of lek persistence. Idaho is taking a more conservative approach than suggested by the literature. A soft trigger is set at a 10% loss of breeding or winter habitat in Core or Important management zones of a Conservation Area, which initiates a review of the management approach. A hard trigger is set at a 20% loss of breeding or winter habitat within a Core Habitat Zone of a Conservation Area, which automatically causes a change in management status of the corresponding Important Habitat Zone.

Table 1. Nest success (%) in SE Idaho study areas before and after a fire in the Table Butte study area. The fire occurred in August 2000.

Year	Area	
	Table Butte	Upper Snake
1999	54	
2000	45	61
2001 <sup>a</sup>	18	56
2002	20	65

### **Potential Implementation Level Actions to Consider in the Event Soft Trigger Criteria are Met**

- ✓ Increase monitoring and evaluation of sage-grouse populations in Priority Habitat Management Area (area of concern).
- ✓ Implement Priority Habitat Management Area management strategy in corresponding Important Habitat Management Area of the same Conservation Area.
- ✓ Implement Priority Habitat Management Area RDFs in corresponding Important Habitat Management Area of the same Conservation Area.
- ✓ Not allow any new (large) infrastructure development within the Priority Habitat Management Area (no exceptions allowed).
- ✓ Reallocate resources to focus on primary threats in the Priority Habitat Management Area (e.g. direct resources from other parts of the state to the area of concern).
- ✓ Reallocate resources to focus on secondary threats in the Priority Habitat Management Area (e.g. direct resources from other parts of the state to the area of concern).
- ✓ Apply Priority Habitat Management Area criteria for all primary threats, and/or all secondary threats to the Important Habitat Management Area.
- ✓ Reallocate resources to focus on primary threats in the Important Habitat Management Area (e.g. direct resources from other parts of the state to the area of concern).
- ✓ Reallocate resources to focus on secondary threats in the Important Habitat Management Area (e.g. direct resources from other parts of the state to the area of concern).

### **If Livestock Grazing is determined to be a Causal Factor Consider the Following Measures:**

1. Employ grazing management systems that ensure adequate nesting and early brood rearing habitat within the breeding landscape.
2. When use-pattern mapping or monitoring demonstrates an opportunity to adjust livestock distribution to benefit occupied sage-grouse breeding habitat, include as appropriate herding, salting, and water-source management (e.g., turning troughs/pipelines on/off, extending pipelines/moving troughs) in grazing programs.
3. If available and feasible, utilize exotic perennial grass seedings and/or annual grasslands to avoid breeding season of use of occupied sage-grouse habitat.

4. Modify authorized seasons of use within grazing permits to provide greater flexibility in managing livestock for the benefit of sage-grouse.
5. Where appropriate, maintain residual herbaceous vegetation at the end of the growing/grazing season to contribute to nesting and brood-rearing habitat during the coming nesting season. Table 5.
6. Insure that permittees are informed of management and movement requirements related to avoidance of recent burns, rehabilitation seedings or other restoration sites.
7. Manage grazing of riparian areas, meadows, springs, and seeps in a manner that promotes vegetative structure and composition appropriate to the site. In some cases enclosure fencing may be a viable option. However, recognize the availability and quality of desired herbaceous species may be improved by periodic grazing use of the enclosure.
8. Implement management actions (grazing decisions, allotment management plan/conservation plan development, or other agreements) to modify grazing management to meet seasonal sage-grouse habitat requirements. Employ proper grazing management by providing flexibility in scheduling the intensity, timing, duration and frequency of grazing use over time that best promotes management objectives. During drought periods, prioritize evaluating effects of drought in the CMA relative to grouse needs for food and cover. Ensure that post-drought management allows for vegetation recovery that meets sage-grouse needs in priority sage-grouse habitat areas.
9. When using salt or mineral supplements: a) place them in existing disturbed sites, areas with reduced sagebrush cover—e.g., seedings or cheatgrass sites—to reduce impacts to sage-grouse breeding habitat, b) where feasible use salts or mineral supplements to improve management of livestock for the benefit of sage-grouse habitat.
10. In general, avoid constructing new fences within 2 km of occupied leks. Where feasible, place new, taller structures, such as corrals, loading facilities, water-storage tanks, windmills, etc., at least 2 km from occupied leks to reduce opportunities for perching raptors. Careful consideration, based on local conditions, should also be given to the placement of new fences or structures near other important seasonal habitats (winter-use areas, movement corridors etc.) to reduce potential impacts.
11. New spring developments in sage-grouse habitat should be designed to maintain or enhance the free-flowing characteristics of springs and wet meadows. Analyze developed springs, seeps and associated pipelines to determine if modifications are necessary to maintain the continuity of the predevelopment riparian area within priority sage-grouse habitat. Make modifications where necessary, considering impacts to other water users when such considerations are neutral or beneficial to sage-grouse.
12. Ensure that new and existing livestock troughs and open water storage tanks are fitted with ramps to facilitate the use of and escape from troughs by sage-grouse and other wildlife. Do not use floating boards or similar objects, as these are too unstable and are ineffective. Use BMPs to mitigate potential impacts from West Nile virus.
13. When placing new water developments in sage-grouse breeding habitat, choose sites and designs that will provide the greatest enhancement for sage-grouse and sage-grouse habitat.
14. Avoid new water developments in higher quality native breeding/early brood habitats that have not had significant prior grazing use except in situations in which water developments may aid in better livestock distribution across the allotment and will not adversely impact the species.
15. Identify and when feasible, establish strategically located forage reserves focusing on areas unsuitable for sage-grouse habitat restoration or lower priority habitat restoration areas.
16. Monitor for, and treat invasive species associated with, existing range improvements.

17. Consider initiating vegetative manipulation projects where sagebrush canopy cover exceeds optimal characteristics to promote grass and forb understory growth. These projects should only be undertaken where it can be achieved without negatively impacting the species.

### **Adaptive Grazing Management Response**

BLM will individually analyze those allotments and pastures within the relevant Conservation Area. Given limited agency resources, prioritization will be given to areas that have the potential to provide the greatest benefit to sage-grouse. Allocation of resources should be concentrated on allotments within the CMA that have declining sage-grouse populations. Following those permits within the CMA, resources will be further prioritized to allotments within the IMA with breeding habitats that have decreasing lek counts. Sage-grouse populations that are stable or trending upward will be a lower priority for permit renewal and the adaptive assessment process. The assessment/determination process for sage-grouse pursuant to Standard 8 will consider published characteristics of sage-grouse habitat and the Ecological Site Descriptions, existing vegetation, habitat inventories/assessments (Stiver et al. 2010), and where available, state and transition models that describe vegetation and other physical attributes for sage-grouse. The related characteristics within the categories shown below will also be included. These characteristics indicate the ability of a given area to provide sage-grouse habitat.

Category 1: The grazing allotment (or any pasture/significant area therein) has the existing vegetation and existing ecological condition (seral state) to provide sage-grouse habitat

Category 2: The grazing allotment (or any pasture/significant area therein) has the ecological potential to provide sage-grouse habitat.

Where an allotment or pasture meets one of these Categories above, the GRSG Habitat Management Objectives will be incorporated into relevant resource management plans as the desired conditions with the understanding that these desired conditions may not be achievable:

- (a) due to the existing ecological condition, ecological potential or the existing vegetation; or
- (b) due to causal events unrelated to existing livestock grazing.

Allotments will only be managed for the primary seasonal habitat that it has the potential to support. Based on these habitat characteristics, BLM will conduct fine and site scale-habitat assessments to help inform grazing management. Where necessary, a determination of factors causing any failure to achieve the habitat characteristics GRSG HMOs will be conducted at a resolution sufficient to document the habitat condition. This determination will include consideration of local spatial and inter-annual variability. A determination of issues attributable to livestock grazing management shall not result from one year of data at a specific location within an allotment. If the process and conditions outlined above demonstrate that livestock grazing is limiting achievement of the habitat characteristics GRSG HMOs, renewed permits will include measures to achieve desired habitat conditions. These measures must be tailored to address the specific management issues associated with seasonal habitat limitations identified in the fine-scale assessments.

## Part V - Travel and Transportation Management Definitions for Use in Anthropogenic Disturbance Calculation

**Roads** are linear routes managed for use by low clearance vehicles having four or more wheels, and are maintained for regular and continuous use.

**Primitive Roads** are linear routes managed for use by four-wheel drive or high-clearance vehicles. They do not normally meet any design standards.

**Trails** are linear routes managed for human-powered, stock, or OHV forms of transportation or for historical or heritage values. Trails are not generally managed for use by four-wheel drive or high-clearance vehicles.

**Linear Disturbances** are human-made linear features that are not part of the designated transportation network are identified as "Transportation Linear Disturbances." These may include engineered (planned) as well as unplanned single and two-track linear features that are not part of the BLM's transportation system.

**Primitive Routes** are any transportation linear feature located within a WSA or lands with wilderness characteristics designated for protection by a land use plan and not meeting the wilderness inventory road definition.

**Temporary routes** are short-term overland roads, primitive roads or trails which are authorized or acquired for the development, construction or staging of a project or event that has a finite lifespan. Temporary routes are not intended to be part of the permanent or designated transportation network and must be reclaimed when their intended purpose(s) has been fulfilled. Temporary routes should be constructed to minimum standards necessary to accommodate the intended use; the intent is that the project proponent (or their representative) will reclaim the route once the original project purpose or need has been completed. Temporary routes are considered emergency, single use or permitted activity access. Unless they are specifically intended to accommodate public use, they should not be made available for that use. A temporary route will be authorized or acquired for the specific time period and duration specified in the written authorization (permit, ROW, lease, contract etc.) and will be scheduled and budgeted for reclamation to prevent further vehicle use and soil erosion from occurring by providing adequate drainage and re-vegetation.

**Administrative routes** are those that are limited to authorized users (typically motorized access). These are existing routes that lead to developments that have an administrative purpose, where the agency or permitted user must have access for regular maintenance or operation. These authorized developments could include such items as power lines, cabins, weather stations, communication sites, spring

### *Maintenance Intensities*

#### **Level 0**

##### Maintenance Description:

Existing routes that will no longer be maintained and no longer be declared a route. Routes identified as Level 0 are identified for removal from the Transportation System entirely.

**Maintenance Objectives:**

- No planned annual maintenance.
- Meet identified environmental needs.
- No preventative maintenance or planned annual maintenance activities.

**Level 1****Maintenance Description:**

Routes where minimum (low intensity) maintenance is required to protect adjacent lands and resource values. These roads may be impassable for extended periods of time.

**Maintenance Objectives:**

- Low (Minimal) maintenance intensity.
- Emphasis is given to maintaining drainage and runoff patterns as needed to protect adjacent lands. Grading, brushing, or slide removal is not performed unless route bed drainage is being adversely affected, causing erosion.
- Meet identified resource management objectives.
- Perform maintenance as necessary to protect adjacent lands and resource values.
- No preventative maintenance.
- Planned maintenance activities limited to environmental and resource protection.
- Route surface and other physical features are not maintained for regular traffic.

**Level 3****Maintenance Description:**

Routes requiring moderate maintenance due to low volume use (for example, seasonally or year-round for commercial, recreational, or administrative access). Maintenance Intensities may not provide year-round access but are intended to generally provide resources appropriate to keep the route in use for the majority of the year.

**Maintenance Objectives:**

- Medium (Moderate) maintenance intensity.
- Drainage structures will be maintained as needed. Surface maintenance will be conducted to provide a reasonable level of riding comfort at prudent speeds for the route conditions and intended use. Brushing is conducted as needed to improve sight distance when appropriate for management uses. Landslides adversely affecting drainage receive high priority for removal; otherwise, they will be removed on a scheduled basis.
- Meet identified environmental needs.
- Generally maintained for year-round traffic.
- Perform annual maintenance necessary to protect adjacent lands and resource values.
- Perform preventative maintenance as required to generally keep the route in acceptable condition.
- Planned maintenance activities should include environmental and resource protection efforts, annual route surface.
- Route surface and other physical features are maintained for regular traffic.

**Level 5****Maintenance Description:**

Route for high (maximum) maintenance due to year-round needs, high volume of traffic, or significant use. Also may include route identified through management objectives as requiring high intensities of maintenance or to be maintained open on a year-round basis.

**Maintenance Objectives:**

- High (Maximum) maintenance intensity.
- The entire route will be maintained at least annually. Problems will be repaired as discovered. These routes may be closed or have limited access due to weather conditions but are generally intended for year-round use.
- Meet identified environmental needs.
- Generally maintained for year-round traffic.
- Perform annual maintenance necessary to protect adjacent lands and resource values.
- Perform preventative maintenance as required to generally keep the route in acceptable condition.
- Planned maintenance activities should include environmental and resource protection efforts, annual route surface.
- Route surface and other physical features are maintained for regular traffic.

## Appendix G – Anthropogenic Disturbance and Adaptive Management

### Part I – Baseline Map and Description of Development

The **biologically significant units (BSUs)** are geographical/spatial areas within Greater Sage-grouse habitat that contains relevant and important habitats which is used as the basis for comparative calculations to support evaluation of changes to habitat. The BSUs include all land ownerships for evaluation, although application of the anthropogenic disturbance cap is specific only to BLM and Forest Service lands. The BSUs are used in the evaluation of anthropogenic disturbance and in the adaptive management habitat trigger.

For the Idaho and Southwestern Montana Greater Sage-Grouse Plan Amendment EIS the biologically significant units are defined as:

***Idaho: All of the modeled nesting<sup>1</sup> and delineated winter habitat, which is based on 2011 data, occurring within Priority and/or Important Habitat Management Areas within individual Conservation Areas<sup>2</sup>***

***Montana: All of the Priority Habitat Management Area***

These BSUs form the geographic basis for the calculation of anthropogenic disturbance and in the soft and hard adaptive management habitat triggers.

While the BSUs define the geographic extent and scale of the Subregion's landscape that will be considered in evaluating anthropogenic disturbance and the adaptive management habitat triggers, how disturbance and habitat triggers are calculated differ since anthropogenic disturbance and habitat loss affect Greater Sage-grouse differently (Knick et al. 2013).

The BSU is the total area (acreage) of nesting and wintering habitat within Priority or Important Habitat Management Areas, separately, by each Conservation Area. For Idaho this results in 8 BSUs, 2 each within the Idaho Conservation Areas – 1 in Priority Habitat Management Areas and 1 in Important Habitat Management Areas. There is 1 BSU in southwest Montana and 1 BSU for the Utah portion of the Sawtooth National Forest (Raft River BSU). There are a total of 10 BSUs within the Idaho and Southwestern Montana Subregion as shown in Map-G-1.

In developing these BSUs it was determined at the subregional level that data from these units must be compatible with aggregation to the PAC and WAFWA Management Zone levels, in order to meet FWS needs. In addition, BSUs must be edge matched/aligned with neighboring states. All sub-regions acknowledge there may be locally important biologically significant units smaller than PACs which may or may not be rolled up to PAC level. The Subregions also acknowledge that assessing disturbance at larger scales such as certain PACs, or via rollup of data, provides a baseline metric for future comparison, but dilution may likely mask disturbance concerns occurring at more local scales.

<sup>1</sup> Modeled nesting habitat is defined as those areas of Priority or Important Habitat Management Areas within 6.2 miles of 2011 active leks.

<sup>2</sup> The Utah portion of the Sawtooth National Forest is calculated separately for the Southern Conservation area.

The application of these calculations requires certain assumptions and associated baseline values which set an appropriate benchmark for future comparison.

For the adaptive management evaluation in Idaho the baseline year for comparison of both the population and habitat values is set at 2011. Sage-grouse have been monitored by counting males on leks since the 1950's (IDFG files). Average male lek attendance (statewide average) reached a low point in 1996 (IDFG in file). A more consistent and intensified survey of leks began with the annual monitoring of all 78 lek routes across southern Idaho in 1996. Average male lek attendance has fluctuated since 1996 (Figure G-1) in response to favorable or unfavorable conditions (e.g. weather, habitat improvements or loss, and West Nile virus). Peaks were in 2000, 2006, and 2011 with low points in 2002 and 2009. The increase in male lek attendance after previous declines indicates that sage-grouse populations can rebound over a relatively short time frame (e.g. 5 years) given desirable conditions. The baseline was set at the 2011 average number of males because this level is approximately the medium (8 higher and 7 lower years) of the counts between 1996-2011. At the statewide scale, the 2011 baseline allows 10% and 20% population triggers to be above the second lowest point in 2009. Application of the trigger at a smaller (Conservation Area) scale is a more conservative approach that will indicate potential trends sooner than if applied at the state-wide scale.

**Commented [BER1]:** Gary Wright - Radio telemetry information collected in 2011 and 2012 from sage-grouse collared in the vicinity of a winter concentration area located about 3.5 miles east of Magic Reservoir near Wedge Butte (Idaho Desert Conservation Area) reveals sage-grouse conduct nesting and brood-rearing activities up to 30 miles north and east of the Wedge Butte area shown as Idaho Mountain and Valleys Conservation Area. Incorporating the adjacent Idaho Mountain and Valleys area occurring within a 30-mile radius of Wedge Butte and north of Hwy 20 and 93 into the Idaho Desert area would result in a more accurate representation of the use area for some of the sage-grouse population wintering in the Idaho Desert area.

**Commented [BER2]:** Tara Anderson - It is hard to discern from the BSU map whether or not the southern boundary of the Idaho Desert Conservation Area of Importance excludes the portion of the Craters of the Moon National Monument and Preserve referred to as the "gap", just north of the Wapi Lava Flow. If so, please consider including this biologically significant area within the Idaho Desert Conservation Area of Importance. Observation data and recent radio-telemetry studies indicate that sage-grouse are consistently utilizing this area for lekking, nesting, brood-rearing, and wintering. This area contains several large and active sage-grouse leks and likely provides connectivity for the local sage-grouse population. Although the area lacks continuous sagebrush cover, significant patches of sagebrush occur both on the rangelands and adjacent lava that support sage-grouse year-round. Also, large portions of the area have been seeded with sagebrush and recovery is evident.

**Part II – Anthropogenic Disturbance Calculation**

The specific formula for the percent of anthropogenic disturbance is defined by:

$$\text{Disturbance Percentage} = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}}{\text{Acres within the BSU} * \left( \frac{\text{Acres of Effective Habitat within the BSU}}{\text{Acres within the BSU}} + 0.3 \right)} \right) \times 100$$

The BSU in the denominator represents the total area (acreage) of the applicable area of analysis. Each BSU is tracked and evaluated separately within each of the 10 BSUs, and reaching the 3% disturbance cap in any one BSU has specific management implications both within and beyond that specific BSU as described in the Proposed Plan.

All sub-regions within the Great Basin Region will use the same types of disturbances for fine/site scale monitoring as were used for broad and mid-scale analysis and would use local data and/or more current satellite imagery if available.

Anthropogenic Disturbance included in the numerator is shown in Table G-1.

Table G-1. Anthropogenic Disturbances and Areas of Impact

Datasets as Described in the Monitoring Framework <sup>3</sup>	Source	Spatial Extent
Oil and Gas Wells and Development Facilities	HIS; BLM (AFMSS)	5.0 ac
Coal Mines	BLM; USFS; Office of Surface Mining Reclamation and Enforcement; USGS Mineral Resource Data System	Polygon Area
Wind Towers	Federal Aviation Administration	3.0 ac
Solar Fields	Platts (power plants)	7.3 ac
Geothermal Development Facilities	IHS	3.0 ac or Polygon Area
Mining (Active Locatable, Leasable and Saleable Developments)	InfoMine	5.0 ac or Polygon Area
Roads <sup>4</sup>	ESRI StreetMap Premium	40.7 ft. (surface streets) 84.0 ft. (major roads) 240.2 ft. (Interstate Hwys.)
Railroads <sup>5</sup>	Federal Railroad Administration	30.8 ft.
Powerlines <sup>6</sup>	Platts	100 ft. (1-199kV)

<sup>3</sup> Taken from Table 6 – GRSG Monitoring Framework.

<sup>4</sup> Values described for line features – roads; railroads; powerlines – represent associated widths centered on the line feature.

<sup>5</sup> See previous note.

<sup>6</sup> See previous note.

Datasets as Described in the Monitoring Framework <sup>3</sup>	Source	Spatial Extent
		150 ft. (200-399kV) 200 ft. (400-699kV) 250 ft. (700+kV)
Communication Towers	Federal Communications Commission	2.5 ac
Other Vertical Structures	Federal Aviation Administration	2.5 ac
<b>Additional Local Datasets (need definitions)</b>		
Underground Pipelines		
Coal Bed Methane Ponds		
Meteorological Towers	BLM; Federal Communications Commission	2.5 ac
Nuclear Energy Facilities	As Available	Polygon Area
Airports	Federal Aviation Administration	Polygon Area
Military Ranges (ground based?)		
Hydropower plants		
Recreation Areas (Developed)	BLM data	Polygon Area

The following data sets would *not* be used to calculate anthropogenic disturbance, but would be used in the habitat baseline to estimate habitat availability or the amount of sagebrush on the landscape within biologically significant units.

1. Habitat treatments
2. Wildfire
3. Invasive plants
4. Conifer encroachment
5. Agriculture
6. Urbanization, Ex-urban and rural development

***Travel and Transportation Disturbance in Sage-Grouse Habitat***

The following would count as disturbance (see Part V for definitions):

- Linear transportation features identified as roads that have a maintenance intensity of 3 or 5
- Linear transportation features identified as primitive roads, temporary routes, or administrative routes that have a functional classification and a maintenance intensity of level 3 or 5

**Non-Disturbance**

The following items would not count as disturbance:

- Linear transportation features identified as trails.
- Linear transportation features identified as primitive roads, temporary routes, or administrative routes that have a maintenance intensity of either level 0 or 1.
- Linear transportation features identified as primitive routes.
- Linear disturbances.

### *Derivation of the Disturbance Formula -*

There is no definitive and scientifically proven formula to determine impact to GRSG from disturbance described in current research. However, Knick et al. (2013) did describe certain relationships between GRSG and anthropogenic disturbance that have been used, in conjunction with specific assumptions to describe a mathematical relationship between human disturbance footprint, effective GRSG habitat and effects to GRSG.

The variables in the equation are defined as:

- Acres of a Biologically Significant Unit (BSU)
- Acres of Anthropogenic Development within the BSU
- Acres of Effective GRSG Habitat (sagebrush) within the BSU

Knick et al. (2013) defined their unit of comparison (analogous to a biologically significant unit) as an area within 5 km of the lek. Within this area they also found that 79% of this area contained sagebrush (analogous to effective GRSG habitat). Results of the study show that “Ninety-nine percent of active leks were in landscapes with <3% developed”. This shows that when areas within 5 km of a lek containing 79% sagebrush were 3% developed there was a measurable effect on the presence of GRSG – this defines a disturbance threshold of 3% at which point GRSG are affected. Knick et al. developed a habitat similarity relationship between the proportion of leks and percent of sagebrush which shows the highest proportion of leks when sagebrush percentage is between 70-90% (Knick et al. 2013, Figure 5, Connelly et al. 2000, Wisdom ???). Above 90% and below 70% the proportion of leks is reduced. This helps define the optimum range for sagebrush at between 70-90% and also indicates that the disturbance threshold of 3% is also dependent upon and varies with the percent of sagebrush present (effective habitat).

These findings from Knick et al. (2013) help define some mathematical parameters to define a modeled relationship between disturbance, effective habitat and effects to GRSG. Figure G-2 illustrates three different ‘disturbance curves’ that reflect the relationship between disturbance (y-axis) and effective habitat (sagebrush percentage) (x-axis) when the footprint disturbed is equivalent to 3% of the area. The red boxes (A) represent the conceptual relationship between disturbance and effective habitat as described and interpreted from Knick et al. (2013). The blue diamonds (B) represent a simple calculation based only on disturbance footprint, without regard to effective habitat. The green triangles (C) represent the derived formula to model the relationship.

The ‘A’ disturbance curve shows that when the disturbance footprint is 3% of the area and the sagebrush percentage is between 70-90% the disturbance calculation would be 3. When sagebrush percent falls below 70% or rises above 90%, the change in habitat, even without a change in disturbed footprint would begin to affect the presence of GRSG. As the amount of sagebrush declines while disturbance remains the same there would be an increasing effect to GRSG presence. This disturbance curve is conceptual and Knick et al. (2013) does not explicitly define this relationship, although this relationship does reflect numerical the observations described in Knick et al. (2013).

The 'B' disturbance curve is a straight calculation based only on disturbed footprint over a specified area. It does not account for variability of sagebrush percentage, and the only variable is the acres of disturbance. For an area that is 3% disturbed the relationship 'curve' is a flat line at 3, regardless of sagebrush percentage. This 'curve' or calculation would match the conceptual curve when sagebrush percentage is between 70 and 90%. This calculation would not account for changes in effective habitat due to loss through fire or gain through restoration and rehabilitation.

The 'C' disturbance curve models and approximates the conceptual relationship described in Knick et al. (2013). It accounts for changes in effective habitat that would translate into variable effects to GRSG based on loss or gain of habitat. It includes the ability to consider habitat loss such as from fire and to consider habitat gain such as from rehabilitation efforts including conifer removal. The model matched the conceptual relationship in the range of 70% sagebrush and approximates the conceptual relationship in areas with more or less sagebrush cover. The conceptual relationship assumes a more exponential relationship to GRSG effects from loss of habitat, while the derived formula assumes a more linear relationship. There are no available scientific studies that more clearly define the nature of the relationship. The derived formula and the conceptual relationship are substantially similar from 35-90% sagebrush percentage to validate the derived formula's relative approximation of the relationship.

Figure G-2. Disturbance Relationships

**Development of the Modeled Formula:**

In order to manage and apply a defined disturbance cap it is necessary to take the findings of the appropriate scientific research and utilize them as appropriately as possible to develop management strategies and evaluation techniques consistent with the management objective. Most scientific research is not completed with the intent to develop specific management objectives or approaches; however, it is through the management approaches that the scientific findings utilized to inform management.

Development of the modeled formula began by describing the simplest relationship of disturbance across a defined area by defining the disturbance percentage as:

$$\% \text{ Disturbance} = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance}}{\text{Acres within Area of Concern}} \right) * 100$$

This accounts for disturbance, but does not account for changes in effective habitat or sagebrush percentage as described in Knick et al. (2013). To account for effective habitat the formula needs to include a term that adjusts the resulting calculation with regard to effective habitat. This should be reflected as an adjustment to the denominator (acres within area of concern). The denominator would be weighted based on the amount of effective habitat. In mathematical terms this would give a denominator of:

$$(\text{Acres within Area of Concern}) * (\text{Adjustment Based on Effective Habitat})$$

The adjustment term must equal 1.0 when the effective habitat is somewhere between 70-90% as described in Knick et al. (2013). Assuming the adjustment term is related to the relative percentage of sagebrush or effective habitat then the *Adjustment Based on Effective Habitat* could be expressed as:

$$\frac{\text{Acres of Effective Habitat within the Area of Concern}}{\text{Acres within the Area of Concern}}$$

However, this term does not equal 1.0 when effective habitat is less than 100%. In order to meet the requirement of equaling 1.0 a constant must be added. This constant, when added to the percentage calculated in the previous term must equal 1.0 when the *Acres of Effective Habitat within the Area of Concern* is somewhere between 70-90%. In the Idaho and Southwestern Montana Subregional Plan an objective of 70% effective habitat has been defined, which is consistent with Knick et al. (2013). If the objective is 70% then the constant that must be added to this term is 0.3 in order to meet the requirement of equaling 1.0 at 70% effective habitat. This defines the following derived formula that approximates the conceptual relationship described in Knick et al. (2013).

$$\text{Disturbance Percentage} = \left( \frac{\text{Footprint Acres from Anthropogenic Disturbance within Area of Concern}}{\text{Acres within the Area of Concern} * \left( \frac{\text{Acres of Effective Habitat within the Area of Concern}}{\text{Acres within the Area of Concern}} + 0.3 \right)} \right) * 100$$

**Scale:**

The particular scale for which this formula is calculated is defined by the Area of Concern. The Knick et al. (2013) used a study area defined by the area within 5 km of an individual lek. The disturbance relationships described previously are applicable at this scale and begin to break down or lose their integrity at greater distances from the lek (18 km). This concern, coupled with limited availability of consistent data across broader areas undermines the reliability and accuracy of the calculation when including areas more distant from the lek.

From a management perspective there is a need to address concerns at the broader scale to help manage those threats before they become a concern at the site specific scale. In Idaho, nesting location data collected by Idaho Department of Fish and Game (IDFG), shows that most nesting habitat occurs

within 6.2 miles (10 km) of the lek. IDFG has also collected telemetry data on GRSG movements and used this data to help define wintering areas. Nesting and wintering areas are the most limited and seasonal habitats in Idaho and additional disturbance in those areas could have impacts to GRSG presence. For these reasons the Area of Concern, referred to as the Biologically Significant Unit have been delineated to include nesting and wintering habitats. This results in areas that include more acres than just those associated within a 5 km area of an individual lek as described by Knick et al. (2013), but that are associated (within 6.2 miles or 10 km) with leks. While the Knick et al. (2013) study did not include winter habitat, because of their relative importance they have also been included as part of the BSU since conceivably disturbances that would cause lek abandonment would also likely cause abandonment or avoidance of other seasonal habitat areas. Using other administratively defined areas not delineated or based on specific GRSG use may undermine the utility and integrity of the disturbance relationship and calculation.

This approach, built upon the findings in Knick et al. (2013), uses those findings to help inform management at a broader scale that would help determine management actions based on disturbance evaluations. Using the BSU as the Area of Concern is a scale larger than described in Knick et al. (2013), but still within the predictive bounds described in that study. The formula can be used to calculate disturbance at the BSU scale to help inform a disturbance cap, and it can also be used at the site or project scale to help inform specific project activities.

**Example 1 – Anthropogenic Disturbance**

In the Southern Conservation Area the Priority BSU was delineated to include 784,958 acres and the Important BSU was delineated to include 1,036,455 acres, which represent the acres of the Biologically Significant Unit to be used in the denominator. The acres of Effective Habitat in the Priority BSU are 424,656 and in the Important BSU are 447,497. This sets up two equations – one for Priority Habitat Management Areas and one for Important Habitat Management Areas.

The existing footprint acres of disturbance within the Priority BSU are 17,661 acres and the footprint acres of disturbance within the Important BSU are 12,748 acres.

This gives the following two equations to define the baseline disturbance condition in the BSUs:

$$Priority = \frac{17661}{(784958 * (\frac{424656}{784958}) + 0.3)} * 100$$

$$Or \left( \frac{17661}{784958 * (0.54) + 0.3} \right) * 100$$

$$Or \left( \frac{17661}{784958 * (0.84)} \right) * 100$$

Yielding a percent disturbance in the Priority BSU of 2.68%

$$Important = \frac{12748}{(1036455 * (\frac{447497}{1036455}) + 0.3)} * 100$$

Yielding the percent disturbance in the Important BSU of 1.68%

If by 2015 we project additional development within the Priority BSU to be 2120 acres (a 12% increase) and development within the Important BSU to be 4000 acres (a 30% increase) then the Priority footprint acres becomes 20,161 acres and the Important footprint acres becomes 16,748 acres. The resulting evaluation for this cumulative disturbance is calculated by:

$$Priority = \frac{19781}{(784958 * (\frac{424656}{784958}) + 0.3)} * 100 \quad Important = \frac{16748}{(1036455 * (\frac{447497}{1036455}) + 0.3)} * 100$$

Yielding the percent disturbance as: Priority = 3.00% and Important = 2.21%

In the examples, given the existing disturbance footprint it would require development of an additional 2,120 acres in the Priority BSU and an additional 10,005 acres in the Important BSU before the 3% cap would be engaged.

### Part III - Adaptive Management

#### Adaptive Management Habitat Trigger-

The specific formula for the change in habitat for the habitat trigger is defined by:

Within Idaho and Utah all factors are measured within the modeled nesting and wintering habitat within Priority or Important Habitat Management Areas (calculated separately) by Conservation Area; in Southwest Montana all factors are measured within the Priority Habitat Management Area.

In simple description the adaptive management habitat trigger calculation is the percentage of Effective Habitat (defined as areas of generally intact sagebrush that provide Greater sage-grouse habitat during some portion of the year) within modeled nesting and wintering areas within Priority or Important Habitat Management Areas by Conservation Area within a particular year when compared to the Effective Habitat within modeled nesting and wintering areas within Priority or Important Habitat Management Areas by Conservation Area as of the 2011 baseline. Using Effective Habitat as the metric of comparison removes non-habitat acres from the calculation. The calculation is evaluated within both Priority and Important Habitat Management Areas separately within each of the 10 BSUs.

For purposes of evaluating the adaptive management habitat triggers, Effective Habitat in Idaho is tracked using the Key Habitat Map which is updated annually by BLM in coordination with IDFG, Forest Service, US FWS and Local Working Groups and tracks the areas of generally intact sagebrush providing Greater sage-grouse habitat during some portion of the year. Effective habitat equates to areas described as Key Habitat on the Key Habitat Map. Appendix F contains a description of the Key Habitat Map maintenance and update process including the inclusion of disturbances from fire and temporary disturbances and habitat restoration/rehabilitation. For Montana and Utah Effective Habitat is based on...

Factors: EHP(Y) – where Y is the year and EHC is the acres of Effective Habitat for that year within the baseline 2011 nesting and wintering areas within the Priority Habitat Management Area by Conservation Area

EHI(Y) - where Y is the year and EHI is the acres of Effective Habitat for that year within the baseline 2011 nesting and wintering areas within the Important Habitat Management Area by Conservation Area

ADP(Y) – where Y is the year and AD is the acres of anthropogenic disturbance within Effective Habitat for that year within the 2011 nesting and wintering areas within the Priority Habitat Management Area by Conservation Area

ADI(Y) – where Y is the year and AD is the acres of anthropogenic disturbance within Effective Habitat for that year (Y) within the baseline 2011 nesting and wintering areas within the Important Habitat Management Area by Conservation Area

EHP(2011) – the Effective Habitat within the baseline 2011 nesting and wintering areas within the Priority Habitat Management Area by Conservation Area

EHI(2011) - the Effective Habitat within the baseline 2011 nesting and wintering areas within the Important Habitat Management Area by Conservation Area

ADP(2011) – the acres of anthropogenic disturbance within Effective Habitat within the baseline 2011 nesting and wintering areas within the Priority Habitat Management Area by Conservation Area

ADI(2011) – the acres of anthropogenic disturbance within Effective Habitat within the baseline 2011 nesting and wintering areas within the Important Habitat Management Area by Conservation Area

Formulas:

$$\text{Priority Habitat Management Area} = 100 - \left( \frac{EHP(Y) - ADP(Y)}{EHP(2011) - ADP(2011)} \right) * 100$$

$$\text{Important Habitat Management Area} = 100 - \left( \frac{EHI(Y) - ADI(Y)}{EHI(2011) - ADI(2011)} \right) * 100$$

When this calculation equals or exceeds 10 then an adaptive trigger has been engaged as per AM-7 & AM-8.

Tables 2-7 describe the acreages associated with the BSUs by Conservation Area for the Idaho and Southwestern Montana Subregion. The tables contain values for the entire BSU (Priority and Important), including all ownerships, acres of effective habitat within the BSUs and acres of anthropogenic disturbance within the BSUs.

These values will be used to provide several examples applying the anthropogenic disturbance and adaptive management habitat trigger evaluations. These are for illustrative purposes and do not represent an actual evaluation of ground conditions.

**Example 2 – Adaptive Management – Habitat**

In the Southern Conservation Area the Priority BSU was delineated to include 784,958 acres, of which 424,656 acres were Effective habitat; therefore EHP(2011) is equal to 424,656 acres. Development within the Effective Habitat in 2011 was measured at 10,074 acres; therefore ADP(2011) is equal to 10,074 acres.

If in 2015 we project a cumulative loss of 42,000 Effective habitat acres due to wildfire (10% loss) and an additional 1000 acres of anthropogenic development (10% increase), then

EHP(2015) is equal to 424,656 – 42,000 or 382,656 and ADP(2015) is equal to 10,074+1000 or 11,074. The evaluation for the adaptive management trigger is calculated by:

$$100 - \left( \frac{382656 - 11074}{424656 - 10074} \right) * 100$$

This simplifies to:  $100 - \left( \frac{371582}{414582} \right) * 100$

Or  $100 - (0.896 * 100)$

Or  $100 - 89.6$

Or  $10.4 - \text{equivalent to } 10.4\%$

This evaluation shows a loss of greater than 10 percent and less than 20 percent which would engage the soft habitat trigger as described in AM-8 and not the hard habitat trigger described in AM-7.

#### **Soft Trigger Considerations and Implementation Actions**

The Sage-Grouse Implementation Task Force, in coordination with BLM and Forest Service would utilize monitoring information to assess when triggers have been tripped. When information indicates that the soft habitat or population trigger may have been tripped, a Sage-Grouse Implementation Task Force, in coordination with BLM and Forest Service - aided by the technical expertise of IDF&G - would assess the factor(s) leading to the decline and identify potential management actions. The Sage-Grouse Implementation Task Force may consider and recommend to BLM possible changes in management to the PHMA. As to the IHMA, the Sage-Grouse Implementation Team may review the causes for decline and potential management changes only to the extent those factors significantly impair the state's ability to meet the overall management objective. It is anticipated IDF&G will collect data annually and will make recommendations to the Implementation Team by August 31st for population triggers and January 15th for habitat triggers.

Only where the monitoring information indicates the cause(s) of the decline is not a primary threat will the Sage-Grouse Implementation Task Force analyze the secondary threats to the species and determine whether further management actions are needed.

#### **Adaptive Management Population Trigger**

##### **Framework**

##### **Population & Habitat Trigger Justification**

##### Triggers

Because unexpected events (e.g., wildfire, West Nile Virus) may result in a substantial loss of habitat or decline in sage-grouse populations, adaptive management triggers have been

developed. These triggers are intended to improve sage-grouse population trends, protect the overall baseline population, preserve a buffer population, and conserve sage-grouse habitat.

The triggers have both population and habitat components. Population components consider population growth and change in lek size. The habitat component considers loss of breeding and/or winter habitat. Lek size has been related to population change in numerous studies (Connelly and Braun 1997, Connelly et al. 2004, Baumgart 2011, Garton et al. 2011). Garton et al. (2011) used both characteristics as well as number of active leks to assess change for sage-grouse populations throughout the west. A variety of researchers (Swensen et al. 1987, Connelly et al. 2000a, Miller et al. 2011) have shown that loss of winter or breeding habitats resulted in decreased sage-grouse populations. The adaptive management triggers set at a lambda value less than one, a 20% decline in males counted on lek routes, and a 20% loss of breeding or winter habitat as break points that would initiate a population or habitat trigger.

Population Growth (Finite Rate of Change)

Although populations cannot be accurately estimated, lek counts of males provide a robust method for assessing population trend and estimating population growth ( $\lambda$ ) in an unbiased fashion. Calculating  $\lambda$  (finite rate of change) between successive years for a sage-grouse population is described in Garton et al. (2011). The ratio of males counted in a pair of successive years estimates the finite rate of change ( $\lambda_t$ ) at each lek site in that one-year interval. These ratios can be combined across leks within a population for each year to estimate  $\lambda_t$  for the entire population (or Conservation Zone) or combined across all leks to estimate  $\lambda_t$  for the state between successive years as:

$$\lambda(t) = \frac{\sum_{i=1}^n M_i(t+1)}{\sum_{i=1}^n M_i(t)}$$

where  $M_i(t)$  = number of males counted at lek  $i$  in year  $t$ , across  $n$  leks counted in both years  $t$  and  $t+1$ . Ratio estimation under classic probability sampling designs—simple random, stratified, cluster, and probability proportional to size (PPS)—assumes the sample units (leks counted in two successive years in this case) are drawn according to some random process but the strict requirement to obtain unbiased estimates is that the ratios measured represent an unbiased sample of the ratios (i.e., finite rates of change) from the population or other area sampled. This assumption seems appropriate for leks and the possible tendency to detect (or count) larger leks than smaller leks does not bias the estimate of  $\lambda_t$  across a population or region (Garton et al. 2011), but makes it analogous to a PPS sample showing dramatically increased precision over simple random samples (Scheaffer et al. 1996). Also precision can be estimated for  $\lambda$ .

Because small game populations (including sage-grouse) typically fluctuate among years due to weather and other environmental variables, a  $\lambda_t$  for any given year is not very meaningful. However, a series of years where  $\lambda_t$  remains at or above 1.0 indicates a stable to increasing

population. Moreover, this situation would also provide strong evidence of the effectiveness of conservation actions that may have been employed.

Definition of “Significance” for Hard Population Trigger:

The Governor’s Alternative (E) did not define criteria for “significantly less than 1.0”. For purposes of the Plan, IDFG proposes to use a 90% confidence interval around the current 3-year average of  $\lambda$  to evaluate whether  $\lambda$  is significantly less than 1.0. If the 90% confidence interval is less than and does not include 1.0, then  $\lambda$  is significantly less than 1.0. The  $\lambda$  and variance will be calculated following Garton et al. (2011). A 90% confidence interval is justified because:

1. Under a 90% confidence interval the probability of making a false conclusion is 10%, however, the error will be on the conservative side; i.e., the error would benefit the sage-grouse population.
2. The  $\lambda$  criteria would not be used alone; as stated in the ADPP,  $\lambda$  would be used in concert with trend in maximum number of males.

#### Males Counted on Leks

Lek attendance by males has been used as an indicator of population trend in some areas since at least the early 1950s. For many years it was the only indicator used to assess status of sage-grouse populations. However, recent research has shown that male attendance at leks can be affected by severity of the previous winter, weather, timing of counts during spring, and a variety of other factors (Emmons and Braun 1984, Hupp 1987, Baumgart 2011). Baumgart (2011) indicated the probability of male sage-grouse attending leks in south-central Idaho varied among years and appeared to be tied to winter severity. Although lek data provide a powerful data set for assessing population trends over time (Garton et al. 2011), counts for a single year may not reflect trends very well. Thus using lek counts as a trigger must consider the inherent variation in these counts. Moreover, males counted on leks appear to have the most value for assessing population change when used in conjunction with other indicators of population status (e.g., finite rate of change).

Emmons and Braun (1984) reported that lek attendance rates varied from 86% for yearling males to 92% for adult males. These rates were pooled over 5 day periods and may have overestimated attendance (Connelly et al. 2011). In contrast, Walsh et al. (2004) reported average daily male attendance rates of 42% (range = 7-85%) and 19% (range = 0-38%) for adult and yearling sage-grouse, respectively but these rates were not adjusted for detection rate and were likely biased low (Connelly et al. 2011). Moreover, this study involved very small sample sizes (17 adult males, 9 yearling males over 15 leks) and only one breeding season and it was not clear whether all leks in the study area were known and sampled. Preliminary data from Utah (D. Dahlgren, personal communication) indicated that in a study area about 30 miles south of Idaho male sage-grouse lek attendance rates varied from roughly 60% at the beginning of April to about 90% at the end of the month. Recent findings in Idaho (Baumgart 2011) predicted the probability of lek attendance for an adult male following an “average” winter would range from 0.894 (SE = 0.025) on week 3 (~1 April) to 0.766 (SE = 0.040) on week 8 (~ 5 May). Published information suggests that a change in maximum number of males counted on leks of say 10-15% cannot confidently be considered a reflection of population status. However, a 20% decline in

maximum number of males counted on leks would likely not be related to lek attendance patterns but instead would reflect a population decline. Thus, the trigger was set at 20%.

Habitat Trigger

Numerous studies have documented the negative effects of habitat loss including fire and energy development on sage-grouse (Connelly et al. 2000b, Fischer et al. 1996, Nelle et al. 2000, Doherty et al. 2008), but few studies have related the amount of sagebrush habitat lost to population change. In a Montana study area with a non-migratory sage-grouse population, there was a 73% decline in breeding males after 16% of the study area was plowed (Swenson et al. 1987). Walker et al. (2007) indicated that the lowest probability for lek persistence within a landscape occurred where, within 6.4 km of a lek center, the area has < 30% sagebrush. Similarly, Wisdom et al. (2011) reported sage-grouse occupying landscapes with <27% sagebrush as dominant cover would have a low probability of persistence. Connelly et al. (2000a) showed that a fire in 1989 that removed 58% of the sagebrush cover in sage-grouse breeding and winter habitat led to an almost 95% decline in the breeding population a few years later. Similarly, a fire that removed about 30% of breeding/winter habitat resulted in substantial population declines over the next few years (J. W. Connelly, unpublished data; Table 1). A 30% loss of breeding and winter habitat is thus far the lowest amount of habitat loss for which a population response could be detected and landscapes with < 30% area in sagebrush within 6.4 km of lek center have the lowest probability of lek persistence. Idaho is taking a more conservative approach than suggested by the literature. A soft trigger is set at a 10% loss of breeding or winter habitat in Core or Important management zones of a Conservation Area, which initiates a review of the management approach. A hard trigger is set at a 20% loss of breeding or winter habitat within a Core Habitat Zone of a Conservation Area, which automatically causes a change in management status of the corresponding Important Habitat Zone.

Table 1. Nest success (%) in SE Idaho study areas before and after a fire in the Table Butte study area. The fire occurred in August 2000.

Year	Area	
	Table Butte	Upper Snake
1999	54	
2000	45	61
2001 <sup>a</sup>	18	56
2002	20	65

**Potential Implementation Level Actions to Consider in the Event Soft Trigger Criteria are Met**

- ✓ Increase monitoring and evaluation of sage-grouse populations in Priority Habitat Management Area (area of concern).
- ✓ Implement Priority Habitat Management Area management strategy in corresponding Important Habitat Management Area of the same Conservation Area.
- ✓ Implement Priority Habitat Management Area RDFs in corresponding Important Habitat Management Area of the same Conservation Area.
- ✓ Not allow any new (large) infrastructure development within the Priority Habitat Management Area (no exceptions allowed).
- ✓ Reallocate resources to focus on primary threats in the Priority Habitat Management Area (e.g. direct resources from other parts of the state to the area of concern).
- ✓ Reallocate resources to focus on secondary threats in the Priority Habitat Management Area (e.g. direct resources from other parts of the state to the area of concern).
- ✓ Apply Priority Habitat Management Area criteria for all primary threats, and/or all secondary threats to the Important Habitat Management Area.
- ✓ Reallocate resources to focus on primary threats in the Important Habitat Management Area (e.g. direct resources from other parts of the state to the area of concern).
- ✓ Reallocate resources to focus on secondary threats in the Important Habitat Management Area (e.g. direct resources from other parts of the state to the area of concern).

**~~If Livestock Grazing is determined to be a Causal Factor Consider the Following Measures:~~**

- ~~1. Employ grazing management systems that ensure adequate nesting and early brood rearing habitat within the breeding landscape.~~
- ~~2. When use pattern mapping or monitoring demonstrates an opportunity to adjust livestock distribution to benefit occupied sage grouse breeding habitat, include as appropriate herding, salting, and water source management (e.g., turning troughs/pipelines on/off, extending pipelines/moving troughs) in grazing programs.~~
- ~~3. If available and feasible, utilize exotic perennial grass seedings and/or annual grasslands to avoid breeding season of use of occupied sage grouse habitat.~~

4. Modify authorized seasons of use within grazing permits to provide greater flexibility in managing livestock for the benefit of sage grouse.
5. Where appropriate, maintain residual herbaceous vegetation at the end of the growing/grazing season to contribute to nesting and brood-rearing habitat during the coming nesting season. Table 5.
6. Insure that permittees are informed of management and movement requirements related to avoidance of recent burns, rehabilitation seedings or other restoration sites.
7. Manage grazing of riparian areas, meadows, springs, and seeps in a manner that promotes vegetative structure and composition appropriate to the site. In some cases enclosure fencing may be a viable option. However, recognize the availability and quality of desired herbaceous species may be improved by periodic grazing use of the enclosure.
8. Implement management actions (grazing decisions, allotment management plan/conservation plan development, or other agreements) to modify grazing management to meet seasonal sage grouse habitat requirements. Employ proper grazing management by providing flexibility in scheduling the intensity, timing, duration and frequency of grazing use over time that best promotes management objectives. During drought periods, prioritize evaluating effects of drought in the CMA relative to grouse needs for food and cover. Ensure that post-drought management allows for vegetation recovery that meets sage grouse needs in priority sage grouse habitat areas.
9. When using salt or mineral supplements: a) place them in existing disturbed sites, areas with reduced sagebrush cover — e.g., seedings or cheatgrass sites — to reduce impacts to sage grouse breeding habitat, b) where feasible use salts or mineral supplements to improve management of livestock for the benefit of sage grouse habitat.
10. In general, avoid constructing new fences within 2 km of occupied leks. Where feasible, place new, taller structures, such as corrals, loading facilities, water storage tanks, windmills, etc., at least 2 km from occupied leks to reduce opportunities for perching raptors. Careful consideration, based on local conditions, should also be given to the placement of new fences or structures near other important seasonal habitats (winter-use areas, movement corridors etc.) to reduce potential impacts.
11. New spring developments in sage grouse habitat should be designed to maintain or enhance the free-flowing characteristics of springs and wet meadows. Analyze developed springs, seeps and associated pipelines to determine if modifications are necessary to maintain the continuity of the predevelopment riparian area within priority sage grouse habitat. Make modifications where necessary, considering impacts to other water users when such considerations are neutral or beneficial to sage grouse.
12. Ensure that new and existing livestock troughs and open water storage tanks are fitted with ramps to facilitate the use of and escape from troughs by sage grouse and other wildlife. Do not use floating boards or similar objects, as these are too unstable and are ineffective. Use BMPs to mitigate potential impacts from West Nile virus.
13. When placing new water developments in sage grouse breeding habitat, choose sites and designs that will provide the greatest enhancement for sage grouse and sage grouse habitat.
14. Avoid new water developments in higher quality native breeding/early brood habitats that have not had significant prior grazing use except in situations in which water developments may aid in better livestock distribution across the allotment and will not adversely impact the species.
15. Identify and when feasible, establish strategically located forage reserves focusing on areas unsuitable for sage grouse habitat restoration or lower priority habitat restoration areas.
16. Monitor for, and treat invasive species associated with, existing range improvements.

17. Consider initiating vegetative manipulation projects where sagebrush canopy cover exceeds optimal characteristics to promote grass and forb understory growth. These projects should only be undertaken where it can be achieved without negatively impacting the species.

### **Adaptive Grazing Management Response**

Improperly managed livestock grazing generally affects seasonal sage-grouse habitat at the site level. Therefore, the specific issues contributing to tripping an adaptive management trigger would need to be defined. Generally, these might be nesting cover from perennial grasses in breeding/nesting habitat, condition and forb availability in brood rearing habitat, and possibly sagebrush cover in winter habitat.

BLM would focus resources to accelerate land health assessments and/or assessment of specific habitat metrics in the areas where deficiencies in site-level habitat metrics are suspected to be a causal factor in tripping a soft or hard trigger. If it is determined that one or more site-level habitat objectives is not being met due to livestock, and an imminent likelihood of resource damage may occur from continued grazing, decisions could be issued in accordance with 4110.3-3(b) to provide immediate protection of resources while a full review of the grazing allotments and grazing permits is conducted. BLM would then focus resources at the state level to accelerate the grazing permit renewal in the area where the trigger has been tripped in order to expedite progress towards meeting land health standards.

BLM will individually analyze those allotments and pastures within the relevant Conservation Area. Given limited agency resources, prioritization will be given to areas that have the potential to provide the greatest benefit to sage grouse. Allocation of resources should be concentrated on allotments within the CMA that have declining sage grouse populations. Following those permits within the CMA, resources will be further prioritized to allotments within the IMA with breeding habitats that have decreasing lek counts. Sage grouse populations that are stable or trending upward will be a lower priority for permit renewal and the adaptive assessment process. The assessment/determination process for sage grouse pursuant to Standard 8 will consider published characteristics of sage grouse habitat and the Ecological Site Descriptions, existing vegetation, habitat inventories/assessments (Stiver et al. 2010), and where available, state and transition models that describe vegetation and other physical attributes for sage grouse. The related characteristics within the categories shown below will also be included. These characteristics indicate the ability of a given area to provide sage grouse habitat:

Category 1: The grazing allotment (or any pasture/significant area therein) has the existing vegetation and existing ecological condition (seral state) to provide sage grouse habitat

Category 2: The grazing allotment (or any pasture/significant area therein) has the ecological potential to provide sage grouse habitat.

Where an allotment or pasture meets one of these Categories above, the GRSG Habitat Management Objectives will be incorporated into relevant resource management plans as the desired conditions with the understanding that these desired conditions may not be achievable:

- (a) due to the existing ecological condition, ecological potential or the existing vegetation; or
- (b) due to causal events unrelated to existing livestock grazing.

Allotments will only be managed for the primary seasonal habitat that it has the potential to support. Based on these habitat characteristics, BLM will conduct fine and site scale habitat assessments to help inform grazing management. Where necessary, a determination of factors causing any failure to achieve the habitat characteristics GRSG HMOs will be conducted at a resolution sufficient to document the habitat condition. This determination will include consideration of local spatial and inter-annual variability. A determination of issues attributable to livestock grazing management shall not result from one year of data at a specific location within an allotment. If the process and conditions outlined above demonstrate that livestock grazing is limiting achievement of the habitat characteristics GRSG HMOs, renewed permits will include measures to achieve desired habitat conditions. These measures must be tailored to address the specific management issues associated with seasonal habitat limitations identified in the fine-scale assessments.

**Part V - Travel and Transportation Management Definitions for Use in Anthropogenic Disturbance Calculation**

**Roads** are linear routes managed for use by low clearance vehicles having four or more wheels, and are maintained for regular and continuous use.

**Primitive Roads** are linear routes managed for use by four-wheel drive or high-clearance vehicles. They do not normally meet any design standards.

**Trails** are linear routes managed for human-powered, stock, or OHV forms of transportation or for historical or heritage values. Trails are not generally managed for use by four-wheel drive or high-clearance vehicles.

**Linear Disturbances** are human-made linear features that are not part of the designated transportation network are identified as "Transportation Linear Disturbances." These may include engineered (planned) as well as unplanned single and two-track linear features that are not part of the BLM's transportation system.

**Primitive Routes** are any transportation linear feature located within a WSA or lands with wilderness characteristics designated for protection by a land use plan and not meeting the wilderness inventory road definition.

**Temporary routes** are short-term overland roads, primitive roads or trails which are authorized or acquired for the development, construction or staging of a project or event that has a finite lifespan. Temporary routes are not intended to be part of the permanent or designated transportation network and must be reclaimed when their intended purpose(s) has been fulfilled. Temporary routes should be constructed to minimum standards necessary to accommodate the intended use; the intent is that the project proponent (or their representative) will reclaim the route once the original project purpose or need has been completed. Temporary routes are considered emergency, single use or permitted activity access. Unless they are specifically intended to accommodate public use, they should not be made available for that use. A temporary route will be authorized or acquired for the specific time period and duration specified in the written authorization (permit, ROW, lease, contract etc.) and will be scheduled and budgeted for reclamation to prevent further vehicle use and soil erosion from occurring by providing adequate drainage and re-vegetation.

**Administrative routes** are those that are limited to authorized users (typically motorized access). These are existing routes that lead to developments that have an administrative purpose, where the agency or permitted user must have access for regular maintenance or operation. These authorized developments could include such items as power lines, cabins, weather stations, communication sites, spring

***Maintenance Intensities***

**Level 0**

Maintenance Description:

Existing routes that will no longer be maintained and no longer be declared a route. Routes identified as Level 0 are identified for removal from the Transportation System entirely.

Maintenance Objectives:

- No planned annual maintenance.
- Meet identified environmental needs.
- No preventative maintenance or planned annual maintenance activities.

**Level 1**

Maintenance Description:

Routes where minimum (low intensity) maintenance is required to protect adjacent lands and resource values. These roads may be impassable for extended periods of time.

Maintenance Objectives:

- Low (Minimal) maintenance intensity.
- Emphasis is given to maintaining drainage and runoff patterns as needed to protect adjacent lands. Grading, brushing, or slide removal is not performed unless route bed drainage is being adversely affected, causing erosion.
- Meet identified resource management objectives.
- Perform maintenance as necessary to protect adjacent lands and resource values.
- No preventative maintenance.
- Planned maintenance activities limited to environmental and resource protection.
- Route surface and other physical features are not maintained for regular traffic.

**Level 3**

Maintenance Description:

Routes requiring moderate maintenance due to low volume use (for example, seasonally or year-round for commercial, recreational, or administrative access). Maintenance Intensities may not provide year-round access but are intended to generally provide resources appropriate to keep the route in use for the majority of the year.

Maintenance Objectives:

- Medium (Moderate) maintenance intensity.
- Drainage structures will be maintained as needed. Surface maintenance will be conducted to provide a reasonable level of riding comfort at prudent speeds for the route conditions and intended use. Brushing is conducted as needed to improve sight distance when appropriate for management uses. Landslides adversely affecting drainage receive high priority for removal; otherwise, they will be removed on a scheduled basis.
- Meet identified environmental needs.
- Generally maintained for year-round traffic.
- Perform annual maintenance necessary to protect adjacent lands and resource values.
- Perform preventative maintenance as required to generally keep the route in acceptable condition.
- Planned maintenance activities should include environmental and resource protection efforts, annual route surface.
- Route surface and other physical features are maintained for regular traffic.

**Level 5**

Maintenance Description:

Route for high (maximum) maintenance due to year-round needs, high volume of traffic, or significant use. Also may include route identified through management objectives as requiring high intensities of maintenance or to be maintained open on a year-round basis.

Maintenance Objectives:

- High (Maximum) maintenance intensity.
- The entire route will be maintained at least annually. Problems will be repaired as discovered. These routes may be closed or have limited access due to weather conditions but are generally intended for year-round use.
- Meet identified environmental needs.
- Generally maintained for year-round traffic.
- Perform annual maintenance necessary to protect adjacent lands and resource values.
- Perform preventative maintenance as required to generally keep the route in acceptable condition.
- Planned maintenance activities should include environmental and resource protection efforts, annual route surface.
- Route surface and other physical features are maintained for regular traffic.

## Appendix H – Anthropogenic Disturbance

### Disturbance Density Calculation

#### GRSG Local/Site Disturbance Calculation

- **All sub-regions:** Agreed to use the same types of disturbances for fine/site scale monitoring as were used for broad and mid-scale analysis. Would use local data and/or more current satellite imagery if available. Recognize that site specific data, where available, provide a more accurate measure of land cover, disturbance and conifer encroachment than Landfire. In the long-term, ensure fine/site scale monitoring provides results that can be used across the GRSG range and “rolled up” for reporting purposes. In the short term (<5 years), locally derived vegetation data may not be available or easily rolled up, so use of seamless land cover data such as Sagestitch is recommended.

Great Basin sub-regions agreed to use the same type of data sets as used for broad and mid-scale to monitor local/site level conditions. Supplement with local data where available and/or more accurate. The following data layers or local surrogate would be used.

1. Energy (oil and gas wells and development facilities) Based on local info, actual footprint; see NOC language for certain exceptions.
2. Energy (coal mines) Actual footprint
3. Energy (wind towers) Based on local info, actual footprint
4. Energy (solar fields) Based on local info, actual footprint
5. Energy (geothermal) Based on local info, actual footprint
6. Mining (active developments; locatable, leasable, saleable) Based on local info, actual footprint
7. Infrastructure (roads) actual footprint; see road attachment for specific guidance
8. Infrastructure (railroads) abandoned railroads are NOT a disturbance
9. Infrastructure (power lines) Using NOC guidance, apply these widths:
  - <100 kV: use ROW width
  - 100-199kV: 100 ft
  - 200-399kV:150 ft
  - 400-699kV: 200 ft
  - 700-799kV: 250 ft
10. Infrastructure (communication towers, fire lookouts, met towers) Based on local info, actual footprint
11. Other developed rights-of-ways

The National Monitoring Framework lists the data sets by threat. These are:

<b>FWS Listing Decision Threat</b>	<b>Sagebrush Habitat Availability</b>	<b>Habitat Degradation (Human Activities)</b>	<b>Density of Energy and Mining Facilities</b>
Agriculture	X		
Urbanization	X		
Wildfire	X		
Conifer encroachment	X		
Treatments	X*		
Invasive Species	X*		
Energy (oil and gas wells and development facilities)		X	X
Energy (coal mines)		X	X
Energy (wind towers)		X	X
Energy (solar fields)		X	X
Energy (geothermal)		X	X
Mining (active locatable, leasable, and salable developments)		X	X
Infrastructure (roads)		X	
Infrastructure (railroads)		X	
Infrastructure (power lines)		X	
Infrastructure (communication towers)		X	
Infrastructure (other vertical structures)		X	
Other developed rights of ways		X*	

The following data sets would *not* be used to calculate anthropogenic disturbance, but would be used in the habitat baseline to estimate habitat availability or the amount of sagebrush on the landscape within biologically significant units. Use best available data, where Landfire or Sagestitch could be used for biophysical setting (bps), compared to existing vegetation type.

1. Habitat treatments
2. Wildfire
3. Invasive plants
4. Conifer encroachment
5. Agriculture
6. Urbanization, Ex-urban and rural development

**Biologically Significant Unit:**

- Idaho proposes use of Priority and Important Habitat Management Areas that generally match PACs, but also anticipates assessing disturbance at other scales including nesting and winter habitat, 5 km lek neighborhood, Conservation Areas and/or at the project-scale, depending on need.
- For all subregions, data from these units would be rolled up to the PAC and WAFWA Management Zone, to meet FWS needs. In addition, units must be edge matched/aligned with neighboring states. All sub-regions acknowledge there may be locally important biologically significant units smaller than PACs which may or may not be rolled up to PAC level. The Subregions also acknowledge that assessing disturbance at larger scales such as certain PACs, or via rollup of data, provides a baseline metric for future comparison, but dilution may likely mask disturbance concerns occurring at more local scales.

***Travel and Transportation Disturbance in Sage-Grouse Habitat***

The following would count as disturbance:

- Linear transportation features identified as roads that have a maintenance intensity of 3 or 5
- Linear transportation features identified as primitive roads, temporary routes, or administrative routes that have a functional classification and a maintenance intensity of level 3 or 5

**Non-Disturbance**

The following items would not count as disturbance:

- Linear transportation features identified as trails.
- Linear transportation features identified as primitive roads, temporary routes, or administrative routes that have a maintenance intensity of either level 0 or 1.

Linear transportation features identified as primitive routes.  
Linear disturbances.

DRAFT

***Travel and Transportation Management Definitions***

**Roads** are linear routes managed for use by low clearance vehicles having four or more wheels, and are maintained for regular and continuous use.

**Primitive Roads** are linear routes managed for use by four-wheel drive or high-clearance vehicles. They do not normally meet any design standards.

**Trails** are linear routes managed for human-powered, stock, or OHV forms of transportation or for historical or heritage values. Trails are not generally managed for use by four-wheel drive or high-clearance vehicles.

**Linear Disturbances** are human-made linear features that are not part of the designated transportation network are identified as “Transportation Linear Disturbances.” These may include engineered (planned) as well as unplanned single and two-track linear features that are not part of the BLM’s transportation system.

**Primitive Routes** are any transportation linear feature located within a WSA or lands with wilderness characteristics designated for protection by a land use plan and not meeting the wilderness inventory road definition.

**Temporary routes** are short-term overland roads, primitive roads or trails which are authorized or acquired for the development, construction or staging of a project or event that has a finite lifespan. Temporary routes are not intended to be part of the permanent or designated transportation network and must be reclaimed when their intended purpose(s) has been fulfilled. Temporary routes should be constructed to minimum standards necessary to accommodate the intended use; the intent is that the project proponent (or their representative) will reclaim the route once the original project purpose or need has been completed. Temporary routes are considered emergency, single use or permitted activity access. Unless they are specifically intended to accommodate public use, they should not be made available for that use. A temporary route will be authorized or acquired for the specific time period and duration specified in the written authorization (permit, ROW, lease, contract etc.) and will be scheduled and budgeted for reclamation to prevent further vehicle use and soil erosion from occurring by providing adequate drainage and re-vegetation.

**Administrative routes** are those that are limited to authorized users (typically motorized access). These are existing routes that lead to developments that have an administrative purpose, where the agency or permitted user must have access for regular maintenance or operation. These authorized developments could include such items as power lines, cabins, weather stations, communication sites, spring

***Maintenance Intensities***

**Level 0**

Maintenance Description:

Existing routes that will no longer be maintained and no longer be declared a route. Routes identified as Level 0 are identified for removal from the Transportation System entirely.

Maintenance Objectives:

- No planned annual maintenance.
- Meet identified environmental needs.
- No preventative maintenance or planned annual maintenance activities.

### **Level 1**

#### Maintenance Description:

Routes where minimum (low intensity) maintenance is required to protect adjacent lands and resource values. These roads may be impassable for extended periods of time.

#### Maintenance Objectives:

- Low (Minimal) maintenance intensity.
- Emphasis is given to maintaining drainage and runoff patterns as needed to protect adjacent lands. Grading, brushing, or slide removal is not performed unless route bed drainage is being adversely affected, causing erosion.
- Meet identified resource management objectives.
- Perform maintenance as necessary to protect adjacent lands and resource values.
- No preventative maintenance.
- Planned maintenance activities limited to environmental and resource protection.
- Route surface and other physical features are not maintained for regular traffic.

### **Level 3**

#### Maintenance Description:

Routes requiring moderate maintenance due to low volume use (for example, seasonally or year-round for commercial, recreational, or administrative access). Maintenance Intensities may not provide year-round access but are intended to generally provide resources appropriate to keep the route in use for the majority of the year.

#### Maintenance Objectives:

- Medium (Moderate) maintenance intensity.
- Drainage structures will be maintained as needed. Surface maintenance will be conducted to provide a reasonable level of riding comfort at prudent speeds for the route conditions and intended use. Brushing is conducted as needed to improve sight distance when appropriate for management uses. Landslides adversely affecting drainage receive high priority for removal; otherwise, they will be removed on a scheduled basis.
- Meet identified environmental needs.
- Generally maintained for year-round traffic.
- Perform annual maintenance necessary to protect adjacent lands and resource values.
- Perform preventative maintenance as required to generally keep the route in acceptable condition.
- Planned maintenance activities should include environmental and resource protection efforts, annual route surface.
- Route surface and other physical features are maintained for regular traffic.

### **Level 5**

#### Maintenance Description:

Route for high (maximum) maintenance due to year-round needs, high volume of traffic, or significant use. Also may include route identified through management objectives as requiring high intensities of maintenance or to be maintained open on a year-round basis.

Maintenance Objectives:

- High (Maximum) maintenance intensity.
- The entire route will be maintained at least annually. Problems will be repaired as discovered. These routes may be closed or have limited access due to weather conditions but are generally intended for year-round use.
- Meet identified environmental needs.
- Generally maintained for year-round traffic.
- Perform annual maintenance necessary to protect adjacent lands and resource values.
- Perform preventative maintenance as required to generally keep the route in acceptable condition.
- Planned maintenance activities should include environmental and resource protection efforts, annual route surface.
- Route surface and other physical features are maintained for regular traffic.

## Appendix J – Mitigation

### Part I – Regional Mitigation Strategy

The BLM/USFS will achieve no net unmitigated loss for authorized land uses within greater sage-grouse priority and general habitat. No net unmitigated loss means that impacts from authorized land uses will be fully offset to benefit the species. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts to greater sage-grouse or its habitat from authorized land uses remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to fully offset those residual impacts in order to achieve the no net unmitigated loss standard. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see glossary).

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy that will inform the NEPA decision making process including the application of the mitigation hierarchy to address impacts within that Zone. A robust and transparent Regional Mitigation Strategy will contribute to greater sage-grouse habitat conservation by reducing, eliminating, or minimizing threats and compensating for residual impacts to greater sage-grouse and its habitat.

The BLM's Regional Mitigation Manual MS-1794 serves as a framework for developing and implementing a Regional Mitigation Strategy. The following sections provide additional guidance specific to the development and implementation of a WAFWA Management Zone Regional Mitigation Strategy.

#### Developing a WAFWA Management Zone Regional Mitigation Strategy

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy to guide the application of the mitigation hierarchy to address impacts within that Zone. The Strategy should consider any State-level greater sage-grouse mitigation guidance that is consistent with the requirements identified in this Appendix. The Regional Mitigation Strategy should be developed in a transparent manner, based on the best science available and standardized metrics.

As described in Chapter 2, the BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. The Strategy will be developed within one year of the issuance of the Record of Decision.

The Regional Mitigation Strategy should include mitigation guidance on avoidance, minimization, and compensation, as follows:

- Avoidance

- Include avoidance areas (e.g. right-of-way avoidance/exclusion areas, no surface occupancy areas) already included in laws, regulations, policies, and/or land use plans (e.g. Resource Management Plans, Forest Plans, State Plans); and,
- Include any potential, additional avoidance actions (e.g. additional avoidance best management practices) with regard to greater sage-grouse conservation.
- **Minimization**
  - Include minimization actions (e.g. required design features, best management practices) already included in laws, regulations, policies, land use plans, and/or land-use authorizations; and,
  - Include any potential, additional minimization actions (e.g. additional minimization best management practices) with regard to greater sage-grouse conservation.
- **Compensation**
  - Include discussion of impact/project valuation, compensatory mitigation options, siting, compensatory project types and costs, monitoring, reporting, and program administration. Each of these topics is discussed in more detail below.
    - **Residual Impact and Compensatory Mitigation Project Valuation Guidance**
      - A common standardized method should be identified for estimating the value of the residual impacts and value of the compensatory mitigation projects.
      - This method should consider the quality of habitat, scarcity of the habitat, and the size of the impact/project.
      - For compensatory mitigation projects, consideration of durability (see glossary), timeliness (see glossary), and the potential for failure may require an upward adjustment of the valuation.
      - The resultant compensatory mitigation project will, after application of the above guidance, result in proactive conservation measures for Greater Sage-grouse (consistent with BLM Manual 6840 – Special Status Species Management, section .02).
    - **Compensatory Mitigation Options**
      - Options for implementing compensatory mitigation should be identified, such as:
        - Utilizing certified mitigation/conservation bank or credit exchanges.
        - Contributing to an existing mitigation/conservation fund.
        - Authorized-user conducted mitigation projects.
      - For any compensatory mitigation project, the investment must be additional (i.e. additionality: the conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project).
    - **Compensatory Mitigation Siting**
      - Sites should be in areas that have the potential to yield the greatest conservation benefit to the greater sage-grouse, regardless of land ownership.
      - Sites should be durable (see glossary).
      - Sites identified by existing plans and strategies (e.g. fire restoration plans, invasive species strategies, healthy land focal areas) should be

considered, if those sites have the potential to yield the greatest benefit to greater sage-grouse and are durable.

- **Compensatory Mitigation Project Types and Costs**
  - Project types should be identified that help reduce threats to greater sage-grouse (e.g. protection, conservation, and restoration projects).
  - Each project type should have a goal and measurable objectives.
  - Each project type should have associated monitoring and maintenance requirements, for the duration of the impact.
  - To inform contributions to a mitigation/conservation fund, expected costs for these project types (and their monitoring and maintenance), within the WAFWA Management Zone, should be identified.
- **Compensatory Mitigation Compliance and Monitoring**
  - Mitigation projects should be inspected to ensure they are implemented as designed, and if not, there should be methods to enforce compliance.
  - Mitigation projects should be monitored to ensure that the goals and objectives are met and that the benefits are effective for the duration of the impact.
- **Compensatory Mitigation Reporting**
  - Standardized, transparent, scalable, and scientifically-defensible reporting requirements should be identified for mitigation projects.
  - Reports should be compiled, summarized, and reviewed in the WAFWA Management Zone in order to determine if greater sage-grouse conservation has been achieved and/or to support adaptive management recommendations.
- **Compensatory Mitigation Program Implementation Guidelines**
  - Guidelines for implementing the State-level compensatory mitigation program should include holding and applying compensatory mitigation funds, operating a transparent and credible accounting system, certifying mitigation credits, and managing reporting requirements.

### Incorporating the Regional Mitigation Strategy into Land Use Authorization Analyses

The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for authorized land uses that may impact greater sage-grouse or its habitat.

### Implementing a Compensatory Mitigation Program

The BLM/USFS need to ensure that compensatory mitigation is strategically implemented to achieve the greatest conservation benefit, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be managed at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

## Glossary Terms

**Additionality:** The conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project. (BLM Manual Section 1794).

**Avoidance mitigation:** Avoiding the impact altogether by not taking a certain action or parts of an action. (40 CFR 1508.20(a)) (e.g. may also include avoiding the impact by moving the proposed action to a different time or location.)

**Compensatory mitigation:** Compensating for the (residual) impact by replacing or providing substitute resources or environments. (40 CFR 1508.20)

**Compensatory mitigation projects:** Specific, on-the-ground actions to improve and/or protect habitats (e.g. chemical vegetation treatments, land acquisitions, conservation easements).

**Compensatory mitigation sites:** The durable areas where compensatory mitigation projects will occur.

**Durability (protective and ecological):** The administrative, legal, and financial assurances that secure and protect the conservation status of a compensatory mitigation site, and the ecological benefits of a compensatory mitigation project, for at least as long as the associated impacts persist. (BLM Manual Section 1794).

**Minimization mitigation:** Minimizing impacts by limiting the degree or magnitude of the action and its implementation. (40 CFR 1508.20 (b))

**Residual impacts:** Impacts from an authorized land use that remain after applying avoidance and minimization mitigation; also referred to as unavoidable impacts.

**Timeliness:** The conservation benefits from compensatory mitigation accruing as early as possible or before impacts have begun. (BLM Manual Section 1794).

## **Part II – Idaho Mitigation Framework**

### **FRAMEWORK FOR MITIGATION OF IMPACTS FROM INFRASTRUCTURE PROJECTS ON SAGE-GROUSE AND THEIR HABITATS**

**Sage-Grouse Mitigation Subcommittee of the Idaho Sage-Grouse State Advisory Committee<sup>1</sup>  
December 6, 2010**

#### **INTRODUCTION**

The Conservation Plan for Greater Sage-grouse in Idaho (Idaho Sage-Grouse Advisory Committee 2006; as amended in 2009) calls for the development of a “proposal for a mitigation and crediting program for sagebrush steppe habitats in Idaho and recommendations for policy consideration” (Measure 6.2.4.). In early 2010, the Idaho Sage-grouse Advisory Committee (SAC) established the Mitigation Subcommittee to complete this task.<sup>1</sup> The Mitigation Subcommittee met several times from the late spring, through the fall of 2010 and found broad areas of agreement among its diverse participants.

This report presents the Mitigation Subcommittee’s consensus recommendations for the creation of an Idaho-based program to compensate for the impacts of infrastructure projects on sagegrouse and their habitats. This program – called the Mitigation Framework – would serve as a science-based “mitigation module” that project developers and government regulators could use to achieve compensatory mitigation objectives called for in project plans and permits. While compensatory mitigation may help offset certain impacts arising from infrastructure projects, mitigation should not be considered a substitute for first avoiding and then minimizing impacts.

In addition, it is important to recognize that federal and state regulatory or land-management agencies, and county or local governments may also require additional stipulations, conditions of approval or other requirements as well as on-site mitigation, in accordance with applicable law, regulation or policy.

This document proposes a general outline or “skeleton” of policies and procedures for such a program. The Mitigation Framework is designed to be transparent, inclusive, and accountable to defined objectives. The Subcommittee’s purpose is to describe the program in enough detail to foster a dialogue among SAC members, spot important issues and points of agreement, and assess the level of support for developing a functioning mitigation program for Idaho sagegrouse and their habitats.

---

<sup>1</sup> Subcommittee participants: John Robison and Lara Rozzelle, Idaho Conservation League; Brett Dumas, Idaho Power Company; Paul Makela and Tom Rinkes, BLM; Don Kemner, Idaho Department of Fish and Game; Will Whelan and Trish Klahr, The Nature Conservancy; Rich Rayhill, Ridgeline Energy, LLC; Lisa LaBolle and Kirsten Sikes, Idaho Office of Energy Resources; Nate Fisher, Idaho Office of Species Conservation; John Romero, Citizen at Large.

## **EXECUTIVE SUMMARY**

The state of Idaho is seeing an increasing number of infrastructure projects, such as transmission lines and wind energy facilities, proposed in the state's sagebrush steppe ecosystems. Where federal permits are required, the environmental review process for these projects will analyze how these projects affect sage-grouse and will consider a range of potential mitigation measures to avoid, minimize, or offset any impacts. It is likely that the environmental review process will lead at least some developers and agencies to implement compensatory mitigation.

Compensatory mitigation consists of compensating for residual project impacts that are not avoided or minimized by providing substitute resources or habitats, often at a different location than the project area. For sage-grouse, this would include, among other things, protecting and restoring sagebrush habitats to offset habitat losses and other effects of infrastructure projects.

This framework describes the general outline for a sage-grouse compensatory mitigation program in Idaho. This program would employ an "in-lieu fee" approach to compensatory mitigation through which a project developer would pay funds into an account managed by the mitigation program for performance of mitigation actions that provide measureable benefits for sage-grouse and their habitats within Idaho.

The Mitigation Framework does not alter the legal standards or procedures for review and approval of infrastructure projects. Rather, it offers an option that project developers and/or regulators may choose for implementing mitigation plans and agency permit conditions. It should be emphasized that this program would not relieve project developers and permitting agencies of their obligation to avoid and minimize environmental impacts through appropriate project siting, design and implementation.

Although the initial focus is on sage-grouse, the Mitigation Framework can be readily adapted to provide compensatory mitigation for other sagebrush obligate and associated species. The suitability of the Framework for other species and natural features has not been evaluated.

The objectives of the Mitigation Framework include:

- Provide a credible, efficient, transparent, and flexible mechanism to implement compensatory mitigation;
- Ensure that sage-grouse impacts are offset by actions that benefit the affected species and habitats;
- Provide increased certainty for developers and agencies;
- Involve private and public partners in crafting solutions;
- Provide developers the opportunity to offset the impacts of project development and operation on sage-grouse and sage-grouse habitat, and provide a consistent mechanism to offset impacts to the species that can be evaluated in future reviews of the species' status; and
- Evaluate issues based on best available scientific information, while acknowledging and responding to scientific uncertainty.

The Mitigation Framework would be established through a memorandum of agreement (MOA) among entities that have the capacity and commitment to assist in its implementation. Such parties

may include land and wildlife management agencies, counties, tribes, participating private infrastructure development companies, and non-governmental organizations. The MOA would define the specific roles and responsibilities, procedures, and tasks needed to operate an Idaho-based compensatory mitigation program.

The Mitigation Framework envisions a program with the following attributes: (1) a Mitigation Team and program administrator to steer the mitigation program and ensure strong oversight; (2) technically sound and transparent guidelines for estimating compensatory mitigation costs; (3) a science-based statewide strategy to guide the selection of mitigation actions that will receive funding; (4) provisions that the costs of operating the program will be borne by infrastructure developers that use the Mitigation Framework to deliver compensatory mitigation; (5) monitoring the implementation and effectiveness of mitigation actions funded by the Mitigation Framework program; (6) a system to track benefits provided by the Mitigation Framework to sage-grouse habitat in Idaho; and (7) periodic evaluation and adaptation of the Mitigation Framework program.

This framework provides only a general outline of a proposed Idaho-based compensatory mitigation program. It is intended to assess the level of support for crafting the agreements and completing the technical tasks needed to bring the Mitigation Framework into being.

## **DISCUSSION**

### **I. The Role of Compensatory Mitigation in Infrastructure Development and Sage-grouse Conservation**

#### **A. Mitigation Basics**

Broadly defined, “mitigation” refers to a wide range of measures that are taken to avoid, minimize, rectify, reduce, or compensate for the adverse impacts of actions affecting the environment. See 40 C.F.R. § 1508.20 (definition of “mitigation” in National Environmental Policy Act (NEPA) rules). In this general sense, mitigation should be an integral part of all phases of project planning and implementation.

The focus of this report is on compensatory mitigation – also known as “biodiversity offsets” or “offsite mitigation.” Compensatory mitigation consists of compensating for residual project impacts that are not avoided or minimized by providing substitute resources or habitats, often at a different location than the project area. For instance, a project developer may fund the restoration of a particular type of habitat in order to replace or “offset” similar habitat that is lost as a result of project construction.

This Framework adopts an “in-lieu fee” approach to compensatory mitigation. Under this approach, a project developer provides funding to a compensatory mitigation program administrator who then distributes the funds to the appropriate government agency, foundation or other organization for performance of mitigation actions. In an in-lieu fee program, the responsibility for actually delivering the compensatory mitigation is transferred from the developer to the program administrator once the developer provides the necessary funds to the in-lieu fee program. It is important to emphasize that compensatory mitigation does not relieve project developers and permitting agencies of their obligation to avoid and minimize environmental impacts. This Framework endorses the principle known as the

“mitigation hierarchy,” which holds that decision makers should consider the elements of environmental mitigation in the following order of priority:

1. Avoid environmental impacts through project siting and design;
2. Minimize the impacts during construction, operation, maintenance, and decommissioning by implementing appropriate conservation measures related to timing and conduct of project activities;
3. Restore areas that have been disturbed or otherwise rectify on-site project-related impacts to the greatest extent practicable; and
4. Compensate for residual impacts (direct and indirect effects that are not mitigated on-site) by providing replacement habitats or other benefits.

This means that compensatory mitigation is addressed only after efforts to avoid, minimize, and mitigate the impacts have been addressed. It also should be noted that significant impacts to habitat areas that support special functions and values for sage-grouse may simply not be replaceable through mitigation and therefore the best course may be to avoid those areas altogether.

### **B. Need for an Idaho Compensatory Mitigation Program**

In recent years, the state of Idaho has seen an increase in the number of major infrastructure projects proposed in the state’s sagebrush steppe ecosystems. Several current proposals involve high voltage transmission lines that would cross over hundreds of miles of sage-grouse habitat. Large scale energy infrastructure projects such as wind farms may also affect large areas of sagegrouse habitat. Where these projects are located at least partially on federally managed public lands they will be required by federal law to go through an extensive environmental review process under NEPA before relevant federal permits are issued. The NEPA process requires the permitting agencies to consider the projects’ environmental effects (both positive and negative), alternatives, and potential mitigation measures. Impacts on sage-grouse will be one of the topics analyzed in the NEPA process.

Even after efforts are taken to avoid and minimize impacts, it is possible that some of these infrastructure projects will degrade some sage-grouse habitat, cause direct sage-grouse mortality, or lead to indirect effects such as avoidance of previously occupied habitat. The extent to which project developers and regulators adopt compensatory mitigation as a means to offset these impacts is not fully known. However, it is likely that at least some developers and regulators will seek to implement compensatory mitigation to benefit sage-grouse and their habitats. Energy companies and other developers face daunting challenges in carrying out compensatory mitigation for sage-grouse habitat. Just identifying specific mitigation actions requires a major effort. Actually implementing sagebrush restoration and enhancement projects is even more difficult and expensive – typically involving years of effort and a significant risk of failure. Delivering this type of technically complex environmental mitigation may be well outside the core business of many infrastructure developers.

### **C. Advantages of the Mitigation Framework**

The Mitigation Framework proposes to respond to these challenges by creating a statewide program to deliver scientifically sound compensatory mitigation for multiple projects. Project developers and regulators would no longer have to design, fund and implement their own mitigation programs. Instead, they would have the option of contributing money to a central fund overseen by agencies with expertise in habitat management and non-governmental partners with similar experience. This approach to compensatory mitigation offers three major advantages. The first advantage stems from the increased efficiency of an Idaho-wide mitigation program compared with fragmented, project-by-project mitigation programs. Mitigation efforts require a significant investment in planning, administration, project oversight, and monitoring. The Mitigation Framework would consolidate these functions, thus avoiding needless duplication. The second advantage is that a state mitigation fund can be used for sage-grouse conservation more strategically and at a greater scale than project-by-project mitigation. As described in more detail below, the Mitigation Framework would fund sage-grouse habitat protection and restoration projects in accordance with a statewide strategy that uses landscape-scale analyses to identify the specific measures and habitats that will provide the greatest benefit for Idaho sagegrouse populations. This Idaho-based mitigation strategy will be integrated with other conservation strategies throughout the range of sage-grouse to ensure that actions taken in Idaho benefit the species as a whole. Third, this method can engage the capacity and competence of natural resources agencies, local governments, private companies, and non-governmental organizations. The Mitigation Framework proposes to enlist these entities in shaping Idaho's strategy, developing criteria for use of the fund, and proposing and implementing habitat protection and restoration projects. The benefits of the Mitigation Framework can be summarized as follows:

*Benefits for Project Developers:*

An efficient and reliable mechanism for meeting compensatory mitigation objectives and permit conditions; and Increased certainty regarding project costs.

*Benefits for Regulatory Agencies:*

Increased certainty that in-lieu fees will result in strategic "on-the-ground" mitigation actions that benefit sage-grouse.

*Benefits for Sage-Grouse:*

Increased certainty that scientifically sound mitigation actions that benefit sage-grouse and offset impacts and habitat losses associated with infrastructure development will be implemented.

#### **D. Ensuring Accountability**

In-lieu fee compensatory mitigation does pose one potentially significant drawback that must be acknowledged and addressed: a poorly designed program may lack accountability for delivering meaningful on-the-ground benefits for sage-grouse. Simply having a project developer contribute to an in-lieu fee mitigation account does not by itself compensate for the sage-grouse impacts caused by the project. Actual mitigation is possible only after well-conceived habitat protection and restoration projects are planned, funded, implemented,

monitored, and successful in achieving stated objectives. The Mitigation Framework seeks to ensure accountability by adopting a series of rigorous and transparent procedures. As described below, the Framework would: (1) ensure that program administration and monitoring functions are adequately funded; (2) provide technically sound guidelines for estimating the costs of delivering compensatory mitigation; (3) establish a sciencebased statewide strategy to guide the program; (4) develop project selection criteria and a request for proposals based on the strategy; (5) require monitoring of the implementation and effectiveness of mitigation actions funded by the program; (6) track benefits the Mitigation

Framework program provides to sage-grouse in Idaho; and (7) require periodic evaluation of the program. Taken together, these procedures provide a high degree of certainty that the Mitigation Framework will be able to turn in-lieu fee payments into tangible, lasting compensatory mitigation for sage-grouse. As described in greater detail in Section E, below, project developers that seek to use the Mitigation Framework will need to show two things. First, they will need to show that their projects' impacts on sage-grouse and their habitats have been evaluated using a scientifically sound process. Second, they will need to show that their contributions to the mitigation fund reflect the Mitigation Framework's compensation guidelines to ensure that funding will be adequate to offset project impacts. Having demonstrated those things, the project developers should then be able to rely on their in-lieu fee contribution to the mitigation account as satisfying their compensatory mitigation objectives or obligations.

## **II. Core Elements of Idaho Sage-Grouse Mitigation Program**

### **A. Program Objectives**

- Provide a credible, efficient, transparent, and flexible mechanism to implement compensatory mitigation;
- Ensure that sage-grouse impacts are offset by mitigation actions that benefit the sage-grouse and their habitats;
- Provide increased certainty for developers and agencies;
- Involve private and public partners in crafting solutions;
- Provide developers the opportunity to offset project impacts on sage-grouse and sage-grouse habitat, and provide a consistent mitigation mechanism that can be evaluated in future reviews of the species' status; and
- Evaluate issues based on best available scientific information while acknowledging and responding to scientific uncertainty.

### **B. Scope**

The Mitigation Framework proposes to mitigate for impacts to Idaho sage-grouse and their habitats in Idaho. The initial focus of the Mitigation Framework is on sage-grouse. However, this program can be readily adapted to provide compensatory mitigation for other sagebrush obligate and associate species, such as pygmy rabbits, if project developers and regulators call for such mitigation.

Whether this Framework is suited for mitigation of impacts to a broader suite of species or natural features has not been evaluated. It should be noted that some subcommittee members expect to advocate in other forums that compensatory mitigation should extend beyond sagegrouse. The Mitigation Framework focuses on infrastructure projects because this type of development is the most likely to give rise to compensatory mitigation under existing environmental policies. As used here, the term “infrastructure” refers to building structures that significantly disturb sage-grouse habitat, including but not limited to projects for electricity transmission, energy generation, pipeline conveyance, transportation, communications, and similar purposes. The Mitigation Framework is not intended to apply to existing projects that are not changing in scope or to the renewal of on-going activities, such as grazing permits. In addition, the Framework is not suited to projects with minor impacts because their contributions to the mitigation program would be too small to justify the effort needed to establish and administer inlieu fee payments.

### **C. Integration with Environmental Review Procedures**

The Mitigation Framework does not alter the legal standards or procedures for review and approval of infrastructure projects. Rather, the Framework offers an option that project developers and/or regulators may choose for implementing mitigation plans and agency permit conditions. The Mitigation Framework is intended to complement the environmental review process conducted pursuant to NEPA and other federal environmental laws as well as county land use planning authorities. Many energy and other infrastructure projects undergo review and approval at the county level. The issues examined and the level of environmental analysis varies widely among individual counties and individual developers. If a county or developer decides to address sage-grouse impacts, it will be able to use the Mitigation Framework as a mechanism for meeting compensatory mitigation objectives that may arise from the county permitting process.

### **D. Mitigation Strategy**

The next step focuses on the Mitigation Team’s task of developing a statewide, science-based strategy that will guide the use of the mitigation fund. The mitigation program strategy would establish priorities for the use of compensatory mitigation funding based on factors/risks identified in the U.S. Fish and Wildlife Service’s 12-Month Findings for Petitions to List Greater Sage-Grouse (*Centrocercus urophasianus*) as Threatened or Endangered (USFWS 2010) and in the Conservation Plan for Greater Sage-grouse in Idaho (2006). The strategy sets mitigation priorities with a landscape view of sage-grouse needs and highlights mitigation opportunities in Idaho based on best available science. In setting priorities, the strategy considers species and community size, landscape condition, and regional context. The strategy is responsive to the threats and risks described in the sage-grouse 12-month findings. The strategy will also generally describe the types of mitigation actions, project specifications, and best practices that are likely to produce measureable benefits for sage-grouse habitat. Finally, the strategy addresses both implementation and effectiveness monitoring requirements for mitigation actions funded through the program. The Mitigation Framework’s strategy will draw heavily from the State of Idaho’s sage-grouse conservation plan but has a narrower focus. It is intended to provide the specific guidance on program priorities, accepted mitigation measures, and geographic areas of emphasis that potential mitigation project sponsors will need to know when they apply for funds. The strategy plays a crucial role in steering mitigation funding to those activities and places that can provide the most effective benefits for Idaho sage-grouse populations consistent

with strategies to increase the viability of the species throughout its range. To this end, the strategy will address one of the major policy questions that arise in the design of compensatory mitigation systems: how closely should the mitigation actions be linked to the type and location of the habitat that was originally affected by the infrastructure project. Stated in the alternative, does removal of the mitigation action from the area of impact improve the effectiveness of or benefit from the action. Some compensatory mitigation systems place a heavy emphasis on this link by favoring “in-kind” and “on-site” compensatory mitigation over “out-of-kind” and “off-site” compensatory mitigation. The subcommittee members generally favor an approach that allows funding to flow to the projects and locations within Idaho that will provide the greatest overall positive impact on sage-grouse populations. The Mitigation Framework calls for a monitoring program that would assess habitat gains provided by mitigation actions and compare them with the mitigation objectives of the participating infrastructure projects. The nature and purpose of this monitoring is described more fully in Mitigation Program Step 4, below.

Once the strategy is complete, the Mitigation Team will develop project ranking criteria and procedures that will guide the selection of the mitigation actions that will receive funding. The goal is to fund projects that provide high quality, lasting benefits based on landscape scale analyses that actually compensate for project impacts.

### **E. Compensation Guidelines**

The Mitigation Framework Program will develop guidelines that may be used by developers and/or regulators to determine the cost of meeting their compensatory mitigation objectives. These compensatory mitigation objectives determine the extent of compensatory mitigation for each project and are generally incorporated into project plans or permits. The compensation guidelines will provide transparent, technically sound principles for determining how much it costs to deliver habitat mitigation for sage-grouse. In other words, the guidelines will represent best estimates of the true cost of implementing the mitigation actions needed to meet each project’s compensatory mitigation objectives. The guidelines may be used by the project developer and the Mitigation Framework Program Administrator to establish the in-lieu fee that the developer will contribute to the mitigation fund. Specific valuation methods will be developed at a later time and will likely draw from compensatory mitigation systems used elsewhere in the West. Although the details have yet to be worked out, the following outline illustrates the core concepts and principles (shown in bold lettering) that are likely to be employed by the MOA parties in setting the Mitigation Framework’s in-lieu fee structure.

- A common unit of measurement would be established for describing and tracking both the project impacts and the benefits of any compensatory mitigation actions. This unit of measurement can be a physical unit such as “acres impacted” or more specifically “acres of summer brood rearing habitat impacted” or “habitat units” lost.
- While the “common unit of measurement” noted above addresses the area of habitat impacted and mitigated, habitat compensation ratios are used to address the quality of the habitat affected by the infrastructure project. These ratios could specify the number of acres of mitigation required per acre of impacted habitat based on the size, habitat quality/condition and function of the impacted habitat; for more critical or important habitat, more mitigation acres might be required. Thus, habitats with higher quality and importance could have higher compensation ratios.

- Several factors are taken into account in calculating how much it will cost to actually compensate for the acres or habitat units. The recommended approach is to evaluate on the costs of implementing a conceptual portfolio of potential mitigation actions or offset activities that provide benefits for sage-grouse. This portfolio of model projects would include a balanced mix of accepted habitat protection and restoration measures reflecting the types of projects expected to be funded by the mitigation program (in accordance with the strategy discussed above). Examples of projects in this portfolio may include such actions as restoring sagebrush canopy and a native understory on recently burned land, improving riparian areas and wet meadows in early brood-rearing habitat, conservation easements to prevent habitat loss, and land management practices that improve sage-grouse habitat. Project costs include the full range of expenses needed to complete all phases of the mitigation action, including administration and monitoring. The average costs of these model mitigation actions per acre or habitat unit is the foundation of the in-lieu fee calculation.
- In addition, the in-lieu fee should also be adjusted to take into consideration the issue of lag time –the time between when habitat is lost at the impacted site relative to when habitat functions are gained at the compensation site.
- The fee also needs to account for contingencies associated with delivering compensatory mitigation, including an estimate of the risk of failure (i.e., the probability that offsite mitigation will not result in any measureable conservation outcomes) for each mitigation site or project.
- In addition to the fee calculated above, costs for establishing and operating the program, including travel, technical consultation and monitoring of program effectiveness must be included. This overhead fee could range from 5-15% depending on the size and complexity of the proposed mitigation program.

## **F. Program Structure and Oversight**

The Mitigation Framework would be established through a memorandum of agreement (MOA) among the entities that would participate in its implementation. The MOA would define the specific roles and responsibilities, procedures, and tasks needed to operate an Idaho-based compensatory mitigation program. The MOA would serve as a joint powers agreement for state and local government parties. The MOA would establish the following administrative structure for the Mitigation Framework:

1. **Core Team:** A core group would oversee the Mitigation Framework program and provide policy-level guidance for the Science Team and Fund Administrator, described below. The Core Team would be composed of three to seven representatives of diverse perspectives among the MOA signatories.
2. **Science Team:** A team of experts drawn from MOA signatories and other targeted organizations will administer the science-based and technical aspects of the program. The Science Team would consist of several individuals with expertise in relevant areas such as habitat protection and restoration, landscape ecology/spatial analysis, wildlife biology, sage-grouse ecology, project development, and mitigation policy.

The Team would focus on developing the policies and statewide strategy that will guide the program, making requests for mitigation project proposals (RFPs), ranking mitigation proposals that will receive funding, tracking monitoring reports and project benefits, and evaluating program success.

3. Program Administrator: A program administrator will be responsible for fund management and administrative tasks. The program administrator will provide administrative support for the Mitigation Team, manage the mitigation account, and administer grants, contracts, and other agreements.

4. Advisory Committee: A broader advisory committee consisting of agencies, companies and organizations with the skills and commitment that will provide useful advice to the Core Team regarding the implementation of the Mitigation Framework. The specific make up of each of these groups will be determined at a later time. Potential participants in the Mitigation Framework include but are not limited to representatives of:

***State of Idaho:***

Department of Fish and Game  
Management  
Office of Energy Resources  
Office of Species Conservation  
Idaho Department of Lands  
Service

***United States:***

Bureau of Land  
U.S. Fish and Wildlife Service  
U.S. Forest Service  
Natural Resources Cons.

***Energy Companies:***

Idaho Power  
Ridgeline Energy  
Conservancy  
Idaho Tribes  
Idaho Sage-Grouse Advisory Committee  
Sage-Grouse Local Working Groups

***Non-Governmental Organizations:***

Idaho Conservation League  
The Nature  
Idaho Counties  
Public Land Users (e.g., grazing

interests)

**G. Funding the Mitigation Program**

The costs of administering the program will be sustained by the project developers that seek compensatory mitigation. Therefore, a portion of the in-lieu fee that project developers contribute to the mitigation account will be applied for program administration. As noted above, protecting and restoring sagebrush habitats are time consuming and expensive undertakings. Ensuring that these activities are conducted with strong oversight should be viewed as an exceptionally wise investment.

**III. Mitigation Program Steps**

The Mitigation Framework envisions a five-step process for developing, implementing, and monitoring compensatory mitigation.

### **A. Step 1 – Assessment of Project Impacts and Development of Mitigation Objectives**

Assessment of project impacts should be undertaken by the project developers proposing new infrastructure projects and the government agencies that conduct environmental reviews of those projects. Although the Mitigation Framework process is not responsible for this step, it is nevertheless crucial to the integrity of the mitigation program. Specifically, the Framework's success in achieving its goal of offsetting major infrastructure project impacts on sage-grouse depends on an accurate accounting of those impacts. For many projects, this analysis will be done as part of the environmental review procedures required by NEPA. As noted above, NEPA requires federal agencies to address the full range of direct, indirect and cumulative impacts of the proposed project, alternatives to the proposed action, and potential mitigation before they act on permit applications. Once impacts have been assessed and compensatory mitigation objectives set, the project developer is ready to engage the Mitigation Framework, starting with determining the developer's in-lieu fee contribution.

### **B. Step 2 – Determine the In-lieu Fee Contribution**

The goal of Step 2 is to use valuation techniques, such as the guidelines presented above, to convert the complex range of project impacts, including direct, indirect and cumulative impacts, into monetary terms that become the basis for the in-lieu fee payment. The accepted in-lieu fee compensatory mitigation plan could be a condition of the instrument approving the project (FONSI, ROD, right-of-way grant, conditional use permit, etc.) and thus legally requires the project developer comply with the approved mitigation plan.

### **C. Step 3 – Commitment of Mitigation Funds by Project Developer**

Infrastructure project developers can employ the Mitigation Framework by entering into an agreement with the program administrator with regard to a specific infrastructure project. This project agreement sets forth the parties' respective responsibilities, including the project developer's commitment to pay the in-lieu fee. Importantly, the agreement provides that the project developer's funds can only be used for the purposes set forth in the Mitigation Framework. The agreement may also include "conditions" as requested by regulatory agencies or project developers. For instance, the agreement might provide that the in lieu fee will be used to fund mitigation actions in specific geographic areas in order to meet permit requirements. The program administrator, based on consultation with the MOA parties, may decline to enter into an agreement that is inconsistent with the Mitigation Framework principles or includes conditions that are burdensome or unworkable. Once the agreement specifying the payment structure and schedule is signed, the project developer makes the required in-lieu fee deposits to an interest bearing account managed by the program administrator. After the completion of this step, the project developer is no longer engaged in the Mitigation Framework – unless it has decided to participate as a MOA party.

### **D. Step 4 – Issue Request for Proposals (RFP) and Select, Implement, and Monitor Mitigation Actions**

At least at annual intervals, the Mitigation Team will issue an RFP that invite private companies, non-governmental organizations, and agencies to submit proposals for sage-grouse habitat protection, restoration, and/or enhancement actions. The RFP will provide guidance to mitigation project sponsors on program priorities and criteria. These priorities and criteria will be drawn from the mitigation program strategy including identification of geographic areas where mitigation might provide the greatest benefits as well as identification of the threats that present the highest risk to the species or its core habitat. The Mitigation Team should also reach out to federal, state, and local agencies, non-governmental organizations and the general public in order to facilitate discussion, engage stakeholders, raise awareness of the program and generate responses to the RFP. The RFP will solicit project proposals that contain an operation or implementation plan and address at least the following elements:

- Geographic area;
- Threats addressed and how the mitigation action project will offset impacts resulting from those threats;
- An analysis of current sage-grouse conditions in the area;
- Resource goals and objectives the mitigation action project will seek to provide;
- A description of any coordination with federal, state, tribal and local resource management and regulatory authorities or other stakeholder involvement required to complete the mitigation action (e.g., requirement for NEPA compliance or county permit);
- A description of recent or proposed projects and events in the vicinity of the proposed project, if any, such as fire rehabilitation treatments, restoration or enhancement treatments or other activities that complement the effectiveness or intent of the proposed, mitigation action;
- A description of the long term protection, management, stewardship for the project being implemented, and the entity responsible for these activities; and
- A commitment to periodic evaluation and reporting on the progress of the project in meeting stated goals and objectives, including a process for adaptively redirecting the project if necessary.

When selecting projects, the Mitigation Team will estimate the biological benefits of the projects activities, the likely success of those activities, the duration of benefit expected and measure those benefits in relation to the strategy and RFP objectives. Mitigation Team and the program administrator will work together on continuing program administration and oversight including annual reporting of program activities, expenditures, and benefits. An annual program report will describe program activities, budget, and assessment of whether the mitigation strategy and associated projects are benefitting sage-grouse and at what level or scale. The Mitigation Team and/or Program Administrator should implement a monitoring program to measure and validate whether project-specific objectives have been met. Monitoring is required of all compensatory mitigation actions to determine if the project is meeting its performance standards and objectives. As mentioned above, at regular intervals, the total habitat and/or population gains provided by the programs will be compared with the habitat/population losses associated with the participating infrastructure projects. The purpose of this comparison is to evaluate the mitigation program and make

any necessary program adjustments – particularly if the monitoring shows that the mitigation benefits are not compensating for habitat losses. This comparison will not be a basis for imposing new, unexpected requirements on the infrastructure project developers.

## **CONCLUSION**

The framework of policies, principles and procedures outlined above are meant to start a dialogue among parties engaged in sage-grouse conservation and infrastructure development. If these parties agree with the Mitigation Subcommittee that there is great value in establishing an Idaho-based compensatory mitigation program, then this framework will mark the beginning of an inclusive effort to fill in the details and complete the tasks needed to bring such a program into being. We have confidence in our collective ability to create a compensatory mitigation program that will benefit infrastructure developers, agencies, conservation interests, and – not least – Idaho's sage-grouse.

DRAFT

**Part III –****IDAHO AND SOUTHWESTERN MONTANA SUBREGION-NO NET UNMITIGATED LOSS PROCESS****Introduction**

The No Net Unmitigated Loss strategy is a means of assuring that proposed anthropogenic activities, when approved and implemented will not result in long-term degradation of Greater Sage-Grouse habitat or population and will have a net conservation benefit to the species. The attached ‘flow chart’ identifies a screening process for review of proposed anthropogenic activities. The goal of the process is to provide a consistent approach regardless of the administrative location of the project and to ensure that authorization of these projects will not contribute to the decline of the species. Though the initial Steps (1-6) are done prior to initiating the NEPA process, the authorized officer must ensure that appropriate documentation regarding the rationale and conclusion for each is included in the administrative record.

The flow chart provides for a sequential screening of proposals. However, Steps 2-6 can be done concurrently. Steps 7-12 are related to project implementation.

**Step 1**

This screening process is initiated upon formal submittal of a proposal for authorization for use of federal lands (BLM or Forest Service). The actual documentation would include, at a minimum, a description of the location, scale of the project, and timing of the disturbance and would be consistent with existing protocol and procedures for the specific type of use. It is anticipated that the proposals would be submitted by a third party.

**Step 2**

This initial review would evaluate whether the proposal would be allowed as prescribed in the Greater-Sage-Grouse Land Use Plan Amendment. For example, certain activities are prohibited in suitable habitat, such as wind or solar energy development. If the proposal is an activity that is specific prohibited, the submitter would be informed that the proposal is being rejected since it would not be consistent with the Land Use Plan, regardless of the design of the project.

In addition to consistency with program allocations, the Land Use Plan identifies a limit on the amount of disturbance that is allowed within a ‘biological significant unit’ (BSU). If current disturbance within the affected unit exceeds this threshold, the project should be deferred until such time as the amount of disturbance within the area has been reduced, through restoration or other management actions.

**Step 3**

In reviewing a proposal, determine if the project will have a direct or indirect impact on population or habitat (PPH or PGH). This can be done by:

1. Reviewing Greater Sage-Grouse Habitat maps.
2. Reviewing the 'Base Line Environment Report' (USGS) which identifies the area of direct and indirect effects for various anthropogenic activities.
3. Consultation with agency, Fish and Wildlife Service, or State Agency wildlife biologist.
4. Reviewing the standard and guidelines in the plan amendments (such as buffer distances for the proposed activity).
5. Other methods

If the proposal will not have a direct or indirect impact on either the habitat or population, proceed with the appropriate process for review, decision, and implementation of the project.

#### **Step 4**

If the project could have a direct or indirect impact of sage-grouse habitat or population, evaluate whether the proposal can be relocated so as to not have the indirect or direct impact and still achieve the intent of the proposal. This Step does not consider redesign of the project as a means of not having direct or indirect impacts but rather authorization of the project in a physical location that will not impact Greater Sage-grouse. If the project can be relocated so as to not have an impact on sage-grouse and still achieve objectives of the proposal, inform applicant and proceed with the appropriate process for review, decision, and implementation of the relocated project.

#### **Step 5**

If the preliminary review of the proposal concludes that there may be impacts to sage-grouse habitat and/or population, and the project cannot be effectively relocated to eliminate these impacts; evaluate whether the agency has the authority to modified or deny the project. If the agency does NOT have the discretionary authority to modify or deny the proposal, proceed with the authorization process (NEPA) and include appropriate mitigation requirements that minimize impacts to sage-grouse habitat and populations. Mitigations could include a combination of actions such as timing of disturbance, design modifications of the proposal, site disturbance restoration, and compensatory mitigation actions.

#### **Step 6**

If the agency has the discretionary authority to deny the project and after careful screening of the proposal (Steps 1-4) has determined that direct and indirect cannot be eliminated, evaluate the proposal to determine if the adverse impacts can be mitigated. If the impacts cannot be effectively mitigated within the BSU, reject or defer the proposal. The criteria for determining this situation would include but not limited to:

- Natural disturbance within the BSU is significant and additional activities within the area would adversely impact the species.
- The current trend within the BSU is down and additional impacts, whether mitigated or not, could lead to further decline of the species or habitat.

- The proposed mitigation has proven to be ineffective or is unproven in terms of science based approach.
- The additional impacts, after applying effective mitigation, would exceed the disturbance threshold for the BSU.
- The project would impact habitat that has been determined, through monitoring, to be a limiting factor for species sustainability within the BSU.
- Other site specific criteria that determined the project would lead to a downward trend to the current species population or habitat with the BSU.

If the project can be mitigated to provide for a net conservation benefit to the species, proceed with the design of the mitigation plan and authorization (NEPA) of the Project. The authorization process could identify issues that may require additional mitigation or denial/deferring of the project based on site specific impacts to the Greater Sage-grouse.

**Appendix K – Lands No Longer Available for Disposal**

The following public land parcels have been previously identified through the land use planning process as available for sale in conformance with the criteria described in the Federal Lands Policy and Management Act. These lands may be considered for exchange as described in the Proposed Plan but are no longer available for sale.

**Appendix L – Travel Management Planning Guidelines:**

- Among other designation criteria from 43 CFR 8342.1(b), “areas and trails shall be located to minimize harassment of wildlife or significant disruption of wildlife habitats. Special attention will be given to protect endangered or threatened species and their habitats.
- During subsequent travel management planning, all routes would undergo a route evaluation to determine its purpose and need and the potential resource and/or user conflicts from motorized travel. Where resource and/or user conflicts outweigh the purpose and need for the route, the route would be considered for closure or considered for relocation outside of sensitive GRSG habitat.
- During implementation-level travel planning, threats to GRSG and their habitat would be considered when evaluating route designations and/or closures.
- During subsequent travel management planning, routes that do not have a purpose or need would be considered for closure.
- During subsequent travel management planning, routes that are duplicative, parallel, or redundant would be considered for closure.
- During subsequent travel management planning, seasonal restrictions on OHV use would be considered in important seasonal habitats where OHV use is a threat.
- During subsequent travel management planning, OHV timing limitations would be considered in important seasonal habitats where OHV use is a threat.
- During subsequent travel management planning, consider limiting over snow vehicle (OSV) travel to designated routes, consider seasonal closures in GRSG wintering areas from November 1 through March 31 or define Designation Criteria (i.e. minimization criteria) to regulate over snow vehicle traffic.
- During subsequent travel management planning, routes not required for public access or recreation with a current administrative/agency purpose or need would be evaluated for administrative access only.
- During subsequent travel management planning, consider prioritizing restoration of routes not designated in a Travel Management Plan.
- During subsequent travel management planning, consider using seed mixes or transplant techniques that will maintain or enhance GRSG habitat when rehabilitating linear disturbances.
- During subsequent travel management planning, consider scheduling road maintenance to avoid disturbance during sensitive periods and times to the extent practicable. Consider using time of day limits (After 10:00 AM to 7:00 PM) to reduce impacts on GRSG during breeding and nesting periods.

Over-snow vehicle – a motor vehicle that is designed for use over snow and that runs on a track or tracks and/or a ski or skis, while in use over snow.

DRAFT

## Appendix X – Development of Proposed Plan Map (Alternative G) Map Differences between Draft EIS Preferred Alternatives and Proposed Plan (Alternative G)

**Overview:** The preparation of the Alternative D (BLM/FS Alternative) GRSG map involved modeling of Preliminary Priority and Preliminary General Habitat (PPH/PGH) by Idaho BLM using available GRSG lek data, Breeding Bird Density and Lek Connectivity Models, available winter habitat and additional refinements using available land use or vegetation data (e.g., agriculture, timber), and as well as expert opinion and additional local data. The Southwest Montana GRSG areas were refined by Montana BLM based on modeling and map refinements previously completed by Montana Fish, Wildlife and Parks, based on their Core area designations. For the Utah portion of the Sawtooth National Forest, BLM/FS adopted Utah BLM’s designation for that area.

For Alternative E, the Idaho Governor’s Sage-Grouse Task Force re-configured the initial BLM PPH/PGH data to create three categories of Management Zones (Core, Important, General), using additional population and habitat information, to support an adaptive management strategy focused on GRSG conservation.

During review of the DEIS, concerns were expressed by agency personnel and others that due to the broad scale nature of the initial analysis, certain portions of the Alt D and/or E maps still encompassed some areas of non-habitat, such as timber or farm lands; or they were missing some areas of potential restoration or other locally definable areas or habitat; or were designated inappropriately as Core and/or Important.

In preparation for the Proposed Plan, BLM, FS, FWS and the State of Idaho worked together to refine the GRSG Habitat Management Area map. To resolve map disparities between Alternatives D and E, and to provide more recognizable boundaries of Habitat Management Areas on the ground, BLM and FS worked closely with field personnel in December 2013, using the State’s Alternative E map as a starting point, but informed with Alt D as well as local expertise. This process had not occurred during preparation of either the Alt D or E maps for the DEIS, due to time limitations. During the winter and spring of 2014 BLM and FS also worked closely with the State of Idaho and U.S. Fish and Wildlife Service (Idaho Fish and Wildlife Office, Boise) in re-evaluating the Core, Important or General Management Zone designations of Alt E, in order to move forward with a map for the Proposed Plan (Alternative G) that met BLM and FS objectives for habitat and State of Idaho and FWS objectives for populations. The final Proposed Plan map is the result of a number of adjustments to the Alternative D or E map, identified in Table 1, displayed in Map 1 and summarized as follows:

- Some additional areas in south-central Idaho, Mountain Home and the Weiser area were added as General Habitat Management Areas (approximately 488,018 acres; these areas contain the similar habitat characteristics as for previously identified General areas and were recognized during the map refinement process between draft and final EIS), that were not reflected in the Alt D or E maps in the DEIS. These generally were annual grassland areas, from the Idaho “Key Habitat Map” that had been previously excluded from the initial PPH/PGH model; or were based on additional imagery. These areas have restoration potential to GRSG habitat, or involve past or

ongoing restoration efforts therefore were incorporated into the Alternative G map, based on recommendations from the field.

- “Donut holes” of habitat inside of a larger matrix were classified the same as the surrounding matrix (approximately 6746 acres).
- Snapping of Priority, Important, or General Habitat Management Areas to meaningful edges or features (canyons, allotment/pasture boundaries, roads etc.) was completed at the field level to facilitate use of the map designations at the field level.
- Changes in Management Area designations for portions of certain Priority, Important or General Habitat Management Areas from Alternative E. Priority Areas for Conservation boundaries in the 2013 Conservation Objectives Team Report were provided by the State of Idaho and comprised Core and Important Management Zones as displayed in Alternative E. The revised mapping of Priority and Important Habitat Management Areas for Alternative G contain additional areas than those identified as PACs. Based on these considerations the revised Priority and Important Habitat Management Areas would be forwarded to USFWS as refined PAC area if any adjustment to existing PAC boundaries were considered by USFWS for Idaho GRSG habitat areas in the future.

**Table 1. Specific Details by Geographic Area:**

<b>Conservation Area</b>	<b>Geographic Area</b>	<b>Initial Recommendation (BLM/FS field)</b>	<b>Final Decision and Rationale</b>	<b>Location and Acres</b>
<b>WEST OWYHEE</b>				
	Mountain tops in the Owyhee Mtns.	Field recommended including the top of mountains, previously mapped as non-habitat, as General. Some local records of bird use; likely some summer use	Left mountain tops as <u>non-habitat</u> . Difficult to justify as General based on nominal bird use and limited other information. No known lek or winter habitat.	A = 127,468 acres  Is the total of non-habitat mountain tops
	Juniper encroachment surrounding Owyhee mountains	Field recommended classifying as Important due to potential for juniper control efforts and habitat improvement. No leks or winter habitat in vicinity.	Kept as <u>General</u> . Difficult to justify as “Important” due to general lack of leks/nest habitat or winter habitat in that zone. Juniper work should probably focus on juniper encroachment in adjacent Core areas. General designation does not preclude restoration work, if otherwise justified.	B = 229,290 acres  Is the total number of GHMA in this area
	Owyhee front	This was a large oblong area recommended by the field to be changed from Important (as in Alt E) to Core, along the Owyhee Front. The majority of the area is overlain by recently modeled winter habitat and also encompasses a number of occupied and undetermined status leks and nesting habitat. BLM also had concerns with	Multiple discussions with the State and US FWS led to a delineation where much of the Owyhee Front remained as Important, with an additional area of Core (~25,000 ac) identified that overlaid a cluster of leks and nesting/winter habitat. Area maintained as Important has fewer and smaller leks.	C1 = 554,026 acres  Total Area of IHMA in the Owyhee Front  C2 = 70,827 Acres of PHMA Total in the Owyhee Front

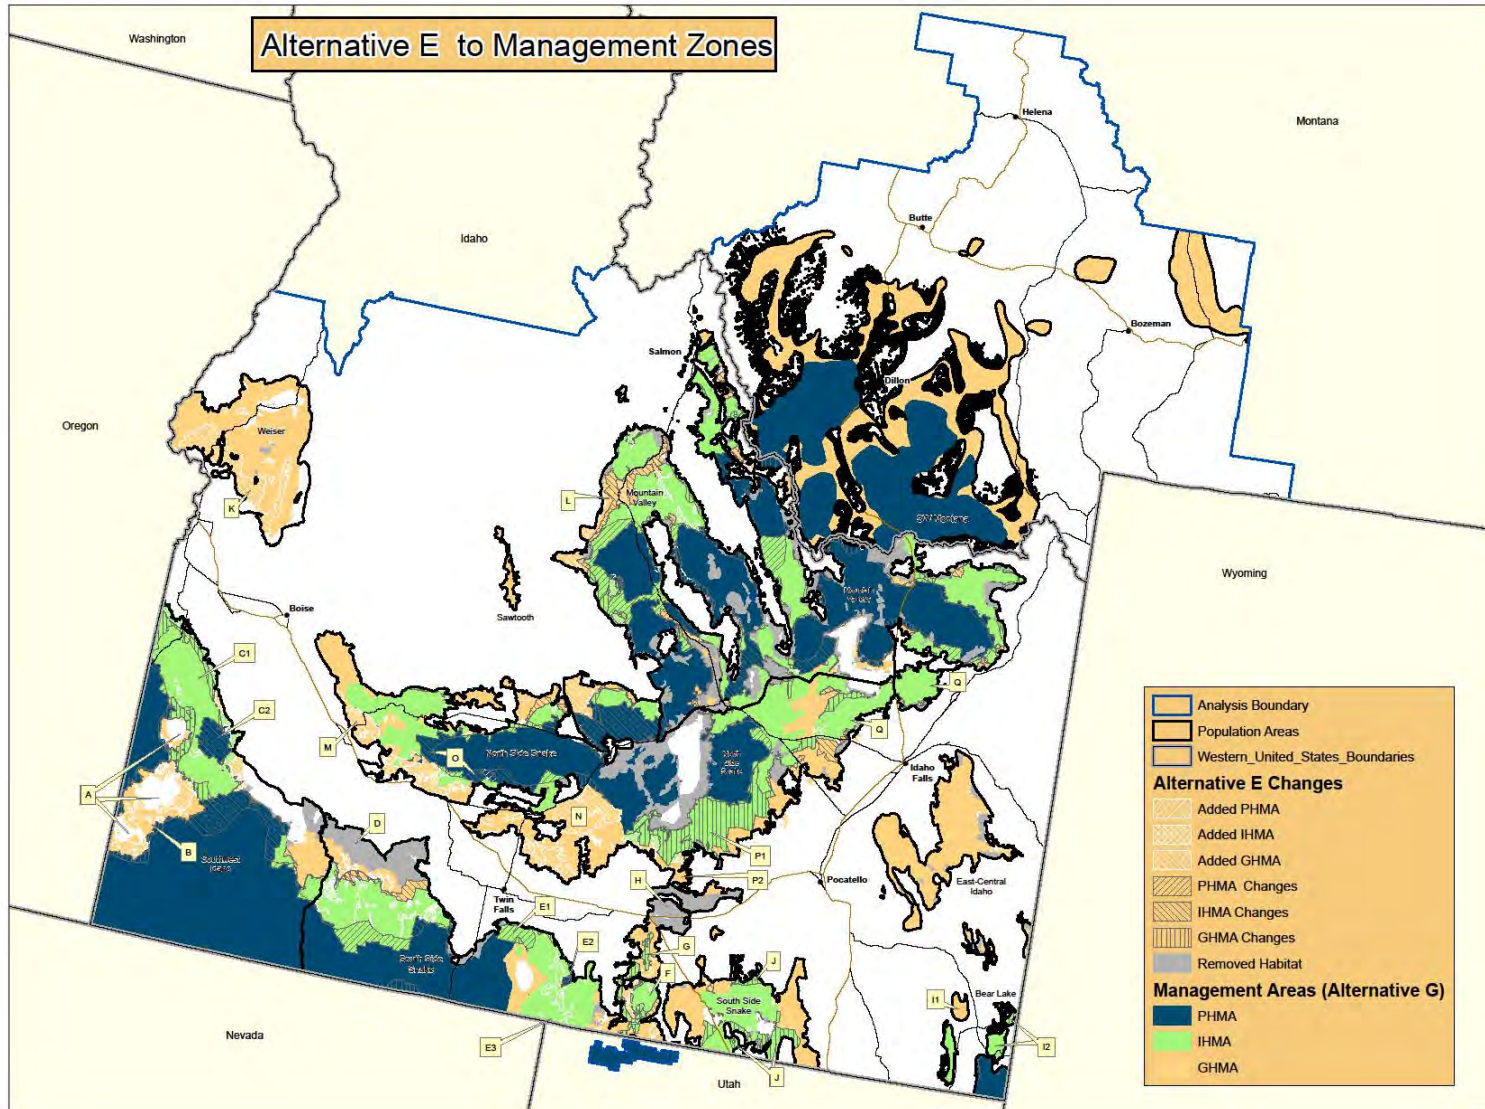

Conservation Area	Geographic Area	Initial Recommendation (BLM/FS field)	Final Decision and Rationale	Location and Acres
		protecting connectivity.		
<b>SOUTHERN</b>				
	Jarbidge FO	Field recommended removal of General habitat at north end of FO that burns repeatedly and modification of some Core to Important in southern 1/3 of the area.	Adopted recommendation for final map.	D = 232,331 acres GHMA Removed
	Burley FO-South Hills	Field recommended changing Core in west half or so of the South Hills to Important, based on existing infrastructure, recreation activity. Also included and important area of winter habitat west of Oakley as Core and added some General to Middle Mountain area.	Adopted recommendations a noted. Also retained Goose Creek area as <u>Important</u> as in Alt E.	E1 = 39,260 acres South Hills E2 = 5,283 acres Priority E3 = 26,174 acres Goose Creek Area as IHMA
	Burley FO-Jim Sage	Field recommended making part of Jim Sage Core; additional edits to Important and General.	Majority of Jim Sage mapped as Important. Proposed Core was small area not readily implementable.	F = 47,629 acres IHMA in Jim Sage
	Burley FO-Cotterel	Field added some Important patches to top of Cotterels.	Adopted recommendation.	G = 14,279 acres IHMA on Cotterel Mountains
	Burley FO-No Mans/Basalt; North of	Field recommended removing the General habitat that extends from the north end of the Cotterels to	Adopted recommendation.	H = 137,827 acres Total of non-habitat

<b>Conservation Area</b>	<b>Geographic Area</b>	<b>Initial Recommendation (BLM/FS field)</b>	<b>Final Decision and Rationale</b>	<b>Location and Acres</b>
	Interstate area.	Lake Walcott. There has been no known GRSG use for many years.		
	Pocatello FO-Bear Lake	Field cleaned up slivers and added some Core. Recommended dropping the larger “U” shaped area of General. Recommended two smaller polygons of I and G north of Bear Lake be Core.	Retained the U shaped area as General habitat as there are two leks just to south. The polygons north of Bear Lake were designated “Important”.	I1 = 23,448 acres I2 = 39,249 acres IHMA N of bear lake
	Pocatello FO-Curlew area	Some additions/revisions to I and G.	Adopted recommendations.	J = 74,820 Habitat change from G to IHMA
<b>MOUNTAIN VALLEY</b>				
	Weiser	Field recommended adding substantial areas of Core and Important as well as additional, previously unmapped General based on additional scrutiny of imagery and lek information.	Keep <u>entire area as General</u> as shown in Alt E. Added in some additional General in SW portion based on imagery and adjacency to existing habitat. Size and number of leks did not justify proposed designation.	K = 181,308 acres GHMA added in the South
	Challis	Field did extensive, detailed work edge snapping. Added some new General; changed a large area from Important (Alt E) to Core, per leks,	Adopted the edge snapping and addition of General. Uniqueness and isolated nature is not a characteristic considered in the classification.	L = 135,608 acres Total GHMA habitat in the area

Conservation Area	Geographic Area	Initial Recommendation (BLM/FS field)	Final Decision and Rationale	Location and Acres
		uniqueness/isolated nature of area and connectivity with Moyer Basin to north.		
<b>DESERT</b>				
	Mountain Home	Field recommended certain “Restoration Type 2” (cheatgrass) areas shown on the “Key Habitat Map” be classified as Important. No leks. Adjacent to Interstate. Nesting habitat and winter habitat (in north half).	Adopted the addition of the R2 but classified as <u>General</u> . Since it is R2 (cheatgrass), it was difficult to justify as Important without more compelling information.	M = 44,939 acres GHMA added
	Wild Horse	Large area not on Alt D or E maps, but currently mapped as R2 (annual grassland) per the Key habitat map has ongoing restoration focus by Shoshone Field Office. Field recommended this area be added as Important. No significant lek presence (only one, small to south); majority is in between mapped winter areas.	Adopted addition of the R2 areas, but classified as <u>General</u> . Could be upgraded in future if restoration efforts show progress and GRSG use, but not justified as Important at this time.	N = 188,475 acres GHMA Added
	Core area in Shoshone FO	Some additional Core added by edge snapping exercise.	Adopted recommendation.	O = 79,687 acres
	Southern Big Desert area	Field recommended adding southern Big Desert area as Core due to leks, connectivity with Craters Nat. Monument core to the west and northern Big Desert Core. Also cut out	Adopted S. Big Desert area as Important, adding to the overall area of PACs. Number and size of leks did not warrant Core designation.  Also designated <u>Important</u> for the areas generally adjacent to southern	P1 = 363,818 Total acres of IHMA in the South Desert and Brigham Point Area

Conservation Area	Geographic Area	Initial Recommendation (BLM/FS field)	Final Decision and Rationale	Location and Acres
		some edge habitat that interfaced with agricultural land, lava.	<p>end of the Craters of the Moon National Monument lava in the Brigham Point Area etc. This added a small acreage to the overall are of initial PACs.</p> <p>Areas to the south of Power lines and east/south side of the Wapi flow were designated <u>General</u>.</p>	P2 = 61,175 total of GHMA acres
	Idaho Falls/Roberts	<p>Field recommended adding some areas of Core per snapping efforts around the edges.</p> <p>Added two small patches of Core near the Interstate; Added moderate sized Core area near Howe (but low lek density, no wintering habitat mapped).</p>	Retained as Important. Changing the small patches near the Interstate to Core would create doughnut holes of different classification not implementable on the ground.	<p>Q = 50,223 acres</p> <p>Stayed IHMA habitat</p>

Map 1. Proposed Plan Map Changes from Draft

## Idaho and Southwestern Montana Recommendation for Proposed Plan Amendment

### 1. Summary Description of the Proposed Plan (Plan)

The Proposed Plan represents a management strategy to address Greater Sage-grouse, their habitat and associated threats within the Idaho and Southwestern Montana Subregion. The Plan has been developed through a coordinated partnership of BLM, Forest Service, the States of Idaho and Montana and the US FWS.

The Plan incorporates appropriate conservation measures to conserve, enhance, and restore GRSG habitat by reducing, eliminating, or minimizing threats to that habitat. The Plan is also consistent with the objectives described in the USFWS Conservation Objectives Team Report (USFWS 2013) to: ‘Conserve sage-grouse so that it is no longer in danger of extinction or likely to become in danger of extinction in the foreseeable future...’ through ‘Maintaining viable, connected, and well-distributed populations and habitats across [the range of GRSG], through threat amelioration, conservation of key habitats, and restoration activities’.

To achieve these objectives the Plan includes a combination of: Goals and Objectives including vegetation/habitat management objectives to be applied during project development and implementation (Table 3); land allocation decisions (Table 1); delineation of five Conservation Areas (Map 1) to support evaluation of the adaptive management strategy and 3% anthropogenic disturbance cap; delineation of Priority, Important and General Habitat Management Areas (Map 2) with associated program management direction; a mitigation framework and strategy; development of Wildfire and Invasive Species Assessments; and associated monitoring to support these decisions.

**Table 1. Idaho and Southwestern Montana GRSG EIS – Land Allocation Decisions Summary<sup>1</sup>**

Solar/Wind/Nuclear/Hydropower – Map 3		
Priority	Important	General
BLM: Exclusion (LR-2) FS: Exclusion	BLM: Avoidance (LR-2) FS: Exclusion	BLM: Open (LR-2) FS: Avoidance
Commercial Service Airports – Map 4		
Priority	Important	General
Exclusion (LR-3)	Avoidance (LR-1)	Open (LR-1)
Landfills – Map 4		
Priority	Important	General
Exclusion (LR-4)	Avoidance (LR-1)	Open (LR-1)
Utility Corridors – Map 5		
Priority	Important	General
Existing designated corridors which are land use plan designations (and include Section 368 Corridors), will remain “open” (subject to the ongoing settlement agreement) and can provide an opportunity to be modified with mitigation. Any new disturbance within these corridors would count towards the disturbance cap. All new, modified, or deleted corridors will require a land use plan amendment. (LR-7)	Same as Priority (LR-7)	Same as Priority (LR-7)
Rights-of-Way and Land Use Authorizations/Permits – Map 6		
Priority	Important	General

**Commented [BER1]:** Ethan Ellsworth - 1. Table 1. The selected land-use decisions for General Habitat are inconsistent with the stated goal of conserving GRSG habitat. In particular, the decision to leave General Habitat “Open” to solar, wind, nuclear, hydropower, commercial service airports, landfills, and ROW has potential to degrade GRSG habitat. The decision to leave general habitat open to these uses is problematic because a significant amount of general habitat contains GRSG active leks and other important seasonal habitats. Moreover, general habitat is not considered in the Adaptive Management approach to anthropogenic disturbance. Thus, there is very little protection afforded from disturbance impacts within general habitat, which could have negative impacts on local GRSG populations that use these areas for breeding or other seasonal habitat. My recommendation is to either include all habitat that includes active leks as Important or Priority (I realize, it’s not going to happen) or increase General habitat protections to the same level as Important habitat.

<sup>1</sup> The Idaho and Southwestern Montana Subregion includes portions of Idaho, Montana and Utah. Where differences exist between direction for Idaho and Montana or between BLM and Forest Service, those are noted in the table and within the management action section. The lands within Utah are part of the Sawtooth National Forest and are managed as such; therefore direction for these lands in Utah is the same as that described for the Sawtooth National Forest in Idaho.

## 2. Goals and Objectives

- 2.1. GOAL-1: Maintain and/or increase the abundance, distribution and connectivity of GRSG by conserving, enhancing and restoring GRSG habitat to maintain resilient populations by reducing, eliminating or minimizing threats to GRSG habitats.
- 2.2. GOAL-2: Provide for the needs of GRSG and their habitat while also providing for resource uses in accordance with the agencies' direction for multiple use and sustained yield as described in FLPMA and the NFMA.
- 2.3. GOAL-3: Manage anthropogenic development and human disturbance to minimize the likelihood of adverse population level effects on GRSG.
- 2.4. GOAL-4: Reduce the risk of West Nile Virus or other disease outbreaks from BLM and USFS management actions.
- 2.5. Management Area (MA) - Objective (OBJ)-1: Maintain a resilient population of GRSG in Idaho and Southwestern Montana.
- 2.6. MA-OBJ-2: Designate GRSG management areas and associated management to maintain a resilient population and to designate strategically located adjacent areas to provide a buffer from unpredictable habitat loss such as wildfire to the resilient population areas.
- 2.7. MA-OBJ-3: Identify and strategically protect larger in-tact sagebrush areas and areas of lower fragmentation to maintain GRSG population persistence.
- 2.8. Vegetation (VEG)-OBJ-1: Reconnect and expand areas of higher native plant community integrity/rangeland health to increase the extent of high quality habitat and, where possible, to accommodate the future effects of climate change.
- 2.9. VEG-OBJ-2: Increase the amount and functionality of seasonal habitats by:
  - a. Increasing canopy cover and average patch size of sagebrush in perennial grasslands.
  - b. Increasing the amount, condition and connectivity of seasonal habitats.
  - c. Protecting or improving GRSG migration/movement corridors.
  - d. Reducing conifer encroachment within GRSG seasonal habitats.
  - e. Improving understory (grass, forb) and/or riparian condition within breeding and late brood-rearing habitats.
  - f. Reducing the extent of annual grasslands within and adjacent to Priority and Important Habitat Management Areas.Decadal treatment objectives by population area are identified in Table 2.
- 2.10. Habitat Management (HM)-OBJ-1: Maintain or make progress toward at least 70% of lands within PHMAs and IHMAs capable of producing sagebrush at 10-30% canopy cover and conifers absent to uncommon within 1.86 miles of occupied leks.
- 2.11. HM-OBJ-2: Incorporate GRSG Seasonal Habitat Objectives (Table 3) into the design of projects or activities, as appropriate, based on site conditions and ecological potential, unless achievement of fuels management objectives require additional reduction in sagebrush cover to meet strategic protection of GRSG habitat and conserve habitat quality for the species; unless at least one of the following conditions can be demonstrated and documented in the NEPA analysis associated with the specific project:  
A specific objective is not applicable to the site-specific conditions of the project or activity;

Commented [BER6]: Objectives or desired conditions? In relation to the HAF.

An alternative objective is determined to provide equal or better protection for GRSG or its habitat (based on appropriate scientific findings); or Analysis concludes that following a specific objective would provide no more protection to GRSG or its habitat than not following it, for the project being proposed.

- 2.12. FUEL-OBJ-1: Design fuel treatments to restore, enhance, or maintain GRSG habitat.
- 2.13. WHB-OBJ-1: Manage wild horse and burro population levels within the established AML ranges to maintain or enhance GRSG habitat.

**Table 2. Acres of Treatment within a 10-Year Period to Achieve Vegetation Objectives<sup>2</sup>**

Population Area	Mechanical Conifer Treatment	Mechanical Sage	Prescribed Fire	Annual Grass Treatment
Bear Lake Plateau		1000		
East Idaho Uplands	6000		9000	1000
S Central Idaho/N Snake River and Mountain Valleys	4000	14000	11000	162000
Weiser				13000
SW Idaho	48000	4000	10000	444000
SW Montana	50	50	1200	

**Commented [BER7]:** Ethan Ellsworth - 3. Table 2. I am not convinced that there is appropriate justification for mechanical sage treatment or prescribed fire at the levels proposed, particularly in the S Central Idaho and Mt valley population. Moreover, this table will certainly raise some eyebrows, given that the impacts of livestock grazing are only superficially addressed in this plan. Perhaps we should think about a more subtle way to couch this table...

**Commented [BER8]:** Double check management actions for prescribed fire in high elevation areas. Footnote direction regarding use of fire in Wyoming sagebrush.

**Commented [BER9]:** Check with Rob and Kelly on numbers for Montana.

**Commented [BER10]:** Ethan Ellsworth - 4. Table 2. I recommend adding, changing or addressing the following – see me to discuss/references

- a. Nesting:
  - i. Annual grass cover (%) < 5
  - ii. Remove the sagebrush height maximum. Weak evidence that sagebrush height is a major habitat attribute, and may be in conflict with objectives for winter habitat in cases where nesting and winter habitat overlap.
  - iii. Perennial grass height < 7 inches
  - iv. Conifer encroachment (%) < 5
  - v. Consider increasing sagebrush canopy cover from a max of 25% to account for variation in GRSG populations. Perhaps relate to ecological site. Some recent studies in Nevada indicate that dense stands of sage (as high as 40% cover) are of greater value to nesting GRSG, and there are likely portions of Idaho that this holds true as well.
- b. Brood-Rearing/Summer
  - i. Remove the sagebrush height maximum
  - ii. Managing for PFC is what we are already managing for at riparian sites. Thus, this plan fails to address or outline a plan to improve an important GRSG habitat component that is, in many cases, in poor condition. Thus, the plan should be designed to be more specific to desired habitat conditions. For example, specify 1) riparian area/meadow interspersed with adjacent sagebrush (perimeter to area ratio of 0.15 within 159 buffer of the microhabitat plot, and 2) forb availability at riparian sites; e.g. > 5 species present.
  - c. Winter
    - i. It should be explained that the desired condition is that >10% of sage canopy should be >10 inches above snow. As it stands now, these two components are separate so it could be misinterpreted.

**Commented [BER11]:** How are these implemented – if not met what happens?

**Table 3. Seasonal Habitat Desired Conditions for Greater Sage-Grouse**

ATTRIBUTE	INDICATOR	DESIRED CONDITION
<b>BREEDING HABITAT (LEK AND NESTING/EARLY BROOD REARING)</b>		
Lek Security	Proximity of trees <sup>7,13</sup>	Trees (i.e., in Idaho mainly juniper, conifers, and does not include old growth juniper, pinyon pine and mountain mahogany; in Montana mainly Douglas-fir) absent or

<sup>2</sup> These acreage figures represent an objective for treatment over a ten-year (decadal) timeframe to support achievement or progress toward vegetation and habitat objectives. This accounts for variations in yearly funding availability and does not reflect a maximum acreage for treatment should funding and site specific conditions allow for more or less treatment than described in order to meet vegetation and habitat objectives.

		uncommon on shrub/grassland ecological sites within 1.86 miles (3 km) of occupied leks.
	Proximity of sagebrush to leks <sup>13</sup>	Adjacent protective sagebrush cover within 328 ft (100 m) of an occupied lek
<b>NESTING/EARLY BROOD REARING<sup>5,10,12,13,14</sup></b>

	Perennial grass canopy cover <sup>2,8</sup>	>15%
	Upland and riparian perennial forb availability <sup>2,13</sup>	Preferred forbs are common with several preferred species present <sup>6</sup> .
	Riparian meadow habitat condition	Proper Functioning Condition <sup>13</sup>
<b>WINTER<sup>1</sup> November-March<sup>1</sup> (Apply to areas of known or likely winter-use)</b>		
Cover and Food	Seasonal habitat extent <sup>8</sup>	>80% of the wintering habitat meets winter habitat characteristics where appropriate (relative to ecological site, etc.).
	Sagebrush canopy cover above snow <sup>2,8,13</sup>	>10%
	Sagebrush height above snow <sup>8</sup>	>10 inches (>25cm)
<b>NOTES AND REFERENCES</b>		
<sup>1</sup> Seasonal dates can be adjusted by local unit according to geographic region.		
<sup>2</sup> Absolute cover is the actual recorded cover and can exceed 100% when recorded across all species and all layers. It is not relative cover, which is the proportions of each species, and equals 100%. Note that cover is reported for only those species (e.g., sagebrush, preferred forbs) that are sampled to determine suitability of habitat for sage-grouse. Overall cover at the site will be greater than that sampled for sage-grouse habitat, due to		

**Commented [BER12]:** Mike Kuyper - 2) One of the reasons for completing this EIS is to ensure "regulatory certainty". On page 20 in Table 3, the term "Adequate nest cover" is used. How does using such terms (adequate) promote "regulatory certainty"?

other species present.

<sup>3</sup> Arid corresponds to the 10 – 12 inch precipitation zone; *Artemisia tridentata wyomingensis* is a common big sagebrush sub-species for this type site (Stiver et al. *In Press*).

<sup>4</sup> Mesic corresponds to the  $\geq 12$  inch precipitation zone; *Artemisia tridentata vaseyana* is a common big sagebrush sub-species for this type site (Stiver et al. *In Press*).

<sup>5</sup> Collectively the indicators for sagebrush (cover, height, and shape), perennial grass and perennial forb (cover, height and/or availability) represent the desired condition range for nesting/early brood rearing habitat characteristics, consistent with the breeding habitat suitability matrix identified in Stiver et al. *In Press*. Sagebrush plants that are more tree or columnar-shaped provide less protective cover near the ground than sagebrush plants with a spreading shape (Stiver et al. *In Press*). Some sagebrush plants are naturally columnar (e.g., Great Basin big sagebrush), and a natural part of the plant community. However, a predominance of columnar shape arising from animal impacts may warrant management investigation or adjustments at site specific scales.

<sup>6</sup> Preferred forbs are listed in Stiver et al. *In press*. Overall total forb cover may be greater than that of preferred forb cover since not all forb species are listed as preferred.

### 3. Coordination

- 3.1. CC-1: Collaborate, coordinate and utilize cooperative planning efforts to implement and monitor activities to achieve desired conditions and to maximize the utilization of available funding opportunities. Coordination efforts could include: adjacent landowners, federal and state agencies, local governments, tribes, communities, other agencies, resource advisory groups, public lands permit holders and non-governmental organizations.
- 3.2. CC-2: Develop a cooperative MOU between the BLM, Forest Service and State of Idaho to establish the State of Idaho as a cooperating agency during implementation of the final decision. The MOU would identify responsibilities, role and interaction of the BLM, FS and Task Team. Montana BLM will participate as appropriate on Montana's Sage-grouse Oversight Team to facilitate coordination and implementation of BLM's final decision and Montana's forthcoming sage-grouse conservation strategy.
- 3.3. CC-3: The BLM and Forest Service would consider any recommendations from the Governor of Idaho as a result of evaluation completed by the Sage-Grouse Implementation Task Force.
- 3.4. CC-4: The BLM and Forest Service would coordinate with the State of Idaho and Montana and the Idaho Sage-Grouse Implementation Task Force and Montana Sage-grouse Oversight Team regarding proposed management changes, the implementation of conservation measures, mitigation, and site-specific monitoring, related to adaptive management and livestock grazing (Appendix O).
- 3.5. CC-5: Upon completion of the Record of Decision the BLM will develop an Implementation Guide for BLM District and Field Offices to define and describe consistent application of the allocations, management actions, required design features, and etc. that are contained within the final plan.
- 3.6. CC-6: At the state level, BLM and Forest Service would coordinate with IDFG, MFWP, USFWS, and other conservation partners in collaborative efforts with adjacent states (Oregon, Nevada, Utah, Montana, Wyoming) in GRSG MZs IV and II to evaluate GRSG habitat and population status and trends and make appropriate recommendations for GRSG conservation at broader scales.
- 3.7. CC-7: At the state level, BLM and Forest Service would coordinate with appropriate WAFWA Sage-grouse Technical Committee to develop consistent population and habitat monitoring approaches that facilitate GRSG conservation at the MZ scale.
- 3.8. CC-8: All prescribed burning would be coordinated with state and local air quality agencies to ensure that local air quality is not significantly impacted by BLM and Forest Service activities.

Commented [BER13]: Use specific title and citation.

Commented [BER14]: Need to clarify what is strictly Idaho. Applies to XX and does not apply t

Commented [BER15]: Break into Montana and Idaho pieces. In support of the MOU in CC-2. Dillon will draft MT portion of Appendix O.

#### 4. Greater Sage-Grouse Management Areas

- 4.1. Management Area (MA)-1: Designate five GRSG Conservation Areas within the sub-region to form the geographic basis for achieving population objectives; evaluating the disturbance density and adaptive regulatory triggers; and tailor adaptive management responses. These conservation areas are depicted in Map 1. These areas are referred to as Mountain Valleys, Desert, West Owyhee, Southern and Southwestern Montana Conservation Areas.

Conservation Area Description:

Mountain Valleys Conservation Area – generally located north of the Snake River Plain, and includes habitat in west-central population area. It extends west from Rexburg, north and west of Highway 33 to Howe, north and west of Highway 33/22 to Arco, north and west of Highway 26/20/93 to Carey, north and west of Highway 20 west to Hill City, north and west of Highway 20 to the Dylan Karas Road, west to Canyon Creek. Canyon Creek to the confluence with the Snake River form the western boundary.

Desert Conservation Area – located north of the Snake River and south of the Mountain Valleys Conservation Area. It extends from the confluence of Canyon Creek and the Snake River, eastward to Idaho Falls. The Snake River and Henry’s Fork form the eastern boundary.

West Owyhee Conservation Area – located south of the Snake River and west of the Bruneau River.

Southern Conservation Area – located south of the Snake River and east of the Bruneau River, including East Idaho uplands and Bear Lake Plateau, and the Utah portion of the Sawtooth National Forest in Box Elder County.

Southwestern Montana – located in southwestern Montana - encompassing the Dillon and Butte BLM Field Office boundaries. (the Butte RMP is not being amended and since there are limited GRSG federal General Habitat Management Areas management actions do not apply in the Butte Field Office).

Additionally, sage-grouse habitats in the Desert and West Owyhee CAs are relatively contiguous, while those in the Mountain Valleys and Southern CAs tend to be more fragmented due to topography, elevational and land use differences.

- 4.2. MA-2: Within each Conservation Area (CA) designate GRSG Habitat Management Areas: Priority, Important and General Habitat Management Areas (Map 2). **Priority Habitat Management Areas (PHMAs)** focus on conserving the two key meta-populations in the sub-region. These meta-populations consist of a large aggregation of interconnected breeding subpopulations of GRSG that have the highest likelihood of long-term persistence. The PHMA encompasses areas with the highest conservation value to GRSG, based on the presence of larger leks, habitat extent, important movement and connectivity corridors and winter habitat. Priority Habitat

**Commented [BER16]:** Include a description in the introduction (Chapter 1) why Butte is not being amended.

**Commented [BER17]:** Ethan Ellsworth - Portions of this section are not clear to me. For example it is stated that “PHMAS focus on conserving the two key meta-populations in the sub-region. These meta-populations consist of a large aggregation of interconnected breeding subpopulations that have the highest likelihood of long-term persistence...” To strengthen the discussion, the following questions should be addressed:

- Which are the two key meta-populations?
- What evidence is there that any sage-grouse in Idaho exist in a meta-population?
- What evidence is there that these particular “interconnected breeding subpopulations” have the highest likelihood of persistence?

Management Areas include adequate area to accommodate continuation of existing land uses and landowner activities. **Important Habitat Management Areas (IHMAs)** contain additional high value habitat and populations that provide a management buffer for the PHMA, connect patches of PHMA. The IHMA encompasses areas of generally moderate to high conservation value habitat and/or populations and in some CAs includes areas beyond those identified by USFWS as necessary to maintain redundant, representative and resilient populations (Priority Areas for Conservation (PACs)). The IHMAs are typically adjacent to PHMAs but generally reflect somewhat lower GRSG population status and/or reduced habitat value due to disturbance, habitat fragmentation or other factors. There are no IHMAs designated within the Southwestern Montana CA. **General Habitat Management Areas (GHMAs)** encompass habitat that is outside of PHMAs or IHMAs. It is generally characterized by more marginal habitat and few, if any, occupied leks or other important seasonal use areas.

- 4.3. MA-3: Delineate PHMA and IHMA to encompass 90% of the breeding males in Idaho.
- 4.4. MA-4: Annually prioritize Conservation Areas at the state scale considering results of the annual adaptive regulatory trigger evaluations relative to implementation of restoration and mitigation activities.
- 4.5. MA-5: Prioritize activities and mitigation to protect, enhance and restore GRSG habitats (i.e. suppression activities, fuels management activities, vegetation treatments, invasive species treatments, etc.) first by Conservation Area, if appropriate (CA under adaptive management or at risk of engaging adaptive management), followed by Priority Habitat Management Areas, then Important Habitat Management Areas then General Habitat Management Areas within the Conservation Areas. Local priority areas within these areas will be further refined as a result of completing the GRSG Wildfire and Invasive Species Habitat Assessments as described in Appendix D. This could include projects outside GRSG habitat when those projects would provide a benefit to GRSG habitat. Priority restoration and mitigation areas are restoration areas identified on the Key Habitat map (R1, R2, R3 and Recent Burn) within nesting and wintering areas in Priority and Important Habitat Management Areas.
- 4.6. MA-6: The management area map and biologically significant unit baseline map would be re-evaluated in conjunction with plan evaluation processes (i.e. approximately every 5 years). This re-evaluation could indicate the need to adjust Priority, Important or General Habitat Management Areas or the habitat baseline. These adjustments could occur upon completion of the appropriate analysis (plan amendment) to review the allocation decisions based on the map. [Results from the Wildfire and Invasive Species Assessments, such as identified focal or emphasis areas would also be used to help inform mapping adjustments during this evaluation.](#)
- 4.7. MA-7: The functionality and capability of GRSG habitat within the project area would be assessed during project-level NEPA analysis within the management area designations (Priority, Important, General) and appropriate updates to the Key Habitat map would occur. Areas without the potential and capability to provide GRSG habitat would be identified, areas with the potential to provide GRSG habitat

**Commented [BER18]:** Ethan Ellsworth - It is stated that "General Habitat ... is characterized by more marginal habitat and few, if any occupied leks or other important seasonal use areas." This should be restated to reflect the biological parameters that were used to define general habitat. For example, rather than saying that general habitat has "few if any occupied leks" (by the way the "if any" part is misleading because we know that several leks do exist in general habitat) we could say something to the effect that "General Habitat is characterized by habitat that 1) is dominated by invasive species, 2) has incurred substantial and frequent fire, 3) has low levels of documented sage-grouse use, and 4) has few active leks (although "few" is pretty subjective). In addition, if PHMA and IMHA encompass 90% of the breeding males, then another part of the definition could be that general habitat encompasses only 10% of breeding males

**Commented [BER19]:** Remapping for Idaho. May need to include an action for remapping in Montana.

**Commented [BER20]:** Ethan Ellsworth - Add "late brood-rearing" areas to the last sentence in the paragraph describing Priority restoration and mitigation areas.

**Commented [BER21]:** Ethan Ellsworth - The last sentence is a bit confusing and open-ended. Does this mean that adjustments could occur only after a plan amendment? Is the plan re-evaluation process well-defined?

**Commented [BER22]:** Define terms – what does these mean – do we all know and have the same understanding?

- would be appropriately classified on the Key Habitat map. Project proposals and their effects would be evaluated based on the habitat and values affected.
- 4.8. MA-87: Idaho BLM will annually update the Key Habitat map as described in Appendix F, in order to reflect habitat changes resulting from wildfire, succession, and vegetation treatments that occurred or were observed since the last update. Updates to the map will also occur if it is determined that mapping errors or omissions have occurred, or that radio-telemetry studies indicate that sage-grouse are consistently utilizing an area. Updates are also intended to capture recommendations by the field offices, sage-grouse Local Working Groups (LWG), or agency partners in sage-grouse conservation.
- 4.9. MA-98: Areas of habitat outside of delineated management areas identified during the Key habitat update process would be evaluated during site specific NEPA for project level activities and GRSG required design features (Appendix A), seasonal timing restrictions (Appendix B) and buffers (Appendix C) would be included as part of project design. These areas would be further evaluated during plan evaluation to determine whether they should be included as Priority, Important or General Habitat Management Areas.

## 5. Adaptive Management

- 5.1. Adaptive Management (AM)-1: Idaho: Use hard and soft population and habitat triggers, evaluated within a Conservation Area, to determine an appropriate management response.
- 5.2. AM-2: Utilize monitoring information collected through the Monitoring Framework Plan (Appendix E) to determine when adaptive regulatory triggers have been met.
- 5.3. AM-3: Idaho: BLM and Forest Service would maintain GRSG habitat information, through use of the Key Habitat map or latest sagebrush/vegetation map, which would be used to track and identify habitat changes to assess the habitat trigger in the adaptive management approach. Key habitat map updates are made each winter by BLM in coordination with the FS and Idaho Department of Fish and Game (IDFG), using the process described in Appendix F.
- 5.4. AM-4: BLM and Forest Service would utilize population information collected and maintained by the Idaho Department of Fish and Game to track and identify population changes to assess the population trigger in the adaptive management approach.
- 5.5. AM-5: Twice each year the applicable monitoring information would be reviewed to determine if any adaptive management criteria have been met.
- 5.6. AM-6: Adaptive regulatory triggers would be individually calculated across all ownerships within the biologically significant units (BSU). The BSU is defined as the Idaho Department of Fish and Game modeled nesting and wintering habitat within Priority and Important Habitat Management Areas within a Conservation Area. The sagebrush component of the BSU is represented by the key habitat within the BSU.
- 5.7. AM-7: Adaptive Regulatory Criteria for Hard Habitat Triggers are defined as:
  - A 20 percent loss of Key Habitat within the biologically significant unit (BSU) (Appendix G) of the PHMA of a CA when compared to the 2011 baseline (the BSU is defined as the nesting and wintering habitat within a Priority and Important Habitat Management Areas (separately) within a Conservation Area, inclusive of all ownerships); or
  - A 20 percent loss of Key Habitat within the BSU of the IHMA of a CA when compared to the 2011 baseline.
- 5.8. AM-8: Adaptive Regulatory Criteria for Soft Habitat Triggers are defined as:
  - A 10 percent loss of Key Habitat within the BSU of the PHMA of a CA when compared to the 2011 baseline; or
  - A 10 percent loss of Key Habitat within the BSU of the IHMA of a CA when compared to the 2011 baseline.
- 5.9. AM-9: Adaptive Regulatory Criteria for Hard Population Triggers are defined as:
  - A 20 percent decline in maximum number of males counted and a finite rate of change significantly below 1.0 within PHMA within a CA over a period of 3 consecutive years compared to the 2009-2011 baseline; or
  - A 20 percent decline in maximum number of males counted and a finite rate of change significantly below 1.0 within IHMA within a CA over a period of 3 consecutive years compared to the 2009-2011 baseline. [Significance for the finite rate of change is defined by the 90% confidence interval around the current 3-year average of finite rate of change to evaluate whether the finite](#)

**Commented [BER23]:** Jim Klott - "Why is the scale different (i.e. Biological Significant Unit vs Conservation Area) when monitoring acres of habitat vs. population monitoring? If there is a substantial (20%) reduction of sage-grouse population in a biological significant unit, this may be a sign of a somewhat localized problem and should be address or at least monitored. Hitting the trigger in a Biological Significant Unit(s) could represent a loss of connection between other units. The time to take action would be before the entire population in the conservation area declines significantly."

**Commented [BER24]:** Ethan Ellsworth - Seems the BSU should include brood-rearing habitat where it does not overlap nesting and winter.

**Commented [BER25]:** Ethan Ellsworth - As far as I can tell, the hard adaptive management trigger for a BSU is based independently on 20% in PMHA and 20% in IMHA. Instead, the triggers should be calculated based on a cumulative 20% for the CA overall. Otherwise a CA could reach an overall disturbance of up to 38% without a trigger being tripped.

**Commented [BER26]:** Mike Kuyper - 3) I was able to discover the following terms used to describe sage-grouse habitat.  
- Biological Significant Units (BSU)  
- Core habitat  
- Priority habitat management area  
- Important habitat management area (IHMA)  
- Key habitat  
- General habitat management area  
- Conservation Area (CA)  
Priority Area for Conservation  
On page 26, four of these descriptions of habitat were used in 1 sentence "A 20 percent loss of Key Habitat within the BSU of the IHMA of a CA when compared to the 2011 baseline. I do not know about "regulatory certainty", but it certainly is confusing. Could the number of different sage-grouse habitats be reduced in the document?"

**Formatted:** Bulleted + Level: 1 + Aligned at: 1.25" + Indent at: 1.5"

rate of change is significantly less than 1.0. If the 90% confidence interval is less than and does not include 1.0, than the finite rate of change is significantly less than 1.0. The finite rate of change and variance will be calculated following Garton et al. (2011).

- 5.10. AM-10: Adaptive Regulatory Criteria for Soft Population Triggers are defined as:
  - A 10 percent decline in maximum number of males counted and a finite rate of change below 1.0 within PHMA within a CA over a period of 3 years when compared to the average finite rate of change from 2009-2011; or
  - A 10 percent decline in maximum number of males counted and a finite rate of change below 1.0 within IHMA within a CA over a period of 3 years when compared to the average finite rate of change from 2009-2011.
- 5.11. AM-11: When any of the Adaptive Regulatory Criteria for Soft Triggers have been met the Implementation Team would evaluate causal factors and recommend additional potential implementation level activities Appendix G.
- 5.12. AM-12: When any of the Adaptive Regulatory Criteria for Hard Triggers have been met then PHMA management actions would be applied to the IHMA within that CA.
- 5.13. AM-13: If an adaptive regulatory trigger is tripped and livestock grazing is identified as a probable limiting factor then adjustments would follow the Adaptive Grazing Management Response described in Appendix G.
- 5.14. AM-14: Remove any adaptive management response when the habitat or population information shows a return to or an exceedance of baseline values within the associated CA.
- 5.15. Montana Adaptive Management:

Formatted: Bulleted + Level: 1 + Aligned at: 1.25" + Indent at: 1.5"

Commented [BER27]: Ethan Ellsworth - There should be some language to explain that the adaptive management response should not be removed based solely on adjustment to the baseline values (key habitat acreage) within the CA. In other words, if a 5 year review reduces the amount of key habitat within a CA that has reached the threshold for the trigger, the trigger should not be removed.

Commented [BER28]: John and Kelly to write up and send ☺

## 6. Anthropogenic Disturbance

- 6.1. Anthropogenic Disturbance (AD)-1: Limit anthropogenic disturbance to 3 percent as calculated within the biologically significant unit (BSU) (Map 3). The BSU is defined as the nesting and wintering habitat within Priority and Important Habitat Management Areas within a Conservation Area, inclusive of all ownerships for evaluation. Anthropogenic disturbance excludes habitat disturbance from wildfire and fuels management activities and includes activities described in Table X. For Idaho this disturbance is measured by direct footprint or by ROW width for linear features (powerlines, pipelines and roads). For Montana this disturbance is measured utilizing the Disturbance Density Calculation Tool process described in Appendix H.
- 6.2. AD-2: New anthropogenic disturbances within Priority or Important Habitat Management Areas within a CA where the disturbance cap is already exceeded from any source or where the proposed development would result in the cap being exceeded would not be allowed until enough habitat has been restored to maintain the area under this cap (subject to valid existing rights).
- 6.3. AD-3: Priority Habitat Management Area: Anthropogenic Disturbance Exception Criteria. In order to avoid surface-disturbing activities in Priority Habitat Management Areas, priority will be given to development (including ROWs, fluid minerals and other mineral resources subject to applicable stipulations) outside of Priority Habitat Management Areas. When authorizing development in Priority Habitat Management Areas, priority will be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-Grouse. In addition to the Priority and Important Habitat Management Area Anthropogenic Disturbance Development Criteria (AD-4), the following criteria must all be met in the project screening and assessment process:
- a. The population trend for the GRSG within the associated Conservation Area is stable or increasing over a three-year period and the population levels are not currently engaging the adaptive management triggers (this applies strictly to new authorizations; renewals and amendments of existing authorizations would not be subject to this criteria when it can be shown that long-term impacts from those renewals or amendments would be substantially the same as the existing development);
  - b. The development with associated mitigation would not result in a net loss of GRSG Key habitat and mitigation would provide a net conservation benefit to the respective Priority Habitat Management Area;
  - c. The project would not result in a net loss of GRSG Key habitat or habitat fragmentation or other impacts causing a decline in the population of the species within the relevant CA (the project would be outside Key habitat in areas not meeting desired habitat conditions or the project would provide a benefit to habitat areas that are functioning in a limited way as habitat);
  - d. Cannot be reasonably accomplished outside of the Priority Habitat Management Area; or can be either: 1) developed pursuant to a valid existing authorization; 2) is an incremental upgrade/capacity increase of existing development (i.e. powerline capacity upgrade); or 3) is co-located within the footprint of existing infrastructure (i.e. powerlines) (proposed actions would not increase the 2011

Commented [BER29]: Ethan Ellsworth - Once again, evaluate whether BSU should include brood-rearing habitat.

- e. authorized footprint and associated impacts more than fifty percent (50%), depending on industry practice.
  - e. Development could be implemented adhering to the required design features (RDF) described in Appendix A;
  - f. The project would not exceed the disturbance cap (AD-1).
  - g. The project has been reviewed by the State Implementation Team and recommended for consideration by the Idaho Governor.
- 6.4.** AD-4: Priority and Important Habitat Management Areas: Anthropogenic Disturbance Development Criteria – the following criteria must be met in the screening and assessment process:
- a. The project cannot reasonably be achieved, technically or economically, outside of this management area; and
  - b. The project siting and/or design should best reduce cumulative impacts and/or impacts on GRSG and other high value natural, cultural, or societal resources; this may include co-location within the footprint for existing infrastructure, to the extent practicable; and
  - c. The project does not result in a net loss of GRSG Key habitat or habitat fragmentation or other impacts causing a decline in the population of the species within the relevant CA; and
  - d. The project design mitigates unavoidable impacts through appropriate compensatory mitigation; and
  - e. The project complies with the applicable RDFs as described in Appendix A.
  - f. The project would not exceed the disturbance cap (AD-1).
- 6.5.** AD-5: Co-locating new infrastructure within existing ROWs and maintaining and upgrading ROWs is preferred over the creation of new ROWs or the construction of new facilities in all management area. Colocation for various activities is defined as:
- Communication Sites – The installation of new equipment/facilities on or within or adjacent to existing authorized equipment/facilities or within a communication site boundary as designated in the Communication Site Plan.
- Electrical Lines – Installation of new rights-of-way (ROWs) adjacent to current ROWs boundaries, not necessarily placed on the same power poles.
- Other Rights-of-Way – The installation of new rights-of-way (ROWs) within the existing footprint of an approved ROW boundary or adjacent to an approved ROW boundary.
- Designated Corridors – The installation of new rights-of-way within the existing corridor or adjacent to the existing corridor.
- 6.6.** AD-6: Incorporate required design features (RDFs) as described in Appendix A in the development of project or proposal implementation, reauthorizations or new authorizations and suppression activities, as conditions of approval into any post-lease activities and as best management practices for locatable minerals activities, to the extent allowable by law, unless at least one of the following conditions can be

- demonstrated and documented in the NEPA analysis associated with the specific project:
- A specific RDF is not applicable to the site-specific conditions of the project or activity;
  - A proposed design feature or BMP is determined to provide equal or better protection for GRSG or its habitat; or
  - Analysis concludes that following a specific RDF would provide no more protection to GRSG or its habitat than not following it, for the project being proposed.
- 6.7. AD-7: Conduct implementation and project activities, including construction and short-term anthropogenic disturbances consistent with seasonal habitat restrictions described in Appendix B.
- 6.8. AD-8: Required Design Features and seasonal habitat restrictions would not be required for emergency or short-term activities necessary to protect and preserve human life or property.
- 6.9. AD-9: Incorporate appropriate buffers into implementation and project design to avoid and minimize impacts to GRSG described in Appendix C.
- 6.9-6.10. [AD-10: Incorporate appropriate conservation measures for slickspot peppergrass \(\*Lepidium papilliferum\*\) as described in the 2014 Conservation Agreement \(as updated, amended or reauthorized\) into implementation and project design within slickspot peppergrass habitat in the Jarbidge and Four Rivers Field Offices to avoid and minimize impacts to slickspot peppergrass. The 2014 Conservation Agreement is included as Appendix ??.](#)

DRAFT

## 7. Mitigation

~~7.1.~~ Mitigation (MIT)-1: BLM and USFS would establish an inter-agency WAFWA Management Zone GRSG Conservation TeamBoard at the state level (both Idaho and Montana) to help guide conservation of oversee-GRSG, within 90 days of the issuance of the Record of Decision. ~~Conservation.~~

**Commented [BER30]:** Compensatory – these actions are appropriate for compensatory mitigation but not avoid and minimize

**Formatted:** Indent: Left: 0.25", Hanging: 0.3"

~~7.2-7.1.~~ MIT-2: The BLM and USFS, in coordination with the GRSG Conservation TeamBoard would develop a State Mitigation Strategy within one year of the issuance of the Record of Decision. In Idaho this strategy would be consistent with the Idaho Mitigation Framework (Appendix I).

~~7.3-7.2.~~ MIT-3: Mitigate impacts from anthropogenic developments (Appendix G Table G-1) to GRSG habitats to a net conservation benefit (~~benefits more birds~~) by first avoidance of impacts, minimizing impacts and then compensating for impacts. A net conservation benefit to GRSG would be achieved by implementing restoration conservation actions, applying a no net unmitigated loss standard for authorized uses in all GRSG habitat with PHMA, IHMA and GHMA; and strategically siting compensatory mitigation actions, consistent with the WAFWA Management Zone Regional Mitigation Strategy as part of a mitigation program in order to achieve cumulative benefits (as outlined in Appendix I).

~~7.4-7.3.~~ MIT-4: Mitigate anthropogenic development (Appendix G Table G-1) impacts to a no net loss of Key habitat standard (Appendix I) through application of appropriate mitigation in accordance with the Mitigation Framework (Appendix I), referred to as no unmitigated loss. No net unmitigated loss means that impacts from implementation level actions would fully offset to benefit the species. This would be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions.

**Commented [BER31]:**

~~7.5-7.4.~~ MIT-5: Mitigate anthropogenic development (Appendix G Table G-1) impacts to GRSG habitat through application of appropriate mitigation in accordance with the Mitigation Framework (Appendix I).

~~7.5.~~ MIT-6: Consistent with regulations for minerals activities, require a full reclamation bond specific to the site when surface disturbing activities are proposed. Ensure reclamation bonds are sufficient to cover costs to fully rehabilitate lost GRSG habitat. Base the reclamation costs on the assumption that contractors for the BLM will perform the work. Areas are considered fully rehabilitated when they meet the conditions described in Table 3.

~~7.6.~~

**Commented [BER32]:** Include within PHMA, etc.

**Formatted:** Normal, No bullets or numbering

**Formatted:** Font: Garamond, 12 pt

## **8. Wildfire Preparedness/Prevention**

- 8.1. Wildfire Preparedness (WFP)-1: Support development and implementation of Rangeland Fire Protection Associations (RFPAs) in coordination with the State of Idaho.
- 8.2. WFP-2: Develop a consistent approach to fire restrictions within GRSG habitat through the existing coordinated inter-agency approach to fire restrictions based upon National Fire Danger Rating System thresholds (fuel conditions, drought conditions, and predicted weather patterns).
- 8.3. WFP-3: Annually incorporate into existing fire management plans results and updates from the Wildfire and Invasive Species Habitat Assessments (FIAT Assessments) described in Appendix D, to communicate/explain the resource value of GRSG habitat, including fire prevention messages and actions to reduce human-caused ignitions.
- 8.4. WFP-4: Continue to participate with the Wildland Fire Leadership Council, a cooperative, interagency organization dedicated to achieving consistent implementation of the goals, actions, and policies in the National Fire Plan and the Federal Wildland Fire Management Policy.
- 8.5. WFP-5: Continue annual coordination meetings held between cooperating agencies that have fire suppression responsibilities. Incorporate Rangeland Fire Protection Associations and other stakeholders into this coordination. Discuss priority suppression areas and distribute maps showing priority suppression areas at both the Conservation Area and the local office levels as based on the adaptive management strategy and FIAT Assessments.
- 8.6. WFP-6: Ensure firefighter personnel receive annual orientation regarding GRSG habitat and sagebrush management issues as related to wildfire suppression.
- 8.7. WFP-7: As part of the FIAT Assessments, identify roads, trails, and recreational use areas with high frequency of human caused fires within or adjacent to the Priority or Important Habitat Management Areas. Consider these areas during annual fire restriction evaluations, and as appropriate, through site specific management.
- 8.8. WFP-8: Coordinate with Federal, State and local jurisdictions on fire and litter prevention programs to reduce human caused ignitions.
- 8.9. WFP-9: Implement activities identified within the FIAT Assessments.

## 9. Wildfire Suppression

- 9.1. WFS-1: Complete Wildland Fire and Invasive Species Assessments (FIAT Assessments) as described within Appendix D and incorporate results into appropriate Fire Management Plans as they are completed. FIAT Assessments are interdisciplinary evaluations of the threats posed by wildfire and invasive species, as well as identification of **focal and emphasis priority** areas/treatment opportunities for fuels management, fire management, and restoration. These FIAT Assessments identify priority areas and describe strategies for fuels management, suppression and restoration activities.
- 9.2. WFS-2: As part of the FIAT Assessments incorporate a wildfire response time analysis focusing on response time to identified priority areas within Priority and Important Habitat Management Areas or on those fires that have the potential to impact Priority and Important Habitat Management Areas. Incorporate findings into Unit Initial Attack program
- 9.3. WFS-3: As part of the FIAT Assessment incorporate a water capacity analysis for suppression purposes, including potential private water sources. Provide water availability to respond to fire in or threatening PHMA and IHMA during initial attack.
- 9.4. WFS-4: During high fire danger conditions, stage initial attack and secure additional resources closer to priority areas identified in the FIAT Assessments, based on anticipated fires and weather conditions, with particular consideration of the West Owyhee, Southern and Desert Conservation Areas to ensure quicker response times in or near GRSG habitat after considerations and placement of resources to protect human life and property.
- 9.5. WFS-5: Utilize a full range of fire management strategies and tactics through strategic wildfire suppression planning consistent with appropriate management response and within acceptable risk levels, to achieve resource objectives for GRSG habitat consistent with land use plan direction. Utilizing both direct and indirect attack as appropriate to limit the overall amount of GRSG habitat burned. This could include suppressing fires in intact sagebrush habitats; limiting fire growth in General Habitat Management Areas when suppression resources are available or managing wildfire for resource benefit in areas of conifer (juniper) encroachment.
- 9.6. WFS-6: Suppression priorities: Firefighter and public safety followed by property are the highest priority for protection during suppression activities. Maintaining GRSG habitat will be prioritized immediately after human life and property, commensurate with threatened and endangered species habitat or other critical habitats to be protected.
- 9.7. WFS-7: Ensure close coordination with federal and state firefighters including the Rangeland Fire Protection Associations during suppression activities.

## **10. Fuels Management**

- 10.1.** FM-1: Design and implement fuels treatments that would reduce the potential start and spread of unwanted wildfires and provide anchor points or control lines for the containment of wildfires during suppression activities with an emphasis on maintaining, protecting, and expanding sagebrush ecosystems and successfully rehabilitated areas and strategically and effectively reduce wildfire threats in the greatest area.
- 10.2.** FM-2: Enhance (or maintain/retain) sagebrush canopy cover and community structure to match expected potential for the ecological site and consistent with GRSG habitat objectives unless fuels management objectives requires additional reduction in sagebrush cover to meet strategic protection of GRSG habitat. Closely evaluate the benefits of the fuel management treatments against the additional loss of sagebrush cover on the local landscape in the NEPA process.
- 10.3.** FM-3: Apply appropriate seasonal restrictions for implementing vegetation and fuels management treatments according to the type of seasonal habitats present. Allow no treatments in known winter range unless the treatments are designed to strategically reduce wildfire risk around and/or in the winter range and would protect, maintain, increase, or enhance winter range habitat quality. Ensure chemical applications are utilized where they would assist in success of fuels treatments. Strategically place treatments on a landscape scale to prevent fire from spreading into Priority Habitat Management Areas or WUI.
- 10.4.** FM-4: Develop a fuels continuity and management strategy to expand, enhance, maintain and protect GRSG habitat informed by the FIAT Assessments completed as described in Appendix D.
- 10.5.** FM-5: When developing the fuels management strategy as part of the FIAT Assessment described in Appendix D consider up-to-date fuels profiles; land use plan direction; current and potential habitat fragmentation; sagebrush and GRSG ecological factors; active vegetation management steps to provide critical breaks in fuel continuity where appropriate; incorporate a comparative risk analysis with regard to the risk of increased habitat fragmentation from a proposed action versus the risk of large scale fragmentation posed by wildfires if the action is not taken.
- 10.6.** FM-6: Fuel treatments will be designed through an interdisciplinary process to expand, enhance, maintain, and protect GRSG habitat which considers a full range of cost effective fuel reduction techniques, including: chemical, biological (including grazing and targeted grazing), mechanical and prescribed fire treatments.
- 10.7.** FM-7: Existing and proposed linear ROWs could be considered for use and maintenance as vegetated fuel breaks in appropriate areas (this activity may or may not be part of the ROW permit or the responsibility of the permit holder, in cases where this activity is considered part of mitigation for project design then it would be appropriately included as part of the ROW permit and the responsibility of the permit holder for development and maintenance).
- 10.8.** FM-8: Fuel breaks would incorporate existing vegetation treatments (seedings) or be located adjacent to existing linear disturbance areas where appropriate. Fuel breaks should be placed in areas with the greatest likelihood of compartmentalizing a fire and/or to foster suppression options to protect existing intact habitat.

- 10.9. FM-9: Strategically pre-treat areas to reduce fine fuels consistent with areas and results identified within the Wildfire and Invasive Species Assessments..
- 10.10. FM-10: Protect seeding efforts from subsequent fire events.
- 10.11. FM-11: Targeted grazing as a fuels treatment to adjust the vegetation conditions to reduce the potential start and spread of unwanted wildfires may be implemented within existing grazing authorizations if feasible such as through temporary non-renewable authorizations, or through contracts, agreements or other appropriate means separate from existing grazing authorizations and permits.
- 10.12. FM-12: Targeted grazing to achieve fuels management objectives should conform to the following criteria:
- Targeted grazing should be implemented strategically on the landscape, and directly involve the minimum footprint and grazing intensity required to meet fuels management objectives.
  - Allow conformance to the applicable Standards for Rangeland Health and Guidelines for Livestock Grazing Management (Idaho or Montana) at the assessment scale.
  - Where feasible and applicable coordinate with the grazing permittee to strategically reduce fuels through livestock management within the Mandatory Terms and Conditions of the applicable grazing authorizations
- 10.13. FM-13: Prioritize the use of native seeds for fuels management treatment based on availability, adaptation (site potential), and probability of success. Where probability of success or native seed availability is low or non-economical, nonnative seeds may be used to meet GRSG habitat objectives to trend toward restoring the fire regime. When reseeding, use fire resistant native and nonnative species, as appropriate, to provide for fuel breaks.
- 10.14. FM-14: Maintain effectiveness of fuels projects, including fuel breaks, to ensure long-term success, including persistence of seeded species and/or other treatment components while maintaining the integrity of adjacent vegetation.

**Commented [BER33]:** Ethan Ellsworth - I strongly suggest adding a line stating that targeted grazing should only be conducted in habitat dominated by invasive annual grasses. The long-term impact of intensive grazing on native grasses is counter to GRSG objectives.

**11. Wildfire Restoration/Rehabilitation – Emergency Stabilization and Rehabilitation**

- 11.1. ESR-1: Utilize the findings and Restoration/Rehabilitation Strategy developed as part of the FIAT Assessment process described in Appendix D to determine if GRSG rehabilitation actions are needed, based on ecological potential, and direct emergency stabilization and rehabilitation (ESR) (BLM) or Burned Area Emergency Restoration (BAER) (FS) actions after fire.
- 11.2. ESR-2: Incorporate GRSG Habitat Management Objectives into ESR/BAER plans based on site potential and in accordance with the Restoration/Rehabilitation Strategy developed as a result of the FIAT Assessments.
- 11.3. ESR-3: Provide adequate rest from livestock grazing to allow natural recovery of existing vegetation and successful establishment of seeded species. New seedlings should not be grazed until at least the end of the second growing season, and longer as needed to allow plants to mature and develop robust root systems which will stabilize the site, compete effectively against cheatgrass and other invasive annuals, and remain sustainable under long-term grazing management. Adjust other management activities, as appropriate, to meet ES&R objectives.
- 11.4. ESR-4: Adjust, as appropriate, livestock management on adjacent unburned areas to mitigate the effect of the burn on local GRSG populations.

## **12. Habitat Restoration and Vegetation Management**

- 12.1. VEG-1: Implement habitat rehabilitation or restoration projects in areas that have potential to improve GRSG habitat using a full array of treatment activities as appropriate, including chemical, mechanical and seeding treatments.
- 12.2. VEG-2: Implement vegetation rehabilitation or manipulation projects to enhance sagebrush cover or to promote diverse and healthy grass and forb understory to achieve the greatest improvement in GRSG habitat based on FIAT Assessments, HAF assessments, other vegetative assessment data and local, site specific factors that indicate sagebrush canopy cover or herbaceous conditions do not meet habitat management objectives (i.e. is minimal or exceeds optimal characteristics). This may necessitate the use of prescribed fire as a site preparation technique to remove annual grass residual growth prior to the use of herbicides in the restoration of certain lower elevation sites (e.g., Wyoming big sagebrush) but such efforts will be carefully planned and coordinated to minimize impacts to sage-grouse seasonal habitats.
- 12.3. VEG-3: Require use of native seeds for restoration based on availability, adaptation (ecological site potential), and probability of success (Richards et al. 1998). Non-native seeds may be used as long as they support GRSG habitat objectives (Pyke 2011) to increase probability of success, when adapted seed availability is low or to compete with invasive species especially on harsher sites.
- 12.4. VEG-4: Implement management changes in restoration and rehabilitation areas, as necessary, to maintain suitable GRSG habitat, improve unsuitable GRSG habitat and to ensure long-term persistence of improved GRSG habitat (Eiswerth and Shonkwiler 2006). Management changes could be considered during livestock grazing permit renewals, travel management planning, and renewal or reauthorization of rights-of-way.
- 12.5. VEG-5: Consider establishing seed harvest areas that are managed for seed production (Armstrong 2007) to provide a reliable source of locally adapted seed to use during rehabilitation and restoration activities.
- 12.6. VEG-6: Allocate use of native seed to GRSG or ESA listed species habitat in years when preferred native seed is in short supply. This may require reallocation of native seed from ESR (BLM) and/or BAER (Forest Service) projects outside of Priority or Important Habitat Management Areas to those inside it. Where probability of success or native seed availability is low, nonnative seeds may be used as long as they meet GRSG habitat conservation objectives (Pyke 2011). Re-establishment of appropriate sagebrush species/subspecies and important understory plants, relative to site potential, shall be the highest priority for rehabilitation efforts.
- 12.7. VEG-7: During land health assessments evaluate the compatibility of existing nonnative seedings for GRSG habitat to keep as a component of a grazing system, development of a forage reserve, or to be used as a fuelbreak (Davies et al. 2011) or during restoration development. If nonnative seedings do not contribute to a grazing system, are not suitable for a forage reserve, and are not suitable fuelbreaks, evaluate the nonnative seedings in and adjacent to PHMA to determine if they should be diversified with or converted to native grasses, forbs, and shrubs, including sagebrush.

- 12.8. VEG-8: Utilize conifer (juniper) removal treatments to reduce the extent of conifer encroachment areas in sagebrush habitats. Prioritize treatments closest to occupied sage-grouse habitats and near occupied leks, and where juniper encroachment is phase 1 or phase 2. Use of site-specific analysis and tools like VDTT and FIAT assessments to help refine the location for specific priority areas to be treated. Refrain from using prescribed fire and conducting removal projects in old-growth juniper stands. Old-growth juniper trees are characterized by rounded tops and spreading canopies, often containing dead limbs and/or spike tops, large branches near the base of the tree, as well as furrowed, fibrous bark, and are typically host to arboreal lichens. Leader growth in the upper quarter of the tree is usually less than one inch. These trees are generally distributed on rock outcrop or rubble land soils, or other soils with coarse fragments in the soil-surface and/or slopes over 12-25%, where juniper vegetation type is the climax plant community (IDFG 2000; Miller et al 2005; USDI and USGS 2007).
- 12.9. VEG-9: Avoid using prescribed fire in Greater Sage-Grouse habitat unless evaluation of site-specific conditions demonstrate that there would be a net benefit for sage-grouse. If prescribed fire is used in Greater Sage-Grouse habitat, include an analysis in the NEPA document that indicates how Greater Sage-Grouse goals and objectives will be addressed and met by its use, why alternative techniques were not selected, and a risk assessment to address how potential threats to Greater Sage-Grouse habitat would be minimized.
- If prescribed fire is to be used at the implementation level, at a minimum, the burn plan will indicate how land use plan objectives would be addressed and met and why alternative techniques were not selected.
  - Avoid prescribed fire as a vegetation or fuels treatment in Wyoming big sagebrush or other xeric sagebrush species, or in areas with a potential for post-fire exotic annual dominance. However, after other treatment opportunities have been explored and as site-specific variables allow, prescribed fire could be used in these areas to meet specific fuels objectives that would maintain, improve, or restore Greater Sage-Grouse habitat (e.g., creation of fuel breaks that would disrupt the fuel continuity across the landscape in stands where annual invasive grasses are a minor component in the understory, burning slash piles from conifer reduction treatments, used as a component with other treatment methods to combat annual grasses and restore native plant communities).
  - Allow no treatments in areas only providing known winter seasonal habitat unless the treatments are designed to strategically reduce wildfire risk around and/or in the winter range and would protect, maintain, increase, or enhance winter range habitat quality.

Commented [BER34]: Paul has new verbiage.

### **13. Invasive Species**

- 13.1. Invasive Species (INV)-1: Incorporate results of the FIAT Assessments into projects and activities addressing invasive species.
- 13.2. INV-2: Implement noxious weed and invasive species control using integrated vegetation management actions per national guidance and local weed management plans for Cooperative Weed Management Areas in cooperation with State and Federal agencies, affected counties, and adjoining private lands owners.
- 13.3. INV-3: Conduct integrated weed management actions for noxious and invasive weed populations that are impacting or threatening GRSG habitat quality using a variety of eradication and control techniques including chemical, mechanical and other appropriate means.
- 13.4. INV-4: Require project proponent (projects described in Table X and which are included in the anthropogenic disturbance cap evaluation) to ensure that noxious weeds and invasive species caused as a result of the project are treated to eliminate establishment on the disturbed project construction areas for at least 3 years.

#### **14. Lands and Realty / Infrastructure**

- 14.1. Lands and Realty (LR)-1: Priority: Designate and manage Priority Habitat Management Areas as ROW avoidance areas, consistent with AD-3 and subject to RDFs, buffers and seasonal timing restrictions (Appendix A, B & C). Important: Designate and manage Important Habitat Management Areas as ROW avoidance areas, consistent with AD-4 and subject to RDFs, buffers and seasonal timing restrictions. General: Designate and manage General Habitat Management Areas as open with proposals subject to RDFs, buffers and seasonal timing restrictions.
- 14.2. LR-2: Priority: Designate and manage Priority Habitat Management Areas as exclusion areas for utility scale (20 MW) Wind and Solar testing and development, nuclear and hydropower energy development. Important: Designate and manage Important Habitat Management Areas as avoidance areas for Wind and Solar testing and development, nuclear and hydropower development. General: Designate and manage General Habitat Management Areas as open for Wind and Solar testing and development and nuclear and hydropower development subject to RDFs, buffers and seasonal timing restrictions.
- 14.3. LR-3: Priority: Development of commercial service airports and facilities (as defined by FAA 2014 – publically owned airports that have at least 2,500 passenger boardings each calendar year and receive scheduled passenger service) would not be allowed within Priority Habitat Management Areas. Important and General Habitat Management Areas are Avoidance and Open respectively for these types of ROW applications as described in LR-1.
- 14.4. LR-4: Priority: Development of new or expansion of existing landfills would not be allowed within Priority Habitat Management Areas. Important and General Habitat Management Areas are Avoidance and Open respectively for these types of ROW applications as described in LR-1.
- 14.5. LR-5: Consistent with LR-2, LR-3 and LR-4, Rights-of-way for development of new or amended ROWs and land use authorizations in PHMA would only be considered when consistent with the Anthropogenic Disturbance Exception Criteria (AD-3); Rights-of-way for development of new or amended ROWs and land use authorizations in IHMA could be considered consistent with the Important Habitat Management Area Anthropogenic Disturbance Development Criteria. (AD-4). General: New ROW and land use authorizations could be considered.
- 14.6. LR-6: If the project is an incremental upgrade/capacity increase of existing development (i.e. powerline capacity upgrade) - the existing transmission line must be removed and area rehabilitated within a specified amount of time after the new line is installed and energized.
- 14.7. LR-7: Existing designated corridors, including Section 368 Corridors, will remain Open (subject to the ongoing settlement agreement).
- 14.8. LR-8: Process unauthorized use. If the use is subsequently authorized, it would be authorized consistent with direction for the Management Areas within which it is located and the RDFs, buffers and seasonal timing restrictions. If the use is not subsequently authorized the site would be reclaimed by removing these features and rehabilitating the habitat.

- 14.9. LR-9: Land use authorizations that are temporary (less than 3 years) in nature would be subject to seasonal or timing restrictions and mitigation requirements regarding habitat loss as needed.
- 14.10. LR-10: New ROW applications for water facilities (ditches, canals, pipelines), or amendments to existing water facilities which include additional structures to improve fish passage or benefits to fisheries (new diversions, fish screens) would be allowed on a case-by-case bases subject to RDFs to reduce impacts to GRSG habitat and mitigation requirements regarding GRSG habitat loss as needed.
- 14.11. LR-11: When a ROW grant expires and is not requested to be renewed, is relinquished, or terminated, the lease holder would be required to reclaim the site by removing overhead lines and other infrastructure and to eliminate avian predator nesting opportunities provided by anthropogenic development on public lands associated with the now void ROW grant (e.g., remove powerline and communication facilities no longer in service).
- 14.12. LR-12: Work with existing ROW holders to retrofit existing towers and structures consistent with RDFs described in Appendix A.
- 14.12.1. LR-13: Lands within Priority, Important or General Habitat Management Areas for Greater Sage-Grouse will be retained in federal management unless: (1) the agency can demonstrate that disposal of the lands will provide a net conservation benefit to the Greater Sage-Grouse or (2) the agency can demonstrate that the disposal of the lands will have no direct or indirect adverse impact on conservation of the Greater Sage-Grouse. Land tenure adjustments would be subject to the following disposal, exchange, and acquisition criteria, which include retaining lands with GRSG habitat. Retention of areas with GRSG would reduce the likelihood of habitat conversion to agriculture, urbanization, or other uses that would remove sagebrush habitat and potentially impact sensitive plants. Criteria:
- a. Lands within Priority, Important and General Habitat Management Areas would not be available for disposal through sale (Appendix J).
  - b. Acquire habitat within Priority and Important Habitat Management Areas, when possible (i.e. willing landowner), and retain ownership of habitat within all Areas, except if a land exchange would allow for additional or more contiguous federal ownership patterns.
  - c. Lands within Priority, Important and General Habitat Management Areas would be retained unless exchange of those lands would increase the extent or provide for connectivity of Priority or Important Habitat Management Areas.
  - d. Evaluate potential land exchanges containing historically low-quality GRSG habitat that may be too costly to restore in exchange for lands of higher quality habitat, lands that connect seasonal GRSG habitats or lands providing for threatened and endangered species. These potential exchanges should lead to an increase in the extent or continuity of or provide for improved connectivity of Priority Habitat Management Areas. Higher priority will be given to exchanges for those in-tact areas of sagebrush that will contribute to the expansion of sagebrush areas within Priority Habitat Management Areas currently in public ownership. Lower priority would be given to other lands that would promote enhancement in the Priority and Important Habitat Management Areas.

e. Identify lands for acquisition that increase the extent of or provide for connectivity of Priority Habitat Management Areas.

DRAFT

## 15. Minerals

### 15.1. Fluid Minerals

- 15.1.1. Fluid Minerals (FLM)-1: Idaho and Montana: Areas within Priority Habitat Management Areas and Important Habitat Management Areas would be open to mineral leasing and development and geophysical exploration subject to no surface occupancy with a limited exception (FLM-3). General Habitat Management Areas would be open to mineral leasing and development and geophysical exploration subject to CSU which includes buffers, seasonal timing restrictions and standard stipulations. ~~Montana: Areas within Priority Habitat Management Areas would be open to leasing subject to no surface occupancy. No waivers, exceptions or modifications would be allowed unless approved by the State Director. General Habitat Management Areas would be open to leasing subject to CSU which includes buffers, seasonal timing restrictions and standard stipulations.~~
- 15.1.2. FLM-2: ~~FLM-7~~: Parcels nominated for lease in Priority or Important Habitat Management Areas would be evaluated prior to lease offering to determine if development is feasible when buffers and seasonal timing restrictions are applied. ~~Parcels that could not be developed when these buffers and restrictions are applied would not be offered for lease, which do not meet the criteria would not be offered for lease.~~
- 15.1.3. FLM-3: Priority and Important Habitat Management Areas: A lease waiver, exception or modification to the NSO stipulation may be considered where a portion of the proposed lease is determined to be in non-greater sage-grouse habitat, the area is not used by Greater sage-grouse, or it would not have direct, indirect or cumulative effects to Greater sage-grouse or its habitat. The determination would be made by a team of interagency Greater sage-grouse experts, including an expert from the state wildlife agency, USFWS and the BLM. Waivers, by regulation, require a 30-day public review (43 CFR ????.??). All exceptions must be approved by the State Director. In the event a waiver, exception or modification were allowed development would still be subject to CSU which includes buffers, seasonal timing restrictions and standard stipulations.

#### **Waivers, Exceptions and Modifications (WEMs) (Source IM-2008-032)**

A waiver is a permanent exemption from a lease stipulation, the stipulation would no longer apply anywhere within the lease. Waivers require a 30-day public review and are approved and signed by the State Director.

An exception is a one-time exemption for a particular site within the lease; exceptions are determined on a case-by-case basis; the stipulation continues to apply to all other sites within the lease. An exception is a limited type of waiver.

A modification is a change to the provisions of a lease stipulation, either temporarily or for the term of the lease. Depending on the specific modification, the stipulation may or may not apply to all sites within the lease to which the restrictive criteria are applied.

- 15.1.4. FLM-4: Incorporate required design features and best management practices appropriate to the management area as conditions of approval when post leasing activity is proposed into any post-lease authorizations. ▲

Formatted: Font: Bold

15.1.5. FLM-5: Prior to leasing conduct a Master Leasing Plan process when all four of the following criteria are met:

· A substantial portion of the area to be analyzed in the MLP is not currently leased.

· There is a majority Federal mineral interest.

· The oil and gas industry has expressed a specific interest in leasing, and there is a moderate or high potential for oil and gas confirmed by the discovery of oil and gas in the general area.

· Additional analysis or information is needed to address likely resource or cumulative impacts if oil and gas development were to occur where there are:  
o multiple-use or natural/cultural resource conflicts;  
o impacts to air quality;  
o impacts on the resources or values of any unit of the National Park System, national wildlife refuge, or National Forest wilderness area, as determined after consultation or coordination with the NPS, the FWS, or the ES; or

15.1.4. o impacts on other specially designated areas. – analyzing likely development scenarios and varying mitigation levels.

15.1.5.15.1.6. FLM-5: Complete a Master Development Plan, consistent with plan development guide, on leases where a producing field is proposed to be developed.

15.1.6.15.1.7. FLM-6: Encourage unitization when deemed necessary for proper development and operation of an area (with strong oversight and monitoring). The unitization must be designed in a manner to minimize adverse impacts on GRSG according to the Federal Lease Form, 3100-11, Sections 4 and 6.

15.1.7.15.1.8. FLM-7: Issue Written Orders of the Authorized Officer (43 CFR 3161.2) requiring reasonable protective measures consistent with the lease terms where necessary to avoid or minimize effects to GRSG populations or habitat.

**15.2. Locatable Minerals**

**15.2.1.** Locatable Minerals (LOC)-1: Lands would remain open to locatable mineral entry in all management areas.

**15.2.2.** LOC-2: Apply reasonable and appropriate required design features and best management practices as Conditions of Approval to prevent unnecessary or undue degradation of GRSG habitat when a Plan of Operations is submitted for BLM or FS approval, in accordance with 43 CFR 3809.411(d)(2) (or 36 CFR 228.5(a)(3) on National Forest System lands).

**15.3. Salable Minerals**

**15.3.1.** Salable Minerals (SAL)-1: Priority: No new site authorizations would be approved. Important: New site authorizations could be considered provided the Anthropogenic Disturbance Development Criteria (AD-4) can be met, and subject to RDFs, buffers and seasonal timing restrictions. Sales from existing community pits within PHMA and IHMA would be subject to seasonal timing restrictions. General: Open to new site authorizations subject to RDFs, buffers and seasonal timing restrictions. Existing sites Open to new sales subject to seasonal timing restrictions.

**15.3.2.** SAL-2: Restore salable mineral pits no longer in use to meet GRSG habitat management objectives.

**15.3.3.** SAL-3: Require reclamation bonding that would require restoration of GRSG habitat on new site authorizations for mineral material pits in IHMA (this would not apply to

Formatted: Indent: Left: 0.85", No bullets or numbering

Formatted: Normal, Indent: First line: 0.5", No bullets or numbering

Commented [BER35]: John has language

free use permits issued to a government entity such as a county road district, but would apply to non-profit entities).

**15.4. Non-Energy Solid Mineral Leasable Minerals**

**15.4.1. Non Energy Leasables (NEL)-1: Priority, Important and General Habitat Management Areas:** Areas within Know Phosphate Leasing Areas (KPLAs) will remain open to leasing subject to standard stipulations. PHMA areas outside KPLAs are closed to leasing and prospecting. IHMA areas outside of KPLAs are open to prospecting and subsequent leasing provided the Anthropogenic Disturbance Development Criteria (AD-4) and the anthropogenic disturbance cap (AD-1) can be met. RDFs, buffers and seasonal timing restrictions shall be applied to prospecting permits. Exceptions to closures in PHMA and IHMA may be made for lease modifications and fringe leases where valid existing rights may be affected. General Habitat Management Areas: Lands outside KPLAs are available for prospecting and subsequent leasing and initial mine development subject to RDFs, buffers, timing restrictions (seasonal and daily) and standard stipulations.

**15.4.2. NEL-2:** Require seasonal and daily timing restrictions in undeveloped non-energy mineral leases when exploration activities or initial mine development is proposed (e.g. exploration drilling, timber removal, shrub clearing, etc.) as conditions of approval.

**15.4.3. NEL-3:** Include RDFs as conditions of approval to mine plans in undeveloped non-energy mineral leases for exploration activities or initial mine development.

**15.5. Mineral Split Estate**

**15.5.1. Mineral Split Estate (MSE)-1: BLM Owns Mineral Estate – non-federal surface owner:** ~~Where the federal government owns the mineral estate in PHMAs, IHMAs, and GHMAs, and the surface is in non-federal ownership, in coordination with surface owner, apply the same stipulations, COAs, and/or conservation measures, and RDFs design features consistent with those applied if the mineral estate is developed on to BLM- and Forest Service-administered lands in the management area, to the maximum extent permissible under existing authorities, and in coordination with the landowner.~~

**15.5.2. MSE-2: BLM owns surface – non-federal mineral estate owner:** ~~In coordination with Recommend to the state regulatory entity and mineral estate owner apply appropriate surface use that timing restrictions, COAs, stipulations, and mineral RDFs through ROW grants or other surface management instruments, to the maximum extent permissible under existing authorities in PHMA, IHMA, and GHMA, and buffer restriction be applied around occupied leks, when concurring to the approval of authorizations for mineral related surface disturbance on lands with GRSG habitat.~~

**Commented [BER36]:** Ethan Ellsworth - Seems to me that if the BLM owns the surface land and must authorize any mineral extraction that the BLM can Require rather than Recommend GRSG stipulations.

## 16. Range Management/Livestock Grazing

- 16.1. Range Management (RM)-1: Maintain existing areas designated as available or unavailable for livestock grazing. Existing active AUMs for livestock grazing within the planning area would not be changed at the broad scale, though the number of AUMs available on an allotment may be adjusted based on site-specific conditions to meet management objectives during term permit renewals, AMP development, or other appropriate implementation planning. Additionally, temporary adjustments can be made annually to livestock numbers, the number of AUMs, and season of use in accordance with applicable regulations.
- 16.2. RM-2: Prioritize BLM land health assessments and processing of BLM grazing permits consistent with management area prioritization (MA-4), unless other higher priority considerations exist such as threatened, endangered and proposed species habitat that livestock grazing could affect. Where possible, conduct land health assessments at the watershed, or other meaningful landscape-scale.
- 16.3. RM-3: Where opportunities exist, coordinate with other land managers to encourage livestock operations that utilize mixed federal, private and/or state land to be managed at the landscape scale to benefit GRSG and their habitat across land ownerships.
- 16.4. RM-4: PHMA & IHMA: During the land health assessment process, identify the type(s) of seasonal habitat the assessed areas are capable of supporting. Utilize the habitat assessment framework, (Stiver et al. 2014 as amended/replaced) or other BLM or Forest Service approved methodology, in accordance with current policy and guidance to determine whether vegetation structure, condition and composition are meeting GRSG habitat objectives including riparian and lentic areas (HM-Obj-2; Table 2). Use appropriate Ecological Site Descriptions, reference sheets and state and transition models to inform desired habitat conditions and expected responses to management changes for the land unit being assessed.
- 16.5. RM-5: When modifying grazing management, analyze indirect effects to habitat, including changes in fuel loading and wildfire behavior.
- 16.6. RM-6: When livestock management practices are determined to not be compatible with meeting or making progress towards achievable habitat objectives following consultation, cooperating and coordination with permittees and interested publics, implement changes in grazing management through grazing authorization modifications, or allotment management plan implementation. Potential modifications include, but are not limited to, changes in:
- 1) Season or timing of use;
  - 2) Numbers of livestock;
  - 3) Distribution of livestock use;
  - 4) Duration and/or level of use;
  - 5) Kind of livestock (e.g., cattle, sheep, horses, or goats) (Briske et al. 2011);
  - 6) Voluntary measures such as temporary non-use; and
  - 7) Grazing schedules (including rest or deferment).
- 16.7. RM-7: Where opportunities exist, establish forage reserves to facilitate restoration and rehabilitation efforts in sage-grouse habitat areas.
- 16.8. RM-8: PHMA, & IHMA & GHMA - When an allotment, or portion thereof, becomes vacant or grazing preference is relinquished, consider ~~voluntary~~ retirement

**Commented [BER37]:** Ethan Ellsworth - I've had discussions with Nika about adding a section titled "Guidelines for Establishing Allowable Use Levels if Not Meeting (or making progress toward) GRSG Objectives, similar to a section in the Nevada DEIS (Table 2.7 below). These guidelines would set triggers for livestock removal (e.g., upland utilization levels and stubble height). I understand that the state would not be amenable (among others), but I believe it is a valuable mechanism to hold livestock grazers accountable, so worth a discussion. I thought I'd put it out there... As it stands now, there are very few substantial differences between current management and the proposed plan (in regards to the grazing section).

Table 2-7  
Guidelines for Establishing Allowable Use Levels if Not Meeting (or Not Making Progress Toward) Greater Sage Grouse Objectives  
Community Type-Key Species Percent Utilization of Key Species Notes Terms and Conditions  
Mountain Big sage <45% herbaceous species;  
<35% shrub species . Holocheck 1998  
Mixed in with a lot of other species . Livestock removed in 3-5 days of reaching utilization level  
Wyoming and Basin Big sage . <35% herbaceous species;  
<35% shrub species . Livestock removed in 3-5 days of reaching utilization level  
Black sage . <35% herbaceous species;  
<35% shrub species Winter sheep forage Livestock removed in 3-5 days of reaching utilization level  
Riparian and wet meadows . As Applicable:  
<50% herbaceous species;  
<35% woody species or  
Average stubble height of at least four to six inches (4-6") (depending on site capability and potential) for herbaceous riparian vegetation. Monitoring would be conducted using accepted protocols (including but not limited to: Burton et al. 2011; USDI, BLM 1996; Platts 1990). Average stubble height 4-6" - Livestock removed in 3-5 days of reaching utilization level based on site. Or (sequential action)  
No grazing from May 15-Aug 30 in brood rearing habitat.

**Commented [BER38]:** Ethan Ellsworth - Consider adding an action concerning drought. For example, "Initiate emergency management measures during times of drought to protect sage-grouse PHMA and IHMA. Implement post-drought management to allow for vegetation recovery that meets sage-grouse life cycle needs."

**Commented [BER39]:** Ethan Ellsworth - I would add an 8th option - consider retiring grazing permits and making grazing unavailable.

**Commented [BER40]:** Ethan Ellsworth - Add a sentence describing what a forage reserve would look like. Is it an area with no grazing?

- of the allotment ~~or grazing preference, or portion thereof, or grazing preference in whole or in part,~~ or converting the area to a forage reserve (a.k.a. reserve common allotment)/buffer when doing so would maintain or enhance sage-grouse habitat ~~as described in subsequent site specific NEPA analysis.~~ GHMA ~~When an allotment becomes vacant or grazing preference is relinquished, consider converting it to a forage reserve/buffer to use during fire rehabilitation or restoration efforts elsewhere, when such actions would result in a net benefit to GRSG habitat and other priority resources.~~
- 16.9. RM-9: PHMA & IHMA - Where practical, design pasture rotations to utilize non-native perennial grass seedings and/or annual grasslands, during GRSG nesting season annually or periodically.
- 16.10. RM-10: Evaluate the locations where salt/supplements are placed. In coordination with the permittee, have salt/supplements placed in areas which would reduce impacts to GRSG habitat (e.g., existing disturbed areas).
- 16.11. RM-11: Incorporate RDFs into Terms and Conditions for crossing permits to limit disturbance of occupied leks when trailing livestock across BLM- and Forest Service-administered lands in the spring. Work with permittees in locating over-nighting, watering and bedding locations to minimize impacts to seasonal habitats.
- 16.12. RM-12: Design any new structural range improvements, following cooperation, consultation and coordination with permittees, to minimize and/or mitigate effects to GRSG habitat. Any new structural range improvements are subject to RDFs (Appendix A). Structural range improvement in this context, include, but are not limited to: fences, exclosures, corrals or other livestock handling structures; pipelines, troughs, storage tanks (including moveable tanks used in livestock water hauling), windmills, ponds/reservoirs, solar panels and spring developments.
- 16.13. RM-13: During the land health assessment and grazing permit renewal process, evaluate existing livestock management range improvements with respect to their effect on GRSG habitat. Consider removal of projects that are not needed for effective livestock management, are no longer in working condition, and/or negatively affect GRSG habitat, with the exception of functional projects needed for management of habitat for other threatened, endangered or proposed species or other sensitive resources.
- 16.14. RM-14: Prioritize removal, modification or marking of fences or other structures in areas of high collision risk following cooperation, consultation and coordination with permittees to reduce the incidence of GRSG mortality due to fence strikes (Stevens et al. 2012).

**17. Wild Horses and Burros**

- 17.1. Wild Horse and Burro (WHB)-1: Develop or amend BLM Herd Management Area Plans to incorporate GRSG habitat objectives and management considerations for all BLM HMAs) and Forest Service Wild Horse Territories.
- 17.2. WHB-2: When evaluating AML on HMAs within PHMA and IHMA, evaluate indicators that address structure/condition/composition of vegetation and measurements specific to achieving GRSG habitat objectives.
- 17.3. WHB-3: Utilize interdisciplinary land health assessments in HMAs containing GRSG habitat to determine whether vegetation characteristics are meeting appropriate seasonal habitat objectives.
- 17.4. WHB-4: PHMA: Do not expand HMAs. IHMA: Analysis of proposed additions to existing HMA boundaries should consider the direct, indirect and cumulative impacts on GRSG habitat, including the need for additional infrastructure such as boundary fencing, and consider alternative areas outside of PHMA and IHMA.
- 17.5. WHB-5: Prioritize gathers and population growth suppression techniques in HMAs within Priority and Important Habitat Management Areas, unless removals are necessary in other areas to address higher priority environmental issues, including herd health impacts. Additional prioritization would be given for HMAs that are near AML or where a reduction would serve the most beneficial purpose.

## 18. Travel Management

- 18.1. **Travel Management (TM) -1:** Limit off-highway vehicle motorized travel within Idaho BLM Field Offices to existing roads, primitive roads, and trails in areas where travel management planning has not been completed or is in progress. This excludes areas previously designated as open through a land use plan decision or currently under review for designation as open, currently being analyzed in ongoing RMP revision efforts in the Four Rivers, Jarbidge and Upper Snake Field Offices. Upon completion of travel management plans the designation would change to limited to designated roads, primitive roads and trails.
- An off-highway vehicle is any motorized vehicle capable of, or designed for, travel on or immediately over land, water, or other natural terrain, excluding: (1) Any nonamphibious registered motorboat; (2) any military, fire, emergency, or law enforcement vehicle while being used for emergency purposes; (3) any vehicle whose use is expressly authorized by the authorized officer, or otherwise officially approved; (4) Vehicles in official use where official use is use by an employee, agent, or designated representative of the Federal Government or one of its contractors, in the course of his employment, agency, or representation.; and (5) any combat or combat support vehicle when used in times of national defense emergencies (43 CFR 8340.0 5).

- 18.2. **TM-2:** Temporary closures will be considered in accordance with 43 CFR subpart 8364 (Closures and Restrictions); 43 CFR subpart 8351 (Designated National Area); 43 CFR subpart 6302 (Use of Wilderness Areas, Prohibited Acts, and Penalties); 43 CFR subpart 8341 (Conditions of Use).

Temporary closure or restriction orders under these authorities are enacted at the discretion of the authorized officer to resolve management conflicts and protect persons, property, and public lands and resources. Where an authorized officer determines that off-highway vehicles are causing or will cause considerable adverse effects upon soil, vegetation, wildlife, wildlife habitat, cultural resources, historical resources, threatened or endangered species, wilderness suitability, other authorized uses, or other resources, the affected areas shall be immediately closed to the type(s) of vehicle causing the adverse effect until the adverse effects are eliminated and measures implemented to prevent recurrence. (43 CFR 8341.2) A closure or restriction order should be considered only after other management strategies and alternatives have been explored. The duration of temporary closure or restriction orders should be limited to 24 months or less; however, certain situations may require longer closures and/or iterative temporary closures. This may include closure of routes or areas.

- 18.3. **TM-3:** Develop Travel Management Plans for each Field Office as described in the BLM Travel Management Handbook 8342.1 and according to the travel management planning guidelines (Appendix K).

- 18.4. **TM-4:** During subsequent travel management planning design and designate a travel system to minimize adverse effects on GRSG. Locate areas and trails to minimize harassment of wildlife or significant disruption of wildlife habitats. Give special attention to protect endangered or threatened species and their habitats. Allow for route upgrade, closure of existing routes, and creation of new routes to help protect

**Commented [BER41]:** Ethan Ellsworth - Perhaps specify the types of trails where motorized travel would be allowed (e.g., established OHV routes).

**Commented [BER42]:** Ethan Ellsworth - In the sentence beginning "Allow for..." add timing restrictions, or seasonal closure to the list of actions.

habitat and meet user group needs, thereby reducing the potential for pioneering unauthorized routes. The emphasis of the comprehensive travel and transportation planning within Priority Habitat Management Areas would be placed on having a neutral or positive effect on GRSG habitat. Individual route designations would occur during subsequent travel management planning efforts.

- 18.5.** TM-5: Conduct road maintenance activities to avoid disturbance during specific times at different seasons – see seasonal and timing restrictions section.

DRAFT

**19. Recreation**

- 19.1. REC-1: Manage existing recreation uses and sites to minimize adverse effects on GRSG or their habitat through incorporation of RDFs, buffers and seasonal restrictions.
- 19.2. REC-2: Do not construct new recreation facilities (e.g., campgrounds, trails, trailheads, staging areas) within PHMAs and IHMAs unless the development would have a neutral effect or be beneficial to GRSG habitat (such as concentrating recreation, diverting use away from critical areas, etc.); or the new construction replaces existing facilities and reduces impacts from the existing facilities as in TM-4, or unless the development is required for visitor safety or resource protection.

DRAFT

**20. Monitoring**

- 20.1. Monitoring (MON)-1: Once FIAT Assessments are complete a Annually complete a review of FIAT Assessment implementation efforts within GRSG habitat with appropriate USFWS and state agency personnel.
- 20.2. MON-2: Annually monitor the effectiveness of fuels treatment projects.
- 20.3. MON-3: Monitor invasive vegetation post vegetation management treatment
- 20.4. MON-4: Monitor project construction areas for noxious weed and invasive species for at least 3 years, unless control is achieved earlier.
- 20.5. MON-5: Use lek, nesting and winter habitat maps and key habitat map (updates) to annually assess GRSG population and habitat status in the context of the adaptive management triggers.
- 20.6. MON-6: Continue to support updates to the Key Habitat map to track vegetation changes in relation to GRSG habitat on a yearly basis, until such a time this process is replaced. The process used to update the Key Habitat Map is described in Appendix F.
- 20.7. MON-7: Monitor GRSG habitat as described in the monitoring framework plan (Appendix E) in coordination with IDFG and MT FWP.

Commented [BER43]: Ethan Ellsworth - What about adding a bullet (20.8) for RHE monitoring?

DRAFT

Commented [BER44]: John working on.

Commented [BER45]: Pat is working on Montana section.

## Idaho and Southwestern Montana Recommendation for Proposed Plan Amendment

### 1. Summary Description of the Proposed Plan (Plan)

The Proposed Plan represents a management strategy to address Greater Sage-grouse, their habitat and associated threats within the Idaho and Southwestern Montana Subregion. The Plan has been developed through a coordinated partnership of BLM, Forest Service, the States of Idaho and Montana and the US FWS.

The Plan incorporates appropriate conservation measures to conserve, enhance, and restore GRSG habitat by reducing, eliminating, or minimizing threats to that habitat. The Plan is also consistent with the objectives described in the USFWS Conservation Objectives Team Report (USFWS 2013) to: ‘Conserve sage-grouse so that it is no longer in danger of extinction or likely to become in danger of extinction in the foreseeable future...’ through ‘Maintaining viable, connected, and well-distributed populations and habitats across [the range of GRSG], through threat amelioration, conservation of key habitats, and restoration activities’.

To achieve these objectives the Plan includes a combination of: Goals and Objectives including vegetation/habitat management objectives to be applied during project development and implementation (Table 3); land allocation decisions (Table 1); delineation of five Conservation Areas (Map 1) to support evaluation of the adaptive management strategy and 3% anthropogenic disturbance cap; delineation of Priority, Important and General Habitat Management Areas (Map 2) with associated program management direction; a mitigation framework and strategy; development of Wildfire and Invasive Species Assessments; and associated monitoring to support these decisions.

Commented [BER1]: Anne Halford – There is a dearth of information on where spatially what other non-federal entities are doing or have done to move toward meeting vegetation objectives.

**Table 1. Idaho and Southwestern Montana GRSG EIS – Land Allocation Decisions Summary<sup>1</sup>**

<b>Solar/Wind/Nuclear/Hydropower – Map 3</b>		
<b>Priority</b>	<b>Important</b>	<b>General</b>
BLM: Exclusion (LR-2) FS: Exclusion	BLM: Avoidance (LR-2) FS: Exclusion	BLM: Open (LR-2) FS: Avoidance
<b>Commercial Service Airports – Map 4</b>		
<b>Priority</b>	<b>Important</b>	<b>General</b>
Exclusion (LR-3)	Avoidance (LR-1)	Open (LR-1)
<b>Landfills – Map 4</b>		
<b>Priority</b>	<b>Important</b>	<b>General</b>
Exclusion (LR-4)	Avoidance (LR-1)	Open (LR-1)
<b>Utility Corridors – Map 5</b>		
<b>Priority</b>	<b>Important</b>	<b>General</b>
Existing designated corridors which are land use plan designations (and include Section 368 Corridors), will remain “open” (subject to the ongoing settlement agreement) and can provide an opportunity to be modified with mitigation. Any new disturbance within these corridors would count towards the disturbance cap. All new, modified, or deleted corridors will require a land use plan amendment. (LR-7)	Same as Priority (LR-7)	Same as Priority (LR-7)
<b>Rights-of-Way and Land Use Authorizations/Permits – Map 6</b>		
<b>Priority</b>	<b>Important</b>	<b>General</b>

**Commented [BER2]:** Ethan Ellsworth - 1. Table 1. The selected land-use decisions for General Habitat are inconsistent with the stated goal of conserving GRSG habitat. In particular, the decision to leave General Habitat “Open” to solar, wind, nuclear, hydropower, commercial service airports, landfills, and ROW has potential to degrade GRSG habitat. The decision to leave general habitat open to these uses is problematic because a significant amount of general habitat contains GRSG active leks and other important seasonal habitats. Moreover, general habitat is not considered in the Adaptive Management approach to anthropogenic disturbance. Thus, there is very little protection afforded from disturbance impacts within general habitat, which could have negative impacts on local GRSG populations that use these areas for breeding or other seasonal habitat. My recommendation is to either include all habitat that includes active leks as Important or Priority (I realize, it’s not going to happen) or increase General habitat protections to the same level as Important habitat.

<sup>1</sup> The Idaho and Southwestern Montana Subregion includes portions of Idaho, Montana and Utah. Where differences exist between direction for Idaho and Montana or between BLM and Forest Service, those are noted in the table and within the management action section. The lands within Utah are part of the Sawtooth National Forest and are managed as such; therefore direction for these lands in Utah is the same as that described for the Sawtooth National Forest in Idaho.

## 2. Goals and Objectives

- 2.1. GOAL-1: Maintain and/or increase the abundance, distribution and connectivity of GRSG by conserving, enhancing and restoring GRSG habitat to maintain resilient populations by reducing, eliminating or minimizing threats to GRSG habitats.
- 2.2. GOAL-2: Provide for the needs of GRSG and their habitat while also providing for resource uses in accordance with the agencies' direction for multiple use and sustained yield as described in FLPMA and the NFMA.
- 2.3. GOAL-3: Manage anthropogenic development and human disturbance to minimize the likelihood of adverse population level effects on GRSG.
- 2.4. GOAL-4: Reduce the risk of West Nile Virus or other disease outbreaks from BLM and USFS management actions.
- 2.5. Management Area (MA) - Objective (OBJ)-1: Maintain a resilient population of GRSG in Idaho and Southwestern Montana.
- 2.6. MA-OBJ-2: Designate GRSG management areas and associated management to maintain a resilient population and to designate strategically located adjacent areas to provide a buffer from unpredictable habitat loss such as wildfire to the resilient population areas.
- 2.7. MA-OBJ-3: Identify and strategically protect larger in-tact sagebrush areas and areas of lower fragmentation to maintain GRSG population persistence.
- 2.8. Vegetation (VEG)-OBJ-1: Reconnect and expand areas of higher native plant community integrity/rangeland health to increase the extent of high quality habitat and, where possible, to accommodate the future effects of climate change.
- 2.9. VEG-OBJ-2: Increase the amount and functionality of seasonal habitats by:
  - a. Increasing canopy cover and average patch size of sagebrush in perennial grasslands.
  - b. Increasing the amount, condition and connectivity of seasonal habitats.
  - c. Protecting or improving GRSG migration/movement corridors.
  - d. Reducing conifer encroachment within GRSG seasonal habitats.
  - e. Improving understory (grass, forb) and/or riparian condition within breeding and late brood-rearing habitats.
  - f. Reducing the extent of annual grasslands within and adjacent to Priority and Important Habitat Management Areas.Decadal treatment objectives by population area are identified in Table 2.
- 2.10. Habitat Management (HM)-OBJ-1: Maintain or make progress toward at least 70% of lands within PHMAs and IHMAs capable of producing sagebrush at 10-30% canopy cover and conifers absent to uncommon within 1.86 miles of occupied leks.
- 2.11. HM-OBJ-2: Incorporate GRSG Seasonal Habitat Objectives (Table 3) into the design of projects or activities, as appropriate, based on site conditions and ecological potential, unless achievement of fuels management objectives require additional reduction in sagebrush cover to meet strategic protection of GRSG habitat and conserve habitat quality for the species; unless at least one of the following conditions can be demonstrated and documented in the NEPA analysis associated with the specific project:  
A specific objective is not applicable to the site-specific conditions of the project or activity;

**Commented [BER11]:** Paul Makela - Why limit to Per Grasslands? Shouldn't this apply anywhere within the three mgt areas or within Conservation Areas?

**Commented [BER12]:** Bart Zwetzig - Incorporating GRSG Seasonal Habitat Objectives into the design of most projects is going to take resources to accomplish. Monitoring for these Objectives could be significant base on work load and type of projects. Those projects that remove vegetation or move soil could require all 5 types of sage-grouse habitat assessments done to be able to say if the GRSG Seasonal Habitat Objectives are being met or not.

**Commented [BER13]:** Paul Makela - Item 2.11 needs to be broken into several sentences. Hard to read.

**Commented [BER14]:** Objectives or desired conditions? In relation to the HAF.

An alternative objective is determined to provide equal or better protection for GRSG or its habitat (based on appropriate scientific findings); or Analysis concludes that following a specific objective would provide no more protection to GRSG or its habitat than not following it, for the project being proposed.

- 2.12. FUEL-OBJ-1: Design fuel treatments to restore, enhance, or maintain GRSG habitat.
- 2.13. WHB-OBJ-1: Manage wild horse and burro population levels within the established AML ranges to maintain or enhance GRSG habitat.

**Table 2. Estimated Acres of Treatment Needed within a 10-Year Period to Achieve Vegetation Objectives<sup>2</sup>**

Population Area	Mechanical Conifer Treatment	Mechanical Sage	Prescribed Fire	Annual Grass Treatment
Bear Lake Plateau		1000

SW Montana	50	50	1200	

**Table 3. Seasonal Habitat Desired Conditions for Greater Sage-Grouse**

ATTRIBUTE	INDICATOR	DESIRED CONDITON
<b>BREEDING HABITAT (LEK AND NESTING/EARLY BROOD REARING)</b>		
Lek Security	Proximity of trees <sup>7,13</sup>	Trees (i.e., in Idaho mainly juniper, conifers, and does not include old growth juniper, pinyon pine and mountain mahogany; in

<sup>2</sup> These acreage figures represent an objective for treatment over a ten-year (decadal) timeframe to support achievement or progress toward vegetation and habitat objectives. This accounts for variations in yearly funding availability and does not reflect a maximum acreage for treatment should funding and site specific conditions allow for more or less treatment than described in order to meet vegetation and habitat objectives.

**Commented [BER15]:** Ethan Ellsworth - 3. Table 2. I am not convinced that there is appropriate justification for mechanical sage treatment or prescribed fire at the levels proposed, particularly in the S Central Idaho and Mt valley population. Moreover, this table will certainly raise some eyebrows, given that the impacts of livestock grazing are only superficially addressed in this plan. Perhaps we should think about a more subtle way to couch this table...

**Commented [BER16]:** Anne Halford – This table outlines proactive treatments but another table should be developed that addresses on-going actions that may or may not contribute to attainment of key vegetation objectives. For instance yearly ES&R and fuels treatments may or may not use appropriate tools and plant species that meet vegetation objectives specific to GRSG habitat. Since these treatments often are imposed at landscape level it is critical that strategies to significantly increase the efficacy of ES&R and fuel treatment are discussed/analyzed. For instance depending on where the treatment sites are on the resistance/resilience continuum as well as site disturbance legacy – stabilization treatments that emphasize the use of competitive non-native species often inhibits sagebrush seeding success as does not using the correct sagebrush seed provenance and subspecies. The use of passive restoration (Pyke) is important as well and is particularly applicable if fires occur within the high end of the RR continuum. These are sites where extant native vegetation often persists and can recover post-fire which should be leveraged via appropriate post-fire management of livestock grazing, versus heavy handed landscape manipulations or treatments that could compromise the recovery of extant native vegetation.

**Commented [BER17]:** Elena Shaw - Will the acres shown in the table be the same as the FIAT assessment? Will they change once the FIAT is done?

**Commented [BER18]:** Double check management actions for prescribed fire in high elevation areas. Footnote direction regarding use of fire in Wyoming sagebrush.

**Commented [BER19]:** Paul Makela - This 4000 ac decadal figure seems low considering the amount of juniper in SC Idaho in Burley FO and Twin Falls RD of Sawtooth.

**Commented [BER20]:** Check with Rob and Kelly on numbers for Montana.

**Commented [BER21]:** Ethan Ellsworth - 4. Table 2. I recommend adding, changing or addressing the following – see me to discuss/references

- a. Nesting:
  - i. Annual grass cover (%) < 5
  - ii. Remove the sagebrush height maximum. Weak evidence that sagebrush height is a major habitat attribute, and may be in conflict with objectives for winter habitat in cases where nesting and winter habitat overlap.
  - iii. Perennial grass height < 7 inches
  - iv. Conifer encroachment (%) < 5
  - v. Consider increasing sagebrush canopy cover from a max of 25% to account for variation in GRSG populations. Perhaps relate to ecological site. Some recent studies in Nevada indicate that ... [1]

**Commented [BER22]:** How are these implemented – if not met what happens?

**Commented [BER23]:** Elena Shaw - Is there a distinction between perennial grass cover and perennial grass canopy cover (nesting vs. late brood rearing), if so might want to footnote the difference for the casual reader or use same terminology.

<b>NOTES AND REFERENCES</b>		
<sup>1</sup> Seasonal dates can be adjusted by local unit according to geographic region.		
<sup>2</sup> Absolute cover is the actual recorded cover and can exceed 100% when recorded across all species and all layers. It is not relative cover, which is the proportions of each species, and equals 100%. Note that cover is		

**Commented [BER24]:** Mike Kuyper - 2) One of the reasons for completing this EIS is to ensure "regulatory certainty". On page 20 in Table 3, the term "Adequate nest cover" is used. How does using such terms (adequate) promote "regulatory certainty"?

**Commented [BER25]:** Jim Klott - The example - "e.g., sagebrush, preferred forbs" implies that only sagebrush and preferred forbs determine suitability while it is actually determined by considering all the attributes in the table. Might be clearer to state "Because the shrub canopy can overlay grasses, forbs, or biological crusts actual cover can exceed 100%."

reported for only those species (e.g., sagebrush, preferred forbs) that are sampled to determine suitability of habitat for sage-grouse. Overall cover at the site will be greater than that sampled for sage-grouse habitat, due to other species present. Manage areas not currently within a mapped seasonal habitat based on case-by case, site specific analysis arising from habitat assessments, telemetry, research or site specific NEPA.

<sup>3</sup> Arid corresponds to the 10 – 12 inch precipitation zone; *Artemisia tridentata wyomingensis* is a common big sagebrush sub-species for this type site (Stiver et al. *In Press*).

<sup>4</sup> Mesic corresponds to the  $\geq 12$  inch precipitation zone; *Artemisia tridentata vaseyana* is a common big sagebrush sub-species for this type site (Stiver et al. *In Press*).

<sup>5</sup> Collectively the indicators for sagebrush (cover, height, and shape), perennial grass and perennial forb (cover, height and/or availability) represent the desired condition range for nesting/early brood rearing habitat characteristics, consistent with the breeding habitat suitability matrix identified in Stiver et al. *In Press*. Sagebrush plants that are more tree or columnar-shaped provide less protective cover near the ground than sagebrush plants with a spreading shape (Stiver et al. *In Press*). Some sagebrush plants are naturally columnar (e.g., Great Basin big sagebrush), and a natural part of the plant community. However, a predominance of columnar shape arising from animal impacts may warrant management investigation or adjustments at site specific scales.

<sup>6</sup> Preferred forbs are listed in Stiver et al. *In press*. Overall total forb cover may be greater than that of preferred forb cover since not all forb species are listed as preferred.

### 3. Coordination

- 3.1. CC-1: Collaborate, coordinate and utilize cooperative planning efforts to implement and monitor activities to achieve desired conditions and to maximize the utilization of available funding opportunities. Coordination efforts could include: adjacent landowners, federal and state agencies, local governments, tribes, communities, other agencies, resource advisory groups, public lands permit holders and non-governmental organizations.
- 3.2. CC-2: Develop a cooperative MOU between the BLM, Forest Service and State of Idaho to establish the State of Idaho as a cooperating agency during implementation of the final decision. The MOU would identify responsibilities, role and interaction of the BLM, FS and ~~State of Idaho Task Team~~. Montana BLM will participate as appropriate on Montana's Sage-grouse Oversight Team to facilitate coordination and implementation of BLM's final decision and Montana's ~~forthcoming~~ sage-grouse conservation strategy.
- 3.3. ~~CC-3: The BLM and Forest Service would consider any recommendations from the Governor of Idaho as a result of evaluation completed by the Sage-Grouse Implementation Task Force.~~
- 3.4. CC-4: The BLM and Forest Service would coordinate with the State of Idaho and Montana and the Idaho Sage-Grouse Implementation Task Force and Montana Sage-grouse Oversight Team regarding proposed management changes, the implementation of conservation measures, mitigation, and site-specific monitoring, related to adaptive management and livestock grazing (Appendix O).
- 3.5. CC-5: Upon completion of the Record of Decision the BLM will develop an initial Implementation Guide for BLM District and Field Offices within a year of issuance of the Record of Decision. This Guide would ~~to~~ define and describe consistent application of the allocations, management actions, required design features, and etc. that are contained within the final plan and would be updated and expanded as needed to respond to issues and concerns.
- 3.6. CC-6: At the state level, BLM and Forest Service would coordinate with IDFG, MFWP, USFWS, and other conservation partners in collaborative efforts with adjacent states (Oregon, Nevada, Utah, Montana, Wyoming) in GRSG MZs IV and II to evaluate GRSG habitat and population status and trends and make appropriate regional recommendations for GRSG conservation at broader scales.
- 3.7. CC-7: At the state level, BLM and Forest Service would coordinate with the appropriate WAFWA Sage-grouse Technical Committee to develop consistent population and habitat monitoring approaches that facilitate GRSG conservation at the MZ scale.
- 3.8. CC-8: All prescribed burning would be coordinated with state and local air quality agencies to ensure that local air quality is not significantly impacted by BLM and Forest Service activities.

Commented [BER27]: Use specific title and citation.

Commented [BER28]: Need to clarify what is strictly Idaho. Applies to XX and does not apply t

Commented [BER29]: Break into Montana and Idaho pieces. In support of the MOU in CC-2. Dillon will draft MT portion of Appendix O.

#### 4. Greater Sage-Grouse Management Areas

- 4.1. Management Area (MA)-1: Designate five GRSG Conservation Areas within the sub-region to form the geographic basis for achieving population objectives; evaluating the disturbance density and adaptive regulatory triggers; and tailor adaptive management responses. These conservation areas are depicted in Map 1. These areas are referred to as Mountain Valleys, Desert, West Owyhee, Southern and Southwestern Montana Conservation Areas.

Conservation Area Description:

Mountain Valleys Conservation Area – generally located north of the Snake River Plain, and includes habitat in west-central population area. It extends west from Rexburg, north and west of Highway 33 to Howe, north and west of Highway 33/22 to Arco, north and west of Highway 26/20/93 to Carey, north and west of Highway 20 west to Hill City, north and west of Highway 20 to the Dylan Karas Road, west to Canyon Creek. Canyon Creek to the confluence with the Snake River form the western boundary.

Desert Conservation Area – located north of the Snake River and south of the Mountain Valleys Conservation Area. It extends from the confluence of Canyon Creek and the Snake River, eastward to Idaho Falls. The Snake River and Henry’s Fork form the eastern boundary.

West Owyhee Conservation Area – located south of the Snake River and west of the Bruneau River.

Southern Conservation Area – located south of the Snake River and east of the Bruneau River, including East Idaho uplands and Bear Lake Plateau, and the Utah portion of the Sawtooth National Forest in Box Elder County.

Southwestern Montana – located in southwestern Montana - encompassing the Dillon and Butte BLM Field Office boundaries. (the Butte RMP is not being amended and since there are limited GRSG federal General Habitat Management Areas management actions do not apply in the Butte Field Office).

Additionally, sage-grouse habitats in the Desert and West Owyhee CAs are relatively contiguous, while those in the Mountain Valleys and Southern CAs tend to be more fragmented due to topography, elevational and land use differences.

- 4.2. MA-2: Within each Conservation Area (CA) designate GRSG Habitat Management Areas: Priority, Important and General Habitat Management Areas (Map 2). Priority Habitat Management Areas (PHMAs) focus on conserving the two key meta-populations in the sub-region. These meta-populations consist of a large aggregation of interconnected breeding subpopulations of GRSG that have the highest likelihood of long-term persistence. The PHMA encompasses areas with the highest conservation value to GRSG, based on the presence of larger leks, habitat extent, important movement and connectivity corridors and winter habitat. Priority Habitat

**Commented [BER30]:** Bart Zwetzig - Mountain and Valleys Conservation Area seems lacking in its description. A descriptor sentence stating that the valleys up to and including Challis and Salmon would help with describing the northern extent of this area.

**Commented [BER31]:** Include a description in the introduction (Chapter 1) why Butte is not being amended.

**Commented [BER32]:** Jim Klott - Recommend describing what is meant by “land use differences”. For example, is it different land uses on public lands versus private lands?

**Commented [BER33]:** Ethan Ellsworth - Portions of this section are not clear to me. For example it is stated that “PHMAs focus on conserving the two key meta-populations in the sub-region. These meta-populations consist of a large aggregation of interconnected breeding subpopulations that have the highest likelihood of long-term persistence...” To strengthen the discussion, the following questions should be addressed:

- a. Which are the two key meta-populations?
- b. What evidence is there that any sage-grouse in Idaho exist in a meta-population?
- c. What evidence is there that these particular “interconnected breeding subpopulations” have the highest likelihood of persistence?

Management Areas include adequate area to accommodate continuation of existing land uses and landowner activities. **Important Habitat Management Areas (IHMA)s** contain additional high value habitat and populations that provide a management buffer for the PHMA and to connect patches of PHMA. The IHMA encompasses areas of generally moderate to high conservation value habitat and/or populations and in some CAs includes areas beyond those identified by USFWS as necessary to maintain redundant, representative and resilient populations (Priority Areas for Conservation (PACs)). The IHMA's are typically adjacent to PHMA's but generally reflect somewhat lower GRSG population status and/or reduced habitat value due to disturbance, habitat fragmentation or other factors. There are no IHMA's designated within the Southwestern Montana CA. **General Habitat Management Areas (GHMA)s** encompass habitat that is outside of PHMA's or IHMA's. It is generally characterized by more marginal habitat and few, if any, occupied leks or other important seasonal use areas.

- 4.3. MA-3: Delineate PHMA and IHMA to encompass 90% of the breeding males in Idaho.
- 4.4. MA-4: Annually prioritize Conservation Areas at the state scale considering results of the annual adaptive regulatory trigger evaluations relative to implementation of restoration and mitigation activities.
- 4.5. MA-5: Prioritize activities and mitigation to protect, enhance and restore GRSG habitats (i.e. fire suppression activities, fuels management activities, vegetation treatments, invasive species treatments, etc.) first by Conservation Area, if appropriate (CA under adaptive management or at risk of engaging adaptive management), followed by Priority Habitat Management Areas, then Important Habitat Management Areas then General Habitat Management Areas within the Conservation Areas. Local priority areas within these areas will be further refined as a result of completing the GRSG Wildfire and Invasive Species Habitat Assessments as described in Appendix D. This could include projects outside GRSG habitat when those projects would provide a benefit to GRSG habitat. Priority restoration and mitigation areas are restoration areas identified on the Key Habitat map (R1, R2, R3 and Recent Burn) within nesting and wintering areas in Priority and Important Habitat Management Areas.
- 4.6. MA-6: The management area map and biologically significant unit baseline map would be re-evaluated in conjunction with plan evaluation processes (i.e. approximately every 5 years). This re-evaluation could indicate the need to adjust Priority, Important or General Habitat Management Areas or the habitat baseline. These adjustments could occur upon completion of the appropriate analysis (plan amendment) to review the allocation decisions based on the map. Results from the Wildfire and Invasive Species Assessments, such as identified focal or emphasis areas would also be used to help inform mapping adjustments during this evaluation.
- 4.7. MA-7: The functionality and capability of GRSG habitat within the project area would be assessed during project-level NEPA analysis within the management area designations (Priority, Important, General) and appropriate annual updates to the Key Habitat map would occur. Areas without the potential and capability to provide GRSG habitat would be identified, areas with the potential to provide GRSG habitat

**Commented [BER34]:** Ethan Ellsworth - It is stated that "General Habitat ... is characterized by more marginal habitat and few, if any occupied leks or other important seasonal use areas." This should be restated to reflect the biological parameters that were used to define general habitat. For example, rather than saying that general habitat has "few if any occupied leks" (by the way the "if any" part is misleading because we know that several leks do exist in general habitat) we could say something to the effect that "General Habitat is characterized by habitat that 1) is dominated by invasive species, 2) has incurred substantial and frequent fire, 3) has low levels of documented sage-grouse use, and 4) has few active leks (although "few" is pretty subjective). In addition, if PHMA and IMHA encompass 90% of the breeding males, then another part of the definition could be that general habitat encompasses only 10% of breeding males

**Commented [BER35]:** Remapping for Idaho. May need to include an action for remapping in Montana.

**Commented [BER36]:** Ethan Ellsworth - Add "late brood-rearing" areas to the last sentence in the paragraph describing Priority restoration and mitigation areas.

**Commented [BER37]:** Ethan Ellsworth - The last sentence is a bit confusing and open-ended. Does this mean that adjustments could occur only after a plan amendment? Is the plan re-evaluation process well-defined?

**Commented [BER38]:** Define terms – what does these mean – do we all know and have the same understanding?

- would be appropriately classified on the Key Habitat map. Project proposals and their effects would be evaluated based on the habitat and values affected.
- 4.8. MA-87: Idaho BLM will annually update the Key Habitat map as described in Appendix F, in order to reflect habitat changes resulting from wildfire, succession, and vegetation treatments that occurred or were observed since the last update. Updates to the map will also occur if it is determined that mapping errors or omissions have occurred, or that radio-telemetry studies indicate that sage-grouse are consistently utilizing an area. Updates are also intended to capture recommendations by the field offices, sage-grouse Local Working Groups (LWG), or agency partners in sage-grouse conservation.
- 4.9. MA-98: Areas of habitat outside of delineated management areas identified during the Key habitat update process would be evaluated during site specific NEPA for project level activities and GRSG required design features (Appendix A), seasonal timing restrictions (Appendix B) and buffers (Appendix C) would be included as part of project design. These areas would be further evaluated during plan evaluation and the 5-year update to the management areas, to determine whether they should be included as Priority, Important or General Habitat Management Areas.

## 5. Adaptive Management

- 5.1. Adaptive Management (AM)-1: Idaho: Use hard and soft population and habitat triggers, evaluated within a Conservation Area, to determine an appropriate management response.
- 5.2. AM-2: Utilize monitoring information collected through the Monitoring Framework Plan (Appendix E) to determine when adaptive regulatory triggers have been met.
- 5.3. AM-3: Idaho: BLM and Forest Service would maintain GRSG habitat information, through use of the Key Habitat map or latest sagebrush/vegetation map, which would be used to track and identify habitat changes to assess the habitat trigger in the adaptive management approach. Key habitat map updates are made each winter by BLM in coordination with the FS and Idaho Department of Fish and Game (IDFG), using the process described in Appendix F.
- 5.4. AM-4: BLM and Forest Service would utilize population information collected and maintained by the Idaho Department of Fish and Game to track and identify population changes to assess the population trigger in the adaptive management approach.
- 5.5. AM-5: Twice each year the applicable monitoring information would be reviewed to determine if any adaptive management triggers/criteria have been met.
- 5.6. AM-6: Adaptive regulatory triggers would be individually calculated across all ownerships within the biologically significant units (BSU). The BSU is defined as the Idaho Department of Fish and Game modeled nesting and wintering habitat within Priority and Important Habitat Management Areas within a Conservation Area. The sagebrush component of the BSU is represented by the key habitat within the BSU.
- 5.7. AM-7: Adaptive Regulatory Criteria for Hard Habitat Triggers are defined as:
- A 20 percent loss of Key Habitat within the biologically significant unit (BSU) (Appendix G) of the PHMA of a CA when compared to the 2011 baseline (the BSU is defined as the nesting and wintering habitat within a Priority and Important Habitat Management Areas (separately) within a Conservation Area, inclusive of all ownerships); or
  - A 20 percent loss of Key Habitat within the BSU of the IHMA of a CA when compared to the 2011 baseline.
- 5.8. AM-8: Adaptive Regulatory Criteria for Soft Habitat Triggers are defined as:
- A 10 percent loss of Key Habitat within the BSU of the PHMA of a CA when compared to the 2011 baseline; or
  - A 10 percent loss of Key Habitat within the BSU of the IHMA of a CA when compared to the 2011 baseline.
- 5.9. AM-9: Adaptive Regulatory Criteria for Hard Population Triggers are defined as:
- A 20 percent decline in maximum number of males counted and a finite rate of change significantly below 1.0 within PHMA within a CA over a period of 3 consecutive years compared to the 2009-2011 baseline; or
  - A 20 percent decline in maximum number of males counted and a finite rate of change significantly below 1.0 within IHMA within a CA over a period of 3 consecutive years compared to the 2009-2011 baseline. Significance for the finite rate of change is defined by the 90% confidence interval around the current 3-year average of finite rate of change to evaluate whether the finite

**Commented [BER39]:** Paul Makela - What about MT and UT portions?

**Commented [BER40]:** Bart Zwetzig - Will population information be codified through state office and disseminated out to field offices? Is the Field Office of State Office responsible for assessing if population triggers have been met? Who will review applicable monitoring information twice a year? Who's is responsible for calculating adaptive regulatory triggers? Recommend appointing a sage-grouse czar to do these duties on a regional level.

**Commented [BER41]:** Jim Klott - "Why is the scale different (i.e. Biological Significant Unit vs Conservation Area) when monitoring acres of habitat vs. population monitoring? If there is a substantial (20%) reduction of sage-grouse population in a biological significant unit, this may be a sign of a somewhat localized problem and should be address or at least monitored. Hitting the trigger in a Biological Significant Unit(s) could represent a loss of connection between other units. The time to take action would be before the entire population in the conservation area declines significantly."

**Commented [BER42]:** Ethan Ellsworth - Seems the BSU should include brood-rearing habitat where it does not overlap nesting and winter.

**Commented [BER43]:** Ethan Ellsworth - As far as I can tell, the hard adaptive management trigger for a BSU is based independently on 20% in PMHA and 20% in IMHA. Instead, the triggers should be calculated based on a cumulative 20% for the CA overall. Otherwise a CA could reach an overall disturbance of up to 38% without a trigger being tripped.

**Commented [BER44]:** Mike Kuyper - 3) I was able to discover the following terms used to describe sage-grouse habitat.

- Biological Significant Units (BSU)
- Core habitat
- Priority habitat management area
- Important habitat management area (IHMA)
- Key habitat
- General habitat management area
- Conservation Area (CA)
- Priority Area for Conservation

On page 26, four of these descriptions of habitat were used in 1 sentence "A 20 percent loss of Key Habitat within the BSU of the IHMA of a CA when compared to the 2011 baseline. I do not know about "regulatory certainty", but it certainly is confusing. Could the number of different sage-grouse habitats be reduced in the document?"

**Formatted:** Bulleted + Level: 1 + Aligned at: 1.25" + Indent at: 1.5"

rate of change is significantly less than 1.0. If the 90% confidence interval is less than and does not include 1.0, then the finite rate of change is significantly less than 1.0. The finite rate of change and variance will be calculated following Garton et al. (2011).

- 5.10. AM-10: Adaptive Regulatory Criteria for Soft Population Triggers are defined as:
- A 10 percent decline in maximum number of males counted and a finite rate of change below 1.0 within PHMA within a CA over a period of 3 years when compared to the average finite rate of change from 2009-2011; or
  - A 10 percent decline in maximum number of males counted and a finite rate of change below 1.0 within IHMA within a CA over a period of 3 years when compared to the average finite rate of change from 2009-2011.
- 5.11. AM-11: When any of the Adaptive Regulatory Criteria for Soft Triggers have been met the Implementation Team would evaluate causal factors and recommend additional potential implementation level activities Appendix G.
- 5.12. AM-12: When any of the Adaptive Regulatory Criteria for Hard Triggers have been met then PHMA management actions would be applied to the IHMA within that CA.
- 5.13. AM-13: If an adaptive regulatory trigger is tripped and livestock grazing is identified as a probable limiting factor then adjustments would follow the Adaptive Grazing Management Response described in Appendix G.
- 5.14. AM-14: Remove any adaptive management response when the habitat or population information shows a return to or an exceedance of baseline values within the associated CA.
- 5.15. Montana Adaptive Management:

Formatted: Bulleted + Level: 1 + Aligned at: 1.25" + Indent at: 1.5"

Commented [BER45]: Ethan Ellsworth - There should be some language to explain that the adaptive management response should not be removed based solely on adjustment to the baseline values (key habitat acreage) within the CA. In other words, if a 5 year review reduces the amount of key habitat within a CA that has reached the threshold for the trigger, the trigger should not be removed.

Commented [BER46]: John and Kelly to write up and send ☺

6. Anthropogenic Disturbance

- 6.1. Anthropogenic Disturbance (AD)-1: Limit anthropogenic disturbance to 3 percent as calculated within the biologically significant unit (BSU) (Map 3). The BSU is defined as the currently mapped nesting and wintering habitat within Priority and Important Habitat Management Areas within a Conservation Area, inclusive of all ownerships for evaluation. Anthropogenic disturbance excludes habitat disturbance from wildfire and fuels management activities and includes activities described in Table X. For Idaho this disturbance is measured by direct footprint or by ROW width for linear features (powerlines, pipelines and roads). For Montana this disturbance is measured utilizing the Disturbance Density Calculation Tool process described in Appendix H.
- 6.2. AD-2: New anthropogenic disturbances within Priority or Important Habitat Management Areas within a CA where the disturbance cap is already exceeded from any source or where the proposed development would result in the cap being exceeded would not be allowed until enough habitat has been restored to maintain the area under this cap (subject to valid existing rights).
- 6.3. AD-3: Priority Habitat Management Area: Anthropogenic Disturbance Exception Criteria. In order to avoid surface-disturbing activities in Priority Habitat Management Areas, priority will be given to development (including ROWs, fluid minerals and other mineral resources subject to applicable stipulations) outside of Priority Habitat Management Areas. When authorizing development in Priority Habitat Management Areas, priority will be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-Grouse. In addition to the Priority and Important Habitat Management Area Anthropogenic Disturbance Development Criteria (AD-4), the following criteria must all be met in the project screening and assessment process:
  - a. The population trend for the GRSG within the associated Conservation Area is stable or increasing over a three-year period and the population levels are not currently engaging the adaptive management triggers (this applies strictly to new authorizations; renewals and amendments of existing authorizations would not be subject to this criteria when it can be shown that long-term impacts from those renewals or amendments would be substantially the same as the existing development);
  - b. The development with associated mitigation would not result in a net loss of GRSG Key habitat and mitigation would provide a net conservation benefit to the respective Priority Habitat Management Area;
  - c. The project and associated impacts would not result in a net loss of GRSG Key habitat or habitat fragmentation or other impacts causing a decline in the population of the species within the relevant CA (the project would be outside Key habitat in areas not meeting desired habitat conditions or the project would provide a benefit to habitat areas that are functioning in a limited way as habitat);
  - d. Cannot be reasonably accomplished outside of the Priority Habitat Management Area; or can be either: 1) developed pursuant to a valid existing authorization; 2) is an incremental upgrade/capacity increase of existing development (i.e. powerline capacity upgrade) ; or 3) is co-located within the footprint of existing infrastructure (i.e. powerlines) (proposed actions would not increase the 2011

**Commented [BER47]:** Anne Halford – Not including anthropogenic disturbances such as livestock grazing especially in post-fire landscapes as well as ES&R and fuel treatments is a red flag – these activities comprise a significant amount of historic and current vegetation manipulations and depending on what kinds of post fire or treatment management occurs, the type of rehab equipment used, seed mixes as well as the spatial location of treatments along the site disturbance continuum all effects where and how well vegetation objectives are met.

**Commented [BER48]:** Ethan Ellsworth - Once again, evaluate whether BSU should include brood-rearing habitat.

**Commented [BER49]:** Elena Shaw - How will development/disturbance be monitored on private land? Should we explain how this will be accomplished so the public is aware and is not surprised later?

**Commented [BER50]:** Jim Klott - Map 3 shows Wind and Solar Development Allocations not BSUs. Map 1 shows the Conservation Areas but not BSUs. Maybe add BSUs to this map or provide a separate map? Also, it is well known anthropogenic impacts may extend well beyond the "direct foot print" of a project (see research on changes to sage-grouse habitat use in areas with gas/oil development in Wyoming), how are these impacts addressed?

**Commented [BER51]:** Elena Shaw - Recommend clarifying that no new disturbance would be allowed in the CA (rather than in the specific habitat management area or the BSU) if the disturbance cap has been met anywhere in the CA.

**Commented [BER52]:** Jim Klott - Because sage-grouse populations are somewhat cyclic, 3 years may not be a long enough time span. It would be better to compare the populations at peaks or troughs in the long term data.

- e. authorized footprint and associated impacts more than fifty percent (50%), depending on industry practice.
  - e. Development could be implemented adhering to the required design features (RDF) described in Appendix A;
  - f. The project would not exceed the disturbance cap (AD-1).
  - g. The project has been reviewed by the State Implementation Team and recommended for consideration by the Idaho Governor.
- 6.4.** AD-4: Priority and Important Habitat Management Areas: Anthropogenic Disturbance Development Criteria – the following criteria must be met in the screening and assessment process:
- a. The project cannot reasonably be achieved, technically or economically, outside of this management area; and
  - b. The project siting and/or design should best reduce cumulative impacts and/or impacts on GRSG and other high value natural, cultural, or societal resources; this may include co-location within the footprint for existing infrastructure, to the extent practicable; and
  - c. The project does not result in a net loss of GRSG Key habitat or habitat fragmentation or other impacts causing a decline in the population of the species within the relevant CA; and
  - d. The project design mitigates unavoidable impacts through appropriate compensatory mitigation; and
  - e. The project complies with the applicable RDFs as described in Appendix A.
  - f. The project would not exceed the disturbance cap (AD-1).
- 6.5.** AD-5: Co-locating new infrastructure within existing ROWs and maintaining and upgrading ROWs is preferred over the creation of new ROWs or the construction of new facilities in all management area. Colocation for various activities is defined as:
- Communication Sites – The installation of new equipment/facilities on or within or adjacent to existing authorized equipment/facilities or within a communication site boundary as designated in the Communication Site Plan.
- Electrical Lines – Installation of new rights-of-way (ROWs) adjacent to current ROWs boundaries, not necessarily placed on the same power poles.
- Other Rights-of-Way – The installation of new rights-of-way (ROWs) within the existing footprint of an approved ROW boundary or adjacent to an approved ROW boundary.
- Designated Corridors – The installation of new rights-of-way within the existing corridor or adjacent to the existing corridor.
- 6.6.** AD-6: Incorporate required design features (RDFs) as described in Appendix A in the development of project or proposal implementation, reauthorizations or new authorizations and suppression activities, as conditions of approval into any post-lease activities and as best management practices for locatable minerals activities, to the extent allowable by law, unless at least one of the following conditions can be

**Commented [BER53]:** Elean Shaw - How do these two criteria differ? If no difference should if only be mentioned in section 6.4.e.?

- demonstrated and documented in the NEPA analysis associated with the specific project:
- A specific RDF is not applicable to the site-specific conditions of the project or activity;
  - A proposed design feature or BMP is determined to provide equal or better protection for GRSG or its habitat; or
  - Analysis concludes that following a specific RDF would provide no more protection to GRSG or its habitat than not following it, for the project being proposed.
- 6.7. AD-7: Conduct implementation and project activities, including construction and short-term anthropogenic disturbances consistent with seasonal habitat restrictions described in Appendix B.
- 6.8. AD-8: Required Design Features and seasonal habitat restrictions would not be required for emergency or short-term activities necessary to protect and preserve human life or property.
- 6.9. AD-9: Incorporate appropriate buffers into implementation and project design to avoid and minimize impacts to GRSG described in Appendix C.
- 6.9-6.10. AD-10: Incorporate appropriate conservation measures for slickspot peppergrass (*Lepidium papilliferum*) as described in the 2014 Conservation Agreement (as updated, amended or reauthorized) into implementation and project design within slickspot peppergrass habitat in the Jarbidge and Four Rivers Field Offices to avoid and minimize impacts to slickspot peppergrass. The 2014 Conservation Agreement is included as Appendix ??.

Table X. Anthropogenic Disturbances and Areas of Impact

Datasets as Described in the Monitoring Framework <sup>3</sup>
Oil and Gas Wells and Development Facilities
Coal Mines
Wind Towers
Solar Fields
Geothermal Development Facilities
Mining (Active Locatable, Leasable and Saleable Developments)
Roads
Railroads
Powerlines
Communication Towers
Other Vertical Structures
Additional Local Datasets (need definitions)
Underground Pipelines
Coal Bed Methane Ponds
Meteorological Towers (e.g., wind energy testing)

Commented [BER54]: Paul Makela - NOC has been working on white paper?

## 7. Mitigation

~~7.1.~~ Mitigation (MIT)-1: BLM and USFS would establish an inter-agency WAFWA Management Zone GRSG Conservation TeamBoard at the state level (both Idaho and Montana) to help guide conservation of oversee GRSG, within 90 days of the issuance of the Record of Decision. ~~Conservation.~~

**Commented [BER55]:** Compensatory – these actions are appropriate for compensatory mitigation but not avoid and minimize

**Formatted:** Indent: Left: 0.25", Hanging: 0.3"

~~7.2-7.1.~~ MIT-2: The BLM and USFS, in coordination with the GRSG Conservation TeamBoard would develop a State Mitigation Strategy within one year of the issuance of the Record of Decision. In Idaho this strategy would be consistent with the Idaho Mitigation Framework (Appendix I).

~~7.3-7.2.~~ MIT-3: Mitigate impacts from anthropogenic developments (Appendix G Table G-1) to GRSG habitats to a net conservation benefit (~~benefits more birds~~) by first avoidance of impacts, minimizing impacts and then compensating for impacts. A net conservation benefit to GRSG would be achieved by implementing restoration conservation actions, applying a no net unmitigated loss standard for authorized uses in all GRSG habitat with PHMA, IHMA and GHMA; and strategically siting compensatory mitigation actions, consistent with the WAFWA Management Zone Regional Mitigation Strategy as part of a mitigation program in order to achieve cumulative benefits (as outlined in Appendix I).

~~7.4-7.3.~~ MIT-4: Mitigate anthropogenic development (Appendix G Table G-1) impacts to a no net loss of Key habitat standard (Appendix I) through application of appropriate mitigation in accordance with the Mitigation Framework (Appendix I), referred to as no unmitigated loss. No net unmitigated loss means that impacts from implementation level actions would fully offset to benefit the species. This would be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions.

**Commented [BER56]:** Jim Klott - How is the "no net loss" determined? If habitat is restored it may take 20 years before the restoration provides functional habitat. This would not mitigate the immediate loss of "key" habitat due to a project. In some cases, loss of high elevation habitat cannot be mitigated by restoration of low elevation habitat.

**Commented [BER57]:** Paul Makela - I still do not see how we get to no net loss of key habitat (= sage cover at least 10%) if mitigation takes 20 +years to take hold. Maybe this no-net loss standard should apply over the long term, over the subregion, recognizing there will be a need for short term losses locally? Or maybe it is a goal but not a standard?

~~7.5-7.4.~~ MIT-5: Mitigate anthropogenic development (Appendix G Table G-1) impacts to GRSG habitat through application of appropriate mitigation in accordance with the Mitigation Framework (Appendix I).

~~7.5.~~ MIT-6: Consistent with regulations for minerals activities, require a full reclamation bond specific to the site when surface disturbing activities are proposed. Ensure reclamation bonds are sufficient to cover costs to fully rehabilitate lost GRSG habitat. Base the reclamation costs on the assumption that contractors for the BLM will perform the work. Areas are considered fully rehabilitated when they meet the conditions described in Table 3.

~~7.6.~~

**Commented [BER58]:** Include within PHMA, etc.

**Formatted:** Normal, No bullets or numbering

**Formatted:** Font: Garamond, 12 pt

## 8. Wildfire Preparedness/Prevention

- 8.1. Wildfire Preparedness (WFP)-1: Support development and implementation of Rangeland Fire Protection Associations (RFPAs) in coordination with the State of Idaho.
- 8.2. WFP-2: Develop a consistent approach to fire restrictions within GRSG habitat through the existing coordinated inter-agency approach to fire restrictions based upon National Fire Danger Rating System thresholds (fuel conditions, drought conditions, and predicted weather patterns).
- 8.3. WFP-3: Annually incorporate into existing fire management plans results and updates from the Wildfire and Invasive Species Habitat Assessments (FIAT Assessments) described in Appendix D, to communicate/explain the resource value of GRSG habitat, including fire prevention messages and actions to reduce human-caused ignitions.
- 8.4. WFP-4: Continue to participate with the Wildland Fire Leadership Council, a cooperative, interagency organization dedicated to achieving consistent implementation of the goals, actions, and policies in the National Fire Plan and the Federal Wildland Fire Management Policy.
- 8.5. WFP-5: Continue annual coordination meetings held between cooperating agencies that have fire suppression responsibilities. Incorporate Rangeland Fire Protection Associations and other stakeholders into this coordination. Discuss priority suppression areas and distribute maps showing priority suppression areas at both the Conservation Area and the local office levels as based on the adaptive management strategy and FIAT Assessments.
- 8.6. WFP-6: Ensure firefighter personnel receive annual orientation regarding GRSG habitat and sagebrush management issues as related to wildfire suppression.
- 8.7. WFP-7: As part of the FIAT Assessments, identify roads, trails, and recreational use areas with high frequency of human caused fires within or adjacent to the Priority or Important Habitat Management Areas. Consider these areas during annual fire restriction evaluations, and as appropriate, through site specific management.
- 8.8. WFP-8: Coordinate with Federal, State and local jurisdictions on fire and litter prevention programs to reduce human caused ignitions.
- 8.9. WFP-9: Implement activities identified within the FIAT Assessments.

Commented [BER59]: Paul Makela - Does this need a due date?

## 9. Wildfire Suppression

- 9.1. WFS-1: Complete Wildland Fire and Invasive Species Assessments (FIAT Assessments) as described within Appendix D and incorporate results into appropriate Fire Management Plans as they are completed. FIAT Assessments are interdisciplinary evaluations of the threats posed by wildfire and invasive species, as well as identification of ~~focal and emphasis priority habitats/areas~~/treatment opportunities for fuels management, fire management, and restoration. These FIAT Assessments identify ~~focal and emphasis priority habitats/areas~~ and describe strategies for fuels management, suppression and restoration activities. Focal and Emphasis Habitats identified through the FIAT Assessment to further refine priority areas for treatments to reduce the threats posed by wildfire, invasive annual grass and conifer expansion.
- 9.2. WFS-2: As part of the FIAT Assessments incorporate a wildfire response time analysis focusing on response time to identified priority areas within Priority and Important Habitat Management Areas or on those fires that have the potential to impact Priority and Important Habitat Management Areas. Incorporate findings into Unit Initial Attack program
- 9.3. WFS-3: As part of the FIAT Assessment incorporate a water capacity analysis for suppression purposes, including potential private water sources. Provide water availability to respond to fire in or threatening PHMA and IHMA during initial attack.
- 9.4. WFS-4: During high fire danger conditions, stage initial attack and secure additional resources closer to priority areas identified in the FIAT Assessments, based on anticipated fires and weather conditions, with particular consideration of the West Owyhee, Southern and Desert Conservation Areas to ensure quicker response times in or near GRSG habitat after considerations and placement of resources to protect human life and property.
- 9.5. WFS-5: Utilize a full range of fire management strategies and tactics through strategic wildfire suppression planning consistent with appropriate management response and within acceptable risk levels, to achieve resource objectives for GRSG habitat consistent with land use plan direction. Utilizing both direct and indirect attack as appropriate to limit the overall amount of GRSG habitat burned. This could include suppressing fires in intact sagebrush habitats; limiting fire growth in General Habitat Management Areas when suppression resources are available or managing wildfire for resource benefit in areas of conifer (juniper) encroachment.
- 9.6. WFS-6: Suppression priorities: Firefighter and public safety followed by property are the highest priority for protection during suppression activities. Maintaining GRSG habitat will be prioritized immediately after human life and property, commensurate with threatened and endangered species habitat or other critical habitats to be protected.
- 9.7. WFS-7: Ensure close coordination with federal and state firefighters including the Rangeland Fire Protection Associations during suppression activities.

## 10. Fuels Management

- 10.1. FM-1: Design and implement fuels treatments that would reduce the potential start and spread of unwanted wildfires and provide anchor points or control lines for the containment of wildfires during suppression activities with an emphasis on maintaining, protecting, and expanding sagebrush ecosystems and successfully rehabilitated areas and strategically and effectively reduce wildfire threats in the greatest area.
- 10.2. FM-2: Enhance (or maintain/retain) sagebrush canopy cover and community structure to match expected potential for the ecological site and consistent with GRSG habitat objectives unless fuels management objectives requires additional reduction in sagebrush cover to meet strategic protection of GRSG habitat. Closely evaluate the benefits of the fuel management treatments against the additional loss of sagebrush cover on the local landscape in the NEPA process.
- 10.3. FM-3: Apply appropriate seasonal restrictions for implementing vegetation and fuels management treatments according to the type of seasonal habitats present. Allow no treatments in known winter range unless the treatments are designed to strategically reduce wildfire risk around and/or in the winter range and would protect, maintain, increase, or enhance winter range habitat quality. Ensure chemical applications are utilized where they would assist in success of fuels treatments. Strategically place treatments on a landscape scale to prevent fire from spreading into Priority Habitat Management Areas or WUI.
- 10.4. FM-4: Develop a fuels continuity and management strategy to expand, enhance, maintain and protect GRSG habitat informed by the FIAT Assessments completed as described in Appendix D.
- 10.5. FM-5: When developing the fuels management strategy as part of the FIAT Assessment described in Appendix D consider up-to-date fuels profiles; land use plan direction; current and potential habitat fragmentation; sagebrush and GRSG ecological factors; active vegetation management steps to provide critical breaks in fuel continuity where appropriate; incorporate a comparative risk analysis with regard to the risk of increased habitat fragmentation from a proposed action versus the risk of large scale fragmentation posed by wildfires if the action is not taken.
- 10.6. FM-6: Fuel treatments will be designed though an interdisciplinary process to expand, enhance, maintain, and protect GRSG habitat which considers a full range of cost effective fuel reduction techniques, including: chemical, biological (including grazing and targeted grazing), mechanical and prescribed fire treatments.
- 10.7. FM-7: Existing and proposed linear ROWs could be considered for use and maintenance as vegetated fuel breaks in appropriate areas (this activity may or may not be part of the ROW permit or the responsibility of the permit holder, in cases where this activity is considered part of mitigation for project design then it would be appropriately included as part of the ROW permit and the responsibility of the permit holder for development and maintenance).
- ~~10.8.~~10.7.1. FM-8: Fuel breaks would incorporate existing vegetation treatments (seedings), rocky areas or other appropriate topography or features or be located adjacent to existing linear disturbance areas where appropriate. Fuel breaks should be placed in areas with the greatest likelihood of compartmentalizing a fire and/or to foster suppression options to protect existing intact habitat.

**Commented [BER60]:** Jim Klott - Recommend addressing the use of non-palatable species such as Secar bluebunch wheatgrass. Secar has been planted throughout the District and although it looks nice nothing really eats it leaving 2 or more years of dead vegetation in the plants increasing fuel loads.

Formatted

- ~~40-9-10.8.~~ FM-9: Strategically pre-treat areas to reduce fine fuels consistent with areas and results identified within the Wildfire and Invasive Species Assessments..
- ~~40-10-10.9.~~ FM-10: Protect seeding efforts from subsequent fire events.
- ~~40-11-10.10.~~ FM-11: Targeted grazing as a fuels treatment to adjust the vegetation conditions to reduce the potential start and spread of ~~unwanted~~ wildfires may be implemented within existing grazing authorizations if feasible such as through temporary non-renewable authorizations, or through contracts, agreements or other appropriate means separate from existing grazing authorizations and permits.
- ~~40-12-10.11.~~ FM-12: Targeted grazing to achieve fuels management objectives should conform to the following criteria:
- Targeted grazing should be implemented strategically on the landscape, and directly involve the minimum footprint and grazing intensity required to meet fuels management objectives.
  - Allow conformance to the applicable Standards for Rangeland Health and Guidelines for Livestock Grazing Management (Idaho or Montana) at the assessment scale.
  - Where feasible and applicable coordinate with the grazing permittee to strategically reduce fuels through livestock management within the Mandatory Terms and Conditions of the applicable grazing authorizations
- ~~40-13-10.12.~~ FM-13: Prioritize the use of native seeds for fuels management treatment based on availability, adaptation (site potential), and probability of success. Where probability of success or native seed availability is low or non-economical, nonnative seeds may be used to meet GRSG habitat objectives to trend toward restoring the fire regime. When reseeding, use fire resistant native and nonnative species, as appropriate, to provide for fuel breaks.
- ~~40-14-10.13.~~ FM-14: Maintain effectiveness of fuels projects, including fuel breaks, to ensure long-term success, including persistence of seeded species and/or other treatment components while maintaining the integrity of adjacent vegetation.

**Commented [BER61]:** Jim Klott - Recommend specifying what seedings will be protected (e.g. seedings, future seedings, sagebrush seedings, native or non-native seedings).

**Commented [BER62]:** Jim Klott - The last sentence under 10.11 says that targeted grazing would be done separate from existing grazing authorizations and permits while the third bullet under 10.12 appears to allow for targeted grazing within the confines of the grazing permit.

**Commented [BER63]:** Ethan Ellsworth - I strongly suggest adding a line stating that targeted grazing should only be conducted in habitat dominated by invasive annual grasses. The long-term impact of intensive grazing on native grasses is counter to GRSG objectives.

**Commented [BER64]:** Paul Makela - Change "allow" to "Ensure"? This is something we have to conform with. Allow is kind of ambiguous.

**11. Wildfire Restoration/Rehabilitation – Emergency Stabilization and Rehabilitation**

- 11.1. ESR-1: Utilize the findings and Restoration/Rehabilitation Strategy developed as part of the FIAT Assessment process described in Appendix D to determine if GRSG rehabilitation actions are needed, based on ecological potential, and direct emergency stabilization and rehabilitation (ESR) (BLM) or Burned Area Emergency Restoration (BAER) (FS) actions after fire.
- 11.2. ESR-2: Incorporate GRSG Habitat Management Objectives into ESR/BAER plans based on site potential and in accordance with the Restoration/Rehabilitation Strategy developed as a result of the FIAT Assessments.
- 11.3. ESR-3: Provide adequate rest from livestock grazing to allow natural recovery of existing vegetation and successful establishment of seeded species. New seedings should not be grazed until at least the end of the second growing season, and longer as needed to allow plants to mature and develop robust root systems which will stabilize the site, compete effectively against cheatgrass and other invasive annuals, and remain sustainable under long-term grazing management. Adjust other management activities, as appropriate, to meet ES&R objectives.
- 11.4. ESR-4: Adjust, as appropriate, livestock management on adjacent unburned areas to mitigate the effect of the burn on local GRSG populations.

**Commented [BER65]:** Elena Shaw - Recommend being clear about the type of new seeding being referred to in the action (e.g. does the two growing seasons rest include sagebrush aerial seedings/shrub plantings?).

**Commented [BER66]:** Paul Makela - Add something about long term management "Once seedings are established, ensure that livestock grazing management practices promote the long-term objectives for the seeding and relevant seasonal habitat."

DRAFT

## 12. Habitat Restoration and Vegetation Management

- 12.1. VEG-1: Implement habitat rehabilitation or restoration projects in areas that have potential to improve GRSG habitat using a full array of treatment activities as appropriate, including chemical, mechanical and seeding treatments.
- 12.2. VEG-2: Implement vegetation rehabilitation or manipulation projects to enhance sagebrush cover or to promote diverse and healthy grass and forb understory to achieve the greatest improvement in GRSG habitat based on FIAT Assessments, HAF assessments, other vegetative assessment data and local, site specific factors that indicate sagebrush canopy cover or herbaceous conditions do not meet habitat management objectives (i.e. is minimal or exceeds optimal characteristics). This may necessitate the use of prescribed fire as a site preparation technique to remove annual grass residual growth prior to the use of herbicides in the restoration of certain lower elevation sites (e.g., Wyoming big sagebrush) but such efforts will be carefully planned and coordinated to minimize impacts to sage-grouse seasonal habitats.
- 12.3. VEG-3: Require use of native seeds for restoration based on availability, adaptation (ecological site potential), and probability of success (Richards et al. 1998). Non-native seeds may be used as long as they support GRSG habitat objectives (Pyke 2011) to increase probability of success, when adapted seed availability is low or to compete with invasive species especially on harsher sites.
- 12.4. VEG-4: Implement management changes in restoration and rehabilitation areas, as necessary, to maintain suitable GRSG habitat, improve unsuitable GRSG habitat and to ensure long-term persistence of improved GRSG habitat (Eiswerth and Shonkwiler 2006). Management changes could be considered during livestock grazing permit renewals, travel management planning, and renewal or reauthorization of rights-of-way.
- 12.5. VEG-5: Consider establishing seed harvest areas that are managed for seed production (Armstrong 2007) to provide a reliable source of locally adapted seed to use during rehabilitation and restoration activities.
- 12.6. VEG-6: Allocate use of native seed to GRSG or ESA listed species habitat in years when preferred native seed is in short supply. This may require reallocation of native seed from ESR (BLM) and/or BAER (Forest Service) projects outside of Priority or Important Habitat Management Areas to those inside it. Where probability of success or native seed availability is low, nonnative seeds may be used as long as they meet GRSG habitat conservation objectives (Pyke 2011). Re-establishment of appropriate sagebrush species/subspecies and important understory plants, relative to site potential, shall be the highest priority for rehabilitation efforts.
- 12.7. VEG-7: During land health assessments, evaluate the relative value of existing nonnative seeding within GRSG habitat as: 1) a component of a grazing system allowing improvement of adjacent native vegetation, 2) development of a forage reserve, 3) incorporation into a fuel break system (Davies et al. 2011) or 4) restoration/diversification for GRSG habitat improvement. Where appropriate and feasible, diversify seedings, or restore to native vegetation when potential benefits to GRSG habitat outweigh the other potential uses of the non-native seeding, with emphasis on PHMA and IHMA. Allow recolonization of seedings by sagebrush and other native vegetation. During land health assessments evaluate the compatibility of existing nonnative seedings for GRSG habitat to

**Commented [BER67]:** Jim Klott - Several actions refer to "maintain, increase, or enhance habitat" for greater sage-grouse. In some cases (e.g. fuel breaks, prescribed fire) the action may reduce and/or fragment habitat. Would these actions also have a mitigation component to replace habitat that is altered? If not, how are these actions consistent with the "no net loss" strategy?

keep as a component of a grazing system, development of a forage reserve, or to be used as a fuelbreak (Davies et al. 2011) or during restoration development. If nonnative seedings do not contribute to a grazing system, are not suitable for a forage reserve, and are not suitable fuelbreaks, evaluate the nonnative seedings in and adjacent to PHMA to determine if they should be diversified with or converted to native grasses, forbs, and shrubs, including sagebrush.

12.8. VEG-8: Utilize conifer (juniper) removal treatments to reduce the extent of conifer encroachment areas in sagebrush habitats. Prioritize treatments closest to occupied sage-grouse habitats and near occupied leks, and where juniper encroachment is phase 1 or phase 2. Use of site-specific analysis and tools like VDTT and FIAT assessments to help refine the location for specific priority areas to be treated. Refrain from using prescribed fire and conducting removal projects in old-growth juniper stands. Old-growth juniper trees are characterized by rounded tops and spreading canopies, often containing dead limbs and/or spike tops, large branches near the base of the tree, as well as furrowed, fibrous bark, and are typically host to arboreal lichens. Leader growth in the upper quarter of the tree is usually less than one inch. These trees are generally distributed on rock outcrop or rubble land soils, or other soils with coarse fragments in the soil-surface and/or slopes over 12-25%, where juniper vegetation type is the climax plant community (IDFG 2000; Miller et al 2005; USDI and USGS 2007).

12.9. VEG-9: Avoid using prescribed fire in Greater Sage-Grouse habitat unless evaluation of site-specific conditions demonstrate that there would be a net benefit for sage-grouse. If prescribed fire is used in Greater Sage-Grouse habitat, include an analysis in the NEPA document that indicates how Greater Sage-Grouse goals and objectives will be addressed and met by its use, why alternative techniques were not selected, and a risk assessment to address how potential threats to Greater Sage-Grouse habitat would be minimized.

- If prescribed fire is to be used at the implementation level, at a minimum, the burn plan will indicate how land use plan objectives would be addressed and met and why alternative techniques were not selected.
- Avoid prescribed fire as a vegetation or fuels treatment in Wyoming big sagebrush or other xeric sagebrush species, or in areas with a potential for post-fire exotic annual dominance. However, after other treatment opportunities have been explored and as site-specific variables allow, prescribed fire could be used in these areas to meet specific fuels objectives that would maintain, improve, or restore Greater Sage-Grouse habitat or vegetation (e.g., creation of fuel breaks that would disrupt the fuel continuity across the landscape in stands where annual invasive grasses are a minor component in the understory, burning slash piles from conifer reduction treatments, used as a component with other treatment methods (such as chemical) to combat annual grasses and restore native plant communities).
- Allow no treatments in areas only providing known winter seasonal habitat range unless the treatments are designed to strategically reduce wildfire risk around and/or in the winter range and/or would protect, maintain, increase, or enhance winter range habitat quality.

**Commented [BER68]:** Paul Makale - I think this should read "If nonnative seedings in or near PHMA or IHMA do not contribute to a grazing system, are not suitable for a forage reserve and are not suitable fuelbreaks, evaluate the seedings to determine if they should be diversified with or converted to native grasses, forbs, and shrubs, including sagebrush. Allowing sagebrush to establish and expand should also be considered. (rationale is that we may not have \$\$ to fully restore but allowing sage to infill at least would add to extent of sagebrush).

**Commented [BER69]:** Paul Makela - unless steps are taken to retain the trees with old growth characteristics. (We can discuss, but what post settlement juniper has infilled around much of the "old growth" putting it at risk as well. What if we have landscape mechanical projects where we can improve GRSG habitat as well as OG juniper stands? As written, we would not be able to enter the OG stand.

**Commented [BER70]:** Paul Makela - What is this paper?

**Commented [BER71]:** Bart Zwertzig - The last bullet statement says to not allow any treatments in winter range. In the CFO winter range overlaps approximately 40 – 45% of the other seasonal habitat types. If this is limited to prescribed fire treatments only as stated in the opening sentence of 12.9, then there is no problem. If it applies to all treatments types, then it would greatly limit the areas in which sage-grouse habitat improvement treatments could be done. A limitation as to a percentage sagebrush removal within a treatment or per specific winter area would still provide for sage-grouse habitat improvement projects and for maintenance of winter habitats.

**Commented [BER72]:** Paul has new verbiage.

**Commented [BER73]:** Paul Makela - Change "and" to "and/or". My rationale is that we may want to do juniper control in or near winter range. As written, this would seem to be disallowed, or at least a hard-sell. Also, maybe this should say Discourage treatments in GRSG winter range...or Be cautious with...since "Allow no unless..." seems kind of ambiguous.

### 13. Invasive Species

- 13.1. Invasive Species (INV)-1: Incorporate results of the FIAT Assessments into projects and activities addressing invasive species.
- 13.2. INV-2: Implement noxious weed and invasive species control using integrated vegetation management actions per national guidance and local weed management plans for Cooperative Weed Management Areas in cooperation with State and Federal agencies, affected counties, and adjoining private lands owners.
- 13.3. INV-3: Conduct integrated weed management actions for noxious and invasive weed populations that are impacting or threatening GRSG habitat quality using a variety of eradication and control techniques including chemical, mechanical and other appropriate means.
- 13.4. INV-4: Require project proponent (projects described in Table X and which are included in the anthropogenic disturbance cap evaluation) to ensure that noxious weeds and invasive species caused as a result of the project are treated to eliminate establishment on the disturbed project construction areas for at least 3 years.

**Commented [BER74]:** Elena Shaw - Shouldn't we require permit holders to treat weeds throughout the term of the permit, unless we are specifically addressing weed establishment caused by project construction. If that is the case need to add "as a result of project construction" to the sentence.

**Commented [BER75]:** Paul Makela - Change to "Require project proponent...to ensure that noxious weeds and invasive species established following initial project disturbance or construction are treated for at least 3 years and monitored and treated during the life of the project. (Rationale is proponent should have to take care of weeds beyond 3 years).

**14. Lands and Realty / Infrastructure**

- 14.1. Lands and Realty (LR)-1: Priority: Designate and manage Priority Habitat Management Areas as ROW avoidance areas, consistent with AD-3 and subject to RDFs, buffers and seasonal timing restrictions (Appendix A, B & C). Important: Designate and manage Important Habitat Management Areas as ROW avoidance areas, consistent with AD-4 and subject to RDFs, buffers and seasonal timing restrictions. General: Designate and manage General Habitat Management Areas as open with proposals subject to RDFs, buffers and seasonal timing restrictions.
- 14.2. LR-2: Priority: Designate and manage Priority Habitat Management Areas as exclusion areas for utility scale (20 MW) Wind and Solar testing and development, nuclear and hydropower energy development. Important: Designate and manage Important Habitat Management Areas as avoidance areas for Wind and Solar testing and development, nuclear and hydropower development. General: Designate and manage General Habitat Management Areas as open for Wind and Solar testing and development and nuclear and hydropower development subject to RDFs, buffers and seasonal timing restrictions.
- 14.3. LR-3: Priority: Development of commercial service airports and facilities (as defined by FAA 2014 – publically owned airports that have at least 2,500 passenger boardings each calendar year and receive scheduled passenger service) would not be allowed within Priority Habitat Management Areas. Important and General Habitat Management Areas are Avoidance and Open respectively for these types of ROW applications as described in LR-1.
- 14.4. LR-4: Priority: Development of new or expansion of existing landfills would not be allowed within Priority Habitat Management Areas. Important and General Habitat Management Areas are Avoidance and Open respectively for these types of ROW applications as described in LR-1.
- 14.5. LR-5: Consistent with LR-2, LR-3 and LR-4, Rights-of-way for development of new or amended ROWs and land use authorizations in PHMA would only be considered when consistent with the Anthropogenic Disturbance Exception Criteria (AD-3); Rights-of-way for development of new or amended ROWs and land use authorizations in IHMA could be considered consistent with the Important Habitat Management Area Anthropogenic Disturbance Development Criteria. (AD-4). General: New ROW and land use authorizations could be considered.
- 14.6. LR-6: If the project is an incremental upgrade/capacity increase of existing development (i.e. powerline capacity upgrade) - the existing transmission line must be removed and area rehabilitated within a specified amount of time after the new line is installed and energized.
- 14.7. LR-7: Existing designated corridors, including Section 368 Corridors, will remain Open (subject to the ongoing settlement agreement).
- 14.8. LR-8: Process unauthorized use. If the use is subsequently authorized, it would be authorized consistent with direction for the Management Areas within which it is located and the RDFs, buffers and seasonal timing restrictions. If the use is not subsequently authorized the site would be reclaimed by removing these features and rehabilitating the habitat.

**Commented [BER76]:** Jim Klott - A term and condition of the ROW should be eradication of noxious weeds and invasive species within the project ROW. If the ROW is not renewed, the applicant should restore the ROW and associated maintenance roads. Project inspection/maintenance crews should ensure vehicles are free of invasive or noxious weed seeds in all habitat mgmt. areas.

**Commented [BER77]:** Elean Shaw - Should we add that energy corridors will remain open in all habitat management areas?

- 14.9. LR-9: Land use authorizations that are temporary (less than 3 years) in nature and are not otherwise excluded or restricted would be subject to seasonal or timing restrictions and mitigation requirements regarding habitat loss as needed.
- 14.10. LR-10: New ROW applications for water facilities (ditches, canals, pipelines), or amendments to existing water facilities which include additional structures to improve fish passage or benefits to fisheries (new diversions, fish screens) would be allowed on a case-by-case bases subject to RDFs to reduce impacts to GRSG habitat and mitigation requirements regarding GRSG habitat loss as needed.
- 14.11. LR-11: When a ROW grant expires and is not requested to be renewed, is relinquished, or terminated, the lease holder would be required to reclaim the site by removing overhead lines and other infrastructure and to eliminate avian predator nesting opportunities provided by anthropogenic development on public lands associated with the now void ROW grant (e.g., remove powerline and communication facilities no longer in service).
- 14.12. LR-12: As opportunities and priorities indicate work with existing ROW holders to retrofit existing towers and structures consistent with RDFs described in Appendix A.
- 14.12.1. LR-13: Lands within Priority, Important or General Habitat Management Areas for Greater Sage-Grouse will be retained in federal management unless: (1) the agency can demonstrate that disposal of the lands will provide a net conservation benefit to the Greater Sage-Grouse or (2) the agency can demonstrate that the disposal of the lands will have no direct or indirect adverse impact on conservation of the Greater Sage-Grouse. Land tenure adjustments would be subject to the following disposal, exchange, and acquisition criteria, which include retaining lands with GRSG habitat. Retention of areas with GRSG would reduce the likelihood of habitat conversion to agriculture, urbanization, or other uses that would remove sagebrush habitat and potentially impact sensitive plants. Criteria:
- Lands within Priority, Important and General Habitat Management Areas would not be available for disposal through sale (Appendix J).
  - Acquire habitat within Priority and Important Habitat Management Areas, when possible (i.e. willing landowner), and retain ownership of habitat within all Areas, except if a land exchange would allow for additional or more contiguous federal ownership patterns.
  - Lands within Priority, Important and General Habitat Management Areas would be retained unless exchange of those lands would increase the extent or provide for connectivity of Priority or Important Habitat Management Areas.
  - Evaluate potential land exchanges containing historically low-quality GRSG habitat that may be too costly to restore in exchange for lands of higher quality habitat, lands that connect seasonal GRSG habitats or lands providing for threatened and endangered species. These potential exchanges should lead to an increase in the extent or continuity of or provide for improved connectivity of Priority Habitat Management Areas. Higher priority will be given to exchanges for those in-tact areas of sagebrush that will contribute to the expansion of sagebrush areas within Priority Habitat Management Areas currently in public ownership. Lower priority would be given to other lands that would promote enhancement in the Priority and Important Habitat Management Areas (i.e., areas with fragmented or less in-tact sagebrush).

**Commented [BER78]:** Todd Kuck - talks about retaining lands within all management areas unless the disposal of lands will provide a benefit to sage grouse, or there would be no direct or indirect adverse impacts, etc. And section (a.) say no lands in these areas would be available for disposal through sale. My comment on this is I think some flexibility to the manager would be useful, specifically why not allow land sales, especially in general habitat, if the goal of not having any adverse impacts can still be met? For example, a sale of a small parcel that is low quality sagebrush habitat could occur if other mitigation results in overall benefits to sage grouse, such as habitat restoration on other parcels of higher quality sagebrush habitat or improving connectivity, etc.

**Commented [BER79]:** Elena Shaw - In Table 1 under Priority and Important habitat mgmt. areas it states that lands are not available for disposal. Under this action it says that they are available if certain criteria are met, but that they are not available for disposal through sale. Suggest changing Table 1 to say disposal through sale is not allowed. What about disposal through R&PP?

e. Identify lands for acquisition that increase the extent of or provide for connectivity of Priority Habitat Management Areas.

DRAFT

## 15. Minerals

### 15.1. Fluid Minerals

- 15.1.1. Fluid Minerals (FLM)-1: Idaho and Montana: Areas within Priority Habitat Management Areas and Important Habitat Management Areas would be open to mineral leasing and development and geophysical exploration subject to no surface occupancy with a limited exception (FLM-3). General Habitat Management Areas would be open to mineral leasing and development and geophysical exploration subject to CSU which includes buffers, seasonal timing restrictions and standard stipulations. ~~Montana: Areas within Priority Habitat Management Areas would be open to leasing subject to no surface occupancy. No waivers, exceptions or modifications would be allowed unless approved by the State Director. General Habitat Management Areas would be open to leasing subject to CSU which includes buffers, seasonal timing restrictions and standard stipulations.~~
- 15.1.2. FLM-2: ~~FLM-7~~: Parcels nominated for lease in Priority or Important Habitat Management Areas would be evaluated prior to lease offering to determine if development is feasible when buffers and seasonal timing restrictions are applied. Parcels that could not be developed when these buffers and restrictions are applied would not be offered for lease, which do not meet the criteria would not be offered for lease.
- 15.1.3. FLM-3: Priority and Important Habitat Management Areas: A lease waiver, exception or modification to the NSO stipulation may be considered where a portion of the proposed lease is determined to be in non-greater sage-grouse habitat, the area is not used by Greater sage-grouse, or it would not have direct, indirect or cumulative effects to Greater sage-grouse or its habitat. The determination would be made by a team of interagency Greater sage-grouse experts, including an expert from the state wildlife agency, USFWS and the BLM. Waivers, by regulation, require a 30-day public review (43 CFR ????.??). All exceptions must be approved by the State Director. In the event a waiver, exception or modification were allowed development would still be subject to CSU which includes buffers, seasonal timing restrictions and standard stipulations.

#### **Waivers, Exceptions and Modifications (WEMs)** (Source IM-2008-032)

A waiver is a permanent exemption from a lease stipulation, the stipulation would no longer apply anywhere within the lease. Waivers, by regulation, require a 30-day public review if the authorized officer has determined, prior to lease issuance, that a stipulation involves an issue of major concern to the public (43 CFR 3101.4) ~~Waivers require a 30-day public review~~ and are approved and signed by the State Director.

An exception is a one-time exemption for a particular site within the lease; exceptions are determined on a case-by-case basis; the stipulation continues to apply to all other sites within the lease. An exception is a limited type of waiver.

A modification is a change to the provisions of a lease stipulation, either temporarily or for the term of the lease. Depending on the specific modification, the stipulation may or may not apply to all sites within the lease to which the restrictive criteria are applied.

15.1.4. FLM-4: Incorporate required design features and best management practices appropriate to the management area as conditions of approval when post leasing activity is proposed into any post-lease authorizations.

15.1.5. FLM-5: Prior to leasing conduct a Master Leasing Plan process when all four of the following criteria are met:

· A substantial portion of the area to be analyzed in the MLP is not currently leased.

· There is a majority Federal mineral interest.

· The oil and gas industry has expressed a specific interest in leasing, and there is a moderate or high potential for oil and gas confirmed by the discovery of oil and gas in the general area.

· Additional analysis or information is needed to address likely resource or cumulative impacts if oil and gas development were to occur where there are:

o multiple-use or natural/cultural resource conflicts;

o impacts to air quality;

o impacts on the resources or values of any unit of the National Park System, national wildlife refuge, or National Forest wilderness area, as determined after consultation or coordination with the NPS, the FWS, or the FS; or

15.1.4. o impacts on other specially designated areas. – analyzing likely development scenarios and varying mitigation levels.

15.1.5-15.1.6. FLM-5: Complete a Master Development Plan, consistent with plan development guide, on leases where a producing field is proposed to be developed.

15.1.6-15.1.7. FLM-6: Encourage unitization when deemed necessary for proper development and operation of an area (with strong oversight and monitoring). The unitization must be designed in a manner to minimize adverse impacts on GRSG according to the Federal Lease Form, 3100-11, Sections 4 and 6.

15.1.7-15.1.8. FLM-7: Issue Written Orders of the Authorized Officer (43 CFR 3161.2) requiring reasonable protective measures consistent with the lease terms where necessary to avoid or minimize effects to GRSG populations or habitat.

## 15.2. Locatable Minerals

15.2.1. Locatable Minerals (LOC)-1: Lands would remain open to locatable mineral entry in all management areas.

15.2.2. LOC-2: Apply reasonable and appropriate required design features and best management practices as Conditions of Approval to prevent unnecessary or undue degradation of GRSG habitat when a Plan of Operations is submitted for BLM or FS approval, in accordance with 43 CFR 3809.411(d)(2) (or 36 CFR 228.5(a)(3) on National Forest System lands).

## 15.3. Salable Minerals

15.3.1. Salable Minerals (SAL)-1: Priority: No new site authorizations would be approved. Important: New site authorizations could be considered provided the Anthropogenic Disturbance Development Criteria (AD-4) can be met, and subject to RDFs, buffers and seasonal timing restrictions. Sales from existing community pits within PHMA and IHMA would be subject to seasonal timing restrictions. General: Open to new site authorizations subject to RDFs, buffers and seasonal timing restrictions. Existing sites Open to new sales subject to seasonal timing restrictions.

15.3.2. SAL-2: Restore salable mineral pits no longer in use to meet GRSG habitat management objectives.

Formatted: Font: Bold

Formatted: Indent: Left: 0.85", No bullets or numbering

Formatted: Font: Garamond, 12 pt

Formatted: Normal, Indent: First line: 0.5", No bullets or numbering

Commented [BER80]: John has language

Commented [BER81]: Karen Porter – This management action doesn't seem appropriate for a plan amendment.

Commented [BER82]: Elena Shaw - Would we still allow locatable minerals if the anthropogenic disturbance cap is not met or will not be met with the action? Might be confusing to the public since we mention it under salable and non-energy solid mineral leasable minerals but not under locatable minerals.

- 15.3.3. SAL-3: Require reclamation bonding that would require restoration of GRSG habitat on new site authorizations for mineral material pits in IHMA (this would not apply to free use permits issued to a government entity such as a county road district, but would apply to non-profit entities).
- 15.4. **Non-Energy Solid Mineral Leasable Minerals**
- 15.4.1. Non Energy Leasables (NEL)-1: Priority, Important and General Habitat Management Areas: Areas within Known Phosphate Leasing Areas (KPLAs) will remain open to leasing subject to standard stipulations. PHMA areas outside KPLAs are closed to leasing and prospecting. IHMA areas outside of KPLAs are open to prospecting and subsequent leasing provided the Anthropogenic Disturbance Development Criteria (AD-4) and the anthropogenic disturbance cap (AD-1) can be met. RDFs, buffers and seasonal timing restrictions shall be applied to prospecting permits. Exceptions to closures in PHMA and IHMA may be made for lease modifications and fringe leases where valid existing rights may be affected. General Habitat Management Areas: Lands outside KPLAs are available for prospecting and subsequent leasing and initial mine development subject to RDFs, buffers, timing restrictions (seasonal and daily) and standard stipulations.
- 15.4.2. NEL-2: Require seasonal and daily timing restrictions in undeveloped non-energy mineral leases when exploration activities or initial mine development is proposed (e.g. exploration drilling, timber removal, shrub clearing, etc.) as conditions of approval.
- 15.4.3. NEL-3: Include RDFs as conditions of approval to mine plans in undeveloped non-energy mineral leases for exploration activities or initial mine development.
- 15.5. **Mineral Split Estate**
- 15.5.1. Mineral Split Estate (MSE)-1: **BLM Owns Mineral Estate – non-federal surface owner:** ~~Where the federal government owns the mineral estate in PHMAs, IHMAs, and GHMAs, and the surface is in non-federal ownership, in coordination with surface owner, apply the same stipulations, COAs, and/or conservation measures, and RDFs design features consistent with those applied if the mineral estate is developed on to BLM and Forest Service administered lands in the management area, to the maximum extent permissible under existing authorities, and in coordination with the landowner.~~
- 15.5.2. ~~MSE-2: BLM owns surface – non-federal mineral estate owner. In coordination with Recommend to the state regulatory entity and mineral estate owner apply appropriate surface use that timing restrictions, COAs, stipulations, and mineral RDFs through ROW grants or other surface management instruments, to the maximum extent permissible under existing authorities in PHMA, IHMA, and GHMA. and buffer restriction be applied around occupied leks, when concurring to the approval of authorizations for mineral related surface disturbance on lands with GRSG habitat.~~

**Commented [BER83]:** Ethan Ellsworth - Seems to me that if the BLM owns the surface land and must authorize any mineral extraction that the BLM can Require rather than Recommend GRSG stipulations.

**16. Range Management/Livestock Grazing**

- 16.1. Range Management (RM)-1: Maintain existing areas designated as available or unavailable for livestock grazing. Existing active AUMs for livestock grazing within the planning area would not be changed at the broad scale, though the number of AUMs available on an allotment may be adjusted based on site-specific conditions to meet management objectives during term permit renewals, AMP development, or other appropriate implementation planning. Additionally, temporary adjustments can be made annually to livestock numbers, the number of AUMs, and season of use in accordance with applicable regulations.
- 16.2. RM-2: Prioritize BLM land health assessments and processing of BLM grazing permits consistent with management area prioritization (MA-4), unless other higher priority considerations exist such as threatened, endangered and proposed species habitat that livestock grazing could affect. Where possible, conduct land health assessments at the watershed, or other meaningful landscape-scale.
- 16.3. RM-3: Where opportunities exist, coordinate with other land managers to encourage livestock operations that utilize mixed federal, private and/or state land to be managed at the landscape scale to benefit GRSG and their habitat across land ownerships.
- 16.4. RM-4: PHMA & IHMA: During the land health assessment process, identify the type(s) of seasonal habitat the assessed areas are capable of supporting. Utilize the habitat assessment framework, (Stiver et al. 2014 as amended/replaced) or other BLM or Forest Service approved methodology, in accordance with current policy and guidance to determine whether vegetation structure, condition and composition are meeting GRSG habitat objectives including riparian and lentic areas (HM-OBJ-2; Table 2). Use appropriate Ecological Site Descriptions, reference sheets and state and transition models to inform desired habitat conditions and expected responses to management changes for the land unit being assessed.
- 16.5. RM-5: When modifying grazing management, analyze indirect effects to habitat, including changes in fuel loading and wildfire behavior.
- 16.6. RM-6: When livestock management practices are determined to not be compatible with meeting or making progress towards achievable habitat objectives following appropriate consultation, cooperating and coordination with permittees and interested parties, implement changes in grazing management through grazing authorization modifications, or allotment management plan implementation. Potential modifications include, but are not limited to, changes in:
  - 1) Season or timing of use;
  - 2) Numbers of livestock;
  - 3) Distribution of livestock use;
  - 4) Duration and/or level of use;
  - 5) Kind of livestock (e.g., cattle, sheep, horses, or goats) (Briske et al. 2011);
  - 6) ~~Voluntary measures such as temporary non-use~~; and
  - 7) Grazing schedules (including rest or deferment).
- 16.7. RM-7: Where opportunities exist, establish forage reserves to facilitate restoration and rehabilitation efforts in sage-grouse habitat areas.
- 16.8. RM-8: PHMA, & IHMA, & GHMA - When an allotment, or portion thereof, becomes vacant or grazing preference is relinquished, consider ~~voluntary~~ retirement

**Commented [BER84]:** Ethan Ellsworth - I've had discussions with Nika about adding a section titled "Guidelines for Establishing Allowable Use Levels if Not Meeting (or making progress toward) GRSG Objectives, similar to a section in the Nevada DEIS (Table 2.7 below). These guidelines would set triggers for livestock removal (e.g., upland utilization levels and stubble height). I understand that the state would not be amenable (among others), but I believe it is a valuable mechanism to hold livestock grazers accountable, so worth a discussion. I thought I'd put it out there... As it stands now, there are very few substantial differences between current management and the proposed plan (in regards to the grazing section).

Table 2-7  
Guidelines for Establishing Allowable Use Levels if Not Meeting (or Not Making Progress Toward) Greater Sage Grouse Objectives  
Community Type-Key Species Percent Utilization of Key Species Notes Terms and Conditions  
Mountain Big sage <45% herbaceous species;  
<35% shrub species . Holocheck 1998  
Mixed in with a lot of other species . Livestock removed in 3-5 days of reaching utilization level  
Wyoming and Basin Big sage <35% herbaceous species;  
<35% shrub species . Livestock removed in 3-5 days of reaching utilization level  
Black sage . <35% herbaceous species;  
<35% shrub species Winter sheep forage Livestock removed in 3-5 days of reaching utilization level  
Riparian and wet meadows . As Applicable:  
<50% herbaceous species;  
<35% woody species or  
Average stubble height of at least four to six inches (4-6 ") (depending on site capability and potential) for herbaceous riparian vegetation. Monitoring would be conducted using accepted protocols (including but not limited to: Burton et al. 2011; USDI, BLM 1996; Platts 1990). Average stubble height 4-6" – Livestock removed in 3-5 days of reaching utilization level based on site. Or (sequential action)  
No grazing from May 15-Aug 30 in brood rearing habitat.

**Commented [BER85]:** Ethan Ellsworth - Consider adding an action concerning drought. For example, "Initiate emergency management measures during times of drought to protect sage-grouse PHMA and IHMA. Implement post-drought management to allow for vegetation recovery that meets sage-grouse life cycle needs."

**Commented [BER86]:** Ethan Ellsworth - I would add an 8th option – consider retiring grazing permits and making grazing unavailable.

**Commented [BER87]:** Ethan Ellsworth - Add a sentence describing what a forage reserve would look like. Is it an area with no grazing?

- of the allotment ~~or grazing preference, or portion thereof, or grazing preference in whole or in part,~~ or converting the area to a forage reserve (a.k.a. reserve common allotment)/buffer when doing so would maintain or enhance sage-grouse habitat ~~as described in subsequent site specific NEPA analysis.~~ ~~GHMA - When an allotment becomes vacant or grazing preference is relinquished, consider converting it to a forage reserve/buffer to use during fire rehabilitation or restoration efforts elsewhere, when such actions would result in a net benefit to GRSG habitat and other priority resources.~~
- 16.9. RM-9: PHMA & IHMA - Where practical, design pasture rotations to utilize non-native perennial grass seedings and/or annual grasslands, during GRSG nesting season annually or periodically.
- 16.10. RM-10: Evaluate the locations where salt/supplements are placed. ~~C~~~~In coordination with the permittee, have salt/supplements placement~~~~in areas which would to~~ reduce impacts to GRSG habitat (e.g., existing disturbed areas).
- 16.11. RM-11: Incorporate RDFs into Terms and Conditions for crossing permits to limit disturbance of occupied leks when trailing livestock across BLM- and Forest Service -administered lands in the spring. Work with permittees in locating over-nighting, watering and bedding locations to minimize impacts to seasonal habitats.
- 16.12. ~~RM-12: Design any new structural range improvements, following appropriate cooperation, consultation and coordination with permittees, to minimize and/or mitigate effects to GRSG habitat. Any new structural range improvements are subject to RDFs (Appendix A). Structural range improvement in this context, include, but are not limited to: fences, exclosures, corrals or other livestock handling structures; pipelines, troughs, storage tanks (including moveable tanks used in livestock water hauling), windmills, ponds/reservoirs, solar panels and spring developments.~~
- 16.13. RM-13: During the land health assessment and grazing permit renewal process, evaluate existing livestock management range improvements with respect to their effect on GRSG habitat. Consider removal of projects that are not needed for effective livestock management, are no longer in working condition, and/or negatively affect GRSG habitat, with the exception of functional projects needed for management of habitat for other threatened, endangered or proposed species or other sensitive resources.
- 16.14. RM-14: Prioritize removal, modification or marking of fences or other structures in areas of high collision risk following appropriate cooperation, consultation and coordination ~~with permittees~~ to reduce the incidence of GRSG mortality due to fence strikes (Stevens et al. 2012).

**Commented [BER88]:** Jim Klott - Recommend adding a statement that new water pipelines or other infrastructure will be placed along existing disturbance corridors to the extent practical. New troughs, corrals could be placed in areas previously used for salting/supplement or other high disturbance areas to the extent practical.

## 17. Wild Horses and Burros

- ~~17.1.~~ Wild Horse and Burro (WHB)-1: Develop or amend herd management area plans (HMAPs) to incorporate GRSG habitat objectives and management considerations for all herd management areas within GRSG habitat, with emphasis placed on PHMA. Develop or amend BLM Herd Management Area Plans to incorporate GRSG habitat objectives and management considerations for all BLM HMAs) and Forest Service Wild Horse Territories.
- ~~17.2.~~17.1. WHB-2: Prioritize gathers and population growth suppression techniques in HMAs in GRSG habitat, unless removals are necessary in other areas to address higher priority environmental issues, including herd health impacts. Additional prioritization would be given for HMAs that are near AML or where reduction would serve the most beneficial purpose. Herd Areas occupied by wild horses and burros managed for zero wild horses and burros. When evaluating AML on HMAs within PHMA and IHMA, evaluate indicators that address structure/condition/composition of vegetation and measurements specific to achieving GRSG habitat objectives.
- ~~17.3.~~17.2. WHB-3: In PHMAs and IHMAs, monitor the effects of WHB use in relation to GRSG seasonal habitat objectives on an annual basis to help inform future management actions. Utilize interdisciplinary land health assessments in HMAs containing GRSG habitat to determine whether vegetation characteristics are meeting appropriate seasonal habitat objectives.
- ~~17.4.~~17.3. WHB-4: Utilize interdisciplinary land health assessments in HMAs containing GRSG habitat to determine whether vegetation characteristics are meeting appropriate seasonal habitat objectives. The priorities for completing assessments are: 1) PHMA, 2) IHMA, 3) GHMA. PHMA: Do not expand HMAs. IHMA: Analysis of proposed additions to existing HMA boundaries should consider the direct, indirect and cumulative impacts on GRSG habitat, including the need for additional infrastructure such as boundary fencing, and consider alternative areas outside of PHMA and IHMA.
- ~~17.5.~~ WHB-5: When evaluating AML on HMAs within PHMA and IHMA, evaluate indicators that address structure/condition/composition of vegetation and measurements specific to achieving GRSG habitat objectives. In PHMAs and IHMAs, assess and adjust AMLs through the NEPA process within HMAs when wild horse use within established AML is identified as a significant causal factor in not meeting land health standards. Prioritize gathers and population growth suppression techniques in HMAs within Priority and Important Habitat Management Areas, unless removals are necessary in other areas to address higher priority environmental issues, including herd health impacts. Additional prioritization would be given for HMAs that are near AML or where a reduction would serve the most beneficial purpose.
- ~~17.4.~~ WHB-6: Consider removals or exclusion of WHB during or immediately following emergency situations (such as fire, floods, and drought) to facilitate meeting GRSG habitat objectives where HMAs overlap with GRSG habitat.
- ~~17.5.~~ WHB-7: When conducting NEPA analysis for wild horse/burro management activities, water developments, or other rangeland improvements for wild horses, address the direct and indirect effects to GRSG populations and habitat. Implement any water developments or rangeland improvements using the criteria identified for domestic livestock.
- ~~17.6.~~ WHB-8: Coordinate with professionals from other federal and state agencies, researchers at universities, and others to utilize and evaluate new management tools (e.g.,

population growth suppression, inventory techniques, and telemetry) for implementing the WHB program.

DRAFT

## 18. Travel Management

18.1. Travel Management (TM) -1: Limit off-highway vehicle motorized travel within Idaho BLM Field Offices to existing roads, primitive roads, and trails in areas where travel management planning has not been completed or is in progress. This excludes areas previously designated as open through a land use plan decision or currently under review for designation as open, currently being analyzed in ongoing RMP revision efforts in the Four Rivers, Jarbidge and Upper Snake Field Offices. Upon completion of travel management plans the designation would change to limited to designated roads, primitive roads and trails.

An off-highway vehicle is any motorized vehicle capable of, or designed for, travel on or immediately over land, water, or other natural terrain, excluding: (1) Any nonamphibious registered motorboat; (2) any military, fire, emergency, or law enforcement vehicle while being used for emergency purposes; (3) any vehicle whose use is expressly authorized by the authorized officer, or otherwise officially approved; (4) Vehicles in official use where official use is use by an employee, agent, or designated representative of the Federal Government or one of its contractors, in the course of his employment, agency, or representation.; and (5) any combat or combat support vehicle when used in times of national defense emergencies (43 CFR 8340.0 5).

18.2. TM-2: Temporary closures will be considered in accordance with 43 CFR subpart 8364 (Closures and Restrictions); 43 CFR subpart 8351 (Designated National Area); 43 CFR subpart 6302 (Use of Wilderness Areas, Prohibited Acts, and Penalties); 43 CFR subpart 8341 (Conditions of Use).

Temporary closure or restriction orders under these authorities are enacted at the discretion of the authorized officer to resolve management conflicts and protect persons, property, and public lands and resources. Where an authorized officer determines that off-highway vehicles are causing or will cause considerable adverse effects upon soil, vegetation, wildlife, wildlife habitat, cultural resources, historical resources, threatened or endangered species, wilderness suitability, other authorized uses, or other resources, the affected areas shall be immediately closed to the type(s) of vehicle causing the adverse effect until the adverse effects are eliminated and measures implemented to prevent recurrence. (43 CFR 8341.2) A closure or restriction order should be considered only after other management strategies and alternatives have been explored. The duration of temporary closure or restriction orders should be limited to 24 months or less; however, certain situations may require longer closures and/or iterative temporary closures. This may include closure of routes or areas.

18.3. TM-3: Develop Travel Management Plans for each Field Office as described in the BLM Travel Management Handbook 8342.1 and according to the travel management planning guidelines (Appendix K).

18.4. TM-4: During subsequent travel management planning design and designate a travel system to minimize adverse effects on GRSG. Locate areas and trails to minimize harassment of wildlife or significant disruption of wildlife habitats. Give special attention to protect endangered or threatened species and their habitats. Allow for route upgrade, closure of existing routes, and creation of new routes to help protect

**Commented [BER89]:** Ethan Ellsworth - Perhaps specify the types of trails where motorized travel would be allowed (e.g., established OHV routes).

**Commented [BER90]:** Elena Shaw - All other sections describing proposed actions focus on sage-grouse habitat while sage-grouse are only mentioned once in action 18.4. Seems that we are doing business as usual rather than developing management action with sage-grouse as our driver.

**Commented [BER91]:** Ethan Ellsworth - In the sentence beginning "Allow for..." add timing restrictions, or seasonal closure to the list of actions.

**Commented [BER92]:** Elena Shaw - Recommend changing second sentence to "...having a neutral or positive effect on GRSG habitat and populations."

habitat and meet user group needs, thereby reducing the potential for pioneering unauthorized routes. The emphasis of the comprehensive travel and transportation planning within Priority Habitat Management Areas would be placed on having a neutral or positive effect on GRSG habitat. Individual route designations would occur during subsequent travel management planning efforts.

- 18.5. TM-5: Conduct road maintenance activities to avoid disturbance during specific times at different seasons – see seasonal and timing restrictions section.

**Commented [BER93]:** Elena Shaw - Should we add other road activities to this action such as road upgrades or construction?

DRAFT

**19. Recreation**

- 19.1. REC-1: Manage existing recreation uses and sites to minimize adverse effects on GRSG or their habitat through incorporation of RDFs, buffers and seasonal restrictions.
- 19.2. REC-2: Do not construct new recreation facilities (e.g., campgrounds, trails, trailheads, staging areas) within PHMAs and IHMAs unless the development would have a neutral effect or be beneficial to GRSG habitat (such as concentrating recreation, diverting use away from critical areas, etc.); or the new construction replaces existing facilities and reduces impacts from the existing facilities as in TM-4, or unless the development is required for visitor safety or resource protection.

DRAFT

**20. Monitoring**

- 20.1. Monitoring (MON)-1: Once FIAT Assessments are complete a Annually complete a review of FIAT Assessment implementation efforts within GRSG habitat with appropriate USFWS and state agency personnel.
- 20.2. MON-2: Annually monitor the effectiveness of fuels treatment projects.
- 20.3. MON-3: Monitor invasive vegetation post vegetation management treatment
- 20.4. MON-4: Monitor project construction areas for noxious weed and invasive species for at least 3 years, unless control is achieved earlier.
- 20.5. MON-5: Use lek, nesting and winter habitat maps and key habitat map (updates) to annually assess GRSG population and habitat status in the context of the adaptive management triggers.
- 20.6. MON-6: Continue to support updates to the Key Habitat map to track vegetation changes in relation to GRSG habitat on a yearly basis, until such a time this process is replaced. The process used to update the Key Habitat Map is described in Appendix F.
- 20.7. MON-7: Monitor GRSG habitat as described in the monitoring framework plan (Appendix E) in coordination with IDFG and MT FWP.

**Commented [BER94]:** Ethan Ellsworth - What about adding a bullet (20.8) for RHE monitoring?

**Commented [BER95]:** Karen Rice - Annually monitor the effectiveness of fuels treatment projects. Suggest 'Annually monitor the effectiveness of fuels treatment projects until monitoring determines the projects' goals have been met'

DRAFT

## Appendices

Appendix A – Required Design Features

Appendix B – Seasonal Timing Restrictions

Appendix C – Application of Buffers

Appendix D – Wildfire and Invasive Species Assessments/FIAT Team

Appendix E – Monitoring Framework Plan

Appendix F – Idaho Key Habitat Map Update Process

Appendix G – Idaho Anthropogenic Disturbance and Adaptive Management

Appendix H – Montana Anthropogenic Disturbance and Adaptive Management Process

Appendix I – Mitigation

Appendix J – Lands No Longer Available for Disposal

Appendix K – Travel Management Planning Guidelines

Appendix L – Functioning of Boards

Commented [BER96]: John working on.

Commented [BER97]: Karen Rice - Upper Snake, Challis, and Dillon FOs are the only units that LUP identified disposal parcels within GR5G habitat?

Commented [BER98]: Pat is working on Montana section.

DRAFT

Ethan Ellsworth - 4. Table 2. I recommend adding, changing or addressing the following – see me to discuss/references

a. Nesting:

- i. Annual grass cover (%) < 5
- ii. Remove the sagebrush height maximum. Weak evidence that sagebrush height is a major habitat attribute, and may be in conflict with objectives for winter habitat in cases where nesting and winter habitat overlap.
- iii. Perennial grass height < 7 inches
- iv. Conifer encroachment (%) < 5
- v. Consider increasing sagebrush canopy cover from a max of 25% to account for variation in GRSG populations. Perhaps relate to ecological site. Some recent studies in Nevada indicate that dense stands of sage (as high as 40% cover) are of greater value to nesting GRSG, and there are likely portions of Idaho that this holds true as well.

b. Brood-Rearing/Summer

- i. Remove the sagebrush height maximum
- ii. Managing for PFC is what we are already managing for at riparian sites. Thus, this plan fails to address or outline a plan to improve an important GRSG habitat component that is, in many cases, in poor condition. Thus, the plan should be designed to be more specific to desired habitat conditions. For example, specify 1) riparian area/meadow interspersed with adjacent sagebrush (perimeter to area ratio of 0.15 within 159 buffer of the microhabitat plot, and 2) forb availability at riparian sites; e.g. > 5 species present.

c. Winter

- i. It should be explained that the desired condition is that >10% of sage canopy should be >10 inches above snow. As it stands now, these two components are separate so it could be misinterpreted.

## **Idaho and Southwestern Montana Recommendation for Proposed Plan Amendment**

### **1. Summary Description of the Proposed Plan (Plan)**

The Proposed Plan represents a management strategy to address Greater Sage-grouse, their habitat and associated threats within the Idaho and Southwestern Montana Subregion. The Plan has been developed through a coordinated partnership of BLM, Forest Service, the States of Idaho and Montana and the US FWS.

The Plan incorporates appropriate conservation measures to conserve, enhance, and restore GRSG habitat by reducing, eliminating, or minimizing threats to that habitat. The Plan is also consistent with the objectives described in the USFWS Conservation Objectives Team Report (USFWS 2013) to: ‘Conserve sage-grouse so that it is no longer in danger of extinction or likely to become in danger of extinction in the foreseeable future...’ through ‘Maintaining viable, connected, and well-distributed populations and habitats across [the range of GRSG], through threat amelioration, conservation of key habitats, and restoration activities’.

To achieve these objectives the Plan includes a combination of: Goals and Objectives including vegetation/habitat management objectives to be applied during project development and implementation (Table 3); land allocation decisions (Table 1); delineation of five Conservation Areas (Map 1) to support evaluation of the adaptive management strategy and 3% anthropogenic disturbance cap; delineation of Priority, Important and General Habitat Management Areas (Map 2) with associated program management direction; a mitigation framework and strategy; development of Wildfire and Invasive Species Assessments; and associated monitoring to support these decisions.

**Table 1. Idaho and Southwestern Montana GRSG EIS – Land Allocation Decisions Summary<sup>1</sup>**

<b>Solar/Wind/Nuclear/Hydropower – Map 3</b>		
<b>Priority</b>	<b>Important</b>	<b>General</b>
BLM: Exclusion (LR-2) FS: Exclusion	BLM: Avoidance (LR-2) FS: Exclusion	BLM: Open (LR-2) FS: Avoidance
<b>Commercial Service Airports – Map 4</b>		
<b>Priority</b>	<b>Important</b>	<b>General</b>
Exclusion (LR-3)	Avoidance (LR-1)	Open (LR-1)
<b>Landfills – Map 4</b>		
<b>Priority</b>	<b>Important</b>	<b>General</b>
Exclusion (LR-4)	Avoidance (LR-1)	Open (LR-1)
<b>Utility Corridors – Map 5</b>		
<b>Priority</b>	<b>Important</b>	<b>General</b>
Existing designated corridors which are land use plan designations (and include Section 368 Corridors), will remain “open” (subject to the ongoing settlement agreement) and can provide an opportunity to be modified with mitigation. Any new disturbance within these corridors would count towards the disturbance cap. All new, modified, or deleted corridors will require a land use plan amendment. (LR-7)	Same as Priority (LR-7)	Same as Priority (LR-7)
<b>Rights-of-Way and Land Use Authorizations/Permits – Map 6</b>		
<b>Priority</b>	<b>Important</b>	<b>General</b>

<sup>1</sup> The Idaho and Southwestern Montana Subregion includes portions of Idaho, Montana and Utah. Where differences exist between direction for Idaho and Montana or between BLM and Forest Service, those are noted in the table and within the management action section. The lands within Utah are part of the Sawtooth National Forest and are managed as such; therefore direction for these lands in Utah is the same as that described for the Sawtooth National Forest in Idaho.

## 2. Goals and Objectives

- 2.1. GOAL-1: Maintain and/or increase the abundance, distribution and connectivity of GRSG by conserving, enhancing and restoring GRSG habitat to maintain resilient populations by reducing, eliminating or minimizing threats to GRSG habitats.
- 2.2. GOAL-2: Provide for the needs of GRSG and their habitat while also providing for resource uses in accordance with the agencies' direction for multiple use and sustained yield as described in FLPMA and the NFMA.
- 2.3. GOAL-3: Manage anthropogenic development and human disturbance to minimize the likelihood of adverse population level effects on GRSG.
- 2.4. GOAL-4: Reduce the risk of West Nile Virus or other disease outbreaks from BLM and USFS management actions.
- 2.5. Management Area (MA) - Objective (OBJ)-1: Maintain a resilient population of GRSG in Idaho and Southwestern Montana.
- 2.6. MA-OBJ-2: Designate GRSG management areas and associated management to maintain a resilient population and to designate strategically located adjacent areas to provide a buffer from unpredictable habitat loss such as wildfire to the resilient population areas.
- 2.7. MA-OBJ-3: Identify and strategically protect larger in-tact sagebrush areas and areas of lower fragmentation to maintain GRSG population persistence.
- 2.8. Vegetation (VEG)-OBJ-1: Reconnect and expand areas of higher native plant community integrity/rangeland health to increase the extent of high quality habitat and, where possible, to accommodate the future effects of climate change.
- 2.9. VEG-OBJ-2: Increase the amount and functionality of seasonal habitats by:
  - a. Increasing canopy cover and average patch size of sagebrush in perennial grasslands.
  - b. Increasing the amount, condition and connectivity of seasonal habitats.
  - c. Protecting or improving GRSG migration/movement corridors.
  - d. Reducing conifer encroachment within GRSG seasonal habitats.
  - e. Improving understory (grass, forb) and/or riparian condition within breeding and late brood-rearing habitats.
  - f. Reducing the extent of annual grasslands within and adjacent to Priority and Important Habitat Management Areas.Decadal treatment objectives by population area are identified in Table 2.
- 2.10. Habitat Management (HM)-OBJ-1: Maintain or make progress toward at least 70% of lands within PHMAs and IHMAs capable of producing sagebrush at 10-30% canopy cover and conifers absent to uncommon within 1.86 miles of occupied leks.
- 2.11. HM-OBJ-2: Incorporate GRSG Seasonal Habitat Objectives (Table 3) into the design of projects or activities, as appropriate, based on site conditions and ecological potential, unless achievement of fuels management objectives require additional reduction in sagebrush cover to meet strategic protection of GRSG habitat and conserve habitat quality for the species; unless at least one of the following conditions can be demonstrated and documented in the NEPA analysis associated with the specific project:

A specific objective is not applicable to the site-specific conditions of the project or activity;

Commented [BER3]: Objectives or desired conditions? In relation to the HAF.

An alternative objective is determined to provide equal or better protection for GRSG or its habitat (based on appropriate scientific findings); or Analysis concludes that following a specific objective would provide no more protection to GRSG or its habitat than not following it, for the project being proposed.

- 2.12. FUEL-OBJ-1: Design fuel treatments to restore, enhance, or maintain GRSG habitat.
- 2.13. WHB-OBJ-1: Manage wild horse and burro population levels within the established AML ranges to maintain or enhance GRSG habitat.

**Table 2. Acres of Treatment within a 10-Year Period to Achieve Vegetation Objectives<sup>2</sup>**

Population Area	Mechanical Conifer Treatment	Mechanical Sage	Prescribed Fire	Annual Grass Treatment
Bear Lake Plateau		1000		
East Idaho Uplands	6000		9000	1000
S Central Idaho/N Snake River and Mountain Valleys	4000	14000	11000	162000
Weiser				13000
SW Idaho	48000	4000	10000	444000

**Commented [BER4]:** Double check management actions for prescribed fire in high elevation areas. Footnote direction regarding use of fire in Wyoming sagebrush.

**Commented [BER5]:** Check with Rob and Kelly on numbers for Montana.

**Table 3. Seasonal Habitat Desired Conditions for Greater Sage-Grouse**

ATTRIBUTE	INDICATOR	DESIRED CONDITON
<b>BREEDING HABITAT (LEK AND NESTING/EARLY BROOD REARING)</b>		
Lek Security	Proximity of trees <sup>7,13</sup>	Trees (i.e., <a href="#">in Idaho</a> mainly juniper, conifers, and does not include old growth juniper, pinyon pine and mountain mahogany; <a href="#">in Montana</a> mainly Douglas-fir) absent or uncommon on shrub/grassland ecological sites

**Commented [BER6]:** How are these implemented – if not met what happens?

<sup>2</sup> These acreage figures represent and objective for treatment over a ten-year (decadal) timeframe to support achievement or progress toward vegetation and habitat objectives. This accounts for variations in yearly funding availability and does not reflect a maximum acreage for treatment should funding and site specific conditions allow for more or less treatment than described in order to meet vegetation and habitat objectives.

	Proximity of sagebrush to leks <sup>13</sup>	within 1.86 miles (3 km) of occupied leks. Adjacent protective sagebrush cover within 328 ft (100 m) of an occupied lek
<b>NESTING/EARLY BROOD REARING<sup>5,10,12,13,14</sup></b>		
Cover and Food	Seasonal habitat extent <sup>8</sup>	>80% of the nesting habitat meets the recommended vegetation characteristics, where appropriate (relative to ecological site potential, etc.).

	Mesic sites <sup>4</sup>	16-31 inches (40-80cm)
	Predominant sagebrush shape <sup>13</sup>	Predominantly spreading shape <sup>5</sup>
	Perennial grass cover <sup>2,8,13</sup>	
	Arid sites <sup>3</sup>	≥10%
Mesic sites <sup>4</sup>	≥15%	
Perennial grass height <sup>8,9,11,13</sup>	Adequate nest cover	
Perennial forb cover <sup>2,8</sup>		
Arid sites <sup>3</sup>	≥5%	
Mesic sites <sup>4</sup>	≥10%	
Perennial forb availability <sup>13</sup>	Preferred forbs are common with several species present <sup>6</sup>	
<b>LATE BROOD-REARING/SUMMER<sup>1</sup> (July-October)<sup>1</sup> (Apply to all habitat outside of nesting/breeding and winter)</b>		
Cover and Food	Seasonal habitat extent <sup>8</sup>	>40% of the summer/brood habitat meets recommended brood habitat characteristics where appropriate (relative to ecological site potential, etc.)
	Sagebrush canopy cover <sup>2,8</sup>	10-25%
	Sagebrush height <sup>8</sup>	16 to 32 inches (40-80cm)
	Perennial grass canopy cover <sup>2,8</sup>	>15%
	Upland and riparian perennial forb availability <sup>2,13</sup>	Preferred forbs are common with several preferred species present <sup>6</sup> .
Riparian meadow habitat condition	Proper Functioning Condition <sup>13</sup>	
<b>WINTER<sup>1</sup> November-March<sup>1</sup> (Apply to areas of known or likely winter-use)</b>		
Cover and Food	Seasonal habitat extent <sup>8</sup>	>80% of the wintering habitat meets winter habitat characteristics where appropriate (relative to ecological site, etc.).
	Sagebrush canopy cover above snow <sup>2,8,13</sup>	>10%
	Sagebrush height above snow <sup>8</sup>	>10 inches (>25cm)
<b>NOTES AND REFERENCES</b>		
<p><sup>1</sup> Seasonal dates can be adjusted by local unit according to geographic region.</p> <p><sup>2</sup> Absolute cover is the actual recorded cover and can exceed 100% when recorded across all species and all layers. It is not relative cover, which is the proportions of each species, and equals 100%. Note that cover is reported for only those species (e.g., sagebrush, preferred forbs) that are sampled to determine suitability of habitat for sage-grouse. Overall cover at the site will be greater than that sampled for sage-grouse habitat, due to other species present.</p>		

<sup>3</sup> Arid corresponds to the 10 – 12 inch precipitation zone; *Artemisia tridentata wyomingensis* is a common big sagebrush sub-species for this type site (Stiver et al. *In Press*).

<sup>4</sup> Mesic corresponds to the  $\geq 12$  inch precipitation zone; *Artemisia tridentata vaseyana* is a common big sagebrush sub-species for this type site (Stiver et al. *In Press*).

<sup>5</sup> Collectively the indicators for sagebrush (cover, height, and shape), perennial grass and perennial forb (cover, height and/or availability) represent the desired condition range for nesting/early brood rearing habitat characteristics, consistent with the breeding habitat suitability matrix identified in Stiver et al. *In Press*. Sagebrush plants that are more tree or columnar-shaped provide less protective cover near the ground than sagebrush plants with a spreading shape (Stiver et al. *In Press*). Some sagebrush plants are naturally columnar (e.g., Great Basin big sagebrush), and a natural part of the plant community. However, a predominance of columnar shape arising from animal impacts may warrant management investigation or adjustments at site specific scales.

<sup>6</sup> Preferred forbs are listed in Stiver et al. *In press*. Overall total forb cover may be greater than that of preferred forb cover since not all forb species are listed as preferred.

### 3. Coordination

- 3.1. CC-1: Collaborate, coordinate and utilize cooperative planning efforts to implement and monitor activities to achieve desired conditions and to maximize the utilization of available funding opportunities. Coordination efforts could include: adjacent landowners, federal and state agencies, local governments, tribes, communities, other agencies, resource advisory groups, public lands permit holders and non-governmental organizations.
- 3.2. CC-2: Develop a cooperative MOU between the BLM, Forest Service and State of Idaho to establish the State of Idaho as a cooperating agency during implementation of the final decision. The MOU would identify responsibilities, role and interaction of the BLM, FS and Task Team. Montana BLM will participate as appropriate on Montana's Sage-grouse Oversight Team to facilitate coordination and implementation of BLM's final decision and Montana's forthcoming sage-grouse conservation strategy.
- 3.3. CC-3: The BLM and Forest Service would consider any recommendations from the Governor of Idaho as a result of evaluation completed by the Sage-Grouse Implementation Task Force.
- 3.4. CC-4: The BLM and Forest Service would coordinate with the State of Idaho and Montana and the Idaho Sage-Grouse Implementation Task Force and Montana Sage-grouse Oversight Team regarding proposed management changes, the implementation of conservation measures, mitigation, and site-specific monitoring, related to adaptive management and livestock grazing (Appendix O).
- 3.5. CC-5: Upon completion of the Record of Decision the BLM will develop an Implementation Guide for BLM District and Field Offices to define and describe consistent application of the allocations, management actions, required design features, and etc. that are contained within the final plan.
- 3.6. CC-6: At the state level, BLM and Forest Service would coordinate with IDFG, MFWP, USFWS, and other conservation partners in collaborative efforts with adjacent states (Oregon, Nevada, Utah, Montana, Wyoming) in GRSG MZs IV and II to evaluate GRSG habitat and population status and trends and make appropriate recommendations for GRSG conservation at broader scales.
- 3.7. CC-7: At the state level, BLM and Forest Service would coordinate with appropriate WAFWA Sage-grouse Technical Committee to develop consistent population and habitat monitoring approaches that facilitate GRSG conservation at the MZ scale.
- 3.8. CC-8: All prescribed burning would be coordinated with state and local air quality agencies to ensure that local air quality is not significantly impacted by BLM and Forest Service activities.

**Commented [BER7]:** Use specific title and citation.

**Commented [BER8]:** Need to clarify what is strictly Idaho. Applies to XX and does not apply t

**Commented [BER9]:** Break into Montana and Idaho pieces. In support of the MOU in CC-2. Dillon will draft MT portion of Appendix O.

#### 4. Greater Sage-Grouse Management Areas

- 4.1. Management Area (MA)-1: Designate five GRSG Conservation Areas within the sub-region to form the geographic basis for achieving population objectives; evaluating the disturbance density and adaptive regulatory triggers; and tailor adaptive management responses. These conservation areas are depicted in Map 1. These areas are referred to as Mountain Valleys, Desert, West Owyhee, Southern and Southwestern Montana Conservation Areas.

Conservation Area Description:

Mountain Valleys Conservation Area – generally located north of the Snake River Plain, and includes habitat in west-central population area. It extends west from Rexburg, north and west of Highway 33 to Howe, north and west of Highway 33/22 to Arco, north and west of Highway 26/20/93 to Carey, north and west of Highway 20 west to Hill City, north and west of Highway 20 to the Dylan Karas Road, west to Canyon Creek. Canyon Creek to the confluence with the Snake River form the western boundary.

Desert Conservation Area – located north of the Snake River and south of the Mountain Valleys Conservation Area. It extends from the confluence of Canyon Creek and the Snake River, eastward to Idaho Falls. The Snake River and Henry’s Fork form the eastern boundary.

West Owyhee Conservation Area – located south of the Snake River and west of the Bruneau River.

Southern Conservation Area – located south of the Snake River and east of the Bruneau River, including East Idaho uplands and Bear Lake Plateau, and the Utah portion of the Sawtooth National Forest in Box Elder County.

Southwestern Montana – located in southwestern Montana - encompassing the Dillon and Butte BLM Field Office boundaries. (the Butte RMP is not being amended and since there are limited GRSG federal General Habitat Management Areas management actions do not apply in the Butte Field Office).

Additionally, sage-grouse habitats in the Desert and West Owyhee CAs are relatively contiguous, while those in the Mountain Valleys and Southern CAs tend to be more fragmented due to topography, elevational and land use differences.

- 4.2. MA-2: Within each Conservation Area (CA) designate GRSG Habitat Management Areas: Priority, Important and General Habitat Management Areas (Map 2). **Priority Habitat Management Areas (PHMAs)** focus on conserving the two key meta-populations in the sub-region. These meta-populations consist of a large aggregation of interconnected breeding subpopulations of GRSG that have the highest likelihood of long-term persistence. The PHMA encompasses areas with the highest conservation value to GRSG, based on the presence of larger leks, habitat extent, important movement and connectivity corridors and winter habitat. Priority Habitat

Commented [BER10]: Include a description in the introduction (Chapter 1) why Butte is not being amended.

Management Areas include adequate area to accommodate continuation of existing land uses and landowner activities. **Important Habitat Management Areas (IHMAs)** contain additional high value habitat and populations that provide a management buffer for the PHMA, connect patches of PHMA. The IHMA encompasses areas of generally moderate to high conservation value habitat and/or populations and in some CAs includes areas beyond those identified by USFWS as necessary to maintain redundant, representative and resilient populations (Priority Areas for Conservation (PACs)). The IHMAs are typically adjacent to PHMAs but generally reflect somewhat lower GRSG population status and/or reduced habitat value due to disturbance, habitat fragmentation or other factors. There are no IHMAs designated within the Southwestern Montana CA. **General Habitat Management Areas (GHMAs)** encompass habitat that is outside of PHMAs or IHMAs. It is generally characterized by more marginal habitat and few, if any, occupied leks or other important seasonal use areas.

- 4.3. MA-3: Delineate PHMA and IHMA to encompass 90% of the breeding males in Idaho.
- 4.4. MA-4: Annually prioritize Conservation Areas at the state scale considering results of the annual adaptive regulatory trigger evaluations relative to implementation of restoration and mitigation activities.
- 4.5. MA-5: Prioritize activities and mitigation to protect, enhance and restore GRSG habitats (i.e. suppression activities, fuels management activities, vegetation treatments, invasive species treatments, etc.) first by Conservation Area, if appropriate (CA under adaptive management or at risk of engaging adaptive management), followed by Priority Habitat Management Areas, then Important Habitat Management Areas then General Habitat Management Areas within the Conservation Areas. Local priority areas within these areas will be further refined as a result of completing the GRSG Wildfire and Invasive Species Habitat Assessments as described in Appendix D. This could include projects outside GRSG habitat when those projects would provide a benefit to GRSG habitat. Priority restoration and mitigation areas are restoration areas identified on the Key Habitat map (R1, R2, R3 and Recent Burn) within nesting and wintering areas in Priority and Important Habitat Management Areas.
- 4.6. MA-6: The management area map and biologically significant unit baseline map would be re-evaluated in conjunction with plan evaluation processes (i.e. approximately every 5 years). This re-evaluation could indicate the need to adjust Priority, Important or General Habitat Management Areas or the habitat baseline. These adjustments could occur upon completion of the appropriate analysis (plan amendment) to review the allocation decisions based on the map. [Results from the Wildfire and Invasives Species Assessments such as identified focal or emphasis areas would also be used to help inform mapping adjustments during this evaluation.](#)
- 4.7. MA-7: The [functionality and capability](#) of GRSG habitat within the project area would be assessed during project-level NEPA analysis within the management area designations (Priority, Important, General) and appropriate updates to the Key Habitat map would occur. Areas without the potential and capability to provide GRSG habitat would be identified, areas with the potential to provide GRSG habitat

Commented [BER11]: Remapping for Idaho. May need to include an action for remapping in Montana.

Commented [BER12]: Define terms – what does these mean – do we all know and have the same understanding?

- would be appropriately classified on the Key Habitat map. Project proposals and their effects would be evaluated based on the habitat and values affected.
- 4.8. MA-87: Idaho BLM will annually update the Key Habitat map as described in Appendix F, in order to reflect habitat changes resulting from wildfire, succession, and vegetation treatments that occurred or were observed since the last update. Updates to the map will also occur if it is determined that mapping errors or omissions have occurred, or that radio-telemetry studies indicate that sage-grouse are consistently utilizing an area. Updates are also intended to capture recommendations by the field offices, sage-grouse Local Working Groups (LWG), or agency partners in sage-grouse conservation.
- 4.9. MA-98: Areas of habitat outside of delineated management areas identified during the Key habitat update process would be evaluated during site specific NEPA for project level activities and GRSG required design features (Appendix A), seasonal timing restrictions (Appendix B) and buffers (Appendix C) would be included as part of project design. These areas would be further evaluated during plan evaluation to determine whether they should be included as Priority, Important or General Habitat Management Areas.

## 5. Adaptive Management

- 5.1. Adaptive Management (AM)-1: Idaho: Use hard and soft population and habitat triggers, evaluated within a Conservation Area, to determine an appropriate management response.
- 5.2. AM-2: Utilize monitoring information collected through the Monitoring Framework Plan (Appendix E) to determine when adaptive regulatory triggers have been met.
- 5.3. AM-3: Idaho: BLM and Forest Service would maintain GRSG habitat information, through use of the Key Habitat map or latest sagebrush/vegetation map, which would be used to track and identify habitat changes to assess the habitat trigger in the adaptive management approach. Key habitat map updates are made each winter by BLM in coordination with the FS and Idaho Department of Fish and Game (IDFG), using the process described in Appendix F.
- 5.4. AM-4: BLM and Forest Service would utilize population information collected and maintained by the Idaho Department of Fish and Game to track and identify population changes to assess the population trigger in the adaptive management approach.
- 5.5. AM-5: Twice each year the applicable monitoring information would be reviewed to determine if any adaptive management criteria have been met.
- 5.6. AM-6: Adaptive regulatory triggers would be individually calculated across all ownerships within the biologically significant units (BSU). The BSU is defined as the Idaho Department of Fish and Game modeled nesting and wintering habitat within Priority and Important Habitat Management Areas within a Conservation Area. The sagebrush component of the BSU is represented by the key habitat within the BSU.
- 5.7. AM-7: Adaptive Regulatory Criteria for Hard Habitat Triggers are defined as:
  - A 20 percent loss of Key Habitat within the biologically significant unit (BSU) (Appendix G) of the PHMA of a CA when compared to the 2011 baseline (the BSU is defined as the nesting and wintering habitat within a Priority and Important Habitat Management Areas (separately) within a Conservation Area, inclusive of all ownerships); or
  - A 20 percent loss of Key Habitat within the BSU of the IHMA of a CA when compared to the 2011 baseline.
- 5.8. AM-8: Adaptive Regulatory Criteria for Soft Habitat Triggers are defined as:
  - A 10 percent loss of Key Habitat within the BSU of the PHMA of a CA when compared to the 2011 baseline; or
  - A 10 percent loss of Key Habitat within the BSU of the IHMA of a CA when compared to the 2011 baseline.
- 5.9. AM-9: Adaptive Regulatory Criteria for Hard Population Triggers are defined as:  
A 20 percent decline in maximum number of males counted and a finite rate of change significantly below 1.0 within PHMA within a CA over a period of 3 consecutive years compared to the 2009-2011 baseline; or  
A 20 percent decline in maximum number of males counted and a finite rate of change significantly below 1.0 within IHMA within a CA over a period of 3 consecutive years compared to the 2009-2011 baseline.
- 5.10. AM-10: Adaptive Regulatory Criteria for Soft Population Triggers are defined as:

- A 10 percent decline in maximum number of males counted and a finite rate of change below 1.0 within PHMA within a CA over a period of 3 years when compared to the average finite rate of change from 2009-2011; or  
A 10 percent decline in maximum number of males counted and a finite rate of change below 1.0 within IHMA within a CA over a period of 3 years when compared to the average finite rate of change from 2009-2011.
- 5.11. AM-11: When any of the Adaptive Regulatory Criteria for Soft Triggers have been met the Implementation Team would evaluate causal factors and recommend additional potential implementation level activities Appendix G.
  - 5.12. AM-12: When any of the Adaptive Regulatory Criteria for Hard Triggers have been met then PHMA management actions would be applied to the IHMA within that CA.
  - 5.13. AM-13: If an adaptive regulatory trigger is tripped and livestock grazing is identified as a probable limiting factor then adjustments would follow the Adaptive Grazing Management Response described in Appendix G.
  - 5.14. AM-14: Remove any adaptive management response when the habitat or population information shows a return to or an exceedance of baseline values within the associated CA.
  - 5.15. Montana Adaptive Management:

Commented [BER13]: John and Kelly to write up and send ☺

## **6. Anthropogenic Disturbance**

- 6.1. Anthropogenic Disturbance (AD)-1: Limit anthropogenic disturbance to 3 percent as calculated within the biologically significant unit (BSU) (Map 3). The BSU is defined as the nesting and wintering habitat within Priority and Important Habitat Management Areas within a Conservation Area, inclusive of all ownerships for evaluation. Anthropogenic disturbance excludes habitat disturbance from wildfire and fuels management activities and includes activities described in Table X. For Idaho this disturbance is measured by direct footprint or by ROW width for linear features (powerlines, pipelines and roads). For Montana this disturbance is measured utilizing the Disturbance Density Calculation Tool process described in Appendix H.
- 6.2. AD-2: New anthropogenic disturbances within Priority or Important Habitat Management Areas within a CA where the disturbance cap is already exceeded from any source or where the proposed development would result in the cap being exceeded would not be allowed until enough habitat has been restored to maintain the area under this cap (subject to valid existing rights).
- 6.3. AD-3: Priority Habitat Management Area: Anthropogenic Disturbance Exception Criteria. In order to avoid surface-disturbing activities in Priority Habitat Management Areas, priority will be given to development (including ROWs, fluid minerals and other mineral resources subject to applicable stipulations) outside of Priority Habitat Management Areas. When authorizing development in Priority Habitat Management Areas, priority will be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-Grouse. In addition to the Priority and Important Habitat Management Area Anthropogenic Disturbance Development Criteria (AD-4), the following criteria must all be met in the project screening and assessment process:
  - a. The population trend for the GRSG within the associated Conservation Area is stable or increasing over a three-year period and the population levels are not currently engaging the adaptive management triggers (this applies strictly to new authorizations; renewals and amendments of existing authorizations would not be subject to this criteria when it can be shown that long-term impacts from those renewals or amendments would be substantially the same as the existing development);
  - b. The development with associated mitigation would not result in a net loss of GRSG Key habitat and mitigation would provide a net conservation benefit to the respective Priority Habitat Management Area;
  - c. The project would not result in a net loss of GRSG Key habitat or habitat fragmentation or other impacts causing a decline in the population of the species within the relevant CA (the project would be outside Key habitat in areas not meeting desired habitat conditions or the project would provide a benefit to habitat areas that are functioning in a limited way as habitat);
  - d. Cannot be reasonably accomplished outside of the Priority Habitat Management Area; or can be either: 1) developed pursuant to a valid existing authorization; 2) is an incremental upgrade/capacity increase of existing development (i.e. powerline capacity upgrade); or 3) is co-located within the footprint of existing infrastructure (i.e. powerlines) (proposed actions would not increase the 2011

- authorized footprint and associated impacts more than fifty percent (50%), depending on industry practice.
- e. Development could be implemented adhering to the required design features (RDF) described in Appendix A;
  - f. The project would not exceed the disturbance cap (AD-1).
  - g. The project has been reviewed by the State Implementation Team and recommended for consideration by the Idaho Governor.
- 6.4.** AD-4: Priority and Important Habitat Management Areas: Anthropogenic Disturbance Development Criteria – the following criteria must be met in the screening and assessment process:
- a. The project cannot reasonably be achieved, technically or economically, outside of this management area; and
  - b. The project siting and/or design should best reduce cumulative impacts and/or impacts on GRSG and other high value natural, cultural, or societal resources; this may include co-location within the footprint for existing infrastructure, to the extent practicable; and
  - c. The project does not result in a net loss of GRSG Key habitat or habitat fragmentation or other impacts causing a decline in the population of the species within the relevant CA; and
  - d. The project design mitigates unavoidable impacts through appropriate compensatory mitigation; and
  - e. The project complies with the applicable RDFs as described in Appendix A.
  - f. The project would not exceed the disturbance cap (AD-1).
- 6.5.** AD-5: Co-locating new infrastructure within existing ROWs and maintaining and upgrading ROWs is preferred over the creation of new ROWs or the construction of new facilities in all management area. Colocation for various activities is defined as:
- Communication Sites – The installation of new equipment/facilities on or within or adjacent to existing authorized equipment/facilities or within a communication site boundary as designated in the Communication Site Plan.
- Electrical Lines – Installation of new rights-of-way (ROWs) adjacent to current ROWs boundaries, not necessarily placed on the same power poles.
- Other Rights-of-Way – The installation of new rights-of-way (ROWs) within the existing footprint of an approved ROW boundary or adjacent to an approved ROW boundary.
- Designated Corridors – The installation of new rights-of-way within the existing corridor or adjacent to the existing corridor.
- 6.6.** AD-6: Incorporate required design features (RDFs) as described in Appendix A in the development of project or proposal implementation, reauthorizations or new authorizations and suppression activities, as conditions of approval into any post-lease activities and as best management practices for locatable minerals activities, to the extent allowable by law, unless at least one of the following conditions can be

- demonstrated and documented in the NEPA analysis associated with the specific project:
- A specific RDF is not applicable to the site-specific conditions of the project or activity;
  - A proposed design feature or BMP is determined to provide equal or better protection for GRSG or its habitat; or
  - Analysis concludes that following a specific RDF would provide no more protection to GRSG or its habitat than not following it, for the project being proposed.
- 6.7. AD-7: Conduct implementation and project activities, including construction and short-term anthropogenic disturbances consistent with seasonal habitat restrictions described in Appendix B.
- 6.8. AD-8: Required Design Features and seasonal habitat restrictions would not be required for emergency or short-term activities necessary to protect and preserve human life or property.
- 6.9. AD-9: Incorporate appropriate buffers into implementation and project design to avoid and minimize impacts to GRSG described in Appendix C.

Table X. Anthropogenic Disturbances and Areas of Impact

Datasets as Described in the Monitoring Framework <sup>3</sup>
Oil and Gas Wells and Development Facilities
Coal Mines
Wind Towers
Solar Fields
Geothermal Development Facilities
Mining (Active Locatable, Leasable and Saleable Developments)
Roads
Railroads
Powerlines
Communication Towers
Other Vertical Structures
Additional Local Datasets (need definitions)
Underground Pipelines
Coal Bed Methane Ponds
Meteorological Towers
Nuclear Energy Facilities
Airports
Military Ranges (ground based?)
Hydropower plants
Recreation Areas (Developed)

<sup>3</sup> Taken from Table 6 – GRSG Monitoring Framework.

DRAFT

## 7. Mitigation

- 7.1. Mitigation (MIT)-1: BLM and USFS would establish an inter-agency GRSG Conservation Board at the state level (both Idaho and Montana) to oversee GRSG Conservation.
- 7.2. MIT-2: The BLM and USFS, in coordination with the GRSG Conservation Board would develop a State Mitigation Strategy. In Idaho this strategy would be consistent with the Idaho Mitigation Framework (Appendix I).
- 7.3. MIT-3: Mitigate impacts from anthropogenic developments (Appendix G Table G-1) to GRSG habitats to a net conservation benefit (benefits more birds) by first avoidance of impacts, minimizing impacts and then compensating for impacts.
- 7.4. MIT-4: Mitigate anthropogenic development (Appendix G Table G-1) impacts to a no net loss of Key habitat standard (Appendix I) through application of appropriate mitigation in accordance with the Mitigation Framework (Appendix I), referred to as no unmitigated loss.
- 7.5. MIT-5: Mitigate anthropogenic development (Appendix G Table G-1) impacts to GRSG habitat through application of appropriate mitigation in accordance with the Mitigation Framework (Appendix I).
- 7.6. MIT-6: Consistent with regulations for minerals activities, require a full reclamation bond specific to the site when surface disturbing activities are proposed. Ensure reclamation bonds are sufficient to cover costs to fully rehabilitate lost GRSG habitat. Base the reclamation costs on the assumption that contractors for the BLM will perform the work. Areas are considered fully rehabilitated when they meet the conditions described in Table 3.

8. From NPT - *"A net conservation gain to the greater sage-grouse will be achieved by implementing restoration conservation actions outlined in this proposed plan [or amendment], applying a no net unmitigated loss standard for authorized land uses in all GRSG habitat (within) [mention all areas that make up GRSG habitat: PHMA, GHMA, IHMA, and/or Core], and, strategically siting compensatory mitigation actions, via a WAFWA Management Zone Regional Mitigation Strategy as part of a mitigation program in order to achieve cumulative benefits (as outlined in [Appendix X])."*

7.6.10. *"No net unmitigated loss means that impacts from implementation level actions will fully offset to benefit the species. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions."*

Commented [BER14]: Compensatory – these actions are appropriate for compensatory mitigation but not avoid and minimize

Commented [BER15]:

Formatted

Commented [BER16]: Include within PHMA, etc.

Formatted: Font: Garamond

## **8.11. Wildfire Preparedness/Prevention**

- 8.1.11.1.** Wildfire Preparedness (WFP)-1: Support development and implementation of Rangeland Fire Protection Associations (RFPAs) in coordination with the State of Idaho.
- 8.2.11.2.** WFP-2: Develop a consistent approach to fire restrictions within GRSG habitat through the existing coordinated inter-agency approach to fire restrictions based upon National Fire Danger Rating System thresholds (fuel conditions, drought conditions, and predicted weather patterns).
- 8.3.11.3.** WFP-3: Annually incorporate into existing fire management plans results and updates from the Wildfire and Invasive Species Habitat Assessments (FIAT Assessments) described in Appendix D, to communicate/explain the resource value of GRSG habitat, including fire prevention messages and actions to reduce human-caused ignitions.
- 8.4.11.4.** WFP-4: Continue to participate with the Wildland Fire Leadership Council, a cooperative, interagency organization dedicated to achieving consistent implementation of the goals, actions, and policies in the National Fire Plan and the Federal Wildland Fire Management Policy.
- 8.5.** WFP-5: Continue annual coordination meetings held between cooperating agencies that have fire suppression responsibilities. Incorporate Rangeland Fire Protection Associations and other stakeholders into this coordination. Discuss priority suppression areas and distribute maps showing priority suppression areas at both the Conservation Area and the local office levels as based on the adaptive management strategy and FIAT Assessments.
- 8.6.** WFP-6: Ensure firefighter personnel receive annual orientation regarding GRSG habitat and sagebrush management issues as related to wildfire suppression.
- 8.7.** WFP-7: As part of the FIAT Assessments, identify roads, trails, and recreational use areas with high frequency of human caused fires within or adjacent to the Priority or Important Habitat Management Areas. Consider these areas during annual fire restriction evaluations, and as appropriate, through site specific management.
- 8.8.** WFP-8: Coordinate with Federal, State and local jurisdictions on fire and litter prevention programs to reduce human caused ignitions.
- 8.9.** WFP-9: Implement activities identified within the FIAT Assessments.

## 9. Wildfire Suppression

- 9.1. WFS-1: Complete Wildland Fire and Invasive Species Assessments (FIAT Assessments) as described within Appendix D and incorporate results into appropriate Fire Management Plans as they are completed. FIAT Assessments are interdisciplinary evaluations of the threats posed by wildfire and invasive species, as well as identification of focal And emphasis priority areas/treatment opportunities for fuels management, fire management, and restoration. These FIAT Assessments identify priority areas and describe strategies for fuels management, suppression and restoration activities.
- 9.2. WFS-2: As part of the FIAT Assessments incorporate a wildfire response time analysis focusing on response time to identified priority areas within Priority and Important Habitat Management Areas or on those fires that have the potential to impact Priority and Important Habitat Management Areas. Incorporate findings into Unit Initial Attack program
- 9.3. WFS-3: As part of the FIAT Assessment incorporate a water capacity analysis for suppression purposes, including potential private water sources. Provide water availability to respond to fire in or threatening PHMA and IHMA during initial attack.
- 9.4. WFS-4: During high fire danger conditions, stage initial attack and secure additional resources closer to priority areas identified in the FIAT Assessments, based on anticipated fires and weather conditions, with particular consideration of the West Owyhee, Southern and Desert Conservation Areas to ensure quicker response times in or near GRSG habitat after considerations and placement of resources to protect human life and property.
- 9.5. WFS-5: Utilize a full range of fire management strategies and tactics through strategic wildfire suppression planning consistent with appropriate management response and within acceptable risk levels, to achieve resource objectives for GRSG habitat consistent with land use plan direction. Utilizing both direct and indirect attack as appropriate to limit the overall amount of GRSG habitat burned. This could include suppressing fires in intact sagebrush habitats; limiting fire growth in General Habitat Management Areas when suppression resources are available or managing wildfire for resource benefit in areas of conifer (juniper) encroachment.
- 9.6. WFS-6: Suppression priorities: Firefighter and public safety followed by property are the highest priority for protection during suppression activities. Maintaining GRSG habitat will be prioritized immediately after human life and property, commensurate with threatened and endangered species habitat or other critical habitats to be protected.
- 9.7. WFS-7: Ensure close coordination with federal and state firefighters including the Rangeland Fire Protection Associations during suppression activities.

## **10. Fuels Management**

- 10.1.** FM-1: Design and implement fuels treatments that would reduce the potential start and spread of unwanted wildfires and provide anchor points or control lines for the containment of wildfires during suppression activities with an emphasis on maintaining, protecting, and expanding sagebrush ecosystems and successfully rehabilitated areas and strategically and effectively reduce wildfire threats in the greatest area.
- 10.2.** FM-2: Enhance (or maintain/retain) sagebrush canopy cover and community structure to match expected potential for the ecological site and consistent with GRSG habitat objectives unless fuels management objectives requires additional reduction in sagebrush cover to meet strategic protection of GRSG habitat. Closely evaluate the benefits of the fuel management treatments against the additional loss of sagebrush cover on the local landscape in the NEPA process.
- 10.3.** FM-3: Apply appropriate seasonal restrictions for implementing vegetation and fuels management treatments according to the type of seasonal habitats present. Allow no treatments in known winter range unless the treatments are designed to strategically reduce wildfire risk around and/or in the winter range and would protect, maintain, increase, or enhance winter range habitat quality. Ensure chemical applications are utilized where they would assist in success of fuels treatments. Strategically place treatments on a landscape scale to prevent fire from spreading into Priority Habitat Management Areas or WUI.
- 10.4.** FM-4: Develop a fuels continuity and management strategy to expand, enhance, maintain and protect GRSG habitat informed by the FIAT Assessments completed as described in Appendix D.
- 10.5.** FM-5: When developing the fuels management strategy as part of the FIAT Assessment described in Appendix D consider up-to-date fuels profiles; land use plan direction; current and potential habitat fragmentation; sagebrush and GRSG ecological factors; active vegetation management steps to provide critical breaks in fuel continuity where appropriate; incorporate a comparative risk analysis with regard to the risk of increased habitat fragmentation from a proposed action versus the risk of large scale fragmentation posed by wildfires if the action is not taken.
- 10.6.** FM-6: Fuel treatments will be designed through an interdisciplinary process to expand, enhance, maintain, and protect GRSG habitat which considers a full range of cost effective fuel reduction techniques, including: chemical, biological (including grazing and targeted grazing), mechanical and prescribed fire treatments.
- 10.7.** FM-7: Existing and proposed linear ROWs could be considered for use and maintenance as vegetated fuel breaks in appropriate areas (this activity may or may not be part of the ROW permit or the responsibility of the permit holder, in cases where this activity is considered part of mitigation for project design then it would be appropriately included as part of the ROW permit and the responsibility of the permit holder for development and maintenance).
- 10.8.** FM-8: Fuel breaks would incorporate existing vegetation treatments (seedings) or be located adjacent to existing linear disturbance areas where appropriate. Fuel breaks should be placed in areas with the greatest likelihood of compartmentalizing a fire and/or to foster suppression options to protect existing intact habitat.

- 10.9. FM-9: Strategically pre-treat areas to reduce fine fuels consistent with areas and results identified within the Wildfire and Invasive Species Assessments..
- 10.10. FM-10: Protect seeding efforts from subsequent fire events.
- 10.11. FM-11: Targeted grazing as a fuels treatment to adjust the vegetation conditions to reduce the potential start and spread of unwanted wildfires may be implemented within existing grazing authorizations if feasible such as through temporary non-renewable authorizations, or through contracts, agreements or other appropriate means separate from existing grazing authorizations and permits.
- 10.12. FM-12: Targeted grazing to achieve fuels management objectives should conform to the following criteria:
- Targeted grazing should be implemented strategically on the landscape, and directly involve the minimum footprint and grazing intensity required to meet fuels management objectives.
  - Allow conformance to the applicable Standards for Rangeland Health and Guidelines for Livestock Grazing Management (Idaho or Montana) at the assessment scale.
  - Where feasible and applicable coordinate with the grazing permittee to strategically reduce fuels through livestock management within the Mandatory Terms and Conditions of the applicable grazing authorizations
- 10.13. FM-13: Prioritize the use of native seeds for fuels management treatment based on availability, adaptation (site potential), and probability of success. Where probability of success or native seed availability is low or non-economical, nonnative seeds may be used to meet GRSG habitat objectives to trend toward restoring the fire regime. When reseeding, use fire resistant native and nonnative species, as appropriate, to provide for fuel breaks.
- 10.14. FM-14: Maintain effectiveness of fuels projects, including fuel breaks, to ensure long-term success, including persistence of seeded species and/or other treatment components while maintaining the integrity of adjacent vegetation.

**11. Wildfire Restoration/Rehabilitation – Emergency Stabilization and Rehabilitation**

- 11.1. ESR-1: Utilize the findings and Restoration/Rehabilitation Strategy developed as part of the FIAT Assessment process described in Appendix D to determine if GRSG rehabilitation actions are needed, based on ecological potential, and direct emergency stabilization and rehabilitation (ESR) (BLM) or Burned Area Emergency Restoration (BAER) (FS) actions after fire.
- 11.2. ESR-2: Incorporate GRSG Habitat Management Objectives into ESR/BAER plans based on site potential and in accordance with the Restoration/Rehabilitation Strategy developed as a result of the FIAT Assessments.
- 11.3. ESR-3: Provide adequate rest from livestock grazing to allow natural recovery of existing vegetation and successful establishment of seeded species. New seedlings should not be grazed until at least the end of the second growing season, and longer as needed to allow plants to mature and develop robust root systems which will stabilize the site, compete effectively against cheatgrass and other invasive annuals, and remain sustainable under long-term grazing management. Adjust other management activities, as appropriate, to meet ES&R objectives.
- 11.4. ESR-4: Adjust, as appropriate, livestock management on adjacent unburned areas to mitigate the effect of the burn on local GRSG populations.

## **12. Habitat Restoration and Vegetation Management**

- 12.1. VEG-1: Implement habitat rehabilitation or restoration projects in areas that have potential to improve GRSG habitat using a full array of treatment activities as appropriate, including chemical, mechanical and seeding treatments.
- 12.2. VEG-2: Implement vegetation rehabilitation or manipulation projects to enhance sagebrush cover or to promote diverse and healthy grass and forb understory to achieve the greatest improvement in GRSG habitat based on FIAT Assessments, HAF assessments, other vegetative assessment data and local, site specific factors that indicate sagebrush canopy cover or herbaceous conditions do not meet habitat management objectives (i.e. is minimal or exceeds optimal characteristics). This may necessitate the use of prescribed fire as a site preparation technique to remove annual grass residual growth prior to the use of herbicides in the restoration of certain lower elevation sites (e.g., Wyoming big sagebrush) but such efforts will be carefully planned and coordinated to minimize impacts to sage-grouse seasonal habitats.
- 12.3. VEG-3: Require use of native seeds for restoration based on availability, adaptation (ecological site potential), and probability of success (Richards et al. 1998). Non-native seeds may be used as long as they support GRSG habitat objectives (Pyke 2011) to increase probability of success, when adapted seed availability is low or to compete with invasive species especially on harsher sites.
- 12.4. VEG-4: Implement management changes in restoration and rehabilitation areas, as necessary, to maintain suitable GRSG habitat, improve unsuitable GRSG habitat and to ensure long-term persistence of improved GRSG habitat (Eiswerth and Shonkwiler 2006). Management changes could be considered during livestock grazing permit renewals, travel management planning, and renewal or reauthorization of rights-of-way.
- 12.5. VEG-5: Consider establishing seed harvest areas that are managed for seed production (Armstrong 2007) to provide a reliable source of locally adapted seed to use during rehabilitation and restoration activities.
- 12.6. VEG-6: Allocate use of native seed to GRSG or ESA listed species habitat in years when preferred native seed is in short supply. This may require reallocation of native seed from ESR (BLM) and/or BAER (Forest Service) projects outside of Priority or Important Habitat Management Areas to those inside it. Where probability of success or native seed availability is low, nonnative seeds may be used as long as they meet GRSG habitat conservation objectives (Pyke 2011). Re-establishment of appropriate sagebrush species/subspecies and important understory plants, relative to site potential, shall be the highest priority for rehabilitation efforts.
- 12.7. VEG-7: During land health assessments evaluate the compatibility of existing nonnative seedlings for GRSG habitat to keep as a component of a grazing system, development of a forage reserve, or to be used as a fuelbreak (Davies et al. 2011) or during restoration development. If nonnative seedlings do not contribute to a grazing system, are not suitable for a forage reserve, and are not suitable fuelbreaks, evaluate the nonnative seedlings in and adjacent to PHMA to determine if they should be diversified with or converted to native grasses, forbs, and shrubs, including sagebrush.

- 12.8. VEG-8: Utilize conifer (juniper) removal treatments to reduce the extent of conifer encroachment areas in sagebrush habitats. Prioritize treatments closest to occupied sage-grouse habitats and near occupied leks, and where juniper encroachment is phase 1 or phase 2. Use of site-specific analysis and tools like VDTT and FIAT assessments to help refine the location for specific priority areas to be treated. Refrain from using prescribed fire and conducting removal projects in old-growth juniper stands. Old-growth juniper trees are characterized by rounded tops and spreading canopies, often containing dead limbs and/or spike tops, large branches near the base of the tree, as well as furrowed, fibrous bark, and are typically host to arboreal lichens. Leader growth in the upper quarter of the tree is usually less than one inch. These trees are generally distributed on rock outcrop or rubble land soils, or other soils with coarse fragments in the soil-surface and/or slopes over 12-25%, where juniper vegetation type is the climax plant community (IDFG 2000; Miller et al 2005; USDI and USGS 2007).
- 12.9. VEG-9: Avoid using prescribed fire in Greater Sage-Grouse habitat unless evaluation of site-specific conditions demonstrate that there would be a net benefit for sage-grouse. If prescribed fire is used in Greater Sage-Grouse habitat, include an analysis in the NEPA document that indicates how Greater Sage-Grouse goals and objectives will be addressed and met by its use, why alternative techniques were not selected, and a risk assessment to address how potential threats to Greater Sage-Grouse habitat would be minimized.
- If prescribed fire is to be used at the implementation level, at a minimum, the burn plan will indicate how land use plan objectives would be addressed and met and why alternative techniques were not selected.
  - Avoid prescribed fire as a vegetation or fuels treatment in Wyoming big sagebrush or other xeric sagebrush species, or in areas with a potential for post-fire exotic annual dominance. However, after other treatment opportunities have been explored and as site-specific variables allow, prescribed fire could be used in these areas to meet specific fuels objectives that would maintain, improve, or restore Greater Sage-Grouse habitat (e.g., creation of fuel breaks that would disrupt the fuel continuity across the landscape in stands where annual invasive grasses are a minor component in the understory, burning slash piles from conifer reduction treatments, used as a component with other treatment methods to combat annual grasses and restore native plant communities).
  - Allow no treatments in areas only providing known winter seasonal habitat unless the treatments are designed to strategically reduce wildfire risk around and/or in the winter range and would protect, maintain, increase, or enhance winter range habitat quality.

Commented [BER17]: Paul has new verbiage.

**13. Invasive Species**

- 13.1. Invasive Species (INV)-1: Incorporate results of the FIAT Assessments into projects and activities addressing invasive species.
- 13.2. INV-2: Implement noxious weed and invasive species control using integrated vegetation management actions per national guidance and local weed management plans for Cooperative Weed Management Areas in cooperation with State and Federal agencies, affected counties, and adjoining private lands owners.
- 13.3. INV-3: Conduct integrated weed management actions for noxious and invasive weed populations that are impacting or threatening GRSG habitat quality using a variety of eradication and control techniques including chemical, mechanical and other appropriate means.
- 13.4. INV-4: Require project proponent (projects described in Table X and which are included in the anthropogenic disturbance cap evaluation) to ensure that noxious weeds and invasive species caused as a result of the project are treated to eliminate establishment on the disturbed project construction areas for at least 3 years.

DRAFT

#### **14. Lands and Realty / Infrastructure**

- 14.1. Lands and Realty (LR)-1: Priority: Designate and manage Priority Habitat Management Areas as ROW avoidance areas, consistent with AD-3 and subject to RDFs, buffers and seasonal timing restrictions (Appendix A, B & C). Important: Designate and manage Important Habitat Management Areas as ROW avoidance areas, consistent with AD-4 and subject to RDFs, buffers and seasonal timing restrictions. General: Designate and manage General Habitat Management Areas as open with proposals subject to RDFs, buffers and seasonal timing restrictions.
- 14.2. LR-2: Priority: Designate and manage Priority Habitat Management Areas as exclusion areas for utility scale (20 MW) Wind and Solar testing and development, nuclear and hydropower energy development. Important: Designate and manage Important Habitat Management Areas as avoidance areas for Wind and Solar testing and development, nuclear and hydropower development. General: Designate and manage General Habitat Management Areas as open for Wind and Solar testing and development and nuclear and hydropower development subject to RDFs, buffers and seasonal timing restrictions.
- 14.3. LR-3: Priority: Development of commercial service airports and facilities (as defined by FAA 2014 – publically owned airports that have at least 2,500 passenger boardings each calendar year and receive scheduled passenger service) would not be allowed within Priority Habitat Management Areas. Important and General Habitat Management Areas are Avoidance and Open respectively for these types of ROW applications as described in LR-1.
- 14.4. LR-4: Priority: Development of new or expansion of existing landfills would not be allowed within Priority Habitat Management Areas. Important and General Habitat Management Areas are Avoidance and Open respectively for these types of ROW applications as described in LR-1.
- 14.5. LR-5: Consistent with LR-2, LR-3 and LR-4, Rights-of-way for development of new or amended ROWs and land use authorizations in PHMA would only be considered when consistent with the Anthropogenic Disturbance Exception Criteria (AD-3); Rights-of-way for development of new or amended ROWs and land use authorizations in IHMA could be considered consistent with the Important Habitat Management Area Anthropogenic Disturbance Development Criteria. (AD-4). General: New ROW and land use authorizations could be considered.
- 14.6. LR-6: If the project is an incremental upgrade/capacity increase of existing development (i.e. powerline capacity upgrade) - the existing transmission line must be removed and area rehabilitated within a specified amount of time after the new line is installed and energized.
- 14.7. LR-7: Existing designated corridors, including Section 368 Corridors, will remain Open (subject to the ongoing settlement agreement).
- 14.8. LR-8: Process unauthorized use. If the use is subsequently authorized, it would be authorized consistent with direction for the Management Areas within which it is located and the RDFs, buffers and seasonal timing restrictions. If the use is not subsequently authorized the site would be reclaimed by removing these features and rehabilitating the habitat.

- 14.9. LR-9: Land use authorizations that are temporary (less than 3 years) in nature would be subject to seasonal or timing restrictions and mitigation requirements regarding habitat loss as needed.
- 14.10. LR-10: New ROW applications for water facilities (ditches, canals, pipelines), or amendments to existing water facilities which include additional structures to improve fish passage or benefits to fisheries (new diversions, fish screens) would be allowed on a case-by-case bases subject to RDFs to reduce impacts to GRSG habitat and mitigation requirements regarding GRSG habitat loss as needed.
- 14.11. LR-11: When a ROW grant expires and is not requested to be renewed, is relinquished, or terminated, the lease holder would be required to reclaim the site by removing overhead lines and other infrastructure and to eliminate avian predator nesting opportunities provided by anthropogenic development on public lands associated with the now void ROW grant (e.g., remove powerline and communication facilities no longer in service).
- 14.12. LR-12: Work with existing ROW holders to retrofit existing towers and structures consistent with RDFs described in Appendix A.
- 14.12.1. LR-13: Lands within Priority, Important or General Habitat Management Areas for Greater Sage-Grouse will be retained in federal management unless: (1) the agency can demonstrate that disposal of the lands will provide a net conservation benefit to the Greater Sage-Grouse or (2) the agency can demonstrate that the disposal of the lands will have no direct or indirect adverse impact on conservation of the Greater Sage-Grouse. Land tenure adjustments would be subject to the following disposal, exchange, and acquisition criteria, which include retaining lands with GRSG habitat. Retention of areas with GRSG would reduce the likelihood of habitat conversion to agriculture, urbanization, or other uses that would remove sagebrush habitat and potentially impact sensitive plants. Criteria:
- a. Lands within Priority, Important and General Habitat Management Areas would not be available for disposal through sale (Appendix J).
  - b. Acquire habitat within Priority and Important Habitat Management Areas, when possible (i.e. willing landowner), and retain ownership of habitat within all Areas, except if a land exchange would allow for additional or more contiguous federal ownership patterns.
  - c. Lands within Priority, Important and General Habitat Management Areas would be retained unless exchange of those lands would increase the extent or provide for connectivity of Priority or Important Habitat Management Areas.
  - d. Evaluate potential land exchanges containing historically low-quality GRSG habitat that may be too costly to restore in exchange for lands of higher quality habitat, lands that connect seasonal GRSG habitats or lands providing for threatened and endangered species. These potential exchanges should lead to an increase in the extent or continuity of or provide for improved connectivity of Priority Habitat Management Areas. Higher priority will be given to exchanges for those in-tact areas of sagebrush that will contribute to the expansion of sagebrush areas within Priority Habitat Management Areas currently in public ownership. Lower priority would be given to other lands that would promote enhancement in the Priority and Important Habitat Management Areas.

e. Identify lands for acquisition that increase the extent of or provide for connectivity of Priority Habitat Management Areas.

DRAFT

## 15. Minerals

### 15.1. Fluid Minerals

- 15.1.1. Fluid Minerals (FLM)-1: Idaho and Montana: Areas within Priority Habitat Management Areas and Important Habitat Management Areas would be open to mineral leasing and development and geophysical exploration subject to no surface occupancy with a limited exception (FLM-3). General Habitat Management Areas would be open to mineral leasing and development and geophysical exploration subject to CSU which includes buffers, seasonal timing restrictions and standard stipulations. Montana: Areas within Priority Habitat Management Areas would be open to leasing subject to no surface occupancy. No waivers, exceptions or modifications would be allowed unless approved by the State Director. General Habitat Management Areas would be open to leasing subject to CSU which includes buffers, seasonal timing restrictions and standard stipulations.
- 15.1.2. FLM-2: FLM-7: Parcels nominated for lease in Priority or Important Habitat Management Areas would be evaluated prior to lease offering to determine if development is feasible when buffers and seasonal timing restrictions are applied. Parcels which do not meet the criteria would not be offered for lease.
- 15.1.3. FLM-3: Priority and Important Habitat Management Areas: A lease waiver, exception or modification to the NSO stipulation may be considered where a portion of the proposed lease is determined to be in non-greater sage-grouse habitat, the area is not used by Greater sage-grouse, or it would not have direct, indirect or cumulative effects to Greater sage-grouse or its habitat. The determination would be made by a team of interagency Greater sage-grouse experts, including an expert from the state wildlife agency, USFWS and the BLM. Waivers, by regulation, require a 30-day public review (43 CFR ????.??). All exceptions must be approved by the State Director. In the event a waiver, exception or modification were allowed development would still be subject to CSU which includes buffers, seasonal timing restrictions and standard stipulations.

#### **Waivers, Exceptions and Modifications (WEMs)** (Source IM-2008-032)

A waiver is a permanent exemption from a lease stipulation, the stipulation would no longer apply anywhere within the lease. Waivers require a 30-day public review and are approved and signed by the State Director.

An exception is a one-time exemption for a particular site within the lease; exceptions are determined on a case-by-case basis; the stipulation continues to apply to all other sites within the lease. An exception is a limited type of waiver.

A modification is a change to the provisions of a lease stipulation, either temporarily or for the term of the lease. Depending on the specific modification, the stipulation may or may not apply to all sites within the lease to which the restrictive criteria are applied.

- 15.1.4. FLM-4: Incorporate required design features and best management practices appropriate to the management area as conditions of approval when post leasing activity is proposed into any post-lease authorizations.
- 15.1.5. FLM-5: Complete a Master Development Plan, consistent with plan development guide, on leases where a producing field is proposed to be developed.

Commented [BER18]: John has language

- 15.1.6. FLM-6: Encourage unitization when deemed necessary for proper development and operation of an area (with strong oversight and monitoring). The unitization must be designed in a manner to minimize adverse impacts on GRSG according to the Federal Lease Form, 3100-11, Sections 4 and 6.
- 15.1.7. FLM-7: Issue Written Orders of the Authorized Officer (43 CFR 3161.2) requiring reasonable protective measures consistent with the lease terms where necessary to avoid or minimize effects to GRSG populations or habitat.
- 15.2. **Locatable Minerals**
- 15.2.1. Locatable Minerals (LOC)-1: Lands would remain open to locatable mineral entry in all management areas.
- 15.2.2. LOC-2: Apply reasonable and appropriate required design features and best management practices as Conditions of Approval to prevent unnecessary or undue degradation of GRSG habitat when a Plan of Operations is submitted for BLM or FS approval, in accordance with 43 CFR 3809.411(d)(2) (or 36 CFR 228.5(a)(3) on National Forest System lands).
- 15.3. **Salable Minerals**
- 15.3.1. Salable Minerals (SAL)-1: Priority: No new site authorizations would be approved. Important: New site authorizations could be considered provided the Anthropogenic Disturbance Development Criteria (AD-4) can be met, and subject to RDFs, buffers and seasonal timing restrictions. Sales from existing community pits within PHMA and IHMA would be subject to seasonal timing restrictions. General: Open to new site authorizations subject to RDFs, buffers and seasonal timing restrictions. Existing sites Open to new sales subject to seasonal timing restrictions.
- 15.3.2. SAL-2: Restore salable mineral pits no longer in use to meet GRSG habitat management objectives.
- 15.3.3. SAL-3: Require reclamation bonding that would require restoration of GRSG habitat on new site authorizations for mineral material pits in IHMA (this would not apply to free use permits issued to a government entity such as a county road district, but would apply to non-profit entities).
- 15.4. **Non-Energy Solid Mineral Leasable Minerals**
- 15.4.1. Non Energy Leasables (NEL)-1: Priority, Important and General Habitat Management Areas: Areas within Know Phosphate Leasing Areas (KPLAs) will remain open to leasing subject to standard stipulations. PHMA areas outside KPLAs are closed to leasing and prospecting. IHMA areas outside of KPLAs are open to prospecting and subsequent leasing provided the Anthropogenic Disturbance Development Criteria (AD-4) and the anthropogenic disturbance cap (AD-1) can be met. RDFs, buffers and seasonal timing restrictions shall be applied to prospecting permits. Exceptions to closures in PHMA and IHMA may be made for lease modifications and fringe leases where valid existing rights may be affected. General Habitat Management Areas: Lands outside KPLAs are available for prospecting and subsequent leasing and initial mine development subject to RDFs, buffers, timing restrictions (seasonal and daily) and standard stipulations.
- 15.4.2. NEL-2: Require seasonal and daily timing restrictions in undeveloped non-energy mineral leases when exploration activities or initial mine development is proposed (e.g. exploration drilling, timber removal, shrub clearing, etc.) as conditions of approval.

15.4.3. NEL-3: Include RDFs as conditions of approval to mine plans in undeveloped non-energy mineral leases for exploration activities or initial mine development.

15.5. **Mineral Split Estate**

15.5.1. Mineral Split Estate (MSE)-1: **BLM Owns Mineral Estate – non-federal surface owner:** In coordination with surface owner, apply stipulations, conservation measures, and design features consistent with those applied to BLM- and Forest Service-administered lands in the management area.

15.5.2. MSE-2: **BLM owns surface – non-federal mineral estate owner:** Recommend to the state regulatory entity and mineral estate owner that timing restrictions, COAs, and buffer restriction be applied around occupied leks, when concurring to the approval of authorizations for mineral-related surface disturbance on lands with GRSG habitat.

DRAFT

## **16. Range Management/Livestock Grazing**

- 16.1. Range Management (RM)-1: Maintain existing areas designated as available or unavailable for livestock grazing. Existing active AUMs for livestock grazing within the planning area would not be changed at the broad scale, though the number of AUMs available on an allotment may be adjusted based on site-specific conditions to meet management objectives during term permit renewals, AMP development, or other appropriate implementation planning. Additionally, temporary adjustments can be made annually to livestock numbers, the number of AUMs, and season of use in accordance with applicable regulations.
- 16.2. RM-2: Prioritize BLM land health assessments and processing of BLM grazing permits consistent with management area prioritization (MA-4), unless other higher priority considerations exist such as threatened, endangered and proposed species habitat that livestock grazing could affect. Where possible, conduct land health assessments at the watershed, or other meaningful landscape-scale.
- 16.3. RM-3: Where opportunities exist, coordinate with other land managers to encourage livestock operations that utilize mixed federal, private and/or state land to be managed at the landscape scale to benefit GRSG and their habitat across land ownerships.
- 16.4. RM-4: PHMA & IHMA: During the land health assessment process, identify the type(s) of seasonal habitat the assessed areas are capable of supporting. Utilize the habitat assessment framework, (Stiver et al. 2014 as amended/replaced) or other BLM or Forest Service approved methodology, in accordance with current policy and guidance to determine whether vegetation structure, condition and composition are meeting GRSG habitat objectives including riparian and lentic areas (HM-OBJ-2; Table 2). Use appropriate Ecological Site Descriptions, reference sheets and state and transition models to inform desired habitat conditions and expected responses to management changes for the land unit being assessed.
- 16.5. RM-5: When modifying grazing management, analyze indirect effects to habitat, including changes in fuel loading and wildfire behavior.
- 16.6. RM-6: When livestock management practices are determined to not be compatible with meeting or making progress towards achievable habitat objectives following consultation, cooperating and coordination with permittees and interested publics, implement changes in grazing management through grazing authorization modifications, or allotment management plan implementation. Potential modifications include, but are not limited to, changes in:
- 1) Season or timing of use;
  - 2) Numbers of livestock;
  - 3) Distribution of livestock use;
  - 4) Duration and/or level of use;
  - 5) Kind of livestock (e.g., cattle, sheep, horses, or goats) (Briske et al. 2011);
  - 6) Voluntary measures such as temporary non-use; and
  - 7) Grazing schedules (including rest or deferment).
- 16.7. RM-7: Where opportunities exist, establish forage reserves to facilitate restoration and rehabilitation efforts in sage-grouse habitat areas.
- 16.8. RM-8: PHMA & IHMA - When an allotment becomes vacant or grazing preference is relinquished, consider voluntary retirement of the allotment or grazing preference

- in whole or in part, or converting the area to a forage reserve/buffer when doing so would maintain or enhance sage-grouse habitat. GHMA - When an allotment becomes vacant or grazing preference is relinquished, consider converting it to a forage reserve/buffer to use during fire rehabilitation or restoration efforts elsewhere, when such actions would result in a net benefit to GRSG habitat and other priority resources.
- 16.9. RM-9: PHMA & IHMA - Where practical, design pasture rotations to utilize non-native perennial grass seedings and/or annual grasslands, during GRSG nesting season annually or periodically.
- 16.10. RM-10: Evaluate the locations where salt/supplements are placed. In coordination with the permittee, have salt/supplements placed in areas which would reduce impacts to GRSG habitat (e.g., existing disturbed areas).
- 16.11. RM-11: Incorporate RDFs into Terms and Conditions for crossing permits to limit disturbance of occupied leks when trailing livestock across BLM- and Forest Service-administered lands in the spring. Work with permittees in locating over-nighting, watering and bedding locations to minimize impacts to seasonal habitats.
- 16.12. RM-12: Design any new structural range improvements, following cooperation, consultation and coordination with permittees, to minimize and/or mitigate effects to GRSG habitat. Any new structural range improvements are subject to RDFs (Appendix A). Structural range improvement in this context, include, but are not limited to: fences, enclosures, corrals or other livestock handling structures; pipelines, troughs, storage tanks (including moveable tanks used in livestock water hauling), windmills, ponds/reservoirs, solar panels and spring developments.
- 16.13. RM-13: During the land health assessment and grazing permit renewal process, evaluate existing livestock management range improvements with respect to their effect on GRSG habitat. Consider removal of projects that are not needed for effective livestock management, are no longer in working condition, and/or negatively affect GRSG habitat, with the exception of functional projects needed for management of habitat for other threatened, endangered or proposed species or other sensitive resources.
- 16.14. RM-14: Prioritize removal, modification or marking of fences or other structures in areas of high collision risk following cooperation, consultation and coordination with permittees to reduce the incidence of GRSG mortality due to fence strikes (Stevens et al. 2012).

**17. Wild Horses and Burros**

- 17.1. Wild Horse and Burro (WHB)-1: Develop or amend BLM Herd Management Area Plans to incorporate GRSG habitat objectives and management considerations for all BLM HMAs) and Forest Service Wild Horse Territories.
- 17.2. WHB-2: When evaluating AML on HMAs within PHMA and IHMA, evaluate indicators that address structure/condition/composition of vegetation and measurements specific to achieving GRSG habitat objectives.
- 17.3. WHB-3: Utilize interdisciplinary land health assessments in HMAs containing GRSG habitat to determine whether vegetation characteristics are meeting appropriate seasonal habitat objectives.
- 17.4. WHB-4: PHMA: Do not expand HMAs. IHMA: Analysis of proposed additions to existing HMA boundaries should consider the direct, indirect and cumulative impacts on GRSG habitat, including the need for additional infrastructure such as boundary fencing, and consider alternative areas outside of PHMA and IHMA.
- 17.5. WHB-5: Prioritize gathers and population growth suppression techniques in HMAs within Priority and Important Habitat Management Areas, unless removals are necessary in other areas to address higher priority environmental issues, including herd health impacts. Additional prioritization would be given for HMAs that are near AML or where a reduction would serve the most beneficial purpose.

## **18. Travel Management**

- 18.1.** Travel Management (TM) -1: Limit off-highway vehicle motorized travel within Idaho BLM Field Offices to existing roads, primitive roads, and trails in areas where travel management planning has not been completed or is in progress. This excludes areas previously designated as open through a land use plan decision or currently under review for designation as open, currently being analyzed in ongoing RMP revision efforts in the Four Rivers, Jarbidge and Upper Snake Field Offices. Upon completion of travel management plans the designation would change to limited to designated roads, primitive roads and trails.
- An off-highway vehicle is any motorized vehicle capable of, or designed for, travel on or immediately over land, water, or other natural terrain, excluding: (1) Any nonamphibious registered motorboat; (2) any military, fire, emergency, or law enforcement vehicle while being used for emergency purposes; (3) any vehicle whose use is expressly authorized by the authorized officer, or otherwise officially approved; (4) Vehicles in official use where official use is use by an employee, agent, or designated representative of the Federal Government or one of its contractors, in the course of his employment, agency, or representation.; and (5) any combat or combat support vehicle when used in times of national defense emergencies (43 CFR 8340.0 5).
- 18.2.** TM-2: Temporary closures will be considered in accordance with 43 CFR subpart 8364 (Closures and Restrictions); 43 CFR subpart 8351 (Designated National Area); 43 CFR subpart 6302 (Use of Wilderness Areas, Prohibited Acts, and Penalties); 43 CFR subpart 8341 (Conditions of Use).
- Temporary closure or restriction orders under these authorities are enacted at the discretion of the authorized officer to resolve management conflicts and protect persons, property, and public lands and resources. Where an authorized officer determines that off-highway vehicles are causing or will cause considerable adverse effects upon soil, vegetation, wildlife, wildlife habitat, cultural resources, historical resources, threatened or endangered species, wilderness suitability, other authorized uses, or other resources, the affected areas shall be immediately closed to the type(s) of vehicle causing the adverse effect until the adverse effects are eliminated and measures implemented to prevent recurrence. (43 CFR 8341.2) A closure or restriction order should be considered only after other management strategies and alternatives have been explored. The duration of temporary closure or restriction orders should be limited to 24 months or less; however, certain situations may require longer closures and/or iterative temporary closures. This may include closure of routes or areas.
- 18.3.** TM-3: Develop Travel Management Plans for each Field Office as described in the BLM Travel Management Handbook 8342.1 and according to the travel management planning guidelines (Appendix K).
- 18.4.** TM-4: During subsequent travel management planning design and designate a travel system to minimize adverse effects on GRSG. Locate areas and trails to minimize harassment of wildlife or significant disruption of wildlife habitats. Give special attention to protect endangered or threatened species and their habitats. Allow for route upgrade, closure of existing routes, and creation of new routes to help protect

habitat and meet user group needs, thereby reducing the potential for pioneering unauthorized routes. The emphasis of the comprehensive travel and transportation planning within Priority Habitat Management Areas would be placed on having a neutral or positive effect on GRSG habitat. Individual route designations would occur during subsequent travel management planning efforts.

- 18.5. TM-5: Conduct road maintenance activities to avoid disturbance during specific times at different seasons – see seasonal and timing restrictions section.

DRAFT

**19. Recreation**

- 19.1. REC-1: Manage existing recreation uses and sites to minimize adverse effects on GRSG or their habitat through incorporation of RDFs, buffers and seasonal restrictions.
- 19.2. REC-2: Do not construct new recreation facilities (e.g., campgrounds, trails, trailheads, staging areas) within PHMAs and IHMAs unless the development would have a neutral effect or be beneficial to GRSG habitat (such as concentrating recreation, diverting use away from critical areas, etc.); or the new construction replaces existing facilities and reduces impacts from the existing facilities as in TM-4, or unless the development is required for visitor safety or resource protection.

DRAFT

## **20. Monitoring**

- 20.1. Monitoring (MON)-1: Once FIAT Assessments are complete a Annually complete a review of FIAT Assessment implementation efforts within GRSG habitat with appropriate USFWS and state agency personnel.
- 20.2. MON-2: Annually monitor the effectiveness of fuels treatment projects.
- 20.3. MON-3: Monitor invasive vegetation post vegetation management treatment
- 20.4. MON-4: Monitor project construction areas for noxious weed and invasive species for at least 3 years, unless control is achieved earlier.
- 20.5. MON-5: Use lek, nesting and winter habitat maps and key habitat map (updates) to annually assess GRSG population and habitat status in the context of the adaptive management triggers.
- 20.6. MON-6: Continue to support updates to the Key Habitat map to track vegetation changes in relation to GRSG habitat on a yearly basis, until such a time this process is replaced. The process used to update the Key Habitat Map is described in Appendix F.
- 20.7. MON-7: Monitor GRSG habitat as described in the monitoring framework plan (Appendix E) in coordination with IDFG and MT FWP.

## Appendices

Appendix A – Required Design Features

Appendix B – Seasonal Timing Restrictions

Appendix C – Application of Buffers

Appendix D – Wildfire and Invasive Species Assessments/FIAT Team

Appendix E – Monitoring Framework Plan

Appendix F – Idaho Key Habitat Map Update Process

Appendix G – Idaho Anthropogenic Disturbance and Adaptive Management

Appendix H – Montana Anthropogenic Disturbance [and Adaptive Management Process](#)

Appendix I – Mitigation

Appendix J – Lands No Longer Available for Disposal

Appendix K – Travel Management Planning Guidelines

Appendix L – Functioning of Boards

**Custer County Idaho Comments on Idaho and Southwestern Montana Greater Sage-Grouse Administrative Draft of Proposed Land Use Plan Amendment and Final Environmental Impact Statement**

On behalf of the Custer County Idaho Board of Commissioners, please incorporate the following comments into the above referenced documents. All prior Custer County comments to this NEPA process are herein incorporated by reference.

**1. FEIS Chapter 1, Page 2: “While historical Euro-American settlement of these lands has been slower and sparser than in other regions of the country, habitat conversion to suit human purposes has contributed to widespread loss and decline of sagebrush habitat availability or quality and associated wildlife populations. These human purposes include agriculture and urban development, energy and mineral resource development, and a long history of dispersed (but sometimes intensive) uses such as domestic grazing.”**

Comment:

The Land Use Plan Amendment (LUPA) and Final Environmental Impact Statement (FEIS) for Idaho and southwestern Montana are based on a series of false assumptions including the statement quoted above. As testimonials from Custer County Commissioners and residents show, before enactment of the ESA, sage-grouse were abundant. Sage-grouse populations thrived in the era of agriculture in Idaho and southwest Montana. This fact is understated in the FEIS in favor of hypothetical pre-European settlement “make-believe” maps that are not

based on science. The artificial stories and maps created by federal biologists leave out the fact that when ranchers, farmers and miners settled in Idaho and Montana in the 1800s and 1900s they cleared trees, leveled land, planted crops, created year round water sources and increased the abundance of sage-grouse and the diversity of habitat the sage-grouse needed for optimum year round survival.

The false assumptions throughout the FEIS result in a proposed action that would harm the Greater Sage-Grouse as well as the economy of Custer County and other counties in Idaho and southwestern Montana. The proposed action would also harm the economic well being of our nation as a whole by destroying the very industries that have helped sage-grouse habitat diversification over time. The proposed action would also harm our military defense system by adding restrictions that are unnecessary and expensive. Every hour and every dollar the military spend on this false crisis is time and money that is urgently needed to strengthen our national defenses.

The false assumptions and incorrect political rationalizations in the name of the Endangered Species Act (ESA) are disingenuous and need to be corrected. For the reasons listed below and those itemized in past comments, the Custer County Board of Commissions recommends the No Action Alternative as the preferred alternative.

**2. FEIS Page 1 -9. “Within the Idaho and southwestern Montana sub-region, the PACs consist of a total 11,232,800 acres.”**

Comment:

Custer County is opposed to restrictions within over 11.2 million acres of Priority Areas for Conservation (PACs) including each and every proposed land withdrawal, restriction on land disposal, leasing closure, leasing constraint, non-energy leasing closure, saleable mineral material leasing closure, travel management restriction, ban from surface occupancy, anthropomorphic surface disturbance limitation and other action that prohibits economic opportunities, scientific vegetative management, and predator control options outlined clearly and succinctly in the Custer County Land Use Plan.

**3. FEIS Figure 1-1**

Comment:

This figure demonstrates that the Greater sage-grouse habitat is widespread and abundant. The proposed action is based on the premise that sage-grouse are declining due to man induced factors related to livestock grazing, oil and gas development, roads, and mining.

Instead, the science shows the sage-grouse populations fluctuate in relation to climate and predators and that sage-grouse are not threatened with extinction. Genetic work by Dr. Zink, discussed in previous comments submitted by Custer County, clearly demonstrates the genetic health of the Greater sage-grouse population across the eleven states where listing is proposed but not warranted.

The very work federal land management agencies should be taking to enhance sage-grouse habitat would be severely restricted by the proposed alternative. The proposed plan of action would limit options to manage sagebrush and riparian communities as well as predators, thus harming sage-grouse populations in Idaho and southwestern Montana.

**4. FEIS Table 1-3 Lists Predators as a threat to sage-grouse in all three documents cited:**

<b>USFWS 2010 Finding</b>	<b>2006 Idaho GRSG Conservation Plan</b>	<b>2005 Montana GRSG Management Plan</b>
---------------------------	--	--

Comment

FEIS Table 1-3 clearly demonstrates that USFWS, Idaho and Montana all consider predators a significant threat to sage-grouse. This fact contradicts Appendix R, Page R 15 which states:

*“The [Catron] county plan identifies predation as the primary threat in the county (p. 14). This threat is not shown as a primary threat on other threat descriptions (BLM, State, USFWS, Local Working Group). **Predator control is not under the jurisdiction or authority of the BLM or FS** (emphasis added) and a specific alternative to address predator control has been eliminated from detailed analysis”*

The FEIS and Appendix R need to be corrected so they don't contradict each other.

Please answer the question of why BLM and FS personnel think they can manage game bird populations (sage-grouse) and their habitat and why they think they can't manage predator populations (foxes, badgers, ravens, etc) and their habitat.

Also, if *“**Predator control is not under the jurisdiction or authority of the BLM or FS**”* (emphasis added) why are the two agencies involved in interdisciplinary teams to manage wolves? Wolves are predators. Wolves prey on sage-grouse.

Stating that BLM and FS can manage sage-grouse and wolves, but not “predators” is illogical and contradicts ongoing actions by both agencies. The statement that predator control is not under the jurisdiction or authority of BLM or FS is false and needs to be corrected. Both agencies know that they currently, through agreements with state and other federal agencies, jointly perform predator management control activities. The statement was merely placed in

Appendix R to discard the Custer County recommendation for predator control actions as a mechanism to increase sage-grouse numbers. The statement is political and it is false.

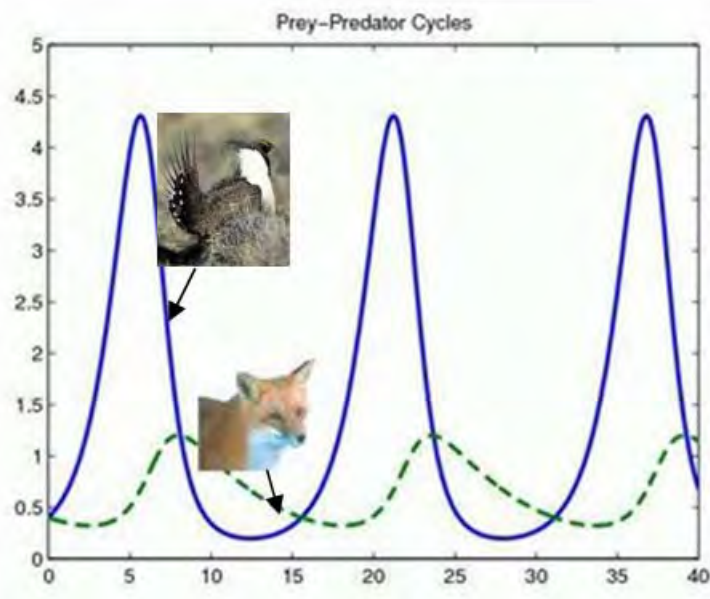

Please rewrite Appendix R as it relates to the Custer County Land Use Plan predator control recommendations and what BLM and FS can and cannot do through interagency agreements to control predators and to fund predator control programs when they so desire.

Why is it that BLM and Forest Service seem to think they can create rules and restrictions for sage-grouse and wolf habitat, hire biologists to count sage-grouse and wolves, radio track sage-grouse and wolves, map sage-grouse and wolf movements, etc. yet the same federal agencies say they can't count badgers, radio track badgers, map badger movements, or otherwise "manage" predators such as badgers?

What federal laws create the distinction between when the BLM and Forest Service can manage a particular species? BLM and Forest Service biologists are involved in programs to track deer and elk, yet these species are not listed as sensitive, threatened or endangered.

The FEIS needs to analyze predators as well a prey. The two are directly related and inseparable.

Anyone with basic wildlife management training knows that there is a predator – prey cycle:

Prior to enacting the ESA, predator control was a key factor in keeping sage-grouse numbers high. This is a well documented fact that recent agency biologists choose to ignore.

The presence or absence of predators is a key population factor in the survival and population viability of sage-grouse and cannot be categorically ignored. By ignoring the predator prey cycle in the FEIS, the agencies have missed a key factor in sage-grouse management that is critical to their decision. The lack of a detailed predator prey analysis negates the ability of the agencies to make an informed decision. The lack of a predator prey analysis makes the current FEIS proposed decision arbitrary and/or capricious.

## **5. FEIS Figure 3-3**

Comment:

This figure demonstrates that catastrophic fires are significant in Idaho and southwestern Montana. Science proves sage-grouse habitat is dynamic and vulnerable to catastrophic fires if left unmanaged (Davies et al 2011). The catastrophic fires that would be perpetuated by the proposed action will destroy soil microbes necessary to restore vegetation.

Livestock grazing prevents blazing, yet livestock grazing is severely restricted under the proposed action. The result of implementing the proposed action would be massive fuel loads that build up and burn hot, requiring federal, state and local resources to fight fires instead of producing food and economic prosperity.

## **6. FEIS Appendix D**

Comment:

Though the federal agencies assess fire strategies, they fail to include the private land and the value of partnerships with private landowners to create an ecosystem approach to fire management. Their analysis also fails to consider the large amount of revenue generated from mining, oil and gas, and livestock grazing that would be available to implement the fire management strategies if these resource uses were allowed to persist and thrive under Congressionally mandated multiple use guidelines.

The combination of natural resource use and mitigation provided when industry is involved in natural resource management, while at the same time creating wealth from food and energy producers, was not analyzed. Money matters. The Big Green organizations are not spending enough of their money on land management. Instead they spend it on litigation and lobbying. The litigation takes money away from federal land management agencies that would be better spent on managing wildlife habitat.

Natural resource users will spend money to manage the land so they can continue to use it wisely. Federal agencies should ally with livestock producers, mining companies, oil and gas companies, hunters and other natural resource users to find ways to work towards the goal of bringing both healthy natural resources and healthy economic metrics into balance. Government would be better served to work with producers instead of against them. The current plan of action works against industry.

The current plan of action did not take into account the comments provided by Custer County to date in regard to this NEPA decision. The proposed action is inconsistent with the Custer County Land Use Plan and the economic needs and willingness of the County and its constituents to work to assure the health of sage-grouse populations and their habitat.

## **7. FEIS Appendix R**

Comment:

Though Appendix R of the FEIS purports to take into account relevant County Land Use Plans, it does nothing to create consistency between federal and local plans. The Custer County Board of Commissioners adopted their Land Use Plan in hopes that it would be relevant to the decisions of federal land managers within the County. Instead, the Custer County Land Use Plan was largely ignored because it did not fit with the easier and less expensive government GIS models that lock up the land instead of managing land as evidenced by the millions of acres that would be withdrawn or restricted from multiple use under the proposed alternative.

## **8. Appendix AA**

Comment

The IMPLAN addressed in Appendix AA is deceiving in respect to tables that show no decrease in AUMs under the proposed action. The problem is that the price of the AUMs increases to the point that livestock producers will not be able to afford the AUMs (Appendix AA).

This real and significant economic impact was not analyzed in the FEIS, in direct violation of NEPA, CEQ regulations, the Regulatory Flexibility Act and a variety of other laws, policies and Executive Orders detailed in previous Custer County comments. Based on a lack of a proper economic analysis, any decision from the FEIS is by nature arbitrary and/or capricious.

The IMPLAN is akin to stating that the number of federal employees in BLM and Forest Service will stay the same, though in a different part of the analysis, their salaries will be cut 90%. Logic tells you the federal employees will leave if their salaries are significantly cut. Why wasn't the same logic used to state that AUMs will be significantly reduced under the proposed action alternative due to the significant increase in the cost of each AUM?

## **9. Appendix R**

Comment:

The LUPA/FEIS continue to ignore the Custer County Land Use Plan as evidenced in Appendix R of the FEIS. Custer County Commissioners have watched as ESA actions to bring back species such as the spotted owl, gray wolf and grizzly bear have restricted perceived threats such as livestock grazing, timber harvest, oil and gas development, mining and other natural resource uses. The result is unhealthy and unbalanced. Custer County Commissioners reacted by writing their own land use plan that should become part of any federal plans within the County. Instead, the proposed action is inconsistent with the County Land Use Plan and the federal government is negligent in its actions to dismiss the County Plan as irrelevant.

The proposed action further restricts land uses and land management tools that constituents of Custer County need to utilize in order to keep sagebrush from becoming decadent. Old growth climax sagebrush is not used by sage-grouse, yet that is what the proposed action will create, to the detriment of the very species the federal agencies purport to want to protect.

How did federal agencies get off track? The answer is simple. Politics, emotions and egos are overtaking science and facts. Many federal biologists have put their careers on the line to get promoted, make friends in Washington DC and become Hollywood – type stars in the eyes of people who trust them to save a species that would be best left to local management.

Pro-sage-grouse organizations are making billions of dollars off this false crisis. Politicians are getting reelected based on the lobbying efforts of these Big Green organizations that know the real issue is not sage-grouse. The real issue is power and wealth, big government control and a wildlands network where rural populations are exterminated for the perceived greater good of the country.

The crime is in the fact that rural Americans that feed the world are the heart and soul of our country. They should not be destroyed in favor of zealots that believe humans are a parasite on this earth. By writing Appendix R in a way that dismissed the Custer County Land Use Plan, the federal agencies are buying into a false premise that will actually put the security of

our nation at risk as we become dependent on other nations for food, energy, minerals, and other necessities of life.

The ESA action to place Canadian timber wolves in Idaho and southwest Montana has created a significant increase in predators which in turn threatens sage-grouse. As documented in earlier Custer County comments, raven numbers have increased thousands of fold in certain areas of Idaho due to the carcasses left by wolves. Ravens and other predators eat sage-grouse eggs and sage-grouse chicks. Why is the fact that ravens and other predators are causing a decline in sage-grouse ignored? The answer has to be political because it certainly isn't scientific. Many members of the Custer County Commission have seen the benefits of predator control. Many of the people who live in Custer County grew up in the County. They know the history, customs and culture of their ancestors. They know wildlife management. They know more about sage-grouse and sage-grouse habitat than federal biologists. Custer County Commissioners know that the proposed action is bad for sage-grouse and bad for their County.

## **10. FEIS Appendix BB**

Comment:

The federal agencies do not see the hypocrisy of their thinking. In Appendix BB they discuss nonmarket values including *“value from using these non-market resources, such as photographing ranch houses, old barns ... driving backcountry roads.”* They don't stop to think that the proposed action will destroy the very values they weigh. The proposed action will cause ranch houses and old barns to crumble and high density subdivisions to be built (Davies et al. 2011). Backcountry roads will either disappear or become paved roads with more traffic. The nonmarket analysis is fatally flawed because it places values on so many resources that will disappear if the proposed action is implemented. The nonmarket analysis must be re-written to take into account this factor.

## **SUMMARY**

In summary, the only acceptable alternative is the No Action Alternative. Idaho and Montana fish and wildlife management agencies need to work with local governments and multiple use groups to keep a wide diversity of habitat, with vegetation in various seral stages, to recreate an ecosystem where sage-grouse and other wild animals thrive. Predator control must be part of the solution.

The western eleven states where Greater sage-grouse are found should not become part of a conservation system that creates protection akin to national parks or wilderness. Sage-grouse

thrive on agriculture and a diversity of land uses and seral stages of vegetation. Sage-grouse do not thrive in climax communities of old growth sagebrush with unpalatable vegetation. The proposed action will exacerbate a situation where a spark of lightening is enough to start a catastrophic fire that burns millions of acres of sage-grouse habitat where fuel loads are so high that the habitat is lost for decades to come.

The FEIS needs to be rewritten to analyze the impacts the proposed action will have as fires increase and add more carbon to the environment than what was analyzed in the FEIS. (See <http://www.lanl.gov/discover/news-release-archive/2013/July/07.09-wildfires-may-contribute-to-global-warming.php>).

Please choose the No Action Alternative and work with local and state governments to manage sage-grouse and their habitat in balance with all wildlife and human activities. To do otherwise will rapidly result in the demise of sage-grouse and their habitat.

Respectfully Submitted on Behalf of Custer County by  
Darling Geomatics Sage-Grouse Biologist

May 13, 2015

Interim State Director Jeff Foss  
Idaho BLM Office  
1387 S. Vinnell Way  
Boise, Idaho 83709

Dear Mr. Foss,

Thank you for the opportunity to provide comments on the Administrative Draft of the Idaho and Southwest Montana Sub-regional Greater Sage-grouse Proposed Resource Management Plan Amendment and Final Environmental Impact Statement (Draft Plan). Attached to this letter are specific comments to the Draft Plan from the State of Idaho.

Idaho values the ongoing local partnership with the Bureau of Land Management ("BLM"), the U.S. Forest Service, and the U.S. Fish and Wildlife Service. When Governor Otter took Secretary Salazar up on his offer to develop state-specific regulatory mechanisms and participate in the federal planning effort, he did so knowing that a local collaborative was key to building and implementing a plan that balanced the needs of sage-grouse with the economic vitality of the State.

Over that past few months, the State has worked in close coordination with your office to ensure that the Final Environmental Impact Statement (EIS) reflected the full intent of the Governor's Alternative. Unfortunately, despite a solid path forward with Idaho BLM, recently issued National Direction from the BLM office in Washington, D.C. stands to diminish the work completed by the Governor's Sage-grouse Task Force, the State of Idaho, and our local federal partners. Many elements of the National Direction were not vetted with the State or the Task Force. To that end, many of the following comments continue to highlight the State's concerns with the National Direction.

The State of Idaho is committed to conserving sage-grouse and its habitat while maintaining multiple-use activities across the landscape. We look forward to continuing our partnership as we move towards the completion of the Final EIS and subsequent record of decision.

Sincerely,

A handwritten signature in blue ink that reads "Dustin T. Miller".

Dustin T. Miller

## Comments from the Office of Species Conservation - May 13, 2015

### BLM portion of Chapter 2

**Chapter 2: Section 2.1 Changes between the Draft LUPA/EIS .... Page 2-5, line 12: A BLM Disturbance and Monitoring Sub-team further enhanced the two Appendices (Appendix G,... Appendix H, ... and Appendix E ...).**

There are three appendices listed and it states that there are two.

**Section 2.6.1 Development of the Proposed Plan Amendment for GRS Management page 2-4: Within these areas, the BLM/FS identified Sagebrush Focal Areas (SFAs), which are PHMAs with the following additional management (Figure 2-3): 1) Recommended for withdrawal from the Mining Law of 1872, subject to valid existing rights. 2) Managed as NSO, without waiver, exception, or modification, for fluid mineral leasing. 3) Prioritized for management and conservation actions in these areas, including, but not limited to review of livestock grazing permits/leases (see livestock grazing section for additional actions).**

SFAs are a deviation from the original three-tiered approach within the Governor's Alternative. The three-tiered approach is a model that prioritizes the best of the best habitat with the most restrictive regulations in Priority (Core) habitat, less restrictive in Important Habitat and the least restrictive in General Habitat.

**Section 2.6.1, page 2-5 lines 9 – 12: Based on these documents, the BLM is proposing to include lek-buffer distances when authorizing activities near leks.**

The addition of lek buffers in all tiers of the plan would disregard the flexible approach within the Governor's Alternative, ranging from Priority being the most restrictive and General being the least.

**Section 2.6.2, HM-OBJ-1, page 2-9, lines 17-20: Maintain or make progress toward at least 70 percent of lands within PHMAs and IHMAs capable of producing sagebrush at 10 to 30 percent canopy cover...**

This habitat objective states that the agency will strive toward having lands capable of producing 10 to 30 percent sagebrush canopy cover. This range does not align with those in table 2-3 on pages 2-10, 2-11 and 2-12 where the range is stated to be from 10 to 25 percent, 10 being the low end in winter range and late brood rearing, while the high end is 25 percent, not 30 percent, in nesting/early brood rearing and late brood rearing.

**Section 2.6.2 page 2-10 lines 6-10: These habitat objectives are not obtainable on every acre within the designated GRS habitat management areas. Therefore, the determination on whether the objectives have been met will be based on the specific site's ecological ability to meet the desired condition identified in the table.**

"Ecological ability" should be defined in this statement. Is this referring to the natural ability of the site without additional resources? In many cases, if a site has crossed an ecological threshold such as a perennial bunchgrass community converting to an annual grass community, return to the proper state is precluded within a time frame relevant to management, without substantial inputs of energy. A large amount of resources are needed to return the ecological processes to functioning within a normal range of variation.

**Section 2.6.2 page 2-10 lines 12-14: If monitoring data show the habitat objectives have not been met nor progress being made towards meeting them, there will be an evaluation and a determination made as to the cause.**

What monitoring points will be used to obtain this data? Will the points be at established monitoring points?

**Table 2-3, pages 2-10 and 2-11. Seasonal Use Period March 1 – June 15: Perennial Grass (and forb) height: Desired Condition: Greater than or equal to 7 inches:**

Having a height of greater than or equal to 7 inches of grass height will increase the fire potential in the area. Also, the measurement of 18 cm or 7 inches was from a study in southeastern Idaho, which is particular to that portion of Idaho. It is important to note that the vegetative preferences described, such as height and canopy coverage, are likely to occur as different-sized patches in sagebrush/grassland communities. Specific measurements, such as grass canopy height at nest sites, do not imply a uniform landscape-wide measurement, but instead are a microsite measurement of vegetation at a specific site. Also, in some parts of Idaho, vegetation may not be capable of achieving the desired height or cover characteristics. Connelly et al. (2000b) suggested, "...in all these cases, local biologists and range ecologists should develop height and cover requirements that are reasonable and ecologically defensible." (Idaho Sage-grouse Advisory Committee. 2006). A better approach to this may be having the desired condition state that the habitat is providing vertical and horizontal concealment for sage-grouse and having local knowledge address the issue of stubble height or desired condition.

**MA-10 page 2-17: Areas of non-PHMA mapped within the SFA boundary will not be managed as SFA except for the Donkey Hills ACEC and three Forest Service parcels in the Lost River Range, Idaho (Borah Peak, Big Flat Top Mountain, and Copper Basin Knob).**

Many of these areas, in particular the top of Borah Peak are NOT sage-grouse habitat.

**AD-1 page 2-19, lines 27-35: If the 3 percent anthropogenic disturbance cap is exceeded on lands ... then no further discrete anthropogenic disturbances ... will be permitted by BLM with GRSG PHMAs and IHMAs in any given BSU until the disturbance has been reduced to less than the cap.**

The four CAs in Idaho were set up to determine the disturbance within each area. Sage-grouse across Idaho are affected regionally by different threats. The purpose of the CA framework with the associated three-tiered HMA approach was to address problems where they are occurring and not penalize the rest of the State, where significant progress may be occurring for GRSG. Application of any disturbance cap must be applied at the CA level and not statewide.

**MON-1 page 2-25, line 2: Once FIAT Assessments are complete annually complete a review of FIAT Assessments...**

There needs to be a comma after the first "complete": Once FIAT Assessments are **complete**, annually complete .....

**FM-6 page 2-31, line 20: Fuel treatments will be designed though an interdisciplinary team process.....**

"Though" needs to be "through" to read: Fuel treatments will be designed through an interdisciplinary team process....

**ESR-4 page 2-33, line 34 &35: Adjust, as appropriate, livestock management on adjacent unburned areas to mitigate the effect of the burn on local GRSG populations.**

Language must be added explaining how the livestock management on adjacent unburned areas will be adjusted. If this plan is setting habitat characteristics and standards across the landscape, then adjustment in adjacent pastures should not be needed.

**RM-3 page 2-34, lines 14-17: Where opportunities exist, coordinate with other land managers to encourage livestock operations that utilize mixed federal, private and/or state land to be managed at the landscape scale to benefit GRSG ...**

This needs to be used to address seasonal restrictions and timing with livestock grazing. If certain areas, usually lower in elevation, are being grazed during the critical growing period for the plants annually, BLM and USFS should work together to help permittees with grazing management rotations instead of not allowing them to graze during the entire breeding, nesting, and early brood rearing period. This could be a detriment to users if seasonal restrictions are implemented.

**RM-7 page 2-35, lines 4-8: Where opportunities exist, establish forage reserves to facilitate restoration and rehabilitation efforts in GRSG habitat areas.**

The situations in which this would occur need to be spelled out. Livestock operators need to understand when this would occur.

**RM-12 page 2-35, lines 26-34: Design any new structural range improvements following ... Any new structural range improvements should be placed along existing disturbance corridors or in unsuitable habitat, to the extent practical, and are subject to RDFs.**

Limiting the tools that a land manager has to use by restricting range improvements to existing disturbance corridors or in unsuitable habitat could severely limit the ability to properly manage grazing with facilitating practices such as cross fences and watering facilities. Practices such as spring developments, watering troughs and cross fences to name a few, are usually not in disturbance corridors or unsuitable habitat, but are crucial for managing proper livestock grazing and maintaining GRSG habitat standards.

**RM-19 page 2-36, lines 31-34: At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider .... Should remain available for livestock grazing or be used for other resource management objectives, such as grass banks or fire breaks.**

A fire break is not a practice that should replace grazing in an allotment. A fire break is a practice that, in many cases, buffers a linear feature such as a road or powerline on both sides for a set distance. This practice does not occupy or take the place of grazing in an entire allotment.

**LR-10 page 2-39, line 22: New ROW applications .... Would be allowed on a case-by case bases subject to RDFs to reduce ....**

Would be allowed on a case-by case bases ... this should be "basis."

**FLM -7 page 2-43, lines 28-30: Issue Written Orders of the Authorized Officer (43 CFR 3161.2) requiring reasonable protective measures consistent with the lease terms where necessary to avoid or minimize effects to GRSG population or habitat.**

The reasonable protective measures need to be listed or identified as RDFs, these terms cannot be ambiguous and unknown.

**LOC-3 page 2-44, lines 1 – 2: Recommend SFAs for withdrawal from the General Mining Act of 1872 ...**

In LOC-2 of this plan there will be RDFs and BMPs applied to all HMAs. Also, regulations within this plan and these RDFs will help protect seasonal habitats for the entire life cycle of the GRSG without the need to withdraw 3.5 million acres in Idaho from locatable minerals. The application of SFAs in Idaho is inconsistent with the Governor's Alternative.

**TM-1 page 2-45, lines 34 – 40: Limit off-highway vehicle motorized travel within Idaho BLM Field Offices to existing roads, primitive roads, and trails ....**

This will limit the ability for grazing permittees to effectively and efficiently manage their livestock to best meet GRSG habitat standards. Activities such as salting, moving livestock to subsequent pastures, fence and trough maintenance, etc. will be severely hampered by this restriction.

**TM-5 page 2-47, lines 8-10: Conduct road construction, upgrades and maintenance activities to avoid disturbance during specific times at different seasons – see seasonal and timing restrictions section.**

This needs to be stated more clearly. I am unsure if this refers to Appendix C – Seasonal Timing Restriction. It appears that the only dates that would be affected would be a range from March 15 – May 15. If so, would this be considered different seasons? Also, there needs to be an exemption for major roadways through these areas for snow removal as maintenance.

**USFS Comments of Chapter 2**

**GRSG-Gen-DC-003-Desired Condition, page 2-48, lines 26-34: In all seasonal habitats, 70 percent of lands capable of producing sagebrush have 10 to 30 percent canopy cover ...**

This habitat objective states that the agency will strive toward having lands capable of producing 10 to 30 percent sagebrush canopy cover. This range does not align with those in table 2-6 on pages 2-48 and 2-49 where the range is stated to be from 10 to 25 percent, 10 being the low end in Winter range and late brood rearing while the high end is 25%, not 30%, in nesting/early brood rearing and late brood rearing.

**GRSG-GEN-GL-004-Guideline, page 2-50, lines 22-26 – Development of tall structures within 2.0 miles from the perimeter of occupied leks, ...**

The Governor's Alternative requires a 1 km buffer for tall structures from occupied leks in Core and Important Habitat.

**GRSG-LR-SUA-ST-001-Standard, page 2-51, lines 9-13 – In PHMA, IHMA and SFAs, restrict issuance of new lands special use authorizations for infrastructure ...**

The Governor's Alternative includes a management continuum whereby flexibility for new land-use activities increase as you move out from the Core Habitat Zone to the General Habitat Zone. In this standard there is no difference between PHMA and IHMA on restricting issuance of new lands special use authorizations for infrastructure which deteriorates the State's three-tiered approach. This three-tiered habitat approach has been validated by the U.S. Fish and Wildlife Service.

**GRSG-LR-SUA-ST-003-Standard, page 2-51, lines 19-21 – In PHMA, IHMA and SFAs, do not authorize temporary lands special uses that result in loss of habitat ...**

See comment above at GRSG-LR-SUA-ST-001.

**Table 2-7 Treatment Acres per Decade on National Forest System Lands, page 2-53: Within the footnote #4; Acres presently dominated by annual grasses that could be improved by herbicide application and seeding of perennial vegetation.**

This treatment of annual grasses does not appear in the table to denote how many acres will be treated for annual grasses on USFS lands per decade.

**GRSG-GRSGH-GL-002-Guideline, page 2-53, lines 24-26: When removing conifers that are encroaching into GRSG habitat, avoid persistent woodlands (old growth relative to the site or more than 100 years old).**

Old growth juniper is not considered “old growth” unless it is pre settlement, when settlers began suppressing fires and allowing for woodland expansion. This would be around 145 years old as of 2015. This is according to Oregon State University technical bulletin 152, Biology, ecology and management of Western Juniper, June 2005.

**GRSG-LG-ST-001-Standard, page 2-54, lines 8-9: In PHMA, IHMA and SFAs, do not approve construction of water developments unless beneficial to GRSG habitat.**

This standard is subjective depending on who is applying the standard of “beneficial.” The literature approves of a 1.2 mile buffer for new permanent livestock facilities of which is covered in Guideline 006. This standard could affect proper grazing management.

**Table 2-8 page 2-54, lines 19-20: when grazing occurs during breeding and nesting season (March 1 to June 15) manage for upland perennial grass height of 7 inches. When grazing occurs post breeding and nesting season (June 16 to October 30) manage for 4 inches of perennial grass height. Retain an average stubble height of 4 inches for herbaceous riparian/mesic meadow vegetation.**

Depending upon the ecological potential, a perennial grass height standard enforced before the growing season in early spring may be unattainable. A riparian/ mesic meadow standard of 4 inches is arbitrary given that the literature suggests a range of between 2 and 6 inches.

**GRSG-LG-GL-002-Guideline, page 2-54, lines 21-24: In PHMA, IHMA, GHMA, and SFAs, consider closure of grazing allotments ....where removal of livestock grazing would enhance the ability to achieve desired habitat conditions.**

Language should be included here stating that once desired conditions are reached, livestock will be reintroduced into the system after a set period of time, and removal would not be permanent.

**GRSG-FM-ST-002-Standard, page 2-55, lines 17-21: In PHMA, SFAs, GHMA, if it is necessary to use prescribed fire to facilitate site preparation for restoration ...**

IHMA should not be excluded from this standard.

**GRSG-FM-GL-001-Guideline, page 2-55, lines 22-24: In wintering or breeding and nesting habitat, sagebrush removal or manipulation, including prescribed fire, should be restricted ...**

Wording that states and/or the management action brings the habitat consistent to desired conditions within Table 2-6.

**GRSG-FM-GL-005-Guideline, page 2-55, lines 33-35: In PHMA, IHMA, GHMA and SFAs, cross country vehicle travel during fire operation should be restricted ....**

Will this hamper firefighting efforts and effective wildfire suppression?

**GRSG-RT-ST-002 Standard, page 2-57, lines 35-37: Do not conduct or allow road and trail maintenance activities within 2 miles from the perimeter of active leks ...**

Only during the breeding and nesting season? How will this affect road maintenance? What if the road is not federal jurisdiction?

**GRSG-M-FMUL-ST-001-Standard, page 2-58, lines 21-30: In PHMA, and IHMA any new oil and gas leases must include an NSO stipulation. There will be no waivers ....**

PHMA and IHMA should not be the same and there should be some increased flexibility when moving from PHMA to IHMA.

**GRSG-M-FML-ST-005-Standard, page 2-59, line 17: In PHMA, GHMA and SFAs, when authorizing development.....**

This should be PHMA, IHMA and SFAs, not GHMA.

**GRSG-FML-GL-003-Guideline,page 2-59, line 30: In PHMA, SFAs, and GHMA ....**

This format for PHMA, SFAs and GHMA is different than what has been used throughout the entire document of PHMA, IHMA, GHMA and SFAs.

**GRSG-M-NEL-GL-002-Guideline: page 2-62, line 1: In PHMA, SFAs, GHMA, the Forest Service should ....**

This format for PHMA, SFAs and GHMA is different than what has been used throughout the entire document of PHMA, IHMA, GHMA and SFAs. The format should be the same throughout the document when using similar HMA's.

## **Appendix B - Required Design Features**

**B-4 RDF – 51: When conducting vegetation treatment in areas inhabited or potentially inhabited by slickspot peppergrass ...**

This is a GRSG document and not the place to have at slickspot peppergrass RDF.

**B-6 RDF – 105: Avoid building new wire fences within 2 km of occupied leks (Stevens 2011). If this is not feasible, ensure that high risk segments are marked with collision diverter devices ...**

The Governor's Alternative states to avoid constructing new fences within one kilometer (0.6 miles) of occupied leks.

May 13, 2015

## Comments from the Office of Energy Resources

### 2.6 Proposed Plan Amendment

#### 2.6.1 Development of the Proposed Plan Amendment for GRSG Management

**MA-10 (p. 2-16):** The proposed Land Use Plan Amendment (LUPA) designates Sagebrush Focal Areas (SFAs) and manages them as priority habitat management areas, with additional management, including: “1) Recommended for withdrawal from the General Mining Act of 1872, as amended, subject to valid existing rights; 2) Managed as no surface occupancy, without waiver, exception, or modification, for fluid mineral leasing; and 3) Prioritized for management and conservation action in these areas, including but not limited to review of livestock grazing permits/leases.”<sup>1</sup>

On March 9, 2012, Governor C.L. “Butch” Otter promulgated Executive Order 2012-02 establishing a 15 member Sage-Grouse Task Force (Task Force). The Task Force’s purpose was to provide Governor Otter with recommendations to ensure long-term viability for Sage-Grouse and prevent the need for federal protection under the Endangered Species Act.<sup>2</sup> The Task Force recommendations were submitted to the Governor on June 15, 2012 and became part of the larger State Plan. MA-10 is inconsistent with the State Plan.

Governor Otter submitted the State Plan to the Bureau of Land Management (BLM) for inclusion in this Environmental Impact Statement. The State Plan envisions a three tiered management approach to sage-grouse habitat, which adequately enables the State and the federal government to prioritize conservation and restoration efforts, and provides the most effective opportunities to benefit sage-grouse populations and their habitat *while maintaining predictable levels of land use*.<sup>3</sup> This management approach takes into account the distribution of sage-grouse populations in Idaho focusing on the two meta-populations in the State.<sup>4</sup>

MA-10 recommends what is effectively a four tier approach by adding SFAs as a habitat classification, in addition to the Priority, Important, and General Habitat Management Areas as delineated in MA-2.<sup>5</sup> This addition of a fourth habitat category creates inconsistency and minimizes the collaborative work between the BLM and the State on the three tiered approach to habitat classification.

Moreover, MA-10 is inconsistent with the direction that the Secretary of the Interior gave the eleven western states to develop a *state-specific regulatory mechanism to conserve the species and preclude the need to list under the ESA*.<sup>6</sup> This direction was received by Governor Otter,

---

<sup>1</sup> Idaho and Southwestern Montana Greater Sage-Grouse Proposed LUPA/Final EIS, p. 2-16, 17 (June 2015).

<sup>2</sup> Idaho Exec. Order No. 2012-02 (Mar. 9, 2012).

<sup>3</sup> State Plan at page 19, emphasis added.

<sup>4</sup> State Plan at page 23.

<sup>5</sup> Proposed LUPA/Final EIS at 2-14, 15 EIS (June 2015).

<sup>6</sup> Idaho Exec. Order 2012-02, emphasis added.

and taken seriously, as shown by its memorialization in Executive Order 2012-02. The Secretary's assurance that Idaho would be allowed to develop its own regulatory mechanism was a portion of Idaho's motivation for creating the State Plan.

MA-10 is inconsistent with the directive contained in Executive Order 2012-02 because it is based off of an October 27, 2014 memorandum from the United States Fish and Wildlife Service to the BLM<sup>7</sup>, which implements a one-size-fits-all approach to sage-grouse habitat management spanning several western states. Idaho was not afforded the opportunity to provide input to SFAs, their associated maps, and was not consulted on the additional management directives that apply to the areas designated as SFAs. MA-10 is not a state-specific regulatory mechanism, and therefore not consistent with the directive given to Idaho by the Secretary of Interior.

Finally, MA-10 is not consistent with the recently adopted Idaho State Board of Land Commissioners Greater Sage-Grouse Conservation Plan (Land Board's Plan).<sup>8</sup> The Land Board's Plan contains mandatory conservation measures for endowment trust land, and programs that fall under Idaho Department of Lands (IDL) regulatory functions.<sup>9</sup> The Land Board's Plan utilizes the State of Idaho Habitat Zone classifications as described in the State Plan, with three distinct management zones.<sup>10</sup> The State and IDL both recognize the value of a three-tiered habitat approach which is essential to the functionality of the adaptive management process.<sup>11</sup> MA-10 is inconsistent with the Land Board's Plan because it creates a fourth tier by managing SFAs differently than Core/Priority, Important, and General Habitat Management Areas.

Because the SFAs are inconsistent with the State's laws, plans, policies and programs, any reference in MA-10 and subsequent LUPAs in this environmental impact statement should be eliminated. With respect to the LUPAs that contain both reference to SFAs and other habitat management zones, BLM should sever reference to SFAs and continue to manage habitat zones as if there was not the fourth tier of habitat management introduced with SFAs.

## 2.6.2 BLM Proposed Plan Amendment

**FLM-1 (p. 2-4I):** Areas within SFAs would be open to fluid mineral leasing and development and geophysical exploration subject to no surface occupancy (NSO) without waiver, exception, or modification.

FLM-1 is inconsistent with state statutes because it does not allow for the development, production and utilization of oil and gas in SFAs. Idaho's legislature "declared it to be in the public interest to foster, encourage and promote the development, production and utilization of natural resources of oil and gas in the state of Idaho in such a manner as will prevent waste; ..."<sup>12</sup> Categorically eliminating the option to develop, produce and utilize Idaho's oil and

---

<sup>7</sup> "Greater Sage-Grouse: Additional Recommendations to Refine Land Use Associations in Highly Important Landscapes" (Oct. 27, 2014).

<sup>8</sup> Adopted April 21, 2015.

<sup>9</sup> Land Board's Sage-grouse Conservation Plan at page 5.

<sup>10</sup> Land Board's Sage-grouse Conservation Plan at page 9.

<sup>11</sup> Land Board's Sage-grouse Conservation Plan at page 10.

<sup>12</sup> Idaho Code § 47-315 (2012).

natural gas resources by eliminating approximately three million acres of land from the possibility of exploration and development is a *per se* inconsistency with Idaho statute.

**LOC-1 (p. 2-43):** Lands would remain open to locatable mineral entry outside of SFAs; and **LOC-3 (p. 2-44):** Recommend SFAs for withdrawal from the General Mining Act of 1872, as amended, subject to valid existing rights.

LOC-1 and LOC-3 are inconsistent with state statutes because Idaho allows people “to locate mining claims upon [the] public domain in the state of Idaho which is open to location under the mining laws of the United States.”<sup>13</sup> Withdrawing three million acres of land from the General Mining Act of 1872 disallows Idaho citizens the opportunity to locate mining claims in SFAs.

Moreover LOC-1 and LOC-3 are inconsistent because Idaho Code leaves open to casual exploration “all lands belonging to the state of Idaho in which mineral deposits... are owned by the state, and which have not been located, leased, or withdrawn...”<sup>14</sup> LOC-1 and LOC-3 creates inconsistency because the SFA designation does not take into account ownership of land. While the BLM only has jurisdiction over federally managed lands, maps showing SFAs cover federally managed land, state endowment land, and private property.

Finally, LOC-1 and LOC-3 are inconsistent with a recently passed piece of legislation<sup>15</sup> amending Section 39-102 Idaho Code which states, “[i]t is the policy of the state to protect groundwater and to allow for the extraction of minerals above and within ground water.” While this code amendment is pertaining to ground water, it is clear that the intent of the legislature is to allow for the extraction of minerals in Idaho. Because LOC-1 and LOC-3 recommends withdrawal of the ability to extract minerals from federally managed lands, it is inconsistent with legislative intent.

### **2.6.3 Forest Service Proposed Plan Amendment**

**GRSG-M-FMUL-ST-003-Standard (p. 2-58):** In SFAs, there will be NSO and no waivers, exceptions, or modifications for fluid mineral leasing.

GRSG-M-FMUL-ST-003-Standard is inconsistent with state statutes because it does not allow for the development, production and utilization of oil and gas in SFAs. Idaho’s legislature “declared it to be in the public interest to foster, encourage and promote the development, production and utilization of natural resources of oil and gas in the state of Idaho in such a manner as will prevent waste; ...”<sup>16</sup> Categorically eliminating the option to develop, produce and utilize Idaho’s oil and natural gas resources by eliminating approximately three million acres of land from the possibility of exploration and development is a *per se* inconsistency with Idaho statute.

Idaho and Southwestern Montana Proposed LUPA/FEIS Grazing comments

**ISDA'S COMMENTS ON CHAPTER 2 (GRAZING – suggested additions in red font, suggested deletions lined out & highlighted in yellow)**

**General Comment:**

ISDA supports and believes that good cooperative planning should come from the local level where ideas and decisions can be discussed openly between all of the entities that are familiar with state wide sage grouse issues, including information from local sage grouse working groups throughout the state. These local working groups have extensive knowledge on sage grouse numbers and issues on both public and private lands. When all parties have been involved in a cooperative and collaborative process working to identify all of the topics and issues that need to be identified, discussed, and planned for up front, the final outcome of the process and plan is generally a very successful product. Through numerous task force meetings, interagency meetings with Federal and State Officials, and numerous conference calls, a good collaborative process was carried out at the local level with the exception of the topic of Sagebrush Focal Areas (SFAs). Unfortunately, Sagebrush Focal Areas were not discussed at the local planning level with all of the cooperating agencies and partners. This concept did not come up until after the document left the local collaboration process and was sent back to the Washington D.C. Office.

**Livestock Grazing**

**RM-1:** Maintain existing areas designated as available or unavailable for livestock grazing. Existing active AUMs for livestock grazing within the planning area would not be changed at the broad scale, though the numbers of AUMS available on an allotment may be adjusted **with supporting quantitative and qualitative monitoring data** based on site specific conditions to meet management objectives during term permit renewals, AMP development, or other appropriate implementation. Additionally, temporary adjustments can be made annually to livestock numbers, the numbers of AUMs, and season of use in accordance with applicable regulations.

**RM-3:** Okay as written as long as **private land is included on a permittee voluntary basis only** and the permittees permit/annual bill reflects the correct percent public land use. [See 43 C.F.R. 4130.3-2(g)]

**RM-4:** Add the following sentence to the end of RM-4. **Public and permittee involvement and participation should be encouraged throughout the entire Rangeland Health Assessment process.**

**RM-6:** When **current** livestock management practices are determined to not be compatible following appropriate consultation, cooperation, and coordination, implement .....

**RM-8:** PHMA, IHMA, & GHMA – When an allotment, or portion thereof, becomes vacant or grazing preference is relinquished, consider **retirement of the allotment or grazing preference, or portion thereof, or** converting the area to a forage reserve (a.k.a. reserve common allotment; forage reserves are areas that are set aside for use). This would allow the BLM/Forest Service vacant allotments to

place operators while sage-grouse related habitat restoration efforts occur in their respective allotments, allowing for increased connectivity of fragmented sagebrush habitats. Some of the reasons ISDA does not support and would discourage the retirement of an allotment or grazing preference are:

- BLM Instruction Memorandum No. 2013-184 clearly states that *“the BLM’s receipt of a relinquishment of permitted use does not, in and of itself, result in that forage allocation becoming unavailable for use by livestock. Reassigning a livestock forage allocation that has become available due to a relinquishment to a new or different permittee supports the BLM’s multiple-use mission. When BLM evaluates potential management actions and opportunities following a relinquishment, managers should strive to develop management strategies that allow public lands to be used for livestock grazing while achieving other land use plan management goals and objectives.”*
- Research shows that with no use, fuel loads increase, creating the likelihood of wildfires which will destroy Sage-Grouse habitat
- Reduces the number of places a permittee may go when displaced by wildfire or even restoration efforts in their allotments to improve Sage-Grouse habitat
- By totally eliminating grazing through the retirement of an allotment or grazing preference, this reduces all of the Federal Land Management Agencies options when working with operators on restoration efforts in their allotments that will benefit Sage-Grouse, they have no-where for the displaced operators to go while restoration work occurs
- Retirement of allotments or grazing preferences can have impacts to local rural economies
- Livestock grazing is one of several tools used in the management of fuel reductions. Why would federal land management agencies completely remove tools out of their “tool box” on a permanent basis?

**RM-9:** Where practical, **and in consultation, cooperation, and coordination with the permittees,** design pasture rotations to utilize non-native perennial grass seedings and/or annual grasslands, during GRSG nesting season annually or periodically.

**RM-10:** Evaluate the locations where salt/supplements are placed, coordinate salt/supplement placement **with permittees** to reduce impacts to GRSG habitat (e.g., existing disturbed areas)

**RM-12:** Design any new structural range improvements ..... Any new structural range improvements, **when possible and practical,** should be placed along existing disturbance corridors or in unsuitable habitat, **to the extent practical,** and are subject to RDFs (**Appendix B**).

**RM-15:** In response to weather conditions (i.e. drought), **and in consultation, cooperation, and coordination with affected users and interested parties as outlined in resource Management During Drought Instruction Memorandums,** adjust grazing management (i.e. delay turnout, adjust pasture rotations, adjust the amount and/or duration of grazing) as appropriate for adequate food and cover for GRSG.

**RM-17:** The original NEPA document should: (1) fully disclose all specific management thresholds and their ranges, (2) clearly define Land Health Standards (43 CFR 4180.2) and Idaho Standards for Rangeland Health and Guidelines for Livestock Grazing Management, and (3) clearly explain the defined responses.

“Defined response” sets up an “if/then” scenario that does not provide the flexibility to address unique rangeland concerns. Additionally, the emphasis on the ecological potential of the site implies that the GRSG Habitat Objectives Table would be populated at a local scale. It is important that the table be populated at a local scale. Finally, there is no mention of ensuring that changes to a permit be accompanied by appropriate spacial and temporal monitoring.

**RM-18:** Allotments within SFA, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision. **Permittees should be extended the invitation to attend when any vegetation type of monitoring (such as utilization, stubble heights, photo monitoring, etc.) occurs on the allotment.**

**RM 19:** At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives. Other resource uses for these allotments may include **uses** such as **forage reserves or grass banks to be used for livestock grazing while restoration efforts occurs in other allotments to improve sage-grouse habitat and improve habitat connectivity in key allotments or while strategic locations to install fire breaks are developed to aid in the protection of other allotments which contain important sage-grouse habitat.**

May 13, 2015

**Wildland Fire Management – Fuels Management - ISDA COMMENTS**

**FUEL-OBJ-1: In coordination, cooperation, and consultation with permittees and the interested publics,** design fuel treatment to restore, enhance, or maintain GRSG habitat.

**Fuels Management**

**FM-1:** Design and implement fuels treatment that would reduce the potential start and spread of unwanted wildfires and provide anchor points or control lines for the containment of wildfires during suppression activities with an emphasis on maintaining, protecting, and expanding sagebrush ecosystems and successfully rehabilitated areas and strategically and effectively reduce wildfire threats in the greatest area. **When determined that vegetation or other resources on the public lands are at substantial risk of wildfire due to fuel buildup, consideration should be made on implementing a rangeland wildfire management decision effective immediately or on a date established in the decision (see 43 CFR 4190.1).**

**FM-2:** Looks okay as written

**FM-3:** As part of the FIAT Assessment incorporate a water capacity analysis for suppression purposes, including potential private water sources **following consultation with private land owner(s).** Provide availability to respond to fire in or threatening PHMA and IHMA during initial attack.

**FM-4:** Looks okay as written

**FM-5:** Looks okay as written

**FM-6:** Fuel treatments will be designed through an interdisciplinary process **including the range user** to expand, enhance, maintain, and protect GRSG habitat which considers a full range of cost effective fuel reduction techniques, including: chemical, biological (including grazing and targeting grazing) mechanical and prescribed fire treatments. **These fuel treatments may be implemented through a rangeland wildfire management decision effective immediately or on a date established in the decision (43 C.F.R. 4190).**

**FM-7:** Existing and proposed linear ROWs could be considered for use and maintenance as vegetated fuel breaks in appropriate areas (this activity may or may not be part of the ROW permit or the responsibility of the permit holder, in cases where this activity is considered part of mitigation for project design, **following consultation cooperation and coordination with the permit holder,** then it would be appropriately included as part of the ROW permit and the responsibility of the permit holder for development and maintenance).

**FM-8:** Looks okay as written

**FM-9:** Looks okay as written

**FM-10:** Protect vegetation restoration and rehabilitation efforts/projects from subsequent fire events **by effectively implementing fuel reduction techniques in a timely manner following successful completion of the vegetation restoration and rehabilitation efforts.**

**FM-11:** Targeted grazing as a fuels treatment to adjust the vegetation conditions to reduce the potential start and spread of wildfires may be implemented within existing grazing authorizations if feasible such as through temporary nonrenewable authorizations, or through contracts, agreements or other appropriate means separate from existing grazing authorizations and permits **such as rangeland wildfire management decision effective immediately or on a date established in the decision (43 C.F.R. 4190).**

**FM-12:** Targeted grazing to achieve fuels management objectives should conform to the following criteria:

- a. Okay as written
- b. Okay as written
- c. **Where livestock grazing to achieve fuels management objectives is determined to be feasible and applicable within an allotment(s),** coordinate with the grazing permittee(s) to strategically reduce **these fine** fuels through livestock management within the Mandatory Terms and Conditions of the applicable grazing authorizations.

**FM-13:** Prioritize the use of native seeds for fuels management treatment based on availability, adaptation (site potential), and probability of success. Where probability of success or native seed availability is low or non-economical, nonnative seeds may be used to meet GRSG habitat objectives to trend toward restoring the fire regime. When reseeding, use fire resistant, **low yield producing** native and nonnative species, as appropriate, to provide for fuel breaks.

**FM-14:** Looks okay as written

**FM-15:** Looks okay as written

## Washington Office Review of Greater Sage-Grouse Proposed RMPA/Final EIS

### Plan Name: Idaho/SW Montana

April 25 – May 9, 2015

**Instructions for Completing a Comment Table:**

1. Objective of this review is to identify any high-level issues or red flags. Many documents are still being technically edited and reviewed for quality assurance; editorial comments are not needed.
2. Fill in all cells that you are responsible for as a Commenter or IMT Reviewer. The four **yellow** columns must be completed by Commenters. The three **blue** columns must be completed by IMT Reviewers.
  - a. Commenters, if you have the same comment more than once, do not refer to another comment number. Instead, repeat your comment by copying and pasting your comment in to a new row in the table and provide the page number, line number, and Commenter name.
  - b. IMT Reviewers, if you have the same Reviewer response more than once, do not refer to another comment number. Instead, repeat your response by copying and pasting your response in the IMT Reviewer response column and fill in the “A, R, or M” and IMT Reviewer name.
3. Identify the specific error in the document being reviewed and provide the exact text that corrects erroneous text. A good way to do this is as follows: Replace the sentence “\_\_\_” with the sentence “\_\_\_”.
4. IMT Reviewer, ensure IMT Reviewer responses to similar comments provide consistent direction for making revisions.

**Comment Table Notes to Commenters and Reviewers:**

**<sup>1</sup>A = Accept:** Requested change from the Commenter is accepted by the Reviewer and no additional changes are needed; **R = Reject:** Requested change from the Commenter is rejected and the Reviewer provides an explanation for the rejection. No changes to the document will occur if there is an “R” in the “A, R, or M” column; **M = Modify:** Reviewer agrees a change to the document is needed, but the Reviewer wants to modify the change provided by the Commenter. Reviewer provides the exact change to the document and explains the reason for the modified change.

**Comment Table**

Cmt #	Completed by Commenter				Completed by IMT Reviewer			Completed by Contractor or BLM Field Staff
	Page #	Line/Row # or Figure/Table #	Commenter Name	Comment <i>(Provide exact new text for use in making changes to document. Comments lacking this information may not be considered.)</i>	IMT Reviewer Name	A, R, or M <sup>1</sup>	IMT Reviewer Response to Comment	Document Change
1.	2-40	LR-14	J Whyte / Lands and Realty	Section needs to be reworded. Needs to include all forms of disposal.  Exchanges should not be the preferred method of land tenure adjustment. This limits the BLM.  Per the BLM manual - “Land exchanges are an important tool to consolidate land ownership for more efficient management and to secure important objectives of resource management, enhancement, development and protection; to meet the needs of communities ; promote multiple-use management; foster sustainable development and to fulfill other public	Hildner	A	Do not identify exchanges at the preferred method of land tenure adjustment.

	Page #	Line/Row # or Figure/Table #	Commenter Name	Comment ( <i>Provide exact new text for use in making changes to document. Comments lacking this information may not be considered.</i> )	IMT Reviewer Name	A, R, or M <sup>1</sup>	IMT Reviewer Response to Comment	Document Change
				needs. However, BLM will evaluate and consider the full range of land disposal and acquisition tools to be able to accomplish these objectives prior to proceeding with a land exchange.”				
2.	2-166	Table 2-11 Land Tenure B-LR-19	JWhyte	<p>Section needs to be reworded. Needs to include all forms of disposal.</p> <p>Exchanges should not be the preferred method of land tenure adjustment. This limits the BLM.</p> <p>Per the BLM manual - “Land exchanges are an important tool to consolidate land ownership for more efficient management and to secure important objectives of resource management, enhancement, development and protection; to meet the needs of communities ; promote multiple-use management; foster sustainable development and to fulfill other public needs. However, BLM will evaluate and consider the full range of land disposal and acquisition tools to be able to accomplish these objectives prior to proceeding with a land exchange.”</p>	Hildner	A	Do not identify exchanges at the preferred method of land tenure adjustment.	
3.	2-8	T2-2	Merrill	This table indicates that Areas not previously withdrawn are open, which seems to conflict with page 2-57 which says that SFA for locatables will be withdrawn. Recommend making this consistent.	Hildner	R	No change needed. SFAs are only recommended to be withdrawn by the RMP, and so would remain open till this is done at a later date.	
4.	2-23	T2-4	Merrill	Replace Leasable with "Non-Energy Leasable"	Hildner	A	Make change	
5.	2-44	1	Merrill	See comment on page 2-8	Hildner	R	No change needed. SFAs are only recommended to be withdrawn by the RMP, and so would remain open till this is done at a later date.	
6.	2-44	23-24	Merrill	This is an unfunded mandate. Without funds this is simply a goal or an objective, since BLM could not required the operator to do this if the contract has already been issued with this requirement.	Hildner	R	This is fine to identify as a management action.	
7.	2-61	10-11	Merrill	Is "co-location" really the right word. Presumably the disturbed land has fulfilled its purpose and can be reclaimed. What we're really talking about is "re-locating" the facility to land that has not been reclaimed yet. I recommend replacing "co-locate" at line 10 and 11 with "relocate".	Hildner	R	This is FS decision. Not BLM. No change needed.	
8.	2-61	24-28	Merrill	Is this language suggesting that phased development be required? I'm not sure we have the authority to require a phase operation, unless UUD would occur. For everything else, 3809.420(a)(5) requires concurrent	Hildner	R	This is FS decision. Not BLM. No change needed.	

Cmt #	Completed by Commenter				Completed by IMT Reviewer			Completed by Contractor or BLM Field Staff
	Page #	Line/Row # or Figure/Table #	Commenter Name	Comment ( <i>Provide exact new text for use in making changes to document. Comments lacking this information may not be considered.</i> )	IMT Reviewer Name	A, R, or M <sup>1</sup>	IMT Reviewer Response to Comment	Document Change
				reclamation, which accomplishes the same goal as the phase operation, which is to keep disturbance to the lowest level possible. I recommend the following wording.  In PHMA, IHMA, GHMA and SFAs keep habitat disturbance at a minimum. A phased development approach should be applied to operations, when necessary to avoid unnecessary or undue degradation, consistent with the rights granted under the General Mining Act of 1872, as amended. Disturbed areas should be reclaimed as soon as they are no longer needed for mineral operations, as required by 43 3809.420(a)(5)				
9.	2-61	33-37	Merrill	This section presupposes that all Nonenergy Leases will be on USFS administered lands. Was this intentional? As written these guidelines would not apply to leases on BLM administered lands, nor are there any guidelines for this.	Hildner	R	This is FS decision. Not BLM. No change needed.	
10.	2-84	T2-9	Merrill	Make consistent with Table 20-2, see comment on page 2-8.	Hildner	R	No change needed. SFAs are only recommended to be withdrawn by the RMP, and so would remain open till this is done at a later date.	
11.	2-84	T2-9	Merrill	Please break out withdrawn vs recommended for withdrawal as I have seen in other plans.	Hildner	A	Make edit as time allows	
12.	2-168	T2-11	Merrill	I find the following sentence to be confusing:  "To the extent allowable by laws and regulations and to the extent the claimant would be willing to apply the standards, limit or ameliorate impacts through the use of the general stipulations identified in the GRSG section."  I recommend rewriting as follows: "To the extent allowable by laws and regulations, limit or ameliorate impacts through the use of the general stipulations identified in the GRSG section."	Hildner	R	These are comments on the draft alternatives. Only supposed to commenting on the proposed alternative due to time.	
13.	2-200	T2-6	Merrill	Third paragraph- Should this be "short-term", rather than "sort term"?	Hildner	A	Make edit	

Cmt #	Completed by Commenter				Completed by IMT Reviewer			Completed by Contractor or BLM Field Staff

14.	4-16	7	Merrill	First line should read "Locatable mineral development"	Hildner	A	Make edit	
15.	4-16	7-11	Merrill	This sentence tries to do too much. Separate out sentences; one for BLM one for USFS. For BLM try: "Locatable minerals development within the sub-region consists of three tiers based on level of disturbance and type of mining; casual use, notice-level operations, and Plan-level operations. In general, casual use operations are activities that result in "no or negligible disturbance". Exploration activities that will disturb less than 5 acres require the filing of a notice. All other mining activities, including exploration with disturbance over 5-acres, require an approved Plan of Operations. Certain operations that would normally not require a plan may be required to do so when certain criteria are met or when the operation is proposed for certain special management areas (43 CFR 3809.11). "  You'll need to contact the forest service for an equivalent statement for 36 CFR 228.4.	Hildner	A	Make edit	
16.	4-16	8	Merrill	For BLM 43 CFR 3809 only refers to Notices or Notice-level operations. Please do not use refer to Notice of Intent unless referring to USFS regulations	Hildner	A	Make edit	
17.	4-16	11	Merrill	"gravel and stone". Not all Oakley is locatable.	Hildner	A	Make edit	
18.	4-38	7-9	Merrill	This section appears to only address fluid leaseables not solid leaseables. Add Solid Leaseable section.	Hildner	A	Make edit	
19.	4-51	27 -31	Merrill	Rename to include "Fluids"; create section for Solid leaseable.	Hildner	M	Reformat if necessary/have sufficient time	
20.	4-52	5	Merrill	Publicly stating that BLM may purchase mining claim may encourage speculators. Further, BLM/DOI's history of buying claims is extremely rare and if BLM were to do so a validity examination would be required first.  Recommend dropping buy-out language.	Hildner	A	Make edit	
21.	4-58	8-13	Merrill	Rename to include "Fluids"; create section for Solid leaseable.	Hildner	M	Reformat if necessary/have sufficient time	

Cmt #	Completed by Commenter				Completed by IMT Reviewer			Completed by Contractor or BLM Field Staff

				252,296 acres of lands with wilderness character within the planning area boundary.				
101.	2-40	7	Matt Preston	<p>Need to work in the “net conservation gain” via application of the mitigation hierarchy to each potentially impacting land use activity described in Chapter 2. Right now, it is only explicitly noted for land disposal and recreation. I know we have language elsewhere in the Chapter, but we need to be consistent throughout. (See my re-write on XXXXXXXXXXXX below, as examples)</p> <p>Same need applies for Sec 2.8, Table 2-6, Table 2-10, and Table 2-11.</p> <p>For example, when discussing fluid minerals management (e.g. Pg. 2-41) add language, such as:</p> <p>“As reasonable (43 CFR, Part 3101.1-2), in consideration of valid existing rights, and to achieve a net conservation gain, the BLM would require compensatory mitigation when impacts cannot be adequately avoided and minimized, and residual impacts would result in habitat loss and degradation. Compensatory mitigation actions will align with the recommendations in the Regional Mitigation Strategy (see Section 2.7.3), as appropriate. A priority may be given to compensatory mitigation actions in the same PHMA as is being impacted, unless a greater benefit can be achieved elsewhere. Compensatory mitigation would be considered when no feasible options remain to adequately avoid and minimize impacts within and immediately adjacent to the impacted site.”</p>	Hildner	R	There is a drop in decision that requires NCG in GRSG habitat throughout the entire planning area; necessary to put the NCG standard in every decision.	
102.	2-41	17	Matt Preston	<p>Strike: “avoid, reduce, and mitigate”</p> <p>Insert: “avoid, minimize, and compensate”</p> <p>GLOBAL CHANGE</p>	Hildner	A	Make edit : Avoid, minimize, and apply compensatory mitigation	
103.	2-41	21	Matt Preston	<p>Strike: “avoid and minimize”</p> <p>Insert: “avoid, minimize, and compensate”</p>	Hildner	A	Make edit: Avoid, minimize, and apply compensatory mitigation

Tim Murphy  
Acting Director  
Idaho State BLM Office  
1387 S. Vinnell Way  
Boise, Idaho 83709

Dear Tim,

Thank you for the opportunity to provide comments on the Idaho and Southwestern Montana Administrative Draft Proposed Plan ("ADPP") for the Greater Sage-Grouse Land-Use Plan Amendment and Final Environmental Impact Statement. Attached to this letter you will find specific comments to the ADPP from the State of Idaho in track change format.

We appreciate the partnerships that have been cultivated throughout this land-use plan amendment process between the State of Idaho, Bureau of Land Management ("BLM"), the U.S. Forest Service ("USFS") and the U.S. Fish and Wildlife Service (Service") and we look forward to continuing this partnership as we move towards the completion of the final EIS.

The State of Idaho strongly encourages the BLM and USFS to adopt in the Final EIS, the three-tiered habitat approach described in the Idaho Governor's Alternative (Alternative E) and the ADPP. As you know, this approach allows the BLM and USFS to prioritize conservation actions within the Core Management Zone or "CMZ", which contains the highest quality habitat and the highest population densities of greater sage-grouse ("GSG") in Idaho. However, the Important Management Zones ("IMZ") plays a crucial role in the adaptive management process as it essentially serves as a habitat and population "bank account" in the event an adaptive regulatory trigger is tripped. Under Alternative E and the ADPP, the CMZ provides for a high level of conservation for GSG, while potential development is focused in areas outside of both the CMZ and IMZ. However, this does not exclude *all* new development in CMZ as an exemption process would allow for some limited new development if certain criteria are met. In essence, the management zones represent continuum whereby flexibility for land-use activities increases as you move from the CMZ to the General Management Zone ("GMZ").

Additionally, it is important to remind our federal partners that the population and habitat triggers and anthropogenic disturbance cap identified in Alternative E and the ADPP are based on nesting and wintering habitats in both CMZ and IMZ within a Conservation Area.

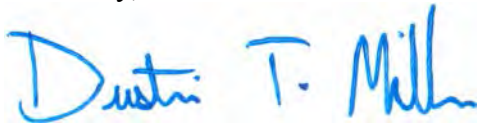

The CMZ, IMZ and GMZ boundaries were reviewed by BLM field office staff. BLM field office staff recommended boundary adjustments based on local knowledge at a finer scale than

was used during the development of the original boundaries. Adjustments were made to include more connectivity areas in CHZ and IHZ. New information on leks densities caused some areas to be moved into a higher classification. Some areas were moved to a lower classification because of their less significant habitat value to GSG. Additionally, boundaries were adjusted to remove non-habitat from the zones. Other adjustments were also made to “snap” boundaries to meaningful and implementable divisions of the landscape.

Idaho believes that the three-tiered habitat structure represents an innovative approach to the conservation of GSG while ensuring the economic vitality of the State of Idaho. Therefore, Idaho remains committed to our continued work with the BLM to ensure this approach is carried forward in the Final EIS.

If you have any questions regarding these comments, please contact me at 334-2189.

Sincerely,

A handwritten signature in blue ink that reads "Dustin T. Miller". The signature is written in a cursive, slightly slanted style.

Dustin T. Miller

Idaho and Southwestern Montana  
Recommendation for Proposed Plan Amendment

1. Summary Description of Plan

- 1.1. Maintain and/or increase the abundance, distribution and connectivity of GRSG by conserving, enhancing and restoring GRSG habitat to maintain resilient populations by reducing, eliminating or minimizing threats to GRSG habitats.
- 1.2. Comply with existing laws, regulations and policies.
- 1.3. Recognize valid existing rights.
- 1.4. BLM and FS would coordinate with the States of Idaho and Montana, as appropriate, during implementation activities including the evaluation of disturbance threshold, adaptive management triggers and mitigation.
- 1.5. The Idaho and Southwestern Montana Sub-Region would be divided into 5 Conservation Areas over which the disturbance threshold and adaptive management triggers would apply. These areas are the West Owyhee, Desert, Mountain Valleys, Southern and Southwestern Montana (Map 1).
- 1.6. The Conservation Areas would be categorized into management zones – Core, Important and General, with the exception of the Southwestern Montana Conservation Area which does not contain Important Management Zones (Map 2).
- 1.7. Adaptive Management: Idaho: actions would engage when population decline by 10 percent or a combined 10 percent loss nesting and/or wintering habitat within Core or Important Management Zones within a Conservation Area is lost (Soft Trigger), and when 20 percent of the population or nesting and wintering habitat within Core or Important Management Zones within a Conservation Area is lost (Hard Trigger) Montana: Adaptive management in Montana is linked with the state evaluation framework.
- 1.8. Additional anthropogenic disturbance (AD-1) would be significantly limited in Core Management Zones with specific exceptions (AD-3 & AD-4); it would be limited unless consistent with specific criteria in Important Management Zones (AD-4) and would be avoided in General Management Zones.
- 1.9. Anthropogenic disturbance (AD-1) would be contained within a 3 percent total disturbance cap as applied to the biologically significant unit (the biologically significant unit (BSU) is defined as the nesting and wintering habitat within Core and Important Management Zones within a Conservation Area), including existing anthropogenic disturbance. In Montana surface disturbance will be calculated through the state surface disturbance analysis process on a project by project basis.
- 1.10. Mitigation would be required for all anthropogenic disturbance activities within GRSG habitat. Within Core Management Zones a standard of no net unmitigated loss would be required.
- 1.11. BLM and Forest Service would set up a Mitigation Board at the State level with state involvement to develop a Mitigation Strategy and oversee the application of mitigation at the site-specific level.
- 1.12. BLM and Forest Service would complete Wildfire and Invasive Species Assessments at the local level to identify priority areas of habitat, and wildfire and invasive species concern. These assessments would support and include the development of fuels, restoration and rehabilitation strategies to use during implementation level activities.

Comment [CY1]: Need clear definition and identify what data layers will be used to calculate this; who is responsible for managing data; etc. Maybe this is in Appendix H.

Comment [CY2]: Only applying disturbance within the BSU could significantly effective the functional 3% disturbance threshold. Task Force recommendations are 3% within nesting and wintering habitat of a CA.

Comment [CY3]: Are only impacts in BSU are counted towards the 3%??

Comment [CY4]: How will BLM's new mitigation policy be coordinated with the state effort?

Comment [CY5]: What is local – BSU or CA?

Comment [d6]: Fuel breaks?

## Idaho and Southwestern Montana GRSG EIS – Land Allocation Decisions Summary

Solar/Wind/Nuclear/Hydropower		
Core	Important	General
Exclusion (LR-2)	Avoidance (LR-2)	Open (LR-2)
Commercial Service Airports		
Core	Important	General
Exclusion (LR-3)	Avoidance (LR-1)	Open (LR-1)
Landfills		
Core	Important	General

## 2. Goals and Objectives

- 2.1. GOAL-1: Maintain and/or increase the abundance, distribution and connectivity of GRSG by conserving, enhancing and restoring GRSG habitat to maintain resilient populations by reducing, eliminating or minimizing threats to GRSG habitats.
  - 2.2. GOAL-2: Provide for the needs of GRSG and their habitat while also providing for resource uses in accordance with the agencies' direction for multiple use and sustained yield as described in FLPMA and the NFMA.
  - 2.3. GOAL-3: Manage anthropogenic development and human disturbance to minimize the likelihood of adverse population level effects on GRSG.
  - 2.4. GOAL-4: Reduce the risk of West Nile Virus or other disease outbreaks from BLM and USFS management actions.
  - 2.5. Management Area (MA) - Objective (OBJ)-1: Maintain a resilient population of GRSG in Idaho and Southwestern Montana.
  - 2.6. MA-OBJ-2: Designate GRSG management zones and associated management to maintain a resilient population and to designate strategically located adjacent zones to provide a buffer from unpredictable habitat loss such as wildfire to the resilient population areas.
  - 2.7. MA-OBJ-3: Identify and strategically protect larger in-tact sagebrush areas and areas of lower fragmentation to maintain GRSG population persistence.
  - 2.8. Vegetation (VEG)-OBJ-1: Reconnect and expand areas of higher native plant community integrity/rangeland health to increase the extent of high quality habitat and, where possible, to accommodate the future effects of climate change.
  - 2.9. VEG-OBJ-2: Increase the amount and functionality of seasonal habitats by:
    - a. Increasing canopy cover and average patch size of sagebrush in perennial grasslands.
    - b. Increasing the amount, condition and connectivity of seasonal habitats.
    - c. Protecting or improving GRSG migration/movement corridors.
    - d. Reducing conifer encroachment within GRSG seasonal habitats.
    - e. Improving understory (grass, forb) and/or riparian condition within breeding and late brood-rearing habitats.
    - f. Reducing the extent of annual grasslands adjacent to Core and Important Management Zones.
- Decadal treatment objectives by population area are identified in Table 1.
- 2.10. Habitat Management (HM)-OBJ-1: Maintain or make progress toward 70% of lands within CMZs and IMZs capable of producing sagebrush at 10-30% canopy cover and less than 10% conifer canopy cover.
  - 2.11. HM-OBJ-2: Incorporate GRSG Seasonal Habitat Objectives (Table 2) into the design of projects or activities, as appropriate, based on site conditions and ecological potential, unless achievement of fuels management objectives require additional reduction in sagebrush cover to meet strategic protection of GRSG habitat and conserve habitat quality for the species.
  - 2.12.

FUEL-OBJ-1: FUEL-OBJ-1:

Comment [CV8]: In a specific CA or should "in" be deleted?

Deleted: in

Deleted:

Comment [CV9]: within and adjacent to...

Comment [BER10]: Tie this value to what is in the table. Paul and Rob to finish table.

Comment [BER11]: Use FS language regarding fuels objectives – get from Rob.

Comment [BER12]: Need to incorporate FIAT results.

Deleted: ¶

**Table 1. Acres of Treatment within a 10-Year Period to Achieve Vegetation Objectives**

Population Area	Mechanical Conifer Treatment	Prescribed Fire	Annual Grass Treatment
SW Idaho	15000-16000	600-700	30000-32000
S Central Idaho	10000-11000	100-200	16000-17000
Mountain Valleys	1500-1600	500-600	0
N Snake River	0	4000-4500	20000-21000
Bear Lake Plateau	100-150	0	100-200
Montana	300-400	10000-12000	0

**Comment [BER13]:** From Paul - The figures in this table look more like what we would need to treat annually. Treating 15000 acres of juniper a decade in SW Idaho won't make a dent, nor will 500 acres of RX fire in mountain valleys (that is far less than one typical RX fire project acreage.). Double check model outputs with Robb. In comment review meeting NV/CA mentioned they are reporting this info for 50 year timeframe....Should we. Discuss.

**Comment [d15]:** This may be financially challenging to treat this many acres annually but their objectives indicates the magnitude of this primary threat.

**Comment [d14]:** I agree with Paul that they must mean this to be annual objectives – otherwise they are not treating enough if this is the total over 10 years.

**Table 2. Seasonal Habitat Desired Conditions for Greater Sage-Grouse**

ATTRIBUTE	INDICATOR	DESIRED CONDITON
Lek Habitat	Proximity of trees <sup>9,16</sup>	<Trees (e.g. juniper) none to uncommon within 3 km of occupied leks
	Proximity of sagebrush to leks <sup>16</sup>	Adjacent protective sagebrush cover within 100 m of an occupied lek <sup>16</sup>
Nesting Habitat	Apply indicators to areas within 10 km of occupied leks, that have the ecological capability to provide sagebrush cover.	
	Seasonal habitat needed <sup>10</sup>	>80% of the landscape in sagebrush cover
	Sagebrush canopy cover <sup>2,10,11,13</sup>	15-25%
	Sagebrush height <sup>10</sup>	
	Arid sites <sup>3</sup>	12-31 inches (30-80cm)
	Mesic sites <sup>4</sup>	16-31 inches (40-80cm)
	Predominant sagebrush shape <sup>16</sup>	>50% in spreading shape <sup>5</sup>
	Perennial grass cover <sup>2,10</sup>	
	Arid sites <sup>3</sup>	≥10%
	Mesic sites <sup>4</sup>	≥15%
	Perennial grass height <sup>10,11,13,16</sup>	≥7 inches <sup>10</sup>
<b>BROOD-REARING/SUMMER<sup>1</sup> (July-October)<sup>1</sup> (Apply to all habitat outside of nesting/breeding and winter)</b>	Cover	
	Seasonal habitat needed <sup>10</sup>	>40% of the landscape in sagebrush cover
	Sagebrush canopy cover <sup>2,10</sup>	10-25%
	Sagebrush height <sup>10</sup>	40-80cm
	Perennial grass canopy cover <sup>2,10</sup>	>15%
	Upland and riparian perennial forb availability <sup>2,16</sup>	Preferred forbs are common with several preferred species present <sup>7,8</sup>

**Comment [LD16]:** Should "tree" be defined? I am just thinking of areas with mountain mahogany or old-growth juniper in limited patches that we would want to preserve, vs. seral juniper. Maybe there is a way to differentiate by saying "as appropriate for existing soils/ecological sites"??

<sup>1</sup> These acreage figures represent an objective for treatment over a ten-year (decadal) timeframe to support achievement or progress toward vegetation and habitat objectives. This accounts for variations in yearly funding availability and does not reflect a maximum acreage for treatment should funding and site specific conditions allow for more or less treatment than described in order to meet vegetation and habitat objectives.

Deleted: d

	Riparian meadow habitat function	>80% relative composition <sup>a</sup> of riparian herbaceous species <sup>7</sup>
<b>WINTER<sup>1</sup> November-March<sup>1</sup> (Apply to areas of low snow accumulation)</b>		
Cover and Food	Seasonal habitat needed <sup>10</sup>	>80%
	Sagebrush canopy cover above snow <sup>2,10</sup>	>10%
	Sagebrush height above snow <sup>10</sup>	>25cm

**Comment [LD17]:** Function is kind of a confusing term to use here. That makes me think of PFC, which doesn't look at spp. Composition. Not a deal breaker, just thought I'd mention it

<sup>1</sup> Seasonal dates can be adjusted by local unit according to geographic region.  
<sup>2</sup> Absolute cover is the actual recorded cover and can exceed 100% when recorded across all species and all layers. It is not relative cover, which is the proportions of each species, and equals 100%. Note that cover is reported for only those species (e.g., sagebrush, preferred forbs) that are sampled to determine suitability of habitat for sage-grouse. Overall cover at the site will be greater than that sampled for sage-grouse habitat, due to other species present.  
<sup>3</sup> 10 – 12 inch precipitation zone; *Artemisia tridentata wyomingensis* is a common big sagebrush sub-species for this type site (HAF 2014).  
<sup>4</sup> ≥12 inch precipitation zone; *Artemisia tridentata vaseyana* is a common big sagebrush sub-species for this type site (HAF 2014).  
<sup>5</sup> Sagebrush plants that are more tree or columnar-shaped do not provide the protective cover of sagebrush with a spreading shape (HAF 2014).  
<sup>7</sup> Preferred forbs are listed in HAF Table III-2 (HAF 2014). Overall total forb cover may be greater than that of preferred forb cover since not all forb species are listed as preferred in Table III-2.  
<sup>8</sup> Cover may be higher according to local riparian classifications.
